PRINTED IN INDIA

By Rajendra Ravindra Printers Pvt. Ltd., 7361, Ram Nagar, New Delhi -110 055  
and published by S. Chand & Company Pvt. Ltd., 7361, Ram Nagar, New Delhi -110 055.

## PREFACE TO THE THIRD REVISED EDITION

---

The book has received very good response from students and teachers within the country and abroad alike. Its previous edition is exhausted in a very short time.

A chapter on Fuzzy set is included at the end of the book to make it more useful

The misprints which came to my knowledge, have been removed.

We are thankful to the Management Team and the Editorial Department of S. Chand & Company Pvt. Ltd. for all help and support in the publication of this book.

Suggestions for the improvement of the book will be gratefully acknowledged.

**AUTHORS**

**Disclaimer :** While the authors of this book have made every effort to avoid any mistake or omission and have used their skill, expertise and knowledge to the best of their capacity to provide accurate and updated information. The author and S. Chand does not give any representation or warranty with respect to the accuracy or completeness of the contents of this publication and are selling this publication on the condition and understanding that they shall not be made liable in any manner whatsoever. S.Chand and the author expressly disclaim all and any liability/responsibility to any person, whether a purchaser or reader of this publication or not, in respect of anything and everything forming part of the contents of this publication. S. Chand shall not be responsible for any errors, omissions or damages arising out of the use of the information contained in this publication.  
Further, the appearance of the personal name, location, place and incidence, if any; in the illustrations used herein is purely coincidental and work of imagination. Thus the same should in no manner be termed as defamatory to any individual.

## PREFACE TO THE FIRST EDITION

---

It gives me great pleasure to present this textbook of **Higher Engineering Mathematics** to the students pursuing various engineering courses.

This book includes the syllabi of various engineering courses and comprises of 65 simple and short chapters to avoid ambiguity. As presently there is not a single textbook which entirely covers so many topics of engineering courses. Therefore an endeavour has been made to cover the syllabus exhaustively and present the subject matter in a systematic and lucid style.

About 2000 solved examples on various topics have been incorporated in the textbook for the better understanding of the students. Care has been taken to systematically grade these examples. While solving the examples, even minor steps have not been missed to take care the difficulty of the students in understanding the subject easily. Most of the examples have been taken from the latest examination papers which should make the students familiar with the standard and trend of questions being set in the examinations.

The author possesses very long and rich experience of more than 50 years in teaching Mathematics to the students preparing examinations of engineering and has first hand experience of the problems and difficulties that students & teachers generally face.

This book should satisfy both average and brilliant students. It would help the students to score good marks in examinations and at the same time would arouse greater intellectual curiosity in them.

We are thankful to the Management Team and the Editorial Department of S. Chand & Company Ltd. for all help and support in the publication of this book.

Suggestions for the improvement of the book will be gratefully acknowledged.

# CONTENTS

## UNIT - I

<b>1. PARTIAL DIFFERENTIATION</b>	<b>1 – 36</b>
1.1 Introduction 1; 1.2 Limit 1; 1.3 Working Rule to find the Limit 1; 1.4 Continuity 5; 1.5 Working Rule for Continuity at a Point $(a, b)$ 5; 1.6 Types of Discontinuity 6; 1.7 Partial Derivatives 8; 1.8 Partial Derivatives of Higher Orders 11; 1.9 Which Variable is to be Treated as constant 19; 1.10 Homogeneous Function 22; 1.11 Euler's Theorem on Homogeneous Function 22.	
<b>2. TOTAL DIFFERENTIATION</b>	<b>37 – 58</b>
2.1 Introduction 37; 2.2 Total Differential Co-efficient 37; 2.3 Important Deductions 51; 2.4 Typical Cases 55; 2.5 Geometrical Interpretation of $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ 56; 2.6 Tangent Plane to a Surface 56.	
<b>3. MAXIMA AND MINIMA OF FUNCTIONS (TWO VARIABLES)</b>	<b>59 – 86</b>
3.1 Maximum Value 59; 3.2 Conditions for Extremum Values 59; 3.3 Working Rule to find Extremum Values 60; 3.4 Lagrange Method of Undetermined Multipliers 72.	
<b>4. ERRORS</b>	<b>87 – 96</b>
4.1 Error Determination 87.	
<b>5. JACOBIANS</b>	<b>97 – 121</b>
5.1 Jacobians 97; 5.2 Properties of Jacobians 104; 5.3 Jacobian of Implicit Functions 115; 5.4 Partial Derivatives of Implicit Functions by Jacobian 118.	
<b>6. TAYLOR'S SERIES FOR FUNCTIONS OF TWO VARIABLES</b>	<b>122 – 132</b>
6.1 Taylor's Series of Two Variables 122.	

## UNIT - II

<b>7. DOUBLE INTEGRALS</b>	<b>133 – 158</b>
7.1 Double Integration 133; 7.2 Evaluation of Double Integral 133; 7.3 Evaluation of double integrals in Polar Co-ordinates 138; 7.4 Change of order of Integration 143; 7.5 Change of Variables 153.	
<b>8. APPLICATION OF THE DOUBLE INTEGRALS (AREA, CENTRE OF GRAVITY, MASS, VOLUME)</b>	<b>159 – 170</b>
8.1 Introduction 159; 8.2 Area in Cartesian Co-ordinates 159; 8.3 Area in Polar Co-ordinates 162; 8.4 Volume of Solid by Rotation of an area (Double Integral) 165; 8.5 Centre of Gravity 167; 8.6 Centre of Gravity of an Arc 169.	
<b>9. TRIPLE INTEGRATION</b>	<b>171 – 181</b>
9.1 Introduction 171; 9.2 Triple Integration 173; 9.3 Integration by Change of Cartesian Coordinates Into Spherical Coordinates 176.	
<b>10. APPLICATION OF TRIPLE INTEGRATION</b>	<b>182 – 206</b>
10.1 Introduction 182; 10.2 Volume = $\iiint dx dy dz$ . 182; 10.3 Volume of Solid bounded by Sphere or by Cylinder 184; 10.4 Volume of Solid bounded by Cylinder or Cone 186; 10.5 Volume Bounded by a Paraboloid 191; 10.6 Surface Area 194; 10.7 Calculation of Mass 198; 10.8 Centre of Gravity 200; 10.9 Moment of Inertia of a Solid 200; 10.10 Centre of Pressure 204.	

**UNIT – III****11. DIFFERENTIAL EQUATIONS OF FIRST ORDER****207 – 242**

11.1 Definition 207; 11.2 order and Degree of a Differential Equation 207; 11.3 Formation of Differential Equations 207; 11.4 Solution of a Differential Equation 210; 11.5 Geometrical Meaning of the Differential Equation of the First order and First Degree 210; 11.6 Differential Equations of the First order and First Degree 210; 11.7 Variables Separable 211; 11.8 Homogeneous Differential Equations 213; 11.9 Equations Reducible to Homogeneous form 215; 11.10 Linear Differential Equations 217; 11.11 Equations Reducible to the Linear form (Bernoulli Equation) 220; 11.12 Exact Differential Equation 226; 11.13 Equations Reducible to the Exact Equations 230; 11.14 Differential Equations Reducible to Exact form (by Inspection) 235; 11.15 Equations of First order and Higher Degree 235; 11.16 Orthogonal Trajectories 237; 11.17 Polar Equation of the Family of Curves 240;

**12. LINEAR DIFFERENTIAL EQUATIONS OF SECOND ORDER****243 – 265**

12.1 Linear Differential Equations 243; 12.2 Non Linear Differential Equations 243; 12.3 Linear Differential Equations of Second order with Constant Coefficients 243; 12.4 Complete Solution = Complementary Function + Particular Integral 244; 12.5 Method for finding the Complementary Function 244; 12.6 Rules to find

Particular Integral 248; 12.7  $\frac{1}{f(D)} e^{ax} = \frac{1}{f(a)} e^{ax}$ . 248; 12.8.  $\frac{1}{f(D)} x^n = [f(D)]^{-1} x^n$  251;

12.9  $\frac{1}{f(D^2)} \sin ax = \frac{\sin ax}{f(-a^2)}$  252; 12.10  $\frac{1}{f(D)} \cdot e^{ax} \cdot \phi(x) = e^{ax} \cdot \frac{1}{f(D+a)} \phi(x)$  256; 12.11 To find

the Value of  $\frac{1}{f(D)} x^n \sin ax$ . 262; 12.12 General Method of finding the Particular Integral of any Function  $f(x)$  263.

**13. CAUCHY – EULER EQUATIONS, METHOD OF VARIATION OF PARAMETERS****266 – 285**

13.1 Cauchy Euler Homogeneous Linear Equations 266; 13.2 Legendre's Homogeneous Differential Equations 272; 13.3 Method of Variation of Parameters 275.

**14. SIMULTANEOUS LINEAR DIFFERENTIAL EQUATIONS****286 – 298**

14.1 Simultaneous Differential Equations 286.

**15. DIFFERENTIAL EQUATION OF OTHER TYPES****299 – 322**

15.1 Introduction 299; 15.2 Equation of the Type  $\frac{d^n y}{dx^n} = f(x)$  299; 15.3 Equation of

the Type  $\frac{d^n y}{dx^n} = f(y)$  300; 15.4 Equations which do not contain 'y' directly 303;

15.5 Equations which do not contain 'x' directly 304; 15.6 Equations whose solution is known 306; 15.7 Normal form (Removal of first derivative) 311; 15.8 Method of Solving Linear Differential Equations by Changing the Independent Variable 314; 15.9 Method of Variation of Parameters 319; 15.10 Method of Undetermined coefficients 320.

**16. APPLICATIONS TO DIFFERENTIAL EQUATIONS****323 – 366**

16.1 Introduction 323; 16.2 Electrical Circuit 323; 16.3 Second order Differential Equation 327; 16.4 Mechanical Engineering Problems 336; 16.5 Vertical Motion 338;

16.6 Vertical Elastic String 342; 16.7 Horizontal Elastic String 342; 16.8 Simple Harmonic Motion 344; 16.9 The Simple Pendulum 349; 16.10 Oscillations of a String 350; 16.11 Beam 359; 16.12 Projectile 362.

## UNIT – IV

**17. DETERMINANTS****367 – 397**

17.1 Introduction 367; 17.2 Determinant as Eliminant 367; 17.3 Minor 368; 17.4 Cofactor 368; 17.5 Properties of Determinants 371; 17.6 Factor theorem 387; 17.7 Special Types of Determinants 389; 17.8 Application of determinants 390; 17.9 Solution of Simultaneous Linear Equations by Determinants (Cramer's Rule) 392; 17.10 Rule for Multiplication of Two Determinants 396.

**18. ALGEBRA OF MATRICES****398 – 423**

18.1 Definition 398; 18.2 Various Types of Matrices 398; 18.3 Addition of Matrices 402; 18.4 Properties of Matrix Addition 403; 18.5 Subtraction of Matrices 404; 18.6 Scalar Multiple of a Matrix 404; 18.7 Multiplication 405; 18.8  $(AB)' = B'A'$  405; 18.9 Properties of Matrix Multiplication 405; 18.10 Adjoint of a Square Matrix 411; 18.11 Mathematical Induction 412; 18.12 Property of Adjoint Matrix 414; 18.13 Inverse of a Matrix 414; 18.14 Elementary Transformations 417; 18.15 Elementary Matrices 418; 18.16 Theorem 418; 18.17 To Compute the Inverse of a Matrix from Elementary Matrices 419; 18.18 The Inverse of a Symmetric Matrix 419.

**19. RANK OF MATRIX****424 – 434**

19.1 Rank of a Matrix 424; 19.2 Normal form (Canonical form) 424; 19.3 Rank of Matrix by Triangular form 430.

**20. CONSISTENCY OF LINEAR SYSTEM OF EQUATIONS AND THEIR SOLUTIONS****435 – 463**

20.1 Solution of Simultaneous Equations 435; 20.2 Types of Linear Equations 438; 20.3 Consistency of a System of Linear Equations 438; 20.4. Homogeneous Equations 448; 20.5 Cramer's Rule 449; 20.6 Vectors 452; 20.7 Linear Dependence and Independence of Vectors 452; 20.8 Linearly Dependence and Independence of Vectors by Rank Method 455; 20.9 another Method (Adjoint Method) to Solve Linear Equations 456; 20.10 Partitioning of Matrices 459; 20.11 Multiplication by Sub-matrices 460.

**21. EIGEN VALUES, EIGEN VECTOR, CAYLEY HAMILTON THEOREM, DIAGONALISATION  
(COMPLEX AND UNITARY MATRICES, APPLICATION)****464 – 511**

21.1 Introduction 464; 21.2 Eigen Values 464; 21.3 Cayley-Hamilton theorem 469; 21.4 Power of Matrix (by Cayley Hamilton theorem) 472; 21.5 Characteristic Vectors or Eigen Vectors 474; 21.6 Properties of Eigen Vectors 475; 21.7 Orthogonal Vectors 475; 21.8 Non-symmetric Matrices with Non-repeated Eigen Values 476; 21.9 Non-Symmetric Matrix with Repeated Eigen Values 479; 21.10 Symmetric Matrices with Non Repeated Eigen Values 482; 21.11 Symmetric Matrices with Repeated Eigen Values 485; 21.12 Matrix having only one linearly independent eigen vector 487; 21.13 Matrix having only two eigen vectors 487; 21.14 Complex Eigen Values 488; 21.15 Algebraic multiplicity 489; 21.16 Geometric multiplicity 489; 21.17 Regular eigen value 489; 21.18 Similarity transformation 491; 21.19 Diagonalisation of a matrix 491; 21.20 Orthogonal transformation of a symmetric matrix to Diagonal form 491; 21.21 Theorem on diagonalization of a matrix 491; 21.22 Powers of a matrix (by

diagonalisation) 496; 21.23 Sylvester theorem 498; 21.24 Complex Matrices 500; 21.25 Theorem 500; 21.26 Transpose of Conjugate of a Matrix 501; 21.27 Hermitian matrix 501; 21.28 The Characteristic Roots of a Hermitian matrix are all real 503; 21.29 Skew-Hermitian Matrix 503; 21.30 Characteristic Roots of a Skew-hermitian Matrix Is Either Zero or Purely an Imaginary Number 506; 21.31 Periodic Matrix 506; 21.32 Idempotent Matrix 506; 21.33 Prove That the Eigen Values of an Idempotent Matrix Are Either Zero or Unity 506; 21.34 Unitary Matrix 508; 21.35 The Modulus of Each Characteristic Root of a Unitary Matrix is Unity 510.

## UNIT – V

### **22. REVIEW OF VECTOR ALGEBRA**

**512 – 524**

22.1 Vectors 512; 22.2 Addition of Vectors 512; 22.3 Rectangular Resolution of a Vector 512; 22.4 Unit Vector 512; 22.5 Position Vector of a Point 513; 22.6 Ratio formula 513; 22.7 Product of Two Vectors 514; 22.8 Scalar, or Dot Product 514; 22.9 Useful Results 514; 22.10 Work Done As A Scalar Product 514; 22.11 Vector Product or Cross Product 515; 22.12 Vector Product Expressed As A Determinant 515; 22.13 Area of Parallelogram 515; 22.14 Moment of a force 516; 22.15 Angular Velocity 516; 22.16 Scalar Triple Product 516; 22.17 Geometrical Interpretation 517; 22.18 Coplanarity Questions 518; 22.19 Vector Product of Three Vectors 521; 22.20 Scalar Product of Four Vectors 523; 22.21 Vector Product of Four Vectors 523.

### **23. DIFFERENTIATION OF VECTOR (POINT FUNCTION, GRADIENT, DIVERGENCE AND CURL OF A VECTOR AND THEIR PHYSICAL INTERPRETATIONS)**

**525 – 564**

23.1 Vector Function 525; 23.2 Differentiation of Vectors 525; 23.3 Formulae of Differentiation 526; 23.4 Scalar and Vector Point Functions 528; 23.5 Gradient of a Scalar Function 528; 23.6 Geometrical Meaning of Gradient, Normal 529; 23.7 Normal and Directional Derivative 529; 23.8 Divergence of a Vector Function 541; 23.9 Physical Interpretation of Divergence 541; 23.10 Curl 546; 23.11 Physical Meaning of Curl 546.

### **24. VECTOR INTEGRATION**

**565 – 611**

24.1 Line Integral 565; 24.2 Surface Integral 573; 24.3 Volume Integral 575; 24.4 Green's Theorem (For a plane) 576; 24.5 Area of the Plane Region by Green's theorem 579; 24.6 Stoke's theorem (Relation Between Line Integral and Surface Integral) 581; 24.7 Another Method of Proving Stoke's theorem 582; 24.8 Gauss's theorem of Divergence 597.

## UNIT – VI

### **25. COMPLEX NUMBERS**

**612 – 656**

25.1 Introduction 612; 25.2 Complex Numbers 612; 25.3 Geometrical Representation of Imaginary Numbers 612; 25.4 Argand Diagram 612; 25.5 Equal Complex Numbers 612; 25.6 Addition 613; 25.7 Addition of Complex Numbers by Geometry 613; 25.8 Subtraction 613; 25.9 Powers of  $i$  614; 25.10 Multiplication 614; 25.11  $i$  (iota) as an operator 615; 25.12 Conjugate of a Complex Number 615; 25.13 Division 616; 25.14 Division of Complex numbers by Geometry 617; 25.15 Modulus and Argument 620; 25.16 Polar form 625; 25.17 Types of Complex Numbers 625; 25.18 Square Root of a Complex Number 627; 25.19 Exponential and Circular Functions of Complex Variables 629; 25.20 De Moivre's theorem (by Exponential Function) 629; 25.21 De Moivre's theorem (by induction) 629; 25.22 Roots of a Complex Number 634; 25.23 Circular

Functions of Complex Numbers 637; 25.24 Hyperbolic Functions 637; 25.25 Relation Between Circular and Hyperbolic Functions 638; 25.26 Formulae of Hyperbolic Functions 638; 25.27 Separation of Real and Imaginary parts of Circular Functions 642; 25.28 Separation of Real and Imaginary Parts of Hyperbolic Functions 643; 25.29 Logarithmic Function of a Complex Variable 648; 25.30 Inverse functions 650; 25.31 Inverse Hyperbolic Functions 650; 25.32 Some Other Inverse Functions 652.

**26. EXPANSION OF TRIGONOMETRIC FUNCTIONS** **657 – 668**

26.1 Expansion of  $\sin n\theta$ ,  $\cos n\theta$  in powers of  $\sin \theta$ ,  $\cos \theta$  657; 26.2 Expansion of  $\cos n\theta$   $\sin n\theta$  in terms of sines and cosines of multiples of  $\theta$  659; 26.3 Summation of Sines and cosines series: 'C + i S' Method 660; 26.4 Approximation 667.

**27. FUNCTIONS OF COMPLEX VARIABLE, ANALYTIC FUNCTION** **669 – 709**

27.1 Introduction 669; 27.2 Complex Variable 669; 27.3 Functions of a Complex Variable 669; 27.4 Limit of a Function of a Complex Variable 669; 27.5 Continuity 669; 27.6 Differentiability 670; 27.7 Analytic Function 672; 27.8 The Necessary Condition for  $F(z)$  to be analytic 673; 27.9 Sufficient Condition for  $F(z)$  to be analytic 673; 27.10 C-R Equations in Polar form 682; 27.11 Derivative of  $f(z)$  In Polar form 683; 27.12 Orthogonal Curves 685; 27.13 Harmonic Function 685; 27.14 Applications to Flow Problems 689; 27.15 Velocity Potential 689; 27.16 Method to Find the Conjugate Function 690; 27.17 Milne Thomson Method (to Construct an Analytic Function) 698; 27.18 Working Rule to Construct an Analytic Function by Milne Thomson Method 699; 27.19 Partial Differentiation of Function of Complex Variable 705.

**28. CONFORMAL TRANSFORMATION** **710 – 741**

28.1 Geometrical representation 710; 28.2 Transformation 710; 28.3 Conformal transformation 711; 28.4 Theorem. If  $f(z)$  is analytic, mapping is conformal 712; 28.5 Theorem 713; 28.6 Translation  $w = z + C$ , 715; 28.7 Rotation  $w = ze^{i\theta}$  715; 28.8 Magnification 716; 28.9 Magnification and rotation 717; 28.10 Inversion and reflection 718; 28.11 Bilinear transformation (Mobius Transformation) 721; 28.12 Invariant points of bilinear transformation. 721; 28.13 Cross-ratio 721; 28.14 Theorem 722; 28.15 Properties of bilinear transformation 722; 28.16 Methods to find bilinear transformation 722; 28.17 Inverse point with respect to a circle 728; 28.18 Transformation: 733; 28.19 Transformation: 735; 28.20 Transformation:  $w = z + \frac{1}{z}$  735; 28.21 Transformation:  $w = e^z$  735; 28.22 Transformation:  $w = \cosh z$  737; 28.23 Schwarz-Christoffel transformation 739.

**29. COMPLEX INTEGRATION** **742 – 770**

29.1 Introduction (Line Integral) 742; 29.2 Important Definitions 751; 29.3 Cauchy's Integral theorem 752; 29.4 Extension of Cauchy's theorem to Multiple Connected Region 753; 29.5 Cauchy Integral Formula 754; 29.6 Cauchy Integral Formula for the Derivative of an Analytic Function 754; 29.7 Morera Theorem (Converse of Cauchy's theorem) 755; 29.8 Cauchy's Inequality 755; 29.9 Liouville Theorem 756; 29.10 Fundamental Theorem of Algebra 757; 29.11 Poisson Integral Formula for a Circle 757; 29.12 Poisson Integral Formula for a Half Plane 759.

**30. TAYLOR'S AND LAURENT'S SERIES** **771 – 792**

30.1 Introduction 771; 30.2 Convergence of a series of complex terms 771; 30.3 Power

Series 771; 30.4 Region of convergence 772; 30.5 Radius of Convergence of Power Series 772; 30.6 Method of expansion of a function 773; 30.7 Taylor theorem 773; 30.8 Laurent's Theorem 783; 30.9 If  $f(z)$  has a Pole at  $z = a$  then  $|f(z)| \rightarrow \infty$  as  $z \rightarrow a$  788.

### 31. THE CALCULUS OF RESIDUES (INTEGRATION)

**793 – 839**

31.1 Zero of Analytic Function 793; 31.2 Singular Point 793; 31.3 Theorem 797; 31.4 Definition of the residue at a pole 798; 31.5 Residue at Infinity 798; 31.6 Method of finding residues 798; 31.7 Residue by definition 800; 31.8 Formula: Residue =  $\lim_{z \rightarrow a} (z - a) f(z)$  800; 31.9 Residue Formula:

$$f(a) = \frac{1}{(n-1)!} \left\{ \frac{d^{n-1}}{dz^{n-1}} [(z-a)^n f(z)] \right\}_{z=a} 802; 31.10 \text{ Formula: Res. (at } z = a) = \frac{\phi(a)}{\psi'(a)} 803;$$

31.11 Formula: Residue = Coefficient of  $\frac{1}{t}$  in  $f(1+t)$  804; 31.12 Residue theorem 806;

31.13 Evaluation of real Definite Integrals by Contour Integration 811; 31.14 Integration round the unit circle of the type  $\int_0^{2\pi} (\cos \theta, \sin \theta) d\theta$ , 812; 31.15 Evaluation of  $\int_{-\infty}^{\infty} \frac{f_1(x)}{f_2(x)} dx$  where  $f_1(x)$  and  $f_2(x)$  are polynomials in  $x$ . 823; 31.16 Rectangular contour 833; 31.17 Indented semi-circular contour 836.

### UNIT – VII

### 32. SERIES SOLUTIONS OF SECOND ORDER DIFFERENTIAL EQUATIONS

**840 – 870**

32.1 Introduction 840; 32.2 Power Series Solutions of Differential Equations 840; 32.3 Analytic Function 840; 32.4 Ordinary Point 840; 32.5 Solution of the Differential Equation when  $x = 0$  is an ordinary Point i.e. when  $P$  does not vanish for  $x = 0$ . 841; 32.6 Working rule to solve a Differential Equation if  $x = 0$  is an ordinary point of the equation 841; 32.7 Singular points about  $x = a$  846; 32.8 Singular Point about  $x = 0$ . 847; 32.9 Frobenius Method 848.

### 33. BESSEL'S FUNCTIONS

**871 – 898**

33.1 Bessel's Equation 871; 33.2 Solution of Bessel's Equation 871; 33.3 Bessel Functions,  $J_n(x)$  872; 33.4 Bessel's function of the second kind of order  $n$ . 874; 33.5 Recurrence formulae 878; 33.6 Equations Reducible to Bessel's Equation 888; 33.7 Orthogonality of Bessel Function 890; 33.8 A Generating Function for  $J_n(x)$  891; 33.9 Trigonometric Expansion Involving Bessel Functions 891; 33.10 Bessel's Integral 893; 33.11 Fourier-Bessel Expansion 894; 33.12 Ber and Bei Functions 896.

### 34. LEGENDRE FUNCTIONS

**899 – 929**

34.1 Legendre's Equation 899; 34.2 Legendre's Polynomial  $P_n(x)$ . 901; 34.3 Legendre's Function of the Second Kind i.e.  $Q_n(x)$  901; 34.4 General Solution of Legendre's Equation 902; 34.5 Rodrigue's formula 902; 34.6 Legendre Polynomials 904; 34.7 A Generating Function of Legendre's Polynomial 906; 34.8 Orthogonality of Legendre Polynomials 913; 34.9 Recurrence formulae 916; 34.10 Laplace's First Definite Integral for  $P_n(x)$  919; 34.11 Laplace's Second Definite Integral for 920; 34.12 Fourier-Legendre Expansion 923; 34.13 Laguerres Differential Equation 927; 34.14 Strum-Liouville Equation 928; 34.15 Orthogonality 929; 34.16 Orthogonality of Eigen Functions 929.

<b>35. HERMITE FUNCTION</b>	<b>930 – 941</b>
35.1 Introduction 930; 35.2 Hermite's Equation 930; 35.3 Generating Function of Hermite Polynomials (Rodrigue formula) 933; 35.4 Orthogonal property 935; 35.5 Recurrence formulae for $H_n(x)$ of Hermite Equation. 936.	
<b>36. LAGUERRE'S FUNCTION</b>	<b>942 – 948</b>
36.1 Laguerre's Function 942; 36.2 Laguerre's Function for Different Values of $n$ . 944; 36.3 Generating Function of Laguerre Polynomial 944; 36.4 Recurrence Relation 945; 36.5 Orthogonal Property 947.	
<b>37. CHEBYSHEV POLYNOMIALS</b>	<b>949 – 961</b>
37.1 Introduction 949; 37.2 Chebyshev Polynomials (Tchebcheff or Tschebyscheff polynomials) 949; 37.3 Chebyshev Equation 949; 37.4 Orthogonal Properties of Chebyshev polynomials. 950; 37.5 Recurrence Relation of Chebyshev polynomials 951; 37.6 Powers of $x$ in terms of $T_n(x)$ 952; 37.7 Recurrence formulae for $u_n(x)$ 954; 37.8 Generating function for $T_n(x)$ 958.	
<b>38. GAMA, BETA FUNCTIONS</b>	<b>962 – 1004</b>
38.1 Gamma Function 962; 38.2 Prove that 964; 38.3 Transformation of Gamma Function 965; 38.4 Beta Function 966; 38.5 Evaluation of Beta Function 966; 38.6 A Property of Beta Function 967; 38.7 Transformation of Beta Function 968; 38.8 Relation Between Beta and Gamma Functions 968; 38.9 Show that 969; 38.10 Duplication formula 975; 38.11 To show that 976; 38.12 To show that 977; 38.13 Double Integration 983; 38.14 Dirichlet's integral (Triple Integration) 985; 38.15 Liouville's Extension of Dirichlet theorem 985; 38.16 Elliptic Integrals 992; 38.17 Definition and Property 992; 38.18 Error Function 996; 38.19 Differentiation Under the Integral Sign 997; 38.20 Leibnitz's Rule 998; 38.21 Rule of Differentiation Under the Integral Sign When the Limits of Integration are Functions of the Parameter 1001.	
<b>UNIT – VIII</b>	
<b>39. INFINITE SERIES</b>	<b>1005 – 1043</b>
39.1 Sequence 1005; 39.2 Limit 1005; 39.3 Convergent Sequence 1005; 39.4 Bounded Sequence 1005; 39.5 Monotonic Sequence 1005; 39.6 Remember the following Limits 1006; 39.7 Series 1006; 39.8 Convergent, Divergent and Oscillatory Series 1006; 39.9 Properties of Infinite Series 1007; 39.10 Properties of Geometric Series 1008; 39.11 Positive Term Series 1009; 39.12 Necessary Conditions for Convergent Series 1009; 39.13 Cauchy's Fundamental Test for Divergence 1010; 39.14 $p$ -Series 1011; 39.15 Comparison Test 1012; 39.16 D'Alembert's Ratio test 1017; 39.17 Raabe's Test (Higher Ratio test) 1020; 39.18. Gauss's Test 1026; 39.19 Cauchy's Integral Test 1027; 39.20 Cauchy's Root Test 1028; 39.21 Logarithmic Test 1031; 39.22 De Morgan's and Bertrand's Test 1034; 39.23 Cauchy's Condensation Test 1035; 39.24 Alternating Series 1035; 39.25 Leibnitz's Rule for Convergence of an Alternating Series 1035; 39.26 Alternating Convergent Series 1038; 39.27 Power Series in $x$ 1041; 39.28 Exponential Series 1042; 39.29 Logarithmic Series 1042; 39.30 Binomial Series 1042; 39.31 Uniform Convergence 1043; 39.32 Abel's Test 1043.	

**40. FOURIER SERIES****1044 – 1082**

40.1 Periodic Functions 1044; 40.2 Fourier Series 1044; 40.3 Dirichlet's Conditions for A Fourier Series 1045; 40.4 Advantages of Fourier Series 1045; 40.5 Useful Integrals 1045; 40.6 Determination of Fourier Coefficients (Euler's formulae) 1046; 40.7 Fourier Series for Discontinuous Functions 1050; 40.8 Function Defined In Two or More Sub-ranges 1051; 40.9 Discontinuous Functions 1052; 40.10 Even Function and Odd Function 1056; 40.11 Half-range Series, Period 0 to  $\pi$  1060; 40.12 Change of Interval and Functions having Arbitrary Period 1063; 40.13 Half Period Series 1066; 40.14 Parseval's formula 1074; 40.15 Fourier Series in Complex form 1078; 40.16 Practical Harmonic Analysis 1079.

**UNIT – IX****41. INTEGRAL TRANSFROMS****1083 – 1136**

41.1 Introduction 1083; 41.2 Integral Transforms 1083; 41.3 Fourier Integral theorem 1084; 41.4 Fourier sine and Cosine Integrals 1085; 41.5 Fourier's complex integral 1086; 41.6 Fourier Transforms 1091; 41.7 Fourier sine and Cosine Transforms 1092; 41.8 Properties of Fourier Transforms 1108; 41.9 Convolution 1111; 41.10 Parseval's Identity for Fourier Transforms 1111; 41.11 Parseval's Identity for Cosine Transform 1112; 41.12 Parseval's Identity for Sine Transform 1112; 41.13 Fourier Transform of Derivatives 1115; 41.14 Relationship between Fourier and Laplace Transforms 1116; 41.15 Solution of Boundary Value Problems by Using Integral Transform 1116; 41.16. Fourier Transforms of Partial Derivative of a Function 1121; 41.17 Applications to Simple Heat Transfer Equations 1122; 41.18 Finite Fourier Transforms 1125; 41.19 Finite Fourier sine and Cosine Transforms of Derivatives 1131.

**42. LAPLACE TRANSFORM****1137 – 1170**

42.1 Introduction 1137; 42.2 Laplace Transform 1137; 42.3 Important formulae 1137; 42.4 Properties of Laplace Transforms 1141; 42.5 Change of scale Property 1141; 42.6 Heaviside's Shifting theorem (Second Translation Property) 1142; 42.7 Existence theorem 1144; 42.8 Laplace Transform of the Derivative of  $f(t)$  1144; 42.9 Laplace Transform of Derivative of order  $n$  1144; 42.10 Laplace Transform of Integral of  $f(t)$  1145; 42.11 Laplace Transform of  $t.f(t)$  (Multiplication by  $t$ ) 1146; 42.12 Initial and

Final Value theorems 1146; 42.13 Exponential Integral Function  $\int_t^{\infty} \left( \frac{e^{-x}}{x} \right) dx$  1147;

42.14 Laplace Transform of  $\frac{1}{t} f(t)$  (Division by  $t$ ) 1150; 42.15 Laplace Transform of Error Function 1152; 42.16 Complementary Error Function 1153; 42.17 Unit Step Function 1154; 42.18 Laplace Transform of Unit Function 1154; 42.19 Second Shifting Theorem 1155; 42.20 Theorem.  $L[f(t)u(t-a)] = e^{-as} L[f(t+a)]$  1156; 42.21 Periodic Functions 1158; 42.22 Impulse Function 1163; 42.23 Convolution theorem 1164; 42.24 Laplace transform of Bessel Functions  $J_0(x)$  and  $J_1(x)$  1165; 42.25 Evaluation of Integrals 1166; 42.26 Formulation of Laplace Transform 1168; 42.27 Properties of Laplace Transform 1169.

**43. INVERSE LAPLACE TRANSFORMS****1171 – 1210**

43.1 Inverse Laplace Transforms 1171; 43.2 Important formulae 1171; 43.3 Multiplication by  $s$  1174; 43.4 Division by  $s$  (Multiplication by  $\frac{1}{s}$ ) 1175; 43.5 First Shifting Property 1175; 43.6 Second Shifting Property 1177; 43.7 Inverse Laplace Transforms of Derivatives 1179; 43.8 Inverse Laplace Transform of Integrals 1182; 43.9 Partial Fractions Method 1182; 43.10 Inverse Laplace Transform by Convolution

1185; 43.11 Heaviside inverse formula of  $\frac{F(s)}{G(s)}$  1188; 43.12 Solution of differential equations by Laplace Transforms 1189; 43.13 Electric circuit 1198 43.14 Solution of Simultaneous Differential Equations by Laplace Transforms 1202; 43.15 Solution of Partial Differential Equation by Laplace Transform 1209.

**44. Z-TRANSFORMS****1211 – 1244**

44.1 Introduction 1211; 44.2 Sequence 1211; 44.3 Representation of A Sequence 1211; 44.4 Basic Operations On Sequences 1212; 44.5 Z-transform 1212; 44.6 Properties of Z-transforms 1213; 44.7 Change of Scale 1220; 44.8 Shifting Property 1221; 44.9 Inverse Z-transform 1222; 44.10 Theorem 1222; 44.11 Solution of Difference Equations 1222; 44.12 Multiplication by  $k$  1223; 44.13 Division by  $k$  1223; 44.14 Initial Value 1224; 44.15 Final Value 1224; 44.16 Partial Sum 1224; 44.17 Convolution 1224; 44.18 Convolution Property of Casual Sequence 1225; 44.19 Transform of Important Sequences 1226; 44.20 Inverse of Z-transform by Division 1228; 44.21 By Binomial Expansion and Partial Fraction 1229; 44.22 Inverse of Z-transform by Partial Fractions 1229; 44.23 Inversion of Z-transform by Residue Method 1236; 44.24 Convolution Method 1238; 44.25 Inverse of Z-transform by Convolution Method 1238; 44.26 Inverse of Z-transform by Power Series Method 1239; 50.27 Difference Equation 1239; 44.28 Order of a Difference Equation = Highest Power of  $E$  1240; 44.29 Degree of a Difference Equation 1240; 44.30 Solution of a Difference Equation 1240; 44.31 Theorem 1240

**45. HANKEL TRANSFORM****1245 – 1261**

45.1 Hankel Transform 1245; 45.2 The formulae Used in Finding the Hankel Transforms. 1245; 45.3 Some More Integrals Involving Exponential Functions and Bessel's Function 1246; 45.4 Inversion Formula for Hankel Transform 1249; 45.5 Parsival's Theorem for Hankel Transform 1251; 45.6 Hankel Transformation of the Derivative of a Function 1251; 45.7 Finite Hankel Transmission Formation 1256; 45.8 Another form of Hankel Transform 1256.

**46. HILBERT TRANSFORM****1262 – 1263**

46.1 Introduction 1262; 46.2 Elementary Functions and their Hilbert Transform 1262; 46.3 Properties 1263; 46.4 Applications 1263.

**UNIT – X****47. FIRST ORDER LAGRANGE'S LINEAR PARTIAL DIFFERENTIAL EQUATIONS****1264 – 1286**

47.1 Partial Differential Equations 1264; 47.2 Order 1264; 47.3 Method of Forming Partial Differential Equations 1264; 47.4 Solution of Equation by Direct Integration 1265; 47.5 Lagrange's Linear Equation is an Equation of the Type 1267; 47.6 Working

Rule to Solve  $Pp + Qq = R$  1268; 47.7 Method of Multipliers 1269; 47.8 Partial differential equations non-linear in  $p$  and  $q$ . 1276; 47.9 Charpit's method 1281.

**48. LINEAR PARTIAL DIFFERENTIAL EQUATIONS WITH CONSTANT COEFFICIENTS OF  
2ND ORDER**

**1287 – 1316**

48.1 Linear Homogeneous Partial Differential Equations of nth Order with Constant Coefficients 1287; 48.2 Rules for Finding the Complementary Function 1287; 48.3 General Rules for Finding the Particular Integral 1290; 48.4 P.I. of any function 1300; 48.5 Non-homogeneous Linear equations 1305; 48.6 If the Equation is of the form 1306; 48.7 Monge's Method (Non Linear Equation of the Second Order) 1310; 48.8 Classification of Partial Differential Equations 1313.

**49. APPLICATIONS OF PARTIAL DIFFERENTIAL EQUATIONS**

**1317 – 1371**

49.1 Introduction 1317; 49.2 Method of Separation of Variables 1317; 49.3 Equation of Vibrating String 1323; 49.4 Solution of Wave Equation by D'Alembert's Method 1335; 49.5 One Dimensional Heat Flow 1337; 49.6 Two Dimensional Heat Flow 1345; 49.7 Equation of Heat Flow in two Dimensions in Polar Coordinates 1355; 49.8 Transmission Line Equations 1359; 49.9 Laplace Equation 1361; 49.10 Vibrating Membrane 1365; 49.11 Solution of the Equation of the Vibrating Membrane (Rectangular Membrane): 1366.

**UNIT – XI**

**50. ALGEBRAIC AND TRANSCENDENTAL EQUATIONS (BISECTION METHOD, REGULA FALSI,  
NEWTON RAPHSON METHOD)**

**1372 – 1401**

50.1 Introduction 1372; 50.2 Polynomial 1372; 50.3 Polynomial Equation 1372; 50.4 Transcendental Equation 1372; 50.5 Initial Approximation 1373; 50.6 Graphical Method 1373; 50.7 Bisection Method (Bolzano Method) 1374; 50.8 Convergence of Bisection Method 1375; 50.9 To show that Bisection Method is Always Converges 1375; 50.10 Newton – Raphson Method 1378; 50.11 Geometrical Interpretation 1379; 50.12 Convergence of Newton – Raphson formula 1379; 50.13 Rate of convergence of Newton - Raphson formula 1380; 50.14 Order of convergence 1380; 50.15 Working Rule to solve  $f(x) = 0$  by Newton - Raphson Method 1381; 50.16 Regula - Falsi Method or False Position Method 1389; 50.17 Rule of False Position (Regula Falsi) 1389; 50.18 Rate of Convergence of False Position Method 1390; 50.19 Secant Method (Chord Method) 1395; 50.20 Iteration Method 1398; 50.21 Test for Convergence 1398.

**51. SIMULTANEOUS LINEAR EQUATIONS**

**1402 – 1425**

51.1 Introduction 1402; 51.2 Gauss Elimination Method 1402; 51.3 Gauss- Jordan Method 1404;; 51.4 Factorisation of a Matrix 1405; 51.5 Crouts – Triangularisation Method 1406; 51.6 Crout's Method 1411; 51.7 Iterative Methods or Indirect Methods 1413; 51.8 Jacobi's Method 1413; 51.9 Gauss-Seidel method 1415.

**52. NUMERICAL TECHNIQUE FOR SOLUTION OF ORDINARY DIFFERENTIAL  
EQUATIONS**

**1426 – 1442**

52.1 Introduction 1426; 52.2 Solution of ordinary Differential Equations 1426; 52.3 Taylor's Series Method; 1426; 52.4 Picard's Method of Successive Approximation 1429; 52.5 Euler's Method 1432; 52.6 Euler's Modified formula 1434; 52.7 Runge's

formula 1436; 52.8 Runge's formula (Third order) 1436; 52.9 Runge-Kutta formula (Fourth order) 1437; 52.10 Higher order Differential Equations 1441.

### **53. NUMERICAL TECHNIQUES FOR SOLUTION OF PARTIAL DIFFERENTIAL EQUATION 1443 – 1455**

53.1 General Linear Partial Differential Equations 1443; 53.2 Finite-difference Approximation to Derivatives 1443; 53.3 Solution of Partial Differential Equation (Laplace Equation) 1444; 53.4 Jacobi's Iteration formula 1445; 53.5 Gauss-seidel Method 1446; 53.6 Successive Over-relaxation or S.O.R. Method 1446; 53.7 Poisson Equation 1450; 53.8 Heat Equation (Parabolic Equation) 1451; 53.9 Wave Equation (Hyperbolic Equation) 1453.

## **UNIT – XII**

### **54. CALCULUS OF VARIATION**

**1456 – 1467**

54.1 Introduction 1456; 54.2 Functionals 1456; 54.3 Definition 1456; 54.4 Euler's Equation is 1456; 54.5 Extremal 1459; 54.6 Isoperimetric Problems 1463; 54.7 Functionals of Second order Derivatives 1466.

### **55. TENSOR ANALYSIS**

**1468 – 1495**

55.1 Introduction 1468; 55.2 Co-ordinate Transformation 1468; 55.3 Summation Convention 1469; 55.4 Summation of co-ordinates 1469; 55.5 Relation between the direction cosines of three mutually perpendicular straight lines 1470; 55.6 Transformation of velocity components on change from one system of rectangular axes to another 1470; 55.7 Rank of a Tensor 1471; 55.8 First order Tensors 1471; 55.9 Second order Tensors 1471; 55.10 Tensors of any order 1472; 55.11 Tensor of Zero order 1472; 55.12 Algebraic Operations On Tensors 1472; 55.13 Product of Two Tensors 1472; 55.14 Quotient Law of Tensors 1473; 55.15 Contraction theorem 1473; 55.16 Symmetric and antisymmetric Tensors 1474; 55.17 Symmetric and Skew Symmetric Tensors 1474; 55.18 Theorem 1475; 55.19 A Fundamental Property of Tensors 1475; 55.20 Zero Tensor 1475; 55.21 Two Special Tensors 1476; 55.22 Kronecker Tensor 1476; 55.23 Isotropic Tensor 1477; 55.24 Relation Between Alternate and Kronecker Tensor 1477; 55.25 Matrices and Tensors of First and Second order 1478; 55.26 Scalar and Vector Products of Two Vectors 1478; 55.27 Three Scalar Invariants of a Second order Tensor 1478; 55.28 Singular and Non-singular Tensors of Second order 1479; 55.29 Reciprocal of a Non-singular Tensor 1479; 55.30 Eigen Values and Eigen Vectors of a Tensor of Second order 1480; 55.31 Theorem 1480; 55.32 Reality of the Eigen Values 1481; 55.33 Association of a Skew Symmetric Tensors of order Two and Vectors 1481; 55.34 Tensor Fields 1482; 55.35 Gradient of Tensor Fields: Gradient of a Scalar Function. 1482; 55.36 Gradient of Vector 1482; 55.37 Divergence of Vector Point Function 1482; 55.38 Curl of a Vector Point Function 1482; 55.39 Second order Differential Operators 1483; 55.40 Tensorial form of Gauss's and Stoke's theorem 1484; 55.41 Stoke's theorem 1484; 55.42 Relation Between Alternate and Kronecker Tensor 1485; 55.43 Three Scalar Invariants of a Second order Tensor 1485; 55.44 Tensor analysis 1486; 55.45 Conjugate or Reciprocal Tensors 1490; 55.46 Christoffel Symbols 1490; 55.47 Transformation Law for Second Kind 1491; 55.48 Contravariant, Covariant and Mixed Tensor 1494.

**UNIT – XIII****56. LINEAR PROGRAMMING****1496 – 1540**

56.1. Introduction 1496; 56.2. Some Definitions 1497; 56.3. Mathematical formulation of Linear Programming Problems 1498; 56.4 Graphical Method of Solving Linear Programming Problems 1506; 56.5 Corner Point Method 1506; 56.6. ISO-profit or ISO-cost Method (Maximum Z) 1512; 56.7 ISO-Profit or ISO-Cost Method (Minimum Z) 1512; 56.8 Solution of Linear Programming Problems 1516; 56.9 Theory of Simplex Method Some Important definitions 1532.

**UNIT – XIV****57. STATISTICAL TECHNIQUE****1541 – 1577**

57.1 Statistics 1541; 57.2 Frequency Distribution. 1541; 57.3 Graphical Representation 1541; 57.4 Exclusive and Inclusive Class Intervals 1542; 57.5 Average or Measures of Central Tendency 1543; 57.6 Arithmetic Mean 1543; 57.7 Median 1544; 57.8 Quartiles 1545; 57.9 Deciles 1546; 57.10 Percentiles 1546; 57.11 Mode 1546; 57.12 Geometric Mean 1547; 57.13 Harmonic Mean 1547; 57.14 Average Deviation or Mean Deviation 1547 57.15 Standard Deviation 1548; 57.16 Shortest Method for Calculating Standard Deviation 1548; 57.17 Symmetry 1549; 57.18 Skewness 1549; 57.19 Test of Skewness 1550; 57.20 Uses of skewness 1550; 57.21 Types of distribution 1550; 57.22 Measure of Skewness 1550; 57.23 Karl Pearson's Coefficient of Skewness: 1550; 57.24 Types of skewness in terms of mean and mode 1550; 57.25 Bowley's Coefficient of Skewness 1553; 57.26 Measure of Bowley's Coefficient of Skewness 1553; 57.27 Characteristics of Bowley's Coefficient of Skewness 1553; 57.28 Limitations of Bowley's Coefficient of Skewness 1553; 57.29 Kelly's Coefficient of Skewness 1556; 57.30 Moments 1558; 57.31 Moment about Mean 1558; 57.32 Moments about any Number (Raw Moment) 1558; 57.33 Moment about the Origin 1560; 57.34 Relation between  $\mu_r$  and  $\mu'_r$  1560; 57.35 Relation between  $v_r$  and  $\mu_r$  1561; 57.36 Measure of Skewness Based on Moment 1562; 57.37 Kurtosis 1563; 57.38 Grouping Error and its Sheppard's corrections (for moments) 1563; 57.39 Moment Generating function 1572; 57.40 Moment Generating Function of a Function of Continuous Variate 1574; 57.41 Property of Moment Generating Function 1574.

## 1.1 INTRODUCTION

Area of a rectangle depends upon its length and breadth, hence we can say that area is the function of two variables *i.e.* its length and breadth.

$z$  is called a function of two variables  $x$  and  $y$  if  $z$  has one definite value for every pair of values of  $x$  and  $y$ . Symbolically, it is written as

$$z = f(x, y)$$

The variable  $x$  and  $y$  are called independent variables while  $z$  is called the dependent variable.

Similarly, we can define  $z$  as a function of more than two variables.

**Geometrically**

Let

$$z = f(x, y)$$

where  $x, y$  belong to an area  $A$  of the  $xy$ -plane. For each point  $(x, y)$  corresponds a value of  $z$ . These values of  $(x, y, z)$  form a surface in space.

Hence, the function  $z = f(x, y)$  represents a surface.

## 1.2 LIMIT

The function  $f(x, y)$  is said to tend to the limit  $l$  as  $x \rightarrow a$  and  $y \rightarrow b$  if and only if the limit  $l$  is independent of the path followed by the point  $(x, y)$  as  $x \rightarrow a$  and  $y \rightarrow b$ . Then

$$\lim_{\substack{x \rightarrow a \\ y \rightarrow b}} f(x, y) = l$$

The function  $f(x, y)$  in region  $R$  is said to tend to the limit  $l$  as  $x \rightarrow a$  and  $y \rightarrow b$  if and only if corresponding to a positive number  $\varepsilon$ , there exists another positive number  $\delta$  such that

$$|f(x, y) - l| < \varepsilon \text{ for } 0 < (x - a)^2 + (y - b)^2 < \delta^2$$

for every point  $(x, y)$  in  $R$ .

## 1.3 WORKING RULE TO FIND THE LIMIT

**Step 1.** Find the value of  $f(x, y)$  along  $x \rightarrow a$  and  $y \rightarrow b$ .

**Step 2.** Find the value of  $f(x, y)$  along  $y \rightarrow b$  and  $x \rightarrow a$ .

If the values of  $f(x, y)$  in step 1 and step 2 remain the same, the limit exists otherwise not.

**Step 3.** If  $a \rightarrow 0$  and  $b \rightarrow 0$ , find the limit along  $y = mx$  or  $y = mx^n$ . If the value of the limit does not contain  $m$  then limit exists. If it contains  $m$ , the limit does not exist.

**Note.** (i) Put  $x = 0$  and then  $y = 0$  in  $f$ . Find its value  $f_1$ .

(ii) Put  $y = 0$  and then  $x = 0$  in  $f$ . Find the value  $f_2$ .

If  $f_1 \neq f_2$ , limit does not exist.

If  $f_1 = f_2$ , then

(iii) Put  $y = mx$  and find the limit  $f_3$ .

If  $f_1 = f_2 \neq f_3$ , then limit does not exist.

If  $f_1 = f_2 = f_3$ , then

- (iv) Put  $y = mx^n$  and find the limit  $f_4$ .  
 If  $f_1 = f_2 = f_3 \neq f_4$ , then limit does not exist.  
 If  $f_1 = f_2 = f_3 = f_4$ , then limit exists.

**Example 1.** If  $f(x, y) = \frac{x+y}{2x-y}$ , show that  $\lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow 0} f(x, y) \right] \neq \lim_{y \rightarrow 0} \left[ \lim_{x \rightarrow 0} f(x, y) \right]$

**Solution.** (i)  $\lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow 0} \frac{x+y}{2x-y} \right] = \lim_{x \rightarrow 0} \left( \frac{x+0}{2x-0} \right) = \frac{1}{2}$

(ii)  $\lim_{y \rightarrow 0} \left[ \lim_{x \rightarrow 0} \frac{x+y}{2x-y} \right] = \lim_{y \rightarrow 0} \left( \frac{0+y}{0-y} \right) = -1$

Hence,  $\lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow 0} f(x, y) \right] \neq \lim_{y \rightarrow 0} \left[ \lim_{x \rightarrow 0} f(x, y) \right]$

**Proved.**

**Example 2.** Evaluate  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 y}{x^4 + y^2}$

**Solution.** (i)  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 y}{x^4 + y^2} = \lim_{y \rightarrow 0} \frac{0}{0 + y^2} = 0 = f_1$  (say)

(ii)  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 y}{x^4 + y^2} = \lim_{x \rightarrow 0} \frac{0}{x^4 + 0} = 0 = f_2$  (say)

Here,  $f_1 = f_2$ , therefore

(iii) Put  $y = mx$

$$\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 mx}{x^4 + m^2 x^2} = \lim_{x \rightarrow 0} \frac{mx}{x^2 + m^2} = 0 = f_3$$
 (say)

Here,  $f_1 = f_2 = f_3$ , therefore

(iv) Put  $y = mx^2$

$$\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 mx^2}{x^4 + m^2 x^4} = \frac{m}{1 + m^2} = f_4$$

Here,  $f_1 = f_2 = f_3 \neq f_4$

Thus, limit does not exist.

**Ans.**

**Example 3.** Evaluate  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^3 + y^3)$ .

**Solution.** (i)  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^3 + y^3) = \lim_{y \rightarrow 0} (0 + y^3) = 0 = f_1$  (say)

(ii)  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^3 + y^3) = \lim_{x \rightarrow 0} (x^3 + 0) = 0 = f_2$  (say)

Here,  $f_1 = f_2$ , therefore

(iii) Put  $y = mx$

$$\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^3 + y^3) = \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow mx} (x^3 + y^3) \right] = \lim_{x \rightarrow 0} (x^3 + m^3 x^3) = 0 = f_3$$
 (say)

Here,  $f_1 = f_2 = f_3$ , therefore

(iv) Put  $y = mx^2$

$$\begin{aligned}\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^3 + y^3) &= \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow mx^2} (x^3 + y^3) \right] = \lim_{x \rightarrow 0} (x^3 + m^3 x^6) \\ &= \lim_{x \rightarrow 0} x^3 (1 + m^3 x^3) = 0 = f_4 \quad (\text{say})\end{aligned}$$

Here,  $f_1 = f_2 = f_3 = f_4$   
Thus, limit exists with value 0. Ans.

**Example 4.** Evaluate  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{y^2 - x^2}{y^2 + x^2}$ ,  $x \neq 0, y \neq 0$

$$\begin{aligned}\text{Solution. } (i) \quad \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \left( \frac{y^2 - x^2}{y^2 + x^2} \right) &= \lim_{y \rightarrow 0} \left( \lim_{x \rightarrow 0} \frac{y^2 - x^2}{y^2 + x^2} \right) \\ &= \lim_{y \rightarrow 0} \left( \frac{y^2 - 0}{y^2 + 0} \right) = \lim_{y \rightarrow 0} \frac{y^2}{y^2} = 1 = f_1 \quad (\text{say}) \\ (ii) \quad \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{y^2 - x^2}{y^2 + x^2} &= \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow 0} \frac{y^2 - x^2}{y^2 + x^2} \right] \\ &= \lim_{x \rightarrow 0} \left( \frac{0 - x^2}{0 + x^2} \right) = \lim_{x \rightarrow 0} \frac{-x^2}{x^2} = -1 = f_2 \quad (\text{say})\end{aligned}$$

Here  $f_1 \neq f_2$   
Thus, limit does not exist. Ans.

**Example 5.** Evaluate  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^3 - y^3}{x^2 + y^2}$ ,  $x \neq 0, y \neq 0$ .

$$\begin{aligned}\text{Solution. } (i) \quad \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^3 - y^3}{x^2 + y^2} &= \lim_{y \rightarrow 0} \left[ \lim_{x \rightarrow 0} \frac{x^3 - y^3}{x^2 + y^2} \right] = \lim_{y \rightarrow 0} \frac{0 - y^3}{0 + y^2} = \lim_{y \rightarrow 0} (-y) = 0 = f_1 \quad (\text{say}) \\ (ii) \quad \lim_{\substack{y \rightarrow 0 \\ x \rightarrow 0}} \frac{x^3 - y^3}{x^2 + y^2} &= \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow 0} \frac{x^3 - y^3}{x^2 + y^2} \right] = \lim_{x \rightarrow 0} \frac{x^3 - 0}{x^2 + 0} = \lim_{x \rightarrow 0} (x) = 0 = f_2 \quad (\text{say})\end{aligned}$$

Here,  $f_1 = f_2$  therefore,  
(iii) Put  $y = mx$

$$\begin{aligned}\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^3 - y^3}{x^2 + y^2} &= \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow 0} \frac{x^3 - y^3}{x^2 + y^2} \right] = \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow mx} \frac{x^3 - y^3}{x^2 + y^2} \right] \\ &= \lim_{x \rightarrow 0} \left[ \frac{x^3 - m^3 x^3}{x^2 + m^2 x^2} \right] = \lim_{x \rightarrow 0} \frac{x(1 - m^3)}{1 + m^2} = 0 = f_3 \quad (\text{say})\end{aligned}$$

Here,  $f_1 = f_2 = f_3$ , therefore

$$\begin{aligned}(iv) \quad \text{Put } y = mx^2 \\ \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow 0} \frac{x^3 - y^3}{x^2 + y^2} \right] &= \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow mx^2} \frac{x^3 - y^3}{x^2 + y^2} \right] \\ &= \lim_{x \rightarrow 0} \frac{x^3 - m^3 x^6}{x^2 + m^2 x^4} = \lim_{x \rightarrow 0} \frac{x(1 - m^3 x^3)}{1 + m^2 x^2} = 0 = f_4 \quad (\text{say})\end{aligned}$$

Here,  $f_1 = f_2 = f_3 = f_4$   
Hence, limit exists with value 0. Ans.

**Example 6.** Evaluate  $\lim_{\substack{x \rightarrow 1 \\ y \rightarrow 2}} \frac{x^2 + 2y}{x + y^2}$ .  $x \neq 0, y \neq 0$

**Solution.** (i)  $\lim_{\substack{x \rightarrow 1 \\ y \rightarrow 2}} \frac{x^2 + 2y}{x + y^2} = \lim_{y \rightarrow 2} \left[ \lim_{x \rightarrow 1} \frac{x^2 + 2y}{x + y^2} \right]$

$$= \lim_{y \rightarrow 2} \left( \frac{1 + 2y}{1 + y^2} \right) = \frac{1 + 4}{1 + 4} = \frac{5}{5} = 1 = f_1 \quad (\text{say})$$

(ii)  $\lim_{\substack{y \rightarrow 2 \\ x \rightarrow 1}} \frac{x^2 + 2y}{x + y^2} = \lim_{x \rightarrow 1} \left[ \lim_{y \rightarrow 2} \frac{x^2 + 2y}{x + y^2} \right]$

$$= \lim_{x \rightarrow 1} \frac{x^2 + 4}{x + 4} = \frac{1 + 4}{1 + 4} = \frac{5}{5} = 1 = f_2 \quad (\text{say})$$

Here,  $f_1 = f_2$   
Thus, limit exists.

**Ans.**

**Example 7.** Evaluate  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow 3}} \frac{2x - 3}{x^3 + 4y^3}$ .

**Solution.** (i)  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow 3}} \frac{2x - 3}{x^3 + 4y^3} = \lim_{y \rightarrow 3} \left[ \lim_{x \rightarrow \infty} \frac{2x - 3}{x^3 + 4y^3} \right]$

$$= \lim_{y \rightarrow 3} \frac{\frac{2}{x^2} - \frac{3}{x^3}}{1 + 4\left(\frac{y}{x}\right)^3} = \lim_{y \rightarrow 3} \frac{0 - 0}{1 + 4(0)} = 0 = f_1 \quad (\text{say})$$

(ii)  $\lim_{\substack{y \rightarrow 3 \\ x \rightarrow \infty}} \frac{2x - 3}{x^3 + 4y^3} = \lim_{x \rightarrow \infty} \left[ \lim_{y \rightarrow 3} \frac{2x - 3}{x^3 + 4y^3} \right]$

$$= \lim_{x \rightarrow \infty} \frac{2x - 3}{x^3 + 108} = \lim_{x \rightarrow \infty} \frac{\frac{2}{x^2} - \frac{3}{x^3}}{1 + \frac{108}{x^3}} = \frac{0 - 0}{1 + 0} = 0 = f_2 \quad (\text{say})$$

Here,  $f_1 = f_2$ .  
Hence, the limit exists with value 0.

**Ans.**

**Example 8.** Evaluate  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow 2}} \frac{xy + 4}{x^2 + 2y^2}$ .

**Solution.** (i)  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow 2}} \frac{xy + 4}{x^2 + 2y^2} = \lim_{x \rightarrow \infty} \left[ \lim_{y \rightarrow 2} \frac{xy + 4}{x^2 + 2y^2} \right] = \lim_{x \rightarrow \infty} \frac{2x + 4}{x^2 + 8}$

$$= \lim_{x \rightarrow \infty} \frac{\frac{2}{x} + \frac{4}{x^2}}{1 + \frac{8}{x^2}} = \lim_{x \rightarrow \infty} \frac{2}{x} = 0 = f_1 \quad (\text{say})$$

(ii)  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow 2}} \frac{xy + 4}{x^2 + 2y^2} = \lim_{y \rightarrow 2} \lim_{x \rightarrow \infty} \frac{\frac{y}{x} + \frac{4}{x^2}}{1 + \frac{y^2}{x^2}} = \lim_{y \rightarrow 2} \frac{0 + 0}{1 + 0} = 0 = f_2$

Since  $f_1 = f_2$ , hence limit exists with value 0.

**Ans.**

**EXERCISE 1.1****Evaluate the following limits:**

$$1. \lim_{\substack{x \rightarrow 1 \\ y \rightarrow 2}} \frac{2x^2 + y^2}{2xy}$$

**Ans.**  $\frac{3}{4}$

$$2. \lim_{\substack{x \rightarrow 2 \\ y \rightarrow 3}} \frac{x^3 + y^2}{x^2 - y},$$

**Ans.** 17

$$3. \lim_{\substack{x \rightarrow \infty \\ y \rightarrow 3}} \frac{2xy - 3}{x^3 + 4y^3},$$

**Ans.** 0

$$4. \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{xy}{y - x^2}; x \neq 0, y \neq 0$$

**Ans.** Limit does not exist

$$5. \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x - y}{x^2 + y^2}; x \neq 0, y \neq 0$$

**Ans.** Limit does not exist

$$6. \lim_{\substack{x \rightarrow 1 \\ y \rightarrow 1}} \frac{xy - 2x}{xy - 2y}$$

**Ans.** 1

$$7. \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^3 + 2y^3}{x^2 + 4y^2} x \neq 0, y \neq 0$$

**Ans.** 0

$$8. \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 y^3}{x^2 + y^2} x \neq 0, y \neq 0$$

**Ans.** 0

$$9. \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{xy + 2}{x^2 + y^2}, x \neq 0, y \neq 0$$

**Ans.** 0

**Choose the correct alternative:**

10. The value of  $\lim_{(x, y) \rightarrow (0, 0)} (x + y) \sin \frac{1}{(x + y)}$ ,  $x \neq 0, y \neq 0$  is

- (a) limit does not exist  
(b) 0  
(c) 1  
(d) -1

**Ans.** (c)

11. The value of the  $\lim_{(x, y) \rightarrow (0, 0)} \frac{x + \sqrt{y}}{\sqrt{(x^2 + y)}}$ ,  $x \neq 0, y \neq 0$  is

- (a) limit does not exist  
(b) 0  
(c) 1  
(d) -1

(AMIETE, June 2010, Dec. 2007) **Ans.** (a)

**1.4 CONTINUITY**

A function  $f(x, y)$  is said to be continuous at a point  $(a, b)$  if

$$\lim_{(x, y) \rightarrow (a, b)} f(x, y) = f(a, b)$$

A function is said to be continuous in a domain if it is continuous at every point of the domain.

**1.5 WORKING RULE FOR CONTINUITY AT A POINT  $(a, b)$** 

**Step 1.**  $f(a, b)$  should be well defined

**Step 2.**  $\lim_{(x, y) \rightarrow (a, b)} f(x, y)$  should exist.

**Step 3.**  $\lim_{(x, y) \rightarrow (a, b)} f(x, y) = f(a, b)$

**Example 9.** Test the function  $f(x, y) = \begin{cases} \frac{x^3 - y^3}{x^2 + y^2} & \text{when } x \neq 0, y \neq 0 \\ 0 & \text{when } x = 0, y = 0 \end{cases}$  for continuity.

**Solution.** **Step 1.** The function is well defined at  $(0, 0)$ .

$$\begin{aligned} \text{Step 2. } \lim_{(x, y) \rightarrow (0, 0)} f(x, y) &= \lim_{(x, y) \rightarrow (0, 0)} \frac{x^3 - y^3}{x^2 + y^2} = \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow mx} \frac{x^3 - y^3}{x^2 + y^2} \right] \\ &= \lim_{x \rightarrow 0} \frac{x^3 - m^3 x^3}{x^2 + m^2 x^2} \end{aligned}$$

$$= \lim_{x \rightarrow 0} \frac{x(1 - m^3)}{1 + m^2} = 0$$

Thus, limit exists at (0, 0).

**Step 3.** limit of  $f(x)$  at origin = value of the function at origin.

$$\lim_{(x, y) \rightarrow (0, 0)} \frac{x^3 - y^3}{x^2 + y^2} = f(0, 0) = 0$$

Hence, the function  $f$  is continuous at the origin. Ans.

**Example 10.** Discuss the continuity of  $f(x, y) = \begin{cases} \frac{x}{\sqrt{x^2 + y^2}}, & x \neq 0, y \neq 0 \\ 2, & x = 0, y = 0 \end{cases}$  at the origin.

**Solution.** Here, we have

$$f(x, y) = \begin{cases} \frac{x}{\sqrt{x^2 + y^2}}, & x \neq 0, y \neq 0 \\ 2, & x = 0, y = 0 \end{cases}$$

**Step 1.** The function  $f(x, y)$  at (0, 0) is well defined.

$$\begin{aligned} \text{Step 2. } \lim_{(x, y) \rightarrow (0, 0)} \frac{x}{\sqrt{x^2 + y^2}} &= \lim_{x \rightarrow 0} \left[ \lim_{y \rightarrow mx} \frac{x}{\sqrt{x^2 + y^2}} \right] = \lim_{x \rightarrow 0} \frac{x}{\sqrt{x^2 + m^2 x^2}} \\ &= \lim_{x \rightarrow 0} \frac{1}{\sqrt{1 + m^2}} \end{aligned}$$

For different values of  $m$  the limit  $f$  is not unique.

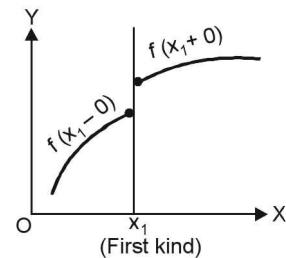

so the  $\lim_{(x, y) \rightarrow (0, 0)} \frac{x}{\sqrt{x^2 + y^2}}$  does not exist.

Hence  $f(x, y)$  is not continuous at origin. Ans.

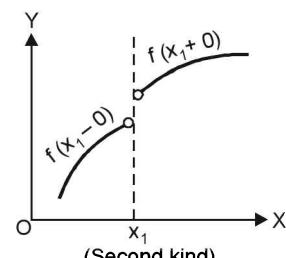

## 1.6 TYPES OF DISCONTINUITY

(Gujarat Univ. I sem. Jan. 2009)

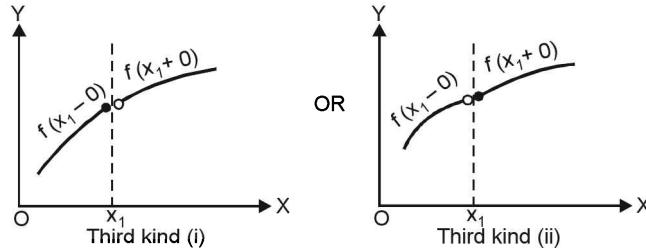

**1. First Kind.**  $f(x)$  is said to have discontinuity of first kind at the point  $x = x_1$  if Right limit  $f(x_1 + 0)$  and left limit  $f(x_1 - 0)$  exist but are not equal.

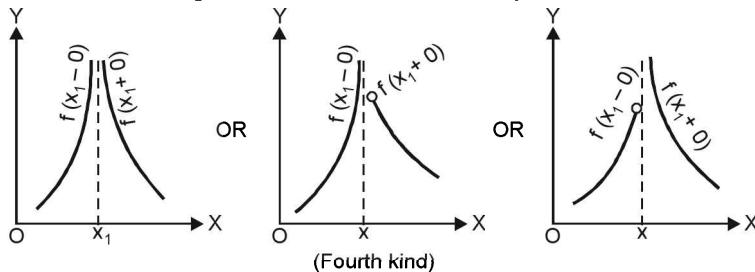

**2. Second Kind.**  $f(x)$  is said to have discontinuity of the second kind at  $x = x_1$  if neither right limit  $f(x_1 + 0)$  exists nor left limit  $f(x_1 - 0)$  exists.

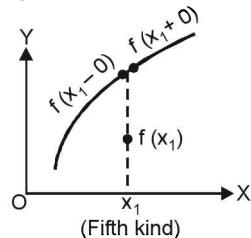

**3. Third Kind (Mixed discontinuity).**  $f(x)$  is said to have mixed discontinuity at the point  $x = x_1$  if only one of the two limits right limit  $f(x_1 + 0)$  and left limit  $f(x_1 - 0)$  exists and not the other.

- 4. Fourth Kind (Infinite discontinuity).**  $f(x)$  is said to have infinite discontinuity at the point  $x = x_1$  if either one or both limits right limit and left limit  $f(x_1 - 0)$  are infinite. If both limits do not exist and if  $f(x_1 \pm h)$  oscillates between limits one of which is infinite as  $\pm h \rightarrow 0$ . It is also a point of infinite discontinuity.

- 5. Fifth Kind (Removable discontinuity).** If right limit  $f(x_1 + 0)$  is equal to left limit  $f(x_1 - 0)$  is not equal to  $f(x_1)$ , then  $f(x)$  is said to have removable discontinuity.

**Example 11.** Show that the given function are discontinuous at all the point  $(2, -2)$ .

$$f(x, y) = \begin{cases} \frac{x^2 + xy + x + y}{x + y}, & (x, y) \neq (2, -2) \\ 4, & (x, y) = (2, -2) \end{cases}$$

(A.M.I.E.T.E., June 2009)

**Solution.** We have,

$$f(x, y) = \begin{cases} \frac{x^2 + xy + x + y}{x + y}, & (x, y) \neq (2, -2) \\ 4, & (x, y) = (2, -2) \end{cases}$$

$$\lim_{(x, y) \rightarrow (2, -2)} \frac{x^2 + xy + x + y}{(x + y)} = \lim_{(x, y) \rightarrow (2, -2)} \frac{(x+y)(x+1)}{x+y} = \lim_{(x, y) \rightarrow (2, -2)} (x+1) = 2 + 1 = 3$$

Here,  $\lim_{(x, y) \rightarrow (2, -2)} f(x, y) \neq f(2, -2)$

Since  $3 \neq 4$

Hence,  $f(x, y)$  is discontinuous at the point  $(2, -2)$

**Proved.**

### EXERCISE 1.2

**Test for continuity:**

1.  $f(x, y) = \begin{cases} \frac{xy(x^2 - y^2)}{x^2 + y^2}, & \text{when } x \neq 0, y \neq 0 \\ 0, & \text{when } x = 0, y = 0 \end{cases}$  at origin. **Ans.** Continuous at origin.
2.  $f(x, y) = \begin{cases} \frac{x^2 - y^2}{x^2 + y^2}, & \text{when } x \neq 0, y \neq 0 \\ 0, & \text{when } x = 0, y = 0 \end{cases}$  at origin. **Ans.** Not continuous at origin.
3.  $f(x, y) = \begin{cases} \frac{x^3 y^3}{x^3 + y^3}, & \text{when } x \neq 0, y \neq 0 \\ 0, & \text{when } x = 0, y = 0 \end{cases}$  at origin. **Ans.** Not continuous at origin.
4.  $f(x, y) = \begin{cases} x^3 + y^3, & \text{when } x \neq 0, y \neq 0 \\ 0, & \text{when } x = 0, y = 0 \end{cases}$  at origin. **Ans.** Continuous at origin.
5.  $f(x, y) = \begin{cases} \frac{x^2 + 2y}{x + y^2}, & \text{at the point } (1, 2). \\ 1 & \text{when } x = 1, y = 2 \end{cases}$  **Ans.** Continuous at (1, 2).
6. Show that the function  $f(x, y) = \begin{cases} 2x^2 + y, & (x, y) \neq (1, 2) \\ 0, & (x, y) = (1, 2) \end{cases}$  is discontinuous at (1, 2)

### 1.7 PARTIAL DERIVATIVES

Let  $z = f(x, y)$  be function of two independent variables  $x$  and  $y$ . If we keep  $y$  constant and  $x$  varies then  $z$  becomes a function of  $x$  only. The derivative of  $z$  with respect to  $x$ , keeping  $y$  as constant is called partial derivative of ' $z$ ', w.r.t. ' $x$ ' and is denoted by symbols.

$$\frac{\partial z}{\partial x}, \frac{\partial f}{\partial x}, f_x(x, y) \text{ etc.}$$

Then  $\frac{\partial z}{\partial x} = \lim_{\delta x \rightarrow 0} \frac{f(x + \delta x, y) - f(x, y)}{\delta x}$

The process of finding the partial differential coefficient of  $z$  w.r.t. ' $x$ ' is that of ordinary differentiation, but with the only difference that we treat  $y$  as constant.

Similarly, the partial derivative of ' $z$ ' w.r.t. ' $y$ ' keeping  $x$  as constant is denoted by

$$\frac{\partial z}{\partial y}, \frac{\partial f}{\partial y}, f_y(x, y) \text{ etc.}$$

$$\frac{\partial z}{\partial y} = \lim_{\delta y \rightarrow 0} \frac{f(x, y + \delta y) - f(x, y)}{\delta y}$$

**Notation.**

$$\frac{\partial z}{\partial x} = p, \quad \frac{\partial z}{\partial y} = q, \quad \frac{\partial^2 z}{\partial x^2} = r, \quad \frac{\partial^2 z}{\partial x \partial y} = s, \quad \frac{\partial^2 z}{\partial y^2} = t$$

**Example 12.** If  $z(x + y) = x^2 + y^2$ , show that

$$\left( \frac{\partial z}{\partial x} - \frac{\partial z}{\partial y} \right)^2 = 4 \left( 1 - \frac{\partial z}{\partial x} - \frac{\partial z}{\partial y} \right)$$

**Solution.**  $z(x + y) = x^2 + y^2, \quad z = \frac{x^2 + y^2}{x + y}$

$$\frac{\partial z}{\partial x} = \frac{(x + y) 2x - (x^2 + y^2) \cdot 1}{(x + y)^2} = \frac{x^2 + 2xy - y^2}{(x + y)^2}$$

$$\begin{aligned}
 \frac{\partial z}{\partial y} &= \frac{(x+y)(2y) - (x^2 + y^2).1}{(x+y)^2} = \frac{-x^2 + 2xy + y^2}{(x+y)^2} \\
 \left( \frac{\partial z}{\partial x} - \frac{\partial z}{\partial y} \right) &= \frac{x^2 + 2xy - y^2}{(x+y)^2} - \frac{-x^2 + 2xy + y^2}{(x+y)^2} \\
 &= \frac{2x^2 - 2y^2}{(x+y)^2} = \frac{2(x-y)}{x+y} \\
 \left( \frac{\partial z}{\partial x} - \frac{\partial z}{\partial y} \right)^2 &= \frac{4(x-y)^2}{(x+y)^2} \quad \dots(1)
 \end{aligned}$$

Now,

$$\begin{aligned}
 4 \left( 1 - \frac{\partial z}{\partial x} - \frac{\partial z}{\partial y} \right) &= 4 \left[ 1 - \frac{x^2 + 2xy - y^2}{(x+y)^2} - \frac{-x^2 + 2xy + y^2}{(x+y)^2} \right] \\
 &= 4 \cdot \frac{x^2 + 2xy + y^2 - x^2 - 2xy + y^2 + x^2 - 2xy - y^2}{(x+y)^2} \\
 &= 4 \cdot \frac{x^2 - 2xy + y^2}{(x+y)^2} = 4 \cdot \frac{(x-y)^2}{(x+y)^2} \quad \dots(2)
 \end{aligned}$$

From (1) and (2), we have

$$\left( \frac{\partial z}{\partial x} - \frac{\partial z}{\partial y} \right)^2 = 4 \left( 1 - \frac{\partial z}{\partial x} - \frac{\partial z}{\partial y} \right) \quad \text{Proved.}$$

**Example 13.** If  $u = \sin^{-1} \left( \frac{x}{y} \right) + \tan^{-1} \left( \frac{y}{x} \right)$ , then find the value of  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y}$ .

**Solution.**

$$\begin{aligned}
 u &= \sin^{-1} \left( \frac{x}{y} \right) + \tan^{-1} \left( \frac{y}{x} \right) \\
 \frac{\partial u}{\partial x} &= \frac{1}{\sqrt{1 - \left( \frac{x}{y} \right)^2}} \cdot \frac{1}{y} + \frac{1}{1 + \left( \frac{y}{x} \right)^2} \cdot \left( -\frac{y}{x^2} \right) = \frac{1}{\sqrt{y^2 - x^2}} - \frac{y}{x^2 + y^2}
 \end{aligned}$$

$$x \frac{\partial u}{\partial x} = \frac{x}{\sqrt{y^2 - x^2}} - \frac{xy}{x^2 + y^2} \quad \dots(1)$$

$$\frac{\partial u}{\partial y} = \frac{1}{\sqrt{1 - \left( \frac{x}{y} \right)^2}} \left( -\frac{x}{y^2} \right) + \frac{1}{1 + \left( \frac{y}{x} \right)^2} \frac{1}{x} = -\frac{x}{y \sqrt{y^2 - x^2}} + \frac{x}{x^2 + y^2}$$

$$y \cdot \frac{\partial u}{\partial y} = -\frac{x}{\sqrt{y^2 - x^2}} + \frac{xy}{x^2 + y^2} \quad \dots(2)$$

On adding (1) and (2), we have

$$x \cdot \frac{\partial u}{\partial x} + y \cdot \frac{\partial u}{\partial y} = 0 \quad \text{Ans.}$$

**Example 14.** Find  $\frac{\partial u}{\partial r}$  and  $\frac{\partial u}{\partial \theta}$  if  $u = e^{r \cos \theta} \cdot \cos(r \sin \theta)$

**Solution.**  $u = e^{r \cos \theta} \cdot \cos(r \sin \theta)$

$$\begin{aligned}\frac{\partial u}{\partial r} &= e^{r \cos \theta} \cdot [-\sin(r \sin \theta) \cdot \sin \theta] + [\cos \theta \cdot e^{r \cos \theta}] \cdot \cos(r \sin \theta) \\ &\quad \text{(keeping } \theta \text{ as constant)}\end{aligned}$$

$$\begin{aligned}&= e^{r \cos \theta} \cdot [-\sin(r \sin \theta) \cdot \sin \theta + \cos(r \sin \theta) \cdot \cos \theta] \\ &= e^{r \cos \theta} \cdot \cos(r \sin \theta + \theta) \quad \text{Ans.}\end{aligned}$$

$$\begin{aligned}\frac{\partial u}{\partial \theta} &= e^{r \cos \theta} \cdot [-\sin(r \sin \theta) \cdot r \cos \theta] + [-r \sin \theta \cdot e^{r \cos \theta}] \cdot \cos(r \sin \theta) \\ &\quad \text{(keeping } r \text{ as constant)}\end{aligned}$$

$$\begin{aligned}&= -r e^{r \cos \theta} \cdot [\sin(r \sin \theta) \cdot \cos \theta + \sin \theta \cos(r \sin \theta)] \\ &= -r e^{r \cos \theta} \cdot \sin(r \sin \theta + \theta) \quad \text{Ans.}\end{aligned}$$

**Example 15.** If  $u = (1 - 2xy + y^2)^{-1/2}$  prove that,  $x \frac{\partial u}{\partial x} - y \frac{\partial u}{\partial y} = y^2 u^3$ . (A.M.I.E.T.E., June 2010)

**Solution.**  $u = (1 - 2xy + y^2)^{-1/2} \quad \dots(1)$

Differentiating (1) partially w.r.t. 'x', we get

$$\frac{\partial u}{\partial x} = -\frac{1}{2}(1 - 2xy + y^2)^{-3/2} (-2y)$$

$$x \frac{\partial u}{\partial x} = xy(1 - 2xy + y^2)^{-3/2} \quad \dots(2)$$

Differentiating (1) partially w.r.t. 'y', we get

$$\frac{\partial u}{\partial y} = -\frac{1}{2}(1 - 2xy + y^2)^{-3/2} (-2x + 2y)$$

$$y \frac{\partial u}{\partial y} = (xy - y^2)(1 - 2xy + y^2)^{-3/2} \quad \dots(3)$$

Subtracting (3) from (2), we get

$$\begin{aligned}x \frac{\partial u}{\partial x} - y \frac{\partial u}{\partial y} &= xy(1 - 2xy + y^2)^{-3/2} - (xy - y^2)(1 - 2xy + y^2)^{-3/2} \\ &= y^2(1 - 2xy + y^2)^{-3/2} = y^2 u^3. \quad \text{Proved.}\end{aligned}$$

**Example 16.** If  $z = e^{ax+by} \cdot f(ax - by)$ , prove that

$$b \frac{\partial z}{\partial x} + a \frac{\partial z}{\partial y} = 2abz. \quad (\text{A.M.I.E.T.E., Summer 2004})$$

**Solution.**  $z = e^{ax+by} \cdot f(ax - by) \quad \dots(1)$

Differentiating (1) w.r.t. x, we get

$$\frac{\partial z}{\partial x} = a e^{ax+by} \cdot f(ax - by) + e^{ax+by} \cdot a f'(ax - by)$$

$$b \frac{\partial z}{\partial x} = a b e^{ax+by} \cdot f(ax - by) + a b e^{ax+by} \cdot f'(ax - by) \quad \dots(2)$$

Differentiating (1) w.r.t. 'y', we get

$$\frac{\partial z}{\partial y} = b e^{ax+by} \cdot f(ax - by) + e^{ax+by} \cdot (-b) f'(ax - by)$$

$$a \frac{\partial z}{\partial y} = a b e^{ax+by} \cdot f(ax - by) - a b e^{ax+by} \cdot f'(ax - by) \quad \dots(3)$$

On adding (2) and (3), we get

$$b \frac{\partial z}{\partial x} + a \frac{\partial z}{\partial y} = 2ab e^{ax+by} f(ax - by) \Rightarrow b \frac{\partial z}{\partial x} + a \frac{\partial z}{\partial y} = 2abz \quad \text{Proved.}$$

### 1.8 PARTIAL DERIVATIVES OF HIGHER ORDERS

Let  $z = f(x, y)$  then  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  being the functions of  $x$  and  $y$  can further be differentiated partially with respect to  $x$  and  $y$ .

$$\text{Symbolically} \quad \frac{\partial}{\partial x} \left( \frac{\partial z}{\partial x} \right) = \frac{\partial^2 z}{\partial x^2} \quad \text{or} \quad \frac{\partial^2 f}{\partial x^2} \quad \text{or} \quad f_{xx}$$

$$\frac{\partial}{\partial y} \left( \frac{\partial z}{\partial x} \right) = \frac{\partial^2 z}{\partial y \partial x} \quad \text{or} \quad \frac{\partial^2 f}{\partial y \partial x} \quad \text{or} \quad f_{yx}$$

$$\frac{\partial}{\partial x} \left( \frac{\partial z}{\partial y} \right) = \frac{\partial^2 z}{\partial x \partial y} \quad \text{or} \quad \frac{\partial^2 f}{\partial x \partial y} \quad \text{or} \quad f_{xy}$$

$$\text{Note.} \quad \frac{\partial^2 z}{\partial y \partial x} = \frac{\partial^2 z}{\partial x \partial y}$$

**Example 17.** Prove that  $y = f(x + at) + g(x - at)$  satisfies

$$\frac{\partial^2 y}{\partial t^2} = a^2 \left( \frac{\partial^2 y}{\partial x^2} \right)$$

where  $f$  and  $g$  are assumed to be at least twice differentiable and  $a$  is any constant.

(U.P., I Semester, Jan. 2011, A.M.I.E.T.E. June 2009, A.M.I.E., Summer 2000)

$$\text{Solution.} \quad y = f(x + at) + g(x - at) \quad \dots(1)$$

Differentiating (1) w.r.t. 'x' partially, we get

$$\frac{\partial y}{\partial x} = f'(x + at) + g'(x - at) \Rightarrow \frac{\partial^2 y}{\partial x^2} = f''(x + at) + g''(x - at)$$

Differentiating (1) w.r.t. 't' partially, we get

$$\begin{aligned} \frac{\partial y}{\partial t} &= f'(x + at).a + g'(x - at)(-a) \Rightarrow \frac{\partial^2 y}{\partial t^2} = a^2 f''(x + at) + g''(x - at)a^2 \\ &= a^2 [f''(x + at) + g''(x - at)] = a^2 \frac{\partial^2 y}{\partial x^2} \end{aligned}$$

Hence

$$\frac{\partial^2 y}{\partial t^2} = a^2 \frac{\partial^2 y}{\partial x^2} \quad \text{Proved.}$$

**Example 18.** If  $z = \tan(y + ax) + (y - ax)^{3/2}$ , then show that  $\frac{\partial^2 z}{\partial x^2} = a^2 \frac{\partial^2 z}{\partial y^2}$ . (M.U. 2009)

**Solution.** Here, we have

$$z = \tan(y + ax) + (y - ax)^{3/2} \quad \dots(1)$$

Differentiating (1) partially w.r.t.  $x$ , we get

$$\begin{aligned} \frac{\partial z}{\partial x} &= a \sec^2(y + ax) - \frac{3}{2}a(y - ax)^{1/2} \\ \frac{\partial^2 z}{\partial x^2} &= 2a^2 \sec(y + ax) \cdot \sec(y + ax) \tan(y + ax) + \frac{3}{4}a^2(y - ax)^{-\frac{1}{2}} \\ \frac{\partial^2 z}{\partial x^2} &= 2a^2 \sec^2(y + ax) \tan(y + ax) + \frac{3}{4}a^2(y - ax)^{-1/2} \\ &= a^2 [2 \sec^2(y + ax) \tan(y + ax) + \frac{3}{4}(y - ax)^{-1/2}] \quad \dots(2) \end{aligned}$$

Differentiating partially (1) w.r.t.  $y$ , we get

$$\begin{aligned}
 \frac{\partial z}{\partial y} &= \sec^2(y + ax) + \frac{3}{2}(y - ax)^{1/2} \\
 \frac{\partial^2 z}{\partial y^2} &= 2 \sec(y + ax) \cdot \sec(y + ax) \tan(y + ax) + \frac{3}{4}(y - ax)^{-1/2} \\
 &= 2 \sec^2(y + ax) \tan(y + ax) + \frac{3}{4}(y - ax)^{-1/2} \\
 a^2 \frac{\partial^2 z}{\partial y^2} &= a^2 [2 \sec^2(y + ax) \tan(y + ax) + \frac{3}{4}(y - ax)^{-1/2}] \\
 &= \frac{\partial^2 z}{\partial x^2} \quad [\text{From (2)] Proved.}]
 \end{aligned}$$

**Example 19.** If  $u = e^{xyz}$ , find the value of  $\frac{\partial^3 u}{\partial x \partial y \partial z}$ . (A.M.I.E. Winter 2000)

**Solution.**  $u = e^{xyz}$

$$\begin{aligned}
 \frac{\partial u}{\partial z} &= e^{xyz} (x y) \Rightarrow \frac{\partial^2 u}{\partial y \partial z} = e^{xyz} (x) + e^{xyz} (x z) (x y) = e^{xyz} (x + x^2 y z) \\
 \frac{\partial^3 u}{\partial x \partial y \partial z} &= e^{xyz} (1 + 2x y z) + e^{xyz} (y z) (x + x^2 y z) \\
 &= e^{xyz} [1 + 2x y z + x y z + x^2 y^2 z^2] = e^{xyz} [1 + 3x y z + x^2 y^2 z^2] \quad \text{Ans.}
 \end{aligned}$$

**Example 20.** If  $z = x \log(x + r) - r$ , where  $r^2 = x^2 + y^2$ .

$$\text{Prove that (i)} \frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = \frac{1}{x + r} \quad (\text{ii}) \frac{\partial^3 z}{\partial x^3} = -\left(\frac{x}{r^3}\right) \quad (\text{M.U. 2009, 2004, 2002})$$

**Solution.** Here, we have

$$z = x \log(x + r) - r \quad \dots(1)$$

where

$$r^2 = x^2 + y^2$$

$$2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}$$

Differentiating (1) partially w.r.t. 'x' we get

$$\begin{aligned}
 \frac{\partial z}{\partial x} &= \left[ \frac{x}{x+r} \left( 1 + \frac{\partial r}{\partial x} \right) + \log(x+r).1 \right] - \frac{\partial r}{\partial x} \\
 &= \left[ \frac{x}{x+r} \left( 1 + \frac{x}{r} \right) + \log(x+r) \right] - \frac{x}{r} \quad \left[ \frac{\partial r}{\partial x} = \frac{x}{r} \right] \\
 &= \frac{x}{r} + \log(x+r) - \frac{x}{r} = \log(x+r) \quad \dots(2)
 \end{aligned}$$

Again differentiating (2) partially w.r.t. 'x', we get

$$\frac{\partial^2 z}{\partial x^2} = \frac{1}{x+r} \left( 1 + \frac{\partial r}{\partial x} \right) = \frac{1}{x+r} \left( 1 + \frac{x}{r} \right) = \frac{1}{r} \quad \dots(3)$$

Differentiating (1) partially w.r.t. 'y', we get

$$\frac{\partial z}{\partial y} = x \cdot \frac{1}{x+r} \left( \frac{\partial r}{\partial y} \right) - \frac{\partial r}{\partial y} = \frac{x}{x+r} \cdot \frac{y}{r} - \frac{y}{r} = \frac{y}{r} \left( \frac{x}{x+r} - 1 \right) = -\frac{y}{x+r} \left[ \because \frac{\partial r}{\partial y} = \frac{y}{r} \right] \dots(4)$$

Again differentiating (4) partially w.r.t. 'y', we get

$$\begin{aligned}
 \frac{\partial^2 z}{\partial y^2} &= -\frac{(x+r)(1) - y\left(\frac{\partial r}{\partial y}\right)}{(x+r)^2} = -\frac{(x+r) - y \cdot \frac{y}{r}}{(x+r)^2} \\
 &= -\frac{r^2 + rx - y^2}{r(x+r)^2} = -\frac{x^2 + y^2 + rx - y^2}{r(x+r)^2} \\
 &= -\frac{rx + x^2}{r(x+r)^2} = -\frac{x(r+x)}{r(x+r)^2} = -\frac{x}{r(x+r)} \quad \dots(5)
 \end{aligned}$$

(i) Adding (3) and (5), we get

$$\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = \frac{1}{r} - \frac{x}{r(x+r)} = \frac{x+r-x}{r(x+r)} = \frac{1}{x+r} \quad \text{Proved.}$$

(ii) Differentiating (3) partially w.r.t. 'x', we get

$$\frac{\partial^3 z}{\partial x^3} = -\frac{1}{r^2} \frac{\partial r}{\partial x} = -\frac{1}{r^2} \left(\frac{x}{r}\right) = -\frac{x}{r^3} \quad \text{Proved.}$$

**Example 21.** Find the value of  $n$  so that the equation  $v = r^n (3 \cos^2 \theta - 1)$  satisfies the relation.

$$\frac{\partial}{\partial r} \left( r^2 \frac{\partial v}{\partial r} \right) + \frac{1}{\sin \theta} \cdot \frac{\partial}{\partial \theta} \left( \sin \theta \frac{\partial v}{\partial \theta} \right) = 0 \quad (\text{Nagpur University, Summer 2005, 2001})$$

**Solution.**  $\frac{\partial v}{\partial \theta} = r^n (-6 \cos \theta \sin \theta)$

$$\sin \theta \frac{\partial v}{\partial \theta} = -6r^n \cos \theta \sin^2 \theta$$

$$\Rightarrow \frac{\partial}{\partial \theta} \left( \sin \theta \frac{\partial v}{\partial \theta} \right) = -6r^n (-\sin^3 \theta + 2 \sin \theta \cos^2 \theta)$$

$$\Rightarrow \frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \left( \sin \theta \frac{\partial v}{\partial \theta} \right) = 6r^n (\sin^2 \theta - 2 \cos^2 \theta) = 6r^n (1 - 3 \cos^2 \theta) \quad \dots(1)$$

Again  $\frac{\partial v}{\partial r} = n r^{n-1} (3 \cos^2 \theta - 1)$

$$r^2 \frac{\partial v}{\partial r} = n r^{n+1} (3 \cos^2 \theta - 1)$$

$$\frac{\partial}{\partial r} \left( r^2 \frac{\partial v}{\partial r} \right) = n(n+1) r^n (3 \cos^2 \theta - 1) \quad \dots(2)$$

Using the relation  $\frac{\partial}{\partial r} \left( r^2 \frac{\partial v}{\partial r} \right) + \frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \left( \sin \theta \frac{\partial v}{\partial \theta} \right) = 0$   $\dots(3)$

Putting the values of (1) and (2) in (3), we get

$$\begin{aligned}
 n(n+1) r^n (3 \cos^2 \theta - 1) - 6r^n (3 \cos^2 \theta - 1) &= 0 \\
 r^n (3 \cos^2 \theta - 1) [n(n+1) - 6] &= 0 \quad \Rightarrow \quad n(n+1) - 6 = 0 \\
 \Rightarrow n^2 + n - 6 &= 0 \quad \Rightarrow \quad (n+3)(n-2) = 0 \\
 \therefore n &= 2, -3 \quad \text{Ans.}
 \end{aligned}$$

**Example 22.** If  $u = (1 - 2xy + y^2)^{-\frac{1}{2}}$ , prove that  $\frac{\partial}{\partial x} \left( (1 - x^2) \frac{\partial u}{\partial x} \right) + \frac{\partial}{\partial y} \left( y^2 \frac{\partial u}{\partial y} \right) = 0$ .

**Solution.** We have

$$\begin{aligned} u &= (1 - 2xy + y^2)^{-\frac{1}{2}} && \dots(1) \\ \frac{\partial u}{\partial x} &= -\frac{1}{2}(1 - 2xy + y^2)^{-\frac{3}{2}} (-2y) = \frac{y}{(1 - 2xy + y^2)^{\frac{3}{2}}} \\ (1 - x^2) \frac{\partial u}{\partial x} &= \frac{(1 - x^2)y}{(1 - 2xy + y^2)^{\frac{3}{2}}} \\ \frac{\partial}{\partial x} \left( (1 - x^2) \frac{\partial u}{\partial x} \right) &= \frac{(1 - 2xy + y^2)^{\frac{3}{2}} (-2xy) - (1 - x^2)y \left( \frac{3}{2}(1 - 2xy + y^2)^{\frac{1}{2}} (-2y) \right)}{(1 - 2xy + y^2)^3} \end{aligned}$$

Cancelling  $(1 - 2xy + y^2)^{\frac{1}{2}}$  from numerator and denominator, we have

$$\begin{aligned} &= \frac{(1 - 2xy + y^2)(-2xy) + 3(1 - x^2)y^2}{(1 - 2xy + y^2)^{\frac{5}{2}}} = \frac{-2xy + 4x^2y^2 - 2xy^3 + 3y^2 - 3x^2y^2}{(1 - 2xy + y^2)^{\frac{5}{2}}} \\ &= \frac{x^2y^2 - 2xy^3 - 2xy + 3y^2}{(1 - 2xy + y^2)^{\frac{5}{2}}} && \dots(2) \end{aligned}$$

Differentiating (1) partially w.r.t.  $y$ , we get

$$\begin{aligned} \frac{\partial u}{\partial y} &= -\frac{1}{2}(1 - 2xy + y^2)^{-\frac{3}{2}} (-2x + 2y) = \frac{x - y}{(1 - 2xy + y^2)^{\frac{3}{2}}} \\ y^2 \frac{\partial u}{\partial y} &= \frac{xy^2 - y^3}{(1 - 2xy + y^2)^{\frac{3}{2}}} \\ \frac{\partial}{\partial y} \left( y^2 \frac{\partial u}{\partial y} \right) &= \frac{(1 - 2xy + y^2)^{\frac{3}{2}} (2xy - 3y^2) - (xy^2 - y^3) \left( \frac{3}{2}(1 - 2xy + y^2)^{\frac{1}{2}} (-2x + 2y) \right)}{(1 - 2xy + y^2)^3} \end{aligned}$$

Dividing numerator and denominator by  $(1 - 2xy + y^2)^{\frac{1}{2}}$ , we get

$$\begin{aligned} \frac{\partial}{\partial y} \left( y^2 \frac{\partial u}{\partial y} \right) &= \frac{(1 - 2xy + y^2)(2xy - 3y^2) + (xy^2 - y^3) 3(x - y)}{(1 - 2xy + y^2)^{\frac{5}{2}}} \\ &= \frac{(2xy - 4x^2y^2 + 2xy^3 - 3y^2 + 6xy^3 - 3y^4) + 3x^2y^2 - 3xy^3 - 3xy^3 + 3y^4}{(1 - 2xy + y^2)^{\frac{5}{2}}} \\ &= \frac{-x^2y^2 + 2xy^3 + 2xy - 3y^2}{(1 - 2xy + y^2)^{\frac{5}{2}}} && \dots(3) \end{aligned}$$

On adding (2) and (3), we get

$$\begin{aligned} \frac{\partial}{\partial x}(1-x^2)\frac{\partial u}{\partial x} + \frac{\partial}{\partial y}\left(y^2\frac{\partial u}{\partial y}\right) &= \frac{x^2y^2 - 2xy^3 - 2xy + 3y^2}{(1-2xy+y^2)^{\frac{5}{2}}} + \frac{-x^2y^2 + 2xy^3 + 2xy - 3y^2}{(1-2xy+y^2)^{\frac{5}{2}}} \\ &= 0 \end{aligned}$$

**Proved.**

**Example 23.** If  $x^x y^y z^z = c$ , show that at  $x = y = z$ .

$$\frac{\partial^2 z}{\partial x \partial y} = -(x \log ex)^{-1} \quad (\text{Nagpur University, Summer 2004, 2000})$$

**Solution.** Given  $x^x y^y z^z = c$

Taking log on both sides, we get

$$x \log x + y \log y + z \log z = \log c \quad \dots(1)$$

Differentiating (1) partially w.r.t. to  $x$ , assuming  $z$  as a function of  $x$  and  $y$ , we have

$$\begin{aligned} \left(x \cdot \frac{1}{x} + \log x\right) + 0 + \left(z \cdot \frac{1}{z} \frac{\partial z}{\partial x} + \log z \frac{\partial z}{\partial x}\right) &= 0 \\ \Rightarrow (1 + \log x) + (1 + \log z) \frac{\partial z}{\partial x} &= 0 \quad \Rightarrow \quad \frac{\partial z}{\partial x} = -\frac{1 + \log x}{1 + \log z} \quad \dots(2) \end{aligned}$$

Similarly differentiating (1) partially w.r.t. to  $y$ , we have

$$\frac{\partial z}{\partial y} = -\frac{1 + \log y}{1 + \log z} \quad \dots(3)$$

Now differentiating (3) partially w.r.t to  $x$ , we get

$$\frac{\partial^2 z}{\partial x \partial y} = \frac{\partial}{\partial x}\left(\frac{\partial z}{\partial y}\right) = \frac{\partial}{\partial x}\left[-\frac{1 + \log y}{1 + \log z}\right] = -(1 + \log y) \cdot \frac{-1}{(1 + \log z)^2} \cdot \frac{1}{z} \cdot \frac{\partial z}{\partial x}$$

Putting the value of  $\frac{\partial z}{\partial x}$ , we get

$$\frac{\partial^2 z}{\partial x \partial y} = \frac{(1 + \log y)}{z(1 + \log z)^2} \left[-\frac{1 + \log x}{1 + \log z}\right] = -\frac{(1 + \log x)(1 + \log y)}{z(1 + \log z)^3}$$

$\therefore$  at  $x = y = z$ , we have,

$$\begin{aligned} \frac{\partial^2 z}{\partial x \partial y} &= -\frac{(1 + \log x)(1 + \log x)}{x(1 + \log x)^3} = \frac{-1}{x(1 + \log x)} \\ &= \frac{-1}{x(\log e + \log x)} = \frac{-1}{x \log ex} = -(x \log ex)^{-1} \quad \text{Proved.} \end{aligned}$$

**Example 24.** Prove that if  $f(x, y) = \frac{1}{\sqrt{y}} e^{-\frac{(x-a)^2}{4y}}$  then  $f_{xy}(x, y) = f_{yx}(x, y)$ .

$$\text{Solution.} \quad f(x, y) = \frac{1}{\sqrt{y}} e^{-\frac{(x-a)^2}{4y}} \quad \dots(1)$$

Differentiating  $f(x, y)$  partially w.r.t.  $x$ , we get

$$f_x(x, y) = \frac{1}{\sqrt{y}} \cdot \frac{[-2(x-a)]}{4y} e^{-\frac{(x-a)^2}{4y}} = \frac{-(x-a)}{2y^{3/2}} e^{-\frac{(x-a)^2}{4y}}$$

Differentiating again partially w.r.t. 'y' by product rule, we have

$$f_{yx}(x, y) = \frac{3(x-a)}{4y^{5/2}} \cdot e^{-\frac{(x-a)^2}{4y}} - \frac{(x-a)^3}{8y^{7/2}} e^{-\frac{(x-a)^2}{4y}}$$

$$= \frac{(x-a)}{8y^{7/2}} e^{-\frac{(x-a)^2}{4y}} [6y - (x-a)^2] \quad \dots(2)$$

Differentiating (1) partially w.r.t. 'y', we have

$$f_y(x, y) = -\frac{1}{2y^{3/2}} e^{-\frac{(x-a)^2}{4y}} + \frac{(x-a)^2}{4y^{5/2}} e^{-\frac{(x-a)^2}{4y}}$$

Differentiating again partially w.r.t. 'x', we have

$$\begin{aligned} f_{xy}(x, y) &= \frac{(x-a)}{4y^{5/2}} e^{-\frac{(x-a)^2}{4y}} + \frac{(x-a)}{2y^{5/2}} e^{-\frac{(x-a)^2}{4y}} - \frac{(x-a)^3}{8y^{7/2}} e^{-\frac{(x-a)^2}{4y}} \\ &= \frac{(x-a)}{8y^{7/2}} e^{-\frac{(x-a)^2}{4y}} [2y + 4y - (x-a)^2] \\ &= \frac{(x-a)}{8y^{7/2}} e^{-\frac{(x-a)^2}{4y}} [6y - (x-a)^2] \end{aligned} \quad \dots(3)$$

From (2) and (3), we have

$$f_{xy}(x, y) = f_{yx}(x, y)$$

**Proved.**

**Example 25.** If  $u = x^y$ , show that  $\frac{\partial^3 u}{\partial x^2 \partial y} = \frac{\partial^3 u}{\partial x \partial y \partial x}$ .

**Solution.**

$$\Rightarrow u = x^y$$

$$\log u = \log x^y = y \log x$$

Differentiating partially, we have

$$\begin{aligned} \frac{1}{u} \cdot \frac{\partial u}{\partial x} &= \frac{y}{x}, \quad \text{and} \quad \frac{1}{u} \cdot \frac{\partial u}{\partial y} = \log x \\ \Rightarrow \frac{\partial u}{\partial x} &= u \frac{y}{x}, \quad \text{and} \quad \frac{\partial u}{\partial y} = u \log x \\ \frac{\partial^2 u}{\partial y \partial x} &= \frac{1}{x} \left[ u + y \cdot \frac{\partial u}{\partial y} \right] = \frac{u}{x} + \frac{y}{x} \cdot \frac{\partial u}{\partial y} = \frac{u}{x} + \frac{uy \log x}{x} \quad \left( \text{As } \frac{\partial u}{\partial y} = u \log x \right) \\ \frac{\partial^3 u}{\partial x \partial y \partial x} &= -\frac{u}{x^2} + \frac{1}{x} \cdot \frac{\partial u}{\partial x} + y \cdot \left\{ \frac{x \cdot \left( \frac{\partial u}{\partial x} \cdot \log x + \frac{u}{x} \right) - u \log x}{x^2} \right\} \\ &= -\frac{u}{x^2} + \frac{1}{x} \frac{\partial u}{\partial x} + \frac{y \log x}{x} \frac{\partial u}{\partial x} + \frac{uy}{x^2} - \frac{uy \log x}{x^2} \\ &= -\frac{u}{x^2} + \frac{uy^2 \log x}{x^2} + \frac{uy}{x^2} - \frac{uy \log x}{x^2} \quad \left[ \because \frac{\partial u}{\partial x} = \frac{uy}{x} \right] \\ &= -\frac{u}{x^2} + \frac{2uy}{x^2} + \frac{uy^2 \log x}{x^2} - \frac{uy \log x}{x^2} \end{aligned} \quad \dots(1)$$

$$\frac{\partial u}{\partial y} = u \log x$$

$$\frac{\partial^2 u}{\partial x \partial y} = \frac{u}{x} + \log x \cdot \frac{\partial u}{\partial x} = \frac{u}{x} + \log x \cdot \frac{uy}{x} \quad \left[ \frac{\partial u}{\partial x} = \frac{uy}{x} \right]$$

$$\frac{\partial^3 u}{\partial x^2 \partial y} = -\frac{u}{x^2} + \frac{1}{x} \cdot \frac{\partial u}{\partial x} + y \cdot \frac{x \cdot \left( \frac{u}{x} + \log x \cdot \frac{\partial u}{\partial x} \right) - u \log x}{x^2} \quad (1)$$

$$\begin{aligned}
&= -\frac{u}{x^2} + \frac{uy}{x^2} + \frac{uy}{x^2} + \frac{y \log x}{x} \frac{\partial u}{\partial x} - \frac{uy \log x}{x^2} \\
&= -\frac{u}{x^2} + \frac{2uy}{x^2} + \frac{y \log x}{x} \frac{uy}{x} - \frac{uy \log x}{x^2} \\
&= -\frac{u}{x^2} + \frac{2uy}{x^2} + \frac{uy^2 \log x}{x^2} - \frac{uy \log x}{x^2} \quad \dots(2)
\end{aligned}$$

From (1) and (2), we get  $\frac{\partial^3 u}{\partial x^2 \partial y} = \frac{\partial^3 u}{\partial x \partial y \partial x}$  Proved.

**Example 26.** If  $u = \log(x^3 + y^3 + z^3 - 3xyz)$ , show that

$$\left( \frac{\partial}{\partial x} + \frac{\partial}{\partial y} + \frac{\partial}{\partial z} \right)^2 u = -\frac{9}{(x+y+z)^2} \quad (\text{U.P. I Semester, winter 2003})$$

**Solution.**  $u = \log(x^3 + y^3 + z^3 - 3xyz)$  ...(1)

Differentiating (1) partially w.r.t. 'x', we get

$$\frac{\partial u}{\partial x} = \frac{3x^2 - 3yz}{x^3 + y^3 + z^3 - 3xyz} \quad \dots(2)$$

Similarly,  $\frac{\partial u}{\partial y} = \frac{3y^2 - 3zx}{x^3 + y^3 + z^3 - 3xyz} \quad \dots(3)$

$$\frac{\partial u}{\partial z} = \frac{3z^2 - 3xy}{x^3 + y^3 + z^3 - 3xyz} \quad \dots(4)$$

On adding (2), (3) and (4), we get

$$\begin{aligned}
\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} &= \frac{3(x^2 + y^2 + z^2 - xy - yz - zx)}{x^3 + y^3 + z^3 - 3xyz} \\
&= \frac{3(x^2 + y^2 + z^2 - xy - yz - zx)}{(x+y+z)(x^2 + y^2 + z^2 - xy - yz - zx)} = \frac{3}{x+y+z}
\end{aligned}$$

$$\begin{aligned}
\Rightarrow \left( \frac{\partial}{\partial x} + \frac{\partial}{\partial y} + \frac{\partial}{\partial z} \right) u &= \frac{3}{x+y+z} \\
\left( \frac{\partial}{\partial x} + \frac{\partial}{\partial y} + \frac{\partial}{\partial z} \right)^2 u &= \left( \frac{\partial}{\partial x} + \frac{\partial}{\partial y} + \frac{\partial}{\partial z} \right) \frac{3}{x+y+z} \\
&= \frac{\partial}{\partial x} \frac{3}{x+y+z} + \frac{\partial}{\partial y} \frac{3}{x+y+z} + \frac{\partial}{\partial z} \frac{3}{x+y+z} \\
&= -3(x+y+z)^{-2} - 3(x+y+z)^{-2} - 3(x+y+z)^{-2} \\
&= -\frac{9}{(x+y+z)^2} \quad \text{Proved.}
\end{aligned}$$

**Example 27.** If  $\frac{x^2}{a^2 + u} + \frac{y^2}{b^2 + u} + \frac{z^2}{c^2 + u} = 1$ , show that:

$$\left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial u}{\partial y} \right)^2 + \left( \frac{\partial u}{\partial z} \right)^2 = 2 \left( x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} \right)$$

(U.P. I Semester, Winter 2002)

**Solution.** Given  $\frac{x^2}{a^2+u} + \frac{y^2}{b^2+u} + \frac{z^2}{c^2+u} = 1$ , ... (1)

where  $u$  is a function of  $x, y$  and  $z$ .

Differentiating (1) partially with respect to  $x$ , we get

$$\Rightarrow \frac{\partial u}{\partial x} = \frac{\frac{2x}{a^2+u} - \left[ \frac{x^2}{(a^2+u)^2} + \frac{y^2}{(b^2+u)^2} + \frac{z^2}{(c^2+u)^2} \right] \frac{\partial u}{\partial x}}{\frac{2x}{(a^2+u)}} \quad \dots(2)$$

$$\text{Similarly, } \frac{\partial u}{\partial y} = \frac{\frac{2y}{a^2+u} - \left[ \frac{x^2}{(a^2+u)^2} + \frac{y^2}{(b^2+u)^2} + \frac{z^2}{(c^2+u)^2} \right] \frac{\partial u}{\partial y}}{\frac{2y}{(b^2+u)}} \quad \dots(3)$$

$$\frac{\partial u}{\partial z} = \frac{\frac{2z}{a^2+u} - \left[ \frac{x^2}{(a^2+u)^2} + \frac{y^2}{(b^2+u)^2} + \frac{z^2}{(c^2+u)^2} \right] \frac{\partial u}{\partial z}}{\frac{2z}{(c^2+u)}} \quad \dots(4)$$

Squaring and adding (2), (3) and (4), we get

$$\therefore \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial u}{\partial y} \right)^2 + \left( \frac{\partial u}{\partial z} \right)^2 = \frac{4 \left[ \frac{x^2}{(a^2+u)^2} + \frac{y^2}{(b^2+u)^2} + \frac{z^2}{(c^2+u)^2} \right]}{\left[ \frac{x^2}{(a^2+u)^2} + \frac{y^2}{(b^2+u)^2} + \frac{z^2}{(c^2+u)^2} \right]^2} \\ = \frac{4}{\left[ \frac{x^2}{(a^2+u)^2} + \frac{y^2}{(b^2+u)^2} + \frac{z^2}{(c^2+u)^2} \right]} \quad \dots(5)$$

Multiplying (1) by  $x$ , (2) by  $y$  and (3) by  $z$  and then on adding, we get

$$\left[ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} \right] = \frac{2 \left[ \frac{x^2}{a^2+u} + \frac{y^2}{b^2+u} + \frac{z^2}{c^2+u} \right]}{\left[ \frac{x^2}{(a^2+u)^2} + \frac{y^2}{(b^2+u)^2} + \frac{z^2}{(c^2+u)^2} \right]} \\ = \frac{2}{\left[ \frac{x^2}{(a^2+u)^2} + \frac{y^2}{(b^2+u)^2} + \frac{z^2}{(c^2+u)^2} \right]} \quad \dots(6) \text{ [Using (1)]}$$

From (5) and (6), we have

$$\left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial u}{\partial y} \right)^2 + \left( \frac{\partial u}{\partial z} \right)^2 = 2 \left[ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} \right] \quad \text{Proved.}$$

### 1.9 WHICH VARIABLE IS TO BE TREATED AS CONSTANT

Let  $x = r \cos \theta, y = r \sin \theta$

To find  $\frac{\partial r}{\partial x}$ , we need a relation between  $r$  and  $x$ .

$$r = x \sec \theta \quad \dots(1)$$

Differentiating (1) w.r.t. 'x' keeping  $\theta$  as constant

$$\frac{\partial r}{\partial x} = \sec \theta \quad \dots(2)$$

Here, we have  $r^2 = x^2 + y^2 \quad \dots(3)$

Differentiating (3) w.r.t. 'x' keeping  $y$  as constant.

$$2r \frac{\partial r}{\partial x} = 2x \quad \text{or} \quad \frac{\partial r}{\partial x} = \frac{x}{r} = \cos \theta \quad \dots(4)$$

From (2),  $\frac{\partial r}{\partial x} = \sec \theta$  and from (4),  $\frac{\partial r}{\partial x} = \cos \theta$ . These two values of  $\frac{\partial r}{\partial x}$  make confusion.

To avoid the confusion we use the following notations.

**Notation.** (i)  $\left(\frac{\partial r}{\partial x}\right)_\theta$  means the partial derivative of  $r$  with respect to  $x$ , keeping  $\theta$  as constant.

From (2),  $\left(\frac{\partial r}{\partial x}\right)_\theta = \sec \theta$

(ii)  $\left(\frac{\partial r}{\partial x}\right)_y$  means the partial derivative of  $r$  with respect to  $x$  keeping  $y$  as constant.

From (4),  $\left(\frac{\partial r}{\partial x}\right)_y = \cos \theta$

(iii) When no indication is given regarding the variables to be treated as constant

$\frac{\partial}{\partial x}$  means  $\left(\frac{\partial}{\partial x}\right)_y$ ,  $\frac{\partial}{\partial y}$  means  $\left(\frac{\partial}{\partial y}\right)_x$ .

$\frac{\partial}{\partial r}$  means  $\left(\frac{\partial}{\partial r}\right)_\theta$ ,  $\frac{\partial}{\partial \theta}$  means  $\left(\frac{\partial}{\partial \theta}\right)_r$ .

**Example 28.** If  $x = r \cos \theta$ ,  $y = r \sin \theta$ , find

$$(i) \left(\frac{\partial x}{\partial r}\right)_\theta \quad (ii) \left(\frac{\partial y}{\partial \theta}\right)_r \quad (iii) \left(\frac{\partial r}{\partial x}\right)_y \quad (iv) \left(\frac{\partial \theta}{\partial y}\right)_x$$

**Solution.** (i)  $\left(\frac{\partial x}{\partial r}\right)_\theta$  means the partial derivative of  $x$  with respect to  $r$ , keeping  $\theta$  as constant.

$$x = r \cos \theta \Rightarrow \left(\frac{\partial x}{\partial r}\right)_\theta = \cos \theta$$

(ii)  $\left(\frac{\partial y}{\partial \theta}\right)_r$  means the partial derivative of  $y$  with respect to  $\theta$ , treating  $r$  as constant.

$$y = r \sin \theta \Rightarrow \left(\frac{\partial y}{\partial \theta}\right)_r = r \cos \theta$$

(iii)  $\left(\frac{\partial r}{\partial x}\right)_y$  means the partial derivative of  $r$  with respect to  $x$ , treating  $y$  as constant.

We have to express  $r$  as a function of  $x$  and  $y$ .

$$r = \sqrt{x^2 + y^2} \quad (\text{From the given equations})$$

$$\left(\frac{\partial r}{\partial x}\right)_y = \frac{1}{2} \frac{1}{\sqrt{x^2 + y^2}} \cdot 2x = \frac{x}{\sqrt{x^2 + y^2}}$$

(iv) Before finding  $\left(\frac{\partial \theta}{\partial y}\right)_x$  we have to express  $\theta$  in terms of  $x$  and  $y$ .

$$\begin{aligned} \theta &= \tan^{-1} \frac{y}{x} && \text{(From the given equations)} \\ \left(\frac{\partial \theta}{\partial y}\right)_x &= \frac{1}{1 + \frac{y^2}{x^2}} \cdot \frac{1}{x} = \frac{x}{x^2 + y^2} \end{aligned}$$

**Ans.****EXERCISE 1.3**

1. If  $z^3 - 3yz - 3x = 0$ , show that  $z \frac{\partial z}{\partial x} = \frac{\partial z}{\partial y}$  and  $z \left[ \frac{\partial^2 z}{\partial x \partial y} + \left( \frac{\partial z}{\partial x} \right)^2 \right] = \frac{\partial^2 z}{\partial y^2}$
2. If  $z(z^2 + 3x) + 3y = 0$ , prove that  $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = \frac{2z(x-1)}{(z^2+x)^3}$ .
3. If  $z = \log(e^x + e^y)$ , show that  $rt - s^2 = 0$ .
4. If  $f(x, y) = x^3y - xy^3$ , find  $\left[ \frac{1}{\frac{\partial f}{\partial x}} + \frac{1}{\frac{\partial f}{\partial y}} \right]_{\substack{x=1 \\ y=2}}$  **Ans.**  $-\frac{13}{22}$
5. If  $\frac{1}{u} = \sqrt{x^2 + y^2 + z^2}$ , show that  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = 0$  az **Ans.** ???
6. Show that the function  $u = \arctan(y/x)$  satisfies the Laplace equation  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$ .
7. If  $z = yf(x^2 - y^2)$  show that  $y \frac{\partial z}{\partial x} + x \frac{\partial z}{\partial y} = \frac{xz}{y}$ .
8. Show that  $\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = 0$ , where  $z = x.f(x+y) + y.g(x+y)$ .
9. If  $u(x, y, z) = \log(\tan x + \tan y + \tan z)$ , prove that  $\sin 2x \frac{\partial u}{\partial x} + \sin 2y \frac{\partial u}{\partial y} + \sin 2z \frac{\partial u}{\partial z} = 2$  (U.P. I Semester, Dec. 2006)
10. If  $u = \log(x^2 + y^2) + \tan^{-1}\left(\frac{y}{x}\right)$ . Show that  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$ .
11. If  $u(x, y, z) = \frac{1}{x^2 + y^2 + z^2}$ , find the value of  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2}$ . **Ans.**  $\frac{2}{(x^2 + y^2 + z^2)^2}$
12. If  $x = e^{r \cos \theta} \cos(r \sin \theta)$  and  $y = e^{r \cos \theta} \sin(r \sin \theta)$   
Prove that  $\frac{\partial x}{\partial r} = \frac{1}{r} \frac{\partial y}{\partial \theta}$ ,  $\frac{\partial y}{\partial r} = -\frac{1}{r} \frac{\partial x}{\partial \theta}$   
Hence deduce that  $\frac{\partial^2 x}{\partial r^2} + \frac{1}{r} \frac{\partial x}{\partial r} + \frac{1}{r} \frac{\partial^2 x}{\partial \theta^2} = 0$
13. If  $x = r \cos \theta$ ,  $y = r \sin \theta$ , prove that  
(a)  $\frac{\partial r}{\partial x} = \frac{\partial x}{\partial r}$ ,  $r \cdot \frac{\partial \theta}{\partial x} = \frac{1}{r} \cdot \frac{\partial x}{\partial \theta}$    (b)  $\frac{\partial^2 \theta}{\partial x^2} + \frac{\partial^2 \theta}{\partial y^2} = 0$    (c)  $\frac{\partial^2 r}{\partial x^2} + \frac{\partial^2 r}{\partial y^2} = \frac{1}{r} \left[ \left( \frac{\partial r}{\partial x} \right)^2 + \left( \frac{\partial r}{\partial y} \right)^2 \right]$
14. If  $z = x^y + y^x$ , verify that  $\frac{\partial^2 z}{\partial x \partial y} = \frac{\partial^2 z}{\partial y \partial x}$
15. If  $u = f(ax^2 + 2hxy + by^2)$  and  $v = \varphi(ax^2 + 2hxy + by^2)$  show that  $\frac{\partial}{\partial y} \left( u \frac{\partial v}{\partial x} \right) = \frac{\partial}{\partial x} \left( u \frac{\partial v}{\partial y} \right)$ .
16. If  $u = r^m$ , where  $r^2 = x^2 + y^2 + z^2$ , find the value of  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2}$ . **Ans.**  $m(m+1)r^{m-2}$

17. If  $x = \frac{r}{2}(e^\theta + e^{-\theta})$ ,  $y = \frac{r}{2}(e^\theta - e^{-\theta})$  prove that  $\frac{\partial x}{\partial r} = \frac{\partial r}{\partial x}$ .
18. If  $u(x, t) = a e^{-gx} \sin(nt - gx)$ , satisfies the equation  $\frac{\partial u}{\partial t} = a^2 \frac{\partial^2 u}{\partial x^2}$ , show that  $ag = \sqrt{\frac{n}{2}}$ .
19. If  $u = f(x, y)$ ,  $x = r \cos \theta$ ,  $y = r \sin \theta$ , then show that  $\left(\frac{\partial u}{\partial x}\right)^2 + \left(\frac{\partial u}{\partial y}\right)^2 = \left(\frac{\partial u}{\partial r}\right)^2 + \frac{1}{r^2} \left(\frac{\partial u}{\partial \theta}\right)^2$
20. If  $z = (x+y) + (x+y) + \left(\frac{y}{x}\right)$ , then prove that  $x \left( \frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial y \partial x} \right) = y \left[ \frac{\partial^2 z}{\partial y^2} - \frac{\partial^2 z}{\partial x \partial y} \right]$  (A.M.I.E.T.E., Dec. 2010)
21. Show that the function  $f(x, y) = \begin{cases} (x+y) \sin\left(\frac{1}{x+y}\right), & x+y \neq 0 \\ 0, & x+y=0 \end{cases}$  is continuous at  $(0, 0)$  but its partial derivatives of first order do not exist at  $(0, 0)$ . (A.M.I.E.T.E., June 2010, Dec. 2007)
- Choose the correct objective:**
22. If  $u = x^2 + y^2$  then the value of  $\frac{\partial^2 u}{\partial x \partial y}$  is equal to  
 (a) 0      (b) 2      (c)  $2x + 2y$       (d)  $y x^{y-1}$  (A.M.I.E.T.E. Dec. 2008) **Ans. (a)**
23. If  $u = \log\left(\frac{x^2}{y}\right)$ , then the value of  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y}$  is  
 (a)  $2u$       (b)  $u$       (c) 0      (d) 1 (A.M.I.E.T.E. Dec. 2007) **Ans. (d)**
24. If  $u = x^y$  then the value of  $\frac{\partial u}{\partial y}$  is equal to  
 (a) 0      (b)  $x^y \log(x)$       (c)  $x y^{x-1}$       (d)  $y x^{y-1}$  (A.M.I.E.T.E. Dec. 2007) **Ans. (b)**

## 1.10 HOMOGENEOUS FUNCTION

A function  $f(x, y)$  is said to be homogeneous function in which the power of each term is the same.

A function  $f(x, y)$  is a homogeneous function of order  $n$ , if the degree of each of its terms in  $x$  and  $y$  is equal to  $n$ . Thus

$$a_0 x^n + a_1 x^{n-1} y + a_2 x^{n-2} y^2 + \dots + a_{n-1} x y^{n-1} + a_n y^n \quad \dots(1)$$

is a homogeneous function of order  $n$ .

The polynomial function (1) which can be written as

$$x^n \left[ a_0 + a_1 \left( \frac{y}{x} \right) + a_2 \left( \frac{y}{x} \right)^2 + \dots + a_{n-1} \left( \frac{y}{x} \right)^{n-1} + a_n \left( \frac{y}{x} \right)^n \right] = x^n \varphi\left(\frac{y}{x}\right) \quad \dots(2)$$

(i) The function  $x^3 \left[ 1 + \frac{y}{x} + 3 \left( \frac{y}{x} \right)^2 + 5 \left( \frac{y}{x} \right)^3 \right]$

is a homogeneous function of order 3.

(ii)  $\frac{\sqrt{x} + \sqrt{y}}{x^2 + y^2} = \frac{\sqrt{x} \left[ 1 + \sqrt{\frac{y}{x}} \right]}{x^2 \left[ 1 + \left( \frac{y}{x} \right)^2 \right]} = x^{-3/2} \cdot \frac{1 + \sqrt{\frac{y}{x}}}{1 + \left( \frac{y}{x} \right)^2}$

is a homogeneous function of order  $-3/2$ .

(iii)  $\sin^{-1} \frac{\sqrt{x} + \sqrt{y}}{x^2 + y^2}$  is not a homogeneous function as it cannot be written in the form of  $x^n f\left(\frac{y}{x}\right)$  so that its degree may be pronounced. It is a function of homogeneous expression.

### 1.11 EULER'S THEOREM ON HOMOGENEOUS FUNCTION

(A.M.I.E.T.E, June 2009, U.P. I Semester, Dec. 2006)

**Statement.** If  $z$  is a homogeneous function of  $x, y$  of order  $n$ , then

$$x \cdot \frac{\partial z}{\partial x} + y \cdot \frac{\partial z}{\partial y} = n z$$

**Proof.** Since  $z$  is a homogeneous function of  $x, y$  of order  $n$ .  
 $\therefore z$  can be written in the form

$$z = x^n \cdot f\left(\frac{y}{x}\right) \quad \dots(1)$$

Differentiating (1) partially w.r.t. 'x', we have

$$\begin{aligned} \frac{\partial z}{\partial x} &= nx^{n-1} \cdot f\left(\frac{y}{x}\right) + x^n \cdot f'\left(\frac{y}{x}\right) \left(-\frac{y}{x^2}\right) \\ &= nx^{n-1} \cdot f\left(\frac{y}{x}\right) - x^{n-2} y \cdot f'\left(\frac{y}{x}\right) \end{aligned}$$

Multiplying both sides by  $x$ , we have

$$x \frac{\partial z}{\partial x} = n x^n \cdot f\left(\frac{y}{x}\right) - x^{n-1} y \cdot f'\left(\frac{y}{x}\right) \quad \dots(2)$$

Differentiating (1) partially w.r.t. 'y', we have

$$\frac{\partial z}{\partial y} = x^n f'\left(\frac{y}{x}\right) \cdot \frac{1}{x}$$

Multiplying both sides by  $y$ , we get

$$y \frac{\partial z}{\partial y} = x^{n-1} y \cdot f'\left(\frac{y}{x}\right) \quad \dots(3)$$

Adding (2) and (3), we have

$$x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = n x^n f\left(\frac{y}{x}\right) \Rightarrow x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = n z \quad \text{Proved.}$$

**Note.** If  $u$  is a homogeneous function of  $x, y, z$  of degree  $n$ , then  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} = n u$

**Example 29.** Verify Euler's theorem for  $z = \frac{x^{1/3} + y^{1/3}}{x^{1/2} + y^{1/2}}$ . (U.P. Ist Semester, Dec. 2009)

**Solution.** Here, we have

$$\begin{aligned} z &= \frac{x^{1/3} + y^{1/3}}{x^{1/2} + y^{1/2}} \\ &= \frac{x^{1/3} \left[ 1 + \left( \frac{y}{x} \right)^{1/3} \right]}{x^{1/2} \left[ 1 + \left( \frac{y}{x} \right)^{1/2} \right]} = x^{-\frac{1}{6}} \phi\left(\frac{y}{x}\right) \end{aligned} \quad \dots(1)$$

Thus  $z$  is homogeneous function of degree  $-\frac{1}{6}$ .

$$\text{By Euler's theorem } x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = -\frac{1}{6}z. \quad \dots(2)$$

Differentiating (1) w.r.t. 'x', we get

$$\frac{\partial z}{\partial x} = \frac{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)\left(\frac{1}{3}x^{-\frac{2}{3}}\right) - \left(x^{\frac{1}{3}} + y^{\frac{1}{3}}\right)\left(\frac{1}{2}x^{-\frac{1}{2}}\right)}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2} = \frac{\frac{1}{3}x^{-\frac{1}{6}} + \frac{1}{3}x^{-\frac{2}{3}}y^{\frac{1}{2}} - \frac{1}{2}x^{-\frac{1}{6}} - \frac{1}{2}x^{-\frac{1}{2}}y^{\frac{1}{3}}}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2}$$

$$x \frac{\partial z}{\partial x} = \frac{\frac{1}{3}x^{\frac{5}{6}} + \frac{1}{3}x^{\frac{1}{3}}y^{\frac{1}{2}} - \frac{1}{2}x^{\frac{5}{6}} - \frac{1}{2}x^{\frac{1}{2}}y^{\frac{1}{3}}}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2} \quad \dots(3)$$

$$\frac{\partial z}{\partial y} = \frac{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)\left(\frac{1}{3}y^{-\frac{2}{3}}\right) - \left(x^{\frac{1}{3}} + y^{\frac{1}{3}}\right)\left(\frac{1}{2}y^{-\frac{1}{2}}\right)}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2} = \frac{\frac{1}{3}x^{\frac{1}{2}}y^{-\frac{2}{3}} + \frac{1}{3}y^{-\frac{1}{6}} - \frac{1}{2}x^{\frac{1}{3}}y^{-\frac{1}{2}} - \frac{1}{2}y^{-\frac{1}{6}}}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2}$$

$$y \frac{\partial z}{\partial y} = \frac{\frac{1}{3}x^{\frac{1}{2}}y^{\frac{1}{3}} + \frac{1}{3}y^{\frac{5}{6}} - \frac{1}{2}x^{\frac{1}{3}}y^{\frac{1}{2}} - \frac{1}{2}y^{\frac{5}{6}}}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2} \quad \dots(4)$$

Adding (3) and (4), we get

$$\begin{aligned} x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} &= \frac{\frac{1}{3}x^{\frac{5}{6}} + \frac{1}{3}x^{\frac{1}{3}}y^{\frac{1}{2}} - \frac{1}{2}x^{\frac{5}{6}} - \frac{1}{2}x^{\frac{1}{2}}y^{\frac{1}{3}} + \frac{1}{3}x^{\frac{1}{2}}y^{\frac{1}{3}} + \frac{1}{3}y^{\frac{5}{6}} - \frac{1}{2}x^{\frac{1}{3}}y^{\frac{1}{2}} - \frac{1}{2}y^{\frac{5}{6}}}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2} \\ &= \frac{-\frac{1}{6}\left[x^{\frac{5}{6}} + y^{\frac{5}{6}} + x^{\frac{1}{3}}y^{\frac{1}{2}} + x^{\frac{1}{2}}y^{\frac{1}{3}}\right]}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2} = \frac{-\frac{1}{6}\left[x^{\frac{1}{2}}\left(x^{\frac{1}{3}} + y^{\frac{1}{3}}\right) + y^{\frac{1}{2}}\left(x^{\frac{1}{3}} + y^{\frac{1}{3}}\right)\right]}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2} \\ &= \frac{-\frac{1}{6}\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)\left(x^{\frac{1}{3}} + y^{\frac{1}{3}}\right)}{\left(x^{\frac{1}{2}} + y^{\frac{1}{2}}\right)^2} = -\frac{1}{6} \frac{x^{\frac{1}{3}} + y^{\frac{1}{3}}}{x^{\frac{1}{2}} + y^{\frac{1}{2}}} \end{aligned}$$

$$x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = -\frac{1}{6} z \quad \dots(5)$$

From (2) and (5), Euler's theorem is verified.

**Verified.**

**Example 30.** If  $f(x, y) = \frac{1}{x^2} + \frac{1}{xy} + \frac{\log x - \log y}{x^2 + y^2}$ , prove that

$$x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} + 2f = 0. \quad (\text{A.M.I.E. Summer 2004})$$

**Solution.**  $f(x, y) = \frac{1}{x^2} + \frac{1}{xy} + \frac{\log x - \log y}{x^2 + y^2}$

$$= \frac{1}{x^2} \left(\frac{y}{x}\right)^0 + \frac{1}{x^2} \frac{1}{\left(\frac{y}{x}\right)} - \frac{1}{x^2} \frac{\log \frac{y}{x}}{\left[1 + \left(\frac{y}{x}\right)^2\right]}$$

$f(x, y)$  is a homogeneous function of degree - 2.

By Euler's Theorem

$$x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} = -2f \Rightarrow x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} + 2f = 0 \quad \text{Proved.}$$

**Example 31.** Verify Euler's Theorem for  $u = x^2 \tan^{-1} \left(\frac{y}{x}\right) - y^2 \tan^{-1} \left(\frac{x}{y}\right)$  and also prove that:

$$\frac{\partial^2 u}{\partial x \partial y} = \frac{x^2 - y^2}{x^2 + y^2}. \quad (\text{M.U. 2008})$$

**Solution.** We have,

$$u = x^2 \tan^{-1} \left(\frac{y}{x}\right) - y^2 \tan^{-1} \left(\frac{x}{y}\right) \quad \dots(1)$$

Here,  $u$  is a homogeneous function of degree two.

By Euler's Theorem, we get

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 2u \quad \dots(2)$$

**Verification**

Differentiating (1) partially w.r.t.  $x$ , we get

$$\begin{aligned} \frac{\partial u}{\partial x} &= 2x \cdot \tan^{-1} \left(\frac{y}{x}\right) + x^2 \cdot \frac{1}{1 + \frac{y^2}{x^2}} \left(-\frac{y}{x^2}\right) - y^2 \cdot \frac{1}{1 + \frac{x^2}{y^2}} \left(\frac{1}{y}\right) \\ &= 2x \tan^{-1} \left(\frac{y}{x}\right) - \frac{x^2 y}{x^2 + y^2} - \frac{y^3}{(x^2 + y^2)} \\ &= 2x \tan^{-1} \left(\frac{y}{x}\right) - y \left(\frac{x^2 + y^2}{x^2 + y^2}\right) = 2x \tan^{-1} \left(\frac{y}{x}\right) - y \end{aligned} \quad \dots(3)$$

Differentiating (1) partially w.r.t. ' $y$ ', we get

$$\begin{aligned} \frac{\partial u}{\partial y} &= x^2 \cdot \frac{1}{1 + \frac{y^2}{x^2}} \left(\frac{1}{x}\right) - 2y \tan^{-1} \left(\frac{x}{y}\right) - y^2 \cdot \frac{1}{1 + \frac{x^2}{y^2}} \left(-\frac{x}{y^2}\right) \\ &= \frac{x^3}{x^2 + y^2} - 2y \tan^{-1} \left(\frac{x}{y}\right) + \frac{xy^2}{x^2 + y^2} \end{aligned}$$

$$= -2y \tan^{-1} \left( \frac{x}{y} \right) + x \left( \frac{x^2 + y^2}{x^2 + y^2} \right) = -2y \tan^{-1} \frac{x}{y} + x \quad \dots(4)$$

Multiplying (3) by  $x$  and (4) by  $y$  and then adding, we get

$$\begin{aligned} x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} &= 2x^2 \tan^{-1} \left( \frac{y}{x} \right) - xy - 2y^2 \tan^{-1} \left( \frac{x}{y} \right) + xy \\ &= 2x^2 \tan^{-1} \left( \frac{y}{x} \right) - 2y^2 \tan^{-1} \left( \frac{x}{y} \right) = 2u \end{aligned} \quad \dots(5)$$

From (2) and (5), we observe that Euler's theorem is verified.

Now, differentiating (4) again partially w.r.t.  $x$ , we get

$$\frac{\partial^2 u}{\partial x \partial y} = -2y \frac{1}{1 + \frac{x^2}{y^2}} \left( \frac{1}{y} \right) + 1 = \frac{-2y^2}{x^2 + y^2} + 1 = \frac{x^2 - y^2}{x^2 + y^2} \quad \text{Proved.}$$

**Example 32.** Verify Euler's theorem for the function  $u = \sin^{-1} \frac{x}{y} + \tan^{-1} \frac{y}{x}$ .

(A.M.I.E.T.E. Dec., 2010, 2007; U.P. Ist Semester, Dec. 2006)

$$\text{Solution.} \quad u = x^0 \sin^{-1} \frac{x}{y} + x^0 \tan^{-1} \frac{y}{x} \quad \dots(1)$$

$u$  is a homogeneous function of degree zero so by Euler's Theorem

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 0 \quad \dots(2)$$

#### Verification

Let us find out the value of L.H.S. of (2) by actual differentiation

Differentiating (1) w.r.t. ' $x$ ', we get

$$\begin{aligned} \frac{\partial u}{\partial x} &= \frac{1}{\sqrt{1 - \frac{x^2}{y^2}}} \left( \frac{1}{y} \right) + \frac{1}{1 + \frac{y^2}{x^2}} \left( -\frac{y}{x^2} \right) = \frac{1}{\sqrt{y^2 - x^2}} - \frac{y}{x^2 + y^2} \\ x \frac{\partial u}{\partial x} &= \frac{x}{\sqrt{y^2 - x^2}} - \frac{xy}{x^2 + y^2} \end{aligned} \quad \dots(3)$$

Differentiating (1) w.r.t. ' $y$ ', we get

$$\begin{aligned} \frac{\partial u}{\partial y} &= \frac{1}{\sqrt{1 - \frac{x^2}{y^2}}} \left( -\frac{x}{y^2} \right) + \frac{1}{1 + \frac{y^2}{x^2}} \frac{1}{x} = \frac{-x}{y \sqrt{y^2 - x^2}} + \frac{x}{x^2 + y^2} \\ y \frac{\partial u}{\partial y} &= \frac{-x}{\sqrt{y^2 - x^2}} + \frac{xy}{x^2 + y^2} \end{aligned} \quad \dots(4)$$

Adding (3) and (4), we get

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 0 \quad \dots(5)$$

From (2) and (5), the theorem is verified.

Verified.

**Example 33.** If  $z$  be a homogeneous function of degree  $n$ , show that

$$(i) \quad x \cdot \frac{\partial^2 z}{\partial x^2} + y \cdot \frac{\partial^2 z}{\partial x \partial y} = (n-1) \frac{\partial z}{\partial x} \quad (ii) \quad x \cdot \frac{\partial^2 z}{\partial x \partial y} + y \cdot \frac{\partial^2 z}{\partial y^2} = (n-1) \frac{\partial z}{\partial y}$$

$$(iii) \quad x^2 \cdot \frac{\partial^2 z}{\partial x^2} + 2xy \cdot \frac{\partial^2 z}{\partial x \partial y} + y^2 \cdot \frac{\partial^2 z}{\partial y^2} = n(n-1)z.$$

(A.M.I.E.T.E. June, 2009; Uttarakhand Ist Semester, Dec. 2006)

**Solution.** By Euler's Theorem  $x \cdot \frac{\partial z}{\partial x} + y \cdot \frac{\partial z}{\partial y} = n z$  ... (1)

Differentiating (1), partially w.r.t. 'x', we get  $\frac{\partial z}{\partial x} + x \cdot \frac{\partial^2 z}{\partial x^2} + y \cdot \frac{\partial^2 z}{\partial x \partial y} = n \frac{\partial z}{\partial x}$

$$\Rightarrow x \cdot \frac{\partial^2 z}{\partial x^2} + y \cdot \frac{\partial^2 z}{\partial x \partial y} = (n-1) \frac{\partial z}{\partial x} \quad \text{Proved (i)} \quad \dots(2)$$

Differentiating (1), partially w.r.t. 'y', we have  $x \cdot \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial z}{\partial y} + y \cdot \frac{\partial^2 z}{\partial y^2} = n \frac{\partial z}{\partial y}$

$$\Rightarrow x \cdot \frac{\partial^2 z}{\partial x \partial y} + y \cdot \frac{\partial^2 z}{\partial y^2} = (n-1) \frac{\partial z}{\partial y} \quad \text{Proved (ii)} \quad \dots(3)$$

Multiplying (2) by x, we have  $x^2 \cdot \frac{\partial^2 z}{\partial x^2} + xy \cdot \frac{\partial^2 z}{\partial x \partial y} = (n-1)x \frac{\partial z}{\partial x}$  ... (4)

Multiplying (3) by y, we have  $xy \cdot \frac{\partial^2 z}{\partial y \partial x} + y^2 \cdot \frac{\partial^2 z}{\partial y^2} = (n-1)y \frac{\partial z}{\partial y}$  ... (5)

Adding (4) and (5), we get

$$\begin{aligned} x^2 \cdot \frac{\partial^2 z}{\partial x^2} + 2xy \cdot \frac{\partial^2 z}{\partial x \partial y} + y^2 \cdot \frac{\partial^2 z}{\partial y^2} &= (n-1) \left( x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} \right) \\ &= (n-1) n z \quad [\text{From (1)}] \\ &= n(n-1) z \quad \text{Proved (iii)} \end{aligned}$$

#### EXERCISE 1.4

1. Verify Euler's theorem in case

$$(i) f(x, y) = ax^2 + 2hxy + by^2 \quad (ii) u = (\sqrt{x} + \sqrt{y})(x^n + y^n)$$

2. If  $v = \frac{x^3 y^3}{x^3 + y^3}$ , show that  $x \cdot \frac{\partial v}{\partial x} + y \cdot \frac{\partial v}{\partial y} = 3v$ .

3. If  $z = (x^2 + y^2)/\sqrt{(x+y)}$ , prove that  $x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = \frac{3}{2}z$ .

4. If  $f(x, y) = x^4 y^2 \sin^{-1} \frac{y}{x}$ , then find the value of  $x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y}$ .

(A.M.I.E.T.E., Winter 2001) **Ans. 6**  $f(x, y)$

5. State and prove Euler's theorem, and verify for  $u = \frac{x}{y} + \frac{y}{z} + \frac{z}{x}$  (A.M.I.E., Summer 2000)

6. If  $u = \frac{x^2 y^2 z^2}{x^2 + y^2 + z^2} + \cos \frac{xy + yz}{x^2 + y^2 + z^2}$ , show that  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} = \frac{4x^2 y^2 z^2}{x^2 + y^2 + z^2}$

7. Verify Euler theorem on homogeneous function when  $f(x, y, z) = 3x^2 yz + 5xy^2 z + 4z^4$

#### I. Deduction from Euler's theorem

If  $z$  is a homogeneous function of  $x, y$  of degree  $n$  and  $z = f(u)$ , then

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = n \frac{f(u)}{f'(u)} \quad (\text{Nagpur University, Winter 2003})$$

**Proof.** Since  $z$  is a homogeneous function of  $x, y$  of degree  $n$ , we have, by Euler's theorem,

$$x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = nz \quad \dots (1)$$

Now  $z = f(u)$ , given

$$\therefore \frac{\partial z}{\partial x} = f'(u) \frac{\partial u}{\partial x} \quad \text{and} \quad \frac{\partial z}{\partial y} = f'(u) \frac{\partial u}{\partial y}$$

Substituting in (1), we get

$$x f'(u) \frac{\partial u}{\partial x} + y f'(u) \frac{\partial u}{\partial y} = n f(u) \Rightarrow x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = n \frac{f(u)}{f'(u)}$$

**Note.** If  $v = f(u)$  where  $v$  is a homogeneous function in  $x, y, z$  of degree  $n$ , then

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} = \frac{n f(u)}{f'(u)}$$

**Example 34.** If  $u = \log_e \left( \frac{x^4 + y^4}{x + y} \right)$ , show that  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 3$ .

(Nagpur University, Summer 2008, Uttarakhand, I Semester 2008)

**Solution.** We have,  $u = \log_e \left( \frac{x^4 + y^4}{x + y} \right)$

Here,  $u$  is not a homogeneous function but if

$$z = e^u = \frac{x^4 + y^4}{x + y} = \frac{x^4 \left[ 1 + \left( \frac{y}{x} \right)^4 \right]}{x \left[ 1 + \left( \frac{y}{x} \right) \right]} = x^3 \varphi \left( \frac{y}{x} \right)$$

Then  $z$  is a homogeneous function of degree 3.

By Euler's Deduction formula I

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = n \frac{f(u)}{f'(u)} = 3 \frac{e^u}{e^u} = 3$$

**Proved.**

**Example 35.** If  $u = \sin^{-1} \left( \frac{x^3 + y^3 + z^3}{ax + by + cz} \right)$ , prove that

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} = 2 \tan u. \quad (\text{U.P., I Semester Winter, 2002, A.M.I.E., Summer 2000})$$

**Solution.** Here,  $u$  is not a homogeneous function, we however write

$$\begin{aligned} v &= \sin u = \frac{x^3 + y^3 + z^3}{ax + by + cz} = \frac{x^3 \left[ 1 + \left( \frac{y}{x} \right)^3 + \left( \frac{z}{x} \right)^3 \right]}{x \left[ a + b \left( \frac{y}{x} \right) + c \left( \frac{z}{x} \right) \right]} \\ &= \frac{x^2 \left[ 1 + \left( \frac{y}{x} \right)^3 + \left( \frac{z}{x} \right)^3 \right]}{a + b \left( \frac{y}{x} \right) + c \left( \frac{z}{x} \right)} = x^2 \phi \left( \frac{y}{x}, \frac{z}{x} \right) \end{aligned}$$

So that  $v$  is a homogeneous function of  $x, y, z$  of order 2.

By Euler's Theorem,

$$\begin{aligned} x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} &= \frac{2f(u)}{f'(u)} = 2 \cdot \frac{\sin u}{\cos u} \\ &= 2 \tan u \end{aligned}$$

**Proved.**

**Example 36.** State Euler's Theorem of differential calculus. Hence verify the theorem for the function  $u = \log \frac{x^2 + y^2}{xy}$ .  
 (Uttarakhand, I Semester 2008)

**Solution.** We have,  $u = \log \frac{x^2 + y^2}{xy}$

By Euler's Theorem

Here,  $u$  is not a homogeneous function but if

$$z = e^u = \frac{x^2 + y^2}{xy} = \frac{x^2 \left[ 1 + \left( \frac{y}{x} \right)^2 \right]}{x^2 \left( \frac{y}{x} \right)} = \frac{1 + \left( \frac{y}{x} \right)^2}{\left( \frac{y}{x} \right)} = \phi \left( \frac{y}{x} \right)$$

Here  $z$  is homogeneous function of degree zero.

By Euler's deduction formula I.

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = n \frac{f(u)}{f'(u)} = \frac{0}{e^u} = 0 \quad \dots(1) \quad \text{Ans.}$$

By Direct Differentiation

$$\begin{aligned} \text{Now, } u &= \log \frac{x^2 + y^2}{xy} \\ \Rightarrow \frac{\partial u}{\partial x} &= \frac{1}{\left( \frac{x^2 + y^2}{xy} \right)} \cdot \frac{\partial}{\partial x} \left( \frac{x^2 + y^2}{xy} \right) = \frac{xy}{x^2 + y^2} \frac{\left( xy \frac{\partial}{\partial x} (x^2 + y^2) - (x^2 + y^2) \frac{\partial}{\partial x} (xy) \right)}{(xy)^2} \\ &= \frac{xy}{x^2 + y^2} \cdot \left[ \frac{xy(2x) - (x^2 + y^2)y}{(xy)^2} \right] \\ &= \frac{1}{xy(x^2 + y^2)} (2x^2y - x^2y - y^3) = \frac{x^2y - y^3}{xy(x^2 + y^2)} \\ &= \frac{x^2 - y^2}{x(x^2 + y^2)} \quad \Rightarrow \quad x \frac{\partial u}{\partial x} = \frac{x^2 - y^2}{x^2 + y^2} \quad \dots(2) \end{aligned}$$

$$\begin{aligned} \text{and } \frac{\partial u}{\partial y} &= \frac{1}{\left( \frac{x^2 + y^2}{xy} \right)} \frac{\partial}{\partial y} \left( \frac{x^2 + y^2}{xy} \right) = \frac{xy}{x^2 + y^2} \frac{\left( xy \frac{\partial}{\partial y} (x^2 + y^2) - (x^2 + y^2) \frac{\partial}{\partial y} (xy) \right)}{(xy)^2} \\ &= \frac{xy}{x^2 + y^2} \left[ \frac{xy(2y) - (x^2 + y^2)x}{(xy)^2} \right] = \frac{1}{xy(x^2 + y^2)} (2xy^2 - x^3 - xy^2) \\ &= \frac{xy^2 - x^3}{xy(x^2 + y^2)} = \frac{y^2 - x^2}{y(x^2 + y^2)} \quad \Rightarrow \quad y \frac{\partial u}{\partial y} = \frac{y^2 - x^2}{x^2 + y^2} \quad \dots(3) \end{aligned}$$

Adding (2) and (3), we get

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = \frac{x^2 - y^2}{x^2 + y^2} + \frac{y^2 - x^2}{x^2 + y^2} = 0 \quad \dots(4)$$

From (1) and (4), we have the same result.

Hence, Euler's Theorem is verified.

**Proved.**

**II. Deduction:** Prove that

$$x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = g(u) [g'(u) - 1] \quad (\text{Nagpur University, Winter 2003})$$

where,

$$g(u) = n \frac{f(u)}{f'(u)}$$

**Proof.** By Euler deduction formula I

$$\begin{aligned} x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} &= n \cdot \frac{f(u)}{f'(u)} && \text{Given } n \frac{f(u)}{f'(u)} = g(u) \\ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} &= g(u) && \dots(1) \end{aligned}$$

Differentiating (1) partially w.r.t. 'x', we have

$$\begin{aligned} \left( x \frac{\partial^2 u}{\partial x^2} + \frac{\partial u}{\partial x} \cdot 1 \right) + y \frac{\partial^2 u}{\partial x \partial y} &= g'(u) \frac{\partial u}{\partial x} \\ \Rightarrow x \frac{\partial^2 u}{\partial x^2} + y \cdot \frac{\partial^2 u}{\partial x \partial y} &= [g'(u) - 1] \frac{\partial u}{\partial x} && \dots(2) \end{aligned}$$

Similarly, on differentiating (1) partially w.r.t. 'y', we have

$$y \frac{\partial^2 u}{\partial y^2} + x \cdot \frac{\partial^2 u}{\partial y \partial x} = [g'(u) - 1] \frac{\partial u}{\partial y} \quad \dots(3)$$

Multiplying (2) by  $x$ , (3) by  $y$  and adding, we get

$$\begin{aligned} x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} &= [g'(u) - 1] \left[ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right] \\ &= [g'(u) - 1] g(u) \\ &= g(u) [g'(u) - 1] && \text{[From (1)]} \end{aligned} \quad \text{Proved.}$$

**Example 37.** If  $u = \log \left( \frac{x^2 + y^2}{\sqrt{x} + \sqrt{y}} \right)$ , find the value of

$$(i) x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \quad (ii) x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} \quad (\text{Nagpur University, Winter 2002})$$

**Solution.** We have,  $z = e^u = \frac{x^2 + y^2}{\sqrt{x} + \sqrt{y}} = x^{\frac{3}{2}} f\left(\frac{y}{x}\right)$

is homogeneous function of degree  $\frac{3}{2}$ .  $[f(u) = e^u]$

**(i) By deduction I, we have**

$$\begin{aligned} x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} &= n \frac{f(u)}{f'(u)} = \frac{3}{2} \frac{e^u}{e^u} = \frac{3}{2} \\ g(u) &= \frac{3}{2}, \quad g'(u) = 0 \end{aligned}$$

**(ii) By deduction II, we have**

$$x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = g(u) [g'(u) - 1] = \frac{3}{2} [0 - 1] = -\frac{3}{2} \quad \text{Ans.}$$

**Example 38.** If  $u = \sin^{-1} \left[ \frac{x+y}{\sqrt{x} + \sqrt{y}} \right]$

$$\text{Prove that } x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = \frac{-\sin u \cos 2u}{4 \cos^3 u}.$$

**Solution.** We have,  $u = \sin^{-1} \frac{x+y}{\sqrt{x} + \sqrt{y}}$

$$\text{Let } z = \sin u = \frac{x+y}{\sqrt{x} + \sqrt{y}} = \frac{x \left[ 1 + \frac{y}{x} \right]}{\sqrt{x} \left[ 1 + \sqrt{\frac{y}{x}} \right]} = x^{1/2} \varphi \left( \frac{y}{x} \right)$$

$$z = f(u) = \sin u$$

$z$  is a homogeneous function of degree  $\frac{1}{2}$ .

By Euler's deduction I

$$\begin{aligned} x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} &= n \frac{f(u)}{f'(u)} \\ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} &= \frac{1}{2} \frac{\sin u}{\cos u} \\ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} &= \frac{1}{2} \tan u \end{aligned}$$

$$\text{Let } g(u) = \frac{1}{2} \tan u, \quad g'(u) = \frac{1}{2} \sec^2 u$$

By Euler's deduction II

$$\begin{aligned} x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} &= g(u) [g'(u) - 1] = \frac{1}{2} \tan u \left( \frac{1}{2} \sec^2 u - 1 \right) \\ &= \frac{1}{4} \frac{\sin u}{\cos u} \left( \frac{1}{\cos^2 u} - 2 \right) = \frac{1}{4} \frac{\sin u}{\cos^3 u} (1 - 2 \cos^2 u) = \frac{-\sin u \cos 2u}{4 \cos^3 u} \quad \text{Proved.} \end{aligned}$$

**Example 39.** If  $u = \tan^{-1} \left( \frac{x^3 + y^3}{\sqrt{x} + \sqrt{y}} \right)$  find the value of

$$(i) \quad x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \quad (ii) \quad x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} \quad (\text{Nagpur University, Winter 2004})$$

**Solution.** We have,  $u = \tan^{-1} \left( \frac{x^3 + y^3}{\sqrt{x} + \sqrt{y}} \right)$

$u$  is not homogeneous function but we see that

$$z = \tan u = \frac{x^3 + y^3}{\sqrt{x} + \sqrt{y}} = \frac{x^3 \left( 1 + \frac{y^3}{x^3} \right)}{\sqrt{x} \left( 1 + \frac{\sqrt{y}}{\sqrt{x}} \right)} = x^{\frac{5}{2}} \phi \left( \frac{y}{x} \right)$$

$$f(u) = \tan u$$

Now,  $z$  is a homogeneous function of  $x$  and  $y$  of degree  $\frac{5}{2}$ .

(i) By deduction I, we have

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = n \frac{f(u)}{f'(u)}$$

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = \frac{5}{2} \frac{\tan u}{\sec^2 u} = \frac{5}{2} \frac{\sin u}{\cos u} \frac{\cos^2 u}{1} = \frac{5}{2} \sin u \cos u = \frac{5}{4} \sin 2u$$

$$g(u) = \frac{5}{4} \sin 2u, \quad g'(u) = \frac{5}{2} \cos 2u$$

(ii) By Euler's Deduction II, we have

$$\begin{aligned} x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} &= g(u)[g'(u) - 1] \\ &= \frac{5}{4} \sin 2u \left[ \frac{5}{2} \cos 2u - 1 \right] = \frac{25}{8} \sin 2u \cos 2u - \frac{5}{4} \sin 2u \\ &= \frac{25}{16} \sin 4u - \frac{5}{4} \sin 2u \end{aligned} \quad \text{Ans.}$$

**Example 40.** Using Euler's theorem show that if  $u = \tan^{-1}(x^2 + 2y^2)$

$$(i) \quad x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = \sin 2u \quad (ii) \quad x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = 2 \sin u \cos 3u$$

Explain whether we can apply Euler's theorem for the function

$$u = f(x, y) = \frac{x^2 + y^2 + 1}{x + 1} \quad (\text{Gujarat, I Semester, Jan. 2009})$$

**Solution.** Euler's Theorem. See Art 1.11 on page 22.

(i) Here, we have

$$u = \tan^{-1}(x^2 + 2y^2)$$

$u$  is not homogeneous function.

Let

$$z = \tan u = x^2 + 2y^2$$

$z$  is a homogeneous function of degree 2.

$$x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = 2z$$

$$x \frac{\partial z}{\partial u} \cdot \frac{\partial u}{\partial x} + y \frac{\partial z}{\partial u} \cdot \frac{\partial u}{\partial y} = 2 \tan u$$

$$\Rightarrow x(\sec^2 u) \cdot \frac{\partial u}{\partial x} + y(\sec^2 u) \cdot \frac{\partial u}{\partial y} = 2 \tan u$$

$$\Rightarrow x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = \frac{2 \tan u}{\sec^2 u}$$

$$\Rightarrow x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 2 \sin u \cos u$$

$$\Rightarrow x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = \sin 2u$$

Proved.

(ii) By Euler's Theorem of second order

$$x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = g(u) [g'(u) - 1]$$

$$\begin{cases} g(u) = \sin 2u \\ g'(u) = 2 \cos 2u \end{cases}$$

$$\begin{aligned}
 &= \sin 2u [2 \cos 2u - 1] = 2 \sin u \cos u [2(2 \cos^2 u - 1) - 1] \\
 &= 2 \sin u \cos u [4 \cos^2 u - 3] \\
 &= 2 \sin u [4 \cos^3 u - 3 \cos u] = 2 \sin u \cos 3u \quad \text{Ans.}
 \end{aligned}$$

Here

$$u = f(x, y) = \frac{x^2 + y^2 + 1}{x + y}$$

But  $u$  is not a homogeneous function because 1 in the numerator is of zero degree and other terms of two degree. So, we cannot apply Euler's theorem. For Euler's Theorem the function should be homogeneous.

**Example 41.** If  $u = \frac{x^3 y^3 z^3}{x^3 + y^3 + z^3} + \log \left( \frac{xy + yz + zx}{x^2 + y^2 + z^2} \right)$  then prove that:

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} = 6 \frac{x^3 y^3 z^3}{x^3 + y^3 + z^3} \quad (\text{M.U. 2009})$$

**Solution.** Here, we have

$$u = \frac{x^3 y^3 z^3}{x^3 + y^3 + z^3} + \log \left( \frac{xy + yz + zx}{x^2 + y^2 + z^2} \right) = v + w$$

where

$$v = \frac{x^3 y^3 z^3}{x^3 + y^3 + z^3} \quad \text{and} \quad w = \log \frac{xy + yz + zx}{x^2 + y^2 + z^2}$$

$v$  is a homogeneous function of degree 6.

$$x \frac{\partial v}{\partial x} + y \frac{\partial v}{\partial y} + z \frac{\partial v}{\partial z} = 6v \quad \dots(1) \quad (\text{By Euler's Theorem})$$

$$w = \log \frac{xy + yz + zx}{x^2 + y^2 + z^2}$$

Let

$$t = e^w = \frac{xy + yz + zx}{x^2 + y^2 + z^2}$$

( $t$  is a homogeneous function of degree zero.)

$$x \frac{\partial w}{\partial x} + y \frac{\partial w}{\partial y} + z \frac{\partial w}{\partial z} = \frac{n f(w)}{f'(w)} \quad (\text{By Euler's Theorem})$$

$$x \frac{\partial w}{\partial x} + y \frac{\partial w}{\partial y} + z \frac{\partial w}{\partial z} = 0 \quad \dots(2)$$

Adding (1) and (2), we get

$$x \left( \frac{\partial v}{\partial x} + \frac{\partial w}{\partial x} \right) + y \left( \frac{\partial v}{\partial y} + \frac{\partial w}{\partial y} \right) + z \left( \frac{\partial v}{\partial z} + \frac{\partial w}{\partial z} \right) = 6v + 0$$

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} = 6 \frac{x^3 y^3 z^3}{x^3 + y^3 + z^3} \quad \text{Proved.}$$

**Example 42.** If  $u = x^2 \tan^{-1} \left( \frac{y}{x} \right) - y^2 \tan^{-1} \left( \frac{x}{y} \right)$ ,  $x > 0, y > 0$  then

evaluate

$$x^2 \frac{\partial^2 u}{\partial x^2} + 2yx \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2}.$$

(A.M.I.E.T.E. Dec 2008)

**Solution.** Here, we have

$$u = x^2 \tan^{-1}\left(\frac{y}{x}\right) - y^2 \tan^{-1}\left(\frac{x}{y}\right)$$

Let  $u = v - w$

$$\text{where, } v = x^2 \tan^{-1}\left(\frac{y}{x}\right) \text{ and } w = y^2 \tan^{-1}\left(\frac{x}{y}\right)$$

Since,  $v$  is a homogeneous function of  $x, y$  of degree 2. Therefore

$$x^2 \frac{\partial^2 v}{\partial x^2} + 2yx \frac{\partial^2 v}{\partial x \partial y} + y^2 \frac{\partial^2 v}{\partial y^2} = 2(2-1)v = 2v \quad \dots(1)$$

since,  $w$  is a homogeneous function of  $x, y$  of degree 2. Therefore

$$x^2 \frac{\partial^2 w}{\partial x^2} + 2yx \frac{\partial^2 w}{\partial x \partial y} + y^2 \frac{\partial^2 w}{\partial y^2} = 2(2-1)w = 2w \quad \dots(2)$$

Subtracting (2) from (1), we get

$$\begin{aligned} x^2 \left( \frac{\partial^2 v}{\partial x^2} - \frac{\partial^2 w}{\partial x^2} \right) + 2yx \left( \frac{\partial^2 v}{\partial x \partial y} - \frac{\partial^2 w}{\partial x \partial y} \right) + y^2 \left( \frac{\partial^2 v}{\partial y^2} - \frac{\partial^2 w}{\partial y^2} \right) &= 2v - 2w = 2(v - w) \\ x^2 \frac{\partial^2 u}{\partial x^2} + 2yx \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} &= 2u \end{aligned} \quad \text{Ans.}$$

**Example 43.** If  $z = x^n f\left(\frac{y}{x}\right) + y^{-n} \phi\left(\frac{x}{y}\right)$  then prove that

$$x^2 \frac{\partial^2 z}{\partial x^2} + 2xy \frac{\partial^2 z}{\partial x \partial y} + y^2 \frac{\partial^2 z}{\partial y^2} + x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = n^2 z. \quad (\text{Nagpur University, Summer 2003})$$

**Solution.** Here, we have  $z = x^n f\left(\frac{y}{x}\right) + y^{-n} \phi\left(\frac{x}{y}\right)$

$$\text{Let } z = u + v \quad \dots(1)$$

$$\text{where, } u = x^n f\left(\frac{y}{x}\right) \text{ and } v = y^{-n} \phi\left(\frac{x}{y}\right)$$

Since  $u$  is a homogeneous function of  $x, y$  of degree  $n$ .

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = n u \quad \dots(2)$$

$$\text{and } x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = n(n-1)u \quad \dots(3)$$

As  $v$  is a homogeneous function of  $x, y$  of degree  $-n$ .

$$x \frac{\partial v}{\partial x} + y \frac{\partial v}{\partial y} = -nv \quad \dots(4)$$

$$\text{and } x^2 \frac{\partial^2 v}{\partial x^2} + 2xy \frac{\partial^2 v}{\partial x \partial y} + y^2 \frac{\partial^2 v}{\partial y^2} = -n(-n-1)v = n(n+1)v \quad \dots(5)$$

On adding (2) and (4), we get

$$\begin{aligned} x \left( \frac{\partial u}{\partial x} + \frac{\partial v}{\partial x} \right) + y \left( \frac{\partial u}{\partial y} + \frac{\partial v}{\partial y} \right) &= nu - nv \\ x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} &= nu - nv \end{aligned} \quad \dots(6) \quad [\text{From (1)}]$$

On adding (3) and (5), we get

$$\begin{aligned} x^2 \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 v}{\partial x^2} \right) + 2xy \left( \frac{\partial^2 u}{\partial x \partial y} + \frac{\partial^2 v}{\partial x \partial y} \right) + y^2 \left( \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 v}{\partial y^2} \right) \\ = n(n-1)u + n(n+1)v \\ x^2 \frac{\partial^2 z}{\partial x^2} + 2xy \frac{\partial^2 z}{\partial x \partial y} + y^2 \frac{\partial^2 z}{\partial y^2} = n(n-1)u + n(n+1)v \end{aligned} \quad \dots(7) \quad [\text{From (1)}]$$

On adding (6) and (7), we have

$$\begin{aligned} x^2 \frac{\partial^2 z}{\partial x^2} + 2xy \frac{\partial^2 z}{\partial x \partial y} + y^2 \frac{\partial^2 z}{\partial y^2} + x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} &= n(n-1)u + n(n+1)v + nu - nv \\ &= nu(n-1+1) + nv(n+1-1) \\ &= n^2u + n^2v = n^2(u+v) = n^2z \end{aligned} \quad \text{Proved.}$$

**Example 44.** If  $f(x, y)$  and  $\phi(x, y)$  are homogeneous functions of  $x, y$  of degree  $P$  and  $q$  respectively and  $u = f(x, y) + \phi(x, y)$ , show that

$$f(x, y) = \frac{1}{P(P-q)} \left[ x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} \right] - \frac{q-1}{P(P-q)} \left[ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right] \quad (\text{A.M.I.E.T.E. Winter 2000})$$

**Solution.** Since  $f$  and  $\phi$  are homogeneous functions of degree  $P$  and  $q$  respectively, we have

$$x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} = Pf \quad \dots(1)$$

$$x \frac{\partial \phi}{\partial x} + y \frac{\partial \phi}{\partial y} = q \cdot \phi \quad \dots(2)$$

On adding (1) and (2), we get

$$x \left[ \frac{\partial f}{\partial x} + \frac{\partial \phi}{\partial x} \right] + y \left[ \frac{\partial f}{\partial y} + \frac{\partial \phi}{\partial y} \right] = Pf + q \phi \quad \dots(3)$$

$$\text{i.e.,} \quad x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = Pf + q \phi \quad \dots(3)$$

$$\text{Also } x^2 \frac{\partial^2 f}{\partial x^2} + 2xy \frac{\partial^2 f}{\partial x \partial y} + y^2 \frac{\partial^2 f}{\partial y^2} = P(P-1)f \quad \dots(4)$$

$$\text{And } x^2 \frac{\partial^2 \phi}{\partial x^2} + 2xy \frac{\partial^2 \phi}{\partial x \partial y} + y^2 \frac{\partial^2 \phi}{\partial y^2} = q(q-1)\phi \quad \dots(5)$$

On adding (4) and (5), we obtain

$$\begin{aligned} x^2 \left( \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 \phi}{\partial x^2} \right) + 2xy \left( \frac{\partial^2 f}{\partial x \partial y} + \frac{\partial^2 \phi}{\partial x \partial y} \right) + y^2 \left( \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 \phi}{\partial y^2} \right) &= P(P-1)f + q(q-1)\phi \\ x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} &= P(P-1)f + q(q-1)\phi \end{aligned} \quad \begin{array}{l} u = f + \phi \\ \frac{\partial u}{\partial x} = \frac{\partial f}{\partial x} + \frac{\partial \phi}{\partial x} \\ \frac{\partial u}{\partial y} = \frac{\partial f}{\partial y} + \frac{\partial \phi}{\partial y} \end{array}$$

Dividing by  $P(P-q)$ , we get

$$\begin{aligned} \Rightarrow \frac{1}{P(P-q)} \left[ x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} \right] \\ = \frac{1}{P(P-q)} [P(P-1)f + q(q-1)\phi] \end{aligned} \quad \begin{array}{l} \therefore u = f + \phi \\ \frac{\partial^2 u}{\partial x^2} = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 \phi}{\partial x^2} \\ \frac{\partial^2 u}{\partial y^2} = \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 \phi}{\partial y^2} \end{array}$$

Subtracting  $\frac{q-1}{P(P-q)} \left( x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right)$  from both sides, we get

$$\begin{aligned} \Rightarrow \quad & \frac{1}{P(P-q)} \left[ x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} \right] - \frac{(q-1)}{P(P-q)} \left[ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right] \\ & = \frac{1}{P(P-q)} [P(P-1) f + q(q-1)\phi] - \frac{q-1}{P(P-q)} \left[ x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right] \\ & = \frac{1}{P(P-q)} [P(P-1) f + q(q-1)\phi - (q-1) [Pf + q\phi]] \quad [\text{From (3)}] \\ & = \frac{1}{P(P-q)} [(P^2 - P - Pq + P)f + (q^2 - q - q^2 + q)\phi] \\ & = \frac{1}{P(P-q)} [(P^2 - Pq)f] = \frac{P(P-q)}{P(P-q)} f = f(x, y) \quad \text{Proved.} \end{aligned}$$

### EXERCISE 1.5

1. If  $u = \sin^{-1} \frac{\sqrt{x} - \sqrt{y}}{\sqrt{x} + \sqrt{y}}$ , show that  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 0$
2. If  $u = \cos^{-1} \left( \frac{x+y}{\sqrt{x} + \sqrt{y}} \right)$ , show that  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + \frac{1}{2} \cot u = 0$  (U.P. I Sem., Dec. 2009)
3. If  $u = \log \frac{x^2 + y^2}{x + y}$ , prove that  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 1$ . (U.P. I Semester, Dec. 2008)
4. If  $x = e^u \tan v$ ,  $y = e^u \sec v$ , find the value of  $\left( x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right) \cdot \left( x \frac{\partial v}{\partial x} + y \frac{\partial v}{\partial y} \right)$ . (A.M.I.E., Summer 2001) Ans. 0

[Hint: Eliminate  $u$  and apply formula I. Again eliminate  $v$  and apply the formula]

5. Given  $F(u) = V(x, y, z)$  where  $V$  is a homogeneous function of  $x, y, z$  of degree  $n$ , prove that

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} = n \frac{F(u)}{F'(u)}$$

6. If  $u = \sin^{-1} \left[ \frac{x^{1/4} + y^{1/4}}{x^{1/6} + y^{1/6}} \right]$ , prove that  $x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = \frac{1}{144} \tan u [\tan^2 u - 11]$ .

7. If  $u = \sec^{-1} \left( \frac{x^3 - y^3}{x + y} \right)$ , show that  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 2 \cot u$ , then evaluate  $x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2}$  (A.M.I.E.T.E., Winter 2001) Ans.  $-2 \cot u (2 \cosec^2 u + 1)$ .

8. Find the value of  $x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2}$  if  $u = \sin^{-1} (x^3 + y^3)^{2/5}$ .

$$\text{Ans. } \frac{6}{5} \tan u \left[ \frac{6}{5} \sec^2 u - 1 \right]$$

9. If  $u = \tan^{-1} \left( \frac{x^3 + y^3}{x - y} \right)$ , prove that

$$(i) \quad x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = \sin 2u \quad (\text{A.M.I.E., Winter 2001})$$

$$(ii) \quad x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = 2 \cos 3u \sin u$$

(M.U. 2009, Nagpur University, Summer 2002)

10. If  $u = \tan^{-1} \frac{\sqrt{x^3 + y^3}}{\sqrt{x} + \sqrt{y}}$ , find the value of  $x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2}$

**Ans.**  $-2 \sin^3 u \cos u$

11. If  $u = f \left( \frac{y}{x} \right) + \sqrt{x^2 + y^2}$ , find the value of  $x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2}$ . **Ans.** 0

12. If  $z = xy/(x + y)$ , find the value of  $x^2 \frac{\partial^2 z}{\partial x^2} + 2xy \frac{\partial^2 z}{\partial x \partial y} + y^2 \frac{\partial^2 z}{\partial y^2}$ . **Ans.** 0

13. If  $u = x \phi \left( \frac{Y}{X} \right) + \psi \left( \frac{Y}{X} \right)$ , prove by Euler theorem on homogeneous function that

$$X^2 \frac{\partial^2 u}{\partial x^2} + 2XY \frac{\partial^2 u}{\partial x \partial y} + Y^2 \frac{\partial^2 u}{\partial y^2} = 0.$$

14. If  $u = \sin^{-1} \left[ \frac{x+2y+3z}{\sqrt{x^2+y^2+z^2}} \right]$ , show that

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} + 3 \tan u = 0.$$

(U.P. I Semester, Winter 2003)

Tick (✓) the correct answer:

15. If  $u = f \left( \frac{x}{y} \right)$  then

$$(a) x \frac{\partial u}{\partial x} - y \frac{\partial u}{\partial y} = 0 \quad (b) \quad x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 0 \quad (c) \quad x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = u \quad (d) \quad x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 1$$

(U.P. I Semester, Jan. 2011, AMIETE, June 2010) **Ans.** (b)

16. If  $z = \sin^{-1} \frac{x^2 + y^2}{x + y}$  then  $x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y}$  is

$$(a) z \quad (b) 2z \quad (c) \tan z \quad (d) \sin z \quad (\text{AMIETE, June 2010}) \quad \text{Ans. (c)}$$

## TOTAL DIFFERENTIATION

---

### 2.1 INTRODUCTION

In partial differentiation of a function of two or more variables, only one variable varies. But in total differentiation, increments are given in all the variables.

### 2.2 TOTAL DIFFERENTIAL CO-EFFICIENT

Let  $z = f(x, y)$  ... (1)

If  $\delta x, \delta y$  be the increments in  $x$  and  $y$  respectively, let  $\delta z$  be the corresponding increment in  $z$ .

Then  $z + \delta z = f(x + \delta x, y + \delta y)$  ... (2)

Subtracting (1) from (2), we have

$$\delta z = f(x + \delta x, y + \delta y) - f(x, y) \quad \dots(3)$$

Adding and subtracting  $f(x, y + \delta y)$  on R.H.S. of (3), we have

$$\delta z = f(x + \delta x, y + \delta y) - f(x, y + \delta y) + f(x, y + \delta y) - f(x, y)$$

$$\delta z = \frac{f(x + \delta x, y + \delta y) - f(x, y + \delta y)}{\delta x} \delta x + \frac{f(x, y + \delta y) - f(x, y)}{\delta y} \delta y$$

On taking limit when  $\delta x \rightarrow 0$  and  $\delta y \rightarrow 0$

$$dz = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy \quad \dots(4) \quad [\text{Remember}]$$

$dz$  is called as the total differential of  $z$ .

**COROLLARY 1.** Differentiation of composite function

If  $z = f(x, y)$

Where  $x = \varphi(t)$ ,  $y = \psi(t)$

Here  $z$  is composite function of  $t$ .

$$\text{Dividing (4) by } dt, \text{ we have } \frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt} \quad \dots(5) \quad [\text{Remember}]$$

Then  $\frac{dz}{dt}$  is called the total differential co-efficient of  $z$ .

**COROLLARY 2.** Let  $z = f(x, y)$

where  $x = \varphi(u, v)$ ,  $y = \psi(u, v)$

Then from (5), we obtain

$$\frac{\partial z}{\partial u} = \frac{\partial f}{\partial x} \cdot \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \cdot \frac{\partial y}{\partial u} \quad \dots(6)$$

$$\text{and} \quad \frac{\partial z}{\partial v} = \frac{\partial f}{\partial x} \cdot \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \cdot \frac{\partial y}{\partial v} \quad \dots(7)$$

**Example 1.** If  $u = x^3 + y^3$  where,  $x = a \cos t$ ,  $y = b \sin t$ , find  $\frac{du}{dt}$  and verify the result.

**Solution.** We have,  $u = x^3 + y^3$

$$x = a \cos t$$

$$y = b \sin t$$

$$\begin{aligned} \frac{du}{dt} &= \frac{\partial u}{\partial x} \frac{dx}{dt} + \frac{\partial u}{\partial y} \frac{dy}{dt} = (3x^2)(-a \sin t) + (3y^2)(b \cos t) \\ &= -3a^3 \cos^2 t \sin t + 3b^3 \sin^2 t \cos t \end{aligned} \quad \dots(1)$$

**Verification.**  $u = x^3 + y^3 = a^3 \cos^3 t + b^3 \sin^3 t$

$$\frac{du}{dt} = -3a^3 \cos^2 t \sin t + 3b^3 \sin^2 t \cos t \quad \dots(2)$$

Results (1) and (2) are the same.

**Verified.**

**Example 2.** Suppose that  $u = f(x, y, z)$  and  $x = g_1(t)$ ,  $y = g_2(t)$ ,  $z = g_3(t)$ .

Then write the chain rule for derivative of  $u$  w.r.t. to  $t$ .

Express  $\partial w / \partial r$  and  $\partial w / \partial s$  in terms of  $r$  and  $s$  if  $w = x + 2y + z^2$

$$x = r/s, \quad y = r^2 + \log(s), \quad z = 2r. \quad (\text{Gujarat, I Semester, Jan 2009})$$

**Solution.**

$$u = f(x, y, z)$$

$$x = g_1(t) \quad y = g_2(t) \quad z = g_3(t)$$

$$\frac{du}{dt} = \frac{\partial u}{\partial x} \frac{\partial g_1}{\partial t} + \frac{\partial u}{\partial y} \frac{\partial g_2}{\partial t} + \frac{\partial u}{\partial z} \frac{\partial g_3}{\partial t}$$

Again

$$w = x + 2y + z^2$$

$$x = \frac{r}{s}, \quad y = r^2 + \log s, \quad z = 2r$$

$$\begin{aligned} \frac{\partial w}{\partial r} &= \frac{\partial w}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial r} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial r} = (1)\left(\frac{1}{s}\right) + (2)(2r) + (2z)(2) \\ &= \frac{1}{s} + 4r + 4z \end{aligned}$$

$$\begin{aligned} \frac{\partial w}{\partial s} &= \frac{\partial w}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial s} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial s} \\ &= (1)\left(-\frac{r}{s^2}\right) + (2)\left(\frac{1}{s}\right) + (2z)(0) = -\frac{r}{s^2} + \frac{2}{s} \end{aligned}$$

**Ans.**

**Example 3.** If  $z = f(x, y)$ ,  $x = e^u + e^{-v}$ ,  $y = e^{-u} - e^v$ . Prove that :

$$\frac{\partial z}{\partial u} - \frac{\partial z}{\partial v} = x \frac{\partial z}{\partial x} - y \frac{\partial z}{\partial y} \quad (\text{M. U. 2009})$$

**Solution.** Here we have

$$x = e^u + e^{-v} \quad \dots(1)$$

$$y = e^{-u} - e^v \quad \dots(2)$$

$$\frac{\partial z}{\partial u} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial u} = \frac{\partial z}{\partial x} (e^u) + \frac{\partial z}{\partial y} (-e^{-u}) \quad \dots(3)$$

$$\frac{\partial z}{\partial v} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial v} = \frac{\partial z}{\partial x} (-e^{-v}) + \frac{\partial z}{\partial y} (-e^v) \quad \dots(4)$$

Subtracting (4) from (3), we get

$$\frac{\partial z}{\partial u} - \frac{\partial z}{\partial v} = \frac{\partial z}{\partial x} e^u - \frac{\partial z}{\partial y} e^{-u} + \frac{\partial z}{\partial x} e^{-v} + \frac{\partial z}{\partial y} e^v$$

$$\begin{aligned}
 &= (e^u + e^{-v}) \frac{\partial z}{\partial x} - (e^{-u} - e^v) \frac{\partial z}{\partial y} \\
 &= x \frac{\partial z}{\partial x} - y \frac{\partial z}{\partial y}
 \end{aligned}$$

**Proved.**

**Example 4.** If  $z = f(x, y)$  where  $x = e^u \cos v$  and  $y = e^u \sin v$ , show that

$$(i) \quad y \frac{\partial z}{\partial u} + x \frac{\partial z}{\partial v} = e^{2u} \frac{\partial z}{\partial y}. \quad (\text{M.U. 2009; Nagpur University 2002})$$

$$(ii) \quad \left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 = e^{-2u} \left[ \left( \frac{\partial z}{\partial u} \right)^2 + \left( \frac{\partial z}{\partial v} \right)^2 \right] \quad (\text{M.U. 2009})$$

**Solution.** (i) We have,

$$\begin{aligned}
 x &= e^u \cos v, \quad y = e^u \sin v \\
 \frac{\partial z}{\partial u} &= \frac{\partial z}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial u} \\
 &= \frac{\partial z}{\partial x} e^u \cos v + \frac{\partial z}{\partial y} e^u \sin v = x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} \\
 y \frac{\partial z}{\partial u} &= x y \frac{\partial z}{\partial x} + y^2 \frac{\partial z}{\partial y} \quad \dots(1)
 \end{aligned}$$

$$\begin{aligned}
 \text{And} \quad \frac{\partial z}{\partial v} &= \frac{\partial z}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial v} = \frac{\partial z}{\partial x} (-e^u \sin v) + \frac{\partial z}{\partial y} (e^u \cos v) = -y \frac{\partial z}{\partial x} + x \frac{\partial z}{\partial y} \\
 x \frac{\partial z}{\partial v} &= -x y \frac{\partial z}{\partial x} + x^2 \frac{\partial z}{\partial y} \quad \dots(2)
 \end{aligned}$$

On adding (1) and (2), we get

$$\begin{aligned}
 y \frac{\partial z}{\partial u} + x \frac{\partial z}{\partial v} &= (x^2 + y^2) \frac{\partial z}{\partial y} = (e^{2u} \cos^2 v + e^{2u} \sin^2 v) \frac{\partial z}{\partial y} \\
 &= e^{2u} (\cos^2 v + \sin^2 v) \frac{\partial z}{\partial y} = e^{2u} \frac{\partial z}{\partial y} \quad \text{Proved.}
 \end{aligned}$$

$$\begin{aligned}
 (ii) \quad \frac{\partial z}{\partial u} &= \frac{\partial z}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial u} \\
 &= \frac{\partial z}{\partial x} (e^u \cos v) + \frac{\partial z}{\partial y} e^u \sin v \\
 e^{-u} \frac{\partial z}{\partial u} &= \frac{\partial z}{\partial x} \cos v + \frac{\partial z}{\partial y} \sin v
 \end{aligned}
 \qquad \left| \begin{array}{l} x = e^u \cos v \\ \Rightarrow \frac{\partial x}{\partial u} = e^u \cos v \text{ and } \frac{\partial x}{\partial v} = -e^u \sin v \\ y = e^u \sin v \\ \Rightarrow \frac{\partial y}{\partial u} = e^u \sin v \text{ and } \frac{\partial y}{\partial v} = e^u \cos v \end{array} \right.$$

On squaring we get

$$e^{-2u} \left( \frac{\partial z}{\partial u} \right)^2 = \left( \frac{\partial z}{\partial x} \right)^2 \cos^2 v + \left( \frac{\partial z}{\partial y} \right)^2 \sin^2 v + 2 \left( \frac{\partial z}{\partial x} \right) \left( \frac{\partial z}{\partial y} \right) \sin v \cos v \quad \dots(3)$$

$$\text{Again} \quad \frac{\partial z}{\partial v} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial v}$$

$$\begin{aligned}
 &= \frac{\partial z}{\partial x} (-e^u \sin v) + \frac{\partial z}{\partial y} (e^u \cos v) \\
 e^{-u} \left( \frac{\partial z}{\partial v} \right) &= -\frac{\partial z}{\partial x} \sin v + \frac{\partial z}{\partial y} \cos v
 \end{aligned}$$

On squaring, we get

$$e^{-2u} \left( \frac{\partial z}{\partial v} \right)^2 = \left( \frac{\partial z}{\partial x} \right)^2 \sin^2 v + \left( \frac{\partial z}{\partial y} \right)^2 \cos^2 v - 2 \left( \frac{\partial z}{\partial x} \right) \left( \frac{\partial z}{\partial y} \right) \sin v \cos v \dots (4)$$

On adding (3) and (4), we get

$$\begin{aligned}
 e^{-2u} \left[ \left( \frac{\partial z}{\partial u} \right)^2 + \left( \frac{\partial z}{\partial v} \right)^2 \right] &= \left( \frac{\partial z}{\partial x} \right)^2 (\sin^2 v + \cos^2 v) + \left( \frac{\partial z}{\partial y} \right)^2 (\sin^2 v + \cos^2 v) \\
 &= \left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2
 \end{aligned}$$

**Proved.**

**Example 5.** If  $w = f(x, y)$ ,  $x = r \cos \theta$ ,  $y = r \sin \theta$ , show that

$$\left( \frac{\partial w}{\partial r} \right)^2 + \frac{1}{r^2} \left( \frac{\partial w}{\partial \theta} \right)^2 = \left( \frac{\partial f}{\partial x} \right)^2 + \left( \frac{\partial f}{\partial y} \right)^2$$

**Solution.**

$$\begin{array}{c|c}
 x = r \cos \theta, & y = r \sin \theta \\
 \frac{\partial x}{\partial r} = \cos \theta & \frac{\partial y}{\partial r} = \sin \theta \\
 \frac{\partial x}{\partial \theta} = -r \sin \theta & \frac{\partial y}{\partial \theta} = r \cos \theta
 \end{array}$$

Now,

$$\frac{\partial w}{\partial r} = \frac{\partial f}{\partial x} \cdot \frac{\partial x}{\partial r} + \frac{\partial f}{\partial y} \cdot \frac{\partial y}{\partial r}$$

$$\frac{\partial w}{\partial r} = \frac{\partial f}{\partial x} \cdot (\cos \theta) + \frac{\partial f}{\partial y} \cdot (\sin \theta) \quad \dots (1)$$

$$\frac{\partial w}{\partial \theta} = \frac{\partial f}{\partial x} \cdot \frac{\partial x}{\partial \theta} + \frac{\partial f}{\partial y} \cdot \frac{\partial y}{\partial \theta} = \frac{\partial f}{\partial x} \cdot (-r \sin \theta) + \frac{\partial f}{\partial y} \cdot (r \cos \theta)$$

$$\Rightarrow \frac{1}{r} \frac{\partial w}{\partial \theta} = -\frac{\partial f}{\partial x} \sin \theta + \frac{\partial f}{\partial y} \cos \theta \quad \dots (2)$$

Squaring (1) and (2) and adding, we obtain

$$\left( \frac{\partial w}{\partial r} \right)^2 + \frac{1}{r^2} \left( \frac{\partial w}{\partial \theta} \right)^2 = \left( \frac{\partial f}{\partial x} \right)^2 + \left( \frac{\partial f}{\partial y} \right)^2$$

**Proved.**

**Example 6.** If  $u = u(y - z, z - x, x - y)$ , prove that

$$\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} = 0$$

(Nagpur University, Winter 2002, U.P., I Sem., Winter 2002, A.M.I.E winter 2001)

**Solution.** Let  $r = y - z$ ,  $s = z - x$ ,  $t = x - y$   
so that  $u = u(r, s, t)$

$$\frac{\partial u}{\partial x} = \frac{\partial u}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial x} + \frac{\partial u}{\partial t} \frac{\partial t}{\partial x}$$

$$= \frac{\partial u}{\partial r}(0) + \frac{\partial u}{\partial s}(-1) + \frac{\partial u}{\partial t}(1) = -\frac{\partial u}{\partial s} + \frac{\partial u}{\partial t} \quad \dots(1)$$

$$\begin{aligned} \frac{\partial u}{\partial y} &= \frac{\partial u}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial y} + \frac{\partial u}{\partial t} \frac{\partial t}{\partial y} \\ &= \frac{\partial u}{\partial r}(1) + \frac{\partial u}{\partial s}(0) + \frac{\partial u}{\partial t}(-1) = \frac{\partial u}{\partial r} - \frac{\partial u}{\partial t} \end{aligned} \quad \dots(2)$$

$$\begin{aligned} \frac{\partial u}{\partial z} &= \frac{\partial u}{\partial r} \frac{\partial r}{\partial z} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial z} + \frac{\partial u}{\partial t} \frac{\partial t}{\partial z} = \frac{\partial u}{\partial r}(-1) + \frac{\partial u}{\partial s}(1) + \frac{\partial u}{\partial t}(0) = -\frac{\partial u}{\partial r} + \frac{\partial u}{\partial s} \end{aligned} \quad \dots(3)$$

Adding (1), (2) and (3), we get

$$\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} = 0 \quad \text{Proved.}$$

**Example 7.** If  $u = f(e^{y-z}, e^{z-x}, e^{x-y})$ , then prove that

$$\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} = 0 \quad (\text{M.U. 2008, 2001})$$

**Solution.** We have,

$$\text{Let } X = e^{y-z}, Y = e^{z-x}, Z = e^{x-y} \quad u = f(X, Y, Z) \quad \dots(1)$$

Differentiating partially (1), w.r.t. 'x', we get

$$\begin{aligned} \Rightarrow \quad \frac{\partial u}{\partial x} &= \frac{\partial u}{\partial X} \cdot \frac{\partial X}{\partial x} + \frac{\partial u}{\partial Y} \cdot \frac{\partial Y}{\partial x} + \frac{\partial u}{\partial Z} \cdot \frac{\partial Z}{\partial x} = \frac{\partial u}{\partial X}(0) + \frac{\partial u}{\partial Y} \cdot e^{z-x}(-1) + \frac{\partial u}{\partial Z} \cdot e^{x-y} \\ &= -\frac{\partial u}{\partial Y} e^{z-x} + \frac{\partial u}{\partial Z} e^{x-y} \end{aligned} \quad \dots(2)$$

Differentiating (1) partially w.r.t. 'y', we get

$$\begin{aligned} \frac{\partial u}{\partial y} &= \frac{\partial u}{\partial X} \cdot \frac{\partial X}{\partial y} + \frac{\partial u}{\partial Y} \cdot \frac{\partial Y}{\partial y} + \frac{\partial u}{\partial Z} \cdot \frac{\partial Z}{\partial y} = \frac{\partial u}{\partial X} e^{y-z} + \frac{\partial u}{\partial Y}(0) + \frac{\partial u}{\partial Z} e^{x-y}(-1) \\ &= \frac{\partial u}{\partial X} e^{y-z} - \frac{\partial u}{\partial Z} e^{x-y} \end{aligned} \quad \dots(3)$$

Differentiating (1) partially w.r.t. 'z', we get

$$\begin{aligned} \frac{\partial u}{\partial z} &= \frac{\partial u}{\partial X} \cdot \frac{\partial X}{\partial z} + \frac{\partial u}{\partial Y} \cdot \frac{\partial Y}{\partial z} + \frac{\partial u}{\partial Z} \cdot \frac{\partial Z}{\partial z} = \frac{\partial u}{\partial X} e^{y-z}(-1) + \frac{\partial u}{\partial Y} e^{z-x}(1) + \frac{\partial u}{\partial Z}(0) \\ &= -\frac{\partial u}{\partial X} e^{y-z} + \frac{\partial u}{\partial Y} e^{z-x} \end{aligned} \quad \dots(4)$$

Adding (2), (3) and (4), we get

$$\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} = 0 \quad \text{Proved.}$$

**Example 8.** If  $u = u\left(\frac{y-x}{xy}, \frac{z-x}{xz}\right)$ , show that  $x^2 \frac{\partial u}{\partial x} + y^2 \frac{\partial u}{\partial y} + z^2 \frac{\partial u}{\partial z} = 0$

(Nagpur University, Summer 2000, U.P.I.Sem., Dec. 2004)

**Solution.**  $u = u \left( \frac{y-x}{xy}, \frac{z-x}{zx} \right) = u(r, s)$

where  $r = \frac{y-x}{xy}$ , and  $s = \frac{z-x}{zx}$

$$r = \frac{1}{x} - \frac{1}{y} \quad \text{and} \quad s = \frac{1}{x} - \frac{1}{z}$$

$$\frac{\partial r}{\partial x} = -\frac{1}{x^2} \quad \text{and} \quad \frac{\partial s}{\partial x} = -\frac{1}{x^2}$$

$$\frac{\partial r}{\partial y} = \frac{1}{y^2} \quad \text{and} \quad \frac{\partial s}{\partial y} = 0$$

$$\frac{\partial r}{\partial z} = 0 \quad \text{and} \quad \frac{\partial s}{\partial z} = \frac{1}{z^2}$$

We know that,

$$\frac{\partial u}{\partial x} = \frac{\partial u}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial x} = \frac{\partial u}{\partial r} \left( -\frac{1}{x^2} \right) + \frac{\partial u}{\partial s} \left( -\frac{1}{x^2} \right) = -\frac{1}{x^2} \frac{\partial u}{\partial r} - \frac{1}{x^2} \frac{\partial u}{\partial s}$$

$$\Rightarrow x^2 \frac{\partial u}{\partial x} = -\frac{\partial u}{\partial r} - \frac{\partial u}{\partial s} \quad \dots(1)$$

$$\frac{\partial u}{\partial y} = \frac{\partial u}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial y} = \frac{\partial u}{\partial r} \frac{1}{y^2} + \frac{\partial u}{\partial s} \times 0 = \frac{1}{y^2} \frac{\partial u}{\partial r}$$

$$\Rightarrow y^2 \frac{\partial u}{\partial y} = \frac{\partial u}{\partial r} \quad \dots(2)$$

$$\frac{\partial u}{\partial z} = \frac{\partial u}{\partial r} \frac{\partial r}{\partial z} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial z} = \frac{\partial u}{\partial r} \times 0 + \frac{\partial u}{\partial s} \times \frac{1}{z^2} = \frac{1}{z^2} \frac{\partial u}{\partial s}$$

$$\Rightarrow z^2 \frac{\partial u}{\partial z} = \frac{\partial u}{\partial s} \quad \dots(3)$$

On adding (1), (2) and (3), we get  $x^2 \frac{\partial u}{\partial x} + y^2 \frac{\partial u}{\partial y} + z^2 \frac{\partial u}{\partial z} = 0$  **Proved.**

**Example 9.** If  $u = f(x^2 + 2yz, y^2 + 2xz)$  then find the value of:

$$(y^2 - xz) \frac{\partial u}{\partial x} + (x^2 - yz) \frac{\partial u}{\partial y} + (z^2 - xy) \frac{\partial u}{\partial z}$$

(Nagpur University, Summer 2005, Winter 2001)

**Solution.** We have,  $u = f(x^2 + 2yz, y^2 + 2xz) = f(v, w)$

Where,  $v = x^2 + 2yz, w = y^2 + 2xz$

$$\frac{\partial u}{\partial x} = \frac{\partial u}{\partial v} \frac{\partial v}{\partial x} + \frac{\partial u}{\partial w} \frac{\partial w}{\partial x} = 2x \frac{\partial u}{\partial v} + 2z \frac{\partial u}{\partial w} \quad \dots(1)$$

$$\frac{\partial u}{\partial y} = \frac{\partial u}{\partial v} \frac{\partial v}{\partial y} + \frac{\partial u}{\partial w} \frac{\partial w}{\partial y} = 2z \frac{\partial u}{\partial v} + 2y \frac{\partial u}{\partial w} \quad \dots(2)$$

$$\frac{\partial u}{\partial z} = \frac{\partial u}{\partial v} \frac{\partial v}{\partial z} + \frac{\partial u}{\partial w} \frac{\partial w}{\partial z} = 2y \frac{\partial u}{\partial v} + 2x \frac{\partial u}{\partial w} \quad \dots(3)$$

Now,  $(y^2 - xz) \frac{\partial u}{\partial x} + (x^2 - yz) \frac{\partial u}{\partial y} + (z^2 - xy) \frac{\partial u}{\partial z}$

$$= (y^2 - xz) 2 \left( x \frac{\partial u}{\partial v} + z \frac{\partial u}{\partial w} \right) + (x^2 - yz) 2 \left( z \frac{\partial u}{\partial v} + y \frac{\partial u}{\partial w} \right) + (z^2 - xy) 2 \left( y \frac{\partial u}{\partial v} + x \frac{\partial u}{\partial w} \right)$$

$$\begin{aligned} \frac{\partial v}{\partial x} &= 2x \\ \frac{\partial v}{\partial y} &= 2z \\ \frac{\partial v}{\partial z} &= 2y \\ \frac{\partial w}{\partial x} &= 2z \\ \frac{\partial w}{\partial y} &= 2y \\ \frac{\partial w}{\partial z} &= 2x \end{aligned}$$

$$= 2(xy^2 - zx^2 + x^2z - yz^2 + yz^2 - xy^2) \frac{\partial u}{\partial v} + 2(y^2z - z^2x + x^2y - y^2z + z^2x - x^2y) \frac{\partial u}{\partial w}$$

$$= 0 \quad \text{Ans.}$$

**Example 10.** If  $\varphi(cx - az, cy - bz) = 0$  show that  $ap + bq = c$  :

$$\text{where } p \equiv \frac{\partial z}{\partial x} \text{ and } q \equiv \frac{\partial z}{\partial y}$$

**Solution.** We have,

$$\varphi(cx - az, cy - bz) = 0$$

$$\varphi(r, s) = 0$$

where

$$\begin{aligned} r &= cx - az, & s &= cy - bz \\ \frac{\partial r}{\partial x} &= c - a \frac{\partial z}{\partial x}, & \frac{\partial s}{\partial x} &= -b \frac{\partial z}{\partial x}, \\ \frac{\partial r}{\partial y} &= -a \frac{\partial z}{\partial y}, & \frac{\partial s}{\partial y} &= c - b \frac{\partial z}{\partial y} \end{aligned}$$

We know that,

$$\begin{aligned} \frac{\partial \varphi}{\partial x} &= \frac{\partial \varphi}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial \varphi}{\partial s} \frac{\partial s}{\partial x} \\ 0 &= \frac{\partial \varphi}{\partial r} \left( c - a \frac{\partial z}{\partial x} \right) + \frac{\partial \varphi}{\partial s} \left( -b \frac{\partial z}{\partial x} \right) \\ \Rightarrow 0 &= c \frac{\partial \varphi}{\partial r} + \frac{\partial z}{\partial x} \left( -a \frac{\partial \varphi}{\partial r} - b \frac{\partial \varphi}{\partial s} \right) \\ c \frac{\partial \varphi}{\partial r} &= \frac{\partial z}{\partial x} \left( a \frac{\partial \varphi}{\partial r} + b \frac{\partial \varphi}{\partial s} \right) \end{aligned}$$

$$\Rightarrow a \frac{\partial z}{\partial x} = \frac{a c \frac{\partial \varphi}{\partial r}}{a \frac{\partial \varphi}{\partial r} + b \frac{\partial \varphi}{\partial s}} \quad \dots(1)$$

$$\text{Again} \quad \frac{\partial \varphi}{\partial y} = \frac{\partial \varphi}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial \varphi}{\partial s} \frac{\partial s}{\partial y}$$

$$\begin{aligned} 0 &= \frac{\partial \varphi}{\partial r} \left( -a \frac{\partial z}{\partial y} \right) + \frac{\partial \varphi}{\partial s} \left( c - b \frac{\partial z}{\partial y} \right) \\ 0 &= c \frac{\partial \varphi}{\partial s} - \frac{\partial z}{\partial y} \left( a \frac{\partial \varphi}{\partial r} + b \frac{\partial \varphi}{\partial s} \right) \end{aligned}$$

$$\Rightarrow c \frac{\partial \varphi}{\partial s} = \frac{\partial z}{\partial y} \left( a \frac{\partial \varphi}{\partial r} + b \frac{\partial \varphi}{\partial s} \right)$$

$$\Rightarrow b \frac{\partial z}{\partial y} = \frac{bc \frac{\partial \varphi}{\partial s}}{a \frac{\partial \varphi}{\partial r} + b \frac{\partial \varphi}{\partial s}} \quad \dots(2)$$

Adding (1) and (2), we get

$$a \frac{\partial z}{\partial x} + b \frac{\partial z}{\partial y} = \frac{ac \frac{\partial \varphi}{\partial r} + bc \frac{\partial \varphi}{\partial s}}{a \frac{\partial \varphi}{\partial r} + b \frac{\partial \varphi}{\partial s}} \Rightarrow a \frac{\partial z}{\partial x} + b \frac{\partial z}{\partial y} = c$$

**Proved.**

**Example 11.** Transform the equation  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$  into polar co-ordinates.

**Solution.** We have,

$$x = r \cos \theta, y = r \sin \theta$$

$$\begin{aligned}
 r^2 &= x^2 + y^2, \quad \theta = \tan^{-1} \frac{y}{x} \\
 \frac{\partial u}{\partial x} &= \frac{\partial u}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial u}{\partial \theta} \frac{\partial \theta}{\partial x} = \frac{\partial u}{\partial r} \frac{x}{r} + \frac{\partial u}{\partial \theta} \frac{-y}{x^2 + y^2} = \frac{\partial u}{\partial r} \cos \theta - \frac{\partial u}{\partial \theta} \frac{\sin \theta}{r} \\
 \frac{\partial^2 u}{\partial x^2} &= \frac{\partial}{\partial x} \left( \frac{\partial u}{\partial x} \right) = \left( \cos \theta \frac{\partial}{\partial r} - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \right) \left( \cos \theta \frac{\partial u}{\partial r} - \frac{\sin \theta}{r} \frac{\partial u}{\partial \theta} \right) \\
 &= \cos \theta \frac{\partial}{\partial r} \left( \cos \theta \frac{\partial u}{\partial r} - \frac{\sin \theta}{r} \frac{\partial u}{\partial \theta} \right) - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \left( \cos \theta \frac{\partial u}{\partial r} - \frac{\sin \theta}{r} \frac{\partial u}{\partial \theta} \right) \\
 &= \cos \theta \left( \cos \theta \frac{\partial^2 u}{\partial r^2} + \frac{\sin \theta}{r^2} \frac{\partial u}{\partial \theta} - \frac{\sin \theta}{r} \frac{\partial^2 u}{\partial r \partial \theta} \right) \\
 &\quad - \frac{\sin \theta}{r} \left( -\sin \theta \frac{\partial u}{\partial r} + \cos \theta \frac{\partial^2 u}{\partial \theta \partial r} - \frac{\cos \theta}{r} \frac{\partial u}{\partial \theta} - \frac{\sin \theta}{r} \frac{\partial^2 u}{\partial \theta^2} \right) \\
 &= \cos^2 \theta \frac{\partial^2 u}{\partial r^2} + \frac{\sin \theta \cos \theta}{r^2} \frac{\partial u}{\partial \theta} - \frac{\sin \theta \cos \theta}{r} \frac{\partial^2 u}{\partial r \partial \theta} \\
 &\quad + \frac{\sin^2 \theta}{r} \frac{\partial u}{\partial r} - \frac{\sin \theta \cos \theta}{r} \frac{\partial^2 u}{\partial \theta \partial r} + \frac{\sin \theta \cos \theta}{r^2} \frac{\partial u}{\partial \theta} + \frac{\sin^2 \theta}{r^2} \frac{\partial^2 u}{\partial \theta^2} \\
 &= \cos^2 \theta \frac{\partial^2 u}{\partial r^2} + \frac{2 \sin \theta \cos \theta}{r^2} \frac{\partial u}{\partial \theta} - \frac{2 \sin \theta \cos \theta}{r} \frac{\partial^2 u}{\partial r \partial \theta} + \frac{\sin^2 \theta}{r} \frac{\partial u}{\partial r} + \frac{\sin^2 \theta}{r^2} \frac{\partial^2 u}{\partial \theta^2} \dots(1) \\
 \frac{\partial u}{\partial y} &= \frac{\partial u}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial u}{\partial \theta} \frac{\partial \theta}{\partial y} = \frac{\partial u}{\partial r} \frac{y}{r} + \frac{\partial u}{\partial \theta} \frac{x}{x^2 + y^2} = \frac{\partial u}{\partial r} \sin \theta + \frac{\partial u}{\partial \theta} \frac{\cos \theta}{r} \\
 \frac{\partial^2 u}{\partial y^2} &= \frac{\partial}{\partial y} \left( \frac{\partial u}{\partial y} \right) = \left( \sin \theta \frac{\partial}{\partial r} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \right) \left( \sin \theta \frac{\partial u}{\partial r} + \frac{\cos \theta}{r} \frac{\partial u}{\partial \theta} \right) \\
 &= \sin \theta \frac{\partial}{\partial r} \left( \sin \theta \frac{\partial u}{\partial r} + \frac{\cos \theta}{r} \frac{\partial u}{\partial \theta} \right) + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \left( \sin \theta \frac{\partial u}{\partial r} + \frac{\cos \theta}{r} \frac{\partial u}{\partial \theta} \right) \\
 &= \sin \theta \left[ \sin \theta \frac{\partial^2 u}{\partial r^2} - \frac{\cos \theta}{r^2} \frac{\partial u}{\partial \theta} + \frac{\cos \theta}{r} \frac{\partial^2 u}{\partial r \partial \theta} \right] \\
 &\quad + \frac{\cos \theta}{r} \left[ \cos \theta \frac{\partial u}{\partial r} + \sin \theta \frac{\partial^2 u}{\partial \theta \partial r} - \frac{\sin \theta}{r} \frac{\partial u}{\partial \theta} + \frac{\cos \theta}{r} \frac{\partial^2 u}{\partial \theta^2} \right] \\
 &= \sin^2 \theta \frac{\partial^2 u}{\partial r^2} - \frac{\sin \theta \cos \theta}{r^2} \frac{\partial u}{\partial \theta} + \frac{\sin \theta \cos \theta}{r} \frac{\partial^2 u}{\partial r \partial \theta} \\
 &\quad + \frac{\cos^2 \theta}{r} \frac{\partial u}{\partial r} + \frac{\sin \theta \cos \theta}{r} \frac{\partial^2 u}{\partial \theta \partial r} - \frac{\sin \theta \cos \theta}{r^2} \frac{\partial u}{\partial \theta} + \frac{\cos^2 \theta}{r^2} \frac{\partial^2 u}{\partial \theta^2} \\
 &= \sin^2 \theta \frac{\partial^2 u}{\partial r^2} - \frac{2 \sin \theta \cos \theta}{r^2} \frac{\partial u}{\partial \theta} + \frac{2 \sin \theta \cos \theta}{r} \frac{\partial^2 u}{\partial r \partial \theta} \\
 &\quad + \frac{\cos^2 \theta}{r} \frac{\partial u}{\partial r} + \frac{\cos^2 \theta}{r^2} \frac{\partial^2 u}{\partial \theta^2} \dots(2)
 \end{aligned}$$

Adding (1) and (2), we get

$$\begin{aligned}\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} &= (\sin^2 \theta + \cos^2 \theta) \frac{\partial^2 u}{\partial r^2} + (\sin^2 \theta + \cos^2 \theta) \frac{1}{r} \frac{\partial u}{\partial r} + (\sin^2 \theta + \cos^2 \theta) \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} \\ &= \frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2}\end{aligned}\quad \text{Ans.}$$

**Example 12.** If  $x = r \cos \theta$ ,  $y = r \sin \theta$ , prove that

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + y^2 \frac{\partial^2 u}{\partial x^2} - 2xy \frac{\partial^2 u}{\partial x \partial y} + x^2 \frac{\partial^2 u}{\partial y^2} = \frac{r \partial u}{\partial r} + \frac{\partial^2 u}{\partial \theta^2}$$

(Nagpur University, Summer 2005, Winter 2001)

**Solution.**

$$\begin{aligned}\frac{\partial u}{\partial r} &= \frac{\partial u}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial r} \\ \Rightarrow \frac{\partial u}{\partial r} &= \cos \theta \frac{\partial u}{\partial x} + \sin \theta \frac{\partial u}{\partial y} \quad \dots(1) \quad \left[ \begin{array}{l|l} x = r \cos \theta & y = r \sin \theta \\ \frac{\partial x}{\partial r} = \cos \theta & \frac{\partial y}{\partial r} = \sin \theta \\ \frac{\partial x}{\partial \theta} = -r \sin \theta & \frac{\partial y}{\partial \theta} = r \cos \theta \end{array} \right] \\ \text{and } \frac{\partial u}{\partial \theta} &= \frac{\partial u}{\partial x} \frac{\partial x}{\partial \theta} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial \theta} \\ &= -r \sin \theta \frac{\partial u}{\partial x} + r \cos \theta \frac{\partial u}{\partial y} \\ \Rightarrow \frac{\partial}{\partial \theta} &= -r \sin \theta \frac{\partial}{\partial x} + r \cos \theta \frac{\partial}{\partial y} \therefore \frac{\partial^2 u}{\partial \theta^2} = \frac{\partial}{\partial \theta} \left( \frac{\partial u}{\partial \theta} \right) \\ \frac{\partial^2 u}{\partial \theta^2} &= \left[ -r \sin \theta \frac{\partial}{\partial x} + r \cos \theta \frac{\partial}{\partial y} \right] \left[ -r \sin \theta \frac{\partial u}{\partial x} + r \cos \theta \frac{\partial u}{\partial y} \right] \\ &= -r \sin \theta \frac{\partial}{\partial x} \left[ -r \sin \theta \frac{\partial u}{\partial x} + r \cos \theta \frac{\partial u}{\partial y} \right] \\ &\quad + r \cos \theta \frac{\partial}{\partial y} \left[ -r \sin \theta \frac{\partial u}{\partial x} + r \cos \theta \frac{\partial u}{\partial y} \right] \\ &= r^2 \sin^2 \theta \frac{\partial^2 u}{\partial x^2} - r^2 \sin \theta \cos \theta \frac{\partial^2 u}{\partial x \partial y} \\ &\quad - r^2 \sin \theta \cos \theta \frac{\partial^2 u}{\partial x \partial y} + r^2 \cos^2 \theta \frac{\partial^2 u}{\partial y^2} \\ &= r^2 \sin^2 \theta \frac{\partial^2 u}{\partial x^2} - 2r^2 \sin \theta \cos \theta \frac{\partial^2 u}{\partial x \partial y} + r^2 \cos^2 \theta \frac{\partial^2 u}{\partial y^2} \quad \dots(2)\end{aligned}$$

Now, using (1) and (2)

$$\begin{aligned}r \frac{\partial u}{\partial r} + \frac{\partial^2 u}{\partial \theta^2} &= r \left[ \cos \theta \frac{\partial u}{\partial x} + \sin \theta \frac{\partial u}{\partial y} \right] + r^2 \sin^2 \theta \frac{\partial^2 u}{\partial x^2} \\ &\quad - 2r^2 \sin \theta \cos \theta \frac{\partial^2 u}{\partial x \partial y} + r^2 \cos^2 \theta \frac{\partial^2 u}{\partial y^2} \\ &= r \cos \theta \frac{\partial u}{\partial x} + r \sin \theta \frac{\partial u}{\partial y} + r^2 \sin^2 \theta \frac{\partial^2 u}{\partial x^2} \\ &\quad - 2r^2 \sin \theta \cos \theta \frac{\partial^2 u}{\partial x \partial y} + r^2 \cos^2 \theta \frac{\partial^2 u}{\partial y^2} \\ &= x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + y^2 \frac{\partial^2 u}{\partial x^2} - 2xy \frac{\partial^2 u}{\partial x \partial y} + x^2 \frac{\partial^2 u}{\partial y^2}\end{aligned}\quad \text{Proved.}$$

**Example 13.** If  $u = f(x, y)$  where  $x = e^r \cos \theta$  and  $y = e^r \sin \theta$ , then show that

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = e^{-2r} \left[ \frac{\partial^2 u}{\partial r^2} + \frac{\partial^2 u}{\partial \theta^2} \right]$$

(Nagpur University, Summer 2008)

**Solution.** Here, we have

$$x = e^r \cos \theta, \quad \frac{\partial x}{\partial r} = e^r \cos \theta = x, \quad \frac{\partial x}{\partial \theta} = -e^r \sin \theta = -y$$

$$y = e^r \sin \theta, \quad \frac{\partial y}{\partial r} = e^r \sin \theta = y, \quad \frac{\partial y}{\partial \theta} = e^r \cos \theta = x$$

$$\frac{\partial u}{\partial r} = \frac{\partial u}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial r} = \frac{\partial u}{\partial x} x + \frac{\partial u}{\partial y} y \Rightarrow \frac{\partial}{\partial r} = x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y}$$

$$\begin{aligned} \frac{\partial^2 u}{\partial r^2} &= \frac{\partial}{\partial r} \left( \frac{\partial u}{\partial r} \right) = \left( x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} \right) \left( x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right) \\ &= x \frac{\partial}{\partial x} \left( x \frac{\partial u}{\partial x} \right) + x \frac{\partial}{\partial x} \left( y \frac{\partial u}{\partial y} \right) + y \frac{\partial}{\partial y} \left( x \frac{\partial u}{\partial x} \right) + y \frac{\partial}{\partial y} \left( y \frac{\partial u}{\partial y} \right) \\ &= x \left( x \frac{\partial^2 u}{\partial x^2} + \frac{\partial u}{\partial x} \right) + x y \frac{\partial^2 u}{\partial y \partial x} + y x \frac{\partial^2 u}{\partial y \partial x} + y \left( y \frac{\partial^2 u}{\partial y^2} + \frac{\partial u}{\partial y} \right) \\ &= x^2 \frac{\partial^2 u}{\partial x^2} + x \frac{\partial u}{\partial x} + 2xy \frac{\partial^2 u}{\partial y \partial x} + y^2 \frac{\partial^2 u}{\partial y^2} + y \frac{\partial u}{\partial y} \end{aligned} \quad \dots(1)$$

$$\frac{\partial u}{\partial \theta} = \frac{\partial u}{\partial x} \frac{\partial x}{\partial \theta} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial \theta} = \frac{\partial u}{\partial x} (-y) + \frac{\partial u}{\partial y} x \Rightarrow \frac{\partial}{\partial \theta} = -y \frac{\partial}{\partial x} + x \frac{\partial}{\partial y}$$

$$\begin{aligned} \frac{\partial^2 u}{\partial \theta^2} &= \frac{\partial}{\partial \theta} \left( \frac{\partial u}{\partial \theta} \right) = \left( -y \frac{\partial}{\partial x} + x \frac{\partial}{\partial y} \right) \left( -y \frac{\partial u}{\partial x} + x \frac{\partial u}{\partial y} \right) \\ &= -y \frac{\partial}{\partial x} \left( -y \frac{\partial u}{\partial x} \right) - y \frac{\partial}{\partial x} \left( x \frac{\partial u}{\partial y} \right) + x \frac{\partial}{\partial y} \left( -y \frac{\partial u}{\partial x} \right) + x \frac{\partial}{\partial y} \left( x \frac{\partial u}{\partial y} \right) \\ &= y^2 \frac{\partial^2 u}{\partial x^2} - y \left( x \frac{\partial^2 u}{\partial x \partial y} + \frac{\partial u}{\partial y} \right) + x \left( -y \frac{\partial^2 u}{\partial x \partial y} - \frac{\partial u}{\partial x} \right) + x^2 \frac{\partial^2 u}{\partial y^2} \\ &= y^2 \frac{\partial^2 u}{\partial x^2} - xy \frac{\partial^2 u}{\partial x \partial y} - y \frac{\partial u}{\partial y} - xy \frac{\partial^2 u}{\partial x \partial y} - x \frac{\partial u}{\partial x} + x^2 \frac{\partial^2 u}{\partial y^2} \\ \frac{\partial^2 u}{\partial \theta^2} &= y^2 \frac{\partial^2 u}{\partial x^2} - 2xy \frac{\partial^2 u}{\partial x \partial y} - y \frac{\partial u}{\partial y} - x \frac{\partial u}{\partial x} + x^2 \frac{\partial^2 u}{\partial y^2} \end{aligned} \quad \dots(2)$$

Adding (1) and (2), we get

$$\begin{aligned} \frac{\partial^2 u}{\partial r^2} + \frac{\partial^2 u}{\partial \theta^2} &= x^2 \frac{\partial^2 u}{\partial x^2} + x \frac{\partial u}{\partial x} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} + y \frac{\partial u}{\partial y} \\ &\quad + y^2 \frac{\partial^2 u}{\partial x^2} - 2xy \frac{\partial^2 u}{\partial x \partial y} - y \frac{\partial u}{\partial y} - x \frac{\partial u}{\partial x} + x^2 \frac{\partial^2 u}{\partial y^2} \\ &= (x^2 + y^2) \frac{\partial^2 u}{\partial x^2} + (y^2 + x^2) \frac{\partial^2 u}{\partial y^2} = e^{2r} \frac{\partial^2 u}{\partial x^2} + e^{2r} \frac{\partial^2 u}{\partial y^2} \end{aligned}$$

$$\Rightarrow e^{-2r} \left( \frac{\partial^2 u}{\partial r^2} + \frac{\partial^2 u}{\partial \theta^2} \right) = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2}$$

**Proved.**

**Example 14.** If  $u = f(r)$  and  $x = r \cos \theta$ ,  $y = r \sin \theta$ , prove that

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f''(r) + \frac{1}{r} f'(r). \quad (\text{Nagpur University, Winter 2004})$$

(A.M.I.E.T.E., Winter 2003, U.P. I Semester, Winter 2005, 2000)

**Solution.**

$$\begin{aligned} x &= r \cos \theta \\ y &= r \sin \theta \end{aligned}$$

$$r^2 = x^2 + y^2 \text{ so that } \frac{\partial r}{\partial x} = \frac{x}{r}$$

$$\begin{aligned} u &= f(r) \\ \frac{\partial u}{\partial x} &= \frac{df}{dr} \cdot \frac{\partial r}{\partial x} \\ \frac{\partial u}{\partial x} &= \frac{df}{dr} \cdot \frac{x}{r} \end{aligned}$$

Differentiating again w.r.t.  $x$ , we get

$$\begin{aligned} \frac{\partial^2 u}{\partial x^2} &= \left( \frac{d^2 f}{dr^2} \cdot \frac{\partial r}{\partial x} \right) \cdot \frac{x}{r} + \frac{df}{dr} \cdot \left[ \frac{r \cdot 1 - x \cdot \frac{\partial r}{\partial x}}{r^2} \right] = \left( \frac{d^2 f}{dr^2} \cdot \frac{x}{r} \right) \cdot \frac{x}{r} + \frac{df}{dr} \cdot \left[ \frac{r \cdot 1 - x \cdot \frac{x}{r}}{r^2} \right] \\ &= \frac{d^2 f}{dr^2} \cdot \frac{x^2}{r^2} + \frac{df}{dr} \cdot \frac{r^2 - x^2}{r^3} = \frac{d^2 f}{dr^2} \cdot \frac{x^2}{r^2} + \frac{df}{dr} \cdot \frac{y^2}{r^3} \end{aligned} \quad \dots(1)$$

$$\text{Similarly, } \frac{\partial^2 u}{\partial y^2} = \frac{d^2 f}{dr^2} \cdot \frac{y^2}{r^2} + \frac{df}{dr} \cdot \frac{x^2}{r^3} \quad \dots(2)$$

On adding (1) and (2), we get

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = \frac{d^2 f}{dr^2} \cdot \frac{x^2 + y^2}{r^2} + \frac{df}{dr} \cdot \frac{x^2 + y^2}{r^3} = \frac{d^2 f}{dr^2} + \frac{df}{dr} \cdot \frac{1}{r} = f''(r) + \frac{1}{r} f'(r)$$

**Proved.**

**Example 15.** A function  $f(x, y)$  is rewritten in terms of new variables

$$u = e^x \cos y, \quad v = e^x \sin y$$

$$\text{Show that (i) } \frac{\partial f}{\partial x} = u \frac{\partial f}{\partial u} + v \frac{\partial f}{\partial v} \quad \text{and} \quad \text{(ii) } \frac{\partial f}{\partial y} = -v \frac{\partial f}{\partial u} + u \frac{\partial f}{\partial v}$$

$$\text{and hence deduce that (iii) } \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = (u^2 + v^2) \left( \frac{\partial^2 f}{\partial u^2} + \frac{\partial^2 f}{\partial v^2} \right)$$

$$\text{Solution. } u = e^x \cos y, \quad \frac{\partial u}{\partial x} = e^x \cos y = u, \quad \frac{\partial u}{\partial y} = -e^x \sin y = -v$$

$$v = e^x \sin y, \quad \frac{\partial v}{\partial x} = e^x \sin y = v, \quad \frac{\partial v}{\partial y} = e^x \cos y = u$$

$$(i) \text{ We know that } \frac{\partial f}{\partial x} = \frac{\partial f}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial f}{\partial v} \frac{\partial v}{\partial x}$$

$$\frac{\partial f}{\partial x} = \frac{\partial f}{\partial u} u + \frac{\partial f}{\partial v} v \quad \dots (1) \text{ Proved.}$$

$$(ii) \quad \frac{\partial f}{\partial y} = \frac{\partial f}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial f}{\partial v} \frac{\partial v}{\partial y} = \frac{\partial f}{\partial u} \cdot (-v) + \frac{\partial f}{\partial v} u = -v \cdot \frac{\partial f}{\partial u} + u \cdot \frac{\partial f}{\partial v} \quad \dots (2) \text{ Proved.}$$

$$\begin{aligned} (iii) \quad \frac{\partial^2 f}{\partial x^2} &= \frac{\partial}{\partial x} \left( \frac{\partial f}{\partial u} \right) \\ &= \left( u \cdot \frac{\partial}{\partial u} + v \cdot \frac{\partial}{\partial v} \right) \left( u \cdot \frac{\partial f}{\partial u} + v \cdot \frac{\partial f}{\partial v} \right) \end{aligned}$$

[From (1)]

$$\begin{aligned}
&= u \frac{\partial}{\partial u} \left( u \frac{\partial f}{\partial u} + v \frac{\partial f}{\partial v} \right) + v \frac{\partial}{\partial v} \left( u \frac{\partial f}{\partial u} + v \frac{\partial f}{\partial v} \right) \\
&= u \frac{\partial}{\partial u} \left( u \frac{\partial f}{\partial u} \right) + u \frac{\partial}{\partial u} \left( v \frac{\partial f}{\partial v} \right) + v \frac{\partial}{\partial v} \left( u \frac{\partial f}{\partial u} \right) + v \frac{\partial}{\partial v} \left( v \frac{\partial f}{\partial v} \right) \\
&= u \left( u \frac{\partial^2 f}{\partial u^2} + \frac{\partial f}{\partial u} \right) + u \left( v \frac{\partial^2 f}{\partial u \partial v} \right) + v \left( u \frac{\partial^2 f}{\partial v \partial u} \right) + v \left( v \frac{\partial^2 f}{\partial v^2} + \frac{\partial f}{\partial v} \right) \\
&= u^2 \frac{\partial^2 f}{\partial u^2} + u \frac{\partial f}{\partial u} + u v \frac{\partial^2 f}{\partial v \partial u} + u v \frac{\partial^2 f}{\partial u \partial v} + v^2 \frac{\partial^2 f}{\partial v^2} + v \frac{\partial f}{\partial v} \quad \dots(3)
\end{aligned}$$

$$\begin{aligned}
\frac{\partial^2 f}{\partial y^2} &= \frac{\partial}{\partial y} \left( \frac{\partial f}{\partial y} \right) = \left( -v \frac{\partial}{\partial u} + u \frac{\partial}{\partial v} \right) \left( -v \frac{\partial f}{\partial u} + u \frac{\partial f}{\partial v} \right) \quad [\text{From (2)}] \\
&= -v \frac{\partial}{\partial u} \left( -v \frac{\partial f}{\partial u} + u \frac{\partial f}{\partial v} \right) + u \frac{\partial}{\partial v} \left( -v \frac{\partial f}{\partial u} + u \frac{\partial f}{\partial v} \right) \\
&= -v \frac{\partial}{\partial u} \left( -v \frac{\partial f}{\partial u} \right) - v \frac{\partial}{\partial u} \left( u \frac{\partial f}{\partial v} \right) + u \frac{\partial}{\partial v} \left( -v \frac{\partial f}{\partial u} \right) + u \frac{\partial}{\partial v} \left( u \frac{\partial f}{\partial v} \right) \\
&= -v \left( -v \frac{\partial^2 f}{\partial u^2} \right) - v \left( u \frac{\partial^2 f}{\partial u \partial v} + \frac{\partial f}{\partial v} \right) + u \left( -v \frac{\partial^2 f}{\partial v \partial u} - \frac{\partial f}{\partial u} \right) + u \left( u \frac{\partial^2 f}{\partial v^2} \right) \\
&= v^2 \frac{\partial^2 f}{\partial u^2} - u v \frac{\partial^2 f}{\partial u \partial v} - v \frac{\partial f}{\partial u} - u v \frac{\partial^2 f}{\partial u \partial v} - u \frac{\partial f}{\partial u} + u^2 \frac{\partial^2 f}{\partial v^2} \quad \dots(4)
\end{aligned}$$

On adding (3) and (4), we obtain

$$\begin{aligned}
\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} &= u^2 \frac{\partial^2 f}{\partial u^2} + v^2 \frac{\partial^2 f}{\partial v^2} + v^2 \frac{\partial^2 f}{\partial u^2} + u^2 \frac{\partial^2 f}{\partial v^2} \\
&= (u^2 + v^2) \frac{\partial^2 f}{\partial u^2} + (u^2 + v^2) \frac{\partial^2 f}{\partial v^2} = (u^2 + v^2) \left( \frac{\partial^2 f}{\partial u^2} + \frac{\partial^2 f}{\partial v^2} \right) \quad \text{Proved.}
\end{aligned}$$

**Example 16.** If  $x + y = 2 e^\theta \cos \phi$  and  $x - y = 2 i e^\theta \sin \phi$

$$\text{Show that : } \frac{\partial^2 V}{\partial \theta^2} + \frac{\partial^2 V}{\partial \phi^2} = 4 x y \frac{\partial^2 V}{\partial x \partial y} \quad (\text{A.M.I.E.T.E., June 2010, Winter 2007})$$

(Nagpur University, Summer 2001, Winter 2000, U.P., I Semester, Winter 2001)

**Solution.** We have,  $x + y = 2 e^\theta \cos \phi \quad \dots(1)$   
 $x - y = 2 i e^\theta \sin \phi \quad \dots(2)$

By adding and subtracting equations (1) and (2), we have

$$\begin{aligned}
2x &= 2e^\theta (\cos \phi + i \sin \phi) \Rightarrow x = e^{\theta+i\phi} \\
\text{and} \quad 2y &= 2e^\theta (\cos \phi - i \sin \phi) \Rightarrow y = e^{\theta-i\phi} \quad \dots(3)
\end{aligned}$$

It is clear that  $V = f(x, y)$  and  $x, y$  are functions of  $\theta$  and  $\phi$ . Hence  $V$  is a composite function of  $\theta$  and  $\phi$ .

We want to convert  $V, \theta, \phi$  in  $V, x, y$  respectively.

From equation (3), we have

$$\frac{\partial x}{\partial \theta} = e^{\theta+i\phi} = x, \quad \frac{\partial x}{\partial \phi} = i e^{\theta+i\phi} = i x, \quad \frac{\partial y}{\partial \theta} = e^{\theta-i\phi} = y,$$

$$\text{and } \frac{\partial y}{\partial \phi} = -i e^{\theta-i\phi} = -iy$$

$$\text{Now } \frac{\partial V}{\partial \theta} = \frac{\partial V}{\partial x} \cdot \frac{\partial x}{\partial \theta} + \frac{\partial V}{\partial y} \cdot \frac{\partial y}{\partial \theta} = x \frac{\partial V}{\partial x} + y \frac{\partial V}{\partial y}$$

and  $\frac{\partial^2 V}{\partial \theta^2} = \frac{\partial}{\partial \theta} \left( \frac{\partial V}{\partial \theta} \right) = \left( x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} \right) \left( x \frac{\partial V}{\partial x} + y \frac{\partial V}{\partial y} \right)$

$$= x \frac{\partial}{\partial x} \left[ x \frac{\partial V}{\partial x} + y \frac{\partial V}{\partial y} \right] + y \frac{\partial}{\partial y} \left[ x \frac{\partial V}{\partial x} + y \frac{\partial V}{\partial y} \right]$$

$$= x \left[ x \frac{\partial^2 V}{\partial x^2} + \frac{\partial V}{\partial x} + y \frac{\partial^2 V}{\partial x \partial y} \right] + y \left[ x \frac{\partial^2 V}{\partial x \partial y} + y \frac{\partial^2 V}{\partial y^2} + \frac{\partial V}{\partial y} \right]$$

$$= x^2 \frac{\partial^2 V}{\partial x^2} + y^2 \frac{\partial^2 V}{\partial y^2} + 2xy \frac{\partial^2 V}{\partial x \partial y} + \left( x \frac{\partial V}{\partial x} + y \frac{\partial V}{\partial y} \right) \quad \dots(4)$$

Again  $\frac{\partial V}{\partial \phi} = \frac{\partial V}{\partial x} \frac{\partial x}{\partial \phi} + \frac{\partial V}{\partial y} \frac{\partial y}{\partial \phi} = i \left[ x \frac{\partial V}{\partial x} - y \frac{\partial V}{\partial y} \right]$

$$\frac{\partial}{\partial \phi} = i \left[ x \frac{\partial}{\partial x} - y \frac{\partial}{\partial y} \right]$$

$$\frac{\partial^2 V}{\partial \phi^2} = \frac{\partial}{\partial \phi} \left( \frac{\partial V}{\partial \phi} \right) = i \left( x \frac{\partial}{\partial x} - y \frac{\partial}{\partial y} \right) i \left( x \frac{\partial V}{\partial x} - y \frac{\partial V}{\partial y} \right)$$

$$= ix \frac{\partial}{\partial x} \cdot i \left[ x \frac{\partial V}{\partial x} - y \frac{\partial V}{\partial y} \right] - iy \frac{\partial}{\partial y} \cdot i \left[ x \frac{\partial V}{\partial x} - y \frac{\partial V}{\partial y} \right]$$

$$= -x \frac{\partial}{\partial x} \left[ x \frac{\partial V}{\partial x} - y \frac{\partial V}{\partial y} \right] + y \frac{\partial}{\partial y} \left[ x \frac{\partial V}{\partial x} - y \frac{\partial V}{\partial y} \right]$$

$$= -x \left[ \frac{\partial V}{\partial x} + x \frac{\partial^2 V}{\partial x^2} - y \frac{\partial^2 V}{\partial x \partial y} \right] + y \left[ x \frac{\partial^2 V}{\partial x \partial y} - y \frac{\partial^2 V}{\partial y^2} - \frac{\partial V}{\partial y} \right]$$

$$= - \left[ x \frac{\partial V}{\partial x} + y \frac{\partial V}{\partial y} \right] + 2xy \frac{\partial^2 V}{\partial x \partial y} - \left[ x^2 \frac{\partial^2 V}{\partial x^2} + y^2 \frac{\partial^2 V}{\partial y^2} \right] \quad \dots(5)$$

Adding (4) and (5), we get

$$\frac{\partial^2 V}{\partial \theta^2} + \frac{\partial^2 V}{\partial \phi^2} = 4xy \frac{\partial^2 V}{\partial x \partial y} \quad \text{Proved.}$$

### EXERCISE 2.1

1. If  $z = u^2 + v^2$  and  $u = at^2$ ,  $v = 2at$ , find  $\frac{dz}{dt}$ . Ans.  $4a^2t(t^2 + 2)$

2. If  $z = \sin^{-1}(x-y)$ ,  $x = 3t$ ,  $y = 4t^3$ , show that  $\frac{dz}{dt} = \frac{3}{\sqrt{1-t^2}}$ .

3. If  $w = f(u, v)$ , where  $u = x+y$  and  $v = x-y$ , show that  $\frac{dw}{dx} + \frac{dw}{dy} = 2 \frac{dw}{du}$

4. If  $u = xe^y z$ , where  $y = \sqrt{a^2 - x^2}$ ,  $z = \sin^3 x$ . Find  $\frac{du}{dx}$ . Ans.  $e^y z \left( 1 - \frac{x^2}{y} + 3x \cot x \right)$

5. If  $u = x^2 + y^2 + z^2 - 2xyz = 1$ , show that  $\frac{dx}{\sqrt{1-x^2}} + \frac{dy}{\sqrt{1-y^2}} + \frac{dz}{\sqrt{1-z^2}} = 0$

[Hint.  $du = \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz = 0$

$= 2(x-yz)dx + 2(y-zx)dy + 2(z-xy)dz = 0$

But  $x^2 + y^2 + z^2 - 2xyz = 1$ ,  $\Rightarrow y^2 - 2xyz = 1 - x^2 - z^2$   
 $y^2 - 2xyz + x^2 z^2 = 1 + x^2 z^2 - x^2 - z^2$   $\Rightarrow (y-xz)^2 = (1-x^2)(1-z^2)$ ]

6. If  $z = z(u, v)$ ,  $u = x^2 - 2xy - y^2$  and  $v = y$ . Show that

$$(x+y) \frac{\partial z}{\partial x} + (x-y) \frac{\partial z}{\partial y} = 0 \text{ is equivalent to } \frac{\partial z}{\partial v} = 0$$

7. If  $V = f(2x - 3y, 3y - 4z, 4z - 2x)$ , compute the value of  $6V_x + 4V_y + 3V_z$ .  
(U.P., I Semester, Dec. 2008) **Ans.** = 0

8. If  $z = \sqrt{x^2 + y^2}$  and  $x^3 + y^3 + 3axy = 5a^2$ , find the value of  $\frac{dz}{dx}$ , when  $x = y = a$ . **Ans.** 0

9. By changing the independent variables  $x$  and  $t$  to  $u$  and  $v$  by means of the relationships  
 $u = x - at$ ,  $v = x + at$

$$\text{Show that } a^2 \frac{\partial^2 y}{\partial x^2} - \frac{\partial^2 y}{\partial t^2} = 4a^2 \frac{\partial^2 y}{\partial u \partial v}$$

10. If  $x^2 = au + bv$ ,  $y = au - bv$ , prove that  $\left(\frac{du}{dx}\right)_y \cdot \left(\frac{dx}{du}\right)_v = \frac{1}{2} = \left(\frac{\partial v}{\partial y}\right)_x \cdot \left(\frac{\partial y}{\partial v}\right)_u$

11. If  $z = f(x, y)$  where  $x = uv$ ,  $y = \frac{u+v}{u-v}$ , show that  $2x \frac{\partial z}{dx} = u \frac{\partial z}{du} + v \frac{\partial z}{dv}$ .

12. If  $u = x \cos \frac{y}{z}$ ,  $x = 3r^2 + 2s$ ,  $y = 4r - 2s^3$ ,  $z = 2r^2 - 3s^2$  find  $\frac{\partial u}{\partial r}, \frac{\partial u}{\partial s}$ .

$$\text{Ans. } \frac{\partial u}{\partial r} = 6r \cos \frac{y}{z} - \frac{4x}{z} \sin \frac{y}{z} + \frac{4xyr}{z^2} \sin \frac{y}{z}, \frac{\partial u}{\partial s} = 2 \cos \frac{y}{z} + \frac{6xs^2}{z} \sin \frac{y}{z} - \frac{6xys}{z^2} \sin \frac{y}{z}$$

13. Find  $\frac{\partial w}{\partial \theta}$  and  $\frac{\partial w}{\partial \phi}$  given that  $w(x, y, z) = f(x^2 + y^2 + z^2)$  where  $x = r \cos \theta \cdot \cos \phi$ ,

$$y = r \cos \theta \cdot \sin \phi, z = r \sin \theta.$$

$$\text{Ans. } \frac{\partial w}{\partial \theta} = 0, \frac{\partial w}{\partial \phi} = 0.$$

14. If  $x = \frac{\cos \theta}{u}$ ,  $y = \frac{\sin \theta}{u}$  and  $z = f(x, y)$ , then show that

$$\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = u^4 \frac{\partial^2 z}{\partial u^2} + u^3 \frac{\partial z}{\partial u} + u^4 \frac{\partial^2 z}{\partial \theta^2}$$

15. If  $x = z \sin^{-1} \frac{y}{x}$  where  $x = 3r^2 + 2s$ ,  $y = 4r - 2s^3$ ,  $z = 2r^2 - 3s^2$ , find  $\frac{\partial u}{\partial r}, \frac{\partial u}{\partial s}$

$$\text{Ans. } \frac{\partial u}{\partial r} = -\frac{6ryz}{x\sqrt{x^2-y^2}} + \frac{4z}{\sqrt{x^2-y^2}} + 4r \sin \frac{y}{x}, \frac{\partial u}{\partial s} = \frac{2yz}{x\sqrt{x^2-y^2}} - \frac{6s^2z}{\sqrt{x^2-y^2}} - 6s \sin \frac{y}{x}$$

16. If  $z = \frac{\sin u}{\cos v}$ , where  $u = \frac{\cos y}{\sin x}$ ,  $v = \frac{\cos x}{\sin y}$ , find  $\frac{\partial z}{\partial x}$ .

$$\text{Ans. } \frac{(u \cot x \cos u \sin y + z \sin v \sin x)}{(\cos v \sin y)}$$

17. If  $v$  is a function of  $u, v$ , where  $u = x - y$  and  $v = xy$  prove that

$$x \frac{\partial^2 v}{\partial x^2} + y \frac{\partial^2 v}{\partial y^2} = (x+y) \left( \frac{\partial^2 v}{\partial u^2} + xy \frac{\partial^2 v}{\partial v^2} \right)$$

18. If  $z = f(x, y)$ , where  $x = r \cos \theta$ ,  $y = r \sin \theta$ , prove that

$$\left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 = \left( \frac{\partial z}{\partial r} \right)^2 + \frac{1}{r^2} \left( \frac{\partial z}{\partial \theta} \right)^2$$

$$\text{and } \frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = \frac{\partial^2 z}{\partial r^2} + \frac{1}{r^2} \left( \frac{\partial^2 z}{\partial \theta^2} \right) + \frac{1}{r} \left( \frac{\partial z}{\partial r} \right)$$

19. If  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$ ,  $v = v(x, y, z)$ , prove that

$$\left(\frac{\partial v}{\partial x}\right)^2 + \left(\frac{\partial v}{\partial y}\right)^2 + \left(\frac{\partial v}{\partial z}\right)^2 = \left(\frac{\partial v}{\partial r}\right)^2 + \left(\frac{1}{r} \frac{\partial v}{\partial \theta}\right)^2 + \left(\frac{1}{r \sin \theta} \frac{\partial v}{\partial \phi}\right)^2$$

20. If  $v$  be a potential function such that  $v = v(r)$  and  $r^2 = x^2 + y^2 + z^2$ , show that

$$\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} + \frac{\partial^2 v}{\partial z^2} = \frac{d^2 v}{dr^2} + \frac{2}{r} \frac{dv}{dr}$$

21. If  $x = u + v + w$ ,  $y = v w + w u + u v$ ,  $z = u v w$  and  $F$  is a function of  $x, y, z$ , then show that

$$u \frac{\partial F}{\partial u} + v \frac{\partial F}{\partial v} + w \frac{\partial F}{\partial w} = x \frac{\partial F}{\partial x} + 2y \frac{\partial F}{\partial y} + 3z \frac{\partial F}{\partial z}$$

22. If  $u = x + a y$  and  $v = x + b y$ , transform the equation

$$2 \frac{\partial^2 z}{\partial x^2} - 5 \frac{\partial^2 z}{\partial x \partial y} + 3 \frac{\partial^2 z}{\partial y^2} = 0 \text{ into the equation } \frac{\partial^2 z}{\partial u \partial v} = 0, \text{ find the values of } a \text{ and } b.$$

(AMIE.TE., Summer 2000) **Ans.**  $\left(a = 1, b = \frac{2}{3}\right), \left(a = \frac{2}{3}, b = 1\right)$

### 2.3 IMPORTANT DEDUCTIONS

Let  $z = f(x, y)$ , then

$$dz = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy$$

If  $z = 0$ ,  $dz = 0$

$$0 = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy \Rightarrow \frac{\partial f}{\partial y} \cdot \frac{dy}{dx} = -\frac{\partial f}{\partial x}$$

$$\Rightarrow \boxed{\frac{dy}{dx} = -\frac{\frac{\partial f}{\partial x}}{\frac{\partial f}{\partial y}}} \quad \text{[Remember] ...(1)}$$

We can find  $\frac{d^2 y}{dx^2}$  by differentiating (1).

$$\text{Let } \frac{\partial f}{\partial x} = p, \quad \frac{\partial f}{\partial y} = q, \quad \frac{\partial^2 f}{\partial x^2} = r, \quad \frac{\partial^2 f}{\partial x \partial y} = s, \quad \frac{\partial^2 f}{\partial y^2} = t$$

$$\text{From (1), } \frac{dy}{dx} = -\frac{p}{q}.$$

$$\text{On differentiating again, we obtain } \frac{d^2 y}{dx^2} = -\frac{q \frac{dp}{dx} - p \frac{dq}{dx}}{q^2} \quad \dots(2)$$

$$\text{But } \frac{dp}{dx} = \frac{\partial p}{\partial x} + \frac{\partial p}{\partial y} \frac{dy}{dx}$$

$$\Rightarrow \frac{dp}{dx} = \frac{\partial}{\partial x} \left( \frac{\partial f}{\partial x} \right) + \frac{\partial}{\partial y} \left( \frac{\partial f}{\partial x} \right) \cdot \frac{dy}{dx}$$

$$\frac{dp}{dx} = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y \partial x} \frac{dy}{dx} = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y \partial x} \left( \frac{-\frac{\partial f}{\partial x}}{\frac{\partial f}{\partial y}} \right) = r - s \frac{p}{q} = \frac{qr - ps}{q}$$

$$\frac{dq}{dx} = \frac{\partial q}{\partial x} + \frac{\partial q}{\partial y} \frac{dy}{dx} = \frac{\partial}{\partial x} \left( \frac{\partial f}{\partial y} \right) + \frac{\partial}{\partial y} \left( \frac{\partial f}{\partial y} \right) \left( \frac{-p}{q} \right)$$

$$= \frac{\partial^2 f}{\partial x \partial y} - \frac{\partial^2 f p}{\partial y^2 q} = s - \frac{t p}{q} = \frac{q s - t p}{q}$$

Making substitutions in (2), we obtain

$$\begin{aligned} \frac{d^2 y}{dx^2} &= - \frac{q \frac{qr - ps}{q} - p \frac{qs - tp}{q}}{q^2} = - \frac{q^2 r - pq s - p q s + p^2 t}{q^3} \\ \Rightarrow \quad \boxed{\frac{d^2 y}{dx^2} = - \frac{q^2 r - 2 p q s + p^2 t}{q^3}} \end{aligned}$$

$$\begin{cases} \frac{\partial z}{\partial x} = p \\ \frac{\partial z}{\partial y} = q \\ \frac{\partial^2 z}{\partial x^2} = r \\ \frac{\partial^2 z}{\partial x \partial y} = s \end{cases}$$

**Example 17.** If  $x^3 + 3x^2y + 6xy^2 + y^3 = 1$ , find  $\frac{dy}{dx}$ .

**Solution.** Let  $f(x, y) = x^3 + 3x^2y + 6xy^2 + y^3 - 1 = 0$

$$\begin{aligned} \frac{\partial f}{\partial x} &= 3x^2 + 6xy + 6y^2 \Rightarrow \frac{\partial f}{\partial y} = 3x^2 + 12xy + 3y^2 \\ \frac{dy}{dx} &= - \frac{\frac{\partial f}{\partial x}}{\frac{\partial f}{\partial y}} = - \frac{3x^2 + 6xy + 6y^2}{3x^2 + 12xy + 3y^2} = - \frac{x^2 + 2xy + 2y^2}{x^2 + 4xy + y^2} \end{aligned}$$

**Ans.**

**Second method.**

$$x^3 + 3x^2y + 6xy^2 + y^3 - 1 = 0.$$

On differentiation, we have

$$\begin{aligned} 3x^2 + \left( 3x^2 \frac{dy}{dx} + 6xy \right) + \left( 6x \cdot 2y \frac{dy}{dx} + 6y^2 \right) + 3y^2 \frac{dy}{dx} &= 0 \\ (3x^2 + 12xy + 3y^2) \frac{dy}{dx} &= -3x^2 - 6xy - 6y^2 \\ \frac{dy}{dx} &= - \frac{3x^2 - 6xy - 6y^2}{3x^2 + 12xy + 3y^2} = - \frac{x^2 + 2xy + 2y^2}{x^2 + 4xy + y^2} \end{aligned}$$

**Ans.**

**Example 18.** If  $y^3 - 3ax^2 + x^3 = 0$ , then prove that

$$\frac{d^2 y}{dx^2} = - \frac{2a^2 x^2}{y^5}$$

**Solution.** Let  $f(x, y) = y^3 - 3ax^2 + x^3$

... (1)

$$p = \frac{\partial f}{\partial x} = -6ax + 3x^2, \quad q = \frac{\partial f}{\partial y} = 3y^2$$

$$r = \frac{\partial^2 f}{\partial x^2} = -6a + 6x, \quad s = \frac{\partial^2 f}{\partial x \partial y} = 0, \quad t = \frac{\partial^2 f}{\partial y^2} = 6y$$

$$\frac{d^2 y}{dx^2} = - \frac{q^2 r - 2 p q s + p^2 t}{q^3} \quad \dots (2) [\text{Art 2.3}]$$

Putting the values of  $p, q, r, s$  and  $t$  in (2), we get

$$\begin{aligned} \frac{d^2 y}{dx^2} &= - \frac{(3y^2)^2(-6a + 6x) - 2(-6ax + 3x^2)(3y^2)(0) + (-6ax + 3x^2)^2(6y)}{(3y^2)^3} \\ &= - \frac{54y^4(-a + x) + 54(-2ax + x^2)^2 y}{27y^6} \end{aligned}$$

$$\frac{d^2 y}{d x^2} = -\frac{2 y^3(-a+x) + 2(4 a^2 x^2 + x^4 - 4 a x^3)}{y^5}$$

Putting the value of  $y^3 = 3 a x^2 - x^3$  from (1) in (3), we get

$$\begin{aligned}\frac{d^2 y}{d x^2} &= -\frac{2(3 a x^2 - x^3)(-a+x) + 2(4 a^2 x^2 + x^4 - 4 a x^3)}{y^5} \\ &= -\frac{-6 a^2 x^2 + 6 a x^3 + 2 a x^3 - 2 x^4 + 8 a^2 x^2 + 2 x^4 - 8 a x^3}{y^5} \\ \frac{d^2 y}{d x^2} &= -\frac{2 a^2 x^2}{y^5}\end{aligned}$$

**Proved.**

**Example 19.** If  $x^3 + y^3 - 3 a x y = 0$ , find  $\frac{dy}{dx}$  and  $\frac{d^2 y}{d x^2}$

**Solution.** Let  $f(x, y) = x^3 + y^3 - 3 a x y = 0$

$$p = \frac{\partial f}{\partial x} = 3 x^2 - 3 a y, \quad q = \frac{\partial f}{\partial y} = 3 y^2 - 3 a x$$

$$r = \frac{\partial^2 f}{\partial x^2} = 6 x, \quad s = \frac{\partial^2 f}{\partial x \partial y} = -3 a, \quad t = \frac{\partial^2 f}{\partial y^2} = 6 y$$

$$\frac{dy}{dx} = -\frac{\frac{\partial f}{\partial x}}{\frac{\partial f}{\partial y}} = -\frac{3x^2 - 3ay}{3y^2 - 3ax} = \frac{ay - x^2}{y^2 - ax}$$

$$\frac{d^2 y}{d x^2} = -\frac{q^2 r - 2 p q s + p^2 t}{q^3} \quad \dots(1) \text{ [Art. 2.3]}$$

Putting the values of  $p, q, r, s$  and  $t$  in (1), we get

$$\begin{aligned}\frac{d^2 y}{d x^2} &= -\frac{(3y^2 - 3ax)^2 6x - 2(3x^2 - 3ay)(3y^2 - 3ax)(-3a) + (3x^2 - 3ay)^2 (6y)}{(3y^2 - 3ax)^3} \\ &= -\frac{2x(y^2 - ax)^2 + 2a(x^2 - ay)(y^2 - ax) + 2y(x^2 - ay)^2}{(y^2 - ax)^3}\end{aligned}$$

$$\frac{d^2 y}{d x^2} = \frac{2a^3 x y}{(ax - y^2)^3}$$

**Ans.**

**Example 20.** Find  $\frac{dy}{dx}$  when  $(\cos x)^y = (\sin y)^x$

**Solution.** Given equation can be written as :

$$(\cos x)^y - (\sin y)^x = 0$$

$$\text{Here } f(x, y) = (\cos x)^y - (\sin y)^x = 0$$

$$\begin{aligned}\frac{\partial f}{\partial x} &= y (\cos x)^{y-1} (-\sin x) - (\sin y)^x \log \sin y \\ &= -[y \sin x (\cos x)^{y-1} + (\sin y)^x \log \sin y]\end{aligned}$$

$$\frac{\partial f}{\partial y} = (\cos x)^y \log \cos x - x (\sin y)^{x-1} \cos y$$

$$\frac{dy}{dx} = -\frac{\frac{\partial f}{\partial x}}{\frac{\partial f}{\partial y}}$$

[Art. 2.3]

$$\frac{dy}{dx} = \frac{y \sin x (\cos x)^{y-1} + (\sin y)^x \log \sin y}{(\cos x)^y \log \cos x - x(\sin y)^{x-1} \cos y} \quad \dots(1)$$

In (1), put  $(\cos x)^y$  for  $(\sin y)^x$

$$\begin{aligned} \frac{dy}{dx} &= \frac{y \sin x (\cos x)^{y-1} + (\cos x)^y \log \sin y}{(\cos x)^y \log \cos x - \frac{x(\cos x)^y}{\sin y} \cdot \cos y} \\ &= \frac{(\cos x)^y [y \tan x + \log \sin y]}{(\cos x)^y [\log \cos x - x \cot y]} = \frac{y \tan x + \log \sin y}{\log \cos x - x \cot y} \quad \text{Ans.} \end{aligned}$$

**Example 21.** If  $f(x, y) = 0$  and  $\phi(y, z) = 0$ , show that

$$\frac{\partial f}{\partial y} \cdot \frac{\partial \phi}{\partial z} \cdot \frac{dz}{dx} = \frac{\partial f}{\partial x} \cdot \frac{\partial \phi}{\partial y}.$$

**Solution.**

$$\begin{aligned} f(x, y) &= 0 & \dots(1) \\ \phi(y, z) &= 0 & \dots(2) \end{aligned}$$

Differentiating (1) w.r.t.  $x$ , we get

$$0 = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} \cdot \frac{dy}{dx} \Rightarrow \frac{dy}{dx} = -\frac{\frac{\partial f}{\partial x}}{\frac{\partial f}{\partial y}} \quad \dots(3)$$

Differentiating (2) w.r.t. 'y', we get

$$0 = \frac{\partial \phi}{\partial y} + \frac{\partial \phi}{\partial z} \cdot \frac{dz}{dy} \Rightarrow \frac{dz}{dy} = -\frac{\frac{\partial \phi}{\partial y}}{\frac{\partial \phi}{\partial z}} \quad \dots(4)$$

Multiplying (3) and (4), we get

$$\frac{dy}{dx} \times \frac{dz}{dy} = \left( -\frac{\frac{\partial f}{\partial x}}{\frac{\partial f}{\partial y}} \right) \left( -\frac{\frac{\partial \phi}{\partial y}}{\frac{\partial \phi}{\partial z}} \right) \Rightarrow \frac{dz}{dx} = \frac{\frac{\partial f}{\partial x} \times \frac{\partial \phi}{\partial y}}{\frac{\partial f}{\partial y} \times \frac{\partial \phi}{\partial z}} \Rightarrow \frac{\partial f}{\partial y} \cdot \frac{\partial \phi}{\partial z} \cdot \frac{dz}{dx} = \frac{\partial f}{\partial x} \cdot \frac{\partial \phi}{\partial y}$$

**Proved.**

## EXERCISE 2.2

Find  $\frac{dy}{dx}$  in the following cases :

1.  $x \sin(x-y) - (x+y) = 0$

**Ans.**  $[y+x^2 \cos(x-y)]/[x+x^2 \cos(x-y)]$

2.  $x^y = y^x$

**Ans.**  $y(y-x \log y)/x(x-y \log x)$

3. Find  $\frac{d^2 y}{dx^2}$  If  $ax^2 + 2hxy + by^2 = 1$ ,

**Ans.**  $\frac{h^2 - ab}{(hx+by)^3}$

4. If  $u = x^2y + y^2z + z^2x$  and if  $z$  is defined implicitly as a function of  $x$  and  $y$  by the equation  $x^2 + yz + z^3 = 0$

find  $\frac{\partial u}{\partial x}$ , where  $u$  is considered as a function of  $x$  and  $y$  alone.

**Ans.**  $\frac{\partial u}{\partial x} = 2xy + z^2 - (y^2 + 2zx) \left( \frac{2x}{y+3z^2} \right)$

5. Find  $\frac{dy}{dx}$ , if  $\tan^{-1} \frac{x}{y} + y^3 + 1 = 0$

**Ans.**  $\frac{y}{x-3x^2y^2-3y^4}$

6. If  $f(x, y, z) = 0$ , prove that

$$\left( \frac{dx}{dy} \right)_z \cdot \left( \frac{dy}{dz} \right)_x \cdot \left( \frac{dz}{dx} \right)_y = -1$$

**Hint.**  $\left( \frac{dx}{dy} \right)_z = -\frac{\partial f}{\partial y} \div \frac{\partial f}{\partial x}$

## 2.4 TYPICAL CASES

**Example 22.** If  $x = f(u, v)$ ,  $y = \phi(u, v)$ , find  $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y}$ .

**Solution.**

$$x = f(u, v) \quad \dots(1)$$

$$y = \phi(u, v) \quad \dots(2)$$

Differentiating (1), (2) w.r.t.  $x$  (treating  $y$  as constant), we obtain

$$1 = \frac{\partial f}{\partial u} \cdot \frac{\partial u}{\partial x} + \frac{\partial f}{\partial v} \cdot \frac{\partial v}{\partial x} \quad \dots(3) \quad \Rightarrow \quad 0 = \frac{\partial \phi}{\partial u} \cdot \frac{\partial u}{\partial x} + \frac{\partial \phi}{\partial v} \cdot \frac{\partial v}{\partial x} \quad \dots(4)$$

Solving the equations (3) and (4) for  $\frac{\partial u}{\partial x}$  and  $\frac{\partial v}{\partial x}$ , we obtain

$$\frac{\partial u}{\partial x} = \frac{\frac{\partial \phi}{\partial v}}{\frac{\partial f}{\partial u} \cdot \frac{\partial \phi}{\partial v} - \frac{\partial f}{\partial v} \cdot \frac{\partial \phi}{\partial u}} \quad \text{Ans.} \quad \Rightarrow \quad \frac{\partial v}{\partial x} = \frac{-\frac{\partial \phi}{\partial u}}{\frac{\partial f}{\partial u} \cdot \frac{\partial \phi}{\partial v} - \frac{\partial f}{\partial v} \cdot \frac{\partial \phi}{\partial u}} \quad \text{Ans.}$$

Similarly, differentiating (1) and (2) w.r.t.  $y$ , we get

$$0 = \frac{\partial f}{\partial u} \cdot \frac{\partial u}{\partial y} + \frac{\partial f}{\partial v} \cdot \frac{\partial v}{\partial y} \quad \dots(5) \quad \Rightarrow \quad 1 = \frac{\partial \phi}{\partial u} \cdot \frac{\partial u}{\partial y} + \frac{\partial \phi}{\partial v} \cdot \frac{\partial v}{\partial y} \quad \dots(6)$$

Solving the equations (5) and (6) for  $\frac{\partial u}{\partial y}$  and  $\frac{\partial v}{\partial y}$ , we obtain

$$\frac{\partial u}{\partial y} = \frac{-\frac{\partial f}{\partial v}}{\frac{\partial f}{\partial u} \cdot \frac{\partial \phi}{\partial v} - \frac{\partial f}{\partial v} \cdot \frac{\partial \phi}{\partial u}} \quad \text{Ans.} \quad \Rightarrow \quad \frac{\partial v}{\partial y} = \frac{\frac{\partial f}{\partial u}}{\frac{\partial f}{\partial u} \cdot \frac{\partial \phi}{\partial v} - \frac{\partial f}{\partial v} \cdot \frac{\partial \phi}{\partial u}} \quad \text{Ans.}$$

**Example 23.** If  $x = u^2 - v^2$  and  $y = uv$ , find

$$\frac{\partial u}{\partial x}, \quad \frac{\partial u}{\partial y}, \quad \frac{\partial v}{\partial x} \quad \text{and} \quad \frac{\partial v}{\partial y} \quad \quad \quad (\text{Nagpur University, Winter 2003})$$

**Solution.** Here, we have

$$x = u^2 - v^2 \quad \dots(1)$$

$$y = uv \quad \dots(2)$$

Differentiating (1) w.r.t.  $x$ , we get

$$\Rightarrow 1 = 2u \frac{\partial u}{\partial x} - 2v \frac{\partial v}{\partial x} \quad \dots(3)$$

Similarly differentiating (2) w.r.t.  $x$ , we get

$$0 = v \frac{\partial u}{\partial x} + u \frac{\partial v}{\partial x} \quad \dots(4)$$

By solving (3) and (4), we get

$$\frac{\partial u}{\partial x} = \frac{u}{2u^2 + 2v^2}, \quad \frac{\partial v}{\partial x} = -\frac{v}{2u^2 + 2v^2} \quad \text{Ans.}$$

On differentiating (1) and (2) w.r.t.  $y$ , we get

$$0 = 2u \frac{\partial u}{\partial y} - 2v \frac{\partial v}{\partial y} \quad \dots(5)$$

$$1 = v \frac{\partial u}{\partial y} + u \frac{\partial v}{\partial y} \quad \dots(6)$$

On solving (5) and (6), we get

$$\frac{\partial v}{\partial y} = \frac{u}{u^2 + v^2}, \quad \text{and} \quad \frac{\partial u}{\partial y} = \frac{v}{u^2 + v^2} \quad \text{Ans.}$$

**Example 24.** If  $x^2 - y^2 + u^2 + 2v^2 = 1$ ,  $x^2 + y^2 - u^2 - v^2 = 2$ ,

find  $\frac{\partial u}{\partial x}$  and  $\frac{\partial v}{\partial x}$ .

**Solution.**  $x^2 - y^2 + u^2 + 2v^2 = 1 \quad \dots(1)$

$$x^2 + y^2 - u^2 - v^2 = 2 \quad \dots(2)$$

Differentiating (1) partially w.r.t. 'x', we get

$$\begin{aligned} 2x + 2u \cdot \frac{\partial u}{\partial x} + 4v \cdot \frac{\partial v}{\partial x} &= 0 \\ \Rightarrow u \frac{\partial u}{\partial x} + 2v \cdot \frac{\partial v}{\partial x} &= -x \end{aligned} \quad \dots(3)$$

Differentiating (2) partially w.r.t. 'x', we get

$$2x - 2u \frac{\partial u}{\partial x} - 2v \cdot \frac{\partial v}{\partial x} = 0 \Rightarrow u \frac{\partial u}{\partial x} + v \cdot \frac{\partial v}{\partial x} = x \quad \dots(4)$$

On subtracting (4) from (3), we get

$$v \frac{\partial v}{\partial x} = -2x \Rightarrow \frac{\partial v}{\partial x} = -\frac{2x}{v}$$

Similarly, we get  $\frac{\partial u}{\partial x} = \frac{3x}{u}$  Ans.

## 2.5 GEOMETRICAL INTERPRETATION OF $\frac{\partial z}{\partial x}$ AND $\frac{\partial z}{\partial y}$ (Gujarat, I Semester, Jan. 2009)

Let  $z = f(x, y)$  be a surface S.

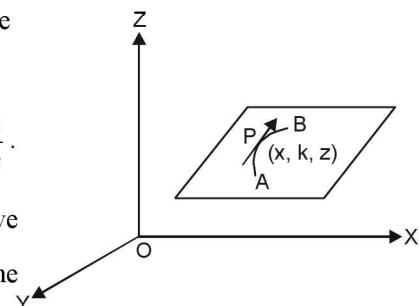

Let  $y = k$  be a plane parallel to  $XZ$ -plane, passing through  $P(x, k, z)$  cutting the surface  $z = f(x, y)$  along the curve APB.

This section APB is a plane curve whose equations are

$$\begin{aligned} z &= f(x, y) \\ y &= k \end{aligned}$$

The slope of the tangent to this curve is given by  $\frac{\partial z}{\partial x}$ .

Similarly,  $\frac{\partial z}{\partial y}$  is the slope of the tangent to the curve of intersection of the surface  $z = f(x, y)$  with a plane parallel to  $YZ$ -plane.

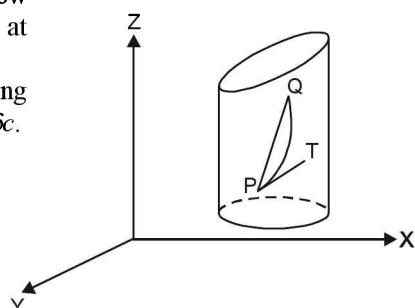

## 2.6 TANGENT PLANE TO A SURFACE

Let  $f(x, y, z) = 0$  be the equation of a surface S. Now we wish to find out the equation of a tangent plane to S at the point  $P(x_1, y_1, z_1)$ .

Let  $Q(x_1 + \delta x_1, y_1 + \delta y_1, z_1 + \delta z_1)$  be a neighbouring point to P. Let the arc  $PQ$  be  $\delta s$  and the chord  $PQ$  be  $\delta c$ .

The direction cosines of  $PQ$  are

$$\begin{aligned} \frac{\delta x}{\delta c}, \frac{\delta y}{\delta c}, \frac{\delta z}{\delta c} \\ \Rightarrow \frac{\delta x}{\delta s} \cdot \frac{\delta s}{\delta c}, \frac{\delta y}{\delta s} \cdot \frac{\delta s}{\delta c}, \frac{\delta z}{\delta s} \cdot \frac{\delta s}{\delta c} \end{aligned}$$

The  $\delta s \rightarrow 0$ ,  $Q \rightarrow P$  and  $PQ$  tends to a tangent line  $PT$ . The direction cosines of  $PT$  are

$$\frac{dx}{ds}, \quad \frac{dy}{ds}, \quad \frac{dz}{ds} \quad \dots(1)$$

Differentiating  $F(x, y, z) = 0$  w.r.t. 's', we get

$$\frac{\partial F}{\partial x} \frac{dx}{ds} + \frac{\partial F}{\partial y} \frac{dy}{ds} + \frac{\partial F}{\partial z} \frac{dz}{ds} = 0 \quad \dots(2)$$

From (1) and (2) it is clear that the tangent whose direction cosines are  $\frac{dx}{ds}, \frac{dy}{ds}, \frac{dz}{ds}$  is perpendicular to a line having direction ratios

$$\frac{\partial F}{\partial x}, \quad \frac{\partial F}{\partial y}, \quad \frac{\partial F}{\partial z} \quad \dots(3)$$

There are a number of tangent lines at  $P$  to the curves joining  $P$  and  $Q$ . All these tangents will be perpendicular to the line having direction ratios as given by (3).

Hence all these tangent lines will lie in a plane known as tangent plane.

#### Equation of tangent plane

$$(x - x_1) \frac{\partial F}{\partial x} + (y - y_1) \frac{\partial F}{\partial y} + (z - z_1) \frac{\partial F}{\partial z} = 0$$

Equation of the normal to the plane.

$$\boxed{\frac{x - x_1}{\frac{\partial F}{\partial x}} = \frac{y - y_1}{\frac{\partial F}{\partial y}} = \frac{z - z_1}{\frac{\partial F}{\partial z}}}$$

**Example 25.** Find the equation of the tangent plane and normal line to the surface

$$x^2 + 2y^2 + 3z^2 = 12 \text{ at } (1, 2, -1). \quad (\text{AMIETE, Dec. 2010})$$

**Solution.**  $F(x, y, z) = x^2 + 2y^2 + 3z^2 - 12$

$$\frac{\partial F}{\partial x} = 2x, \quad \frac{\partial F}{\partial y} = 4y, \quad \frac{\partial F}{\partial z} = 6z$$

$$\text{At the point } (1, 2, -1) \quad \frac{\partial F}{\partial x} = 2, \quad \frac{\partial F}{\partial y} = 8, \quad \frac{\partial F}{\partial z} = -6$$

Hence the equation of the tangent plane at  $(1, 2, -1)$  is

$$\begin{aligned} 2(x - 1) + 8(y - 2) - 6(z + 1) &= 0 \\ \Rightarrow 2x + 8y - 6z &= 24 \Rightarrow x + 4y - 3z = 12 \end{aligned}$$

$$\text{Equation of normal is } \frac{x-1}{2} = \frac{y-2}{8} = \frac{z+1}{-6}$$

$$\Rightarrow \frac{x-1}{1} = \frac{y-2}{4} = \frac{z+1}{-3} \quad \text{Ans.}$$

**Example 26.** Find the equations of tangent plane and the normal line to the surface

$$2x^2 + y^2 + 2z = 3 \text{ at the point } (2, 1, -3).$$

**Solution.**  $F(x, y, z) = 2x^2 + y^2 + 2z - 3 = 0$

$$\Rightarrow \frac{\partial F}{\partial x} = 4x, \quad \frac{\partial F}{\partial y} = 2y, \quad \frac{\partial F}{\partial z} = 2$$

At the point  $(2, 1, -3)$

$$\frac{\partial F}{\partial x} = 8, \quad \frac{\partial F}{\partial y} = 2, \quad \frac{\partial F}{\partial z} = 2$$

Hence, the equation of the tangent plane at  $(2, 1, -3)$  is

$$\begin{aligned} & 8(x-2) + 2(y-1) + 2(z+3) = 0 \\ \Rightarrow & 8x + 2y + 2z - 12 = 0 \\ \Rightarrow & 4x + y + z - 6 = 0 \end{aligned} \quad \text{Ans.}$$

Equation of normal is

$$\begin{aligned} \frac{x-2}{8} &= \frac{y-1}{2} = \frac{z+3}{2} \\ \Rightarrow \quad \frac{x-2}{4} &= \frac{y-1}{1} = \frac{z+3}{1} \end{aligned} \quad \text{Ans.}$$

**Example 27.** Show that the surface  $x^2 - 2yz + y^3 = 4$  is perpendicular to any number of the family of surfaces  $x^2 + 1 = (2 - 4a)y^2 + az^2$  at the point of intersection  $(1, -1, 2)$ .

**Solution.**

$$\begin{aligned} f(x, y, z) &= x^2 - 2yz + y^3 - 4 = 0 & \dots(1) \\ F(x, y, z) &= x^2 + 1 - (2 - 4a)y^2 - az^2 = 0 & \dots(2) \end{aligned}$$

$$\frac{\partial f}{\partial x} = 2x, \quad \frac{\partial f}{\partial y} = -2z + 3y^2, \quad \frac{\partial f}{\partial z} = -2y$$

Direction ratios to the normal of the tangent plane to (1) are

$$2x, -2z + 3y^2, -2y$$

DRs at the point  $(1, -1, 2)$  are  $2, -1, 2$ .

Now differentiating (2), we get

$$\frac{\partial F}{\partial x} = 2x, \quad \frac{\partial F}{\partial y} = -2(2 - 4a)y, \quad \frac{\partial F}{\partial z} = -2az.$$

Direction ratios to the normal of the tangent plane to (2) are

$$2x, (-4 + 8a)y, -2az.$$

DRs at the point  $(1, -1, 2)$  are  $2, 4 - 8a, -4a$

Now

$$\begin{aligned} l_1 l_2 + m_1 m_2 + n_1 n_2 &= (2)(2) + (-1)(4 - 8a) + 2(-4a) \\ &= 4 - 4 + 8a - 8a = 0. \end{aligned}$$

Hence the given surfaces are perpendicular at  $(1, -1, 2)$ . Ans.

### EXERCISE 2.3

1. Find the equation of tangent plane and the normal line to the surface

$$xyz = 6 \text{ at } (1, 2, 3). \quad \text{Ans. } 6x + 3y + 2z = 18, \quad \frac{x-1}{6} = \frac{y-2}{3} = \frac{z-3}{2}$$

2. Find the equations of the tangent plane and the normal to the surface  $z^2 = 4(1 + x^2 + y^2)$  at

$$(2, 2, 6). \quad \text{Ans. } 4x + 4y - 3z + 2 = 0, \quad \frac{x-2}{4} = \frac{y-2}{4} = \frac{z-6}{-3}$$

3. Find the equations of the tangent plane and the normal to the surface

$$\frac{x^2}{2} - \frac{y^2}{3} = z \text{ at } (2, 3, -1) \quad \text{Ans. } 2x - 2y - z + 1 = 0, \quad \frac{x-2}{2} = \frac{y-3}{-2} = \frac{z+6}{-1}$$

4. Show that the plane  $3x + 12y - 6z - 17 = 0$ , touch the conicoid  $3x^2 - 6y^2 + 9z^2 + 17 = 0$ .

Find also the point of contact. Ans.  $\left(1, 2, \frac{2}{3}\right)$

5. Show that the plane  $ax + by + cz + d = 0$  touches the surface  $px^2 + qy^2 + 2z = 0$ ,

$$\text{if } \frac{a^2}{p} + \frac{b^2}{q} + 2cd = 0.$$

**CHAPTER**  
**3**

## **MAXIMA AND MINIMA OF FUNCTIONS** **(TWO VARIABLES)**

---

### **3.1 MAXIMUM VALUE**

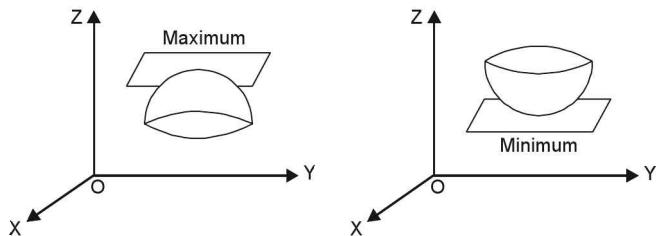

A function  $f(x, y)$  is said to have a maximum value at  $x = a, y = b$ , if there exists a small neighbourhood of  $(a, b)$  such that,

$$f(a, b) > f(a + h, b + k)$$

**Minimum Value.** A function  $f(x, y)$  is said to have a minimum value for  $x = a, y = b$ , if there exists a small neighbourhood of  $(a, b)$  such that,

$$f(a, b) < f(a + h, b + k)$$

The maximum and minimum values of a function are also called extreme or extremum values of the function.

#### **Saddle Point or Minimax**

It is a point where function is neither maximum nor minimum.

Geometrically such a surface (looks like the leather seat on the back of a horse) forms a ridge rising in one direction and falling in another direction.

### **3.2 CONDITIONS FOR EXTREMUM VALUES**

If  $f(a + h, b + k) - f(a, b)$  remains of the same sign for all values (positive or negative) of  $h, k$  then  $f(a, b)$  is said to be extremum value of  $f(x, y)$  at  $(a, b)$

(i) If  $f(a + h, b + k) - f(a, b) < 0$ , then  $f(a, b)$  is maximum.

(ii) If  $f(a + h, b + k) - f(a, b) > 0$ , then  $f(a, b)$  is minimum.

By Taylor's Theorem

$$\begin{aligned} f(a + h, b + k) &= f(a, b) + \left( h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y} \right)_{(a,b)} + \frac{1}{2!} \left[ h^2 \frac{\partial^2 f}{\partial x^2} + 2hk \frac{\partial^2 f}{\partial x \partial y} + k^2 \frac{\partial^2 f}{\partial y^2} \right] + \dots \\ \Rightarrow f(a + h, b + k) - f(a, b) &= \left( h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y} \right)_{(a,b)} \\ &\quad + \frac{1}{2!} \left[ h^2 \frac{\partial^2 f}{\partial x^2} + 2hk \frac{\partial^2 f}{\partial x \partial y} + k^2 \frac{\partial^2 f}{\partial y^2} \right] + \dots \quad \dots(1) \end{aligned}$$

$$\Rightarrow f(a + h, b + k) - f(a, b) = \left( h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y} \right)_{(a,b)} \quad \dots(2)$$

For small values of  $h, k$ , the second and higher order terms are still smaller and hence may be neglected.

The sign of L.H.S. of (2) is governed by  $h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y}$  which may be positive or negative depending on  $h, k$ .

Hence, the necessary condition for  $(a, b)$  to be a maximum or minimum is that

$$\left( h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y} \right) = 0 \Rightarrow \frac{\partial f}{\partial x} = 0, \quad \frac{\partial f}{\partial y} = 0$$

By solving the equations, we get, point  $x = a, y = b$  which may be maximum or minimum value.

Then from (1)

$$\begin{aligned} f(a+h, b+k) - f(a, b) &= \frac{1}{2!} \left[ h^2 \frac{\partial^2 f}{\partial x^2} + 2hk \frac{\partial^2 f}{\partial x \partial y} + k^2 \frac{\partial^2 f}{\partial y^2} \right] \\ &= \frac{1}{2!} [h^2 r + 2hks + k^2 t] \quad \dots(3) \\ &\text{where } r = \frac{\partial^2 f}{\partial x^2}, s = \frac{\partial^2 f}{\partial x \partial y}, t = \frac{\partial^2 f}{\partial y^2} \text{ at } (a, b) \end{aligned}$$

Now the sign of L.H.S. of (3) is sign of  $[rh^2 + 2hks + k^2 t]$

$$\begin{aligned} &= \text{sign of } \frac{1}{r} [r^2 h^2 + 2hks + k^2 rt] = \text{sign of } \frac{1}{r} [(r^2 h^2 + 2hks + k^2 s^2) + (-k^2 s^2 + k^2 rt)] \\ &= \text{sign of } \frac{1}{r} [(hr + ks)^2 + k^2(rt - s^2)] \\ &= \text{sign of } \frac{1}{r} [(\text{always } + ve) + k^2(rt - s^2)] \quad [(hr + ks)^2 = + ve] \\ &= \text{sign of } \frac{1}{r} [k^2(rt - s^2)] = \text{sign of } r \text{ if } rt - s^2 > 0 \end{aligned}$$

Hence, if  $rt - s^2 > 0$ , then  $f(x, y)$  has a maximum or minimum at  $(a, b)$  according as  $r < 0$  or  $r > 0$ .

**Note:** (i) If  $rt - s^2 < 0$ , then L.H.S. will change with  $h$  and  $k$  hence there is no maximum or minimum at  $(a, b)$ , i.e., it is a saddle point.

$$(ii) \quad \text{If } rt - s^2 = 0, \text{ then } rh^2 + 2shk + tk^2 = \frac{1}{r} [(rh + sk)^2 + k^2(rt - s^2)]$$

$$= \frac{1}{r} (rh + sk)^2 \text{ which is zero for values of } h, k, \text{ such that}$$

$$\Rightarrow \frac{h}{k} = -\frac{s}{r}$$

This is, therefore, a doubtful case, further investigation is required.

### 3.3 WORKING RULE TO FIND EXTREMUM VALUES

(i) Differentiate  $f(x, y)$  and find out

$$\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial^2 f}{\partial x^2}, \frac{\partial^2 f}{\partial x \partial y}, \frac{\partial^2 f}{\partial y^2}$$

(ii) Put  $\frac{\partial f}{\partial x} = 0$  and  $\frac{\partial f}{\partial y} = 0$  and solve these equations for  $x$  and  $y$ . Let  $(a, b)$  be the values of  $(x, y)$ .

(iii) Evaluate  $r = \frac{\partial^2 f}{\partial x^2}, s = \frac{\partial^2 f}{\partial x \partial y}, t = \frac{\partial^2 f}{\partial y^2}$  for these values  $(a, b)$ .

- (iv) If  $rt - s^2 > 0$  and

  - (a)  $r < 0$ , then  $f(x, y)$  has a maximum value.
  - (b)  $r > 0$ , then  $f(x, y)$  has a minimum value.

(v) If  $rt - s^2 < 0$ , then  $f(x, y)$  has no extremum value at the point  $(a, b)$ .

(iv) If  $rt - s^2 = 0$ , then the case is doubtful and needs further investigation.

**Note:** The point  $(a, b)$ , which are the roots of  $\frac{\partial f}{\partial x} = 0$  and  $\frac{\partial f}{\partial y} = 0$  are called stationary points.

**Example 1.** Find the absolute maximum and minimum values of

$$f(x, y) = 2 + 2x + 2y - x^2 - y^2$$

on triangular plane in the first quadrant, bounded by the lines  $x = 0$ ,  $y = 0$  and  $y = 9 - x$ . (Gujarat, I Semester, Jan. 2009)

**Solution.** We have,  $f(x, y) = 2 + 2x + 2y - x^2 - y^2$

$$\frac{\partial f}{\partial x} = 2 - 2x, \quad \frac{\partial f}{\partial y} = 2 - 2y$$

$$\frac{\partial^2 f}{\partial x^2} = -2, \quad \frac{\partial^2 f}{\partial x \partial y} = 0, \quad \frac{\partial^2 f}{\partial y^2} = -2$$

For maxima and minima,

$$\frac{\partial f}{\partial x} = 0 \quad \Rightarrow \quad 2 - 2x = 0 \quad \Rightarrow \quad x = 1$$

$$\text{and} \quad \frac{\partial f}{\partial y} = 0 \quad \Rightarrow \quad 2 - 2y = 0 \quad \Rightarrow \quad y = 1$$

$$\text{At } (1, 1) \quad r t - s^2 = (-2)(-2) - 0 = +4.$$

$$\partial^2 f$$

Here  $r = \frac{\partial^2}{\partial x^2} = -2 = -\text{ve}$

**Ans.**  
*e values.*  
 (M.U. 2008)

**Solution** We have  $f(x-y) = y^2 + 4xy + 3x^2 + x^3$

$$p = \frac{\partial f}{\partial x} = 4y + 6x + 3x^2 \quad | \quad q = \frac{\partial f}{\partial y} = 2y + 4x$$

$$r = \frac{\partial^2 f}{\partial x^2} = 6 + 6x$$

$$t = \frac{\partial^2 f}{\partial y^2} = 2$$

For maxima or minima

$$\Rightarrow \begin{array}{l} \frac{\partial f}{\partial x} = 0 \\ 4y + 6x + 3x^2 = 0 \end{array} \quad \text{and} \quad \left| \begin{array}{l} \frac{\partial f}{\partial y} = 0 \\ 2y + 4x = 0 \\ y = -2x \end{array} \right. \quad \dots(2)$$

Putting the value of  $v$  from (2) in (1), we get

$$\begin{aligned} \text{Putting the value of } y \text{ from (2) in (1), we get:} \\ \Rightarrow 4(-2x) + 6x + 3x^2 &= 0 \\ \Rightarrow 3x^2 + 6x - 8x &= 0 \\ \Rightarrow 3x^2 - 2x &= 0 \Rightarrow x(3x-2) = 0 \end{aligned}$$

$$\Rightarrow x = 0 \text{ or } x = \frac{2}{3}$$

when  $x = 0$  then  $y = 0$

$$\text{when } x = \frac{2}{3} \text{ then } y = -2 \left( \frac{2}{3} \right) = -\frac{4}{3}$$

Thus, the stationary points are  $(0, 0)$  and  $\left( \frac{2}{3}, -\frac{4}{3} \right)$ ,

	$(0, 0)$	$\left( \frac{2}{3}, -\frac{4}{3} \right)$
$r = 6 + 6x$	6	10
$s = 4$	4	4
$t = 2$	2	2
$rt - s^2$	-4	+4

At  $(0, 0)$  there is no extremum value, since  $rt - s^2 < 0$ ;

At  $\left( \frac{2}{3}, -\frac{4}{3} \right)$ ,  $rt - s^2 > 0$ ,  $r > 0$ .

Therefore  $\left( \frac{2}{3}, -\frac{4}{3} \right)$  is a point of minimum value.

$$\begin{aligned} \text{The minimum value of } f \left( \frac{2}{3}, -\frac{4}{3} \right) &= \left( \frac{-4}{3} \right)^2 + 4 \left( \frac{2}{3} \right) \left( -\frac{4}{3} \right) + 3 \left( \frac{2}{3} \right)^2 + \left( \frac{2}{3} \right)^3 \\ \Rightarrow f \left( \frac{2}{3}, -\frac{4}{3} \right) &= \frac{16}{9} - \frac{32}{9} + \frac{12}{9} + \frac{8}{27} = \frac{8}{27} - \frac{4}{9} = -\frac{4}{27} \end{aligned}$$

Ans.

**Example 3.** Show that the minimum value of  $u = xy + a^3 \left( \frac{1}{x} + \frac{1}{y} \right)$  is  $3a^2$ .

(M. U. 2002)

**Solution.** We have,

$$\begin{array}{l|l} f(x, y) = xy + a^3 \left( \frac{1}{x} + \frac{1}{y} \right) & \\ p = \frac{\partial f}{\partial x} = y - \frac{a^3}{x^2} & q = \frac{\partial f}{\partial y} = x - \frac{a^3}{y^2} \\ r = \frac{\partial^2 f}{\partial x^2} = \frac{2a^3}{x^3} & s = \frac{\partial^2 f}{\partial x \partial y} = 1 \\ t = \frac{\partial^2 f}{\partial y^2} = \frac{2a^3}{y^3} & \end{array}$$

For maxima and minima

$$\begin{array}{ll} \frac{\partial f}{\partial x} = 0 & \text{and} \quad \frac{\partial f}{\partial y} = 0 \\ \Rightarrow y - \frac{a^3}{x^2} = 0 & \Rightarrow x - \frac{a^3}{y^2} = 0 \\ \Rightarrow x^2 y = a^3 & \Rightarrow x = \frac{a^3}{y^2} \end{array} \quad \dots(1) \quad \dots(2)$$

Putting the value of  $x$  from (2) in (1), we get

$$\left( \frac{a^3}{y^2} \right)^2 y = a^3 \Rightarrow \frac{a^6}{y^3} = a^3 \Rightarrow y = a \quad \dots(3)$$

On putting the value of  $y$  from (3) in (1), we get

$$x^2 a = a^3 \Rightarrow x^2 = a^2 \Rightarrow x = \pm a$$

Thus, the stationary pairs are  $(a, a)$  and  $(-a, a)$

	$(a, a)$	$(-a, a)$
$r = \frac{2a^3}{x^3}$	2	-2
$s = 1$	1	1
$t = \frac{2a^3}{y^3}$	2	2
$rt - s^2$	+3	-5

At  $(-a, a)$ ,  $rt - s^2 = -ve$

Hence, we reject this pair.

At  $(a, a)$ ,  $r = +ve$ ,  $rt - s^2 = +ve$

Hence,  $f(x, y)$  is minimum at  $(a, a)$ .

$$\text{Minimum value} = a^2 + a^3 \left( \frac{1}{a} + \frac{1}{a} \right) = 3a^2 \quad \text{Ans.}$$

**Example 4.** Examine  $f(x, y) = x^3 + y^3 - 3axy$  for maximum and minimum values.

(GBtU, Dec. 2012, M.U. 2004, 2003; U.P. I sem. Dec. 2004)

**Solution.** We have,  $f(x, y) = x^3 + y^3 - 3axy$

$$p = \frac{\partial f}{\partial x} = 3x^2 - 3ay, \quad q = \frac{\partial f}{\partial y} = 3y^2 - 3ax$$

$$r = \frac{\partial^2 f}{\partial x^2} = 6x, \quad s = \frac{\partial^2 f}{\partial x \partial y} = -3a, \quad t = \frac{\partial^2 f}{\partial y^2} = 6y$$

For maxima and minima

$$\begin{aligned} \frac{\partial f}{\partial x} &= 0 \text{ and} & \frac{\partial f}{\partial y} &= 0. \\ 3x^2 - 3ay &= 0 & 3y^2 - 3ax &= 0 \\ \Rightarrow x^2 = ay &\Rightarrow y = \frac{x^2}{a} \quad \dots(1) & \Rightarrow y^2 = ax &\dots(2) \end{aligned}$$

Putting the value of  $y$  from (1) in (2), we get

$$\begin{aligned} x^4 &= a^3 x \Rightarrow x(x^3 - a^3) = 0 \\ \Rightarrow x(x-a)(x^2 + ax + a^2) &= 0 \\ &x = 0, a \end{aligned}$$

Putting  $x = 0$  in (1), we get  $y = 0$

Putting  $x = a$  in (1), we get  $y = a$ ,

	$(0, 0)$	$(a, a)$
$r$	0	$6a$
$s$	$-3a$	$-3a$
$t$	0	$6a$
$rt - s^2$	$-9a^2 < 0$	$27a^2 > 0$

At  $(0, 0)$  there is no extremum value, since  $rt - s^2 < 0$ .

At  $(a, a)$ ,  $rt - s^2 > 0$ ,  $r > 0$

Therefore  $(a, a)$  is a point of minimum value.

The minimum value of  $f(a, a) = a^3 + a^3 - 3a^3 = -a^3$

Ans.

**Example 5.** Show that the function

$$f(x, y) = x^3 + y^3 - 63(x + y) + 12xy$$

is maximum at  $(-7, -7)$  and minimum at  $(3, 3)$ .

**Solution.** We have,  $f(x, y) = x^3 + y^3 - 63(x + y) + 12xy$  ... (1)

$$\frac{\partial f}{\partial x} = 3x^2 - 63 + 12y, \quad \frac{\partial f}{\partial y} = 3y^2 - 63 + 12x$$

$$\frac{\partial^2 f}{\partial x^2} = 6x, \quad \frac{\partial^2 f}{\partial x \partial y} = 12, \quad \frac{\partial^2 f}{\partial y^2} = 6y$$

For extremum, we have

$$p = \frac{\partial f}{\partial x} = 3x^2 - 63 + 12y = 0 \Rightarrow x^2 + 4y - 21 = 0 \quad \dots(2)$$

$$q = \frac{\partial f}{\partial y} = 3y^2 - 63 + 12x = 0 \Rightarrow y^2 + 4x - 21 = 0 \quad \dots(3)$$

$$r = \frac{\partial^2 f}{\partial x^2} = 6x, \quad s = \frac{\partial^2 f}{\partial x \partial y} = 12, \quad t = \frac{\partial^2 f}{\partial y^2} = 6y$$

We have to solve (2) and (3) for  $x, y$ .

On subtracting (3) from (2), we have

$$x^2 - y^2 - 4(x - y) = 0 \Rightarrow (x - y)(x + y - 4) = 0 \quad \dots(4)$$

If  $x = y$  then (2) becomes,  $x^2 + 4x - 21 = 0, \quad (x + 7)(x - 3) = 0$

$$\begin{aligned} x &= -7, \text{ and } x = 3 \\ y &= -7, \text{ and } y = 3 \end{aligned}$$

Two stationary points are  $(-7, -7)$  and  $(3, 3)$

On solving (2) and (4), we get

$$\begin{aligned} x^2 + 4(4 - x) - 21 &= 0 \Rightarrow x^2 - 4x - 5 = 0 \\ \Rightarrow (x - 5)(x + 1) &= 0 \\ x &= -1, x = 5 \\ y &= 5, y = -1 \end{aligned}$$

Two more stationary points are  $(-1, 5)$  and  $(5, -1)$

Hence four possible extremum points of  $f(x, y)$  are  $(-7, -7)$ ,  $(3, 3)$ ,  $(-1, 5)$  and  $(5, -1)$  may be.

	$(-7, -7)$	$(3, 3)$	$(-1, 5)$	$(5, -1)$
$r = 6x$	-42	+18	-6	30
$s = 12$	12	12	12	12
$t = 6y$	-42	18	30	-6
$r t - s^2$	+1620	+180	-324	-324

At  $(-7, -7)$

$$r = -\text{ve}, \text{ and } r t - s^2 = +\text{ve}$$

Hence,  $f(x, y)$  is maximum at  $(-7, -7)$ .

At  $(3, 3)$

$$r = +\text{ve}, \text{ and } r t - s^2 = +\text{ve}$$

Hence  $f(x, y)$  is minimum at  $(3, 3)$ .

**Proved.**

**Example 6.** Find the points on the surface  $z^2 = xy + 1$  nearest to the origin.

(M.U. 2002, 2001; Nagpur University, Summer 2005, Winter 2004, 2002)

**Solution.** Let the point on the surface  $z^2 = xy + 1$  be  $(x, y, z)$ . ... (1)

$\therefore$  Its distance from origin is  $r = \sqrt{x^2 + y^2 + z^2}$ .

$$\text{Let } u = r^2 = x^2 + y^2 + z^2 \quad \dots(2)$$

We have to find the values of  $x, y, z$  for which ' $u$ ' is minimum.

Put the value of  $z^2$  from (1) in (2) to get the equation in two variables only.

$$u = x^2 + y^2 + xy + 1$$

For maximum or minimum, we have

$$\frac{\partial u}{\partial x} = 2x + y = 0 \quad \dots(3) \quad \text{and} \quad \frac{\partial u}{\partial y} = 2y + x = 0 \quad \dots(4)$$

Solving equations (3) and (4), we get  $x = 0, y = 0$

On putting  $x = 0, y = 0$  in  $z^2 = xy + 1$ , we get

$$z^2 = 0 + 1 = 1 \quad \therefore z = \pm 1$$

$$\text{Now, } \frac{\partial^2 u}{\partial x^2} = 2, \quad \frac{\partial^2 u}{\partial y^2} = 2, \quad \frac{\partial^2 u}{\partial x \partial y} = 1$$

$$r = 2, \quad t = 2, \quad s = 1$$

$$r t - s^2 = 2 \times 2 - (1)^2 = +3$$

But  $r = +2$ , so  $u$  in minimum for  $(0, 0, \pm 1)$

**Ans.**

**Example 7.** Divide 120 into three parts so that the sum of their products taken two at a time shall be maximum.

**Solution.** Let  $x, y, z$  be the number whose sum is 120.

$$\text{i.e., } x + y + z = 120 \Rightarrow z = 120 - x - y \quad \dots(1)$$

$$\text{Let } f = xy + yz + zx$$

$$\Rightarrow f = xy + y(120 - x - y) + x(120 - x - y) \quad [\text{Using (1)}]$$

$$\Rightarrow f = xy + 120y - xy - y^2 + 120x - x^2 - xy$$

$$\Rightarrow f = 120x + 120y - xy - x^2 - y^2$$

$$p = \frac{\partial f}{\partial x} = 120 - y - 2x \quad \left| \quad q = \frac{\partial f}{\partial y} = 120 - x - 2y \right.$$

$$r = \frac{\partial^2 f}{\partial x^2} = -2 \quad \left| \quad s = \frac{\partial^2 f}{\partial x \partial y} = -1 \right.$$

$$t = \frac{\partial^2 f}{\partial y^2} = -2$$

For maxima and minima

$$\begin{array}{l|c|c} \frac{\partial f}{\partial x} = 0 & \text{and} & \frac{\partial f}{\partial y} = 0 \\ \Rightarrow 120 - y - 2x = 0 & & \Rightarrow 120 - x - 2y = 0 \\ \Rightarrow y = 120 - 2x & & \end{array} \dots(2) \quad \dots(3)$$

Putting the value of  $y$  from (2) in (3), we get

$$\begin{aligned} 120 - x - 2(120 - 2x) &= 0 \\ \Rightarrow 120 - x - 240 + 4x &= 0 \quad \Rightarrow \quad 3x = 120 \quad \Rightarrow \quad x = 40 \end{aligned}$$

Putting the value of  $x$  in (1), we get

$$y = 120 - 2(40) = 120 - 80 = 40$$

Thus, the stationary pair is  $(40, 40)$ .

	(40, 40)
$r = -2$	-2
$s = -1$	-1
$t = -2$	-2
$r t - s^2$	+3

At  $(40, 40)$ ,  $r = -$  ve and  $rt - s^2 = +$  ve

Hence,  $f$  is maximum at  $(40, 40)$ .

Putting  $x = 40, y = 40$  in (1), we get

$$40 + 40 + z = 120 \Rightarrow z = 40$$

Hence,  $f$  is maximum at  $x = 40, y = 40$  and  $z = 40$ .

**Ans.**

**Example 8.** Divide 24 into three parts such that continued product of first, square of second and cube of third is a maximum. (Nagpur University, Summer 2005, Winter 2001)

**Solution.** Let, 24 be divided into  $x, y, z$  then  $x + y + z = 24 \Rightarrow z = 24 - x - y$

$$\text{and } f(x, y, z) = x^3 y^2 z = x^3 y^2 (24 - x - y)$$

$$\frac{\partial f}{\partial x} = 72x^2 y^2 - 4x^3 y^2 - 3x^2 y^3$$

$$\frac{\partial f}{\partial y} = 48x^3 y - 2x^4 y - 3x^3 y^2$$

For a maximum value of  $f$ ,  $\frac{\partial f}{\partial x} = 0$  and  $\frac{\partial f}{\partial y} = 0$ .

Hence, we have  $x^2 y^2 (72 - 4x - 3y) = 0$

$$\Rightarrow 72 - 4x - 3y = 0 \quad \dots(1)$$

$$\text{and } x^3 y (48 - 2x - 3y) = 0$$

$$\Rightarrow 48 - 2x - 3y = 0 \quad \dots(2)$$

By (2)  $\times 2 -$  (1), we get  $24 - 3y = 0 \Rightarrow y = 8$

$$\text{Hence, } x = \frac{48 - 24}{2} = 12$$

	$x = 12, y = 8$
$r = \frac{\partial^2 f}{\partial x^2} = 144xy^2 - 12x^2y^2 - 6xy^3$	$144.(12).(8)^2 - 12(12)^2 8^2 - 6(12)8^3 = 12(64)(-48) = -36864$
$t = \frac{\partial^2 f}{\partial y^2} = 48x^3 - 2x^4 - 6x^3y$	$48.(12)^3 - 2(12)^4 - 6(12)^3 8 = (12)^3 (-24) = -41472$
$s = \frac{\partial^2 f}{\partial x \partial y} = 144x^2y - 8x^3y - 9x^2y^2$	$144.(12)^2 (8) - 8(12)^3 8 - 9(12)^2 (8)^2 = 144(8)(-24) = -27648$
$rt - s^2$	$(-36864)(-41472) - (-27648)^2 = 764411904 > 0$

Since  $rt - s^2 > 0$  and  $r < 0$ , so  $f$  is maximum at  $(12, 8)$

Putting  $x = 12, y = 8$  in  $x + y + z = 24$ , we get  $z = 4$ .

Hence, the division is 12, 8 and 4.

**Ans.**

**Example 9.** A rectangular box, open at the top, is to have a volume of 32 c.c. Find the dimensions of the box requiring least material for its construction.

(A.M.I.E.T.E., June 2009, M.U. 2009; U.P. I semester Dec. 2005, A.M.I.E Summer 2001)

**Solution.** Let  $l, b$  and  $h$  be the length, breadth, and height of the box respectively and  $S$  its surface area and  $V$  the volume.

$$V = 32 \text{ c.c.}$$

$$\Rightarrow l b h = 32 \text{ or } b = \frac{32}{lh}$$

$$S = 2(l + b)h + lb$$

$\dots(1)$

Putting the value of  $b$  in (1), we get

$$\begin{aligned} S &= 2 \left( l + \frac{32}{lh} \right) h + l \left( \frac{32}{lh} \right) \\ S &= 2l h + \frac{64}{l} + \frac{32}{h} \end{aligned} \quad \dots(2)$$

Differentiating (2) partially w.r.t.  $l$ , we get

$$\frac{\partial S}{\partial l} = 2h - \frac{64}{l^2} \quad \dots(3)$$

Differentiating (2) partially w.r.t.  $h$ , we get

$$\frac{\partial S}{\partial h} = 2l - \frac{32}{h^2} \quad \dots(4)$$

For maximum and minimum  $S$ , we get

$$\frac{\partial S}{\partial l} = 0 \Rightarrow 2h - \frac{64}{l^2} = 0 \Rightarrow h = \frac{32}{l^2} \quad \dots(5)$$

$$\frac{\partial S}{\partial h} = 0 \Rightarrow 2l - \frac{32}{h^2} = 0 \Rightarrow l = \frac{16}{h^2} \quad \dots(6)$$

From (5) and (6),  $l = 4$ ,  $h = 2$  and  $b = 4$

$$\frac{\partial^2 S}{\partial l^2} = \frac{128}{l^3} = \frac{128}{64} = 2$$

$$\frac{\partial^2 S}{\partial l \partial h} = 2$$

$$\frac{\partial^2 S}{\partial h^2} = \frac{64}{h^3} = \frac{64}{8} = 8$$

$$\frac{\partial^2 S}{\partial l^2} \cdot \frac{\partial^2 S}{\partial h^2} - \left( \frac{\partial^2 S}{\partial l \partial h} \right)^2 = (2)(8) - (2)^2 = + 12$$

$$\frac{\partial^2 S}{\partial l^2} = + 2, \text{ so } S \text{ is minimum for } l = 4 \text{ cm, } b = 4 \text{ cm, } h = 2 \text{ cm}$$

**Ans.**

**Example 10.** In a plane triangle  $ABC$ , find the maximum value of  $\cos A \cos B \cos C$ .

(Nagpur University Summer 2000)

**Solution.**

$$\begin{aligned} \cos A \cos B \cos C &= \cos A \cos B \cos [\pi - (A + B)] \\ &= -\cos A \cos B \cos (A + B) \end{aligned}$$

Let

$$f(A, B) = -\cos A \cos B \cos (A + B)$$

$$\begin{aligned} \frac{\partial f}{\partial A} &= -\cos B [-\sin A \cos (A + B) - \cos A \sin (A + B)] \\ &= \cos B \sin [A + (A + B)] \\ &= \cos B \sin (2A + B) \end{aligned}$$

$$\begin{aligned} \frac{\partial f}{\partial B} &= -\cos A [-\sin B \cos (A + B) - \cos B \sin (A + B)] \\ &= \cos A \sin [B + (A + B)] = \cos A \sin (A + 2B) \end{aligned}$$

$$r = \frac{\partial^2 f}{\partial A^2} = 2 \cos B \cos (2A + B)$$

$$\begin{aligned} s &= \frac{\partial^2 f}{\partial A \partial B} = -\sin B \sin (2A + B) + \cos B \cos (2A + B) \\ &= \cos [B + (2A + B)] = \cos (2A + 2B) \end{aligned}$$

$$t = \frac{\partial^2 f}{\partial B^2} = 2 \cos A \cos (A + 2B)$$

For maxima and minima

$$\frac{\partial f}{\partial A} = 0 \text{ and } \frac{\partial f}{\partial B} = 0$$

$$\cos B \sin (2A + B) = 0 \quad \dots(1)$$

$$\cos A \sin (A + 2B) = 0 \quad \dots(2)$$

From (1) if  $\cos B = 0$ , then  $B = \pi/2$

$$\cos A \sin (A + 2B) = 0$$

From (2),  $\cos A \sin (A + \pi) = 0 \Rightarrow \cos A (-\sin A) = 0$

$\Rightarrow$  either  $\cos A = 0$ , i.e.  $A = \pi/2$  which is not possible.

$\sin A = 0$  i.e.  $A = 0$  or  $\pi$ , which is not possible.

$$\left[ \begin{array}{l} \therefore A + B + C = \pi \\ \frac{\pi}{2} + \frac{\pi}{2} + C = \pi \Rightarrow C = 0 \end{array} \right]$$

From (1) if  $\cos B \neq 0$ , similarly  $\cos A \neq 0$ .

$$\text{From (1), } \sin (2A + B) = 0 \Rightarrow 2A + B = \pi \quad \dots(3)$$

$$\text{From (2), } \sin (A + 2B) = 0 \Rightarrow A + 2B = \pi \quad \dots(4)$$

Solving (3) and (4), we get  $A = B = \pi/3$

$$r = 2 \cos \frac{\pi}{3} \cos \pi = 2 \times \frac{1}{2} (-1) = -1$$

$$s = \cos \frac{4\pi}{3} = -\frac{1}{2}$$

$$t = 2 \cos \frac{\pi}{3} \cos \pi = 2 \left( \frac{1}{2} \right) (-1) = -1$$

$$r t - s^2 = 1 - \frac{1}{4} = \frac{3}{4} = + \text{ve}$$

Also,  $r = -1 = - \text{ve}$

$$\Rightarrow f(A, B) \text{ is maximum at } A = B = \frac{\pi}{3}$$

$$\text{Maximum value} = f(\pi/3, \pi/3) = \cos \frac{\pi}{3} \cos \frac{\pi}{3} \cos \frac{\pi}{3}$$

$$= \left( \frac{1}{2} \right) \left( \frac{1}{2} \right) \left( \frac{1}{2} \right) = \frac{1}{8}. \quad \text{Ans.}$$

**Example 11.** Prove that if the perimeter of a triangle is constant, its area is maximum when the triangle is equilateral.

**Solution.** Let  $a, b, c$ , be the sides of a triangle whose perimeter  $2s$  is constant.

$$\text{Then } 2s = a + b + c \Rightarrow c = 2s - a - b \quad \dots(1)$$

$$\Delta = \sqrt{s(s-a)(s-b)(s-c)} = \sqrt{s(s-a)(s-b)(a+b-s)} \quad [\text{Using (1)}]$$

$$\text{Let } z = \Delta^2 = s(s-a)(s-b)(a+b-s) = f(a, b)$$

$$\frac{\partial f}{\partial a} = s(s-b) \frac{\partial}{\partial a} [(s-a)(a+b-s)]$$

$$= s(s-b) [-(a+b-s) + (s-a)] = s(s-b)(2s-2a-b)$$

$$\frac{\partial f}{\partial b} = s(s-a) \frac{\partial}{\partial b} [(s-b)(a+b-s)]$$

$$= s(s-a) [- (a+b-s) + (s-b)] = s(s-a) (2s-a-2b)$$

Now,  $\frac{\partial f}{\partial a} = 0$  and  $\frac{\partial f}{\partial b} = 0$

$$\Rightarrow s(s-b)(2s-2a-b) = 0 \quad \text{and } s(s-a)(2s-a-2b) = 0$$

$$\Rightarrow (s-b)(2s-2a-b) = 0 \quad \dots(2) \Rightarrow (s-a)(2s-a-2b) = 0 \quad \dots(3) [\because s \neq 0]$$

From (2),  $s = b$  or  $2s = 2a + b$

When  $s = b$ , from (3),  $(b-a)(-a) = 0 \Rightarrow b = a$   $[\because a \neq 0]$

When  $2s = 2a + b$ , from (3),  $\frac{b}{2}(a-b) = 0$  or  $a = b$   $[\because b \neq 0]$

If we express  $z$  as a function of  $b$  and  $c$ , we similarly get  $b = c$

$$\therefore a = b = c = \frac{2s}{3}$$

$$\frac{\partial^2 f}{\partial a^2} = -2s(s-b) \Rightarrow \frac{\partial^2 f}{\partial b^2} = -2s(s-a)$$

$$\frac{\partial^2 f}{\partial a \partial b} = s[-(2s-a-2b)-(s-a)] = s(2a+2b-3s)$$

$$\frac{\partial^2 f}{\partial a^2} = -2s\left(\frac{s}{3}\right) = -\frac{2s^2}{3} < 0$$

$$\frac{\partial^2 f}{\partial a \partial b} = s\left(\frac{4s}{3} + \frac{4s}{3} - 3s\right) = s\left(-\frac{s}{3}\right) = -\frac{s^2}{3}$$

$$\frac{\partial^2 f}{\partial b^2} = -2s\left(\frac{s}{3}\right) = -\frac{2s^2}{3}$$

$$\frac{\partial^2 f}{\partial a^2} \frac{\partial^2 f}{\partial b^2} - \left(\frac{\partial^2 f}{\partial a \partial b}\right)^2 = \frac{4s^4}{9} - \frac{s^4}{9} = \frac{s^4}{3} > 0. \text{ Also } \frac{\partial^2 f}{\partial a^2} < 0$$

Hence,  $\Delta$  is maximum when  $a = b = c = \frac{2s}{3}$  i.e. when the triangle is equilateral. **Proved.**

**Example 12.** Show that the diameter of the right circular cylinder of greatest curved surface which can be inscribed in a given cone is equal to the radius of the cone.

(R.G.P.V. Bhopal, April 2010)

**Solution.** Let  $R$  be the radius of the cone  $ABC$  and  $H$  be the height of the cone.

A cylinder  $PQRS$  of radius  $r$  and height  $h$  is inscribed in the cone.

In  $\Delta APT$  and  $\Delta PBQ$

$$\frac{AT}{PQ} = \frac{PT}{BQ} \Rightarrow \frac{H-h}{h} = \frac{r}{R-r} \Rightarrow \left(\frac{H}{h} - 1\right) = \frac{r}{R-r} \Rightarrow \frac{H}{h} = \frac{r}{R-r} + 1$$

$$\frac{H}{h} = \frac{r+R-r}{R-r} \Rightarrow \frac{H}{h} = \frac{R}{R-r} \Rightarrow h = \frac{R-r}{R} H$$

Let the curved surface of the cylinder be  $S$ .

$$S = 2\pi r h$$

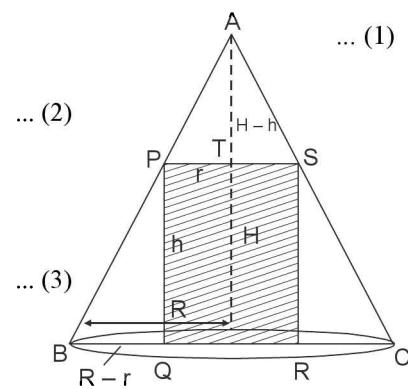

Putting the value of  $h$  from (1) in (2), we get

$$S = 2\pi r \frac{R-r}{R} H$$

$$= \frac{2\pi H}{R} (rR - r^2)$$

Differentiating (3) w.r.t. ' $r$ ', we get

$$\frac{\partial S}{\partial r} = \frac{2\pi H}{R} (R-2r)$$

$$\frac{\partial^2 S}{\partial r^2} = \frac{2\pi H}{R} (-2) = -\frac{4\pi H}{R} = -Ve$$

For maximum curved surface area  $\frac{\partial S}{\partial r} = 0$

$$\Rightarrow \frac{2\pi H}{R} (R - 2r) = 0 \Rightarrow R - 2r = 0 \Rightarrow R = 2r \text{ and } \frac{\partial^2 S}{\partial r^2} = -Ve$$

Hence, for maximum 'S', Diameter of the cylinder = Radius of the cone. **Proved.**

### EXERCISE 3.1

Find the stationary points of the following functions

1.  $f(x, y) = x^3 y^2 (1 - x - y)$  [A.M.I.E., Summer 2004] **Ans.**  $\left(\frac{1}{2}, \frac{1}{3}\right)$ , Maximum

2.  $f(x, y) = x^3 + 3xy^2 - 15x^2 - 15y^3 + 72x$ . (M.U. 2007, 2005, 2004) **Ans.** (6, 0), (4 0)

3.  $f(x, y) = x^2 + 2xy + 2y^2 + 2x + 3y$  such that  $x^2 - y = 1$ . **Ans.**  $\left(-\frac{3}{4}, -\frac{7}{16}\right)$ ,  $-\frac{155}{128}$ .

4.  $f(x, y) = xy e^{-(2x+3y)}$  (A.M.I.E., Winter 2000) **Ans.** (3, 2)

5. Find the extreme value of the function  $f(x, y) = x^2 + y^2 + xy + x - 4y + 5$ .

State whether this value is a relative maximum or a relative minimum.

**Ans.** Minimum value of  $f(x, y)$  at  $(-2, 3) = -2$ .

6. Find the values of  $x$  and  $y$  for which  $x^2 + y^2 + 6x + 12$  has a minimum value and find this minimum value. **Ans.**  $(-3, 0)$ , 3.

7. In a plane triangle  $ABC$ , find the maximum value of  $\cos A \cos B \cos C$ .

8. Find a point within a triangle such that the sum of the square of its distances from the three angular points is a minimum.

9. Find the maximum and minimum values of  $x^3 + 3xy^2 - 3x^2 - 3y^2 + 4$ . (M.U. 2006) **Ans.** Maximum at  $(0, 0)$  and minimum  $(2, 0)$

10. Test the function  $f(x, y) = (x^2 + y^2) e^{-(x^2 + y^2)}$  for maxima and minima for limits not on the circle  $x^2 + y^2 = 1$ . (U.P. Q. Bank 2001)

**Tick (✓) the correct answer in the following :**

11. One of the stationary values of the function  $f(x, y) = x^4 + y^4 - 2x^2 + 4xy - 2y^2$  is

- (a)  $(\sqrt{2}, -\sqrt{2})$  (b)  $(2, -2)$  (c)  $(\sqrt{2}, \sqrt{2})$  (d)  $(-2, 2)$   
(AMIETE, June 2009)

### 3.4 LAGRANGE METHOD OF UNDETERMINED MULTIPLIERS

Let  $f(x, y, z)$  be a function of three variables  $x, y, z$  and the variables be connected by the relation.

$$\phi(x, y, z) = 0 \quad \dots(1)$$

$\Rightarrow f(x, y, z)$  to have stationary values,

$$\frac{\partial f}{\partial x} = 0, \frac{\partial f}{\partial y} = 0, \frac{\partial f}{\partial z} = 0 \quad \dots(2)$$

$$\Rightarrow \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz = 0 \quad \dots(2)$$

By total differentiation of (1), we get

$$\frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz = 0 \quad \dots(3)$$

Multiplying (3) by  $\lambda$  and adding to (2), we get

$$\left( \frac{\partial f}{\partial x} dx + \lambda \frac{\partial \phi}{\partial x} dx \right) + \left( \frac{\partial f}{\partial y} dy + \lambda \frac{\partial \phi}{\partial y} dy \right) + \left( \frac{\partial f}{\partial z} dz + \lambda \frac{\partial \phi}{\partial z} dz \right) = 0$$

$$\left( \frac{\partial f}{\partial x} + \lambda \frac{\partial \phi}{\partial x} \right) dx + \left( \frac{\partial f}{\partial y} + \lambda \frac{\partial \phi}{\partial y} \right) dy + \left( \frac{\partial f}{\partial z} + \lambda \frac{\partial \phi}{\partial z} \right) dz = 0$$

This equation will hold good if

$$\frac{\partial f}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \quad \dots(4)$$

$$\frac{\partial f}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \quad \dots(5)$$

$$\frac{\partial f}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \quad \dots(6)$$

On solving (1), (4), (5), (6), we can find the values of  $x$ ,  $y$ ,  $z$  and  $\lambda$  for which  $f(x, y, z)$  has stationary value.

**Draw Back** in Lagrange method is that the nature of stationary point cannot be determined.

**Example 13.** The shape of a hole pored by a drill is a cone surmounted by cylinder. If the cylinder be of height  $h$  and radius  $r$  and the semi-vertical angle of the cone be  $\alpha$ , where

$\tan \alpha = \frac{h}{r}$  show that for a total height  $H$  of the hole, the volume removed is maximum if

$h = H (\sqrt{7} + 1) / 6$ . (R.G.P.V., Bhopal I sem. 2003)

**Solution.** Let  $ABCD$  be the given cylinder of height ' $h$ ' and radius ' $r$ ' and  $DPC$  be the cone of course, of radius  $r$ .

Now, since  $\alpha$  is the semi-vertical angle of the cone.

$$\therefore \tan \alpha = \frac{PC}{OP} = \frac{r}{OP} \quad \dots(1)$$

$$\text{but, given that } \tan \alpha = \frac{h}{r} \quad \dots(2)$$

$$\text{From (1) and (2), we have } \frac{h}{r} = \frac{r}{OP} \quad \dots(3)$$

$$\Rightarrow OP = \frac{r^2}{h} \quad \dots(4)$$

Total height of the hole =  $H$

$$\Rightarrow H = h + OP \Rightarrow OP = H - h \quad \dots(5)$$

From (3) and (4)

$$\frac{r^2}{h} = H - h \quad \dots(6)$$

$$\text{Again, let } \phi = H - h - \frac{r^2}{h} \quad \dots(6)$$

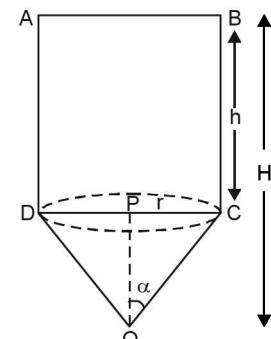

In drilling a hole, the volume of the removed portion

$$\frac{\partial \phi}{\partial r} = -\frac{2r}{h}, \quad \frac{\partial \phi}{\partial h} = -1 + \frac{r^2}{h^2}$$

$V$  = Volume of the cylinder + Volume of the cone.

$$= \pi r^2 h + \frac{1}{3} \pi r^2 (OP) = \pi r^2 h + \frac{1}{3} \pi r^2 \cdot \frac{r^2}{h} \quad [\text{From (3)}]$$

$$V = \pi r^2 h + \frac{\pi r^4}{3h},$$

$$\frac{\partial V}{\partial r} = 2\pi rh + \frac{4\pi r^3}{3h} \quad \dots(7)$$

By Lagrange Method

$$\frac{\partial V}{\partial r} + \lambda \frac{\partial \phi}{\partial r} = 0 \Rightarrow 2\pi rh + \frac{4\pi r^3}{3h} + \lambda \left( \frac{-2r}{h} \right) = 0 \quad \dots(8)$$

$$\frac{\partial V}{\partial h} + \lambda \frac{\partial \phi}{\partial h} = 0 \Rightarrow \pi r^2 - \frac{\pi r^4}{3h^2} + \lambda \left( -1 + \frac{r^2}{h^2} \right) = 0 \quad \dots(9)$$

Multiplying (8) by  $r$  and (9) by  $2h$ , we get

$$2\pi r^2 h + \frac{4\pi r^4}{3h} + \lambda \left( \frac{-2r^2}{h} \right) = 0 \Rightarrow 2\pi r^2 h - \frac{2\pi r^4}{3h} + 2\lambda \left( -h + \frac{r^2}{h} \right) = 0$$

On subtracting, we get

$$\frac{6\pi r^4}{3h} + \lambda \left( \frac{-2r^2}{h} + 2h - \frac{2r^2}{h} \right) = 0 \Rightarrow \frac{6\pi r^4}{3h} + \lambda \left( \frac{-4r^2}{h} + 2h \right) = 0$$

$$2\pi r^4 + \lambda (-4r^2 + 2h^2) = 0 \Rightarrow \pi r^4 + \lambda (-2r^2 + h^2) = 0$$

$$\Rightarrow \lambda = \frac{\pi r^4}{-h^2 + 2r^2}$$

Putting the value of  $\lambda$  in (8), we get

$$2\pi rh + \frac{4\pi r^3}{3h} + \left( \frac{\pi r^4}{-h^2 + 2r^2} \right) \left( -\frac{2r}{h} \right) = 0$$

$$\Rightarrow h + \frac{2r^2}{3h} + \frac{r^4}{h(h^2 - 2r^2)} = 0 \quad \left[ \frac{r^2}{h} = H - h \right]$$

$$h + \frac{2}{3}(H-h) + \frac{h^2(H-h)^2}{h[h^2 - 2h(H-h)]} = 0$$

$$h + \frac{2}{3}(H-h) + \frac{(H^2 + h^2 - 2hH)}{h-2H+2h} = 0$$

$$h + \frac{2}{3}(H-h) + \frac{H^2 + h^2 - 2hH}{3h-2H} = 0$$

$$3h^2 - 2Hh + \frac{2}{3}(H-h)(3h-2H) + H^2 + h^2 - 2hH = 0$$

$$9h^2 - 6Hh + 6Hh - 4H^2 - 6h^2 + 4Hh + 3H^2 + 3h^2 - 6hH = 0$$

$$6h^2 - 2hH - H^2 = 0$$

$$h = \frac{2H \pm \sqrt{4H^2 + 24H^2}}{12}$$

$$h = \frac{H \pm H\sqrt{7}}{6} = H \frac{[\sqrt{7} \pm 1]}{6} \quad (\text{ve is not possible})$$

**Proved.**

**Example 14.** Find the minimum value of  $x^2 + y^2 + z^2$  subject to the condition  $xyz = a^3$ .

(A.M.I.T.E., June 2009)

**Solution.** Let  $f(x, y) = x^2 + y^2 + z^2$  and  $\phi(x, y) = xyz - a^3$  ...(1)

$\phi(x, y) = xyz - a^3$  ...(2)

By Lagrange's method

$$\frac{\partial f}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \Rightarrow 2x + \lambda(yz) = 0 \quad \dots(3)$$

$$\frac{\partial f}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \Rightarrow 2y + \lambda(xz) = 0 \quad \dots(4)$$

$$\frac{\partial f}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \Rightarrow 2z + \lambda(xy) = 0 \quad \dots(5)$$

On multiplying (3) by  $x$ , (4) by  $y$  and (5) by  $z$ , we get

$$2x^2 + \lambda(xyz) = 0 \quad \dots(6)$$

$$2y^2 + \lambda(xyz) = 0 \quad \dots(7)$$

$$2z^2 + \lambda(xyz) = 0 \quad \dots(8)$$

On subtracting (7) from (6), we get

$$2x^2 - 2y^2 = 0 \Rightarrow x = y$$

On subtracting (8) from (7), we get

$$2y^2 - 2z^2 = 0 \Rightarrow y = z$$

so  $x = y = z$

Now, putting the value of  $y$  and  $z$  in term of  $x$  in (2), we get

$$(x)(x)(x) = a^3 \Rightarrow x^3 = a^3 \Rightarrow x = a$$

$$\Rightarrow y = a, z = a$$

Putting the values of  $x, y, z$  in (1), we get

$$f(x, y) = a^2 + a^2 + a^2 = 3a^2$$

Hence, the minimum value of  $f(x, y) = 3a^2$

**Ans.**

**Example 15.** Find the point upon the plane  $ax + by + cz = p$  at which the function

$$f = x^2 + y^2 + z^2$$

has a minimum value and find this minimum f. (Nagpur University, Winter 2000)

**Solution.** We have,  $f = x^2 + y^2 + z^2 \quad \dots(1)$

$$ax + by + cz = p \Rightarrow \phi = ax + by + cz - p \quad \dots(2)$$

$$\frac{\partial f}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \Rightarrow 2x + \lambda a = 0 \Rightarrow x = \frac{-\lambda a}{2}$$

$$\frac{\partial f}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \Rightarrow 2y + \lambda b = 0 \Rightarrow y = \frac{-\lambda b}{2}$$

$$\frac{\partial f}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \Rightarrow 2z + \lambda c = 0 \Rightarrow z = \frac{-\lambda c}{2}$$

Substituting the values of  $x, y, z$  in (2), we get

$$a\left(\frac{-\lambda a}{2}\right) + b\left(\frac{-\lambda b}{2}\right) + c\left(\frac{-\lambda c}{2}\right) = p$$

$$\lambda(a^2 + b^2 + c^2) = -2p \Rightarrow \lambda = \frac{-2p}{a^2 + b^2 + c^2}$$

$$\therefore x = \frac{ap}{a^2 + b^2 + c^2}, \quad y = \frac{bp}{a^2 + b^2 + c^2}, \quad z = \frac{cp}{a^2 + b^2 + c^2}$$

$$\begin{aligned} \text{The minimum value of } f &= \frac{a^2 p^2}{(a^2 + b^2 + c^2)^2} + \frac{b^2 p^2}{(a^2 + b^2 + c^2)^2} + \frac{c^2 p^2}{(a^2 + b^2 + c^2)^2} \\ &= \frac{p^2(a^2 + b^2 + c^2)}{(a^2 + b^2 + c^2)^2} = \frac{p^2}{a^2 + b^2 + c^2} \end{aligned} \quad \text{Ans.}$$

**Example 16.** Find the maximum value of  $u = x^p y^q z^r$  when the variables  $x, y, z$  are subject to the condition  $ax + by + cz = p + q + r$ .

**Solution.** Here, we have  $u = x^p y^q z^r \quad \dots(1)$

If  $\log u = p \log x + q \log y + r \log z \quad \dots(2)$

$$\begin{aligned}\frac{l}{u} \frac{\partial u}{\partial x} &= \frac{p}{x} \Rightarrow \frac{\partial u}{\partial x} = \frac{pu}{x} \\ \frac{l}{u} \frac{\partial u}{\partial y} &= \frac{q}{y} \Rightarrow \frac{\partial u}{\partial y} = \frac{qu}{y} \\ \frac{l}{u} \frac{\partial u}{\partial z} &= \frac{r}{z} \Rightarrow \frac{\partial u}{\partial z} = \frac{ru}{z} \\ ax + by + cz &= p + q + r \\ \phi(x, y, z) &= ax + by + cz - p - q - r \\ \frac{\partial \phi}{\partial x} &= a, \quad \frac{\partial \phi}{\partial y} = b, \quad \frac{\partial \phi}{\partial z} = c\end{aligned}$$

Lagranges equations are

$$\begin{aligned}\frac{\partial u}{\partial x} + \lambda \frac{\partial \phi}{\partial x} &= 0 \Rightarrow \frac{pu}{x} + \lambda a = 0 \Rightarrow x = -\frac{pu}{\lambda a} \\ \frac{\partial u}{\partial y} + \lambda \frac{\partial \phi}{\partial y} &= 0 \Rightarrow \frac{qu}{y} + \lambda b = 0 \Rightarrow y = -\frac{qu}{\lambda b} \\ \frac{\partial u}{\partial z} + \lambda \frac{\partial \phi}{\partial z} &= 0 \Rightarrow \frac{ru}{z} + \lambda c = 0 \Rightarrow z = -\frac{ru}{\lambda c}\end{aligned}$$

Putting in  $ax + by + cz = p + q + r$  we have

$$\begin{aligned}-\frac{pu}{\lambda} - \frac{qu}{\lambda} - \frac{ru}{\lambda} &= p + q + r \\ -\frac{u}{\lambda}(p+q+r) &= p + q + r, \Rightarrow -\frac{u}{\lambda} = 1, \Rightarrow \lambda = -u \\ x &= -\frac{pu}{\lambda a} = \frac{-pu}{-ua} = \frac{p}{a} \quad y = -\frac{qu}{\lambda b} = \frac{-qu}{-ub} = \frac{q}{b} \\ z &= -\frac{ru}{\lambda c} = \frac{-ru}{-uc} = \frac{r}{c}\end{aligned}$$

Putting in (1), we have

$$\text{Maximum value of } u = \left(\frac{p}{a}\right)^p \left(\frac{q}{b}\right)^q \left(\frac{r}{c}\right)^r \quad \text{Ans.}$$

**Example 17.** If  $xyz = 8$ , find the value of  $x, y, z$  for which  $u = \frac{5xyz}{x+2y+4z}$  is maximum.  
(K. University Dec. 2008)

**Solution.** Here, we have

$$u = \frac{5xyz}{x+2y+4z} \quad \dots (1)$$

$$xyz = 8 \Rightarrow xyz - 8 = 0 \quad \text{Let } \phi = xyz - 8 = 0 \quad \dots (2)$$

$$\begin{aligned}\frac{\partial u}{\partial x} &= \frac{(x+2y+4z)5yz - 5xyz(1)}{(x+2y+4z)^2} = \frac{5yz(x+2y+4z-x)}{(x+2y+4z)^2} \\ &= \frac{10y^2z + 20yz^2}{(x+2y+4z)^2}\end{aligned}$$

$$\text{Similarly } \frac{\partial u}{\partial y} = \frac{5x^2z + 20xz^2}{(x+2y+4z)^2}, \text{ and } \frac{\partial u}{\partial z} = \frac{5x^2y + 10xy^2}{(x+2y+4z)^2}$$

Lagrange's equations are

$$\frac{\partial u}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \Rightarrow \frac{10y^2z + 20yz^2}{(x+2y+4z)^2} + \lambda yz = 0 \quad \dots (3)$$

$$\frac{\partial u}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \Rightarrow \frac{5x^2z + 20xz^2}{(x+2y+4z)^2} + \lambda xz = 0 \quad \dots (4)$$

$$\frac{\partial u}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \Rightarrow \frac{5x^2y + 10xy^2}{(x+2y+4z)^2} + \lambda xy = 0 \quad \dots (5)$$

On multiplying (3) by  $x$  and (4) by  $y$  and then subtracting, we get

$$\begin{aligned} \frac{10xy^2z + 20xyz^2}{(x+2y+4z)^2} - \frac{5x^2yz + 20xyz^2}{(x+2y+4z)^2} &= 0 \Rightarrow 10xy^2z + 20xyz^2 - 5x^2yz - 20xyz^2 = 0 \\ \Rightarrow 10xy^2z - 5x^2yz &= 0, \Rightarrow 2y = x \end{aligned} \quad \dots (6)$$

On multiplying (4) by  $y$  and (5) by  $z$  and then subtracting, we get

$$\begin{aligned} \frac{5x^2yz + 20xyz^2}{(x+2y+4z)^2} - \frac{5x^2yz + 10xy^2z}{(x+2y+4z)^2} &= 0 \Rightarrow 5x^2yz + 20xy^2z - 5x^2yz - 10xy^2z = 0 \\ \Rightarrow 20xy^2z - 10xy^2z &= 0 \Rightarrow 2z = y \end{aligned}$$

But  $x = 2y = 2(2z) = 4z \Rightarrow x = 4z$

On putting  $x = 4z$ ,  $y = 2z$  in (2), we get

$$\begin{aligned} (4z)(2z)z &= 8 \\ x = 4, \quad y = 2, \quad z = 1 & \Rightarrow 8z^3 = 8 \Rightarrow z^3 = 1 \Rightarrow z = 1 \end{aligned} \quad \text{Ans.}$$

**Example 18.** Show that the stationary value of  $u = x^m y^n z^p$

where  $x + y + z = a$  is  $\frac{m^m n^n p^p a^{m+n+p}}{(m+n+p)^{m+n+p}}$  (Nagpur University, Summer 2003)

**Solution.** Here, we have  $u = x^m y^n z^p$  and

$$\phi = x + y + z - a$$

$$\frac{\partial u}{\partial x} = mx^{m-1} y^n z^p,$$

$$\frac{\partial u}{\partial y} = n x^m y^{n-1} z^p,$$

$$\frac{\partial u}{\partial z} = p x^m y^n z^{p-1},$$

$$\frac{\partial \phi}{\partial x} = 1$$

$$\frac{\partial \phi}{\partial y} = 1$$

$$\frac{\partial \phi}{\partial z} = 1$$

By Lagrange's Method

$$\frac{\partial u}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \Rightarrow mx^{m-1} y^n z^p + \lambda = 0 \quad \dots (3)$$

$$\frac{\partial u}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \Rightarrow n x^m y^{n-1} z^p + \lambda = 0 \quad \dots (4)$$

$$\frac{\partial u}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \Rightarrow p x^m y^n z^{p-1} + \lambda = 0 \quad \dots (5)$$

Multiplying (3), (4), (5) by  $x, y, z$  respectively and adding, we get

$$\begin{aligned} x^m y^n z^p (m+n+p) + \lambda (x+y+z) &= 0 \\ \Rightarrow x^m y^n z^p (m+n+p) + \lambda a &= 0 \end{aligned} \quad [\text{From (2)}]$$

$$\Rightarrow \lambda = -\frac{x^m y^n z^p (m+n+p)}{a}$$

Putting the value of  $\lambda$  in (3), we get

$$\begin{aligned} m x^{m-1} y^n z^p - \frac{x^m y^n z^p (m+n+p)}{a} = 0 &\Rightarrow m - x \frac{(m+n+p)}{a} = 0 \\ \Rightarrow \frac{m}{x} = \frac{m+n+p}{a} &\Rightarrow x = \frac{am}{m+n+p} \end{aligned}$$

$$\text{Similarly, } y = \frac{an}{m+n+p} \quad \text{and} \quad z = \frac{ap}{m+n+p}$$

Putting the values of  $x, y$  and  $z$  in (1), we get

$$\begin{aligned} u &= \left( \frac{am}{m+n+p} \right)^m \cdot \left( \frac{an}{m+n+p} \right)^n \cdot \left( \frac{ap}{m+n+p} \right)^p \\ u &= \frac{m^m n^n p^p a^{m+n+p}}{(m+n+p)^{m+n+p}} \end{aligned}$$

**Proved.**

**Example 19.** Show that the rectangular solid of maximum volume that can be inscribed in a sphere is a cube.

**Solution.** Let  $2x, 2y, 2z$  be the length, breadth and height of the rectangular solid.

Let  $R$  be the radius of the sphere.

$$\text{Volume of solid } V = 8 x \cdot y \cdot z \quad \dots(1)$$

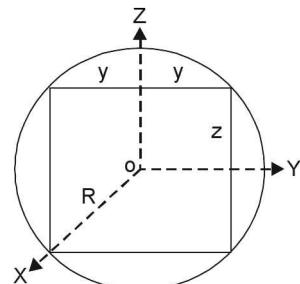

$$x^2 + y^2 + z^2 = R^2 \quad \dots(2)$$

$$\Rightarrow \phi(x, y, z) = x^2 + y^2 + z^2 - R^2 = 0$$

$$\frac{\partial V}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \Rightarrow 8yz + \lambda(2x) = 0 \quad \dots(3)$$

$$\frac{\partial V}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \Rightarrow 8xz + \lambda(2y) = 0 \quad \dots(4)$$

$$\frac{\partial V}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \Rightarrow 8xy + \lambda(2z) = 0 \quad \dots(5)$$

$$\text{From (3)} \quad 2\lambda x = -8yz \Rightarrow 2\lambda x^2 = -8xyz$$

$$\text{From (4)} \quad 2\lambda y = -8xz \Rightarrow 2\lambda y^2 = -8xyz$$

$$\text{From (5)} \quad 2\lambda z = -8xy \Rightarrow 2\lambda z^2 = -8xyz$$

$$2\lambda x^2 = 2\lambda y^2 = 2\lambda z^2$$

$$\Rightarrow x^2 = y^2 = z^2 \Rightarrow x = y = z$$

Hence rectangular solid is a cube.

**Proved.**

**Example 20.** If  $x, y, z$  are the length of the perpendiculars dropped any point  $P$  to the three sides of a triangle of constant area  $A$ , find the minimum value of  $x^2 + y^2 + z^2$ .

(Nagpur University, Summer 2004)

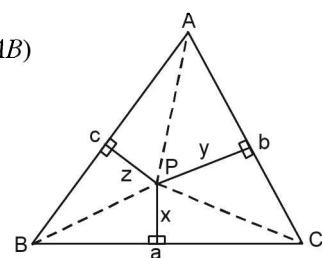

**Solution.** Let  $x, y, z$  are the length of the perpendiculars dropped from point  $P$  to the three sides  $a, b$  and  $c$  of a triangle.

$$\text{Area}(\Delta ABC) = \text{Area}(\Delta PBC) + \text{Area}(\Delta PAC) + \text{Area}(\Delta PAB)$$

$$\therefore \text{Area of triangle} = \frac{1}{2} x a + \frac{1}{2} y b + \frac{1}{2} z c$$

$$A = \frac{1}{2} x a + \frac{1}{2} y b + \frac{1}{2} z c \quad \dots(1)$$

$$\therefore \phi(x, y, z) = \frac{1}{2} x a + \frac{1}{2} y b + \frac{1}{2} z c - A = 0$$

$$F(x, y, z) = x^2 + y^2 + z^2$$

∴ Lagranges multiplier method

$$\frac{\partial F}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \Rightarrow 2x + \lambda \frac{1}{2}a = 0 \quad \dots(2)$$

$$\frac{\partial F}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \Rightarrow 2y + \lambda \frac{1}{2}b = 0 \quad \dots(3)$$

$$\frac{\partial F}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \Rightarrow 2z + \lambda \frac{1}{2}c = 0 \quad \dots(4)$$

Multiplying (2) by  $x$ , (3) by  $y$  and (4) by  $z$  and adding, we get

$$2(x^2 + y^2 + z^2) + \lambda \left[ \frac{1}{2}xa + \frac{1}{2}yb + \frac{1}{2}zc \right] = 0$$

$$\therefore 2F + \lambda A = 0 \Rightarrow \lambda = \frac{-2F}{A}$$

$$\text{From (2), } 2x - \frac{2F}{A} \cdot \frac{1}{2}a = 0 \Rightarrow x = \frac{aF}{2A}$$

$$\text{From (3), } 2y - \frac{2F}{A} \cdot \frac{1}{2}b = 0 \Rightarrow y = \frac{bF}{2A}$$

$$\text{From (4), } 2z - \frac{2F}{A} \cdot \frac{1}{2}c = 0 \Rightarrow z = \frac{cF}{2A}$$

Putting the values of  $x, y, z$  in (1), we get

$$A = \frac{1}{2} \frac{aF}{2A} \cdot a + \frac{1}{2} \frac{bF}{2A} \cdot b + \frac{1}{2} \frac{cF}{2A} \cdot c = \frac{F}{4A} [a^2 + b^2 + c^2]$$

$$\Rightarrow 4A^2 = F(a^2 + b^2 + c^2) \Rightarrow F = \frac{4A^2}{a^2 + b^2 + c^2}$$

$$\text{Hence, } x^2 + y^2 + z^2 = \frac{4A^2}{a^2 + b^2 + c^2} \quad \text{Ans.}$$

**Example 21.** Find the dimension of rectangular box of maximum capacity whose surface area is given when (a) box is open at the top (b) box is closed. (U.P., I Semester, Dec 2008)

**Solution.** Let  $x, y, z$  be the length, breadth and height of rectangular box respectively. Then

$$\text{volume, } V = xyz \Rightarrow \frac{\partial V}{\partial x} = yz, \frac{\partial V}{\partial y} = xz, \frac{\partial V}{\partial z} = xy$$

(a) **Surface of open rectangular box**

$$\text{Surface area, } S_1 = xy + 2(yz + zx)$$

$$\Rightarrow \frac{\partial S_1}{\partial x} = y + 2z, \frac{\partial S_1}{\partial y} = x + 2z, \frac{\partial S_1}{\partial z} = 2(x + y)$$

By Lagrange's method

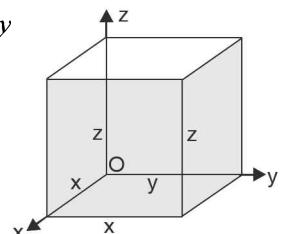

$$\frac{\partial V}{\partial x} + \lambda \frac{\partial S_1}{\partial x} = 0 \Rightarrow yz + [y + 2z]\lambda = 0 \quad \dots(1)$$

$$\frac{\partial V}{\partial y} + \lambda \frac{\partial S_1}{\partial y} = 0 \Rightarrow xz + [x + 2z]\lambda = 0 \quad \dots(2)$$

$$\frac{\partial V}{\partial z} + \lambda \frac{\partial S_1}{\partial z} = 0 \Rightarrow xy + [2y + 2x]\lambda = 0 \quad \dots(3)$$

Multiplying (1) by  $x$ , (2) by  $y$  and subtracting, we get

$$2z(x - y)\lambda = 0 \Rightarrow x = y \quad \dots(4)$$

Multiplying (2) by  $y$  and (3) by  $z$  and then subtracting, we get

$$x(y - 2z)\lambda = 0 \Rightarrow y = 2z \quad \dots(5)$$

From (4) and (5), we get

$$x = y = 2z$$

$\Rightarrow$  Length = Breadth =  $2 \times$  Height.

(b) **Surface of closed rectangular box:**

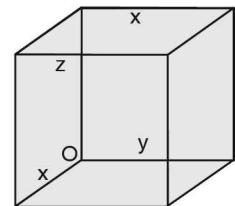

$$\text{Surface area } S_2 = 2(xy + yz + zx) \Rightarrow \frac{\partial S_2}{\partial x} = 2(y + z), \frac{\partial S_2}{\partial y} = 2(x + z), \frac{\partial S_2}{\partial z} = 2(x + y)$$

By Lagrange's method, we have

$$\frac{\partial V}{\partial x} + \lambda \frac{\partial S_2}{\partial x} = 0 \Rightarrow yz + 2(y + z)\lambda = 0 \quad \dots(6)$$

$$\frac{\partial V}{\partial y} + \lambda \frac{\partial S_2}{\partial y} = 0 \Rightarrow xz + 2(x + z)\lambda = 0 \quad \dots(7)$$

$$\frac{\partial V}{\partial z} + \lambda \frac{\partial S_2}{\partial z} = 0 \Rightarrow xy + 2(y + x)\lambda = 0 \quad \dots(8)$$

Multiplying (6) by  $x$  and (7) by  $y$  and then subtracting, we get

$$2z(x - y)\lambda = 0 \Rightarrow x = y \quad \dots(9)$$

Multiplying (7) by  $y$  and (8) by  $z$  and then subtracting, we get

$$2x(y - z)\lambda = 0 \Rightarrow y = z \quad \dots(10)$$

From (9) and (10), we get

$$x = y = z$$

Thus, Length = Breadth = Height. Ans.

**Example 22.** Find the area of a greatest rectangle that can be inscribed in an ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad (\text{Nagpur University, Winter 2001})$$

**Solution.** Let,  $ABCD$  be the rectangle.

Let the co-ordinates of point  $A$  be  $(x, y)$ .

$$AB = 2x, BC = 2y$$

$$\text{Area} = A = (2x)(2y) = 4xy, \quad \frac{\partial A}{\partial x} = 4y, \quad \frac{\partial A}{\partial y} = 4x \quad \dots(1)$$

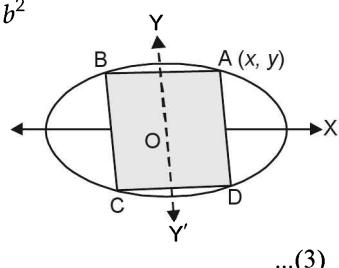

$$\phi = \frac{x^2}{a^2} + \frac{y^2}{b^2} - 1 = 0, \quad \frac{\partial \phi}{\partial x} = \frac{2x}{a^2}, \quad \frac{\partial \phi}{\partial y} = \frac{2y}{b^2}$$

By Lagrange's method

$$\begin{aligned} \frac{\partial A}{\partial x} + \lambda \frac{\partial \phi}{\partial x} &= 0 \\ \Rightarrow 4y + \lambda \frac{2x}{a^2} &= 0 \Rightarrow \lambda = -\frac{2ya^2}{x} \quad \dots(2) \\ \frac{\partial A}{\partial y} + \lambda \frac{\partial \phi}{\partial y} &= 0 \Rightarrow 4x + \lambda \frac{2y}{b^2} = 0 \end{aligned}$$

Putting the value of  $\lambda$  from (2) in (3), we get

$$4x - \frac{2ya^2}{x} \left( \frac{2y}{b^2} \right) = 0 \quad [\text{From (2)}]$$

$$\Rightarrow x^2 - \frac{y^2 a^2}{b^2} = 0 \quad \Rightarrow \quad \frac{x^2}{a^2} = \frac{y^2}{b^2} \quad \dots(4)$$

Putting the value of  $\frac{y^2}{b^2}$  from (4) in  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ , we get

$$\frac{x^2}{a^2} + \frac{x^2}{a^2} = 1 \quad \Rightarrow \frac{2x^2}{a^2} = 1 \quad \Rightarrow \quad x = \pm \frac{a}{\sqrt{2}}$$

Similarly,  $y = \pm \frac{b}{\sqrt{2}}$

$$\text{Area} = 4xy = 4 \left( \frac{a}{\sqrt{2}} \right) \left( \frac{b}{\sqrt{2}} \right) = 2ab$$

Hence, area of greatest rectangle inscribed in the ellipse =  $2ab$  Ans.  
**Example 23.** Use the method of the Lagrange's multipliers to find the volume of the largest

rectangular parallelopiped that can be inscribed in the ellipsoid  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ .

(Nagpur University, Summer 2008, Winter 2003)  
(A.M.I.E.T.E., Summer 2004, U.P., I Semester, Winter 2002, 2000)

**Solution.** Here, we have  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$

$$\Rightarrow \phi(x, y, z) = \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} - 1 = 0 \quad \dots(1)$$

Let  $2x, 2y, 2z$  be the length, breadth and height of the rectangular parallelopiped inscribed in the ellipsoid.

$$\begin{aligned} V &= (2x)(2y)(2z) = 8xyz \\ \frac{\partial V}{\partial x} &= 8yz; \quad \frac{\partial V}{\partial y} = 8xz, \quad \frac{\partial V}{\partial z} = 8xy \\ \frac{\partial \phi}{\partial x} &= \frac{2x}{a^2}, \quad \frac{\partial \phi}{\partial y} = \frac{2y}{b^2}, \quad \frac{\partial \phi}{\partial z} = \frac{2z}{c^2} \end{aligned}$$

Lagrange's equations are

$$\frac{\partial V}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \quad \Rightarrow \quad 8yz + \lambda \frac{2x}{a^2} = 0 \quad \dots(1)$$

$$\frac{\partial V}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \quad \Rightarrow \quad 8xz + \lambda \frac{2y}{b^2} = 0 \quad \dots(2)$$

$$\frac{\partial V}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \quad \Rightarrow \quad 8xy + \lambda \frac{2z}{c^2} = 0 \quad \dots(3)$$

Multiplying (1), (2) and (3) by  $x, y, z$  respectively and adding, we get

$$24xyz + 2\lambda \left[ \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} \right] = 0 \quad \left[ \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \right]$$

$$\Rightarrow 24xyz + 2\lambda(1) = 0 \quad \Rightarrow \quad \lambda = -12xyz$$

Putting the value of  $\lambda$  in (1), we get

$$\begin{aligned} 8yz + (-12xyz) \frac{2x}{a^2} &= 0 \quad \Rightarrow \quad 1 - \frac{3x^2}{a^2} = 0 \\ \Rightarrow x &= \frac{a}{\sqrt{3}} \end{aligned}$$

Similarly from (2) and (3), we have

$$y = \frac{b}{\sqrt{3}}, \quad z = \frac{c}{\sqrt{3}}$$

Volume of the largest rectangular parallelopiped = 8 xyz

$$= 8 \left( \frac{a}{\sqrt{3}} \right) \left( \frac{b}{\sqrt{3}} \right) \left( \frac{c}{\sqrt{3}} \right) = \frac{8abc}{3\sqrt{3}} \quad \text{Ans.}$$

**Example 24.** The pressure  $P$  at any point  $(x, y, z)$  in space is  $P = 400xyz^2$ . Find the highest pressure at the surface of a unit sphere  $x^2 + y^2 + z^2 = 1$ . (Gujarat, I Semester, Jan. 2009)

**Solution.** We have,  $P = 400xyz^2$

$$x^2 + y^2 + z^2 = 1, \quad \phi(x, y, z) = x^2 + y^2 + z^2 - 1$$

$$\frac{\partial P}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \quad \Rightarrow \quad 400yz^2 + \lambda(2x) = 0 \quad \dots(1)$$

$$\frac{\partial P}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \quad \Rightarrow \quad 400xz^2 + \lambda(2y) = 0 \quad \dots(2)$$

$$\frac{\partial P}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \quad \Rightarrow \quad 800xyz + \lambda(2z) = 0 \quad \dots(3)$$

Multiplying (1) by  $x$ , (2) by  $y$  and (3) by  $z$  and adding, we get

$$1600xyz^2 + 2\lambda(x^2 + y^2 + z^2) = 0$$

$$1600xyz^2 + 2\lambda(1) = 0 \quad (x^2 + y^2 + z^2 = 1)$$

$$\Rightarrow \lambda = -800xyz^2$$

Putting the value of  $\lambda$  in (1), we get

$$400yz^2 + 2x(-800xyz^2) = 0 \Rightarrow 1 - 4x^2 = 0 \Rightarrow x = \pm \frac{1}{2}$$

Similarly,  $y = \pm \frac{1}{2}$

On putting the value of  $\lambda$  in (3), we get

$$800xyz - 1600xyz^3 = 0$$

$$1 - 2z^2 = 0 \Rightarrow z = \pm \frac{1}{\sqrt{2}}$$

On putting the values of  $x, y, z$  in  $P$ , we get

$$P = 400 \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} = 50 \quad \text{Ans.}$$

**Example 25.** A scope probe in the shape of ellipsoid  $4x^2 + y^2 + 4z^2 = 16$  enters the earth atmosphere and its surface begins to heat. After one hour the temperature at the point  $(x, y, z)$  on the surface is  $T(x, y, z) = 8x^2 + 4yz - 16z + 600$ . Find the hottest point on the probe surface. (Nagpur University, Summer 2001)

**Solution.** Given temperature on the surface  $(x, y, z)$  is

$$T(x, y, z) = 8x^2 + 4yz - 16z + 600 \quad \dots(1)$$

and ellipsoid is

$$4x^2 + y^2 + 4z^2 = 16$$

Let

$$\phi = 4x^2 + y^2 + 4z^2 - 16 = 0 \quad \dots(2)$$

$$\frac{\partial T}{\partial x} = 16x, \quad \text{and} \quad \frac{\partial \phi}{\partial x} = 8x$$

$$\frac{\partial T}{\partial y} = 4z, \quad \text{and} \quad \frac{\partial \phi}{\partial y} = 2y$$

$$\frac{\partial T}{\partial z} = 4y - 16, \quad \text{and} \quad \frac{\partial \phi}{\partial z} = 8z$$

By Lagrange's method

$$\frac{\partial T}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 0 \quad \Rightarrow \quad 16x + 8 \lambda x = 0 \quad \dots(3)$$

$$\frac{\partial T}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 0 \quad \Rightarrow \quad 4z + 2\lambda y = 0 \quad \dots(4)$$

$$\frac{\partial T}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 0 \quad \Rightarrow \quad 4y - 16 + 8 \lambda z = 0 \quad \dots(5)$$

From (3),  $\lambda = -2$

Putting the value of  $\lambda$  in (4) and (5), we get

$$4z + 2(-2)y = 0 \quad \Rightarrow \quad z - y = 0 \quad \dots(6)$$

$$\text{and } 4y - 16 + 8(-2)z = 0 \quad \Rightarrow \quad y - 4z = 4 \quad \dots(7)$$

Adding (6) and (7), we get

$$-3z = 4 \text{ and } z = -\frac{4}{3}$$

$$\text{From (6), } y = z = -\frac{4}{3}$$

On putting the values of  $y$  and  $z$  in (2), we get

$$4x^2 + \left(-\frac{4}{3}\right)^2 + 4\left(-\frac{4}{3}\right)^2 - 16 = 0 \quad \Rightarrow \quad x^2 = \frac{16}{9} \Rightarrow x = \pm\frac{4}{3}$$

Hence, the hottest points on the probe surface is  $\left(\pm\frac{4}{3}, -\frac{4}{3}, -\frac{4}{3}\right)$  Ans.

**Example 26.** A tent of a given volume has a square base of side  $2a$ , has its four-side vertical of length  $b$  and is surmounted by a regular pyramid of height  $h$ . Find the values of  $a$  and  $b$  in terms of  $h$  such that the canvas required for its construction is minimum.

**Solution.** Let  $V$  be the volume and  $S$  be the surface of the tent.

$$V = 4a^2b + \frac{1}{3}(4a^2)h \quad [\text{Volume of pyramid} = \frac{1}{3} \text{ Area of the base} \times \text{height}]$$

$$S = 8ab + 4a\sqrt{a^2 + h^2} \quad [\text{Surface Area of pyramid} = \frac{1}{2} \text{ perimeter} \times \text{slant height}]$$

$$\frac{\partial S}{\partial a} + \lambda \frac{\partial V}{\partial a} = 0$$

$$\Rightarrow 8b + 4\sqrt{a^2 + h^2} + \frac{4a^2}{\sqrt{a^2 + h^2}} + \lambda \left[ 8ab + \frac{8ah}{3} \right] = 0 \quad \dots(1)$$

$$\frac{\partial S}{\partial b} + \lambda \frac{\partial V}{\partial b} = 0 \quad \Rightarrow \quad 8a + 4\lambda a^2 = 0 \quad \dots(2)$$

$$\frac{\partial S}{\partial h} + \lambda \frac{\partial V}{\partial h} = 0 \quad \Rightarrow \quad \frac{4ah}{\sqrt{a^2 + h^2}} + \frac{4}{3}\lambda a^2 = 0 \quad \dots(3)$$

$$\text{From (2)} \quad \lambda a + 2 = 0 \quad \Rightarrow \quad \lambda a = -2 \quad \dots(4)$$

$$\text{From (3)} \quad 12ah + 4\lambda a^2 \sqrt{a^2 + h^2} = 0$$

$$\Rightarrow 3h + \lambda a \sqrt{a^2 + h^2} = 0 \quad \dots(5)$$

Substituting the value of  $\lambda$  &  $a$  from (4) in (5), we get

$$3h - 2\sqrt{a^2 + h^2} = 0 \Rightarrow 9h^2 = 4a^2 + 4h^2 \Rightarrow 4a^2 = 5h^2$$

$$a = \frac{\sqrt{5}}{2}h$$

Substituting  $\lambda$ ,  $a = -2$  and  $a = \frac{\sqrt{5}}{2}h$  in (1) and simplifying, we get

$$8b + 4\sqrt{\frac{5h^2}{4} + h^2} + \frac{5h^2}{\sqrt{\frac{5h^2}{4} + h^2}} - 2\left[8b + \frac{8h}{3}\right] = 0$$

$$\Rightarrow 8b + 6h + \frac{10h}{3} - 16b - \frac{16h}{3} = 0$$

$$\Rightarrow -8b + 4h = 0 \Rightarrow b = \frac{h}{2}.$$

Thus, when  $a = \frac{\sqrt{5}}{2}h$  and  $b = \frac{h}{2}$  we get the stationary value of  $S$ .

**Ans.**

**Example 27.** Find the maximum and minimum distances of the point (3, 4, 12) from the sphere  $x^2 + y^2 + z^2 = 1$ . *(AMIETE, June 2010)*

**Solution.** Let the co-ordinates of the given point be  $(x, y, z)$ , then its distance ( $D$ ) from (3, 4, 12).

$$D = \sqrt{(x-3)^2 + (y-4)^2 + (z-12)^2}$$

$$\Rightarrow F(x, y, z) = (x-3)^2 + (y-4)^2 + (z-12)^2$$

$$x^2 + y^2 + z^2 = 1$$

$$\phi(x, y, z) = x^2 + y^2 + z^2 - 1$$

$$\frac{\partial F}{\partial x} + \lambda \frac{\partial \phi}{\partial x} = 2(x-3) + 2\lambda x = 0 \quad \dots(1)$$

$$\frac{\partial F}{\partial y} + \lambda \frac{\partial \phi}{\partial y} = 2(y-4) + 2\lambda y = 0 \quad \dots(2)$$

$$\frac{\partial F}{\partial z} + \lambda \frac{\partial \phi}{\partial z} = 2(z-12) + 2\lambda z = 0 \quad \dots(3)$$

Multiplying (1) by  $x$ , (2) by  $y$  and (3) by  $z$  and adding, we get

$$(x^2 + y^2 + z^2) - 3x - 4y - 12z + \lambda(x^2 + y^2 + z^2) = 0$$

$$1 - 3x - 4y - 12z + \lambda = 0 \quad \dots(4)$$

From (1)  $x = \frac{3}{1+\lambda} \quad \dots(5)$

From (2)  $y = \frac{4}{1+\lambda} \quad \dots(6)$

From (3)  $z = \frac{12}{1+\lambda} \quad \dots(7)$

Putting these values of  $x, y, z$  in (4), we have

$$1 + \lambda - \frac{9}{1+\lambda} - \frac{16}{1+\lambda} - \frac{144}{1+\lambda} = 0 \Rightarrow (1 + \lambda)^2 = 169$$

$$\Rightarrow 1 + \lambda = \pm 13$$

Putting the value of  $1 + \lambda$  in (5), (6) and (7) we have the points

$$\left(\frac{3}{13}, \frac{4}{13}, \frac{12}{13}\right) \text{ and } \left(\frac{-3}{13}, \frac{-4}{13}, \frac{-12}{13}\right).$$

$$\begin{aligned} \text{The minimum distance} &= \sqrt{\left(3 - \frac{3}{13}\right)^2 + \left(4 - \frac{4}{13}\right)^2 + \left(12 - \frac{12}{13}\right)^2} = 12 \\ \text{The maximum distance} &= \sqrt{\left(3 + \frac{3}{13}\right)^2 + \left(4 + \frac{4}{13}\right)^2 + \left(12 + \frac{12}{13}\right)^2} = 14 \quad \text{Ans.} \end{aligned}$$

**Example 28.** Use the method of Lagrange's multipliers to find the extreme values of  $f(x, y, z) = 2x + 3y + z$  subject to  $x^2 + y^2 = 5$  and  $x + z = 1$ .

(A.M.I.E.T.E, June 2010, Dec. 2007, Uttarakhand, I Semester, Dec. 2006)

**Solution.** Let  $f(x, y, z) = 2x + 3y + z$  ... (1)  
 $\phi(x, y) = x^2 + y^2 - 5$  ... (2)  
 $\psi(x, z) = x + z - 1$  ... (3)

Lagranges Multipliers Equations are

$$\frac{\partial f}{\partial x} + \lambda \frac{\partial \phi}{\partial x} + \mu \frac{\partial \psi}{\partial x} = 0 \Rightarrow 2 + \lambda(2x) + \mu(1) = 0 \quad \dots(4)$$

$$\frac{\partial f}{\partial y} + \lambda \frac{\partial \phi}{\partial y} + \mu \frac{\partial \psi}{\partial y} = 0 \Rightarrow 3 + \lambda(2y) + \mu(0) = 0 \quad \dots(5)$$

$$\frac{\partial f}{\partial z} + \lambda \frac{\partial \phi}{\partial z} + \mu \frac{\partial \psi}{\partial z} = 0 \Rightarrow 1 + \lambda(0) + \mu(1) = 0 \Rightarrow \mu = -1 \dots(6)$$

Putting the value of  $\mu$  in (4) and (5), we get

$$2 + 2\lambda x - 1 = 0 \Rightarrow 2\lambda x = -1, \Rightarrow x = -\frac{1}{2\lambda}$$

$$3 + 2\lambda y = 0 \Rightarrow 2\lambda y = -3, \Rightarrow y = -\frac{3}{2\lambda}$$

Putting the values of  $x, y$  in  $x^2 + y^2 = 5$ , we get

$$\frac{1}{4\lambda^2} + \frac{9}{4\lambda^2} = 5 \Rightarrow \frac{10}{4\lambda^2} = 5 \Rightarrow 2\lambda^2 = 1$$

$$\Rightarrow \lambda^2 = \frac{1}{2} \Rightarrow \lambda = \pm \frac{1}{\sqrt{2}}$$

We know that  $x = -\frac{1}{2\lambda} = \pm \frac{\sqrt{2}}{2} = \pm \frac{1}{\sqrt{2}}$

$$y = -\frac{3}{2\lambda} = \pm \frac{3\sqrt{2}}{2} = \pm \frac{3}{\sqrt{2}}$$

From (3),  $x + z = 1 \Rightarrow z = 1 - x = 1 \mp \frac{1}{\sqrt{2}}$

Putting  $x = \frac{1}{\sqrt{2}}, y = \frac{3}{\sqrt{2}}$  and  $z = 1 - \frac{1}{\sqrt{2}}$  in (1), we get

$$f = \frac{2}{\sqrt{2}} + \frac{9}{\sqrt{2}} + 1 - \frac{1}{\sqrt{2}} = \frac{10}{\sqrt{2}} + 1 = 5\sqrt{2} + 1$$

Putting  $x = -\frac{1}{\sqrt{2}}, y = -\frac{3}{\sqrt{2}}$  and  $z = 1 + \frac{1}{\sqrt{2}}$  in (1), we get

$$\begin{aligned} f &= 2\left(-\frac{1}{\sqrt{2}}\right) + 3\left(-\frac{3}{\sqrt{2}}\right) + \left(1 + \frac{1}{\sqrt{2}}\right) = -\frac{2}{\sqrt{2}} - \frac{9}{\sqrt{2}} + 1 + \frac{1}{\sqrt{2}} \\ &= 1 - 5\sqrt{2} \end{aligned}$$

Ans.

**Example 29.** A torpedo has the shape of a cylinder with conical ends. For given surface area, show that the dimensions which give maximum volume are,  $l = h = \frac{2}{\sqrt{5}} r$ , where  $l$  is the length of the cylinder,  $r$  its radius and  $h$  the altitude of the cone.

(A.M.I.E.T.E. Summer 2000)

**Solution.** Let  $V$  be the volume enclosed by the torpedo and  $S$  its surface. Then  
 $V = \text{Volume of the cylinder} + \text{Volume of two cones}$

$$= \pi r^2 l + 2 \cdot \frac{1}{3} \pi r^2 h$$

$$S = \text{Surface of the cylinder} + 2(\text{surface of the cone})$$

$$= (\text{Circumference of the base} \times \text{height}) + 2 \left( \frac{1}{2} \times \text{perimeter of the base} \times \text{slant height} \right)$$

$$\phi = S = 2\pi r l + 2\pi r \sqrt{r^2 + h^2} \quad \dots(1)$$

$$\text{Let } F(l, h, r) = V = \pi r^2 l + \frac{2}{3} \pi r^2 h \quad \dots(2)$$

By Lagrange's method

$$\frac{\partial F}{\partial l} + \lambda \frac{\partial \phi}{\partial l} = 0 \Rightarrow \pi r^2 + 2\pi r \lambda = 0 \Rightarrow \lambda = -\frac{r}{2} \quad \dots(3)$$

$$\frac{\partial F}{\partial h} + \lambda \frac{\partial \phi}{\partial h} = 0 \Rightarrow \frac{2}{3} \pi r^2 + \frac{2\pi r h \lambda}{\sqrt{r^2 + h^2}} = 0 \quad \dots(4)$$

$$\text{and } \frac{\partial F}{\partial r} + \lambda \frac{\partial \phi}{\partial r} = 0 \Rightarrow 2\pi r l + \frac{4}{3} \pi r h + \lambda \left[ 2\pi l + 2\pi \sqrt{r^2 + h^2} + \frac{2\pi r^2}{\sqrt{r^2 + h^2}} \right] = 0 \quad \dots(5)$$

Putting the value of  $\lambda$  in (4), we get

$$\frac{2}{3} \pi r^2 + \frac{2\pi r h}{\sqrt{r^2 + h^2}} \left( -\frac{r}{2} \right) = 0 \Rightarrow \frac{2}{3} - \frac{h}{\sqrt{r^2 + h^2}} = 0$$

$$\Rightarrow \frac{2}{3} = \frac{h}{\sqrt{r^2 + h^2}} \Rightarrow \frac{4}{9} = \frac{h^2}{r^2 + h^2} \Rightarrow 9h^2 = 4r^2 + 4h^2 \Rightarrow 5h^2 = 4r^2$$

$$h = \frac{2}{\sqrt{5}} r$$

Putting  $\lambda = -\frac{r}{2}$  and  $h = \frac{2}{\sqrt{5}} r$  in (5), we get

$$2rl + \frac{4}{3}r \left( \frac{2}{\sqrt{5}}r \right) - \frac{r}{2} \left( 2l + 2\sqrt{r^2 + \frac{4}{5}r^2} + \frac{2r^2}{\sqrt{r^2 + \frac{4}{5}r^2}} \right) = 0$$

$$2l + \frac{8r}{3\sqrt{5}} - l - \sqrt{\frac{9r^2}{5}} - r^2 \sqrt{\frac{5}{9r^2}} = 0 \Rightarrow l = \frac{-8r}{3\sqrt{5}} + \frac{3r}{\sqrt{5}} + \frac{\sqrt{5}}{3}r$$

$$l = \left( \frac{-8}{3\sqrt{5}} + \frac{3}{\sqrt{5}} + \frac{\sqrt{5}}{3} \right) r \Rightarrow l = \frac{2r}{\sqrt{5}}$$

Hence  $l = h = \frac{2r}{\sqrt{5}}$ . Proved.

**Example 30.** If  $u = ax^2 + by^2 + cz^2$  where  $x^2 + y^2 + z^2 = 1$  and  $lx + my + nz = 0$  prove that stationary values of ' $u$ ' satisfy the equation

$$\frac{l^2}{a-u} + \frac{m^2}{b-u} + \frac{n^2}{c-u} = 0$$

**Solution.** We have,  $u = ax^2 + by^2 + cz^2$  ... (1)

Let  $\phi = x^2 + y^2 + z^2 - 1$  ... (2)

$\psi = lx + my + nz$  ... (3)

$$\frac{\partial u}{\partial x} = 2ax, \quad \frac{\partial u}{\partial y} = 2by, \quad \frac{\partial u}{\partial z} = 2cz$$

$$\frac{\partial \phi}{\partial x} = 2x, \quad \frac{\partial \phi}{\partial y} = 2y, \quad \frac{\partial \phi}{\partial z} = 2z$$

$$\frac{\partial \psi}{\partial x} = l, \quad \frac{\partial \psi}{\partial y} = m, \quad \frac{\partial \psi}{\partial z} = n$$

By Lagrange's method

$$\frac{\partial u}{\partial x} + \lambda_1 \frac{\partial \phi}{\partial x} + \lambda_2 \frac{\partial \psi}{\partial x} = 0, \quad 2ax + 2x\lambda_1 + \lambda_2 l = 0 \quad \dots(4)$$

$$\frac{\partial u}{\partial y} + \lambda_1 \frac{\partial \phi}{\partial y} + \lambda_2 \frac{\partial \psi}{\partial y} = 0, \quad 2by + 2y\lambda_1 + \lambda_2 m = 0 \quad \dots(5)$$

$$\frac{\partial u}{\partial z} + \lambda_1 \frac{\partial \phi}{\partial z} + \lambda_2 \frac{\partial \psi}{\partial z} = 0, \quad 2cz + 2z\lambda_1 + \lambda_2 n = 0 \quad \dots(6)$$

Multiplying (4), (5) and (6) by  $x, y$  and  $z$  respectively and adding, we get

$$(2ax^2 + 2by^2 + 2cz^2) + (2x^2 + 2y^2 + 2z^2)\lambda_1 + (lx + my + nz)\lambda_2 = 0$$

$$2u + 2\lambda_1 = 0, \quad \lambda_1 = -u$$

Putting the value of  $\lambda_1$  in (4), (5) and (6), we get

$$2ax - 2xu + \lambda_2 l = 0, \quad x = \frac{-\lambda_2 l}{2(a-u)}$$

$$2by - 2yu + \lambda_2 m = 0, \quad y = \frac{-\lambda_2 m}{2(b-u)}$$

$$2cz - 2zu + \lambda_2 n = 0, \quad z = \frac{-\lambda_2 n}{2(c-u)}$$

Putting the values of  $x, y, z$  in (3), we get

$$\frac{-\lambda_2 l^2}{2(a-u)} + \frac{-\lambda_2 m^2}{2(b-u)} + \frac{-\lambda_2 n^2}{2(c-u)} = 0$$

$$\frac{l^2}{a-u} + \frac{m^2}{b-u} + \frac{n^2}{c-u} = 0$$

Proved.

## EXERCISE 3.2

1. Show that the greatest value of  $x^m y^n$  where  $x$  and  $y$  are positive and  $x + y = a$  is  $\frac{m^m \cdot n^n \cdot a^{m+n}}{(m+n)^{m+n}}$ , where  $a$  is constant.
2. Find the absolute maximum and minimum values of the function  $f(x, y) = 3x^2 + y^2 - x$  over the region  $2x^2 + y^2 \leq 1$ . *(A.M.I.E.T.E., Dec. 2008)*
3. Using Lagrange's method (of multipliers), find the critical (stationary values) of the function  $f(x, y, z) = x^2 + y^2 + z^2$ , given that  $z^2 = xy + 1$ . **Ans.**  $(0, 0, -1), (0, 0, 1)$ .
4. The sum, of three numbers is constant. Prove that their product is a maximum when they are equal.
5. Using the method of Lagrange's multipliers, find the largest product of the numbers  $x, y$  and  $z$  when  $x^2 + y^2 + z^2 = 9$ . **Ans.**  $3\sqrt{3}$
6. Find a point in the plane  $x + 2y + 3z = 13$  nearest to the point  $(1, 1, 1)$  using the method of Lagrange's multipliers. **Ans.**  $\left(\frac{3}{2}, 2, \frac{5}{2}\right)$
7. Using the Lagrange's method (of multipliers), find the shortest distance from the point  $(1, 2, 2)$  to the sphere  $x^2 + y^2 = 36$ . **Ans.** 3
8. Find the shortest and the longest distances from the point  $(1, 2, -1)$  to the surface  $x^2 + y^2 + z^2 = 24$ . *(U.P. I Semester, Dec 2009)* **Ans.**  $\sqrt{6}, 3\sqrt{6}$
9. The sum of the surfaces of a sphere and a cube is given. Show that when the sum of the volumes is least, the diameter of the sphere is equal to the edge of the cube.
10. If  $u = \frac{a^3}{x^2} + \frac{b^3}{y^2} + \frac{c^3}{z^2}$ , where  $x + y + z = 1$ , prove that the stationary value of  $u$  is given by  

$$x = \frac{a}{a+b+c}, \quad y = \frac{b}{a+b+c}, \quad z = \frac{c}{a+b+c}$$
11. If  $u = a^3x^2 + b^3y^2 + c^3z^2$  where  $x^{-1} + y^{-1} + z^{-1} = 1$ , show that the stationary value of  $u$  is given by  

$$x = \frac{\Sigma a}{a}, \quad y = \frac{\Sigma b}{b}, \quad z = \frac{\Sigma c}{c}$$
 *(AMIEETE, Dec. 2009)*
12. Find maximum value of the expression  $\sum_{i=1}^n a_i x_i$  with  $\sum_{i=1}^n x_i^2 = 1$ , where  $a_1, a_2, a_3, \dots, a_n$  are positive constants. **Ans.**  $(a_1^2 + a_2^2 + \dots + a_n^2)^{\frac{1}{2}}$
13. If  $r$  is the distance of a point on conic  $ax^2 + by^2 + cz^2 = 1$ ,  $lx + my + nz = 0$  from origin, then the stationary values of  $r$  are given by the equation.  

$$\frac{l^2}{1-ar^2} + \frac{m^2}{1-br^2} + \frac{n^2}{1-cr^2} = 0$$
 *(A.M.I.E.T.E., Winter 2002)*
14. If  $x$  and  $y$  satisfy the relation  $ax^2 + by^2 = ab$ , prove that the extreme values of function  $u = x^2 + xy + y^2$  are given by the roots of the equation  $4(u - a)(u - b) = ab$  *(A.M.I.E.T.E., Winter 2000)*
15. Use the Lagranges method of undetermined multipliers to find the minimum value of  $x^2 + y^2 + z^2$  subject to the conditions  $x + y + z = 1$ ,  $xyz + 1 = 0$ .
16. The temperature ' $T$ ' at any point  $(xyz)$  in space is  $T(xyz) = kxyz^2$  where  $k$  is constant. Find the highest temperature on the surface of the sphere  $x^2 + y^2 + z^2 = a^2$ . **Ans.**  $\frac{ka^4}{8}$
17. Prove that the stationary values of  $u = \frac{x^2}{a^4} + \frac{y^2}{b^4} + \frac{z^2}{c^4}$ , where  $lx + my + nz = 0$  and  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$  are the roots of the equation :  $\frac{l^2 a^4}{1-a^2 u} + \frac{m^2 b^4}{1-b^2 u} + \frac{n^2 c^4}{1-c^2 u} = 0$

## ERRORS

---

### 4.1 ERROR DETERMINATION

We know that  $\lim_{\delta x \rightarrow 0} \frac{\delta y}{\delta x} = \frac{dy}{dx}$   
 $\frac{\delta y}{\delta x} = \frac{dy}{dx}$  approximately  $\Rightarrow \delta y = \left(\frac{dy}{dx}\right) \cdot \delta x$  approximately

**Definition.**

(i)  $\delta x$  is known as absolute error in  $x$ .

(ii)  $\frac{\delta x}{x}$  is known as relative error in  $x$ .

(iii)  $\left(\frac{\delta x}{x}\right) \times 100$  is known as percentage error in  $x$ .

**Example 1.** Find the percentage error in the area of a rectangle when an error of +1 percent is made in measuring its length and breadth (R.G.P.V., Bhopal, June 2008, 2004)

**Solution.** Let  $A$  be the area and  $l, b$ , be the length and breadth respectively.

Area of the rectangle,  $A = lb$

Taking log of both the sides, we have

$$\log A = \log l + \log b \quad \dots (1)$$

Differentiating equation (1), we get

$$\begin{aligned} \frac{\delta A}{A} &= \frac{\delta l}{l} + \frac{\delta b}{b} \\ \Rightarrow 100 \frac{\delta A}{A} &= 100 \frac{\delta l}{l} + 100 \frac{\delta b}{b} = +1 + 1 = +2 \end{aligned}$$

Hence, percentage error in area = + 2

**Ans.**

**Example 2.** The power dissipated in a resistor is given by  $P = \frac{E^2}{R}$ . Find by using calculus

the approximate percentage change in  $P$  when  $E$  is increased by 3% and  $R$  is decreased by 2%. (A.M.I.E. Summer 2001)

**Solution.** Here, we have  $\frac{100 \delta E}{E} = 3\%$  and  $\frac{100 \delta R}{R} = -2\%$

$$P = \frac{E^2}{R} \Rightarrow \log P = 2 \log E - \log R$$

On differentiating, we get

$$\frac{\delta P}{P} = \frac{2}{E} \delta E - \frac{\delta R}{R} \Rightarrow 100 \frac{\delta P}{P} = 2 \times \frac{100 \delta E}{E} - \frac{100 \delta R}{R}$$

$$100 \frac{\delta P}{P} = 2(3) - (-2) = 8$$

Percentage change in  $P = 8\%$

**Ans.**

**Example 3.** The focal length of a mirror is found from the formula  $\frac{2}{f} = \frac{1}{v} - \frac{1}{u}$ . Find the percentage error in  $f$  if  $v$  and  $u$  are both in error by 2% each.

**Solution.** Here, we have

$$\frac{2}{f} = \frac{1}{v} - \frac{1}{u} \quad \dots(1)$$

$$\frac{100 \delta v}{v} = 2\%, \quad \frac{100 \delta u}{u} = 2\%$$

Taking the differential of (1), we get  $-\frac{2}{f^2} \delta f = -\frac{1}{v^2} \delta v + \frac{1}{u^2} \delta u$

$$\begin{aligned} -\frac{2}{f} \left( \frac{100}{f} \right) \delta f &= -\frac{1}{v} \left( \frac{100}{v} \right) \delta v + \frac{1}{u} \left( \frac{100}{u} \right) \delta u = -\frac{1}{v} \cdot 2 + \frac{1}{u} \cdot 2 = -2 \left( \frac{1}{v} - \frac{1}{u} \right) \\ &= -\frac{4}{f} \quad \left[ \because \frac{1}{v} - \frac{1}{u} = \frac{2}{f} \right] \end{aligned}$$

$$\Rightarrow \frac{100}{f} \cdot \delta f = 2$$

Hence, the percentage error in  $f = 2\%$

**Ans.**

**Example 4.** In determining the specific gravity by the formula  $S = \frac{A}{A-w}$  where  $A$  is the weight in air and  $w$  is the weight in water;  $A$  can be read within 0.01 gm and  $w$  within 0.02 gm. Find approximately the maximum error in  $S$  if the readings are  $A = 1.1$  gm,  $w = 0.6$  gm. Find also the maximum relative error. (Q. Bank U.P.T.U.2001)

**Solution.** We have,  $S = \frac{A}{A-w}$

Differentiating, we get

$$\delta S = \frac{(A-w)\delta A - A(\delta A - \delta w)}{(A-w)^2} \quad \dots(1)$$

Maximum error in  $S$  can be obtained if we take  $\delta A = -0.01$  and  $\delta w = 0.02$

$$\therefore \text{From (1), } \delta S = \frac{(1.1-0.6)(-0.01) - (1.1)(-0.01-0.02)}{(1.1-0.6)^2} = 0.112$$

Maximum relative error in

$$S = \frac{(\delta S)_{\max}}{S} = \frac{0.112}{\left( \frac{1.1}{1.1-0.6} \right)} = 0.05091. \quad \text{Ans.}$$

**Example 5.** What error in the common logarithm of a number will be produced by an error of 1% in the number. (U.P., Q. Bank, I Semester, 2001)

**Solution.** Let  $x$  be the number.

and  $y = \log_{10} x$  ... (1)  
On differentiating both sides of (1), we get

$$\delta y = \frac{\delta x}{x} \log_e 10$$

$$y = (\log_{10} x \log_e 10) \log_{10} e = \log_e x \log_{10} e$$

On differentiating (1) w.r.t. 'x', we get

$$\begin{aligned}\frac{\delta y}{y} &= \frac{\delta x}{x} \log_{10} e \\ \frac{\delta y}{y} &= \frac{1}{100} \left( 100 \frac{\delta x}{x} \right) \log_{10} e \quad \left[ \begin{array}{l} \text{Given} \\ 100 \frac{\delta x}{x} = 1\% \end{array} \right] \\ &= \frac{1}{100} (1) \log_{10} e = \frac{1}{100} (0.4343) \quad \left[ \log_{10} e = 0.4343 \right] \\ &= 0.004343\% \quad \text{Ans.}\end{aligned}$$

**Example 6.** The power 'P' required to propel a steamer of length 'l' at a speed 'u' is given by  $P = \lambda u^3 l^3$  where  $\lambda$  is constant. If  $u$  is increased by 3% and  $l$  is decreased by 1%, find the corresponding increase in 'P'. (U.P., I Semester, Dec. 2009)

**Solution.** We have,

$$P = \lambda u^3 l^3$$

On taking log on both sides, we get

$$\log P = \log \lambda + 3 \log u + 3 \log l$$

On differentiating, we get

$$\begin{aligned}\frac{\delta P}{P} &= 0 + 3 \frac{\delta u}{u} + 3 \frac{\delta l}{l} \quad \left[ \begin{array}{l} \text{Given } \frac{100 \delta u}{u} = 3 \\ \frac{100 \delta l}{l} = -1 \end{array} \right] \\ \Rightarrow \quad \frac{100 \delta P}{P} &= 3 \times \frac{100 \delta u}{u} + 3 \times 100 \frac{\delta l}{l} \\ &= 3 (3) + 3 (-1) = 9 - 3 = 6\% \quad \text{Ans.}\end{aligned}$$

**Example 7.** Find the percentage error in the area of an ellipse if one percent error is made in measuring the major and minor axis. (K. University Dec. 2008)

**Solution.** Here we have the equation of an ellipse is

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \dots (1)$$

Differentiating equation (1), we get

$$\frac{2x \delta x}{a^2} + \frac{2y \delta y}{b^2} = 0$$

Area of ellipse ( $A$ ) =  $\pi a b$ .

$$\log A = \log \pi + \log a + \log b$$

Differentiating, we get

$$\begin{aligned}\frac{\delta A}{A} &= 0 + \frac{2 \delta a}{2a} + \frac{2 \delta b}{2b} \quad \left[ \begin{array}{l} \text{Major axis} = 2a \\ \text{Minor axis} = 2b \end{array} \right] \\ 100 \frac{\delta A}{A} &= 100 \frac{(2 \delta a)}{2a} + \frac{100 (2 \delta b)}{2b} = 1 + 1 \\ &= 2\% \quad \text{Ans.}\end{aligned}$$

**Example 8.** The range  $R$  of a projectile which starts with a velocity  $v$  at an elevation  $\alpha$  is

given by  $R = \frac{v^2 \sin 2\alpha}{g}$ . Find the percentage error in  $R$  due to an error of 1% in  $v$  and an error of 0.5% in  $\alpha$ . (K. University Dec. 2009)

**Solution.** Here, we have

$$R = \frac{v^2 \sin 2\alpha}{g} \quad \dots (1)$$

Taking log of both sides of (1), we get

$$\log R = 2 \log v + \log \sin 2\alpha - \log g \quad \dots (2)$$

Differentiating (2), we get

$$\begin{aligned} \frac{\delta R}{R} &= \frac{2\delta v}{v} + \frac{2 \cos 2\alpha \cdot \delta \alpha}{\sin 2\alpha} - \frac{\delta g}{g} \\ 100 \frac{\delta R}{R} &= 100 \cdot \frac{2\delta v}{v} + 100 \frac{2 \alpha \cos 2\alpha \cdot \delta \alpha}{\sin 2\alpha} - 100 \frac{\delta g}{g} \\ &= 2(1) + 2\alpha \cot 2\alpha (0.5) \\ &= 2 + \alpha \cot 2\alpha \end{aligned}$$

**Ans.**

**Example 9.** The period  $T$  of a simple pendulum is

$$T = 2\pi \sqrt{\frac{l}{g}}$$

Find the maximum error in  $T$  due to possible errors upto 1% in  $l$  and 2% in  $g$ .

(AMITE, Dec. 2010, Uttarakhand, I Semester, 2009, Dec. 2006)

**Solution.** Here, we have  $T = 2\pi \sqrt{\frac{l}{g}}$   $\dots (1)$

$$100 \times \frac{\delta l}{l} = 1, \quad 100 \times \frac{\delta g}{g} = 2$$

Taking log of both sides of (1), we get

$$\Rightarrow \log T = \log 2\pi + \frac{1}{2} \log l - \frac{1}{2} \log g$$

Differentiating, we get

$$\begin{aligned} \frac{\delta T}{T} &= 0 + \frac{1}{2} \frac{\delta l}{l} - \frac{1}{2} \frac{\delta g}{g} \\ 100 \times \left( \frac{\delta T}{T} \right) &= \frac{1}{2} \times \left[ 100 \times \left( \frac{\delta l}{l} \right) - 100 \times \left( \frac{\delta g}{g} \right) \right] \\ 100 \times \left( \frac{\delta T}{T} \right) &= \frac{1}{2}[1 \pm 2] = \frac{3}{2} \end{aligned}$$

Maximum error in  $T = 1.5\%$

**Ans.**

**Example 10.** The time  $T$  of a pendulum of length  $l$  under certain conditions is given by

$$T = 2\pi \sqrt{\frac{l}{g'}} \text{ where } g' = g \left( \frac{r}{r+h} \right)^2. \text{ Find the error in } T \text{ due to error } p\% \text{ and } q\% \text{ in } h \text{ and}$$

$l$  respectively. ( $g$  and  $r$  are constants)

**Solution.** We have,

$$\frac{100 \delta h}{h} = P \text{ and } \frac{100 \delta l}{l} = q$$

$$T = 2\pi \sqrt{\frac{l}{g'}} \quad \dots (1) \quad \left[ g' = g \left( \frac{r}{r+h} \right)^2 \right]$$

On putting the value of  $g'$  in (1), we get

$$T = 2\pi \sqrt{\frac{l}{g \left( \frac{r}{r+h} \right)^2}} = 2\pi \sqrt{\left( \frac{l}{g} \right) \cdot \left( \frac{r+h}{r} \right)}$$

Taking log of both the sides, we get

$$\begin{aligned}\log T &= \log 2\pi + \frac{1}{2} \log l - \frac{1}{2} \log g + \log (r + h) - \log r \\ \therefore \frac{1}{T} \delta T &= 0 + \frac{1}{2} \frac{\delta l}{l} - 0 + \frac{1}{r+h} \delta h - 0 \\ \Rightarrow \frac{100 \delta T}{T} &= \frac{1}{2} \left( 100 \frac{\delta l}{l} \right) + \frac{1}{r+h} h \left( 100 \frac{\delta h}{h} \right) \\ \Rightarrow \frac{100 \delta T}{T} &= \frac{1}{2} \cdot q + \frac{h}{r+h} \cdot p\end{aligned}$$

Hence percentage error in  $T$  is  $\frac{1}{2} q + \frac{h p}{r+h} \%$  Ans.

**Example 11.** A balloon is in the form of right circular cylinder of radius 1.5 m and length 4 m and is surmounted by hemispherical ends. If the radius is increased by 0.01 m and the length by 0.05 m, find the percentage change in the volume of the balloon.

(U.P. I Semester Dec., 2005, Comp. 2002)

**Solution.** Radius of the cylinder ( $r$ ) = 1.5 m

Length of the cylinder ( $h$ ) = 4 m

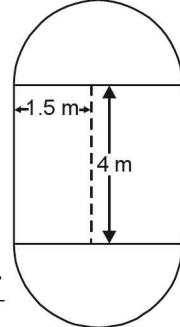

Volume of balloon = Volume of cylinder + Volume of two hemispherical ends

$$\text{Volume } (V) = \pi r^2 h + \frac{2}{3} \pi r^3 + \frac{2}{3} \pi r^3 = \pi r^2 h + \frac{4}{3} \pi r^3$$

Differentiating, we get

$$\begin{aligned}\delta V &= \pi 2r \delta r \cdot h + \pi r^2 \cdot \delta h + \frac{4}{3} \pi 3r^2 \cdot \delta r \\ \frac{\delta V}{V} &= \frac{\pi r [2 \delta r \cdot h + r \cdot \delta h + 4r \delta r]}{\pi r^2 h + \frac{4}{3} \pi r^3} = \frac{2 \cdot \delta r \cdot h + r \cdot \delta h + 4r \cdot \delta r}{r h + \frac{4}{3} r^2} \\ &= \frac{2 \times 0.01 \times 4 + 1.5 \times 0.05 + 4 \times 1.5 \times 0.01}{1.5 \times 4 + \frac{4}{3} (1.5)^2} = \frac{0.08 + 0.075 + 0.06}{6 + 3} = \frac{0.215}{9}\end{aligned}$$

$$100 \frac{\delta V}{V} = \frac{100 \times 0.215}{9} = \frac{21.5}{9} = 2.389 \% \quad \text{Ans.}$$

**Example 12.** In estimating the number of bricks in a pile which is measured to be (5m  $\times$  10m  $\times$  5m), count of bricks is taken as 100 bricks per  $m^3$ . Find the error in the cost when the tape is stretched 2% beyond its standard length. The cost of bricks is Rs. 2,000 per thousand bricks.

**Solution.** Volume  $V = x y z$

$$\log V = \log x + \log y + \log z$$

Differentiating, we get

$$\frac{\delta V}{V} = \frac{\delta x}{x} + \frac{\delta y}{y} + \frac{\delta z}{z}$$

$$100 \frac{\delta V}{V} = \frac{100 \delta x}{x} + \frac{100 \delta y}{y} + \frac{100 \delta z}{z} = 2 + 2 + 2 = 6$$

$$\delta V = \frac{6 V}{100} = \frac{6 (5 \times 10 \times 5)}{100} = 15 \text{ cubic metre.}$$

Number of bricks in  $\delta V = 15 \times 100 = 1500$

$$\text{Error in cost} = \frac{1500 \times 2000}{1000} = 3000$$

This error in cost, a loss to the seller of brick = Rs. 3000 Ans.

**Example 13.** With the usual meaning for  $a, b, c$  and  $s$ , if  $\Delta$  be the area of a triangle, prove that the error in  $\Delta$  resulting from a small error in the measurement of  $c$  is given by

$$\delta \Delta = \frac{\Delta}{4} \left[ \frac{1}{s} + \frac{1}{s-a} + \frac{1}{s-b} - \frac{1}{s-c} \right] \delta c.$$

**Solution.** We know that

$$\begin{aligned} \Delta &= \sqrt{s(s-a)(s-b)(s-c)} \\ \log \Delta &= \frac{1}{2} [\log s + \log(s-a) + \log(s-b) + \log(s-c)] \left[ \begin{array}{l} \because \Delta = \frac{1}{2} bc \sin A \\ b = a \cos C + c \cos A \end{array} \right] \\ \frac{1}{\Delta} \frac{\delta \Delta}{\delta c} &= \frac{1}{2} \left[ \frac{1}{s} \frac{\delta s}{\delta c} + \frac{1}{s-a} \frac{\delta(s-a)}{\delta c} + \frac{1}{s-b} \frac{\delta(s-b)}{\delta c} + \frac{1}{s-c} \frac{\delta(s-c)}{\delta c} \right] \\ &\quad \left[ s = \frac{1}{2}(a+b+c), \frac{\delta s}{\delta c} = \frac{1}{2} \quad \text{and } s-c = \frac{1}{2}(a+b-c), \right. \\ &\quad \left. \frac{d}{dc}(s-c) = \frac{ds}{dc} - 1 = \frac{1}{2} - 1 = -\frac{1}{2} \right] \end{aligned}$$

Putting the values of  $\frac{\delta s}{\delta c}$ ,  $\frac{\delta(s-a)}{\delta c}$ ,  $\frac{\delta(s-b)}{\delta c}$  and  $\frac{\delta(s-c)}{\delta c}$ , we get

$$\Rightarrow \frac{1}{\Delta} \frac{\delta \Delta}{\delta c} = \frac{1}{2} \left[ \frac{1}{2} \frac{1}{s} + \frac{1}{2} \frac{1}{s-a} + \frac{1}{2} \frac{1}{s-b} - \frac{1}{2} \frac{1}{s-c} \right]$$

$$\Rightarrow \delta \Delta = \frac{\Delta}{4} \left[ \frac{1}{s} + \frac{1}{s-a} + \frac{1}{s-b} - \frac{1}{s-c} \right] \delta c \quad \text{Proved.}$$

**Example 14.** The angles of a triangle are calculated from the sides  $a, b, c$ . If small changes  $\delta a, \delta b, \delta c$  are made in the sides, show that approximately

$$\delta A = \frac{a}{2\Delta} [\delta a - \delta b \cos C - \delta c \cos B],$$

where  $\Delta$  is the area of the triangle and  $A, B, C$  are the angles opposite to  $a, b, c$  respectively.  
Verify that  $\delta A + \delta B + \delta C = 0$

(A.M.I.E.T.E., June 2010, Dec. 2007, Summer 2001  
U.P., I Sem., Winter 2001)

**Solution.** We know that

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc} \Rightarrow a^2 = b^2 + c^2 - 2bc \cos A \quad \dots(1)$$

Differentiating both sides of (1), we get

$$2a \delta a = 2b \delta b + 2c \delta c - 2b \delta c \cos A - 2 \delta b c \cos A + 2b c \sin A \delta A \quad (\text{approx.})$$

$$a \delta a = b \delta b + c \delta c - b \delta c \cos A - \delta b c \cos A + b c \sin A \delta A$$

$$\Rightarrow bc \sin A \delta A = a \delta a - (b - c \cos A) \delta b - (c - b \cos A) \delta c$$

$$\Rightarrow 2 \Delta \delta A = a \delta a - (a \cos C + c \cos A - c \cos A) \delta b - (a \cos B + b \cos A - b \cos A) \delta c$$

$$2 \Delta \delta A = a \delta a - a \delta b \cos C - a \delta c \cos B$$

$$= a (\delta a - \delta b \cos C - \delta c \cos B)$$

$$\Rightarrow \delta A = \frac{a}{2\Delta} [\delta a - \delta b \cos C - \delta c \cos B] \quad \dots(2) \text{ Proved.}$$

Similarly,

$$\delta B = \frac{b}{2\Delta} [\delta b - \delta c \cos A - \delta a \cos C] \quad \dots(3)$$

$$\delta C = \frac{c}{2\Delta} [\delta c - \delta a \cos B - \delta b \cos A] \quad \dots(4)$$

On adding (2), (3) and (4), we get

$$\begin{aligned} [\delta A + \delta B + \delta C] &= \frac{1}{2\Delta} [(a - b \cos C - c \cos B) \delta a + (b - a \cos C - c \cos A) \delta b \\ &\quad + (c - a \cos B - b \cos A) \delta c] \\ &= \frac{1}{2\Delta} [ \{a - (b \cos C + c \cos B)\} \delta a + \{b - (a \cos C + c \cos A)\} \delta b + \{c - (a \cos B + b \cos A)\} \delta c ] \\ &= \frac{1}{2\Delta} [(a - a) \delta a + (b - b) \delta b + (c - c) \delta c] = 0 \quad [\because b \cos C + c \cos B = a] \quad \text{Verified.} \end{aligned}$$

**Example 15.** Find the possible percentage error in computing the parallel resistance  $r$  of three resistances  $r_1, r_2, r_3$  from the formula  $\frac{1}{r} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3}$ , if  $r_1, r_2$  and  $r_3$  are each in error by plus 1.2%.

**Solution.** Here,  $\frac{1}{r} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3}$ , ...(1)

Differentiating, we get

$$\begin{aligned} -\frac{1}{r^2} dr &= -\frac{1}{r_1^2} dr_1 - \frac{1}{r_2^2} dr_2 - \frac{1}{r_3^2} dr_3 \\ \Rightarrow \frac{1}{r} \left( \frac{100 dr}{r} \right) &= \frac{1}{r_1} \left( \frac{100 dr_1}{r_1} \right) + \frac{1}{r_2} \left( \frac{100 dr_2}{r_2} \right) + \frac{1}{r_3} \left( \frac{100 dr_3}{r_3} \right) \\ &= \frac{1}{r_1} (1.2) + \frac{1}{r_2} (1.2) + \frac{1}{r_3} (1.2) = (1.2) \left[ \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3} \right] \\ &= 1.2 \left( \frac{1}{r} \right) \quad \text{[From (1)]} \end{aligned}$$

$$\Rightarrow \frac{100 dr}{r} = 1.2 \% \quad \text{Ans.}$$

**Example 16.** The height  $h$  and semi-vertical angle  $\alpha$  of a cone are measured, and from there  $A$ , the total area of the cone, including the base, is calculated. If  $h$  and  $\alpha$  are in error by small quantities  $\delta h$  and  $\delta\alpha$  respectively, find the corresponding error in the area. Show further that,

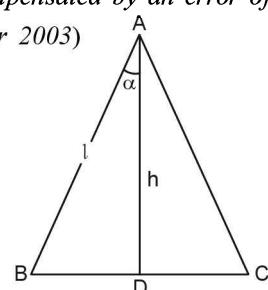

if  $\alpha = \frac{\pi}{6}$ , an error of + 1 percent in  $h$  will be approximately compensated by an error of - 19.8' in  $\alpha$ . (A.M.I.E.T.E. Summer 2003)

**Solution.** Let  $l$  be the slant height of the cone and  $r$  its radius.

$$l = h \sec \alpha$$

$$r = h \tan \alpha$$

$$\begin{aligned} A &= \pi r^2 + \pi r l \\ &= \pi h^2 \tan^2 \alpha + \pi (h \tan \alpha) (h \sec \alpha) \\ &= \pi h^2 [\tan^2 \alpha + \tan \alpha \sec \alpha] \end{aligned}$$

$$\begin{aligned}\delta A &= 2\pi h \delta h [\tan^2 \alpha + \tan \alpha \sec \alpha] \\ &\quad + \pi h^2 [2 \tan \alpha \sec^2 \alpha \delta \alpha + \sec^2 \alpha \cdot \delta \alpha \cdot \sec \alpha + \tan \alpha \sec \alpha \tan \alpha \delta \alpha] \\ \delta A &= 2\pi h [\tan \alpha + \sec \alpha] \tan \alpha \cdot \delta h + \pi h^2 [2 \tan \alpha \sec \alpha \\ &\quad + \sec^2 \alpha + \tan^2 \alpha] \cdot \sec \alpha \cdot \delta \alpha \\ \delta A &= 2\pi h [\tan \alpha + \sec \alpha] \tan \alpha \cdot \delta h + \pi h^2 [\tan \alpha + \sec \alpha]^2 \sec \alpha \cdot \delta \alpha \\ \delta A &= \pi h^2 [\tan \alpha + \sec \alpha] [2 \tan \alpha \frac{\delta h}{h} + (\tan \alpha + \sec \alpha) \sec \alpha \cdot \delta \alpha]\end{aligned}$$

On putting  $\delta A = 0$ ,  $\alpha = \frac{\pi}{6}$ ,  $\frac{\delta h}{h} \times 100 = 1$ , we get

$$\begin{aligned}0 &= \pi h^2 \left[ \tan \frac{\pi}{6} + \sec \frac{\pi}{6} \right] \left[ \left( 2 \tan \frac{\pi}{6} \right) \frac{1}{100} + \left( \tan \frac{\pi}{6} + \sec \frac{\pi}{6} \right) \sec \frac{\pi}{6} \delta \alpha \right] \\ 0 &= \left( 2 \tan \frac{\pi}{6} \right) \frac{1}{100} + \left( \tan \frac{\pi}{6} + \sec \frac{\pi}{6} \right) \sec \frac{\pi}{6} \delta \alpha \\ 0 &= \left[ \frac{2}{\sqrt{3}} \frac{1}{100} + \left( \frac{1}{\sqrt{3}} + \frac{2}{\sqrt{3}} \right) \frac{2}{\sqrt{3}} \delta \alpha \right] \\ \frac{2}{\sqrt{3}} \frac{1}{100} &= - \left( \frac{1}{\sqrt{3}} + \frac{2}{\sqrt{3}} \right) \frac{2}{\sqrt{3}} \delta \alpha \\ \frac{1}{100} &= - \left( \frac{1}{\sqrt{3}} + \frac{2}{\sqrt{3}} \right) \delta \alpha \Rightarrow \frac{1}{100} = - \frac{3}{\sqrt{3}} \delta \alpha \Rightarrow \delta \alpha = - \frac{1}{100\sqrt{3}} \\ \delta \alpha &= - \frac{1}{100\sqrt{3}} \frac{180}{\pi} \text{ degree} = \left( - \frac{9}{5\sqrt{3}\pi} \right) 60 \text{ minutes} = -19.8 \text{ minutes} \quad \text{Ans.}\end{aligned}$$

**Example 17.** Compute an approximate value of  $(1.04)^{3.01}$ .

**Solution.** Let  $f(x, y) = x^y$

$$\text{We have } \frac{\partial f}{\partial x} = y x^{y-1}, \quad \frac{\partial f}{\partial y} = x^y \log x \quad \dots(1)$$

$$\text{Here} \quad \text{Let} \quad \begin{cases} x = 1, & \delta x = 0.04 \\ y = 3, & \delta y = 0.01 \end{cases} \quad \dots(2)$$

$$\begin{aligned}\text{Now} \quad df &= \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy \\ &= y x^{y-1} dx + x^y \log x dy \quad \dots(3) \text{ [Using (1)]}\end{aligned}$$

Substituting the values from (2) in (3), we get

$$\begin{aligned}df &= (3)(1)(0.04) + (1)^3 \log(1)(0.01) = 0.12 \\ (1.04)^{3.01} &= f(1, 3) + df = 1 + 0.12 = 1.12 \quad \text{Ans.}\end{aligned}$$

**Example 18.** Find  $[(3.82)^2 + 2(2.1)^3]^{\frac{1}{5}}$

**Solution.** Let  $f(x, y) = (x^2 + 2y^3)^{\frac{1}{5}}$

$$\begin{aligned}\text{Taking} \quad x &= 4, \quad \delta x = 3.82 - 4 = -0.18 \\ y &= 2, \quad \delta y = 2.1 - 2 = 0.1\end{aligned}$$

$$\frac{\partial f}{\partial x} = \frac{1}{5} \left[ x^2 + 2y^3 \right]^{-\frac{4}{5}} (2x) = \frac{2(4)}{5} \left[ 16 + 2(2)^3 \right]^{-\frac{4}{5}} = \frac{8}{5} \left( \frac{1}{16} \right) = \frac{1}{10}$$

$$\frac{\partial f}{\partial y} = \frac{1}{5} [x^2 + 2y^3]^{-\frac{4}{5}} (6y^2) = \frac{6}{5} (2)^2 [16 + 2(2)^3]^{-\frac{4}{5}} = \frac{24}{5} \times \left(\frac{1}{16}\right) = \frac{3}{10}$$

By total differentiation,

$$df = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy = \frac{1}{10} (-0.18) + \frac{3}{10} (0.1) = -0.018 + 0.03 = 0.012$$

$$\begin{aligned} [(3.82)^2 + 2(2.1)^3]^{\frac{1}{5}} &= f(4, 2) + df \\ &= [(4)^2 + 2(2)^3]^{\frac{1}{5}} + 0.012 = 2 + 0.012 = 2.012 \end{aligned} \quad \text{Ans.}$$

**Example 19.** Find approximate value of  $[(0.98)^2 + (2.01)^2 + (1.94)^2]^{1/2}$ .

**Solution.** Let  $f(x, y, z) = (x^2 + y^2 + z^2)^{1/2}$

Taking

$x = 1, y = 2$  and  $z = 2$  so that

$$dx = -0.02, dy = 0.01, dz = -0.06$$

From (1),

$$\frac{\partial f}{\partial x} = x(x^2 + y^2 + z^2)^{-1/2}, \quad \frac{\partial f}{\partial y} = y(x^2 + y^2 + z^2)^{-1/2},$$

$$\frac{\partial f}{\partial z} = z(x^2 + y^2 + z^2)^{-1/2}$$

Now,

$$\begin{aligned} df &= \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz \quad [\text{By total differentiation}] \\ &= \frac{\partial f}{\partial x} (dx + dy + dz) \\ &= (x^2 + y^2 + z^2)^{-1/2} (x dx + y dy + z dz) \\ &= (1 + 4 + 4)^{-\frac{1}{2}} [1(-0.02) + 2(0.01) + 2(-0.06)] \\ &= \frac{1}{3} (-0.02 + 0.02 - 0.12) = -0.04 \end{aligned}$$

$$\therefore [(0.98)^2 + (2.01)^2 + (1.94)^2]^{1/2} = f(1, 2, 2) + df = 3 + (-0.04) = 2.96. \quad \text{Ans.}$$

### EXERCISE 4.1

- If the density  $\rho$  of a body be inferred from its weights  $W, \omega$  in air and water respectively, show that the relative error in  $\rho$  due to errors  $\delta W, \delta \omega$  in  $W, \omega$  respectively is  $\frac{\delta \rho}{\rho} = \frac{-\omega}{W-\omega} \cdot \frac{\delta W}{W} + \frac{\delta \omega}{W-\omega}$
- The time  $T$  of a complete oscillation of a simple pendulum of length ' $L$ ' is governed by the

equation  $T = 2\pi \sqrt{\frac{L}{g}}$ ,  $g$  is constant, find the approximate error in the calculated value of  $T$

corresponding to an error of 2% in the value of  $L$ . (U.P., I semester, Dec. 2008) **Ans. 1%**

- The period of oscillation of a pendulum is computed by the formula

$$T = 2\pi \sqrt{\frac{l}{g}}$$

Show that the percentage error in  $T = \frac{1}{2} [\% \text{ error in } l - \% \text{ error in } g]$

If  $l = 6$  cm and relative error in  $g$  is equal to  $\frac{1}{160}$ , find the error in the determination of  $T$ .

(Given  $g = 981 \text{ cm/sec}^2$ ) **Ans. - 00153**

4. The indicated horse power  $I$  of an engine is calculated from the formula.

$$I = PLAN/33000$$

where  $A = \frac{\pi}{4} d^2$ . Assuming that errors of  $r$  per cent may have been made in measuring  $P, L, N$  and  $d$ . Find the greatest possible error in  $I$ .

**Ans.**  $5 r\%$

5. The dimensions of a cone are radius 4 cm, height 6 cm. What is the error in its volume if the scale used in taking the measurement is short by 0.01 cm per cm. ...(2)

**Ans.**  $0.96 \pi \text{ cm}^3$

6. The work that must be done to propel a ship of displacement  $D$  for a distance  $s$  in time  $t$  is proportional to  $s^2 D^{2/3} t^2$ .

Find approximately the percentage increase of work necessary when the displacement is increased

by 1% the time is diminished by 1% and the distance is increased by 3%. **Ans.**  $\frac{14}{3}\%$

7. The power  $P$  required to propel a ship of length  $l$  moving with a velocity  $V$  is given by  $P = kV^3 t^2$ .

Find the percentage increase in power if increase in velocity is 3% and increase in length is 4%.

**Ans.** 17%

8. In estimating the cost of a pile of bricks measured as  $2 \text{ m} \times 15 \text{ m} \times 1.2 \text{ m}$ , the tape is stretched 1% beyond the standard length if the count is 450 bricks to  $1 \text{ m}^3$  and bricks cost Rs. 1300 per 1000, find the approximate error in the cost.

**Ans.** Rs. 631.80

9. In estimating the cost of a pile of bricks measured as  $6' \times 50' \times 4'$ , the tape is stretched 1% beyond the standard length. If the count is 12 bricks to  $\text{ft}^3$ , and bricks cost Rs. 100 per 1000, find the approximate error in the cost.

**Ans.** 720 bricks, Rs. 25.20 (U.P. I Sem. Dec. 2004)

10. The sides of a triangle are measured as 12 cm and 15 cm and the angle included between them as  $60^\circ$ . If the lengths can be measured within 1% accuracy while the angle can be measured within 2% accuracy. Find the percentage error in determining (i) area of the triangle (ii) length of opposite side of the triangle. (A.M.I.E.T.E., Winter 2002) **Ans.** ???

11. In determining the specific gravity by the formula  $S = \frac{A}{A - w}$ , where  $A$  is the weight in air and  $w$  is the weight in water.  $A$  can be read within 0.01 gm and  $w$  within 0.02 gm. Find approximately the maximum error in  $S$  if the reading are  $A = 1.1$  gm and  $w = 0.6$  gm. **Ans.** -0.112

12. The voltage  $V$  across a resistor is measured with error  $h$ , and the resistance  $R$  is measured with an error  $k$ . Show that the error in calculating the power  $W(V, R) = \frac{V^2}{R}$  generated in the resistor is

$\frac{V}{R^2}(2Rh - Vk)$ . If  $V$  can be measured to an accuracy of 0.5 p.c. and  $R$  to an accuracy of 1 p.c.,

what is the approximate possible percentage error in  $W$ ? **Ans.** Zero per cent

13. Find the percentage error in calculating the area of ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ , when error of + 1% is made in measuring the major and minor axes. (A.M.I.E.T.E., June 2009) **Ans.** 2%

14. If  $f = x^2 y^2 z^{10}$ , find the approximate value of  $f$ , when  $x = 1.99$ ,  $y = 3.01$  and  $z = 0.98$ . **Ans.** 107.784

15. Find approximate value of  $\sqrt{(0.98)^2 + (2.01)^2 + (1.94)^2}$  **Ans.** 2.96

**CHAPTER**  
**5**

## JACOBIANS

---

---

### 5.1 JACOBIANS

If  $u$  and  $v$  are functions of the two independent variables  $x$  and  $y$ , then the determinant

$$\begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix}$$

is called the Jacobian of  $u, v$  with respect to  $x, y$  and is written as

$$\frac{\partial(u, v)}{\partial(x, y)} \text{ or } J \begin{pmatrix} u, v \\ x, y \end{pmatrix}$$

Similarly the Jacobian of  $u, v, w$  with respect to  $x, y, z$  is

$$\frac{\partial(u, v, w)}{\partial(x, y, z)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix}$$

**Example 1.** If  $x = r \cos \theta$ ,  $y = r \sin \theta$ ; evaluate  $\frac{\partial(x, y)}{\partial(r, \theta)}$  and  $\frac{\partial(r, \theta)}{\partial(x, y)}$

**Solution.**  $x = r \cos \theta, \quad y = r \sin \theta$

$$\frac{\partial x}{\partial r} = \cos \theta \quad \frac{\partial y}{\partial r} = \sin \theta$$

$$\frac{\partial x}{\partial \theta} = -r \sin \theta, \quad \frac{\partial y}{\partial \theta} = r \cos \theta$$

$$\begin{aligned} \frac{\partial(x, y)}{\partial(r, \theta)} &= \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix} = \begin{vmatrix} \cos \theta & -r \sin \theta \\ \sin \theta & r \cos \theta \end{vmatrix} \\ &= r \cos^2 \theta + r \sin^2 \theta = r(\cos^2 \theta + \sin^2 \theta) = r \end{aligned}$$

Now  $r^2 = x^2 + y^2, \quad \theta = \tan^{-1} \frac{y}{x}$

$$\frac{\partial r}{\partial x} = \frac{x}{r}, \quad \frac{\partial \theta}{\partial x} = \frac{-y}{x^2 + y^2} = -\frac{y}{r^2}$$

$$\frac{\partial r}{\partial y} = \frac{y}{r}$$

$$\frac{\partial \theta}{\partial y} = \frac{x}{x^2 + y^2} = \frac{x}{r^2}$$

$$\frac{\partial(r, \theta)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial r}{\partial x} & \frac{\partial r}{\partial y} \\ \frac{\partial \theta}{\partial x} & \frac{\partial \theta}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{x}{r} & \frac{y}{r} \\ -\frac{y}{r^2} & \frac{x}{r^2} \end{vmatrix} = \frac{x^2}{r^3} + \frac{y^2}{r^3} = \frac{x^2 + y^2}{r^3} = \frac{r^2}{r^3} = \frac{1}{r}$$

Ans.

Note :  $\frac{\partial(x, y)}{\partial(r, \theta)} \times \frac{\partial(r, \theta)}{\partial(x, y)} = r \frac{1}{r} = 1.$

**Example 2.** Find the Jacobian  $J\left(\frac{u, v}{x, y}\right)$  for  $u = e^x \sin y$  and

$$v = x \log \sin y$$

(U.P.I semester, Dec 2009)

**Solution.** Here, we have

$$\begin{array}{ll} u = e^x \sin y & v = x \log \sin y \\ \frac{\partial u}{\partial x} = e^x \sin y & \frac{\partial v}{\partial x} = \log \sin y \\ \frac{\partial u}{\partial y} = e^x \cos y & \frac{\partial v}{\partial y} = \frac{x \cos y}{\sin y} \\ J\left(\frac{u, v}{x, y}\right) = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} & = \begin{vmatrix} e^x \sin y & e^x \cos y \\ \log \sin y & \frac{x \cos y}{\sin y} \end{vmatrix} \\ & = e^x x \cos y - e^x \cos y \log \sin y = e^x \cos y [x - \log \sin y] \end{array}$$

Ans.

**Example 3.** If  $x = a \cosh \xi \cos \eta$ ,  $y = a \sinh \xi \sin \eta$ , show that

$$\frac{\partial(x, y)}{\partial(\xi, \eta)} = \frac{a^2}{2} (\cosh 2\xi - \cos 2\eta)$$

**Solution.**  $x = a \cosh \xi \cos \eta$

$$y = a \sinh \xi \sin \eta$$

$$\begin{aligned} \frac{\partial(x, y)}{\partial(\xi, \eta)} &= \begin{vmatrix} \frac{\partial x}{\partial \xi} & \frac{\partial x}{\partial \eta} \\ \frac{\partial y}{\partial \xi} & \frac{\partial y}{\partial \eta} \end{vmatrix} = \begin{vmatrix} a \sinh \xi \cos \eta & -a \cosh \xi \sin \eta \\ a \cosh \xi \sin \eta & a \sinh \xi \cos \eta \end{vmatrix} \\ &= a^2 \begin{vmatrix} \sinh \xi \cos \eta & -\cosh \xi \sin \eta \\ \cosh \xi \sin \eta & \sinh \xi \cos \eta \end{vmatrix} \end{aligned}$$

$$= a^2 [\sinh^2 \xi \cos^2 \eta + \cosh^2 \xi \sin^2 \eta]$$

$$= a^2 [\sinh^2 \xi (1 - \sin^2 \eta) + (1 + \sinh^2 \xi) \sin^2 \eta]$$

$$= a^2 [\sinh^2 \xi - \sinh^2 \xi \sin^2 \eta + \sin^2 \eta + \sinh^2 \xi \sin^2 \eta]$$

$$= a^2 [\sinh^2 \xi + \sin^2 \eta] = \frac{a^2}{2} [\cosh 2\xi - 1 + \cos 2\eta]$$

$$= \frac{a^2}{2} [\cosh 2\xi - \cos 2\eta]$$

Proved.

**Example 4.** If  $y_1 = \frac{x_2 x_3}{x_1}$ ,  $y_2 = \frac{x_3 x_1}{x_2}$ ,  $y_3 = \frac{x_1 x_2}{x_3}$ .

Show that the Jacobian of  $y_1, y_2, y_3$  with respect to  $x_1, x_2, x_3$  is 4.

(U.P. I Sem. 2004, Comp. 2002, A.M.I.E., Winter 2001, Summer 2002, 2000)

**Solution.** We have,  $y_1 = \frac{x_2 x_3}{x_1}$ ,  $y_2 = \frac{x_3 x_1}{x_2}$ ,  $y_3 = \frac{x_1 x_2}{x_3}$ .

$$\begin{aligned} \frac{\partial(y_1, y_2, y_3)}{\partial(x_1, x_2, x_3)} &= \begin{vmatrix} \frac{\partial y_1}{\partial x_1} & \frac{\partial y_1}{\partial x_2} & \frac{\partial y_1}{\partial x_3} \\ \frac{\partial y_2}{\partial x_1} & \frac{\partial y_2}{\partial x_2} & \frac{\partial y_2}{\partial x_3} \\ \frac{\partial y_3}{\partial x_1} & \frac{\partial y_3}{\partial x_2} & \frac{\partial y_3}{\partial x_3} \end{vmatrix} = \begin{vmatrix} -\frac{x_2 x_3}{x_1^2} & \frac{x_3}{x_1} & \frac{x_2}{x_1} \\ \frac{x_3}{x_2} & -\frac{x_3 x_1}{x_2^2} & \frac{x_1}{x_2} \\ \frac{x_2}{x_3} & \frac{x_1}{x_3} & -\frac{x_1 x_2}{x_3^2} \end{vmatrix} \\ &= \frac{1}{x_1^2 x_2^2 x_3^2} \begin{vmatrix} -x_2 x_3 & x_3 x_1 & x_1 x_2 \\ x_2 x_3 & -x_3 x_1 & x_1 x_2 \\ x_2 x_3 & x_3 x_1 & -x_1 x_2 \end{vmatrix} = \frac{x_1^2 x_2^2 x_3^2}{x_1^2 x_2^2 x_3^2} \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix} \\ &= -1(1-1) - 1(-1-1) + 1(1+1) \\ &= 0 + 2 + 2 = 4 \end{aligned}$$

Proved.

**Example 5.** If  $x = r \sin \theta \cos \phi$ ,  
 $y = r \sin \theta \sin \phi$ ,  
 $z = r \cos \theta$ ,

show that  $\frac{\partial(x, y, z)}{\partial(r, \theta, \phi)} = r^2 \sin \theta$  (U.P. I, Sem. Winter 2002)

**Solution.**

$$x = r \sin \theta \cos \phi, \quad y = r \sin \theta \sin \phi, \quad z = r \cos \theta$$

$$\frac{\partial x}{\partial r} = \sin \theta \cos \phi, \quad \frac{\partial y}{\partial r} = \sin \theta \sin \phi, \quad \frac{\partial z}{\partial r} = \cos \theta$$

$$\frac{\partial x}{\partial \theta} = r \cos \theta \cos \phi, \quad \frac{\partial y}{\partial \theta} = r \cos \theta \sin \phi, \quad \frac{\partial z}{\partial \theta} = -r \sin \theta$$

$$\frac{\partial x}{\partial \phi} = -r \sin \theta \sin \phi, \quad \frac{\partial y}{\partial \phi} = r \sin \theta \cos \phi, \quad \frac{\partial z}{\partial \phi} = 0$$

$$\begin{aligned} \frac{\partial(x, y, z)}{\partial(r, \theta, \phi)} &= \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} & \frac{\partial x}{\partial \phi} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} & \frac{\partial y}{\partial \phi} \\ \frac{\partial z}{\partial r} & \frac{\partial z}{\partial \theta} & \frac{\partial z}{\partial \phi} \end{vmatrix} = \begin{vmatrix} \sin \theta \cos \phi & r \cos \theta \cos \phi & -r \sin \theta \sin \phi \\ \sin \theta \sin \phi & r \cos \theta \sin \phi & r \sin \theta \cos \phi \\ \cos \theta & -r \sin \theta & 0 \end{vmatrix} \\ &= r^2 \sin \theta \begin{vmatrix} \sin \theta \cos \phi & \cos \theta \cos \phi & -\sin \phi \\ \sin \theta \sin \phi & \cos \theta \sin \phi & \cos \phi \\ \cos \theta & -\sin \theta & 0 \end{vmatrix} \end{aligned}$$

$$\begin{aligned} &= r^2 \sin \theta [\sin \theta \cos \phi (0 + \sin \theta \cos \phi) - \cos \theta \cos \phi (0 - \cos \theta \cos \phi) - \sin \phi (-\sin^2 \theta \sin \phi - \cos^2 \theta \sin \phi)] \\ &= r^2 \sin \theta [\sin^2 \theta \cos^2 \phi + \cos^2 \theta \cos^2 \phi + \sin^2 \theta \sin^2 \phi + \cos^2 \theta \sin^2 \phi] \\ &= r^2 \sin \theta [( \sin^2 \theta + \cos^2 \theta) \cos^2 \phi + (\sin^2 \theta + \cos^2 \theta) \sin^2 \phi] \\ &= r^2 \sin \theta [\cos^2 \phi + \sin^2 \phi] = r^2 \sin \theta \end{aligned}$$

Proved.

**Theorem.** If the relations connecting  $u_i$ 's and  $x_i$ 's are of the form.

$$u_1 = f_1(x)$$

$$u_2 = f_2(x_1, x_2)$$

.....

.....

$$u_n = f_n(x_1, x_2, \dots, x_n)$$

$$\text{then } \frac{\partial(u_1, u_2, \dots, u_n)}{\partial(x_1, x_2, \dots, x_n)} = \frac{\partial u_1}{\partial x_1} \cdot \frac{\partial u_2}{\partial x_2} \cdot \frac{\partial u_3}{\partial x_3} \cdots \frac{\partial u_n}{\partial x_n}$$

**Proof.** We know that,

$$\frac{\partial(u_1, u_2, \dots, u_n)}{\partial(x_1, x_2, \dots, x_n)} = \begin{vmatrix} \frac{\partial u_1}{\partial x_1} & \frac{\partial u_1}{\partial x_2} & \frac{\partial u_1}{\partial x_3} & \cdots & \frac{\partial u_1}{\partial x_n} \\ \frac{\partial u_2}{\partial x_1} & \frac{\partial u_2}{\partial x_2} & \frac{\partial u_2}{\partial x_3} & \cdots & \frac{\partial u_2}{\partial x_n} \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ \frac{\partial u_n}{\partial x_1} & \frac{\partial u_n}{\partial x_2} & \frac{\partial u_n}{\partial x_3} & \cdots & \frac{\partial u_n}{\partial x_n} \end{vmatrix}$$

$u_1$  is not function of  $x_2, x_3, \dots, x_n$ . Therefore,

$$\frac{\partial u_1}{\partial x_2} = 0, \frac{\partial u_1}{\partial x_3} = 0, \dots, \frac{\partial u_1}{\partial x_n} = 0$$

$u_2$  is not function of  $x_3, x_4, x_5, \dots, x_n$ . Therefore,

$$\frac{\partial u_2}{\partial x_3} = 0, \frac{\partial u_2}{\partial x_4} = 0, \dots, \frac{\partial u_2}{\partial x_n} = 0$$

$u_3$  is not function of  $x_4, x_5, x_6, \dots, x_n$ . Therefore,

$$\frac{\partial u_3}{\partial x_4} = 0, \frac{\partial u_3}{\partial x_5} = 0, \dots, \frac{\partial u_3}{\partial x_n} = 0$$

$u_n$  is function of  $x_1, x_2, \dots, x_n$  therefore all  $\frac{\partial u_n}{\partial x_1}, \frac{\partial u_n}{\partial x_2}, \dots, \frac{\partial u_n}{\partial x_n}$  will exist.

Putting these values in (1), we get

$$\frac{\partial(u_1, u_2, u_3, \dots, u_n)}{\partial(x_1, x_2, x_3, \dots, x_n)} = \begin{vmatrix} \frac{\partial u_1}{\partial x_1} & 0 & 0 & \cdots & 0 \\ \frac{\partial u_2}{\partial x_1} & \frac{\partial u_2}{\partial x_2} & 0 & \cdots & 0 \\ \frac{\partial u_3}{\partial x_1} & \frac{\partial u_3}{\partial x_2} & \frac{\partial u_3}{\partial x_3} & \cdots & 0 \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ \frac{\partial u_n}{\partial x_1} & \frac{\partial u_n}{\partial x_2} & \frac{\partial u_n}{\partial x_3} & \cdots & \frac{\partial u_n}{\partial x_n} \end{vmatrix}$$

Expanding the determinant in terms of first row, we get

$$\frac{\partial(u_1, u_2, \dots, u_n)}{\partial(x_1, x_2, \dots, x_n)} = \frac{\partial u_1}{\partial x_1} \cdot \frac{\partial u_2}{\partial x_2} \cdot \frac{\partial u_3}{\partial x_3} \cdots \frac{\partial u_n}{\partial x_n}.$$

**Proved.**

**Example 6.** If  $y_1 = \cos x_1$ ,  $y_2 = \sin x_1 \cos x_2$  and  $y_3 = \sin x_1 \sin x_2 \cos x_3$ , then show that

$$\frac{\partial(y_1, y_2, y_3)}{\partial(x_1, x_2, x_3)} = -\sin^3 x_1 \sin^2 x_2 \sin x_3.$$

**Solution.**  $\frac{\partial(y_1, y_2, y_3)}{\partial(x_1, x_2, x_3)} = \frac{\partial y_1}{\partial x_1} \cdot \frac{\partial y_2}{\partial x_2} \cdot \frac{\partial y_3}{\partial x_3}$

$$= (-\sin x_1)(-\sin x_1 \sin x_2) (-\sin x_1 \sin x_2 \sin x_3)$$

$$= -\sin^3 x_1 \sin^2 x_2 \sin x_3.$$

**Ans.**

**Example 7.** If  $y_1 = 1 - x_1$ ,  $y_2 = x_1(1 - x_2)$ ,  $y_3 = x_1x_2(1 - x_3)$ , .....

$$\dots y_n = x_1 x_2 x_3 \dots x_{n-1}(1 - x_n)$$

then show that

$$\frac{\partial(y_1, y_2, \dots, y_n)}{\partial(x_1, x_2, \dots, x_n)} = (-1)^n x_1^{n-1} x_2^{n-2} \dots x_{n-1}.$$

**Solution.** we know that,

$$\begin{aligned} \frac{\partial(y_1, y_2, \dots, y_n)}{\partial(x_1, x_2, \dots, x_n)} &= \frac{\partial y_1}{\partial x_1} \cdot \frac{\partial y_2}{\partial x_2} \cdots \frac{\partial y_n}{\partial x_n} \\ &= (-1)(-x_1)(-x_1 x_2) \dots (-x_1 x_2 \dots x_{n-1}) \\ &= (-1)^n x_1^{n-1} x_2^{n-2} \dots x_{n-1} \end{aligned}$$

**Proved.**

**Example 8.** If  $u_1 = \frac{x_1}{x_n}$ ,  $u_2 = \frac{x_2}{x_n}$ ,  $u_3 = \frac{x_3}{x_n}$ , ...,  $u_{n-1} = \frac{x_{n-1}}{x_n}$  and

$$x_1^2 + x_2^2 + x_3^2 + \dots + x_{n-1}^2 + x_n^2 = 1, \text{ find the value of the Jacobian } \frac{\partial(u_1, u_2, u_3, \dots, u_{n-1})}{\partial(x_1, x_2, x_3, \dots, x_{n-1})}.$$

**Solution.** Here, we have  $u_1 = \frac{x_1}{x_n} \Rightarrow \frac{\partial u_1}{\partial x_1} = \frac{x_n - x_1}{x_n^2} \frac{\partial x_n}{\partial x_1}$  ... (1)

Differentiating  $x_1^2 + x_2^2 + x_3^2 + \dots + x_n^2 = 1$  partially w.r.t  $x_1$ , we get

$$2x_1 + 2x_n \frac{\partial x_n}{\partial x_1} = 0 \Rightarrow \frac{\partial x_n}{\partial x_1} = -\frac{x_1}{x_n} \quad \dots (2)$$

Putting the value of  $\frac{\partial x_n}{\partial x_1}$  from (2) in (1), we get

$$\frac{\partial u_1}{\partial x_1} = \frac{x_n - x_1 \left( \frac{-x_1}{x_n} \right)}{x_n^2} = \frac{x_n^2 + x_1^2}{x_n^3}$$

Similarly,  $\frac{\partial u_1}{\partial x_2} = -\frac{x_1}{x_n^2} \cdot \frac{\partial x_n}{\partial x_2} = -\frac{x_1}{x_n^2} \cdot \left( \frac{-x_2}{x_n} \right) = \frac{x_1 x_2}{x_n^3}$

$$\frac{\partial(u_1, u_2, u_3, \dots, u_{n-1})}{\partial(x_1, x_2, x_3, \dots, x_{n-1})} = \begin{vmatrix} \frac{x_n^2 + x_1^2}{x_n^3} & \frac{x_1 x_2}{x_n^3} & \frac{x_1 x_3}{x_n^3} & \dots & \frac{x_1 x_{n-1}}{x_n^3} \\ \frac{x_2 x_1}{x_n^3} & \frac{x_n^2 + x_2^2}{x_n^3} & \frac{x_2 x_3}{x_n^3} & \dots & \frac{x_2 x_{n-1}}{x_n^3} \\ \frac{x_3 x_1}{x_n^3} & \frac{x_3 x_2}{x_n^3} & \frac{x_n^2 + x_3^2}{x_n^3} & \dots & \frac{x_3 x_{n-1}}{x_n^3} \\ \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots \\ \frac{x_{n-1} x_1}{x_n^3} & \frac{x_{n-1} x_2}{x_n^3} & \frac{x_{n-1} x_3}{x_n^3} & \dots & \frac{x_n^2 + x_{n-1}^2}{x_n^3} \end{vmatrix}$$

Taking  $\frac{1}{x_n^3}$  common from each of  $(n - 1)$  columns and we get

$$= \left( \frac{1}{x_n^3} \right)^{n-1} \begin{vmatrix} x_n^2 + x_1^2 & x_1 x_2 & x_1 x_3 & \dots & x_1 x_{n-1} \\ x_2 x_1 & x_n^2 + x_2^2 & x_2 x_3 & \dots & x_2 x_{n-1} \\ x_3 x_1 & x_3 x_2 & x_n^2 + x_3^2 & \dots & x_3 x_{n-1} \\ \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots \\ x_{n-1} x_1 & x_{n-1} x_2 & x_{n-1} x_3 & \dots & x_n^2 + x_{n-1}^2 \end{vmatrix}$$

Multiplying I column by  $x_1$  and dividing the determinant by  $x_1$ , we get

$$= \frac{1}{x_1 x_n^{3(n-3)}} \begin{vmatrix} x_1(x_n^2 + x_1^2) & x_1 x_2 & x_1 x_3 & \dots & x_1 x_{n-1} \\ x_2 x_1^2 & x_n^2 + x_2^2 & x_1 x_3 & \dots & x_2 x_{n-1} \\ x_3 x_1^2 & x_3 x_2 & x_n^2 + x_3^2 & \dots & x_3 x_{n-1} \\ \dots & \dots & \dots & \dots & \dots \\ x_{n-1} x_1^2 & x_{n-1} x_2 & x_{n-1} x_3 & \dots & x_n^2 + x_{n-1}^2 \end{vmatrix}$$

Multiplying  $c_2$  by  $x_2$ ,  $c_3$  by  $x_3$  and so on and then adding to 1 column, we get

$$= \frac{1}{x_1 x_n^{3(n-3)}} \begin{vmatrix} x_1(x_n^2 + x_1^2) + x_1 x_2^2 + x_1 x_3^2 + \dots + x_1 x_{n-1}^2 & x_1 x_2 & x_1 x_3 & \dots & x_1 x_{n-1} \\ x_2 x_1^2 + x_2(x_n^2 + x_2^2) + x_2 x_3^2 + \dots + x_2 x_{n-1}^2 & x_n^2 + x_2^2 & x_2 x_3 & \dots & x_2 x_{n-1} \\ x_3 x_1^2 + x_2^2 x_3 + x_3(x_n^2 + x_3^2) + \dots + x_3 x_{n-1}^2 & x_3 x_2 & x_n^2 + x_3^2 & \dots & x_3 x_{n-1} \\ \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots \\ x_{n-1} x_1^2 + x_2^2 x_{n-1} + \dots + x_{n-1} x_{n-1}^2 & x_{n-1} x_2 & x_{n-1} x_3 & \dots & x_n^2 + x_{n-1}^2 \end{vmatrix}$$

$$= \frac{1}{x_1 x_n^{3(n-3)}} \begin{vmatrix} x_1(x_n^2 + x_1^2 + x_2^2 + x_3^2 + \dots + x_{n-1}^2) & x_1 x_2 & x_1 x_3 & \dots & x_1 x_{n-1} \\ x_2(x_1^2 + x_n^2 + x_2^2 + x_3^2 + \dots + x_{n-1}^2) & x_n^2 + x_2^2 & x_2 x_3 & \dots & x_2 x_{n-1} \\ x_3(x_1^2 + x_2^2 + x_n^2 + x_3^2 + \dots + x_{n-1}^2) & x_3 x_2 & x_n^2 + x_3^2 & \dots & x_3 x_{n-1} \\ x_{n-1}(x_1^2 + x_2^2 + x_3^2 + \dots + x_n^2 + x_{n-1}^2) & x_{n-1} x_2 & x_{n-1} x_3 & \dots & x_n^2 + x_{n-1}^2 \end{vmatrix}$$

$$\text{Apply } = x_1^2 + x_2^2 + x_3^2 + \dots + x_{n-1}^2 + x_n^2 = 1$$

$$J = \frac{1}{x_1 x_n^{3n-3}} \begin{vmatrix} x_1 & x_1 x_2 & x_1 x_3 & \dots & x_1 x_{n-1} \\ x_2 & x_n^2 + x_2^2 & x_2 x_3 & \dots & x_2 x_{n-1} \\ x_3 & x_3 x_2 & x_n^2 + x_3^2 & \dots & x_3 x_{n-1} \\ \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots \\ x_{n-1} & x_{n-1} x_2 & x_{n-1} x_3 & \dots & x_n^2 + x_{n-1}^2 \end{vmatrix}$$

Taking  $x_1$  common from  $R_1$  and then applying  $R_2 \rightarrow R_2 - x_2 R_1, R_3 \rightarrow R_3 - x_3 R_1, \dots, R_{n-1} \rightarrow R_{n-1} - x_{n-1} R_1$ , we get

$$J = \frac{1}{x_n^{3n-3}} \begin{vmatrix} 1 & x_2 & x_3 & \dots & x_{n-1} \\ 0 & x_n^2 & 0 & \dots & 0 \\ 0 & 0 & x_n^2 & \dots & 0 \\ \dots & \dots & \dots & \dots & \dots \\ 0 & 0 & 0 & \dots & x_n^2 \end{vmatrix}$$

$$= \frac{1}{x_n^{3n-3}} (x_n^2)^{n-2} = \frac{1}{(x_n)^{n+1}}.$$

**Ans.**

### EXERCISE 5.1

1. If  $u = x^2, v = y^2$ , find  $\frac{\partial(u, v)}{\partial(x, y)}$  **Ans.**  $4xy$
2. If  $u = \frac{y-x}{1+xy}$  and  $v = \tan^{-1}y - \tan^{-1}x$ , find  $\frac{\partial(u, v)}{\partial(x, y)}$  **Ans.** 0
3. If  $u = xyz, v = xy + yz + zx, w = x + y + z$ , compute  $\frac{\partial(u, v, w)}{\partial(x, y, z)}$  **Ans.**  $(x-y)(y-z)(z-x)$
4. If  $x = r \cos\theta, y = r \sin\theta, z = z$  find  $\frac{\partial(x, y, z)}{\partial(r, \theta, z)}$ .
5. If  $u_1 = \frac{x_1}{x_n}, u_2 = \frac{x_2}{x_n}, \dots, u_{n-1} = \frac{x_{n-1}}{x_n}$  and  $x_1^2 + x_2^2 + x_3^2 + \dots + x_n^2 = 1$  find  $\frac{\partial(u_1, u_2, \dots, u_{n-1})}{\partial(x_1, x_2, \dots, x_{n-1})}$  **Ans.**  $\frac{1}{x_n^{n-1}}$

6. Find the value of  $\frac{\partial(y_1, y_2, y_3)}{\partial(x_1, x_2, x_3)}$ ,  $y_1 = (1-x_1), y_2 = x_1(1-x_2), y_3 = x_1 x_2 (1-x_3)$  **Ans.**  $-x_1^2 x_2$

7. If  $u = \frac{x}{y-z}, v = \frac{y}{z-x}, w = \frac{z}{x-y}$  then show that  $\frac{\partial(u, v, w)}{\partial(x, y, z)} = 0$ .

8. Fill in the blanks :

(i) If  $x = r \cos \theta, y = r \sin \theta$ , then the value of Jacobians  $\frac{\partial(x, y)}{\partial(r, \theta)}$  is...

(ii) If  $u = x(1-y), v = xy$ , then the value of the Jacobian  $\frac{\partial(u, v)}{\partial(x, y)} = \dots$  **Ans.** (i)  $r$ , (ii)  $x$

## 5.2 PROPERTIES OF JACOBIANS

### (1) First Property

If  $u$  and  $v$  are the functions of  $x$  and  $y$ , then

$$\frac{\partial(u, v)}{\partial(x, y)} \times \frac{\partial(x, y)}{\partial(u, v)} = 1 \quad (\text{A.M.I.E.T.E., Summer 2009, 2005})$$

**Proof.** Let  $u = f(x, y)$

$$v = \phi(x, y) \quad \dots(1)$$

$$\frac{\partial(u, v)}{\partial(x, y)} \times \frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} \times \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} \quad \dots(2)$$

On interchanging the rows and columns of second determinant

$$= \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} \times \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} \frac{\partial u}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial u} & \frac{\partial u}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial v} \\ \frac{\partial v}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial u} & \frac{\partial v}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial v} \end{vmatrix} \quad \dots(3)$$

On differentiating (1) and (2) w.r.t.  $u$  and  $v$ , we get

$$\left. \begin{aligned} \frac{\partial u}{\partial u} &= 1 = \frac{\partial u}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial u} \\ \frac{\partial u}{\partial v} &= 0 = \frac{\partial u}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial v} \\ \frac{\partial v}{\partial v} &= 1 = \frac{\partial v}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial v} \\ \frac{\partial v}{\partial u} &= 0 = \frac{\partial v}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial u} \end{aligned} \right\} \quad \dots(4)$$

On making substitutions from (4) in (3), we get

$$\frac{\partial(u, v)}{\partial(x, y)} \times \frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} = 1 \quad \text{Proved.}$$

**Example 9.** If  $x = uv$ ,  $y = \frac{u+v}{u-v}$ , find  $\frac{\partial(u, v)}{\partial(x, y)}$ .

**Solution.** Here it is easy to find,  $\frac{\partial x}{\partial u}, \frac{\partial x}{\partial v}, \frac{\partial y}{\partial u}, \frac{\partial y}{\partial v}$ . But to find  $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y}$  is comparatively difficult. So we first find  $\frac{\partial(x, y)}{\partial(u, v)}$ .

$$\begin{aligned} \frac{\partial(x, y)}{\partial(u, v)} &= \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} v & u \\ -2v & 2u \end{vmatrix} \\ &= \frac{uv}{(u-v)^2} \begin{vmatrix} 1 & 1 \\ -2 & 2 \end{vmatrix} = \frac{uv}{(u-v)^2} (2+2) = \frac{4uv}{(u-v)^2} \end{aligned}$$

But  $\frac{\partial(u, v)}{\partial(x, y)} \times \frac{\partial(x, y)}{\partial(u, v)} = 1$

$$\frac{\partial(u, v)}{\partial(x, y)} \times \frac{4uv}{(u-v)^2} = 1 \Rightarrow \frac{\partial(u, v)}{\partial(x, y)} = \frac{(u-v)^2}{4uv}$$

Ans.

**Example 10.** If  $u = xyz$ ,  $v = x^2 + y^2 + z^2$ ,  $w = x + y + z$ , find  $J = \frac{\partial(x, y, z)}{\partial(u, v, w)}$

**Solution.** Since  $u, v, w$  are explicitly given, so first we evaluate

$$J' = \frac{\partial(u, v, w)}{\partial(x, y, z)}$$

$$J' = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix} = \begin{vmatrix} yz & zx & xy \\ 2x & 2y & 2z \\ 1 & 1 & 1 \end{vmatrix}$$

$$\begin{aligned} &= yz(2y - 2z) - zx(2x - 2z) + xy(2x - 2y) = 2[yz(y-z) - zx(x-z) + xy(x-y)] \\ &= 2[x^2y - x^2z - xy^2 + xz^2 + y^2z - yz^2] = 2[x^2(y-z) - x(y^2 - z^2) + yz(y-z)] \\ &= 2(y-z)[x^2 - x(y+z) + yz] = 2(y-z)[y(z-x) - x(z-x)] \\ &= 2(y-z)(z-x)(y-x) = -2(x-y)(y-z)(z-x) \end{aligned}$$

Hence, by  $JJ' = 1$ , we have

$$J = \frac{\partial(x, y, z)}{\partial(u, v, w)} = \frac{-1}{2(x-y)(y-z)(z-x)}$$

Ans.

### EXERCISE 5.2

- Given  $u = x^2 - y^2$ ,  $v = 2xy$ , calculate  $\frac{\partial(x, y)}{\partial(u, v)}$ . Ans.  $\frac{1}{4(x^2 + y^2)}$
- If  $x = uv$ ,  $y = \frac{u+v}{u-v}$ , find  $\frac{\partial(u, v)}{\partial(x, y)}$ . Ans.  $\frac{(u-v)^2}{4uv}$
- If  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$ , find  $\frac{\partial(r, \theta, \phi)}{\partial(x, y, z)}$ . Ans.  $\frac{1}{r^2 \sin \theta}$
- If  $x = u(1-v)$ ,  $y = uv$ , verify that  $\frac{\partial(x, y)}{\partial(u, v)} \times \frac{\partial(u, v)}{\partial(x, y)} = 1$  (A.M.I.E. Summer 2001)
- For the transformation  $x = e^u \cos v$ ,  $y = e^u \sin v$ , prove that  $\frac{\partial(x, y)}{\partial(u, v)} \times \frac{\partial(u, v)}{\partial(x, y)} = 1$
- Verify  $JJ' = 1$ , if  $x = uv$ ,  $y = \frac{u}{v}$ . 7. Verify  $JJ' = 1$ , if  $x = e^v \sec u$ ,  $y = e^v \tan u$ .
- Verify  $JJ' = 1$ , if  $x = \sin \theta \cos \phi$ ,  $y = \sin \theta \sin \phi$

### (2) Second Property

If  $u, v$  are the functions of  $r, s$  where  $r, s$  are functions of  $x, y$ , then

$$\frac{\partial(u, v)}{\partial(x, y)} = \frac{\partial(u, v)}{\partial(r, s)} \times \frac{\partial(r, s)}{\partial(x, y)}$$

**Proof.**  $\frac{\partial(u, v)}{\partial(r, s)} \times \frac{\partial(r, s)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial u}{\partial r} & \frac{\partial u}{\partial s} \\ \frac{\partial v}{\partial r} & \frac{\partial v}{\partial s} \end{vmatrix} \times \begin{vmatrix} \frac{\partial r}{\partial x} & \frac{\partial r}{\partial y} \\ \frac{\partial s}{\partial x} & \frac{\partial s}{\partial y} \end{vmatrix}$

On interchanging the columns and rows in second determinant

$$\begin{aligned} &= \begin{vmatrix} \frac{\partial u}{\partial r} & \frac{\partial u}{\partial s} \\ \frac{\partial v}{\partial r} & \frac{\partial v}{\partial s} \end{vmatrix} \times \begin{vmatrix} \frac{\partial r}{\partial x} & \frac{\partial s}{\partial x} \\ \frac{\partial r}{\partial y} & \frac{\partial s}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{\partial u}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial u}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial y} \\ \frac{\partial v}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial v}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial v}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial v}{\partial s} \frac{\partial s}{\partial y} \end{vmatrix} \\ &= \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \frac{\partial(u, v)}{\partial(x, y)} \quad \text{Ans.} \\ \text{Similarly, } &\frac{\partial(u, v, w)}{\partial(x, y, z)} = \frac{\partial(u, v, w)}{\partial(r, s, t)} \times \frac{\partial(r, s, t)}{\partial(x, y, z)} \end{aligned}$$

**Example 11.** Find the value of the Jacobian  $\frac{\partial(u, v)}{\partial(r, \theta)}$ , where  $u = x^2 - y^2$ ,  $v = 2xy$  and

$$x = r \cos \theta, y = r \sin \theta.$$

**Solution.**  $u = x^2 - y^2$   
 $v = 2xy$

$$\frac{\partial(u, v)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \begin{vmatrix} 2x & -2y \\ 2y & 2x \end{vmatrix} = 4(x^2 + y^2) = 4r^2$$

$$\frac{\partial(x, y)}{\partial(r, \theta)} = \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix} = \begin{vmatrix} \cos \theta & -r \sin \theta \\ \sin \theta & r \cos \theta \end{vmatrix} = r \cos^2 \theta + r \sin^2 \theta = r$$

$$\frac{\partial(u, v)}{\partial(r, \theta)} = \frac{\partial(u, v)}{\partial(x, y)} \times \frac{\partial(x, y)}{\partial(r, \theta)} = 4r^2 \cdot r = 4r^3 \quad \text{Ans.}$$

**Example 12.** If  $x = \sqrt{vw}$ ,  $y = \sqrt{wu}$ ,  $z = \sqrt{uv}$  and

$$u = r \sin \theta \cos \phi, v = r \sin \theta \sin \phi, w = r \cos \theta. \text{ Calculate } \frac{\partial(x, y, z)}{\partial(r, \theta, \phi)}$$

(Gujarat, I Semester, Jan 2009)

**Solution.** We have,

$$\begin{aligned} x &= \sqrt{vw}, & y &= \sqrt{wu}, & z &= \sqrt{uv} \\ u &= r \sin \theta \cos \phi, & v &= r \sin \theta \sin \phi, & w &= r \cos \theta \end{aligned}$$

$$\frac{\partial(x, y, z)}{\partial(r, \theta, \phi)} = \frac{\partial(x, y, z)}{\partial(u, v, w)} \frac{\partial(u, v, w)}{\partial(r, \theta, \phi)}$$

$$\begin{aligned}
\frac{\partial(x, y, z)}{\partial(u, v, w)} &= \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w} \end{vmatrix} = \begin{vmatrix} 0 & \frac{\sqrt{w}}{2\sqrt{v}} & \frac{\sqrt{v}}{2\sqrt{w}} \\ \frac{\sqrt{w}}{2\sqrt{u}} & 0 & \frac{\sqrt{u}}{2\sqrt{w}} \\ \frac{\sqrt{v}}{2\sqrt{u}} & \frac{\sqrt{u}}{2\sqrt{v}} & 0 \end{vmatrix} = \frac{1}{8} \begin{vmatrix} 0 & \sqrt{\frac{w}{v}} & \sqrt{\frac{v}{w}} \\ \sqrt{\frac{w}{v}} & 0 & \sqrt{\frac{u}{w}} \\ \sqrt{\frac{v}{u}} & \sqrt{\frac{u}{v}} & 0 \end{vmatrix} \\
&= \frac{1}{8} \left[ -\frac{\sqrt{w}}{v} \left( 0 \frac{\sqrt{uv}}{uw} \right) + \sqrt{\frac{u}{w}} \left( \frac{\sqrt{wu}}{uv} \right) \right] = \frac{1}{8} [1+1] \\
\frac{\partial(u, v, w)}{\partial(r, \theta, \phi)} &= \begin{vmatrix} \frac{\partial u}{\partial r} & \frac{\partial x}{\partial \theta} & \frac{\partial u}{\partial \phi} \\ \frac{\partial v}{\partial r} & \frac{\partial y}{\partial \theta} & \frac{\partial v}{\partial \phi} \\ \frac{\partial w}{\partial r} & \frac{\partial w}{\partial \theta} & \frac{\partial w}{\partial \phi} \end{vmatrix} = \begin{vmatrix} \sin \theta \cos \phi & r \cos \theta \cos \phi & -\sin \phi \\ \sin \theta \sin \phi & \cos \theta \sin \phi & \cos \phi \\ \cos \phi & -\sin \theta & 0 \end{vmatrix} \\
&= r^2 \sin \theta [\sin \theta \cos \phi (0 + \sin \theta \cos \phi) - \cos \theta \cos \phi (0 - \cos \phi \cos \theta) \\
&\quad - \sin \phi (-\sin^2 \theta \sin \phi - \cos^2 \theta \sin \phi)] \\
&= r^2 \sin \theta [\sin \theta \cos^2 \phi + \cos^2 \theta \cos^2 \phi + \sin^2 \theta - \sin^2 \phi + \cos^2 \theta \sin^2 \phi] \\
&= r^2 \sin \theta [\sin^2 \theta + \cos^2 \theta) \cos^2 \phi + (\sin^2 \phi + \cos^2 \phi) \sin^2 \theta \\
&= r^2 \sin \theta [\cos^2 \phi + \sin^2 \phi] = r^2 \sin \theta
\end{aligned}$$

Putting the values of  $\frac{\partial(x, y, z)}{\partial(u, v, w)}$  and  $\frac{\partial(u, v, w)}{\partial(r, \theta, \phi)}$  from (2) and (3) in (1), we get

$$\frac{\partial(x, y, z)}{\partial(r, \theta, \phi)} = \frac{1}{4} r^2 \sin \theta$$

**Example 13.** Verify the chain rule for Jacobians if  $x = u$ ,  $y = u \tan v$ ,  $z = w$ .

(U.P.I Semester, Dec 2008)

**Solution.** Here, we have

$$x = u \quad \Rightarrow \quad u = x$$

$$y = u \tan v \quad \Rightarrow \quad v = \tan^{-1} \frac{y}{u} \quad \Rightarrow \quad \frac{\partial v}{\partial y} = \frac{1}{1 + \frac{y^2}{u^2}} \cdot \frac{1}{u}$$

$$z = w \quad \Rightarrow \quad w = z$$

Let

$$\begin{aligned}
f_1 &= x - u \\
f_2 &= y - u \tan v \\
f_3 &= z - w
\end{aligned}$$

We have to prove chain rule

$$\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, z)} = \frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} \cdot \frac{\partial(u, v, w)}{\partial(x, y, z)} \quad \dots(1)$$

Now,

$$\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, z)} = \begin{vmatrix} \frac{\partial f_1}{\partial x} & \frac{\partial f_1}{\partial y} & \frac{\partial f_1}{\partial z} \\ \frac{\partial f_2}{\partial x} & \frac{\partial f_2}{\partial y} & \frac{\partial f_2}{\partial z} \\ \frac{\partial f_3}{\partial x} & \frac{\partial f_3}{\partial y} & \frac{\partial f_3}{\partial z} \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1 \quad \dots(2)$$

$$\frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} = \begin{vmatrix} \frac{\partial f_1}{\partial u} & \frac{\partial f_1}{\partial v} & \frac{\partial f_1}{\partial w} \\ \frac{\partial f_2}{\partial u} & \frac{\partial f_2}{\partial v} & \frac{\partial f_2}{\partial w} \\ \frac{\partial f_3}{\partial u} & \frac{\partial f_3}{\partial v} & \frac{\partial f_3}{\partial w} \end{vmatrix} = \begin{vmatrix} -1 & 0 & 0 \\ -\tan v & -u \sec^2 v & 0 \\ 0 & 0 & 1 \end{vmatrix} = u \sec^2 v$$

$$\frac{\partial(u, v, w)}{\partial(x, y, z)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 \\ 0 & \frac{u}{u^2 + y^2} & 0 \\ 0 & 0 & 1 \end{vmatrix} = \frac{u}{u^2 + y^2}$$

$$\frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} \times \frac{\partial(u, v, w)}{\partial(x, y, z)} = (u \sec^2 v) \left( \frac{u}{u^2 + y^2} \right) = \frac{u^2 \sec^2 v}{u^2 + u^2 \tan^2 v}$$

$$= \frac{u^2 (1 + \tan^2 v)}{u^2 (1 + \tan^2 v)} = 1 \quad \dots(3)$$

From (1), (2) and (3), we have

$$\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, z)} = \frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} \cdot \frac{\partial(u, v, w)}{\partial(x, y, z)}$$

Hence, chain rule is verified.

**Proved.**

### EXERCISE 5.3

1. If  $u = e^x \cos y$ ,  $v = e^x \sin y$ , where  $x = lr + sm$ ,  $y = mr - sl$ , verify

$$\frac{\partial(u, v)}{\partial(x, y)} \times \frac{\partial(x, y)}{\partial(r, s)} = \frac{\partial(u, v)}{\partial(r, s)}$$

2. If  $u = x(1 - r^2)^{-\frac{1}{2}}$ ,  $v = y(1 - r^2)^{-\frac{1}{2}}$

$$w = z(1 - r^2)^{-\frac{1}{2}} \quad \text{where } r^2 = x^2 + y^2 + z^2$$

$$\text{Show that } \frac{\partial(u, v, w)}{\partial(x, y, z)} = (1 - r^2)^{-\frac{5}{2}}$$

3. If  $u = x+y+z$ ,  $u^2 v = y+z$ ,  $u^3 w = z$ , show that  $\frac{\partial(u, v, w)}{\partial(x, y, z)} = u^{-5}$

**[Hint.]** Put  $r = x+y+z$ ,  $s = y+z$ ,  $t = z$   
 $u=r$        $u^2 v = s$        $u^3 w = t$

$$\frac{\partial(u, v, w)}{\partial(x, y, z)} = \frac{\partial(u, v, w)}{\partial(r, s, t)} \times \frac{\partial(r, s, t)}{\partial(x, y, z)} = \frac{1}{\left(\frac{\partial(r, s, t)}{\partial(u, v, w)}\right)} \times \frac{\partial(r, s, t)}{\partial(x, y, z)}$$

4. If  $u = x + y + z$ ,  $uv = y + z$ ,  $uvw = z$ . Evaluate  $\frac{\partial(x, y, z)}{\partial(u, v, w)}$ . *(K.U. Dec. 2009)* **Ans.**  $u^2 v$
5. If  $u^3 + v^3 = x + y$ ,  $u^2 + v^2 = x^3 + y^3$ , show that  $\frac{\partial(u, v)}{\partial(x, y)} = \frac{1}{2} \frac{(y^2 - x^2)}{uv(u-v)}$ .

### (3) Third Property

If functions  $u, v, w$  of three independent variables  $x, y, z$  are not independent, then  $\frac{\partial(u, v, w)}{\partial(x, y, z)} = 0$ .

**Proof.** As  $u, v, w$  are not independent, then  $f(u, v, w) = 0$

Differentiating (1) w.r.t.  $x, y, z$ , we get

$$\frac{\partial f}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial f}{\partial v} \frac{\partial v}{\partial x} + \frac{\partial f}{\partial w} \frac{\partial w}{\partial x} = 0 \quad \dots(2)$$

$$\frac{\partial f}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial f}{\partial v} \frac{\partial v}{\partial y} + \frac{\partial f}{\partial w} \frac{\partial w}{\partial y} = 0 \quad \dots(3)$$

$$\frac{\partial f}{\partial u} \frac{\partial u}{\partial z} + \frac{\partial f}{\partial v} \frac{\partial v}{\partial z} + \frac{\partial f}{\partial w} \frac{\partial w}{\partial z} = 0 \quad \dots(4)$$

Eliminating  $\frac{\partial f}{\partial u}, \frac{\partial f}{\partial v}, \frac{\partial f}{\partial w}$  from (2), (3) and (4), we have

$$\begin{vmatrix} \frac{\partial u}{\partial u} & \frac{\partial v}{\partial u} & \frac{\partial w}{\partial u} \\ \frac{\partial u}{\partial x} & \frac{\partial v}{\partial x} & \frac{\partial w}{\partial x} \\ \frac{\partial u}{\partial y} & \frac{\partial v}{\partial y} & \frac{\partial w}{\partial y} \\ \frac{\partial u}{\partial z} & \frac{\partial v}{\partial z} & \frac{\partial w}{\partial z} \end{vmatrix} = 0$$

On interchanging rows and columns, we get

$$\Rightarrow \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix} = 0 \Rightarrow \frac{\partial(u, v, w)}{\partial(x, y, z)} = 0 \quad \text{Proved.}$$

**Example 14.** If  $u = \sin^{-1} x + \sin^{-1} y$ ,  $v = x \sqrt{1 - y^2} + y \sqrt{1 - x^2}$  find  $\frac{\partial(u, v)}{\partial(x, y)}$ . Is  $u, v$  functionally related? If so, find the relationship. *(Q. bank U. P. T. U. 2001)*

**Solution.** Here, we have

$$u = \sin^{-1} x + \sin^{-1} y \quad \dots(1) \text{ (Given)}$$

$$\frac{\partial u}{\partial x} = \frac{1}{\sqrt{1 - x^2}} \text{ and } \frac{\partial u}{\partial y} = \frac{1}{\sqrt{1 - y^2}}$$

Also

$$v = x \sqrt{1 - y^2} + y \sqrt{1 - x^2} \quad \dots(2) \text{ (Given)}$$

$$\frac{\partial v}{\partial x} = \sqrt{1-y^2} - \frac{xy}{\sqrt{1-x^2}}, \quad \frac{\partial v}{\partial y} = \frac{-xy}{\sqrt{1-y^2}} + \sqrt{1-x^2}$$

Now,

$$\begin{aligned}\frac{\partial(u, v)}{\partial(x, y)} &= \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{1}{\sqrt{1-x^2}} & \frac{1}{\sqrt{1-y^2}} \\ \sqrt{1-y^2} - \frac{xy}{\sqrt{1-x^2}} & \frac{-xy}{\sqrt{1-y^2}} + \sqrt{1-x^2} \end{vmatrix} \\ &= \frac{-xy}{\sqrt{(1-x^2)(1-y^2)}} + 1 - 1 + \frac{xy}{\sqrt{(1-x^2)(1-y^2)}} = 0\end{aligned}$$

By the third property of Jacobian  $u$  and  $v$  are functionally related.

$\text{Let } \sin^{-1} x = \alpha, \sin \alpha = x \text{ and } \cos \alpha = \sqrt{1 - \sin^2 \alpha} = \sqrt{1 - x^2}$ $\sin^{-1} y = \beta, \sin \beta = y \text{ and } \cos \beta = \sqrt{1 - \sin^2 \beta} = \sqrt{1 - y^2}$ $\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$ $= x \sqrt{1 - y^2} + y \sqrt{1 - x^2}$ $\alpha + \beta = \sin^{-1} [x \sqrt{1 - y^2} + y \sqrt{1 - x^2}]$ $\sin^{-1} x + \sin^{-1} y = \sin^{-1} [x \sqrt{1 - y^2} + y \sqrt{1 - x^2}]$
--

We know that

$$\begin{aligned}u &= \sin^{-1} x + \sin^{-1} y \\ &= \sin^{-1} [x \sqrt{1 - y^2} + y \sqrt{1 - x^2}] = \sin^{-1} v\end{aligned}$$

$$\Rightarrow \sin u = v$$

This is the required relation between  $u$  and  $v$ .

Ans.

**Example 15.** If  $u = xy + yz + zx, v = x^2 + y^2 + z^2$  and  $w = x + y + z$ , determine whether there is a functional relationship between  $u, v, w$  and if so, find it. (Uttarakhand, Ist Sem. Dec. 2009)

**Solution.**  $u = xy + yz + zx, v = x^2 + y^2 + z^2, w = x + y + z$

$$\begin{aligned}\frac{\partial(u, v, w)}{\partial(x, y, z)} &= \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix} = \begin{vmatrix} y+z & z+x & x+y \\ 2x & 2y & 2z \\ 1 & 1 & 1 \end{vmatrix} \\ &= 2 \begin{vmatrix} y+z & z+x & x+y \\ x & y & z \\ 1 & 1 & 1 \end{vmatrix} = 2 \begin{vmatrix} x+y+z & x+y+z & x+y+z \\ x & y & z \\ 1 & 1 & 1 \end{vmatrix} R_1 + R_2 \\ &= 2(x+y+z) \begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ 1 & 1 & 1 \end{vmatrix} = 0 \quad (R_1 = R_3)\end{aligned}$$

Hence the functional relationship exists between,  $u, v$  and  $w$ .

$$\text{Now } w^2 = (x+y+z)^2 = x^2 + y^2 + z^2 + 2(xy + yz + zx)$$

$$w^2 = v + 2u$$

$$w^2 - v - 2u = 0 \quad \text{which is the required relationship.}$$

Ans.

**Example 16.** If  $u = x + 2y + z$ ,  $v = x - 2y + 3z$ ,  $w = 2xy - xz + 4yz - 2z^2$

Show that they are functionally related, and find the relation between them.

(Nagpur University, Winter 2000)

$$\begin{aligned} \text{Solution. } u &= x + 2y + z & \therefore \frac{\partial u}{\partial x} &= 1, \quad \frac{\partial u}{\partial y} = 2, \quad \frac{\partial u}{\partial z} = 1 \\ v &= x - 2y + 3z & \therefore \frac{\partial v}{\partial x} &= 1, \quad \frac{\partial v}{\partial y} = -2, \quad \frac{\partial v}{\partial z} = 3 \\ w &= 2xy - xz + 4yz - 2z^2 & \therefore \frac{\partial w}{\partial x} &= 2y - z, \quad \frac{\partial w}{\partial y} = 2x + 4z, \quad \frac{\partial w}{\partial z} = -x + 4y - 4z \end{aligned}$$

$$\text{We know that } \frac{\partial(u, v, w)}{\partial(x, y, z)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix} = \begin{vmatrix} 1 & 2 & 1 \\ 1 & -2 & 3 \\ 2y - z & 2x + 4z & -x + 4y - 4z \end{vmatrix}$$

$$\begin{aligned} &= 1\{-2(-x + 4y - 4z) - 3(2x + 4z)\} - 2\{(-x + 4y - 4z) - 3(2y - z) + 1(2x + 4z + 2(2y - z)\} \\ &= 2x - 8y + 8z - 6x - 12z + 2x - 8y + 8z + 12y - 6z + 2x + 4z + 4y - 2z \\ &= 6x - 6x - 8y + 8y + 12z - 12z = 0. \end{aligned}$$

$\therefore \frac{\partial(u, v, w)}{\partial(x, y, z)} = 0$ , the functions  $u, v, w$  are functionally related.

Now we have to find the relation between  $u, v$  and  $w$  clearly

$$\begin{aligned} u + v &= 2x + 4z = 2(x + 2z) \\ u - v &= 4y - 2z = 2(2y - z) \\ (u + v)(u - v) &= 4(x + 2z)(2y - z) \\ &= 4(2xy - xz + 4yz - 2z^2) \\ \therefore u^2 - v^2 &= 4w \text{ is the required relationship.} \end{aligned}$$

**Ans.**

**Example 17.** If  $u = 3x + 2y - z$ ,  $v = x - 2y + z$ ,

$w = x(x + 2y - z)$ , show that they are functionally related and find relation.

(Nagpur University, Summer 2008)

**Solution.** Here, we have

$$\begin{aligned} u &= 3x + 2y - z, & \frac{\partial u}{\partial x} &= 3, & \frac{\partial u}{\partial y} &= 2, & \frac{\partial u}{\partial z} &= -1 \\ v &= x - 2y + z, & \frac{\partial v}{\partial x} &= 1, & \frac{\partial v}{\partial y} &= -2, & \frac{\partial v}{\partial z} &= 1 \\ w &= x^2 + 2xy - xz, & \frac{\partial w}{\partial x} &= 2x + 2y - z, & \frac{\partial w}{\partial y} &= 2x, & \frac{\partial w}{\partial z} &= -x \end{aligned}$$

$$\begin{aligned}\frac{\partial(u,v,w)}{\partial(x,y,z)} &= \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix} = \begin{vmatrix} 3 & 2 & -1 \\ 1 & -2 & 1 \\ 2x+2y-z & 2x & -x \end{vmatrix} \\ &= 3(2x-2x) - 2(-x-2x-2y+z) - 1(2x+4x+4y-2z) \\ &= 3(0) - 2(-3x-2y+z) - 6x - 4y + 2z = 0 + 6x + 4y - 2z - 6x - 4y + 2z \\ &= 0\end{aligned}$$

Hence the functional relationship exists between  $u, v$  and  $w$ .

Now, we have to find the relation between  $u, v$  and  $w$ .

$$u+v = (3x+2y-z) + (x-2y+z) = 4x$$

$$u-v = (3x+2y-z) - (x-2y+z) = 2x+4y-2z$$

$$\Rightarrow (u+v)(u-v) = 4x(2x+4y-2z)$$

$$\Rightarrow u^2 - v^2 = 8x(x+2y-z)$$

$$\Rightarrow u^2 - v^2 = 8w$$

**Ans.**

**Example 18.** Show that the functions :

$$u = x+y+z,$$

$$v = x^2 + y^2 + z^2 - 2xy - 2xz - 2yz \text{ and}$$

$$w = x^3 + y^3 + z^3 - 3xyz \text{ are functionally related.}$$

Find the relation between them. (Nagpur University, Winter 2001)

$$\begin{aligned}\text{Solution. } \frac{\partial(u,v,w)}{\partial(x,y,z)} &= \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix} \\ &= \begin{vmatrix} 1 & 1 & 1 \\ 2x-2y-2z & 2y-2x-2z & 2z-2y-2x \\ 3x^2-3yz & 3y^2-3xz & 3z^2-3xy \end{vmatrix} \\ &= \begin{vmatrix} 1 & 0 & 0 \\ 2(x-y-z) & 4(y-x) & 4(z-x) \\ 3(x^2-yz) & 3[y^2-x^2+z(y-x)] & 3[z^2-x^2+y(z-x)] \end{vmatrix} \quad \left| \begin{array}{l} C_2 \rightarrow C_2 - C_1 \\ C_3 \rightarrow C_3 - C_1 \end{array} \right. \\ &= 4(y-x)3[z^2-x^2+y(z-x)] - 4(z-x)3[(y^2-x^2)+z(y-x)] \\ &= 12(y-x)(z-x)(x+y+z) - 12(z-x)(y-x)(x+y+z) = 0\end{aligned}$$

Hence,  $u, v$  &  $w$  are functionally related.

$$\begin{aligned}w &= x^3 + y^3 + z^3 - 3xyz \\ &= (x+y+z)(x^2+y^2+z^2-xy-yz-zx) \\ &= (x+y+z)[x^2+y^2+z^2-2(xy+yz+zx)+xy+yz+zx]\end{aligned}$$

$$\begin{aligned} &= u \left\{ v + \frac{1}{4} [(x+y+z)^2 - (x^2 + y^2 + z^2 - 2xy - 2yz - 2zx)] \right\} \\ &= u \left\{ v + \frac{1}{4} (u^2 - v) \right\} = \frac{u^3}{4} + \frac{3}{4} uv \end{aligned}$$

$\Rightarrow 4w = u^3 + 3uv$  is the required relationship.

**Ans.**

**Example 19.** Verify whether the following functions are functionally dependent, and if so, find the relation between them.

$$\begin{aligned} u &= \frac{x+y}{1-xy}, & v &= \tan^{-1} x + \tan^{-1} y. \\ \text{Solution.} \quad \frac{\partial(u, v)}{\partial(x, y)} &= \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{1+y^2}{(1-xy)^2} & \frac{1+x^2}{(1-xy)^2} \\ \frac{1}{1+x^2} & \frac{1}{1+y^2} \end{vmatrix} = \frac{1}{(1-xy)^2} - \frac{1}{(1-xy)^2} = 0 \end{aligned}$$

Hence,  $u, v$  are functionally related.

$$\begin{aligned} \tan^{-1} x + \tan^{-1} y &= \tan^{-1} \frac{x+y}{1-xy} \\ v &= \tan^{-1} u \\ \Rightarrow u &= \tan v. \end{aligned}$$

**Ans.**

$$\text{Example 20. If } u = \frac{x+y}{x-y} \text{ and } v = \frac{xy}{(x-y)^2}, \text{ find } \frac{\partial(u, v)}{\partial(x, y)}.$$

Are  $u$  and  $v$  functionally related? If so, find the relationship.

(Nagpur University, Summer 2005, 2004, Winter 2004)

**Solution.** We have,  $u = \frac{x+y}{x-y}$

$$\therefore \frac{\partial u}{\partial x} = \frac{(x-y)-(x+y)}{(x-y)^2} = \frac{-2y}{(x-y)^2}, \text{ and } \frac{\partial u}{\partial y} = \frac{2x}{(x-y)^2}$$

$$\text{Also } v = \frac{xy}{(x-y)^2}$$

$$\text{Hence, } \frac{\partial v}{\partial x} = \frac{(x-y)^2 \cdot y - xy(2)(x-y)}{(x-y)^4} = -\frac{y(x+y)}{(x-y)^3}$$

$$\frac{\partial v}{\partial y} = \frac{(x-y)^2 \cdot x - xy(2)(x-y)(-1)}{(x-y)^4} = \frac{(x^3 - 2x^2y + xy^2) + 2x^2y - 2xy^2}{(x-y)^4} = \frac{x(x+y)}{(x-y)^3}$$

$$\text{Now, } \frac{\partial(u, v)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{-2y}{(x-y)^2} & \frac{2x}{(x-y)^2} \\ \frac{-y(x+y)}{(x-y)^3} & \frac{x(x+y)}{(x-y)^3} \end{vmatrix} = \frac{-2xy(x+y)}{(x-y)^5} + \frac{2xy(x+y)}{(x-y)^5} = 0$$

Since Jacobian of  $u, v$  with respect to  $x, y$  is zero therefore  $u$  and  $v$  are functionally related.

$$\text{Now, } u^2 = \frac{(x+y)^2}{(x-y)^2} \text{ and } 4v = \frac{4xy}{(x-y)^2}$$

$$\therefore u^2 - 4v = \frac{(x+y)^2 - 4xy}{(x-y)^2} = \frac{x^2 + 2xy + y^2 - 4xy}{(x-y)^2}$$

$$\Rightarrow u^2 - 4v = \frac{(x-y)^2}{(x-y)^2} = 1 \quad \Rightarrow \quad u^2 = 1 + 4v$$

This is the required relationship between  $u$  and  $v$ . Ans.

**Example 21.** Show that  $ax^2 + 2hxy + by^2$  and  $Ax^2 + 2Hxy + By^2$  are independent unless :

$$\frac{a}{A} = \frac{b}{B} = \frac{h}{H}$$

**Solution.** Let  $u = ax^2 + 2hxy + by^2$ ,  $\frac{\partial u}{\partial x} = 2ax + 2hy$ ,  $\frac{\partial u}{\partial y} = 2hx + 2by$   
 $v = Ax^2 + 2Hxy + By^2$ ,  $\frac{\partial v}{\partial x} = 2Ax + 2Hy$ ,  $\frac{\partial v}{\partial y} = 2Hx + 2By$

$u$  and  $v$  will not be independent if there exists a relationship between them and in that case

$\frac{\partial(u, v)}{\partial(x, y)}$  should vanish identically.

i.e.  $\frac{\partial(u, v)}{\partial(x, y)} = \begin{vmatrix} 2(ax+hy) & 2(hx+by) \\ 2(Ax+Hy) & 2(Hx+By) \end{vmatrix} = 0$   
 $\Rightarrow (ax+hy)(Hx+By) - (hx+by)(Ax+Hy) = 0$   
 $\Rightarrow (aH-Ah)x^2 + (ab-Ba)xy + (Bh-bH)y^2 = 0$

Now, the variables  $x$  and  $y$  are independent and as such the coefficients of  $x^2$  and  $y^2$  should vanish separately.

$$\therefore aH - Ah = 0 \quad \Rightarrow \quad \frac{a}{A} = \frac{h}{H}$$

and  $Bh - bH = 0 \quad \Rightarrow \quad \frac{h}{H} = \frac{b}{B}$

Hence,  $\frac{a}{A} = \frac{h}{H} = \frac{b}{B}$  and these conditions also make the coefficient of  $xy$  zero.

Hence,  $\frac{a}{A} = \frac{h}{H} = \frac{b}{B}$  are the required conditions. Proved.

#### EXERCISE 5.4

1. Verify whether  $u = \frac{x-y}{x+y}$ ,  $v = \frac{x+y}{x}$  are

functionally dependent, and if so, find the relation between them. Ans.  $u = \frac{2-v}{v}$

2. Determine functional dependence and find relation between

$$u = \frac{x-y}{x+y}, \quad v = \frac{xy}{(x+y)^2} \quad \text{Ans. } 4v = 1 - u^2$$

3. Are  $x + y - z$ ,  $x - y + z$ ,  $x^2 + y^2 + z^2 - 2yz$  functionally dependent? If so, find a relation between them.

$$\text{Ans. } u^2 + v^2 = 2w$$

4. If  $u = x + y + z$ ,  $v = x^2 + y^2 + z^2$ ,  $w = x^3 + y^3 + z^3 - 3xyz$ , prove that  $u$ ,  $v$ ,  $w$  are not independent and find the relation between them. Ans.  $2w = u(3v - u^2)$

5. Are the following two functions of  $x, y, z$  functionally dependent? If so find the relation between them.

$$u = \frac{x-y}{x+z}, \quad v = \frac{x+z}{y+z} \quad \text{Ans. } v = \frac{1}{1-u}$$

6. Determine whether  $u = \sin^{-1} x + \sin^{-1} y$  and  $v = x\sqrt{1-y^2} + y\sqrt{1-x^2}$  are functionally dependent.  
(A.M.I.E., Winter 2001) Ans.  $v = \sin u$

7. If  $u = \frac{x+v}{z}$ ,  $v = \frac{y+z}{x}$ ,  $w = \frac{y(x+y+z)}{xz}$ , show that  $u, v, w$  are not independent and find the relation

between them. Ans.  $u^2 - 4v = 1$

### 5.3 JACOBIAN OF IMPLICIT FUNCTIONS

The variables  $x, y, u, v$  are connected by implicit functions

$$f_1(x, y, u, v) = 0 \quad \dots (1)$$

$$f_2(x, y, u, v) = 0 \quad \dots (2)$$

where  $u, v$  are implicit functions of  $x, y$ .

Differentiating (1) and (2) w.r.t.  $x, y$ , we get

$$\frac{\partial f_1}{\partial x} + \frac{\partial f_1}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial f_1}{\partial v} \frac{\partial v}{\partial x} = 0 \quad \dots (3)$$

$$\frac{\partial f_1}{\partial y} + \frac{\partial f_1}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial f_1}{\partial v} \frac{\partial v}{\partial y} = 0 \quad \dots (4)$$

$$\frac{\partial f_2}{\partial x} + \frac{\partial f_2}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial f_2}{\partial v} \frac{\partial v}{\partial x} = 0 \quad \dots (5)$$

$$\frac{\partial f_2}{\partial y} + \frac{\partial f_2}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial f_2}{\partial v} \frac{\partial v}{\partial y} = 0 \quad \dots (6)$$

Now we have

$$\frac{\partial(f_1, f_2)}{\partial(u, v)} \times \frac{\partial(u, v)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial f_1}{\partial u} & \frac{\partial f_1}{\partial v} \\ \frac{\partial f_2}{\partial u} & \frac{\partial f_2}{\partial v} \end{vmatrix} \times \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{\partial f_1}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial f_1}{\partial v} \frac{\partial v}{\partial x} & \frac{\partial f_1}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial f_1}{\partial v} \frac{\partial v}{\partial y} \\ \frac{\partial f_2}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial f_2}{\partial v} \frac{\partial v}{\partial x} & \frac{\partial f_2}{\partial u} \frac{\partial u}{\partial y} + \frac{\partial f_2}{\partial v} \frac{\partial v}{\partial y} \end{vmatrix}$$

$$= \begin{vmatrix} -\frac{\partial f_1}{\partial x} & -\frac{\partial f_1}{\partial y} \\ -\frac{\partial f_2}{\partial x} & -\frac{\partial f_2}{\partial y} \end{vmatrix} \quad [\text{From (3), (4), (5) and (6)}]$$

$$= (-1)^2 \frac{\partial(f_1, f_2)}{\partial(x, y)}$$

$$\frac{\partial(u, v)}{\partial(x, y)} = (-1)^2 \frac{\partial(f_1, f_2)/\partial(x, y)}{\partial(f_1, f_2)/\partial(u, v)}$$

In general, the variables  $x_1, x_2, \dots, x_n$  are connected with  $u_1, u_2, \dots, u_n$  implicitly as  $f_1(x_1, x_2, \dots, x_n, u_1, u_2, \dots, u_n) = 0, f_2(x_1, x_2, \dots, x_n, u_1, u_2, \dots, u_n) = 0, \dots, \dots, f_n(x_1, x_2, \dots, x_n, u_1, u_2, \dots, u_n) = 0$   
Then we have

$$\frac{\partial(u_1, u_2, \dots, u_n)}{\partial(x_1, x_2, \dots, x_n)} = (-1)^n \frac{\partial(f_1, f_2, \dots, f_n)/\partial(x_1, x_2, \dots, x_n)}{\partial(f_1, f_2, \dots, f_n)/\partial(u_1, u_2, \dots, u_n)}$$

**Example 22.** If  $x^2 + y^2 + u^2 - v^2 = 0$  and  $uv + xy = 0$ , prove that  $\frac{\partial(u, v)}{\partial(x, y)} = \frac{x^2 - y^2}{u^2 + v^2}$

**Solution.** Let  $f_1 = x^2 + y^2 + u^2 - v^2$ ,  $f_2 = uv + xy$

$$\frac{\partial(f_1, f_2)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial f_1}{\partial x} & \frac{\partial f_1}{\partial y} \\ \frac{\partial f_2}{\partial x} & \frac{\partial f_2}{\partial y} \end{vmatrix} = \begin{vmatrix} 2x & 2y \\ y & x \end{vmatrix} = 2(x^2 - y^2)$$

$$\frac{\partial(f_1, f_2)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial f_1}{\partial u} & \frac{\partial f_1}{\partial v} \\ \frac{\partial f_2}{\partial u} & \frac{\partial f_2}{\partial v} \end{vmatrix} = \begin{vmatrix} 2u & -2v \\ v & u \end{vmatrix} = 2(u^2 + v^2)$$

But  $\frac{\partial(u, v)}{\partial(x, y)} = (-1)^2 \frac{\frac{\partial(f_1, f_2)}{\partial(x, y)}}{\frac{\partial(f_1, f_2)}{\partial(u, v)}} = \frac{2(x^2 - y^2)}{2(u^2 + v^2)} = \frac{x^2 - y^2}{u^2 + v^2}$  **Proved.**

**Example 23.** If  $u^3 + v + w = x + y^2 + z^2$ ,  $u + v^3 + w = x^2 + y + z^2$ ,  $u + v + w^3 = x^2 + y^2 + z$ ,

$$\text{Prove that } \frac{\partial(u, v, w)}{\partial(x, y, z)} = \frac{1 - 4(xy + yz + zx) + 16xyz}{2 - 3(u^2 + v^2 + w^2) + 27u^2v^2w^2}$$

**Solution.** Let  $f_1 = u^3 + v + w - x - y^2 - z^2$   
 $f_2 = u + v^3 + w - x^2 - y - z^2$   
 $f_3 = u + v + w^3 - x^2 - y^2 - z$

Now,  $\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, z)} = \begin{vmatrix} -1 & -2y & -2z \\ -2x & -1 & -2z \\ -2x & -2y & -1 \end{vmatrix} = -1 + 4(yz + zx + xy) - 16xyz$

and  $\frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} = \begin{vmatrix} 3u^2 & 1 & 1 \\ 1 & 3v^2 & 1 \\ 1 & 1 & 3w^2 \end{vmatrix} = 2 - 3(u^2 + v^2 + w^2) + 27u^2v^2w^2$

$$\frac{\partial(u, v, w)}{\partial(x, y, z)} = (-1)^3 \frac{\partial(f_1, f_2, f_3)/\partial(x, y, z)}{\partial(f_1, f_2, f_3)/\partial(u, v, w)} = \frac{1 - 4(yz + zx + xy) + 16xyz}{2 - 3(u^2 + v^2 + w^2) + 27u^2v^2w^2}$$
 **Proved.**

**Example 24.** If  $x + y + z = u$ ,  $y + z = uv$ ,  $z = uvw$ , show that  $\frac{\partial(x, y, z)}{\partial(u, v, z)} = u^2v$ .

**Solution.** Let  $f_1 = x + y + z - u$   
 $f_2 = y + z - uv$   
 $f_3 = z - uvw$

$$\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, z)} = \begin{vmatrix} \frac{\partial f_1}{\partial x} & \frac{\partial f_1}{\partial y} & \frac{\partial f_1}{\partial z} \\ \frac{\partial f_2}{\partial x} & \frac{\partial f_2}{\partial y} & \frac{\partial f_2}{\partial z} \\ \frac{\partial f_3}{\partial x} & \frac{\partial f_3}{\partial y} & \frac{\partial f_3}{\partial z} \end{vmatrix} = \begin{vmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{vmatrix} = 1$$

$$\frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} = \begin{vmatrix} \frac{\partial f_1}{\partial u} & \frac{\partial f_1}{\partial v} & \frac{\partial f_1}{\partial w} \\ \frac{\partial f_2}{\partial u} & \frac{\partial f_2}{\partial v} & \frac{\partial f_2}{\partial w} \\ \frac{\partial f_3}{\partial u} & \frac{\partial f_3}{\partial v} & \frac{\partial f_3}{\partial w} \end{vmatrix} = \begin{vmatrix} -1 & 0 & 0 \\ -v & -u & 0 \\ -vw & -uv & -uv \end{vmatrix} = -u^2 v$$

But  $\frac{\partial(x, y, z)}{\partial(u, v, w)} = (-1)^3 \frac{\frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)}}{\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, z)}} = -\frac{-u^2 v}{1} = u^2 v$  Proved.

**Example 25.** If  $u, v, w$  are the roots of the equation  $(\lambda - x)^3 + (\lambda - y)^3 + (\lambda - z)^3 = 0$  in  $\lambda$ ,

$$\text{find } \frac{\partial(u, v, w)}{\partial(x, y, z)}. \quad (\text{U.P. I Semester, Winter 2001})$$

**Solution.** We have

$$\Rightarrow 3\lambda^3 - 3(x+y+z)\lambda^2 + 3(x^2 + y^2 + z^2)\lambda - (x^3 + y^3 + z^3) = 0$$

$$\text{Sum of the roots} = u + v + w = x + y + z \quad \dots(1)$$

$$\text{Product of the roots} = uv + vw + wu = x^2 + y^2 + z^2 \quad \dots(2)$$

$$uvw = \frac{1}{3}(x^3 + y^3 + z^3) \quad \dots(3)$$

Equations (1), (2) and (3) can be rewritten as

$$f_1 = u + v + w - x - y - z$$

$$f_2 = uv + vw + wu - x^2 - y^2 - z^2$$

$$f_3 = uvw - \frac{1}{3}(x^3 + y^3 + z^3)$$

$$\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, z)} = \begin{vmatrix} \frac{\partial f_1}{\partial x} & \frac{\partial f_1}{\partial y} & \frac{\partial f_1}{\partial z} \\ \frac{\partial f_2}{\partial x} & \frac{\partial f_2}{\partial y} & \frac{\partial f_2}{\partial z} \\ \frac{\partial f_3}{\partial x} & \frac{\partial f_3}{\partial y} & \frac{\partial f_3}{\partial z} \end{vmatrix} = \begin{vmatrix} -1 & -1 & -1 \\ -2x & -2y & -2z \\ -x^2 & -y^2 & -z^2 \end{vmatrix}$$

$$= (-1)(-2)(-1) \begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ x^2 & y^2 & z^2 \end{vmatrix} = -2 \begin{vmatrix} 0 & 0 & 1 \\ x-y & y-z & z \\ x^2-y^2 & y^2-z^2 & z^2 \end{vmatrix} \quad C_1 \rightarrow C_1 - C_2$$

$$C_2 \rightarrow C_2 - C_3$$

$$= -2(x-y)(y-z) \begin{vmatrix} 0 & 0 & 1 \\ 1 & 1 & z \\ x+y & y+z & z^2 \end{vmatrix} = -2(x-y)(y-z)(y+z-x-y)$$

$$= -2(x-y)(y-z)(z-x)$$

$$\frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} = \begin{vmatrix} \frac{\partial f_1}{\partial u} & \frac{\partial f_1}{\partial v} & \frac{\partial f_1}{\partial w} \\ \frac{\partial f_2}{\partial u} & \frac{\partial f_2}{\partial v} & \frac{\partial f_2}{\partial w} \\ \frac{\partial f_3}{\partial u} & \frac{\partial f_3}{\partial v} & \frac{\partial f_3}{\partial w} \end{vmatrix} = \begin{vmatrix} 1 & 1 & 1 \\ v+w & u+w & u+v \\ vw & wu & uv \end{vmatrix} = \begin{vmatrix} 0 & 0 & 1 \\ v-u & w-v & u+v \\ w(v-u) & u(w-v) & uv \end{vmatrix}$$

$$\begin{aligned}
 &= (v-u)(w-v) \begin{vmatrix} 0 & 0 & 1 \\ 1 & 1 & u+v \\ w & u & uv \end{vmatrix} = (v-u)(w-v)(u-w) \\
 &\quad - (u-v)(v-w)(w-u) \\
 \frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} &= (-1)^3 \frac{\partial(x, y, z)}{\partial(f_1, f_2, f_3)} = -\frac{-2(x-y)(y-z)(z-x)}{-(u-v)(v-w)(w-u)} = \frac{-2(x-y)(y-z)(z-x)}{(u-v)(v-w)(w-u)} \quad \text{Ans.}
 \end{aligned}$$

**EXERCISE 5.5**

1. If  $u^3 + v^3 = x + y = u^2 + v^2 = x^3 + y^3$ , then prove that  $\frac{\partial(u, v)}{\partial(x, y)} = \frac{1}{2} \frac{y^2 - x^2}{2uv(u-v)}$

2. If  $u^3 + v^3 + w^3 = x + y + z$ ,  
 $u^2 + v^2 + w^2 = x^3 + y^3 + z^3$ ,  
 $u + v + w = x^2 + y^2 + z^2$ ,

show that  $\frac{\partial(u, v, w)}{\partial(x, y, z)} = \frac{(x-y)(y-z)(z-x)}{(u-v)(v-w)(w-u)}$

3. If  $u = \frac{x}{\sqrt{1-r^2}}$ ,  $v = \frac{y}{\sqrt{1-r^2}}$ ,  $w = \frac{z}{\sqrt{1-r^2}}$ , show that

$$\frac{\partial(u, v, w)}{\partial(x, y, z)} = \frac{1}{(1-r^2)^{5/2}} \text{ where } r^2 = x^2 + y^2 + z^2$$

4. If  $u_1 = x_1 + x_2 + x_3 + x_4$ ,  $u_1 u_2 = x_2 + x_3 + x_4$ ,  $u_1 u_2 u_3 = x_3 + x_4$ ,  $u_1 u_2 u_3 u_4 = x_4$

show that  $\frac{\partial(x_1, x_2, x_3, x_4)}{\partial(u_1, u_2, u_3, u_4)} = u_1^3 u_2^2 u_3$

5. If  $u, v, w$  are the roots of the equation in  $\lambda$  and  $\frac{x}{a+\lambda} + \frac{y}{b+\lambda} + \frac{z}{c+\lambda} = 1$ , then find  $\frac{\partial(x, y, z)}{\partial(u, v, w)}$ .

$$\text{Ans. } \frac{(u-v)(v-w)(w-u)}{(a-b)(b-c)(c-a)}$$

**5.4 PARTIAL DERIVATIVES OF IMPLICIT FUNCTIONS BY JACOBIAN**

Given  $f_1(x, y, u, v) = 0, f_2(x, y, u, v) = 0$

$$\frac{\partial f_1}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial f_1}{\partial v} \frac{\partial v}{\partial x} + \frac{\partial f_1}{\partial x} \cdot 1 = 0 \quad \dots(1)$$

$$\frac{\partial f_2}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial f_2}{\partial v} \frac{\partial v}{\partial x} + \frac{\partial f_2}{\partial x} \cdot 1 = 0 \quad \dots(2)$$

Solving (1) and (2), we get

$$\begin{aligned}
 \frac{\frac{\partial u}{\partial x}}{\frac{\partial f_1}{\partial x} \frac{\partial f_2}{\partial x} - \frac{\partial f_1}{\partial x} \frac{\partial f_2}{\partial v}} &= \frac{\frac{\partial v}{\partial x}}{\frac{\partial f_1}{\partial x} \frac{\partial f_2}{\partial v} - \frac{\partial f_1}{\partial v} \frac{\partial f_2}{\partial x}} = \frac{1}{\frac{\partial f_1}{\partial x} \frac{\partial f_2}{\partial v} - \frac{\partial f_1}{\partial v} \frac{\partial f_2}{\partial x}} \\
 \frac{\frac{\partial u}{\partial x}}{\frac{\partial f_1}{\partial v} \frac{\partial f_2}{\partial x} - \frac{\partial f_1}{\partial x} \frac{\partial f_2}{\partial v}} &= -\frac{\frac{\partial(f_1, f_2)}{\partial(x, v)}}{\frac{\partial(f_1, f_2)}{\partial(u, v)}}
 \end{aligned}$$

$$\frac{\partial v}{\partial x} = \frac{\frac{\partial f_1}{\partial x} \cdot \frac{\partial f_2}{\partial u} - \frac{\partial f_1}{\partial u} \cdot \frac{\partial f_2}{\partial x}}{\frac{\partial f_1}{\partial u} \cdot \frac{\partial f_2}{\partial v} - \frac{\partial f_1}{\partial v} \cdot \frac{\partial f_2}{\partial u}} = -\frac{\frac{\partial(f_1, f_1)}{\partial(x, u)}}{\frac{\partial(f_1, f_2)}{\partial(v, u)}}$$

and if,  $f_1(x, y, z, u, v, w) = 0, f_2(x, y, z, u, v, w) = 0,$   
 $f_3(x, y, z, u, v, w) = 0$   
 $\frac{\partial x}{\partial u} = -\frac{\partial(f_1, f_2, f_3)/\partial(u, y, z)}{\partial(f_1, f_2, f_3)/\partial(x, y, z)}$

and so on

**Note.** First we write the Jacobian in the denominator and then we write the Jacobian in the numerator by replacing  $x$  by  $u$ .

**Example 26.** Use Jacobians to find  $\left(\frac{\partial u}{\partial x}\right)_v$  if:

$$u^2 + xv^2 - xy = 0 \text{ and } u^2 + xyv + v^2 = 0$$

**Solution.** Let

$$f_1 = u^2 + xv^2 - xy, \quad f_2 = u^2 + xyv + v^2$$

$$\begin{aligned} \frac{\partial(f_1, f_2)}{\partial(u, v)} &= \begin{vmatrix} \frac{\partial f_1}{\partial u} & \frac{\partial f_1}{\partial v} \\ \frac{\partial f_2}{\partial u} & \frac{\partial f_2}{\partial v} \end{vmatrix} = \begin{vmatrix} 2u & 2xv \\ 2u & xy + 2v \end{vmatrix} = 2uxy + 4uv - 4uxv \\ \frac{\partial(f_1, f_2)}{\partial(x, v)} &= \begin{vmatrix} \frac{\partial f_1}{\partial x} & \frac{\partial f_1}{\partial v} \\ \frac{\partial f_2}{\partial x} & \frac{\partial f_2}{\partial v} \end{vmatrix} = \begin{vmatrix} v^2 - y & 2xv \\ yv & xy + 2v \end{vmatrix} = xyv^2 + 2v^3 - xy^2 - 2yv - 2xyv^2 \\ &= -xyv^2 + 2v^3 - xy^2 - 2yv \\ \frac{\partial u}{\partial x} &= -\frac{\partial(f_1, f_2)/\partial(x, v)}{\partial(f_1, f_2)/\partial(u, v)} \\ &= \frac{xyv^2 - 2v^3 + xy^2 + 2yv}{2uxy + 4uv - 4xuv} \end{aligned}$$

**Ans.**

**Example 27.** If  $u = x + y^2, v = y + z^2, w = z + x^2$ , prove that

$$(i) \quad \frac{\partial x}{\partial u} = -\frac{1}{1+8xyz}$$

$$(ii) \quad \text{Also find } \frac{\partial^2 x}{\partial u^2}.$$

**Solution.** (i) Here,  $f_1 = u - x - y^2, f_2 = v - y - z^2, f_3 = w - z - x^2$ .

$$\text{Now} \quad \frac{\partial(f_1, f_2, f_3)}{\partial(u, y, z)} = \begin{vmatrix} 1 & -2y & 0 \\ 0 & -1 & -2z \\ 0 & 0 & -1 \end{vmatrix} = 1;$$

$$\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, z)} = \begin{vmatrix} -1 & -2y & 0 \\ 0 & -1 & -2z \\ -2x & 0 & -1 \end{vmatrix} = -1(1+0) + 2y(0-4zx) = -1 - 8xyz$$

$$\frac{\partial x}{\partial u} = -\frac{\partial(f_1, f_2, f_3)/\partial(u, y, z)}{\partial(f_1, f_2, f_3)/\partial(x, y, z)}$$

$$\frac{\partial x}{\partial u} = -\left(\frac{1}{-1-8xyz}\right) = \frac{1}{1+8xyz}$$

Ans.

$$(ii) \quad \begin{aligned} \frac{\partial^2 x}{\partial u^2} &= \frac{\partial}{\partial u} \left( \frac{\partial x}{\partial u} \right) = \frac{\partial}{\partial u} \left( \frac{1}{1+8xyz} \right) = -\frac{1}{(1+8xyz)^2} \frac{\partial}{\partial u} (1+8xyz) \\ &= \frac{-1}{(1+8xyz)^2} \left[ 0 + 8 \left( \frac{\partial x}{\partial u} yz + \frac{\partial y}{\partial u} zx + \frac{\partial z}{\partial u} xy \right) \right] \\ &= \frac{-8}{(1+8xyz)^2} \left[ \frac{\partial x}{\partial u} yz + \frac{\partial y}{\partial u} zx + \frac{\partial z}{\partial u} xy \right] \end{aligned} \quad \dots(1)$$

We have  $\frac{\partial(f_1, f_2, f_3)}{\partial(x, u, z)} = \begin{vmatrix} -1 & 1 & 0 \\ 0 & 0 & -2z \\ -2x & 0 & -1 \end{vmatrix} = 4zx ;$

$$\frac{\partial(f_1, f_2, f_3)}{\partial(x, y, u)} = \begin{vmatrix} -1 & -2y & 1 \\ 0 & -1 & 0 \\ -2x & 0 & 0 \end{vmatrix} = -2x .$$

Now,

$$\begin{aligned} \frac{\partial y}{\partial u} &= -\frac{\partial(f_1, f_2, f_3)/\partial(x, u, z)}{\partial(f_1, f_2, f_3)/\partial(x, y, z)} \\ \therefore \quad \frac{\partial y}{\partial u} &= -\frac{4zx}{-1-8xyz} = \frac{4zx}{1+8xyz} \end{aligned}$$

$$\begin{aligned} \frac{\partial z}{\partial u} &= -\frac{\partial(f_1, f_2, f_3)/\partial(x, y, u)}{\partial(f_1, f_2, f_3)/\partial(x, y, z)} \\ \therefore \quad \frac{\partial z}{\partial u} &= -\frac{-2x}{-1-8xyz} = \frac{-2x}{1+8xyz} \end{aligned}$$

Substituting in (1), we have

$$\begin{aligned} \frac{\partial^2 x}{\partial u^2} &= \frac{-8}{(1+8xyz)^2} \left[ \frac{yz}{1+8xyz} + \frac{4z^2x^2}{1+8xyz} + \frac{-2x^2y}{1+8xyz} \right] \\ &= -\frac{-8(yz + 4z^2x^2 - 2x^2y)}{(1+8xyz)^2} \end{aligned}$$

Ans.

**Example 28.** Given,  $x = u + v + w, y = u^2 + v^2 + w^2, z = u^3 + v^3 + w^3$

$$\text{show that } \frac{\partial u}{\partial x} = \frac{vw}{(u-v)(u-w)}$$

**Solution.** Let

$$f_1 = u + v + w - x = 0$$

$$f_2 = u^2 + v^2 + w^2 - y = 0$$

$$f_3 = u^3 + v^3 + w^3 - z = 0$$

$$\frac{\partial u}{\partial x} = -\frac{\partial(f_1 f_2 f_3)/\partial(x, v, w)}{\partial(f_1 f_2 f_3)/\partial(u, v, w)} \quad \dots(1)$$

$$\begin{aligned}\frac{\partial(f_1, f_2, f_3)}{\partial(x, v, w)} &= \begin{vmatrix} -1 & 1 & 1 \\ 0 & 2v & 2w \\ 0 & 3v^2 & 3w^2 \end{vmatrix} = -6vw \begin{vmatrix} 1 & 1 \\ v & w \end{vmatrix} \\ &= 6vw(v-w) \quad \dots(2)\end{aligned}$$

$$\begin{aligned}\frac{\partial(f_1, f_2, f_3)}{\partial(u, v, w)} &= \begin{vmatrix} 1 & 1 & 1 \\ 2u & 2v & 2w \\ 3u^2 & 3v^2 & 3w^2 \end{vmatrix} = 6(v-u)(w-u)(w-v) \quad \dots(3)\end{aligned}$$

Thus from (1),(2) and (3), we get

$$\frac{\partial u}{\partial x} = -\frac{6vw(v-w)}{6(v-u)(w-u)(w-v)} = \frac{vw}{(u-v)(u-w)} \quad \text{Proved.}$$

### EXERCISE 5.6

1. If  $u^2 + xv^2 - uxy = 0, v^2 - xy^2 + 2uv + u^2 = 0$ , find  $\frac{\partial u}{\partial x}$ . **Ans.**  $-\frac{(v^2 - uy)(u+v) + xvy^2}{(u+v)(2u - xy - 2xv)}$
2. If  $x = u + e^{-v} \sin u, y = v + e^{-v} \cos u$ , find  $\frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}$ . **Ans.**  $\frac{\partial u}{\partial y} = \frac{\partial v}{\partial x} = \frac{e^{-v} \sin u}{1 - e^{-3v}}$
3. If  $x = u^2 - v^2, y = 2uv$ , find  $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y}$  and  $\frac{\partial(u, v)}{\partial(x, y)}$ .  
**Ans.**  $\frac{u}{2(u^2 + v^3)}, \frac{v}{2(u^2 + v^3)}, \frac{-v}{2(u^2 + v^2)}, \frac{u}{2(u^2 + v^2)}, \frac{1}{4(u^2 + v^2)}$
4. If  $u^3 + xv^2 - uy = 0, u^2 + xyv + v^2 = 0$ , find  $\frac{\partial u}{\partial x}$ . **Ans.**  $\frac{xvv^2 - 2v^3}{3xyu^2 - xy^2 + 6u^2v - 2vy - 4xuv}$
5. If  $u^2 + xv^2 = x + y, v^2 + yu^2 = x - y$ , find  $\frac{\partial u}{\partial x}, \frac{\partial v}{\partial y}$ . **Ans.**  $\frac{1-x-v^2}{2u(1-xy)}, \frac{1+y+u^2}{-2v(1-xy)}$
6. If  $u = xyz, v = x^2 + y^2 + z^2, w = x + y + z$  find  $\frac{\partial x}{\partial u}$ . **Ans.**  $\frac{1}{(x-y)(x-z)}$
7. If  $u = x^2 + y^2 + z^2, v = xyz$ , find  $\frac{\partial x}{\partial u}$ . **Ans.**  $\frac{x}{2(2x^2 - y^2)}$

**Choose the Correct answer:**

1. The Jacobian  $\frac{\partial(u, v)}{\partial(x, y)}$  for the function  $u = e^x \sin y, v = (x + \log \sin y)$  is
  - (a) 1
  - (b)  $\sin x \sin y - xy \cos x \cos y$
  - (c) 0
- (c)  $\frac{e^x}{x}$       (U.P.I. Semester, Dec. 2008)    **Ans. (c)**

**CHAPTER**  
**6**

## TAYLOR'S SERIES FOR FUNCTIONS OF TWO VARIABLES

---

---

### 6.1 TAYLOR'S SERIES OF TWO VARIABLES

If  $f(x, y)$  and all its partial derivatives upto the  $n$ th order are finite and continuous for all points  $(x, y)$ , where

$$a \leq x \leq a + h, b \leq y \leq b + k$$

$$\text{Then } f(a + h, b + k) = f(a, b) + \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right) f + \frac{1}{2!} \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^2 f + \frac{1}{3!} \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^3 f + \dots$$

**Proof.** Suppose that  $f(x + h, y + k)$  is a function of one variable only, say  $x$  where  $y$  is assumed as constant. Expanding by Taylor's Theorem for one variable, we have

$$f(x + \delta x, y + \delta y) = f(x, y + \delta y) + \delta x \frac{\partial}{\partial x} f(x, y + \delta y) + \frac{(\delta x)^2}{2!} \frac{\partial^2}{\partial x^2} f(x, y + \delta y) + \dots$$

Now expanding for  $y$ , we get

$$\begin{aligned} &= \left[ f(x, y) + \delta y \frac{\partial}{\partial y} f(x, y) + \frac{(\delta y)^2}{2!} \frac{\partial^2}{\partial y^2} f(x, y) + \dots \right] + \delta x \cdot \frac{\partial}{\partial x} \left[ f(x, y) + \delta y \frac{\partial}{\partial y} f(x, y) + \dots \right] \\ &\quad + \frac{(\delta x)^2}{2!} \frac{\partial^2}{\partial x^2} \left[ f(x, y) + \delta y \frac{\partial}{\partial y} f(x, y) + \dots \right] + \dots \\ &= \left[ f(x, y) + \delta y \frac{\partial}{\partial y} f(x, y) + \frac{(\delta y)^2}{2!} \frac{\partial^2}{\partial y^2} f(x, y) + \dots \right] + \\ &\quad + \delta x \left[ \frac{\partial f(x, y)}{\partial x} + \delta y \cdot \frac{\partial^2}{\partial x \partial y} f(x, y) \right] + \frac{(\delta x)^2}{2!} \left[ \frac{\partial^2}{\partial x^2} f(x, y) + \dots \right] + \dots \\ &= f(x, y) + \left[ \delta x \frac{\partial f(x, y)}{\partial x} + \delta y \cdot \frac{\partial f(x, y)}{\partial y} \right] + \frac{1}{2!} \left[ (\delta x)^2 \frac{\partial^2 f(x, y)}{\partial x^2} + 2 \delta x \cdot \delta y \cdot \frac{\partial^2 f(x, y)}{\partial x \partial y} \right. \\ &\quad \left. + (\delta y)^2 \cdot \frac{\partial^2 f(x, y)}{\partial y^2} \right] + \dots \\ \Rightarrow f(a + h, b + k) &= f(a, b) + \left[ h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y} \right] + \frac{1}{2!} \left[ h^2 \frac{\partial^2 f}{\partial x^2} + 2hk \frac{\partial^2 f}{\partial x \partial y} + k^2 \frac{\partial^2 f}{\partial y^2} \right] + \dots \end{aligned}$$

$$\Rightarrow f(a+h, b+k) = f(a, b) + \left[ h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right] f + \frac{1}{2!} \left[ h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right]^2 f + \dots$$

On putting  $a = 0, b = 0, h = x, k = y$ , we get

$$f(x, y) = f(0, 0) + \left( x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} \right) + \frac{1}{2!} \left( x^2 \frac{\partial^2 f}{\partial x^2} + 2xy \frac{\partial^2 f}{\partial x \partial y} + y^2 \frac{\partial^2 f}{\partial y^2} \right) + \dots$$

**Example 1.** Expand  $e^x \cdot \sin y$  in powers of  $x$  and  $y$ ,  $x = 0, y = 0$  as far as terms of third degree.

**Solution.**

		$x = 0, y = 0$
$f(x, y)$	$e^x \sin y,$	0
$f_x(x, y)$	$e^x \sin y,$	0
$f_y(x, y)$	$e^x \cos y,$	1
$f_{xx}(x, y)$	$e^x \sin y,$	0
$f_{xy}(x, y)$	$e^x \cos y,$	1
$f_{yy}(x, y)$	$-e^x \sin y,$	0
$f_{xxx}(x, y)$	$e^x \sin y,$	0
$f_{xxy}(x, y)$	$e^x \cos y,$	1
$f_{xyy}(x, y)$	$-e^x \sin y,$	0
$f_{yyy}(x, y)$	$-e^x \cos y,$	-1

By Taylor's theorem

$$\begin{aligned} f(x, y) &= f(0, 0) + \left( x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} \right) f(0, 0) + \frac{1}{2!} \left( x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} \right)^2 f(0, 0) \\ &\quad + \frac{1}{3!} \left( x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} \right)^3 f(0, 0) + \dots \\ &= f(0, 0) + x f_x(0, 0) + y f_y(0, 0) + \frac{x^2}{2!} f_{xx}(0, 0) + \frac{2xy}{2!} f_{xy}(0, 0) + \frac{y^2}{2!} f_{yy}(0, 0) \\ &\quad + \frac{1}{3!} x^3 f_{xxx}(0, 0) + \frac{3x^2 y}{3!} f_{xxy}(0, 0) + \frac{3}{3!} x y^2 f_{xyy}(0, 0) + \frac{1}{3!} y^3 f_{yyy}(0, 0) + \dots \end{aligned}$$

$$\begin{aligned} e^x \sin y &= 0 + x(0) + y(1) + \frac{x^2}{2}(0) + xy(1) + \frac{y^2}{2}(0) + \frac{x^3}{6}(0) + \frac{3x^2 y}{6}(1) \\ &\quad + \frac{3xy^2}{6}(0) + \frac{y^3}{6}(-1) + \dots \\ &= y + xy + \frac{x^2 y}{2} - \frac{y^3}{6} + \dots \end{aligned}$$

**Ans.**

**Example 2.** Find the expansion for  $\cos x \cos y$  in powers of  $x, y$  upto fourth order terms.

**Solution.**

		$x = 0, y = 0$
$f(x, y)$	$\cos x \cos y,$	1
$f_x$	$-\sin x \cos y,$	0
$f_y$	$-\cos x \sin y,$	0
$f_{xx}$	$-\cos x \cos y,$	-1
$f_{xy}$	$\sin x \sin y,$	0
$f_{yy}$	$-\cos x \cos y,$	-1
$f_{xxx}$	$\sin x \cos y,$	0
$f_{xxy}$	$\cos x \sin y,$	0
$f_{xyy}$	$\sin x \cos y,$	0
$f_{yyy}$	$\cos x \sin y,$	0
$f_{xxxx}$	$\cos x \cos y,$	1
$f_{xxx}y$	$-\sin x \sin y,$	0
$f_{xx}yy$	$\cos x \cos y,$	1
$f_{xxyy}$	$-\sin x \sin y,$	0
$f_{yyyy}$	$\cos x \cos y,$	1

By Taylor's Series

$$\begin{aligned}
 f(x, y) &= f(0, 0) + x f_x(0, 0) + y f_y(0, 0) + \frac{1}{2!} \left[ x^2 f_x^2(0, 0) \right. \\
 &\quad \left. + 2xy f_{xy}(0, 0) + y^2 f_{yy}(0, 0) \right] + \frac{1}{3!} \left[ x^3 f_x^3(0, 0) + 3x^2 y f_{xy}^2(0, 0) \right. \\
 &\quad \left. + 3xy^2 f_{xy}^2(0, 0) + y^3 f_y^3(0, 0) \right] + \frac{1}{4!} \left[ x^4 f_x^4(0, 0) + 4x^3 y f_{xy}^3(0, 0) \right. \\
 &\quad \left. + 6x^2 y^2 f_{xy}^{22}(0, 0) + 4xy^3 f_{xy}^3(0, 0) + y^4 f_y^4(0, 0) \right] + \dots
 \end{aligned}$$

$$\begin{aligned}
 \cos x \cos y &= 1 + 0 + 0 + \frac{1}{2}(-x^2 + 0 - y^2) + \frac{1}{6}(0 + 0 + 0 + 0) \\
 &\quad + \frac{1}{24}(x^4 + 0 + 6x^2 y^2 + 0 + y^4) \\
 &= 1 - \frac{x^2}{2} - \frac{y^2}{2} + \frac{x^4}{24} + \frac{x^2 y^2}{4} + \frac{y^2}{24} + \dots
 \end{aligned}
 \tag{Ans.}$$

**Example 3.** Find the first six terms of the expansion of the function  $e^x \log(I + y)$  in a Taylor's series in the neighbourhood of the point  $(0, 0)$ .

**Solution.**

		$x = 0, y = 0$
$f(x, y)$	$e^x \log(1 + y)$	0
$\frac{\partial f}{\partial x}$	$e^x \log(1 + y)$	0
$\frac{\partial f}{\partial y}$	$\frac{e^x}{1 + y}$	1
$\frac{\partial^2 f}{\partial x^2}$	$e^x \log(1 + y)$	0
$\frac{\partial^2 f}{\partial y^2}$	$-\frac{e^x}{(1 + y)^2}$	-1
$\frac{\partial^2 f}{\partial x \partial y}$	$\frac{e^x}{(1 + y)}$	1

Taylor's series is

$$\begin{aligned}
 f(x, y) &= f(0, 0) + \left( x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} \right) + \frac{1}{2!} \left( x^2 \frac{\partial^2 f}{\partial x^2} + 2xy \frac{\partial^2 f}{\partial x \partial y} + y^2 \frac{\partial^2 f}{\partial y^2} \right) + \dots \\
 \Rightarrow e^x \log(1 + y) &= 0 + (x \times 0 + y \times 1) + \frac{1}{2!} [x^2 \times (0) + 2xy \times 1 + y^2 \times (-1)] + \dots \\
 \Rightarrow e^x \log(1 + y) &= y + xy - \frac{y^2}{2} \quad \text{Ans.}
 \end{aligned}$$

**EXERCISE 6.1**

1. Expand  $e^x \cos y$  at  $(0, 0)$  upto three terms. Ans.  $1 + x + \frac{1}{2}(x^2 - y^2) + \dots$
  2. Expand  $z = e^{2x} \cos 3y$  in power series of  $x$  and  $y$  upto quadratic terms. (AMIE Summer 2004)
- Ans.  $1 + 2x + 2x^2 - \frac{9}{2}y^2 + \dots$
3. Show that  $e^y \log(1 + x) = x + xy - \frac{x^2}{2}$  approximately.
  4. Verify  $\sin(x + y) = x + y - \frac{(x + y)^3}{3} + \dots$

**Example 4.** Expand  $\sin(xy)$  in powers of  $(x - 1)$  and  $\left(y - \frac{\pi}{2}\right)$  as far as the terms of second degree. (Nagpur University, Summer 2003)

**Solution.** We have,  $f(x, y) = \sin(xy)$

Here

$$\begin{cases} a + h = x \text{ and } h = x - 1 \\ \Rightarrow a + (x - 1) = x \Rightarrow a = 1 \\ b + k = y \text{ and } k = y - \frac{\pi}{2} \\ \Rightarrow b + y - \frac{\pi}{2} = y \Rightarrow b = \frac{\pi}{2} \end{cases}$$

		$x = 1, y = \frac{\pi}{2}$
$f(x, y)$	$\sin(xy)$	1
$f_x(x, y)$	$y \cos(xy),$	0
$f_y(x, y)$	$x \cos(xy),$	0
$f_{xx}(x, y)$	$-y^2 \sin(xy),$	$-\frac{\pi^2}{4}$
$f_{xy}(x, y)$	$\cos(xy) - xy \sin(xy),$	$-\frac{\pi}{2}$
$f_{yy}(x, y)$	$-x^2 \sin(xy),$	-1

By Taylor's theorem for a function of two variables, we have

$$\begin{aligned}
f(a+h, b+k) &= f(a, b) + hf_x(a, b) + kf_y(a, b) \\
&\quad + \frac{1}{2!} \left\{ h^2 f_{xx}(a, b) + 2hk f_{xy}(a, b) + k^2 f_{yy}(a, b) \right\} \\
\Rightarrow f(x, y) &= f\left(1, \frac{\pi}{2}\right) + (x-1)f_x\left(1, \frac{\pi}{2}\right) + \left(y - \frac{\pi}{2}\right)f_y\left(1, \frac{\pi}{2}\right) \\
&\quad + \frac{1}{2!} \left\{ (x-1)^2 f_{xx}\left(1, \frac{\pi}{2}\right) + 2(x-1)\left(y - \frac{\pi}{2}\right)f_{xy}\left(1, \frac{\pi}{2}\right) + \left(y - \frac{\pi}{2}\right)^2 f_{yy}\left(1, \frac{\pi}{2}\right) \right\} \\
\Rightarrow \sin(xy) &= 1 + (x-1) \cdot 0 + \left(y - \frac{\pi}{2}\right) \cdot 0 + \\
&\quad \frac{1}{2!} \left\{ (x-1)^2 \left(-\frac{\pi^2}{4}\right) + 2(x-1)\left(y - \frac{\pi}{2}\right)\left(-\frac{\pi}{2}\right) + \left(y - \frac{\pi}{2}\right)^2 (-1) \right\} + \dots \\
\Rightarrow \sin(xy) &= 1 - \frac{\pi^2}{8}(x-1)^2 - \frac{\pi}{2}(x-1)\left(y - \frac{\pi}{2}\right) - \frac{1}{2}\left(y - \frac{\pi}{2}\right)^2 + \dots \quad \text{Ans.}
\end{aligned}$$

**Example 5.** Expand  $e^x \cdot \cos y$  in powers of  $x$  and  $\left[y - \frac{\pi}{2}\right]$  upto terms of degree 3.

(Nagpur University, Summer 2002)

**Solution.** Here, we have

$$\begin{aligned}
\left[ \begin{array}{l} a+h=x \text{ and } h=x \\ \Rightarrow a+x=x \Rightarrow a=0 \end{array} \right] &\Rightarrow \left[ \begin{array}{l} b+k=y \text{ and } k=y - \frac{\pi}{2} \\ \Rightarrow b+y - \frac{\pi}{2} = y \Rightarrow b = \frac{\pi}{2} \end{array} \right] \\
f(x+h, y+k) &= f(x, y) + \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right) f + \frac{1}{2!} \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^2 f \\
&\quad + \frac{1}{3!} \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^3 f + \dots \quad \dots(1)
\end{aligned}$$

		$x = 0, y = \frac{\pi}{2}$
$f(x, y)$	$e^x \cos y$	0
$\frac{\partial f}{\partial x}$	$e^x \cos y$	0
$\frac{\partial f}{\partial y}$	$-e^x \sin y$	-1
$\frac{\partial^2 f}{\partial x^2}$	$e^x \cos y$	0
$\frac{\partial^2 f}{\partial x \partial y}$	$-e^x \sin y$	-1
$\frac{\partial^2 f}{\partial y^2}$	$-e^x \cos y$	0
$\frac{\partial^3 f}{\partial x^3}$	$e^x \cos y$	0
$\frac{\partial^3 f}{\partial x^2 \partial y}$	$-e^x \sin y$	-1
$\frac{\partial^3 f}{\partial y^2 \partial x}$	$-e^x \cos y$	0
$\frac{\partial^3 f}{\partial y^3}$	$e^x \sin y$	1

Putting these values in (1), we get

$$\begin{aligned}
 e^x \cos y &= 0 + x \cdot 0 + \left( y - \frac{\pi}{2} \right) (-1) + \\
 &\quad \frac{1}{2!} \left[ x^2 \cdot 0 + 2x \left( y - \frac{\pi}{2} \right) (-1) + \left( y - \frac{\pi}{2} \right)^2 \cdot 0 \right] + \\
 &\quad \frac{1}{3!} \left[ x^3 \cdot 0 + 3x^2 \left( y - \frac{\pi}{2} \right) (-1) + 3x \left( y - \frac{\pi}{2} \right)^2 \cdot 0 + \left( y - \frac{\pi}{2} \right)^3 \cdot 1 \right] + \dots \\
 &= -\left( y - \frac{\pi}{2} \right) - x \left( y - \frac{\pi}{2} \right) - \frac{1}{2} x^2 \left( y - \frac{\pi}{2} \right) + \frac{1}{6} \left( y - \frac{\pi}{2} \right)^3 + \dots
 \end{aligned}
 \tag{Ans.}$$

**Example 6.** Expand  $e^x \cos y$  near the point  $\left( 1, \frac{\pi}{4} \right)$  by Taylor's Theorem.

(U.P., I Semester Dec. 2007)

$$\begin{aligned}
 \textbf{Solution. } f(x+h, y+k) &= f(x, y) + \left[ h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right] f + \frac{1}{2!} \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^2 f \\
 &\quad + \frac{1}{3!} \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^3 f + \dots
 \end{aligned}$$

$$e^x \cos y = f(x, y) = f\left[1 + (x - 1), \frac{\pi}{4} + \left(y - \frac{\pi}{4}\right)\right]$$

where  $h = x - 1, k = y - \frac{\pi}{4}$   
 $= f\left(1 + h, \frac{\pi}{4} + k\right)$   
 $\Rightarrow x = 1, y = \frac{\pi}{4}$

$f(x, y)$	$e^x \cos y$	$\frac{e}{\sqrt{2}}$
$\frac{\partial f}{\partial x}$	$e^x \cos y,$	$\frac{e}{\sqrt{2}}$
$\frac{\partial f}{\partial y}$	$-e^x \sin y,$	$\frac{-e}{\sqrt{2}}$
$\frac{\partial^2 f}{\partial x^2}$	$e^x \cos y,$	$\frac{e}{\sqrt{2}}$
$\frac{\partial^2 f}{\partial y^2}$	$-e^x \cos y,$	$\frac{-e}{\sqrt{2}}$
$\frac{\partial^2 f}{\partial x \partial y}$	$-1 e^x \sin y,$	$\frac{-e}{\sqrt{2}}$

Putting these values in Taylor's Theorem, we get

$$\begin{aligned} e^x \cos y &= \frac{e}{\sqrt{2}} + \left[ (x - 1) \frac{e}{\sqrt{2}} + \left(y - \frac{\pi}{4}\right) \left(\frac{-e}{\sqrt{2}}\right) \right] \\ &\quad + \frac{1}{2!} \left[ (x - 1)^2 \frac{e}{\sqrt{2}} + 2(x - 1) \left(y - \frac{\pi}{4}\right) \left(\frac{-e}{\sqrt{2}}\right) + \left(y - \frac{\pi}{4}\right)^2 \left(\frac{-e}{\sqrt{2}}\right) \right] + \dots \\ &= \frac{e}{\sqrt{2}} \left[ 1 + (x - 1) - \left(y - \frac{\pi}{4}\right) + \frac{(x - 1)^2}{2} - (x - 1) \left(y - \frac{\pi}{4}\right) - \left(y - \frac{\pi}{4}\right)^2 + \dots \right] \quad \text{Ans.} \end{aligned}$$

**Example 7.** If  $f(x, y) = \tan^{-1}(xy)$ , compute an approximate value of  $f(0.9, -1.2)$ .

**Solution.** We have,

$$f(x, y) = \tan^{-1}(xy)$$

Let us expand  $f(x, y)$  near the point  $(1, -1)$

$$\begin{aligned} f(0.9, -1.2) &= f(1 - 0.1, -1 - 0.2) \\ &= f(1, -1) + \left[ (-0.1) \frac{\partial f}{\partial x} + (-0.2) \frac{\partial f}{\partial y} \right] + \frac{1}{2!} \left[ (-0.1)^2 \frac{\partial^2 f}{\partial x^2} \right. \\ &\quad \left. + 2(-0.1)(-0.2) \frac{\partial^2 f}{\partial x \partial y} + (-0.2)^2 \frac{\partial^2 f}{\partial y^2} \right] + \dots \quad \text{...}(1) \end{aligned}$$

Substituting the values of  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}$  etc. in (1), we get

$$\begin{aligned} f(0.9, -1.2) &= -\frac{\pi}{4} + (-0.1) \left(-\frac{1}{2}\right) + (-0.2) \left(\frac{1}{2}\right) + \frac{1}{2} \left[ (-0.1)^2 \left(\frac{1}{2}\right) \right. \\ &\quad \left. + 2(-0.1)(-0.2) 0 + (-0.2)^2 \left(\frac{1}{2}\right) \right] + \dots \\ &= -\frac{22}{28} + 0.05 - 0.1 + \frac{1}{2} (0.005 + 0.02) \\ &= -0.786 + 0.05 - 0.1 + 0.0125 = -0.8235 \quad \text{Ans.} \end{aligned}$$

		$x = 1, y = -1$
$f(x, y)$	$\tan^{-1}(xy)$	$-\frac{\pi}{4}$
$\frac{\partial f}{\partial x}$	$\frac{y}{1+x^2y^2},$	$-\frac{1}{2}$
$\frac{\partial f}{\partial y}$	$\frac{x}{1+x^2y^2},$	$\frac{1}{2}$
$\frac{\partial^2 f}{\partial x^2}$	$-\frac{(2x)y}{(1+x^2y^2)^2},$	$\frac{1}{2}$
$\frac{\partial^2 f}{\partial y \partial x}$	$\frac{1+x^2y^2-x(2x)y^2}{(1+x^2y^2)^2} = \frac{1-x^2y^2}{(1+x^2y^2)^2}$	0
$\frac{\partial^2 f}{\partial y^2}$	$\frac{-x(2x^2y)}{(1+x^2y^2)^2},$	$\frac{1}{2}$

**Example 8.** Obtain Taylor's expansion of  $\tan^{-1} \frac{y}{x}$  about (1, 1) upto and including the second degree terms. Hence compute  $f(1, 1, 0.9)$ . (U.P., I Sem. Winter 2005, 2002)

**Solution.**

		$x = 1, y = 1$
$f(x, y)$	$\tan^{-1} \frac{y}{x}$	$\frac{\pi}{4}$
$\frac{\partial f}{\partial x}$	$\frac{1}{1+\frac{y^2}{x^2}} \left(-\frac{y}{x^2}\right) = \frac{-y}{x^2+y^2},$	$-\frac{1}{2}$
$\frac{\partial f}{\partial y}$	$\frac{1}{1+\frac{y^2}{x^2}} \left(\frac{1}{x}\right) = \frac{x}{x^2+y^2},$	$\frac{1}{2}$
$\frac{\partial^2 f}{\partial x^2}$	$\frac{y(2x)}{(x^2+y^2)^2} = \frac{2xy}{(x^2+y^2)^2},$	$\frac{1}{2}$
$\frac{\partial^2 f}{\partial y^2}$	$\frac{-x(2y)}{(x^2+y^2)^2} = \frac{-2xy}{(x^2+y^2)^2},$	$-\frac{1}{2}$
$\frac{\partial^2 f}{\partial y \partial x}$	$\frac{(x^2+y^2)-(x)(2x)}{(x^2+y^2)^2} = \frac{y^2-x^2}{(x^2+y^2)^2},$	0

By Taylor's Theorem

$$f(x, y) = f(a, b) + \left[ (x-a) \frac{\partial f}{\partial x} + (y-b) \frac{\partial f}{\partial y} \right] + \frac{1}{2!} \left[ (x-a)^2 \frac{\partial^2 f}{\partial x^2} + 2(x-a)(y-b) \frac{\partial^2 f}{\partial x \partial y} + (y-b)^2 \frac{\partial^2 f}{\partial y^2} \right] + \dots$$

Here,

$$a = 1, b = 1$$

$$\begin{aligned} \tan^{-1} \frac{y}{x} &= \frac{\pi}{4} + (x-1) \left(-\frac{1}{2}\right) + (y-1) \frac{1}{2} + \frac{1}{2!} \left[ (x-1)^2 \left(\frac{1}{2}\right) \right. \\ &\quad \left. + 2(x-1)(y-1)(0) + (y-1)^2 \left(-\frac{1}{2}\right) \right] + \dots \end{aligned}$$

$$\tan^{-1} \frac{y}{x} = \frac{\pi}{4} - \frac{1}{2}(x-1) + \frac{1}{2}(y-1) + \frac{1}{4}(x-1)^2 - \frac{1}{4}(y-1)^2 + \dots \quad \dots(1)$$

Putting  $(x-1) = 1.1 - 1 = 0.1$ ,  $(y-1) = 0.9 - 1 = -0.1$  in (1), we get

$$\begin{aligned} f(1.1, 0.9) &= \frac{\pi}{4} - \frac{1}{2}(0.1) - \frac{1}{2}(-0.1) + \frac{1}{4}(0.1)^2 - \frac{1}{4}(-0.1)^2 \\ &= 0.786 - 0.05 + 0.05 + 0.0025 - 0.0025 = 0.786 \end{aligned} \quad \text{Ans.}$$

**Example 9.** Expand  $\frac{(x+h)(y+k)}{x+h+y+k}$  in powers of  $h, k$  upto and inclusive of the second degree terms. (A.M.I.E.T.E., Summer 2001)

**Solution.**  $f(x+h, y+k) = \frac{(x+h)(y+k)}{x+h+y+k}$

$$f(x, y) = \frac{xy}{x+y}$$

$$\frac{\partial f}{\partial x} = \frac{(x+y)y - xy}{(x+y)^2} = \frac{y^2}{(x+y)^2}$$

$$\frac{\partial f}{\partial y} = \frac{(x+y)x - xy}{(x+y)^2} = \frac{x^2}{(x+y)^2} \Rightarrow \frac{\partial^2 f}{\partial x^2} = \frac{-2y^2}{(x+y)^3}$$

$$\frac{\partial^2 f}{\partial y \partial x} = \frac{(x+y)^2 2x - 2(x+y)x^2}{(x+y)^4} = \frac{(x+y)2x - 2x^2}{(x+y)^3} = \frac{2xy}{(x+y)^3}$$

$$\frac{\partial^2 f}{\partial y^2} = \frac{-2x^2}{(x+y)^3}$$

$$f(x+h, y+k) = f(x, y) + \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right) f(x, y) + \frac{1}{2!} \left( h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^2 f(x, y) + \dots$$

$$\begin{aligned} \frac{(x+h)(y+k)}{x+h+y+k} &= \frac{xy}{x+y} + h \frac{y^2}{(x+y)^2} + k \frac{x^2}{(x+y)^2} \\ &\quad + \frac{h^2}{2!} \frac{(-2y^2)}{(x+y)^3} + \frac{1}{2!} 2hk \frac{2xy}{(x+y)^3} + \frac{1}{2!} k^2 \frac{(-2x^2)}{(x+y)^3} + \dots \\ &= \frac{xy}{x+y} + \frac{hy^2}{(x+y)^2} + \frac{kx^2}{(x+y)^2} - \frac{h^2y^2}{(x+y)^3} + \frac{2hkxy}{(x+y)^3} - \frac{k^2x^2}{(x+y)^3} + \dots \quad \text{Ans.} \end{aligned}$$

**Example 10.** Expand  $x^2y + 3y - 2$  in powers of  $x - 1$  and  $y + 2$  using Taylor's Theorem.

(A.M.I.E.T.E., Winter 2003, A.M.I.E., Summer 2004, 2003)

**Solution.**  $f(x, y) = x^2y + 3y - 2$

Here  $a + h = x$  and  $h = x - 1$ , so  $a = 1$

$b + k = y$  and  $k = y + 2$  so  $b = -2$

Now Taylor's Theorem is

$$\begin{aligned} f(a+h, b+k) &= f(a, b) + \left( h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y} \right)_{(a,b)} + \frac{1}{2!} \left[ h^2 \frac{\partial^2 f}{\partial x^2} + 2hk \frac{\partial^2 f}{\partial x \partial y} + k^2 \frac{\partial^2 f}{\partial y^2} \right]_{(a,b)} \\ &\quad + \frac{1}{3!} \left( h^3 \frac{\partial^3 f}{\partial x^3} + 3h^2k \frac{\partial^3 f}{\partial x^2 \partial y} + 3hk^2 \frac{\partial^3 f}{\partial x \partial y^2} + k^3 \frac{\partial^3 f}{\partial y^3} \right)_{(a,b)} + \dots \end{aligned}$$

		$x = 1, y = -2$
$f(x, y)$	$x^2y + 3y - 2,$	- 10
$f_x(x, y)$	$2xy,$	- 4
$f_y(x, y)$	$x^2 + 3,$	4
$f_{xx}(x, y)$	$2y,$	- 4
$f_{xy}(x, y)$	$2x,$	2
$f_{yy}(x, y)$	0,	0
$f_{xxx}(x, y)$	0,	0
$f_{xxy}(x, y)$	2,	2
$f_{xyy}(x, y)$	0,	0
$f_{yyy}(x, y)$	0,	0

Putting the values of  $f(a, b)$  etc. in Taylor's Theorem, we get

$$x^2y + 3y - 2 = -10 + [(x-1)(-4) + (y+2)(4)]$$

$$+ \frac{1}{2!} [(x-1)^2(-4) + 2(x-1)(y+2)(2) + (y+2)^2(0)]$$

$$+ \frac{1}{3!} [(x-1)^3(0) + 3(x-1)^2(y+2)(2) + 3(x-1)(y+2)^2(0) + (y+2)^3(0)]$$

$$x^2y + 3y - 2 = -10 - 4(x-1) + 4(y+2) - 2(x-1)^2 + 2(x-1)(y+2) + (x-1)^2(y+2) \text{ Ans.}$$

**Example 11.** Expand  $x^y$  in powers of  $(x-1)$  and  $(y-1)$  upto the third degree terms.

(U.P., I Sem. Winter 2003)

**Solution.**  $f(x, y) = x^y$

Here  $a + h = x$ , and  $h = x - 1 \Rightarrow a = 1$

$b + k = y$ , and  $k = y - 1 \Rightarrow b = 1$

Now Taylor's series is

$$\begin{aligned} f(a+h, b+k) &= f(a, b) + \left( h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y} \right) + \frac{1}{2!} \left( h^2 \frac{\partial^2 f}{\partial x^2} + 2hk \frac{\partial^2 f}{\partial x \partial y} + k^2 \frac{\partial^2 f}{\partial y^2} \right) \\ &\quad + \frac{1}{3!} \left[ h^3 \frac{\partial^3 f}{\partial x^3} + 3h^2k \frac{\partial^3 f}{\partial x \partial x \partial y} + 3hk^2 \frac{\partial^3 f}{\partial x \partial y \partial y} + k^3 \frac{\partial^3 f}{\partial y^3} \right] \end{aligned}$$

$$x^y = 1 + (x-1) + 0 + \frac{1}{2!} [0 + 2(x-1)(y-1) + 0] + \frac{1}{3!} [0 + 3(x-1)^2(y-1) + 0 + 0]$$

$$= 1 + (x-1) + (x-1)(y-1) + \frac{1}{2} (x-1)^2 (y-1) \text{ Ans.}$$

		$x = 1, y = 1$
$f(x, y)$	$x^y$	1
$f_x(x, y)$	$y x^{y-1}$	1
$f_y(x, y)$	$x^y \log x$	0
$f_{xx}(x, y)$	$y(y-1)x^{y-2}$	0
$f_{yx}(x, y)$	$x^y \cdot \frac{1}{x} + y x^{y-1} \log x = x^{y-1} + y x^{y-1} \log x$	1
$f_{yy}(x, y)$	$x^y (\log x)^2$	0
$f_{xxx}(x, y)$	$y(y-1)(y-2)x^{y-3}$	0
$f_{xyy}(x, y)$	$(y-1)x^{y-2} + y(y-1)x^{y-2} \log x + y x^{y-1} \cdot \frac{1}{x}$ $= (y-1)x^{y-2} + y(y-1)x^{y-2} \log x + y x^{y-2}$	1
$f_{xyy}(x, y)$	$y x^{y-1} (\log x)^2 + x^y \frac{2 \log x}{x}$ $= y x^{y-1} (\log x)^2 + 2x^{y-1} \log x$	0
$f_{yyy}(x, y)$	$x^y (\log x)^3$	0

**EXERCISE 6.2**

1. Expand  $e^{xy}$  at (1, 1) upto three terms.

$$\text{Ans. } e[1 + (x-1) + (y-1) + \frac{1}{2!}[(x-1)^2 + 4(x-1)(y-1) + (y-1)^2]]$$

2. Expand  $y^x$  at (1, 1) upto second term  
3. Expand  $e^{ax} \sin by$  in powers of  $x$  and  $y$  as far as the terms of third degree.

$$\text{Ans. } by + abxy + \frac{1}{3!} (3a^2 bx^2 y - b^3 y^3) + \dots$$

4. Expand  $(x^2 y + \sin y + e^x)$  in powers of  $(x-1)$  and  $(x-\pi)$ .

$$\text{Ans. } \pi + e + (x-1)(2\pi + e) + \frac{1}{2}(x-1)^2(2\pi + e) + 2(x-1)(y-\pi).$$

5. Expand  $(1 + x + y^2)^{1/2}$  at (1, 0).  
 $\text{Ans. } \sqrt{2} \left[ 1 + \frac{x-1}{4} - \frac{(x-1)^2}{32} + \frac{y^2}{4} + \dots \right]$

6. Obtain the linearised form  $T(x, y)$  of the function  $f(x, y) = x^2 - xy + \frac{1}{2} y^2 + 3$  at the point (3, 2), using the Taylor's series expansion. Find the maximum error in magnitude in the approximation  $f(x, y) \approx T(x, y)$  over the rectangle R:  $|x-3| < 0.1, |y-2| < 0.1$ .  
 $\text{Ans. } 8 + 4(x-3) - (y-2)$ , Error 0.04.

7. Expand  $\sin(x+h)(y+k)$  by Taylor's Theorem.

$$\text{Ans. } \sin xy + h(x+y) \cos xy + hk \cos xy - \frac{1}{2}h^2(x+y)^2 \sin xy + \dots$$

Fill in the blank:

8. If  $f(x) = f(0) + kf_1(0) + \frac{k^2}{2!}f_2(0k)$ ,  $0 < \theta < 1$  then the value of  $k$  when  $k = 1$  and  $f(x) = (1-x)^{3/2}$  is given as .....  
(U.P. Ist Semester, Dec 2008)

# CHAPTER 7

## DOUBLE INTEGRALS

---

### 7.1 DOUBLE INTEGRATION

We know that

$$\int_a^b f(x) dx = \lim_{\substack{n \rightarrow \infty \\ \delta x \rightarrow 0}} [f(x_1) \delta x_1 + f(x_2) \delta x_2 + f(x_3) \delta x_3 + \dots + f(x_n) \delta x_n]$$

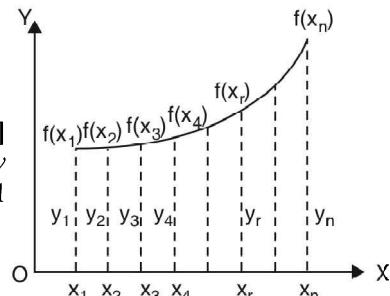

Let us consider a function  $f(x, y)$  of two variable  $x$  and  $y$  defined in the finite region  $A$  of  $xy$ -plane. Divide the region  $A$  into elementary areas.

$$\delta A_1, \delta A_2, \delta A_3, \dots, \delta A_n$$

Then

$$\iint_A f(x, y) dA$$

$$= \lim_{\substack{n \rightarrow \infty \\ \delta A \rightarrow 0}} [f(x_1, y_1) \delta A_1 + f(x_2, y_2) \delta A_2 + \dots + f(x_n, y_n) \delta A_n]$$

### 7.2 EVALUATION OF DOUBLE INTEGRAL

Double integral over region  $A$  may be evaluated by two successive integrations.

If  $A$  is described as  $f_1(x) \leq y \leq f_2(x)$  [ $y_1 \leq y \leq y_2$ ] and  $a \leq x \leq b$ ,

$$\text{Then } \iint_A f(x, y) dA = \int_a^b \int_{y_1}^{y_2} f(x, y) dx dy$$

#### (1) First Method

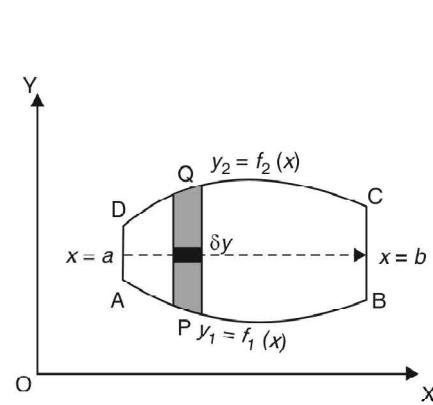

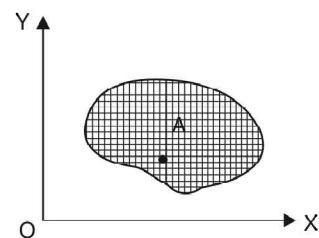

$$\iint_A f(x, y) dA = \int_a^b \left[ \int_{y_1}^{y_2} f(x, y) dy \right] dx$$

$f(x, y)$  is first integrated with respect to  $y$  treating  $x$  as constant between the limits  $a$  and  $b$ .

In the region we take an elementary area  $\delta x \delta y$ . Then integration w.r.t  $y$  ( $x$  keeping constant). converts small rectangle  $\delta x \delta y$  into a strip  $PQ$  ( $y \delta x$ ). While the integration of the result w.r.t.  $x$  corresponding to the sliding to the strip  $PQ$ , from  $AD$  to  $BC$  covering the whole region  $ABCD$ .

#### Second method

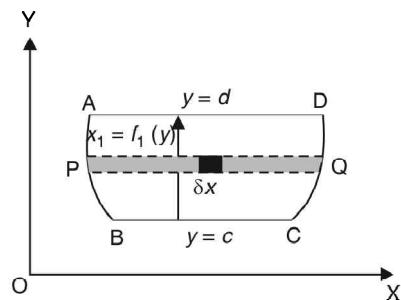

$$\iint_A f(x, y) dxdy = \int_c^d \left[ \int_{x_1}^{x_2} f(x, y) dx \right] dy$$

Here  $f(x,y)$  is first integrated w.r.t  $x$  keeping  $y$  constant between the limits  $x_1$  and  $x_2$  and then the resulting expression is integrated with respect to  $y$  between the limits  $c$  and  $d$

Take a small area  $\delta x \delta y$ . The integration w.r.t.  $x$  between the limits  $x_1, x_2$  keeping  $y$  fixed indicates that integration is done, along  $PQ$ . Then the integration of result w.r.t  $y$  corresponds to sliding the strips  $PQ$  from  $BC$  to  $AD$  covering the whole region  $ABCD$ .

Note. For constant limits, it does not matter whether we first integrate w.r.t  $x$  and then w.r.t  $y$  or vice versa.

**Example 1.** Evaluate  $\int_0^1 \int_0^x (x^2 + y^2) dA$ , where  $dA$  indicates small area in  $xy$ -plane.

(Gujarat, I Semester, Jan. 2009)

$$\begin{aligned}
 \text{Solution. Let } I &= \int_0^1 \int_0^x (x^2 + y^2) dy dx = \int_0^1 \left[ x^2 y + \frac{y^3}{3} \right]_0^x dx \\
 &= \int_0^1 \left[ x^2 (x-0) + \frac{1}{3} (x^3 - 0) \right] dx = \int_0^1 \left[ x^3 + \frac{x^3}{3} \right] dx \\
 &= \int_0^1 \frac{4}{3} x^3 dx = \frac{4}{3} \left[ \frac{x^4}{4} \right]_0^1 = \frac{1}{3} [1-0] = \frac{1}{3} \text{ sq. units.} \quad \text{Ans.}
 \end{aligned}$$

**Example 2.** Evaluate  $\int_{-1}^1 \int_0^{1-x} x^{1/3} y^{-1/2} (1-x-y)^{1/2} dy dx$ . (M.U., II Semester 2002)

**Solution.** Here, we have

$$I = \int_{-1}^1 \int_0^{1-x} x^{1/3} y^{-1/2} (1-x-y)^{1/2} dy dx \quad \dots(1)$$

Putting  $(1-x) = c$  in (1), we get

$$I = \int_{-1}^1 x^{1/3} dx \int_0^c y^{-1/2} (c-y)^{1/2} dy \quad \dots(2)$$

Again putting  $y = ct \Rightarrow dy = c dt$  in (2), we get

$$\begin{aligned}
 I &= \int_{-1}^1 x^{1/3} dx \int_0^1 c^{-\frac{1}{2}} t^{-\frac{1}{2}} (c-ct)^{\frac{1}{2}} c dt \\
 &= \int_{-1}^1 x^{1/3} dx \int_0^1 c^{-1/2} t^{-1/2} c^{1/2} (1-t)^{1/2} c dt \\
 &= \int_{-1}^1 c x^{1/3} dx \int_0^c t^{-1/2} (1-t)^{1/2} dt = \int_{-1}^1 c x^{1/3} dx \int_0^1 t^{1/2-1} (1-t)^{3/2-1} dt \\
 &= \int_{-1}^1 c x^{\frac{1}{3}} dx \beta\left(\frac{1}{2}, \frac{3}{2}\right) \quad \left[ \int_0^1 x^{l-1} (1-x)^{m-1} dx = \beta(l, m) \right] \\
 &= \int_{-1}^1 c x^{1/3} dx \frac{\frac{1}{2} \cdot \frac{3}{2}}{\frac{1}{2} + \frac{3}{2}} = \int_{-1}^1 c x^{1/3} dx \frac{\frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2}}{\frac{1}{2}} = \int_{-1}^1 c x^{1/3} dx \frac{\sqrt{\pi} \frac{1}{2} \sqrt{\pi}}{1} \\
 &= \int_{-1}^1 c x^{1/3} \frac{\pi}{2} dx = \frac{\pi}{2} \int_{-1}^1 x^{1/3} \cdot c dx
 \end{aligned}$$

Putting the value of  $c$ , we get

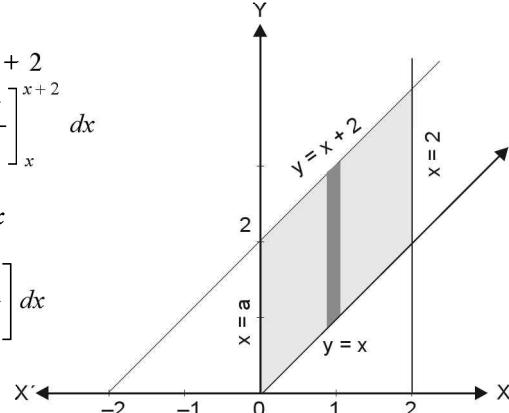

$$\begin{aligned} I &= \frac{\pi}{2} \int_{-1}^1 x^{1/3} (1-x) dx = \frac{\pi}{2} \int_{-1}^1 (x^{1/3} - x^{4/3}) dx = \frac{\pi}{2} \left[ \frac{x^{4/3}}{4} - \frac{x^{7/3}}{7} \right]_{-1}^1 \\ &= \frac{\pi}{2} \left[ \frac{3}{4}(1) - \frac{3}{7}(1) - \frac{3}{4}(-1) + \frac{3}{7}(-1) \right] = \frac{\pi}{2} \left[ \frac{9}{14} \right] = \frac{9\pi}{28} \quad \text{Ans.} \end{aligned}$$

**Example 3.** Evaluate  $\iint_R (x+y) dy dx$ ,  $R$  is the region bounded by  $x = 0$ ,  $x = 2$ ,  $y = x$ ,  $y = x + 2$ .  
(Gujarat, I Semester, Jan. 2009)

**Solution.** Let  $I = \iint_R (x+y) dy dx$

The limits are  $x = 0$ ,  $x = 2$ ,  $y = x$  and  $y = x + 2$

$$\begin{aligned} I &= \int_0^2 dx \int_x^{x+2} (x+y) dy = \int_0^2 \left[ xy + \frac{y^2}{2} \right]_x^{x+2} dx \\ &= \int_0^2 \left[ x(x+2) + \frac{1}{2}(x+2)^2 - x^2 - \frac{x^2}{2} \right] dx \\ &= \int_0^2 \left[ x^2 + 2x + \frac{1}{2}(x^2 + 4x + 4) - x^2 - \frac{x^2}{2} \right] dx \\ &= \int_0^2 [2x + 2x + 2] dx \\ &= 2 \int_0^2 (2x+1) dx = 2 [x^2 + x]_0^2 = 2 [4 + 2] = 12 \quad \text{Ans.} \end{aligned}$$

**Example 4.** Evaluate  $\iint_R xy dx dy$

where  $R$  is the quadrant of the circle  $x^2 + y^2 = a^2$  where  $x \geq 0$  and  $y \geq 0$ .

(A.M.I.E.T.E, Summer 2004, 1999)

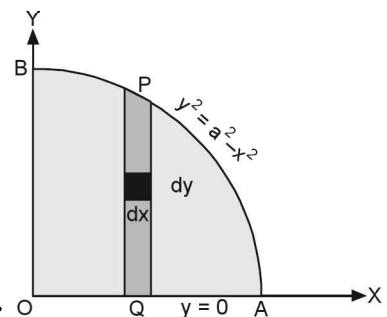

**Solution.** Let the region of integration be the first quadrant of the circle  $OAB$ .

$$\iint_R xy dx dy \quad (x^2 + y^2 = a^2, y = \sqrt{a^2 - x^2})$$

First we integrate w.r.t.  $y$  and then w.r.t.  $x$ .

The limits for  $y$  are 0 and  $\sqrt{a^2 - x^2}$  and for  $x$ , 0 to  $a$ .

$$\begin{aligned} &= \int_0^a x dx \int_0^{\sqrt{a^2 - x^2}} y dy = \int_0^a x dx \left[ \frac{y^2}{2} \right]_0^{\sqrt{a^2 - x^2}} \\ &= \frac{1}{2} \int_0^a x(a^2 - x^2) dx = \frac{1}{2} \left[ \frac{a^2 x^2}{2} - \frac{x^4}{4} \right]_0^a = \frac{a^4}{8} \quad \text{Ans.} \end{aligned}$$

**Example 5.** Evaluate  $\iint_S \sqrt{xy - y^2} dy dx$ ,

where  $S$  is a triangle with vertices  $(0, 0)$ ,  $(10, 1)$  and  $(1, 1)$ .

**Solution.** Let the vertices of a triangle  $OBA$  be  $(0, 0)$ ,  $(10, 1)$  and  $(1, 1)$ .

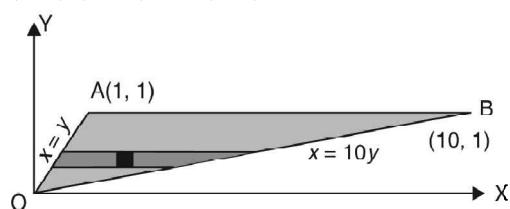

Equation of  $OA$  is  $x = y$ .

Equation of  $OB$  is  $x = 10y$ .

The region of  $\Delta OBA$ , given by the limits

$$y \leq x \leq 10y \text{ and } 0 \leq y \leq 1.$$

$$\iint_S \sqrt{xy - y^2} dy dx = \int_0^1 dy \int_y^{10y} (xy - y^2)^{1/2} dx$$

$$\begin{aligned}
 &= \int_0^1 dy \left[ \frac{2}{3} \frac{1}{y} (xy - y^2)^{3/2} \right]_y^{10y} = \int_0^1 \frac{2}{3} \frac{1}{y} (9y^2)^{3/2} dy = 18 \int_0^1 y^2 dy \\
 &= 18 \left[ \frac{y^3}{3} \right]_0^1 = \frac{18}{3} = 6
 \end{aligned}$$

**Ans.**

**Example 6.** Evaluate  $\iint_A x^2 dx dy$ , where  $A$  is the region in the first quadrant bounded by the hyperbola  $xy = 16$  and the lines  $y = x$ ,  $y = 0$  and  $x = 8$ . (A.M.I.E., Summer 2001)

**Solution.** The line  $OP$ ,  $y = x$  and the curve  $PS$ ,  $xy = 16$  intersect at  $(4, 4)$ .

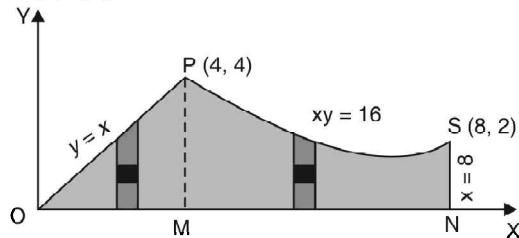

The line  $SN$ ,  $x = 8$  intersects the hyperbola at  $S(8, 2)$ .  $y = 0$  is  $x$ -axis.

The area  $A$  is shown shaded.

Divide the area in to two part by  $PM$  perpendicular to  $OX$ .

For the area  $OMP$ ,  $y$  varies from 0 to  $x$ , and then  $x$  varies from 0 to 4.

For the area  $PMNS$ ,  $y$  varies from 0 to  $16/x$  and then  $x$  varies from 4 to 8.

$$\begin{aligned}
 \therefore \iint_A x^2 dx dy &= \int_0^4 \int_0^x x^2 dx dy + \int_4^8 \int_0^{16/x} x^2 dx dy \\
 &= \int_0^4 x^2 dx \int_0^x dy + \int_4^8 x^2 dx \int_0^{16/x} dy = \int_0^4 x^2 [y]_0^x dx + \int_4^8 x^2 [y]_0^{16/x} dx \\
 &= \int_0^4 x^3 dx + \int_4^8 16x dx = \left[ \frac{x^4}{4} \right]_0^4 + 16 \left[ \frac{x^2}{2} \right]_4^8 = 64 + 8(8^2 - 4^2) = 64 + 384 = 448. \text{ Ans.}
 \end{aligned}$$

**Example 7.** Evaluate  $\iint (x+y)^2 dx dy$  over the area bounded by the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  (U.P. Ist Semester Compartment 2004)

**Solution.** For the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$

$$\Rightarrow \frac{y}{b} = \pm \sqrt{1 - \frac{x^2}{a^2}} \Rightarrow y = \pm \frac{b}{a} \sqrt{a^2 - x^2}$$

$\therefore$  The region of integration can be expressed as

$$-a \leq x \leq a \text{ and } -\frac{b}{a} \sqrt{a^2 - x^2} \leq y \leq \frac{b}{a} \sqrt{a^2 - x^2}$$

$$\therefore \iint (x+y)^2 dx dy = \iint (x^2 + y^2 + 2xy) dx dy$$

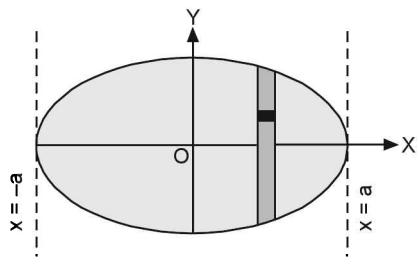

$$= \int_{-a}^a \int_{(-b/a)\sqrt{a^2-x^2}}^{(b/a)\sqrt{a^2-x^2}} (x^2 + y^2 + 2xy) dx dy$$

$$= \int_{-a}^a \int_{(-b/a)\sqrt{a^2-x^2}}^{(b/a)\sqrt{a^2-x^2}} (x^2 + y^2) dx dy \int_{-a}^a \int_{(-b/a)\sqrt{a^2-x^2}}^{(b/a)\sqrt{a^2-x^2}} 2xy dy dx$$

$$= \int_{-a}^a \int_0^{(b/a)\sqrt{a^2-x^2}} 2(x^2 + y^2) dy dx + 0$$

[Since  $(x^2 + y^2)$  is an even function of  $y$  and  $2xy$  is an odd function of  $y$ ]

$$= \int_{-a}^a \left[ 2 \left( x^2 y + \frac{y^3}{3} \right) \right]_0^{(b/a)\sqrt{a^2-x^2}} dx$$

$$\begin{aligned}
&= 2 \int_{-a}^a \left[ x^2 \times \frac{b}{a} \sqrt{a^2 - x^2} + \frac{1}{3} \frac{b^3}{a^3} (a^2 - x^2)^{3/2} \right] dx \\
&= 4 \int_0^a \left[ \frac{b}{a} x^2 \sqrt{a^2 - x^2} + \frac{b^3}{3a^3} (a^2 - x^2)^{3/2} \right] dx \\
&\quad [\text{On putting } x = a \sin \theta \text{ and } dx = a \cos \theta d\theta] \\
&= 4 \int_0^{\pi/2} \left( \frac{b}{a} \cdot a^2 \sin^2 \theta \cdot a \cos \theta + \frac{b^3}{3a^3} a^3 \cos^3 \theta \right) \times a \cos \theta d\theta \\
&= 4 \int_0^{\pi/2} \left( a^3 b \sin^2 \theta \cos^2 \theta + \frac{ab^3}{3} \cos^4 \theta \right) d\theta = 4 \left[ a^3 b \cdot \frac{1}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} + \frac{ab^3}{3} \cdot \frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} \right] \\
&= \frac{\pi}{4} (a^3 b + ab^3) = \frac{\pi}{4} ab (a^2 + b^2)
\end{aligned}$$

Ans.

**Example 8.** Evaluate  $\iint (x^2 + y^2) dx dy$  throughout the area enclosed by the curves  $y = 4x$ ,

$$x + y = 3, y = 0 \text{ and } y = 2.$$

**Solution.** Let  $OC$  represent  $y = 4x$ ;  $BD$ ,  $x + y = 3$ ;  $OB$ ,  $y = 0$ , and  $CD$ ,  $y = 2$ . The given integral is to be evaluated over the area A of the trapezium  $OCDB$ .

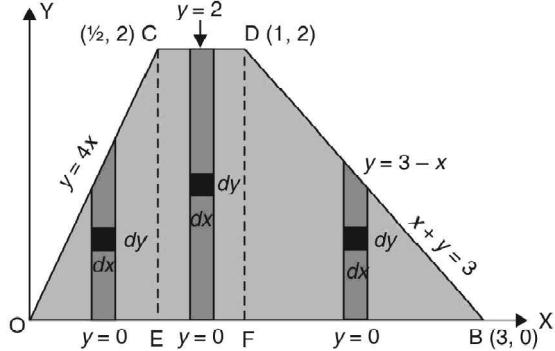

Area  $OCDB$  consists of area  $OCE$ , area  $ECDF$  and area  $FDB$ .

The co-ordinates of C, D and B are  $\left(\frac{1}{2}, 2\right)$  (1, 2) and (3, 0) respectively.

$$\begin{aligned}
\therefore \iint_A (x^2 + y^2) dy dx &= \iint_{OCE} (x^2 + y^2) dy dx + \iint_{ECDE} (x^2 + y^2) dy dx + \iint_{FDB} (x^2 + y^2) dy dx \\
&= \int_0^{1/2} dx \int_0^{4x} (x^2 + y^2) dy + \int_{1/2}^1 dx \int_0^2 (x^2 + y^2) dy + \int_1^3 dx \int_0^{3-x} (x^2 + y^2) dy \\
\text{Now, } I_1 &= \int_0^{1/2} dx \int_0^{4x} (x^2 + y^2) dy = \int_0^{1/2} \left[ x^2 y + \frac{y^3}{3} \right]_{0}^{4x} dx = \int_0^{1/2} \frac{76}{3} x^3 dx \\
&= \frac{76}{3} \int_0^{1/2} x^3 dx = \frac{76}{3} \left[ \frac{x^4}{4} \right]_0^{1/2} = \frac{76}{3} \left[ \frac{1}{4} \cdot \frac{1}{16} \right] = \frac{19}{48}
\end{aligned}$$

$$\begin{aligned}
I_2 &= \int_{1/2}^1 dx \int_{1/2}^1 (x^2 + y^2) dy = \int_{1/2}^1 \left[ x^2 y + \frac{y^3}{3} \right]_0^1 dx = \int_{1/2}^1 \left( 2x^2 + \frac{8}{3} \right) dx \\
&= \left[ \frac{2x^3}{3} + \frac{8}{3} x \right]_{1/2}^1 = \left[ \left( \frac{2}{3} + \frac{8}{3} \right) - \left( \frac{2}{3} \cdot \frac{1}{8} + \frac{8}{3} \cdot \frac{1}{2} \right) \right] = \frac{23}{12}
\end{aligned}$$

$$\begin{aligned}
I_3 &= \int_1^3 dx \int_0^{3-x} (x^2 + y^2) dy = \int_1^3 \left[ x^2 y + \frac{y^3}{3} \right]_0^{3-x} dx = \int_0^3 \left[ x^2 (3-x) + \frac{(3-x)^3}{3} \right] dx \\
&= \int_1^3 \left[ 3x^2 - x^3 + \frac{(3-x)^3}{3} \right] dx = \left[ x^3 - \frac{x^4}{4} - \frac{(3-x)^4}{3} \right]_1^3
\end{aligned}$$

$$\begin{aligned}
 &= \left[ 27 - \frac{81}{4} - 0 - 1 + \frac{1}{4} + \frac{16}{12} \right] = \frac{22}{3} \\
 \therefore \int_A \int (x^2 + y^2) dy dx &= I_1 + I_2 + I_3 = \frac{19}{48} + \frac{23}{12} + \frac{22}{3} = \frac{463}{48} = 9 \frac{31}{48}. \quad \text{Ans.}
 \end{aligned}$$

### EXERCISE 7.1

Evaluate

$$\int_0^2 \int_0^{x^2} e^{\frac{y}{x}} dy dx$$

Ans.  $e^2 - 1$

$$\int_0^a \int_0^{\sqrt{ay}} xy dx dy$$

Ans.  $\frac{a^4}{6}$

$$\int_0^a \int_0^{\sqrt{a^2 - y^2}} dx dy$$

Ans.  $\frac{\pi a^2}{4}$

$$\int_0^1 \int_{y^2}^y (1 + xy^2) dx dy$$

Ans.  $\frac{41}{210}$

$$\int_0^{2a} \int_0^{\sqrt{2ax-x}} xy dy dx$$

Ans.  $\frac{2a^4}{3}$

$$\int_0^{2a} \int_0^{\sqrt{2ax-x^2}} x^2 dy dx$$

Ans.  $\frac{5\pi a^4}{8}$

$$\int_0^a \int_0^{\sqrt{a^2-x^2}} \sqrt{a^2 - x^2 - y^2} dy dx \quad \text{Ans. } \frac{\pi a^3}{4}$$

$$\int_0^1 \int_0^{\sqrt{\frac{1}{2}(1-y^2)}} \frac{dx dy}{\sqrt{1-x^2-y^2}} \quad \text{Ans. } \frac{\pi}{4}$$

$$\int_0^a \int_0^{\sqrt{a^2-x^2}} \frac{dx dy}{(1+e^y) \sqrt{a^2 - x^2 - y^2}} \quad \text{Ans. } \frac{\pi}{2} \log \frac{2e^a}{1+e^a}$$

$$\int_0^a \int_0^a \frac{x dx dy}{\sqrt{x^2+y^2}} \quad \text{Ans. } \frac{a^2}{2} \log (\sqrt{2} + 1)$$

$$\int_{x=0}^1 \int_{y=0}^2 (x^2 + 3xy^2) dx dy \quad (\text{A.M.I.E.T.E., June 2009})$$

Ans.  $\frac{14}{3}$

$$\int_A \int (5 - 2x - y) dx dy, \text{ where } A \text{ is given by } y = 0, x + 2y = 3, x = y^2. \quad \text{Ans. } \frac{217}{60}$$

$$\int_A \int xy dx dy, \text{ where } A \text{ is given by } x^2 + y^2 - 2x = 0, y^2 = 2x, y = x. \quad \text{Ans. } \frac{7}{12}$$

$$\int_A \int \sqrt{4x^2 - y^2} dx dy, \text{ where } A \text{ is the triangle given by } y = 0, y = x \text{ and } x = 1. \quad \text{Ans. } \frac{1}{3} \left( \frac{\pi}{3} + \frac{\sqrt{3}}{2} \right)$$

$$\int_R \int x^2 dx dy, \text{ where } R \text{ is the two-dimensional region bounded by the curves } y = x \text{ and } y = x^2. \quad \text{Ans. } \frac{1}{20}$$

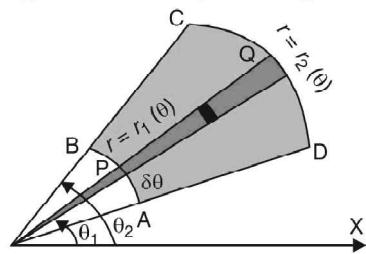

$$\int_A \int \sqrt{xy(1+x-y)} dx dy \text{ where } A \text{ is the area bounded by } x = 0, y = 0 \text{ and } x + y = 1. \quad \text{Ans. } \frac{2\pi}{105}$$

### 7.3 EVALUATION OF DOUBLE INTEGRALS IN POLAR CO-ORDINATES

We have to evaluate  $\int_{\theta_1}^{\theta_2} \int_{r_1(\theta)}^{r_2(\theta)} f(r, \theta) dr d\theta$  over the region bounded by the straight lines

$\theta = \theta_1$  and  $\theta = \theta_2$  and the curves  $r = r_1(\theta)$  and  $r = r_2(\theta)$ . We first integrate with respect to  $r$  between the limits  $r = r_1(\theta)$  and  $r = r_2(\theta)$  and taking  $\theta$  as constant. Then the resulting expression is integrated with respect to  $\theta$  between the limits  $\theta = \theta_1$  and  $\theta = \theta_2$ .

The area of integration is  $ABCD$ . On integrating first with respect to  $r$ , the strip extends from  $P$  to  $Q$  and the integration with respect to  $\theta$  means the rotation of this strip  $PQ$  from  $AD$  to  $BC$ .

**Example 9.** Evaluate  $\int_0^{\pi/2} \left[ \int_0^{a \cos \theta} r \sqrt{a^2 - r^2} dr \right] d\theta$ .

$$\begin{aligned}\text{Solution. } I &= \int_0^{\pi/2} \left[ \int_0^{a \cos \theta} r \sqrt{a^2 - r^2} dr \right] d\theta = \int_0^{\pi/2} \left[ \int_0^{a \cos \theta} -\frac{1}{2} (a^2 - r^2)^{1/2} (-2r) dr \right] d\theta \\ &= \int_0^{\pi/2} \left[ -\frac{1}{2} \cdot \frac{(a^2 - r^2)^{3/2}}{3/2} \right]_0^{a \cos \theta} d\theta = -\frac{1}{3} \int_0^{\pi/2} \left[ (a^2 - a^2 \cos^2 \theta)^{3/2} - (a^2)^{3/2} \right] d\theta \\ &= -\frac{1}{3} \int_0^{\pi/2} \left[ a^2 (1 - \cos^2 \theta)^{3/2} - a^3 \right] d\theta \\ &= -\frac{1}{3} \int_0^{\pi/2} (a^3 \sin^3 \theta - a^3) d\theta = -\frac{a^3}{3} \left[ \frac{2}{3} - \frac{\pi}{2} \right] = \frac{a^3}{18} (3\pi - 4).\end{aligned}$$

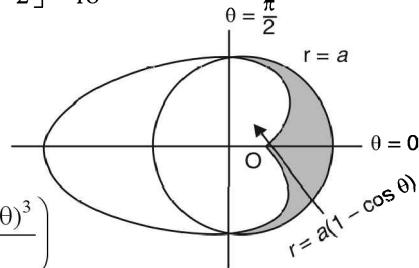

**Ans.**

**Example 10.** Evaluate  $\int_0^{\pi/2} \int_{a(1-\cos \theta)}^a r^2 dr d\theta$

**Solution.**  $\int_0^{\pi/2} d\theta \int_{a(1-\cos \theta)}^a r^2 dr$

$$\begin{aligned}&= \int_0^{\pi/2} d\theta \left[ \frac{r^3}{3} \right]_{a(1-\cos \theta)}^a = \int_0^{\pi/2} d\theta \left( \frac{a^3}{3} - \frac{a^3 (1 - \cos \theta)^3}{3} \right) \\ &= \frac{a^3}{3} \int_0^{\pi/2} [1 - (1 - \cos \theta)^3] d\theta = \frac{a^3}{3} \int_0^{\pi/2} [1 - (1 - 3 \cos \theta + 3 \cos^2 \theta - \cos^3 \theta)] d\theta \\ &= \frac{a^3}{3} \int_0^{\pi/2} (3 \cos \theta - 3 \cos^2 \theta + \cos^3 \theta) d\theta\end{aligned}$$

$$= \frac{a^3}{3} \left[ [3 \sin \theta]_0^{\pi/2} - 3 \frac{1}{2} \frac{\pi}{2} + \frac{2}{3.1} \right] = \frac{a^3}{3} \left[ 3 - \frac{3\pi}{4} + \frac{2}{3} \right] = \frac{a^3}{36} [44 - 9\pi]$$

**Ans.**

**Example 11.** Evaluate  $\iint r^3 dr d\theta$ , over the area bounded between the circles  $r = 2 \cos \theta$  and  $r = 4 \cos \theta$ .  
(K. University, Dec. 2008)

**Solution.** Here, we have

$$r = 2 \cos \theta \quad \text{circle} \quad \dots (1)$$

$$r = 4 \cos \theta \quad \text{circle} \quad \dots (2)$$

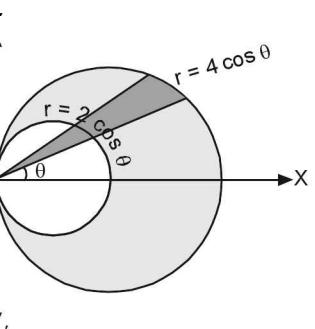

$$\text{Let } I = \iint r^3 dr d\theta \quad \dots (3)$$

$$= \int_{-\pi/2}^{\pi/2} d\theta \int_{2 \cos \theta}^{4 \cos \theta} r^3 dr$$

$$= \int_{-\pi/2}^{\pi/2} d\theta \left[ \frac{r^4}{4} \right]_{2 \cos \theta}^{4 \cos \theta}$$

$$= \frac{1}{4} \int_{-\pi/2}^{\pi/2} d\theta (256 \cos^4 \theta - 16 \cos^4 \theta) = \frac{240}{4} \int_{-\pi/2}^{\pi/2} \cos^4 \theta d\theta$$

$$= 120 \int_0^{\pi/2} \cos^4 \theta d\theta$$

[\cos^4 theta is an even function]

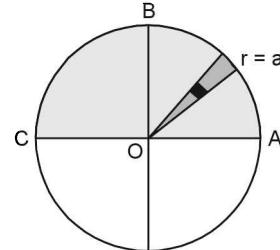

$$\begin{aligned}
 &= 120 \frac{\left[ \frac{4+1}{2} \right] \left[ \frac{0+1}{2} \right]}{2 \sqrt{\frac{4+1+0+1}{2}}} = 60 \frac{\left[ \frac{5}{2} \right] \left[ \frac{1}{2} \right]}{\sqrt{3}} \\
 &= 60 \left[ \frac{3}{2} \left( \frac{1}{2} \right) \right] \left[ \frac{1}{2} \right] = \frac{45}{2} (\sqrt{\pi}) (\sqrt{\pi}) = \frac{45\pi}{2} \quad \text{Ans.}
 \end{aligned}$$

**Example 12.** Transform the integral to cartesian form and hence evaluate

$$\int_0^\pi \int_0^a r^3 \sin \theta \cos \theta dr d\theta. \quad (\text{M.U., II Semester 2000})$$

**Solution.** Here, we have

$$\int_0^\pi \int_0^a r^3 \sin \theta \cos \theta dr d\theta \quad \dots(1)$$

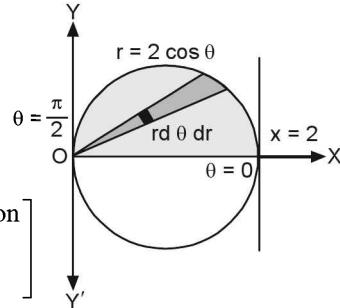

Here the region i.e., semicircle ABC of integration is bounded by  $r = 0$ , i.e., x-axis.

$r = a$  i.e., circle,  $\theta = 0$  and  $\theta = \pi$  i.e., x-axis in the second quadrant.

$$\int \int (r \sin \theta) (r \cos \theta) (r dr d\theta)$$

Putting  $x = r \cos \theta$ ,  $y = r \sin \theta$ ,  $dx dy = r d\theta dr$  in (1), we get

$$\begin{aligned}
 &\int_{-a}^a \int_0^{\sqrt{a^2-x^2}} xy dy dx = \int_{-a}^a x dx \int_0^{\sqrt{a^2-x^2}} y dy \\
 &= \int_{-a}^a x dx \left[ \frac{y^2}{2} \right]_0^{\sqrt{a^2-x^2}} = \int_{-a}^a x dx \frac{(a^2 - x^2)}{2} \\
 &= \frac{1}{2} \int_{-a}^a (a^2 x - x^3) dx = 0 \quad \text{Ans.} \quad \left[ \begin{array}{l} \text{Since } f(x) \text{ is odd function} \\ \int_{-a}^a f(x) dx = 0 \end{array} \right]
 \end{aligned}$$

$$\text{Example 13. Evaluate } \int_0^2 \int_0^{\sqrt{2x-x^2}} (x^2 + y^2) dy dx$$

$$\text{Solution. } \int_0^2 \int_0^{\sqrt{2x-x^2}} (x^2 + y^2) dy dx$$

$$\text{Limits of } y = \sqrt{2x-x^2} \Rightarrow y^2 = 2x - x^2 \Rightarrow x^2 + y^2 - 2x = 0 \quad \dots(1)$$

(1) represents a circle whose centre is  $(1, 0)$  and radius = 1.

Lower limit of  $y$  is 0 i.e., x-axis.

Region of integration is upper half circle.

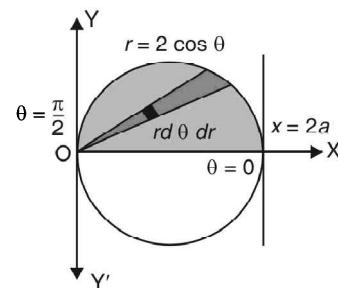

Let us convert (1) into polar co-ordinate by putting

$$\begin{aligned}
 x &= r \cos \theta, y = r \sin \theta \\
 r^2 - 2r \cos \theta &= 0 \Rightarrow r = 2 \cos \theta
 \end{aligned}$$

Limits of  $r$  are 0 to  $2 \cos \theta$

$$\text{Limits of } \theta \text{ are } 0 \text{ to } \frac{\pi}{2}$$

$$\begin{aligned}
 \int_0^2 \int_0^{\sqrt{2x-x^2}} (x^2 + y^2) dy dx &= \int_0^{\frac{\pi}{2}} \int_0^{2 \cos \theta} r^2 (r dr d\theta) = \int_0^{\frac{\pi}{2}} d\theta \int_0^{2 \cos \theta} r^3 dr = \int_0^{\frac{\pi}{2}} d\theta \left[ \frac{r^4}{4} \right]_0^{2 \cos \theta} \\
 &= 4 \int_0^{\frac{\pi}{2}} \cos^4 \theta d\theta = 4 \times \frac{3 \times 1 \times \pi}{4 \times 2 \times 2} = \frac{3\pi}{4} \quad \text{Ans.}
 \end{aligned}$$

**Example 14.** Evaluate  $\int_0^2 \int_0^{\sqrt{2x-x^2}} \frac{x dy dx}{\sqrt{x^2+y^2}}$  by changing to polar coordinates.

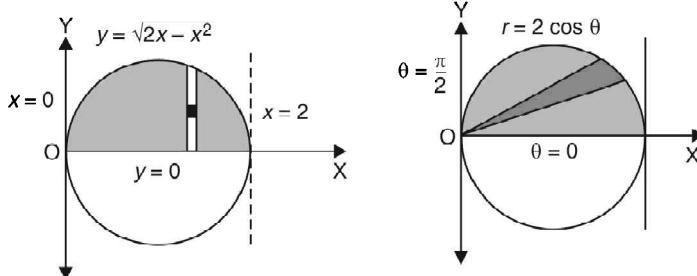

**Solution.** In the given integral,  $y$  varies from 0 to  $\sqrt{2x-x^2}$  and  $x$  varies from 0 to 2.

$$\begin{aligned} y &= \sqrt{2x-x^2} \\ \Rightarrow y^2 &= 2x-x^2 \\ \Rightarrow x^2+y^2 &= 2x \end{aligned}$$

In polar co-ordinates, we have  $r^2 = 2r \cos \theta \Rightarrow r = 2 \cos \theta$ .

$\therefore$  For the region of integration,  $r$  varies from 0 to  $2 \cos \theta$  and  $\theta$  varies from 0 to  $\frac{\pi}{2}$ .

In the given integral, replacing  $x$  by  $r \cos \theta$ ,  $y$  by  $r \sin \theta$ ,  $dy dx$  by  $r dr d\theta$ , we have

$$I = \int_0^{\pi/2} \int_0^{2 \cos \theta} \frac{r \cos \theta \cdot r dr d\theta}{r} = \int_0^{\pi/2} \int_0^{2 \cos \theta} r \cos \theta dr d\theta$$

$$= \int_0^{\pi/2} \cos \theta \left[ \frac{r^2}{2} \right]_0^{2 \cos \theta} d\theta = \int_0^{\pi/2} 2 \cos^3 \theta d\theta = 2 \cdot \frac{2}{3} = \frac{4}{3}. \quad \text{Ans.}$$

**Example 15.** Evaluate  $\iint \frac{(x^2+y^2)^2}{x^2y^2} dx dy$  over the area common to  $x^2 + y^2 = ax$  and  $x^2 + y^2 = by$ ,  $a, b > 0$ . (M.U. II Semester 2008, 2003, 2002)

**Solution.** The boundary of area of integration are

$$x^2 + y^2 = ax \Rightarrow r^2 = ar \cos \theta \Rightarrow r = a \cos \theta$$

and  $x^2 + y^2 = by \Rightarrow r^2 = br \sin \theta \Rightarrow r = b \sin \theta$

The region of integration is bounded by  $r = a \cos \theta$  and  $r = b \sin \theta$ .

Point of intersection is given by

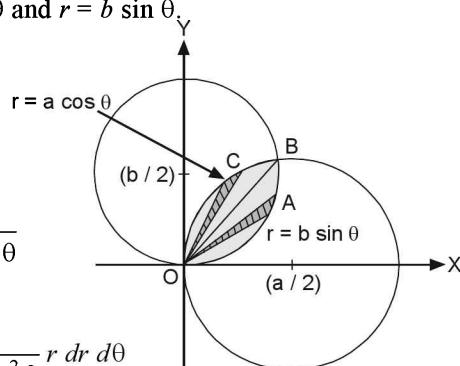

$$ra \cos \theta = rb \sin \theta$$

$$\tan \theta = \frac{a}{b} \Rightarrow \theta = \tan^{-1} \frac{a}{b}$$

$$\text{And } \frac{(x^2+y^2)^2}{x^2y^2} = \frac{r^4}{r^4 \sin^2 \theta \cos^2 \theta} = \frac{1}{\sin^2 \theta \cos^2 \theta}$$

$$dx dy = r dr d\theta$$

$$\begin{aligned} \iint \frac{(x^2+y^2)^2}{x^2y^2} dx dy &= \int_0^{\tan^{-1} \frac{a}{b}} \int_0^{b \sin \theta} \frac{1}{\sin^2 \theta \cos^2 \theta} r dr d\theta \\ &\quad + \int_{\tan^{-1} \frac{a}{b}}^{\frac{\pi}{2}} \int_0^{a \cos \theta} \frac{1}{\sin^2 \theta \cos^2 \theta} r dr d\theta \\ &= I_1 + I_2 \text{ (say)} \end{aligned}$$

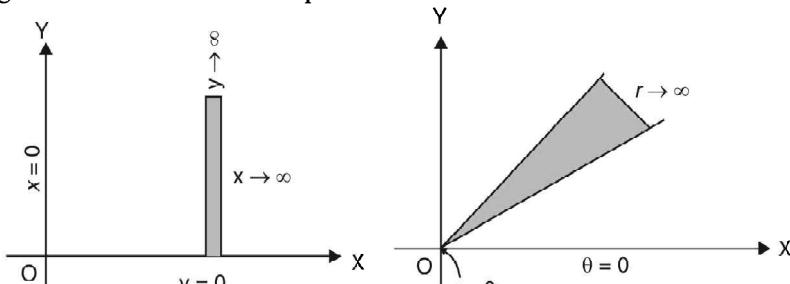

$$\begin{aligned}
 I_1 &= \int_0^{\tan^{-1} \frac{a}{b}} \int_0^{b \sin \theta} \frac{1}{\sin^2 \theta \cos^2 \theta} r dr d\theta = \int_0^{\tan^{-1} \frac{a}{b}} \frac{1}{\sin^2 \theta \cos^2 \theta} d\theta \left[ \frac{r^2}{2} \right]_0^{b \sin \theta} \\
 &= \int_0^{\tan^{-1} \frac{a}{b}} \frac{1}{\sin^2 \theta \cos^2 \theta} \left( \frac{b^2 \sin^2 \theta}{2} \right) d\theta = \frac{1}{2} b^2 \int_0^{\tan^{-1} \frac{a}{b}} \sec^2 \theta d\theta = \frac{b^2}{2} [\tan \theta]_0^{\tan^{-1} \frac{a}{b}} \\
 &= \frac{1}{2} b^2 \tan \left( \tan^{-1} \frac{a}{b} \right) = \frac{1}{2} b^2 \frac{a}{b} = \frac{ab}{2}. \\
 I_2 &= \int_{\tan^{-1} \frac{a}{b}}^{\frac{\pi}{2}} \int_0^{r=a \cos \theta} \frac{d\theta}{\sin^2 \theta \cos^2 \theta} r dr \\
 &= \int_{\tan^{-1} \frac{a}{b}}^{\frac{\pi}{2}} \frac{d\theta}{\sin^2 \theta \cos^2 \theta} \left[ \frac{r^2}{2} \right]_0^{a \cos \theta} = \int_{\tan^{-1} \frac{a}{b}}^{\frac{\pi}{2}} \frac{d\theta}{\sin^2 \theta \cos^2 \theta} \left( \frac{a^2 \cos^2 \theta}{2} \right) \\
 &= \frac{a^2}{2} \int_{\tan^{-1} \frac{a}{b}}^{\frac{\pi}{2}} \frac{d\theta}{\sin^2 \theta} = \frac{a^2}{2} \int_{\tan^{-1} \frac{a}{b}}^{\frac{\pi}{2}} \cosec^2 \theta d\theta = \frac{a^2}{2} [-\cot \theta]_{\tan^{-1} \frac{a}{b}}^{\frac{\pi}{2}} \\
 &= -\frac{a^2}{2} \left[ \cot \frac{\pi}{2} - \cot \left( \tan^{-1} \frac{a}{b} \right) \right] = -\frac{a^2}{2} \left[ 0 - \frac{b}{a} \right] = \frac{ab}{2} \\
 \iint \frac{(x^2 + y^2)^2}{x^2 y^2} dx dy &= I_1 + I_2 = \frac{ab}{2} + \frac{ab}{2} = ab
 \end{aligned}$$

Ans.

**Example 16.** Evaluate :  $\iint_0^\infty e^{-(x^2 + y^2)} dx dy$  by changing to polar co-ordinates.

Hence, show that  $\int_0^\infty e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$  (AMIETE, June 2010, U.P., IIInd Semester, Summer 2002)

**Solution.** From the limit of integration, we find that the first integration is along a vertical strip extending from  $y = 0$  to  $y = \infty$ . The strip slides from  $x = 0$  and goes to  $x = \infty$ . Thus the region of integration is the whole of first quadrant.

This region can be covered by radial strips extending from  $r = 0$  to  $r = \infty$ . The strip starts from  $\theta = 0$  and goes upto  $\theta = \pi/2$ .

$$\begin{aligned}
 \text{Hence, } \iint_0^\infty \int_0^\infty e^{-(x^2 + y^2)} dx dy &= \int_0^{\pi/2} \int_0^\infty e^{-r^2} r dr d\theta \\
 &= -\frac{1}{2} \int_0^{\pi/2} \int_0^\infty (-2r) e^{-r^2} dr d\theta = -\frac{1}{2} \int_0^{\pi/2} [e^{-r^2}]_0^\infty d\theta \\
 &= -\frac{1}{2} \int_0^{\pi/2} (0 - 1) d\theta = \frac{1}{2} \int_0^{\pi/2} 1 d\theta = \frac{\pi}{4}
 \end{aligned}$$

Ans.

Let

$$I = \int_0^\infty e^{-x^2} dx \quad \dots(1)$$

Also,

$$I = \int_0^\infty e^{-y^2} dy \quad \dots(2) [\text{Property of definite integrals}]$$

Multiplying (1) and (2), we get

$$\begin{aligned} I^2 &= \int_0^\infty \int_0^\infty e^{-(x^2 + y^2)} dx dy = \frac{\pi}{4} && [\text{As obtained above}] \\ \Rightarrow I &= \sqrt{\frac{\pi}{4}} = \frac{\sqrt{\pi}}{2} && \text{Proved.} \end{aligned}$$

### EXERCISE 7.2

Evaluate the following:

1.  $\int_0^\pi \int_0^{a(1-\cos\theta)} 2\pi r^2 \sin\theta dr d\theta$  Ans.  $\frac{8}{3}\pi a^3$
2.  $\int_0^\pi \int_0^{a(1+\cos\theta)} r^2 \cos\theta dr d\theta$  Ans.  $\frac{5}{8}\pi a^3$
3.  $\iint_A \frac{r dr d\theta}{\sqrt{r^2 + a^2}}$  where  $A$  is a loop of  $r^2 = a^2 \cos 2\theta$  Ans.  $2a - \frac{\pi a}{2}$
4.  $\iint_A r^2 \sin\theta dr d\theta$  where  $A$  is  $r = 2a \cos\theta$  above initial line. (A.M.I.E. Winter 2001) Ans.  $\frac{2a^3}{3}$
5. Calculate the integral  $\iint \frac{(x-y)^2}{x^2+y^2} dx dy$  over the circle  $x^2 + y^2 \leq 1$ . Ans.  $\pi - 2$
6.  $\iint (x^2 + y^2) x dx dy$  over the positive quadrant of the circle  $x^2 + y^2 = a^2$  by changing to polar coordinates. Ans.  $\frac{a^2}{5}$
7.  $\iint_R \sqrt{x^2 + y^2} dx dy$  by changing to polar coordinates,  $R$  is the region in the  $xy$ -plane bounded by the circles  $x^2 + y^2 = 4$  (AMIETE, Dec. 2009) Ans.  $\frac{38\pi}{3}$
8. Convert into polar coordinates  $\int_0^{2a} \int_0^{2ax-x^2} dx dy$  Ans.  $\int_0^{\pi/2} \int_0^{2a \cos\theta} r d\theta dr$
9.  $\iint r^3 dr d\theta$ , over the area bounded between the circles  $r = 2b \cos\theta$  and  $r = 2b \cos\theta$ . Ans.  $\frac{3\pi}{2} (a^4 - b^4)$
10.  $\iint r \sin\theta dr d\theta$  over the area of the cardioid  $r = a(1 + \cos\theta)$  above the initial line. Ans.  $\frac{5}{8}\pi a^3$
11.  $\iint_A x^2 dr d\theta$ , where  $A$  is the area between the circles  $r = a \cos\theta$  and  $r = 2a \cos\theta$ . Ans.  $\frac{28a^3}{9}$
12. Transform the integral  $\int_0^1 \int_0^x f(x, y) dy dx$  to the integral in polar co-ordinates. Ans.  $\int_0^{\pi/4} \int_0^{\sec\theta} f(r, \theta) r d\theta dr$

### 7.4 CHANGE OF ORDER OF INTEGRATION

On changing the order of integration, the limits of integration change. To find the new limits, we draw the rough sketch of the region of integration.

Some of the problems connected with double integrals, which seem to be complicated, can be made easy to handle by a change in the order of integration.

**Example 17.** Evaluate  $\int_0^a \int_y^a \frac{x}{x^2 + y^2} dx dy$  by changing the order of integration.

(AMIETE, June 2010, Nagpur University, Summer 2008)

**Solution.** Here we have

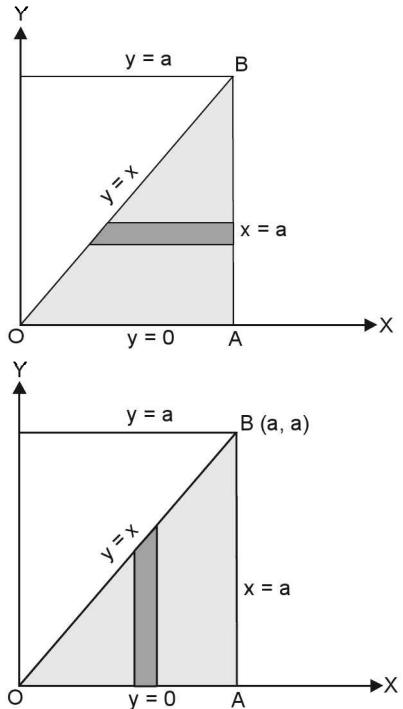

$$I = \int_0^a \int_y^a \frac{x}{x^2 + y^2} dx dy$$

Here  $x = a, x = y, y = 0$  and  $y = a$

The area of integration is  $OAB$ .

On changing the order of integration Lower limit of  $y = 0$  and upper limit is  $y = x$ .  
Lower limit of  $x = 0$  and upper limit is  $x = a$ .

$$\begin{aligned} I &= \int_0^a x dx \int_0^{y=x} \frac{1}{x^2 + y^2} dy \\ &= \int_0^a x dx \left[ \frac{1}{x} \tan^{-1} \frac{y}{x} \right]_0^{y=x} \\ &= \int_0^a \frac{x}{x} dx \left( \tan^{-1} \frac{x}{x} - \tan^{-1} 0 \right) \\ &= \int_0^a dx \left( \frac{\pi}{4} \right) = \frac{\pi}{4} [x]_0^a = \frac{\pi a}{4} \text{ Ans.} \end{aligned}$$

**Example 18.** Change the order of integration in

$$I = \int_0^1 \int_{x^2}^{2-x} xy dx dy \text{ and hence evaluate the same.}$$

(A.M.I.E.T.E., June 2010, 2009, U.P. I Sem., Dec., 2004)

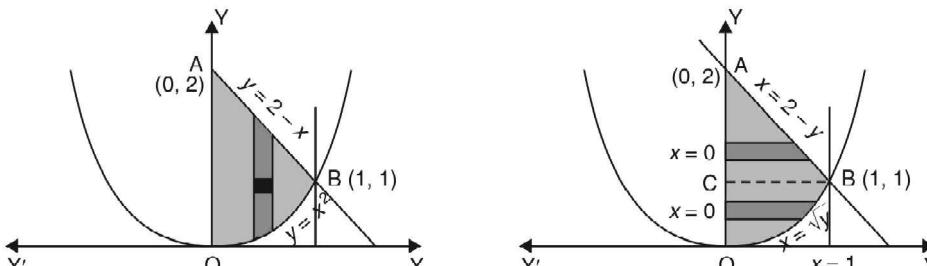

**Solution.**  $I = \int_0^1 \int_{x^2}^{2-x} xy dx dy$

The region of integration is shown by shaded portion in the figure bounded by parabola  $y = x^2$  and the line  $y = 2 - x$ .

The point of intersection of the parabola  $y = x^2$  and the line  $y = 2 - x$  is B (1, 1).

In the figure below (left) we have taken a strip parallel to  $y$ -axis and the order of integration is

$$\int_0^1 x dx \int_{x^2}^{2-x} y dy$$

In the second figure above we have taken a strip parallel to  $x$ -axis in the area  $OBC$  and second strip in the area  $ABC$ . The limits of  $x$  in the area  $OBC$  are 0 and  $\sqrt{y}$  and the limits of  $x$  in the area  $ABC$  are 0 and  $2 - y$ .

$$= \int_0^1 y dy \int_0^{\sqrt{y}} x dx + \int_1^2 y dx \int_0^{2-y} x dx = \int_0^1 y dy \left[ \frac{x^2}{2} \right]_0^{\sqrt{y}} + \int_0^{\sqrt{y}} y dy \left[ \frac{x^2}{2} \right]_0^{2-y}$$

$$\begin{aligned}
 &= \frac{1}{2} \int_0^1 y^2 dy + \frac{1}{2} \int_1^2 y(2-y)^2 dy = \frac{1}{2} \left[ \frac{y^3}{3} \right]_0^1 + \frac{1}{2} \int_1^2 (4y - 4y^2 + y^3) dy \\
 &= \frac{1}{6} + \frac{1}{2} \left[ 2y^2 - \frac{4}{3}y^3 + \frac{y^4}{4} \right]_1^2 = \frac{1}{6} + \frac{1}{2} \left[ 8 - \frac{32}{3} + 4 - 2 + \frac{4}{3} - \frac{1}{4} \right] \\
 &= \frac{1}{6} + \frac{1}{2} \left[ \frac{96 - 128 + 48 - 24 + 16 - 3}{12} \right] = \frac{1}{6} + \frac{5}{24} = \frac{9}{24} = \frac{3}{8}
 \end{aligned}
 \quad \text{Ans.}$$

**Example 19.** Evaluate the integral  $\int_0^\infty \int_0^x x \exp\left(-\frac{x^2}{y}\right) dx dy$  by changing the order of integration  
(U.P. I Semester Dec., 2005)

**Solution.** Limits are given

$$\begin{aligned}
 y &= 0 \text{ and } y = x \\
 x &= 0 \text{ and } x = \infty
 \end{aligned}$$

Here, the elementary strip  $PQ$  extends from  $y = 0$  to  $y = x$  and this vertical strip slides from  $x = 0$  to  $x = \infty$ .

The region of integration is shown by shaded portion in the figure bounded by  $y = 0$ ,  $y = x$ ,  $x = 0$  and  $x = \infty$ .

On changing the order of integration, we first integrate with respect to  $x$  along a horizontal strip  $RS$  which extends from  $x = y$  to  $x = \infty$  and this horizontal strip slides from  $y = 0$  to  $y = \infty$  to cover the given region of integration.

New limits :

$$\begin{aligned}
 x &= y \quad \text{and} \quad x = \infty \\
 y &= 0 \quad \text{and} \quad y = \infty
 \end{aligned}$$

We first integrate with respect to  $x$ .

Thus,

$$\begin{aligned}
 \int_0^\infty dy \int_y^\infty x e^{-\frac{x^2}{y}} dx &= \int_0^\infty dy \int_y^\infty -\frac{y}{2} \left( -\frac{2x}{y} e^{-\frac{x^2}{y}} \right) dx \\
 &= \int_0^\infty dy \left[ -\frac{y}{2} e^{-\frac{x^2}{y}} \right]_y^\infty = \int_0^\infty dy \left[ 0 + \frac{y}{2} e^{-\frac{y^2}{2}} \right] = \int_0^\infty \frac{y}{2} e^{-y} dy \\
 &= \left[ \frac{y}{2} (-e^{-y}) - \left( \frac{1}{2} \right) (e^{-y}) \right]_0^\infty \\
 &= \left[ (0 - 0) - \left( 0 - \frac{1}{2} \right) \right] = \frac{1}{2}
 \end{aligned}
 \quad \text{(Integrating by parts)}$$

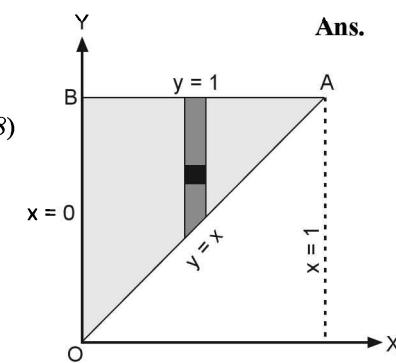

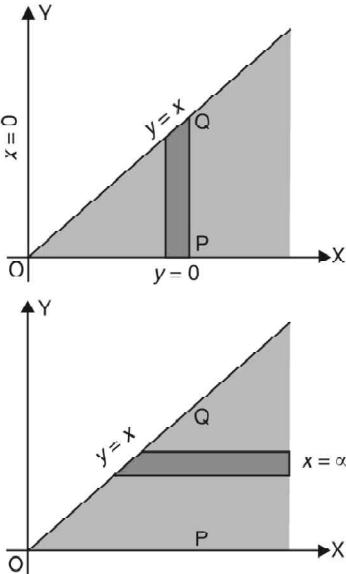

**Ans.**

**Example 20.** Evaluate the double integral.

$$\int_0^1 \int_x^1 \sin(y^2) dy dx \quad (\text{B.P.U.T.; I Semester 2008})$$

**Solution.** Here, we have  $\int_0^1 \int_x^1 \sin(y^2) dy dx$

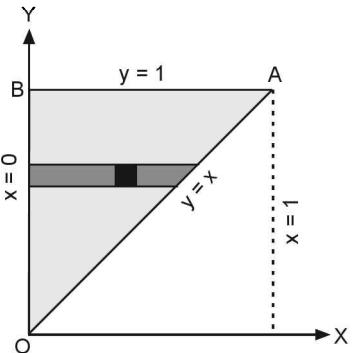

The region  $OAB$  integration is bounded by the straight lines  $y = x$ ,  $x = 0$  and  $y = 1$ . A strip is drawn parallel to  $y$  axis.  $y$  varies from  $x$  to 1 and  $x$  varies from 0 to 1.

In the given problem the integration is first w.r.t.  $y$  and then w.r.t.  $x$ . But by this way the evaluation of integral is difficult.

So we change the order of integration. Now we will integrate first w.r.t.  $x$  and then w.r.t.  $y$ . Here we draw a strip parallel to  $x$  axis. On this strip  $x$  varies from 0 to  $y$  and  $y$  varies from 0 to 1.

$$\begin{aligned} \text{Hence, } & \int_0^1 dx \int_x^1 \sin(y^2) dy \\ &= \int_0^1 \sin(y^2) dy \int_0^y dx = \int_0^1 \sin(y^2) dy [x]_0^y \\ &= \int_0^1 \sin y^2 \cdot (y) dy = \left[ \frac{\cos y^2}{2} \right]_0^1 = \frac{\cos 1}{2} - \frac{1}{2} \quad \text{Ans.} \end{aligned}$$

**Example 21.** Change the order of the integration

$$\int_0^\infty \int_0^x e^{-xy} y dy dx$$

**Solution.** Here, we have

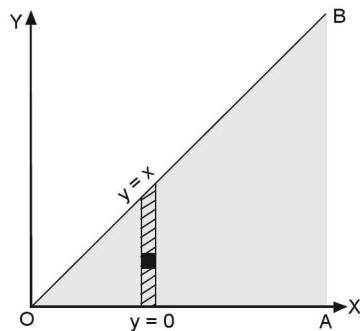

$$\int_0^\infty \int_0^x e^{-xy} y dy dx$$

Here the region  $OAB$  of integration is bounded by  $y = 0$  ( $x$ -axis),  $y = x$  (a straight line),  $x = 0$ , i.e.,  $y$  axis. A strip is drawn parallel to  $y$ -axis,  $y$  varies 0 to  $x$  and  $x$  varies 0 to  $\infty$ .

On changing the order of integration, first we integrate w.r.t.  $x$  and then w.r.t.  $y$ .

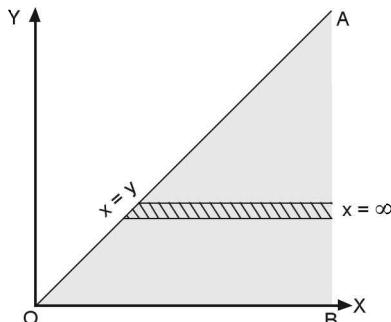

A strip is drawn parallel to  $x$ -axis. On this strip  $x$  varies from  $y$  to  $\infty$  and  $y$  varies from 0 to  $\infty$ .

(B.P.U.T.; I Semester 2008)

$$\text{Hence } \int_0^\infty \int_0^x e^{-xy} y dy dx = \int_0^\infty y dy \int_y^\infty e^{-xy} dx$$

$$\begin{aligned} &= \int_0^\infty y dy \left( \frac{e^{-xy}}{-y} \right)_y^\infty \\ &= \int_0^\infty \frac{y dy}{-y} [0 - e^{-y^2}] \\ &= \int_0^\infty e^{-y^2} dy = \frac{1}{2} \sqrt{\pi} \quad \text{Ans.} \end{aligned}$$

**Example 22.** Change the order of integration and evaluate:

$$\int_0^a \int_0^y \frac{dx dy}{\sqrt{(a^2 + x^2)(a-y)(y-x)}}$$

(M.U., II Semester 2004, 2003)

**Solution.** Here we have

$$\int_0^a \int_0^y \frac{dx dy}{\sqrt{(a^2 + x^2)(a-y)(y-x)}}$$

The region of integration is bounded by  $x = 0$  ( $y$  axis),  $x = y$  (straight line),  $y = 0$  ( $x$ -axis),  $y = a$  (straight line).

Here we integrate first w.r.t.  $x$  and then  $y$ .

On changing the order of integration we have to integrate first w.r.t.  $y$  and then  $x$ .

$$\begin{aligned}\text{Given integral} &= \int_0^a \int_0^y \frac{dx dy}{\sqrt{(a^2 + x^2)} (a - y) (y - x)} \\ &= \int_0^a \int_x^a \frac{dy dx}{\sqrt{(a^2 + x^2)} (a - y) (y - x)}\end{aligned}$$

Put  $y - x = t^2$ ,  $dy = 2t dt$

When  $y = x$ ,  $t = 0$ , when  $y = a$ ,  $t = \sqrt{a-x}$

$$\begin{aligned}\therefore I &= \int_0^a \int_0^{\sqrt{a-x}} \frac{dx}{\sqrt{a^2 + x^2}} \cdot \frac{2t dt}{\sqrt{(a-x) - t^2} \cdot t} \\ &= 2 \int_0^a \frac{dx}{\sqrt{a^2 + x^2}} \left[ \sin^{-1} \frac{t}{\sqrt{a-x}} \right]_0^{\sqrt{a-x}} \\ &= 2 \int_0^a \frac{1}{\sqrt{a^2 + x^2}} [\sin^{-1} 1 - \sin^{-1} 0] dx \\ &= 2 \int_0^a \frac{1}{\sqrt{a^2 + x^2}} \cdot \frac{\pi}{2} dx \\ &= 2 \left( \frac{\pi}{2} \right) \int_0^a \frac{1}{\sqrt{a^2 + x^2}} dx \\ &= \pi \left[ \log \left( x + \sqrt{a^2 + x^2} \right) \right]_0^a \\ &= \pi \left[ \log \left( a + \sqrt{a^2 + a^2} \right) - \log \left( 0 + \sqrt{a^2 + 0} \right) \right] = \pi [\log (a + \sqrt{2}a) - \log a] \\ &= \pi [\log a (1 + \sqrt{2}) - \log a] = \pi \log (1 + \sqrt{2})\end{aligned}$$

**Ans.**

**Example 23.** Change the order of integration and evaluate

$$\int_0^a \int_0^x \frac{\sin y dy dx}{\sqrt{[(a-x)(x-y)]} (4 - 5 \cos y)^2} \quad (\text{M.U., II Semester 2002})$$

**Solution.** The limits of  $y$  are 0 and  $x$ , that of  $x$  are 0 and  $a$ . The area  $OAB$  of integration is bounded by  $y = 0$ ,  $y = x$  and  $x = 0$  and  $x = a$ . The given function is integrated first w.r.t.  $y$  and then  $x$ .

The strip is drawn parallel to  $y$ -axis and varies  $y = 0$  and  $y = x$  and  $x$  varies from  $x = 0$  and  $x = a$ .

On changing the order of integration  
we integrate first w.r.t.  $x$  and then  $y$ .

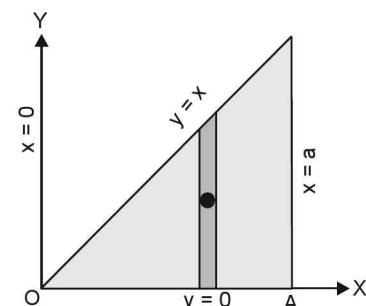

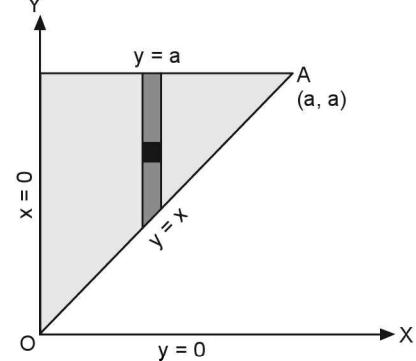

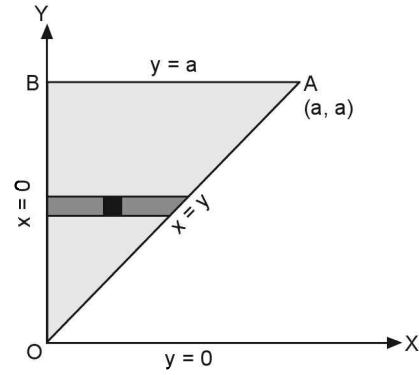

On the strip parallel to  $x$ -axis,  $x$  varies from  $x = y$  to  $x = a$  and  $y$  varies from  $y = 0$  to  $y = a$ .

On changing the order of integration.  
The given integral

$$= \int_{y=0}^{y=a} \int_{x=y}^{x=a} \frac{\sin y}{(4 - 5 \cos y)} \cdot \frac{dx}{\sqrt{[(a-x)(x-y)]}} dy$$

On putting  $x - y = t^2$ ,  $dx = 2t dt$  in (1), we get

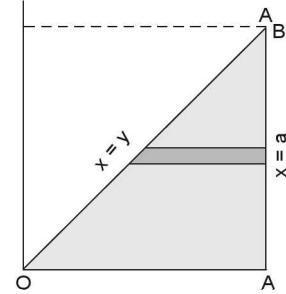

$$= \int_0^a \int_0^{\sqrt{a-y}} \frac{\sin y}{(4 - 5 \cos y)} \cdot \frac{2t dt}{\sqrt{[(a-y-t^2)]} t} dy$$

$$\begin{aligned}
 &= \int_0^a \frac{\sin y dy}{(4 - 5 \cos y)} \int_0^{\sqrt{a-y}} \frac{2t dt}{\sqrt{[(a-y)-t^2]t}} \\
 &= \int_0^a \frac{\sin y dy}{(4 - 5 \cos y)} \int_0^{\sqrt{a-y}} \frac{2dt}{\sqrt{(a-y)-t^2}} \\
 &= 2 \int_0^a \frac{\sin y dy}{4 - 5 \cos y} \cdot \left[ \sin^{-1} \left( \frac{t}{\sqrt{a-y}} \right) \right]_0^{\sqrt{a-y}} dy \\
 &= 2 \int_0^a \frac{\sin y dy}{4 - 5 \cos y} \left( \sin^{-1} \frac{\sqrt{a-y}}{\sqrt{a-y}} - \sin^{-1} 0 \right) \\
 &= 2 \int_0^a \frac{\sin y dy}{4 - 5 \cos y} [\sin^{-1}(1)] = 2 \cdot \frac{\pi}{2} \int_0^a \frac{\sin y dy}{4 - 5 \cos y} \\
 &= \pi \left[ \frac{1}{5} \log(4 - 5 \cos y) \right]_0^a = \frac{\pi}{5} [\log(4 - 5 \cos a) - \log(-1)] \\
 &= \frac{\pi}{5} \log \frac{(4 - 5 \cos a)}{-1} = \frac{\pi}{5} \log(5 \cos a - 4)
 \end{aligned}$$

**Ans.**

Put  $x - y = t^2 \therefore dx = 2t dt$   
 When  $x = y$ , then  $t = 0$ ;  
 when  $x = a$ , then  $t = \sqrt{a-y}$

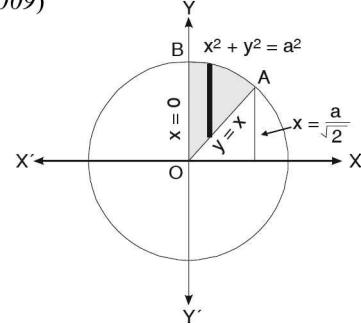

**Example 24.** Change the order of integration and evaluate  $\int_0^{a/\sqrt{2}} \int_x^{\sqrt{a^2-x^2}} y^2 dA$   
 (Gujarat, I Semester, Jan., 2009)

**Solution.** We have,

$$\int_0^{a/\sqrt{2}} \int_x^{\sqrt{a^2-x^2}} y^2 dA$$

Here the limits are

$$\begin{aligned}
 x &= 0 \\
 x &= \frac{a}{\sqrt{2}} \\
 y &= x \\
 y &= \sqrt{a^2 - x^2} \Rightarrow x^2 + y^2 = a^2
 \end{aligned}$$

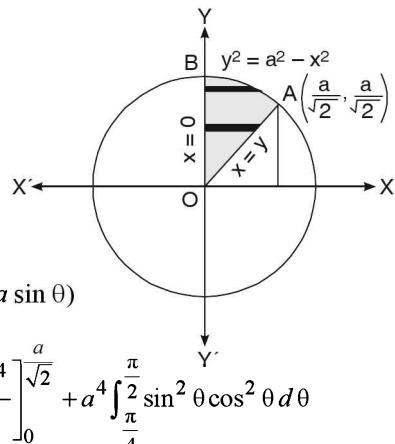

Area of integration is shaded area OAB in the figure.

On changing the order of integration we integrate first w.r.t. 'x' and then w.r.t. 'y'

In this way we have to divided the area of integration in two parts OAC and ABC.

$$\begin{aligned}
 &\int_0^{\frac{a}{\sqrt{2}}} dx \int_x^{\sqrt{a^2-x^2}} y^2 dy \\
 &= \int_0^{\frac{a}{\sqrt{2}}} y^2 dy \int_0^y dx + \int_{\frac{a}{\sqrt{2}}}^a y^2 dy \int_0^{\sqrt{a^2-y^2}} dx \\
 &= \int_0^{\frac{a}{\sqrt{2}}} y^2 dy (x)_0^y + \int_{\frac{a}{\sqrt{2}}}^a y^2 dy (x)_0^{\sqrt{a^2-y^2}} \\
 &= \int_0^{\frac{a}{\sqrt{2}}} y^2 dy (y) + \int_{\frac{a}{\sqrt{2}}}^a y^2 dy \sqrt{a^2 - y^2} \quad (\text{Put } y = a \sin \theta) \\
 &= \int_0^{\frac{a}{\sqrt{2}}} y^3 dy + \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} a^2 \sin^2 \theta (a \cos \theta) a \cos \theta d\theta \\
 &= \frac{a^4}{4} + a^4 \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \sin^2 \theta (1 - \sin^2 \theta) d\theta \\
 &= \frac{a^4}{4} + a^4 \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \sin^2 \theta \cos^2 \theta d\theta
 \end{aligned}$$

$$\begin{aligned}
 &= \left[ \frac{y^4}{4} \right]_{\frac{\pi}{4}}^{\frac{\pi}{2}} + a^4 \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \sin^2 \theta \cos^2 \theta d\theta \\
 &= \frac{a^4}{16} + a^4 \left( \frac{\pi}{32} \right) = a^4 \left( \frac{\pi+2}{32} \right) \quad \text{Ans.}
 \end{aligned}$$

**Example 25.** Change the order of integration

$$\int_0^1 \int_{\sqrt{2x-x^2}}^{1+\sqrt{1-x^2}} f(x, y) dy dx \quad (\text{M.U. II Semester 2009})$$

**Solution.** Here, we have

$$\int_0^1 \int_{\sqrt{2x-x^2}}^{1+\sqrt{1-x^2}} f(x, y) dy dx$$

In the given integral problem it is integrated first w.r.t.  $y$  and then  $x$ .

The limits of  $x$  are 0 and 1.

The limits of  $y$  are  $\sqrt{2x-x^2}$  (circle) and  $1+\sqrt{1-x^2}$  (circle).

The shaded region of integration is bounded by two circles.

On changing the order of integration we integrate first w.r.t. ' $x$ ' and then ' $y$ '.

The limits of  $y$  are 0 and 1.

The limits of  $x$  are  $1+\sqrt{1-y^2}$  and  $\sqrt{2y-y^2}$ .

$$\text{Thus } \int_0^1 dx \int_{\sqrt{2x-x^2}}^{1+\sqrt{1-x^2}} f(x, y) dy = \int_0^1 dy \int_{\sqrt{2y-y^2}}^{1+\sqrt{1-y^2}} f(x, y) dx$$

**Example 26.** Change the order of integration  $\int_0^a \int_{\sqrt{a^2-x^2}}^{x+3a} f(x, y) dx dy$ . (M.U., II Sem. 2008)

**Solution.** Here we have  $\int_0^a \int_{\sqrt{a^2-x^2}}^{x+3a} f(x, y) dx dy \dots (1)$

Here we have integrated (1) first w.r.t. ' $y$ ' and then  $x$ .

The limits of  $y$  are  $\sqrt{a^2-x^2}$  (circle) and  $x+3a$  and the limits of  $x$  are 0 and  $a$ . The shaded portion  $ABCD A$  of the region of the integration is bounded by  $y = \sqrt{a^2-x^2}$  (circle),  $y = x+3a$  (straight line)  $x=0$  ( $y$ -axis) and  $x=a$  (a straight line).

On changing the order of integration we have to integrate (1) w.r.t. to  $x$  first and then  $y$ .

For this way we have to divide the region  $ABCD A$  of integration into three parts  $AFDA$ ,  $DFGC$  and  $BCG$ .

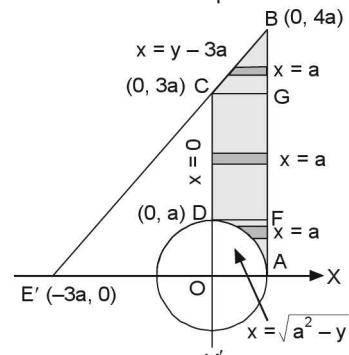

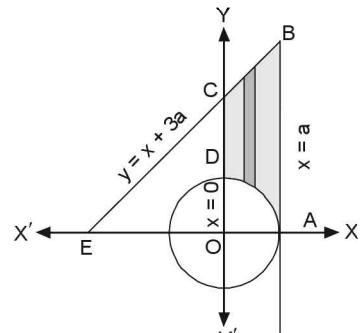

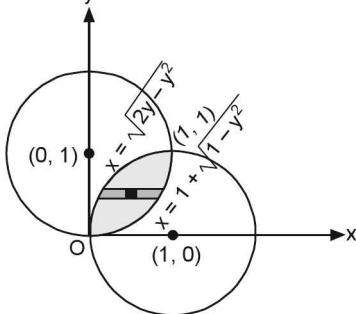

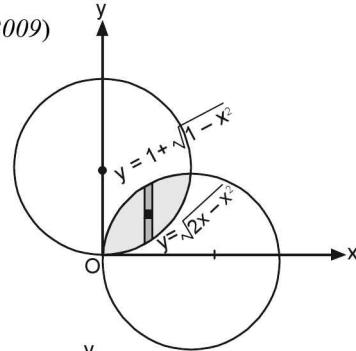

One part is  $AFDA$  in which the limits of  $x$  are  $\sqrt{a^2-y^2}$  and  $x=a$  and the limits of  $y$  are 0 and  $a$ .

Second part is  $FGCD$  in which the limits of  $x=0$  and  $x=a$  and the limits of  $y$  are  $a$  and  $3a$ .

In third part  $BCGB$  the limits of  $x$  are  $x=y-3a$  and  $x=a$  and the limits of  $y$  are  $3a$  and  $4a$ .

$$\text{Hence, } \int_0^a \int_{\sqrt{a^2-x^2}}^{x+3a} f(x, y) dy dx$$

$$= \int_0^a \int_{\sqrt{a^2-y^2}}^a f(x, y) dx dy + \int_a^{3a} \int_0^a f(x, y) dx dy + \int_{3a}^{4a} \int_{y-3a}^a f(x, y) dx dy \quad \text{Ans.}$$

**Example 27.** Change the order of integration in the double integral

$$\int_0^{2a} \int_{\sqrt{2ax-x^2}}^{\sqrt{2ax}} V \, dx \, dy$$

**Solution.** Limits are given as

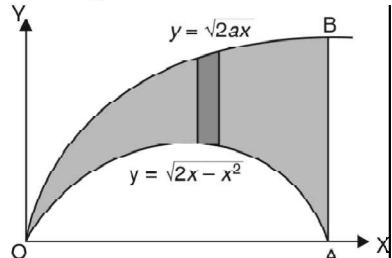

$$x = 0, x = 2a$$

$$y = \sqrt{2ax}$$

$$\text{and } y = \sqrt{2ax - x^2} \Rightarrow y^2 = 2ax$$

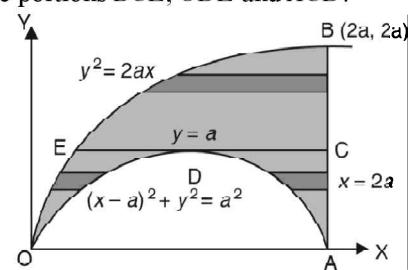

$$\text{and } (x-a)^2 + y^2 = a^2$$

The area of integration is the shaded portion  $OAB$ . On changing the order of integration first we have to integrate w.r.t.  $x$ , The area of integration has three portions  $BCE$ ,  $ODE$  and  $ACD$ .

$$\begin{aligned} & \int_0^{2a} dx \int_{\sqrt{2ax-x^2}}^{\sqrt{2ax}} V \, dy \\ &= \int_0^{2a} dy \int_{y^2/2a}^{2a} V \, dx + \int_0^a dy \int_{a+\sqrt{a^2-y^2}}^{a+\sqrt{a^2+y^2}} V \, dx \\ &+ \int_0^a dy \int_{a+\sqrt{a^2-y^2}}^{2a} V \, dx \end{aligned}$$

Ans.

**Example 28.** Changing the order of integration of  $\int_0^\infty \int_0^\infty e^{-xy} \sin nx \, dx \, dy$  show that

$$\int_0^\infty \frac{\sin nx}{x} \, dx = \frac{\pi}{2}$$

(AMIETE, Dec. 2010, U.P. I Semester winter 2003, A.M.I.E., Summer 2000)

**Solution.** The region of integration is bounded by  $x = 0$ ,  $x = \infty$ ,  $y = 0$ ,  $y = \infty$ , i.e., first quadrant.

$$\begin{aligned} \int_0^\infty \int_0^\infty e^{-xy} \sin nx \, dx \, dy &= \int_0^\infty dy \int_0^\infty e^{-xy} \sin nx \, dx \\ &= \int_0^\infty dy \left[ \frac{e^{-xy}}{n^2 + y^2} \{-y \sin nx - n \cos nx\} \right]_0^\infty \\ &= \int_0^\infty dy \left[ 0 + \frac{n}{n^2 + y^2} \right] = \int_0^\infty \frac{n}{n^2 + y^2} dy = \left[ \tan^{-1} y \right]_0^\infty = \frac{\pi}{2} \quad \dots(1) \end{aligned}$$

On changing the order of integration

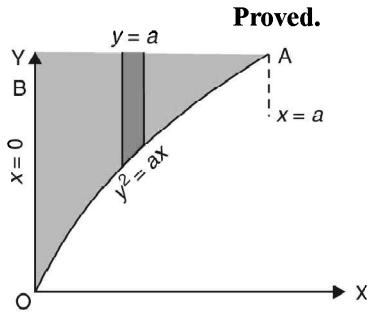

$$\begin{aligned} \int_0^\infty \int_0^\infty e^{-xy} \sin nx \, dx \, dy &= \int_0^\infty \sin nx \, dx \int_0^\infty e^{-xy} \, dy \\ &= \int_0^\infty \sin nx \, dx \left[ \frac{e^{-xy}}{-x} \right]_0^\infty = \int_0^\infty \frac{\sin nx}{x} \, dx \left[ -\frac{1}{e^{xy}} \right]_0^\infty \\ &= \int_0^\infty \frac{\sin nx}{x} \, dx [-0+1] = \int_0^\infty \frac{\sin nx}{x} \, dx \quad \dots(2) \end{aligned}$$

From (1) and (2),  $\int_0^\infty \frac{\sin nx}{x} \, dx = \frac{\pi}{2}$

**Example 29.** Change order of integration and hence evaluate:

$$\int_0^a \int_{\sqrt{ax}}^a \frac{y^2 \, dx \, dy}{\sqrt{y^4 - a^2 x^2}}$$

**Solution.** The given limits show that the area of integration lies between  $y^2 = ax$ ,  $y = a$ ,  $x = 0$  and  $x = a$ . We can consider it as lying between  $y = 0$ ,  $y = a$ ,  $x = 0$  and  $x = y^2/a$  by changing the order of integration. Hence, the given integral.

$$\begin{aligned}
 \int_{x=0}^a \int_{y=\sqrt{ax}}^a \frac{y^2 dx dy}{\sqrt{y^4 - a^2 x^2}} &= \int_{y=0}^a \int_{x=0}^{\frac{y^2}{a}} \frac{y^2 dy dx}{\sqrt{y^4 - a^2 x^2}} \\
 &= \frac{1}{a} \int_0^a \int_0^{\frac{y^2}{a}} \frac{y^2 dy dx}{\sqrt{\left(\frac{y^2}{a}\right)^2 - x^2}} = \frac{1}{a} \int_a^a y^2 \left[ \sin^{-1} \left( \frac{ax}{y^2} \right) \right]_0^{y^2/a} dy \\
 &= \frac{1}{a} \int_0^a y^2 [\sin^{-1}(1) - \sin^{-1}(0)] dy = \frac{\pi}{2a} \int_0^a y^2 dy = \frac{\pi}{2a} \left( \frac{y^3}{3} \right)_0^a = \frac{\pi}{6a} (a^3) = \frac{\pi a^2}{6}. \quad \text{Ans.}
 \end{aligned}$$

**Example 30.** Evaluate  $\int_0^a \int_0^x \frac{f'(y) dy dx}{[(a-x)(x-y)]^{1/2}}$

**Solution.** Let  $I = \int_0^a \int_0^x \frac{f'(y) dy dx}{[(a-x)(x-y)]^{1/2}}$

Here the limits are  $x = 0, x = a$  and  $y = 0, y = x$ . Evidently the region of integration is  $OABO$ . By changing the order of integration, we have

$$\begin{aligned}
 I &= \int_0^a \int_y^a \frac{f'(y) dy dx}{[(a-x)(x-y)]^{1/2}} \\
 &= \int_0^a f'(y) dy \int_y^a \frac{dx}{\sqrt{(a-x)(x-y)}} \dots (1)
 \end{aligned}$$

Let us find the values of  $(a-x)$  and  $(x-y)$  for (1)

Putting  $x = a \cos^2 \theta + y \sin^2 \theta$

$$\begin{aligned}
 \text{We have } a-x &= a - a \cos^2 \theta - y \sin^2 \theta \\
 &= a(1 - \cos^2 \theta) - y \sin^2 \theta
 \end{aligned}$$

$$a-x = a \sin^2 \theta - y \sin^2 \theta = (a-y) \sin^2 \theta \dots (2)$$

$\Rightarrow -dx = 2(a-y) \sin \theta \cos \theta d\theta$ , keeping  $y$  constant.

$$\begin{aligned}
 \text{Also, } x-y &= a \cos^2 \theta + y \sin^2 \theta - y \\
 &= a \cos^2 \theta - y(1 - \sin^2 \theta) \\
 &= a \cos^2 \theta - y \cos^2 \theta \\
 &= (a-y) \cos^2 \theta \dots (3)
 \end{aligned}$$

$$dx = -2(a-y) \sin \theta \cos \theta d\theta \dots (4)$$

when  $x = y$  then  $x-y = 0$

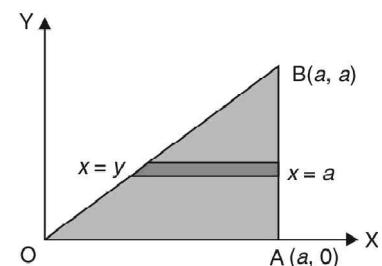

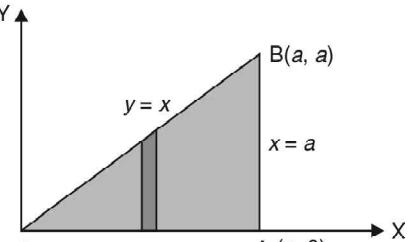

$$\begin{aligned}
 \text{Upper limit } x &= a \\
 x-y &= (a-y) \cos^2 \theta \\
 a-y &= (a-y) \cos^2 \theta \\
 \cos^2 \theta &= 1 \Rightarrow \theta = 0 \\
 x &= y
 \end{aligned}$$

$$x-y = (a-y) \cos^2 \theta$$

$$x-x = (a-y) \cos^2 \theta \Rightarrow 0 = \cos^2 \theta \Rightarrow 0 = \frac{\pi}{2}$$

Putting the values of  $a-x$ ,  $x-y$  and  $dx$  from (2), (3), and (4) respectively in (1), we get

$$\begin{aligned}
 I &= \int_0^a f'(y) dy \int_{\frac{\pi}{2}}^0 \frac{-2(a-y) \sin 0 \cos 0}{\sqrt{(a-y) \sin^2 0 \cdot (a-y) \cos^2 0}} d\theta \\
 &= \int_0^a f'(y) dy \int_{\frac{\pi}{2}}^0 \frac{-2(a-y) \sin 0 \cos 0}{(a-y) \sin 0 \cos 0} d\theta \\
 &= -2 \int_0^a f'(y) dy \int_{\frac{\pi}{2}}^0 d\theta = 2 \int_0^a f'(y) [0]_0^{\pi/2} dy = 2 \int_0^a f'(y) dy \cdot \frac{\pi}{2} = 2[f(y)]_0^a \cdot \frac{\pi}{2} = [f(a) - f(0)] \pi
 \end{aligned}$$

### EXERCISE 7.3

**Change the order of integration and hence evaluate the following:**

1.  $\int_0^a \int_0^x \frac{\cos y dy}{\sqrt{(a-x)(a-y)}} dx$

**Ans.** (a)  $\int_0^a dy \int_y^a \frac{\cos y dx}{\sqrt{(a-x)(a-y)}} (b) 2 \sin a.$

2.  $\int_0^{2a} \int_{\frac{x^2}{4a}}^{3a-x} (x^2 + y^2) dy dx$  **Ans.** (a)  $\int_0^a dy \int_0^{2\sqrt{ay}} (x^2 + y^2) dx + \int_a^{3a-y} dy \int_0^{3a-y} (x^2 + y^2) dx$  (b)  $\frac{314 a^4}{35}$ .

3.  $\int_0^1 \int_{x^2}^x (x^2 + y^2)^{-1/2} dy dx$

**Ans.**  $\int_0^1 dy \int_y^{\sqrt{y}} (x^2 + y^2)^{-1/2} dx.$

4.  $\int_0^a \int_{\sqrt{a^2 - y^2}}^{y+a} f(x, y) dx dy$

**(A.M.I.E.T.E., Summer 2000)**

**Ans.**  $\int_0^a dx \int_{\sqrt{a^2 - x^2}}^a f(x, y) dy + \int_a^{2a} dx \int_{x-a}^a f(x, y) dy$

5.  $\int_{-a}^a \int_0^{\sqrt{a^2 - y^2}} f(x, y) dx dy$

**Ans.**  $\int_0^a dx \int_{-\sqrt{a^2 - x^2}}^{\sqrt{a^2 - x^2}} f(x, y) dy$

6.  $\int_0^1 \int_x^{\frac{2-x}{y}} dy dx$

**Ans.**  $\int_0^a \frac{dy}{y} \int_0^{\frac{2-y}{y}} x dx + \int_1^{\frac{2-y}{y}} \frac{dy}{y} \int_0^y x dx; \log \frac{4}{e}$

7.  $\int_0^b \int_y^a \frac{x dy}{x^2 + y^2}$  **(M.P. 2003)**

**Ans.**  $\frac{\pi ab}{4}$

8.  $\int_0^a \int_0^{bx/a} x dy dx$

**Ans.** (a)  $\int_0^b dy \int_{ay/b}^a x dx$  (b)  $\frac{1}{3} a^2 b$

9.  $\int_0^5 \int_{2-x}^{2+x} f(x, y) dx dy$

**(A.M.I.E.T.E. Winter 1999)**

**Ans.**  $\int_0^2 dy \int_{2-y}^5 f(x, y) dx + \int_2^7 dy \int_{y-2}^5 f(x, y) dx$

10.  $\int_0^\infty \int_{-y}^y (y^2 - x^2) e^{-y} dx dy$

**Ans.**  $\int_{-\infty}^\infty dx \int_{-x}^x (y^2 - x^2) e^{-y} dy$ , 8 (AMIE., Summer 2000)

11.  $\int_{y=0}^1 \int_{x=\sqrt{y}}^{2-y} yx dx dy$  **(A.M.I.E.T.E., June 2009)** **Ans.**  $\frac{7}{12}$

12.  $\int_0^a \int_{\frac{x^2}{a}}^{2a-x} xy dx dy$  **(U.P. I Semester, Dec., 2007)**

**Ans.**  $\int_0^a \int_0^{\sqrt{ay}} xy dx dy + \int_0^{2a-y} xy dx dy, \frac{3a^2}{8}$

13.  $\int_0^a \int_{a-\sqrt{a^2-y^2}}^{a+\sqrt{a^2-y^2}} xy dx dy$

**Ans.**  $\int_0^{2a} x dx \int_0^{\sqrt{a^2-(x-a)^2}} y dy, \frac{2}{3} a^4$

**[Hint:** Put  $x = a \sin^2 \theta \Rightarrow dx = 2 a \sin \theta \cos \theta d\theta$ ]

14.  $\int_0^1 \int_{-1}^{1-y} x^{1/3} y^{-1/2} (1-x-y)^{1/2} dx dy$  **Ans.**  $\int_{-1}^1 \frac{1}{x^3} dx \int_0^{1-x} y^{-\frac{1}{2}} (1-x-y)^{\frac{1}{2}} dy, -\frac{3\pi}{7}$

15.  $\int_0^{2a} dx \int_0^{\frac{x^2}{4a}} (x+y)^3 dy$

**Ans.**  $\int_0^a dy \int_{\sqrt{4ay}}^{2a} (x+y)^3 dx$

16.  $\int_0^1 \int_0^y (x^2 + y^2) dx dy + \int_1^2 \int_0^{2-y} (x^2 + y^2) dx dy$  **(A.M.I.E. Winter 2000)**

**Ans.**  $\int_0^1 dx \int_x^{2-x} (x^2 + y^2) dy, \frac{5}{3}$

17.  $\int_0^a \int_0^{\sqrt{a^2 - x^2}} y^2 \sqrt{x^2 + y^2} dx dy$  by changing into polar coordinates. **Ans.**  $\frac{\pi a^5}{20}$

**(U.P. I Semester, Dec. 2007, A.M.I.E., Summer 2001)**

18.  $\int_0^1 \int_1^2 \frac{1}{x^2 + y^2} dx dy + \int_0^2 \int_y^2 \frac{1}{x^2 + y^2} dx dy = \int_R \int \frac{1}{x^2 + y^2} dy dx$

Recognise the region  $R$  of integration on the R.H.S. and then evaluate the integral on the right in the order indicated. **(AMIETE, Dec. 2004)**

**Ans.** Region  $R$  is  $x = 0, x = y, y = 1$  and  $y = 2, \frac{\pi}{4} \log 2$ .

19. Express as single integral and evaluate :

$$\int_0^{\frac{a}{\sqrt{2}}} \int_0^x x \, dx \, dy + \int_{\frac{a}{\sqrt{2}}}^a \int_0^{\sqrt{a^2 - x^2}} x \, dx \, dy$$

**Ans.**  $\int_0^{\frac{a}{\sqrt{2}}} dy \int_y^{\sqrt{a^2 - y^2}} x \, dx, \frac{5a^3}{6\sqrt{2}}$

20. Express as single integral and evaluate :

$$\int_0^1 \int_0^y (x^2 + y^2) \, dx \, dy + \int_1^2 \int_0^{2-y} (x^2 + y^2) \, dx \, dy$$

**Ans.**  $\int_0^1 dx \int_x^{2-x} (x^2 + y^2) \, dy, \frac{5}{3}$

21. If  $f(x, y) \, dx \, dy$ , where  $R$  is the circle  $x^2 + y^2 = a^2$ , is  $R$  equivalent to the repeated integral.

(AMIE winter 2001) [Ans.  $\int_0^{2\pi} \int_0^1 (r, \theta) r \, dr \, d\theta.$ ]

## 7.5 CHANGE OF VARIABLES

Sometimes the problems of double integration can be solved easily by change of independent variables. Let the double integral as be  $\iint_R f(x, y) \, dx \, dy$ . It is to be changed by the new variables  $u, v$ .

The relation of  $x, y$  with  $u, v$  are given as  $x = f(u, v), y = \Psi(u, v)$ . Then the double integration is converted into.

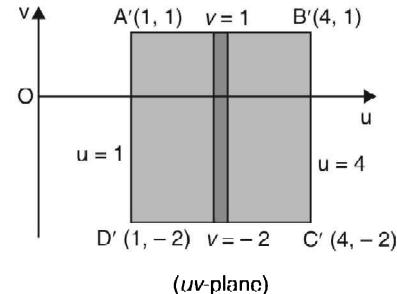

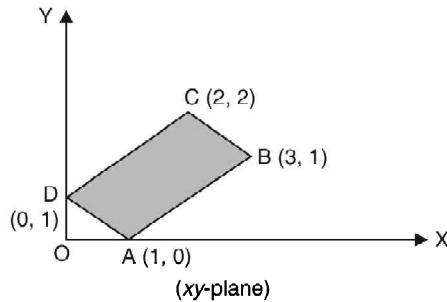

$$\begin{aligned} \iint_{R'} f\{\phi(u, v), \Psi(u, v)\} |J| \, du \, dv, \text{ where} \\ dx \, dy = |J| \, du \, dv = \frac{\partial(x, y)}{\partial(u, v)} \, du \, dv = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} \, du \, dv \end{aligned}$$

**Example 31.** Evaluate  $\iint_R (x + y)^2 \, dx \, dy$ , where  $R$  is the parallelogram in the  $xy$ -plane with vertices  $(1, 0), (3, 1), (2, 2), (0, 1)$ , using the transformation  $u = x + y$  and  $v = x - 2y$ .  
(U.P., I Semester, 2003)

**Solution.** The region of integration is a parallelogram  $ABCD$ , where  $A(1, 0), B(3, 1), C(2, 2)$  and  $D(0, 1)$  in  $xy$ -plane.

The new region of integration is a rectangle  $A'B'C'D'$  in  $uv$ -plane

$xy$ -plane	$A \equiv (x, y)$ $A \equiv (1, 0)$	$B \equiv (x, y)$ $B \equiv (3, 1)$	$C \equiv (x, y)$ $C \equiv (2, 2)$	$D \equiv (x, y)$ $D \equiv (0, 1)$
$uv$ -plane	$A' \equiv (u, v)$ $A' \equiv (x + y, x - 2y)$ $A' \equiv (1 + 0, 1 - 2 \times 0)$ $A' \equiv (1, 1)$	$B' \equiv (u, v)$ $B' \equiv (x + y, x - 2y)$ $B' \equiv (3 + 1, 3 - 2 \times 1)$ $B' \equiv (4, 1)$	$C' \equiv (u, v)$ $C' \equiv (u, v)$ $C' \equiv (2 + 2, 2 - 2 \times 2)$ $C' \equiv (4, -2)$	$D' \equiv (u, v)$ $D' \equiv (0 + 1, 0 - 2 \times 1)$ $D' \equiv (1, -2)$

and

$$\begin{cases} u = x + y \\ v = x - 2y \end{cases} \Rightarrow x = \frac{1}{3}(2u + v) \quad \text{and} \quad y = \frac{1}{3}(u - v)$$

$$J = \frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} \frac{2}{3} & \frac{1}{3} \\ \frac{1}{3} & -\frac{1}{3} \end{vmatrix} = -\frac{1}{3}$$

$$dx dy = |J| du dv = \frac{1}{3} du dv$$

$$\iint_R (x+y)^2 dx dy = \int_{-2}^1 \int_1^4 u^2 \cdot \frac{1}{3} du dv = \int_{-2}^1 \frac{1}{3} \left[ \frac{u^3}{3} \right]_1^4 dv = \int_{-2}^1 7 dv = 7 [v]_2^1 = 7 \times 3 = 21 \text{ Ans.}$$

**Example 32.** Transform  $\int_0^{\pi/2} \int_0^{\pi/2} \sqrt{\frac{\sin \phi}{\sin \theta}} d\phi d\theta$  by the substitution  $x = \sin \phi \cos \theta, y = \sin \phi \sin \theta$  and show that its value is  $\pi$ .

**Solution.**  $x = \sin \phi \cos \theta, y = \sin \phi \sin \theta$ .

$$\Rightarrow x^2 + y^2 = \sin^2 \phi \text{ and } \frac{y}{x} = \tan \theta$$

$$\text{limit of } \theta \text{ are } 0 \text{ are } \frac{\pi}{2}.$$

Also, the limits of  $\phi$  are 0 and  $\frac{\pi}{2}$ .

$$x^2 + y^2 = \sin^2 \phi = \sin^2 \frac{\pi}{2} = 1$$

limits of  $x$  are 0 to  $\sqrt{1 - y^2}$

limits of  $y$  are 0 to 1.

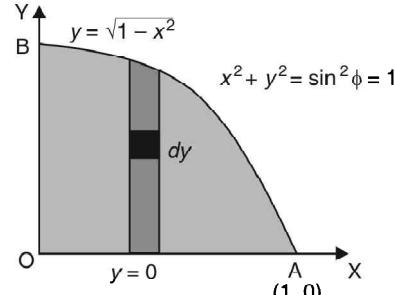

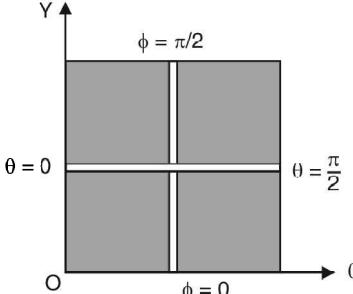

$$\begin{aligned} \text{Now, } d\phi d\theta &= \frac{\partial(\phi, \theta)}{\partial(x, y)} dx dy = \begin{vmatrix} \frac{\partial \phi}{\partial x} & \frac{\partial \phi}{\partial y} \\ \frac{\partial \theta}{\partial x} & \frac{\partial \theta}{\partial y} \end{vmatrix} dx dy \\ &= \begin{vmatrix} \frac{x}{\sin \phi \cos \phi} & -y \cos^2 \theta \\ \frac{y}{\sin \phi \cos \phi} & \frac{\cos^2 \theta}{x} \end{vmatrix} dx dy = \left[ \frac{\cos^2 \theta}{\sin \phi \cos \phi} + \frac{y^2 \cos^2 \theta}{x^2 \sin \phi \cos \phi} \right] dx dy \\ &= \frac{(x^2 + y^2) \cos^2 \theta}{x^2 \sin \phi \cos \phi} dx dy = \frac{\sin^2 \phi \cos^2 \theta}{(\sin^2 \phi \cos^2 \theta) \sin \phi \cos \phi} dx dy = \frac{1}{\sin \phi \cos \phi} dx dy \end{aligned}$$

$$\text{Again, } \iint \sqrt{\left( \frac{\sin \phi}{\sin \theta} \right)} d\phi d\theta = \iint \sqrt{\left( \frac{\sin \phi}{\sin \theta} \right)} \frac{dx dy}{\sin \phi \cos \phi}$$

$$= \iint \frac{dx dy}{\cos \phi \sqrt{\sin \phi \sin \theta}} = \iint \frac{dx dy}{\sqrt{1 - \sin^2 \phi} \sqrt{\sin \phi \sin \theta}}$$

$$= \int_0^1 \int_0^{\sqrt{1-y^2}} \frac{1}{\sqrt{1-(x^2+y^2)} \sqrt{y}} dx dy \quad \begin{bmatrix} x^2 + y^2 = \sin^2 \phi \\ y = \sin \phi \sin \theta \end{bmatrix}$$

$$I = \int_0^1 \int_0^{\sqrt{1-y^2}} \frac{dx dy}{\sqrt{y} \sqrt{\{(1-y^2)-x^2\}}} \quad = \int_0^1 \frac{dy}{\sqrt{y}} \int_0^{\sqrt{1-y^2}} \frac{dx}{\sqrt{\{(1-y^2)-x^2\}}}$$

$$\begin{aligned}
 &= \int_0^1 \frac{1}{\sqrt{(y)}} \left\{ \sin^{-1} \frac{x}{\sqrt{(1-y^2)}} \right\}_0^{\sqrt{(1-y^2)}} dy = \int_0^1 \frac{1}{\sqrt{(y)}} \{ \sin^{-1} 1 - \sin^{-1} 0 \} dy \\
 &= \frac{\pi}{2} \{ 2\sqrt{(y)} \}_0^1 = \pi
 \end{aligned}$$

**Proved.****Example 33.** Using the transformation  $x + y = u$ ,  $y = uv$  show that

$$\int_0^1 \int_0^{1-x} e^{y(x+y)} dy dx = \frac{1}{2}(e-1)$$

**Solution.** Since,  $x = u(1-v)$ ,  $y = uv$ 

$$\begin{aligned}
 \therefore J &= \frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} 1-v & -u \\ v & u \end{vmatrix} \\
 &= u - uv + uv = u
 \end{aligned}$$

$$\begin{aligned}
 \therefore dx dy &= |J| du dv = u du dv \\
 \text{Also } x = 0 &\Rightarrow u(1-v) = 0 \\
 &\Rightarrow u = 0, v = 1 \\
 y = 0 &\Rightarrow uv = 0 \\
 &\Rightarrow u = 0, v = 0 \\
 x + y = 0 &\Rightarrow u = 1
 \end{aligned}$$

Hence, the limits of  $u$  are 0 to 1 and the limits of  $v$  are 0 to 1.The area of integration is  $O'PQR$  in  $uv$ -plane.

$$\begin{aligned}
 \therefore \int_0^1 \int_0^{1-x} e^{y(x+y)} dy dx &= \int_0^1 \int_0^1 e^{uv/u} |J| du dv \\
 &= \int_0^1 \int_0^1 ue^v du dv = \left( \frac{u^2}{2} \right)_0^1 (e^v)_0^1 = \frac{1}{2}(e-1).
 \end{aligned}$$

**Proved.****Example 34.** Using the transformation  $x + y = u$ ,  $y = uv$ , show that

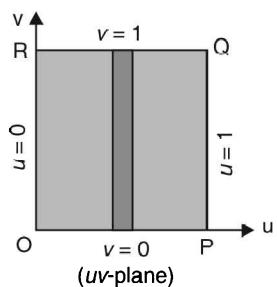

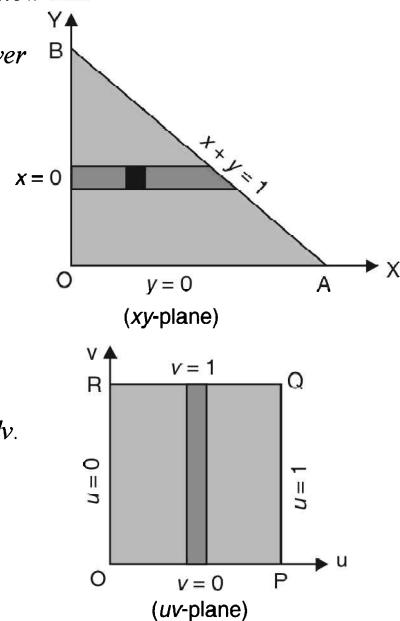

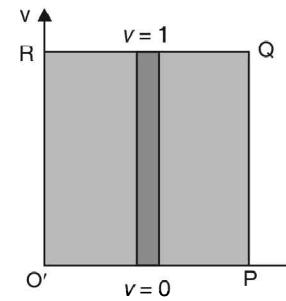

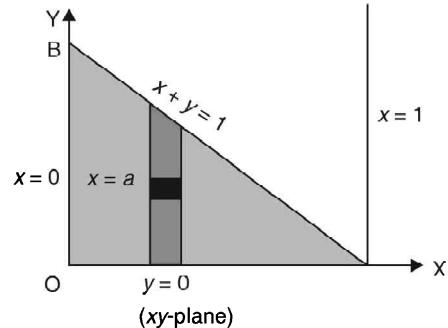

$$\begin{aligned}
 \iint [xy(1-x-y)]^{1/2} dx dy &= \frac{2\pi}{105}, \text{ integration being taken over} \\
 \text{the area of the triangle bounded by the lines } x = 0, y = 0, \\
 x + y = 1.
 \end{aligned}$$

**Solution.**  $\iint [xy(1-x-y)]^{1/2} dx dy$ 

$$x + y = u \text{ or } x = u - y = u - uv,$$

$$\begin{aligned}
 dx dy &= \frac{\partial(x, y)}{\partial(u, v)} du dv = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} du dv \\
 &= \begin{vmatrix} 1-v & -u \\ v & u \end{vmatrix} du dv = u du dv
 \end{aligned}$$

$$\begin{aligned}
 x = 0 &\Rightarrow u(1-v) = 0 \\
 &\Rightarrow u = 0, v = 1 \\
 y = 0 &\Rightarrow uv = 0 \\
 &\Rightarrow u = 0, v = 0 \\
 x + y = 1 &\Rightarrow u = 1
 \end{aligned}$$

Hence, the limits of  $u$  are from 0 to 1 and the limits of  $v$  are from 0 to 1.

The area of integration is a square  $OPQR$  in  $uv$ -plane.

On putting  $x = u - uv$ ,  $y = uv$ ,  $dx dy = u du dv$  in (1), we get

$$\begin{aligned} & \int \int (u - uv)^{1/2} (uv)^{1/2} (1-v)^{1/2} u du dv \\ &= \int_0^1 u^2 (1-u)^{1/2} du \int_0^1 v^{1/2} (1-v)^{1/2} dv = \frac{\sqrt{3}}{9} \times \frac{\sqrt{3}}{2} \times \frac{\sqrt{3}}{2} \\ &= \frac{2 \cdot \frac{\sqrt{3}}{2}}{\frac{7}{2} \cdot \frac{5}{2} \cdot \frac{3}{2} \cdot \frac{\sqrt{3}}{2}} \times \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{\frac{7}{2} \cdot \frac{5}{2} \cdot \frac{3}{2}} \times \frac{\frac{1}{2} \sqrt{\pi} \cdot \frac{1}{2} \sqrt{\pi}}{1} = \frac{2\pi}{105} \quad \text{Ans.} \end{aligned}$$

**Example 35.** Using the transformation  $x + y = u$ ,  $y = v$ , evaluate  $\int_0^\pi \int_0^\pi |\cos(x+y)| dx dy$ .

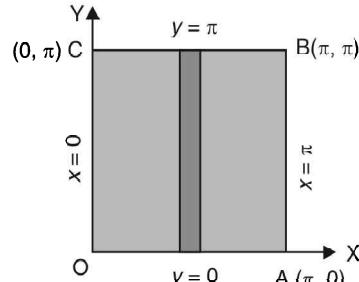

**Solution.** Let

$$I = \int_0^\pi \int_0^\pi |\cos(x+y)| dx dy$$

$$\begin{cases} x + y = u \\ y = v \end{cases} \Rightarrow \begin{cases} x = u - v \\ y = v \end{cases}$$

$$J = \frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} 1 & -1 \\ 0 & 1 \end{vmatrix} = 1$$

$$dx dy = |J| du dv = du dv$$

The area of integration is a square  $OABC$  in  $xy$ -plane, where  $O$  is  $(0, 0)$ ,  $A \equiv (\pi, 0)$ ,  $B \equiv (\pi, \pi)$ ,  $C \equiv (0, \pi)$

xy-plane	$O \equiv (x, y)$ $O \equiv (1, 0)$ $O' \equiv (u, v)$	$A \equiv (x, y)$ $A \equiv (\pi, 0)$ $A' \equiv (u, v)$	$B \equiv (x, y)$ $B \equiv (2, 2)$ $B' \equiv (u, v)$	$C \equiv (x, y)$ $C \equiv (0, 1)$ $C' \equiv (u, v)$
uv-plane	$O' \equiv (x+y, y)$ $O' \equiv (0+0, 0)$ $O' \equiv (0, 0)$	$A' \equiv (x+y, y)$ $A' \equiv (\pi+0, 0)$ $A' \equiv (\pi, 0)$	$B' \equiv (x+y, y)$ $B' \equiv (\pi+\pi, \pi)$ $B' \equiv (2\pi, \pi)$	$C' \equiv (x+y, y)$ $C' \equiv (0+\pi, \pi)$ $C' \equiv (\pi, \pi)$

The new area of integration is  $O'A'B'C'$  in  $uv$ -plane where  $O'(0, 0)$ ,  $A'(\pi, 0)$ ,  $B'(2\pi, \pi)$ ,  $C'(\pi, \pi)$ .

Equation of  $O'C'$  is  $v = u$

$$\text{Equation of } A'B' \text{ is } v - 0 = \frac{0 - \pi}{\pi - 2\pi} (u - \pi)$$

$$\Rightarrow v = u - \pi \Rightarrow u = v + \pi$$

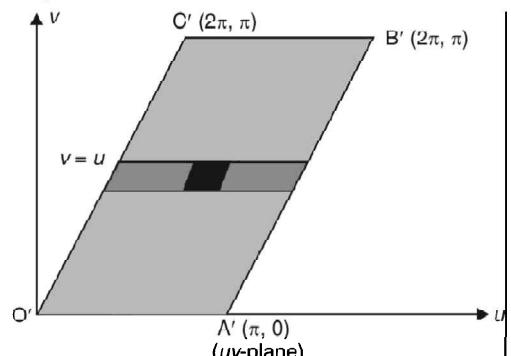

$$\text{Now, } I = \int_0^\pi \int_0^\pi |\cos(x+y)| dx dy$$

$$= \int_0^\pi \int_v^{\pi+v} |\cos u| du dv$$

$$= \int_0^\pi dv \int_v^{\pi+v} |\cos u| du$$

$$= \int_0^\pi dv \left[ \int_{\pi/2}^{\pi/2} |\cos u| du + \int_{\pi/2}^\pi |\cos u| du + \int_\pi^{\pi+v} |\cos u| du \right]$$

$$= \int_0^\pi dv \left[ \int_{\pi/2}^{\pi/2} \cos u du + \int_{\pi/2}^\pi -\cos u du + \int_\pi^{\pi+v} -\cos u du \right]$$

$$\begin{aligned}
&= \int_0^\pi dv \left[ (\sin u)_v^{\pi/2} - (\sin u)_{\pi/2}^\pi - (\sin u)_{\pi}^{\pi+v} \right] \\
&= \int_0^\pi dv [1 - \sin v) - (0 - 1) - |\sin(\pi + v) - 0|] \\
&= \int_0^\pi dv [(1 - \sin v) + 1 - \{-\sin v - 0\}] \\
&= \int_0^\pi dv [1 - \sin v + 1 + \sin v] \\
&= \int_0^\pi dv (2) = 2 \int_0^\pi dv = 2(v)_0^\pi = 2(\pi - 0) = 2\pi
\end{aligned}$$

Interval	$\cos u$	$ \cos u $
$(v, \frac{\pi}{2})$	+ ve	$\cos u$
$(\frac{\pi}{2}, \pi)$	- ve	$-\cos u$
$(\pi, \pi + v)$	- ve	$-\cos u$

**Example 36.** Evaluate  $\iint \sqrt{\frac{a^2b^2 - b^2x^2 - a^2y^2}{a^2b^2 + b^2x^2 + a^2y^2}} dx dy$  where  $R$  is the region bounded by the

ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ , using polar coordinates. (M.U. II Semester, 2009)

**Solution.** The region of integration is bounded by the

ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ .

Let us substitute

$$\begin{aligned}
\frac{x}{a} &= r \cos \theta \\
x &= a r \cos \theta
\end{aligned}$$

$$\begin{aligned}
\frac{y}{b} &= r \sin \theta \\
y &= b r \sin \theta
\end{aligned}$$

$$\Rightarrow y = b r \sin \theta$$

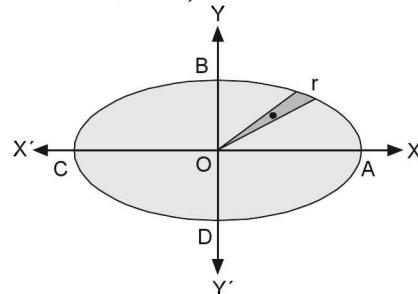

$$J = \frac{\partial(x, y)}{\partial(r, \theta)} = \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix}$$

$$\begin{aligned}
&= \begin{vmatrix} a \cos \theta & -ar \sin \theta \\ b \sin \theta & br \cos \theta \end{vmatrix} \\
&= abr \cos^2 \theta + abr \sin^2 \theta \\
&= abr (\cos^2 \theta + \sin^2 \theta) \\
&= abr
\end{aligned}$$

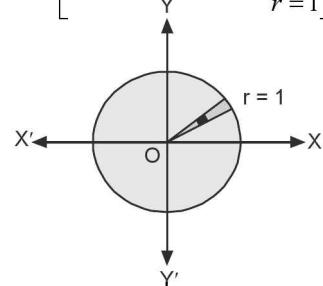

$$dx dy = J dr d\theta$$

$$= abr dr d\theta$$

$$\begin{aligned}
\iint \sqrt{\frac{a^2b^2 - b^2x^2 - a^2y^2}{a^2b^2 + b^2x^2 + a^2y^2}} dx dy &= 4 \int_0^{\frac{\pi}{2}} \int_0^1 \sqrt{\frac{a^2b^2 - b^2a^2r^2 \cos^2 \theta - a^2b^2r^2 \sin^2 \theta}{a^2b^2 + b^2a^2r^2 \cos^2 \theta + a^2b^2r^2 \sin^2 \theta}} abr dr d\theta \\
&= 4 \int_0^{\frac{\pi}{2}} \int_0^1 \sqrt{\frac{a^2b^2 - a^2b^2r^2(\cos^2 \theta + \sin^2 \theta)}{a^2b^2 + a^2b^2r^2(\cos^2 \theta + \sin^2 \theta)}} abr dr d\theta \\
&= 4 \int_0^{\frac{\pi}{2}} \int_0^1 \sqrt{\frac{a^2b^2 - a^2b^2r^2}{a^2b^2 + a^2b^2r^2}} abr dr d\theta
\end{aligned}$$

$$\begin{aligned}
&\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \\
&r^2 \cos^2 \theta + r^2 \sin^2 \theta = 1 \\
&r^2 (\cos^2 \theta + \sin^2 \theta) = 1 \\
&r^2 = 1 \\
&r = 1
\end{aligned}$$

$$\begin{aligned}
&= 4 \int_0^{\frac{\pi}{2}} \int_0^1 \sqrt{\frac{a^2 b^2 (1 - r^2)}{a^2 b^2 (1 + r^2)}} abr \, dr \, d\theta = 4 \int_0^{\frac{\pi}{2}} \int_0^1 \sqrt{\frac{1 - r^2}{1 + r^2}} abr \, dr \, d\theta \\
&= 4 \int_0^{\frac{\pi}{2}} \int_0^1 \sqrt{\frac{(1 - r^2)(1 - r^2)}{(1 + r^2)(1 - r^2)}} abr \, dr \, d\theta = 4ab \int_0^{\frac{\pi}{2}} \int_0^1 \frac{1 - r^2}{\sqrt{1 - r^4}} r \, dr \, d\theta \quad [\text{Put } r^2 = \sin t] \\
&= 4ab \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \frac{1 - \sin t}{\cos t} \cdot \frac{1}{2} \cos t \, dt \, d\theta = 2ab \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} (1 - \sin t) \, dt \, d\theta \\
&= 2ab \int_0^{\frac{\pi}{2}} [t + \cos t]_0^{\pi/2} \, d\theta = 2ab \int_0^{\frac{\pi}{2}} \left[ \frac{\pi}{2} - 1 \right] d\theta = 2ab \left( \frac{\pi}{2} - 1 \right) \int_0^{\frac{\pi}{2}} d\theta \\
&= 2ab \left( \frac{\pi}{2} - 1 \right) [\theta]_0^{\pi/2} = \pi ab \left( \frac{\pi}{2} - 1 \right).
\end{aligned}$$

**Ans.****EXERCISE 7.4**

1. Evaluate  $\int_0^\infty \int_0^\infty e^{-(x+y)} \sin\left(\frac{\pi y}{x+y}\right) dx \, dy$  by means of the transformation  $u = x + y, v = y$  from  $(x, y)$  to

 $(u, v)$ **Ans.**  $\frac{1}{\pi}$ 

2. Using the transformation  $x + y = u, y = uv$ , show that  $\int_0^1 \int_0^{1-x} \frac{y}{e^{x+y}} dy \, dx = \frac{1}{2}(e-1)$   
*(A.M.I.E. Winter 2001)*

3. Using the transformation  $u = x - y, v = x + y$ , prove that  $\iint_R \cos \frac{x-y}{x+y} dx \, dy = \frac{1}{2} \sin 1$  where  $R$  is bounded by  $x = 0, y = 0, x + y = 1$

**Hint :**  $x = \frac{1}{2}(u+v), y = \frac{1}{2}(v-u)$  so that  $|J| = \frac{1}{2}$

# CHAPTER

# 8

## APPLICATION OF THE DOUBLE INTEGRALS (AREA, CENTRE OF GRAVITY, MASS, VOLUME)

---

---

### 8.1 INTRODUCTION

In this chapter, we will study how to find out area, centre of gravity, mass of lamina and the volume by revolving the area.

### 8.2 AREA IN CARTESIAN CO-ORDINATES

Let the curves  $AB$  and  $CD$  be  $y_1 = f_1(x)$  and  $y_2 = f_2(x)$ .

Let the ordinates  $AD$  and  $BC$  be  $x = a$  and  $x = b$ .

So the area enclosed by the two curves  $y_1 = f_1(x)$  and  $y_2 = f_2(x)$  and  $x = a$  and  $x = b$  is  $ABCD$ .

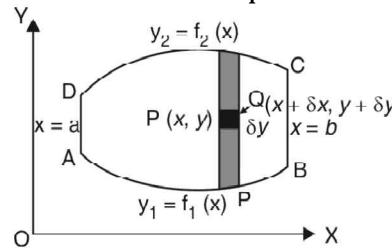

Let  $P(x, y)$  and  $Q(x + \delta x, y + \delta y)$  be two neighbouring points, then the area of the small rectangle  $PQ = \delta x \cdot \delta y$ .

Area of the vertical strip =  $\lim_{\delta y \rightarrow 0} \sum_{y_1}^{y_2} \delta x \delta y = \delta x \int_{y_1}^{y_2} dy \delta x$  the width of the strip is constant throughout.

If we add all the strips from  $x = a$  to  $x = b$ , we get

$$\text{The area } ABCD = \lim_{\delta x \rightarrow 0} \sum_a^b \delta x \int_{y_1}^{y_2} dy = \int_a^b dx \int_{y_1}^{y_2} dy$$

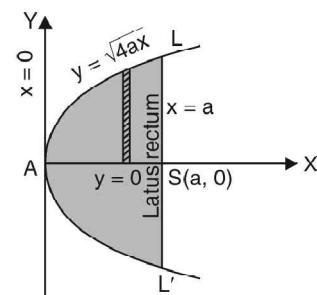

$$\boxed{\text{Area} = \int_a^b \int_{y_1}^{y_2} dx dy}$$

**Example 1.** Find the area bounded by the parabola  $y^2 = 4ax$  and its latus rectum.

**Solution.** Required area = 2 (area (ASL))

$$\begin{aligned} &= 2 \int_0^a \int_0^{2\sqrt{ax}} dy dx \\ &= 2 \int_0^a 2\sqrt{ax} dx \\ &= 4\sqrt{a} \left( \frac{x^{3/2}}{3/2} \right)_0^a = \frac{8a^2}{3} \end{aligned}$$

**Example 2.** Find the area between the parabolas  $y^2 = 4ax$  and  $x^2 = 4ay$ .

**Solution.**

$$y^2 = 4ax \quad \dots(1)$$

$$x^2 = 4ay \quad \dots(2)$$

On solving the equations (1) and (2) we get the point of intersection  $(4a, 4a)$ .

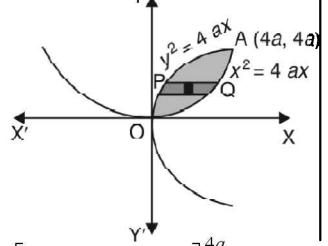

Divide the area into horizontal strips of width  $\delta y$ ,  $x$  varies

from  $P, \frac{y^2}{4a}$  to  $Q, \sqrt{4ay}$  and then  $y$  varies from  $O(y=0)$  to  $A(y=4a)$ .

$$\therefore \text{The required area} = \int_0^{4a} dy \int_{y^2/4a}^{\sqrt{4ay}} dx$$

$$\begin{aligned} &= \int_0^{4a} dy \left[ x \right]_{y^2/4a}^{\sqrt{4ay}} = \int_0^{4a} dy \left[ \sqrt{4ay} - \frac{y^2}{4a} \right] = \left[ \sqrt{4a} \frac{y^{3/2}}{3} - \frac{y^3}{12a} \right]_0^{4a} \\ &= \left[ \frac{4\sqrt{a}}{3} (4a)^{3/2} - \frac{(4a)^3}{12a} \right] = \left[ \frac{32}{3} a^2 - \frac{16}{3} a^2 \right] = \frac{16}{3} a^2 \end{aligned}$$

Ans.

**Example 3.** Find by double integration the area enclosed by the pair of curves

$$y = 2 - x \text{ and } y^2 = 2(2 - x)$$

**Solution.**

$$y = 2 - x$$

$$y^2 = 2(2 - x)$$

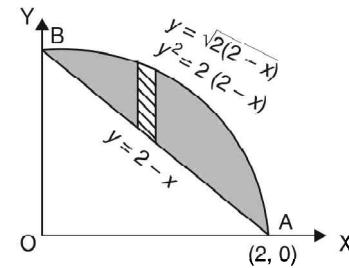

On solving the equations (1) and (2), we get the points of intersection  $(2, 0)$  and  $(0, 2)$ .

$$A = \int \int dx dy$$

$$\text{The required area} = \int_0^2 dx \int_{2-x}^{\sqrt{2(2-x)}} dy$$

$$= \int_0^2 dx \left[ y \right]_{2-x}^{\sqrt{2(2-x)}} = \int_0^2 dx [\sqrt{4-2x} - 2+x] = \left[ \frac{2}{3 \times -2} (4-2x)^{3/2} - 2x + \frac{x^2}{2} \right]_0^2$$

$$= \left[ -\frac{1}{3} (4-2x)^{3/2} - 2x + \frac{x^2}{2} \right]_0^2 = \left( -4 + \frac{4}{2} \right) + \frac{8}{3} = \frac{2}{3}$$

**Example 4.** By double integration, find the whole area of the curve  $a^2 x^2 = y^3 (2a - y)$ .

(U.P., II Semester, Summer 2001)

**Solution.**

$$a^2 x^2 = y^3 (2a - y) \quad \dots(1)$$

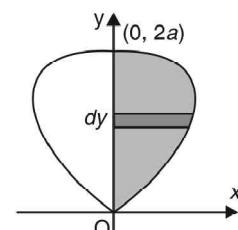

The area enclosed by the curve (1) is the shaded portion of the figure

Take a horizontal strip extending from  $x = 0$  to  $x = \frac{y^{3/2} \sqrt{(2a-y)}}{a}$ .

The required area

$$= \int \int dx dy = 2 \int_0^{y^{3/2} \sqrt{(2a-y)}} dy \int_0^{2a} dx = 2 \int_0^{2a} dy \left[ x \right]_0^{\frac{y^{3/2} \sqrt{(2a-y)}}{a}}$$

$$= \int \int dx dy = 2 \int_0^{y^{3/2} \sqrt{(2a-y)}} dy \int_0^{2a} dx = 2 \int_0^{2a} dy \left[ x \right]_0^{\frac{y^{3/2} \sqrt{(2a-y)}}{a}}$$

Put  $y = 2a \sin^2 \theta$  so that  $dy = 4a \sin \theta \cos \theta d\theta$

$$\text{Area} = \frac{2}{a} \int_0^{2a} y^{3/2} \sqrt{2a-y} dy = \frac{2}{a} \int_0^{\pi/2} (2a \sin^2 \theta)^{3/2} \sqrt{2a - 2a \sin^2 \theta} [4a \sin \theta \cos \theta d\theta]$$

$$= \frac{2}{a} (2a)^{3/2} \sqrt{2a} (4a) \int_0^{\pi/2} \sin^3 \theta \cos \theta \cdot \sin \theta \cos \theta d\theta$$

$$\begin{aligned}
 &= 32a^2 \int_0^{\frac{\pi}{2}} \sin^4 \theta \cos^2 \theta d\theta = 32a^2 \frac{\left[ \frac{5}{2} \right] \left[ \frac{3}{2} \right]}{24} \\
 &= 32a^2 \frac{\frac{3}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2}}{2 \times 3 \times 2 \times 1} = 32a^2 \frac{\frac{3}{2} \times \frac{1}{2} \sqrt{\pi} \times \frac{1}{2} \sqrt{\pi}}{12} = \pi a^2 \quad \text{Ans.}
 \end{aligned}$$

**Example 5.** Find the mass of the area bounded by the curves  $y^2 = x$  and  $y = x^3$ , if  $\rho = \mu(x^2 + y^2)$ .  
*(Nagpur University, Summer 2008)*

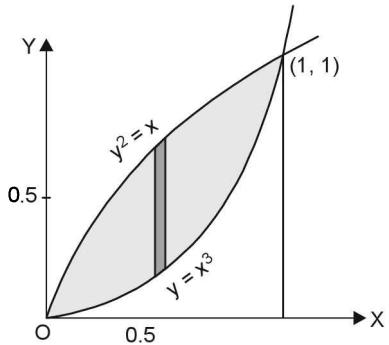

**Solution.** Here we have

$$y^2 = x \text{ and } y = x^3$$

$$\text{Area bounded by the curves} = \iint dx dy$$

Mass of the area

$$\begin{aligned}
 &= \iint \mu(x^2 + y^2) dx dy = \mu \int_0^1 \int_{x^3}^{\sqrt{x}} (x^2 + y^2) dx dy \\
 &= \mu \int_0^1 \int_{x^3}^{\sqrt{x}} (x^2 + y^2) dy = \mu \int_0^1 \left[ x^2 y + \frac{y^3}{3} \right]_{x^3}^{\sqrt{x}} \\
 &= \mu \int_0^1 \left[ \left( x^{\frac{5}{2}} + \frac{x^{\frac{3}{2}}}{3} \right) - \left( x^5 + \frac{x^9}{3} \right) \right] = \mu \left[ \frac{2}{7} x^{\frac{7}{2}} + \frac{2}{15} x^{\frac{5}{2}} - \frac{x^6}{6} - \frac{x^{10}}{30} \right]_0^1 = \mu \left[ \frac{2}{7} + \frac{2}{15} - \frac{1}{6} - \frac{1}{30} \right] \\
 &= \frac{\mu}{210} [60 + 28 - 35 - 7] = \frac{46}{210} \mu = \frac{23}{105} \mu \quad \text{Ans.}
 \end{aligned}$$

### EXERCISE 8.1

Use double integration in the following questions:

- Find the area bounded by  $y = x - 2$  and  $y^2 = 2x + 4$ . Ans. 18.
- Find the area between the circle  $x^2 + y^2 = a^2$  and the line  $x + y = a$  in the first quadrant. Ans.  $(\pi - 2)a^2/4$
- Find the area of a plate in the form of quadrant of the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ . Ans.  $\frac{\pi ab}{4}$
- Find the area included between the curves  $y^2 = 4a(x + a)$  and  $y^2 = 4b(b - x)$ . Ans.  $\frac{8\sqrt{ab}}{3}$   
*(A.M.I.E.T.E., Summer 2001)*
- Find the area bounded by (a)  $y^2 = 4 - x$  and  $y^2 = x$ . Ans.  $\frac{16\sqrt{2}}{3}$   
 (b)  $x - 2y + 4 = 0$ ,  $x + y - 5 = 0$ ,  $y = 0$  Ans.  $\frac{27}{2}$   
*(A.M.I.E., Winter 2001)*
- Find the area enclosed by the lemniscate  $r^2 = a^2 \cos 2\theta$ . Ans.  $a^2$
- Find the area common to the circles  $x^2 + y^2 = a^2$  and  $x^2 + y^2 = 2ax$ . Ans.  $\left[ \frac{\pi}{3} - \frac{\sqrt{3}}{4} \right] a^2$
- Find the area included between the curves  $y = x^2 - 6x + 3$  and  $y = 2x + 9$ .  
Ans.  $\frac{88\sqrt{22}}{3}$   
*(A.M.I.E., Summer 2001)*
- Determine the area of region bounded by the curves  $xy = 2$ ,  $4y = x^2$ ,  $y = 4$ . Ans.  $\frac{28}{3} - 4 \log 2$   
*(U.P. I Semester 2003)*

### 8.3 AREA IN POLAR CO-ORDINATES

$$\text{Area} = \iint r d\theta dr$$

Let us consider the area enclosed by the curve  $r = f(\theta)$ .

Let  $P(r, \theta), Q(r + \delta r, \theta + \delta\theta)$  be two neighbouring points.

Draw arcs  $PL$  and  $QM$ , radii  $r$  and  $r + \delta r$ .

$$PL = r\delta\theta, PM = \delta r$$

Area of rectangle

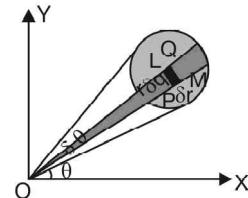

$$PLQM = PL \times PM$$

$$= (r\delta\theta)(\delta r) = r\delta\theta\delta r.$$

The whole area  $A$  is composed of such small rectangles.

Hence,

$$A = \lim_{\delta r \rightarrow 0} \sum_{\delta\theta \rightarrow 0} \sum r \delta\theta \cdot \delta r = \iint r d\theta dr$$

**Example 6.** Find by double integration, the area lying inside the cardioid  $r = a(1 + \cos \theta)$  and outside the circle  $r = a$ . (Nagpur University, Winter 2000)

**Solution.**

$$r = a(1 + \cos \theta) \quad \dots(1)$$

$$r = a \quad \dots(2)$$

Solving (1) and (2), by eliminating  $r$ , we get

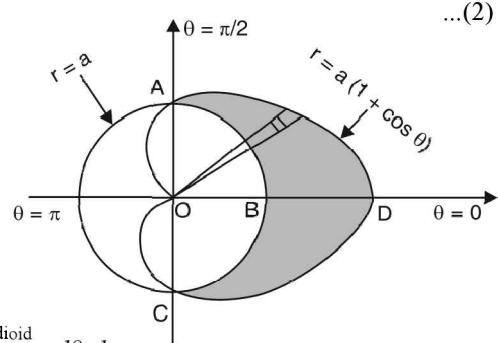

$$a(1 + \cos \theta) = a \Rightarrow 1 + \cos \theta = 1$$

$$\cos \theta = 0 \Rightarrow \theta = -\frac{\pi}{2} \text{ or } \frac{\pi}{2}$$

limits of  $r$  are  $a$  and  $a(1 + \cos \theta)$

limits of  $\theta$  are  $-\frac{\pi}{2}$  to  $\frac{\pi}{2}$

Required area = Area ABCDA

$$= \int_{-\pi/2}^{\pi/2} \int_{r \text{ for circle}}^{\text{for cardioid}} r d\theta dr$$

$$= \int_{-\pi/2}^{\pi/2} \int_a^{a(1+\cos\theta)} r d\theta dr \quad = \int_{-\pi/2}^{\pi/2} \left( \frac{r^2}{2} \right)_a^{a(1+\cos\theta)} d\theta$$

$$= \frac{a^2}{2} \int_{-\pi/2}^{\pi/2} [(1+\cos\theta)^2 - 1] d\theta \quad = \frac{a^2}{2} \int_{-\pi/2}^{\pi/2} (\cos^2\theta + 2\cos\theta) d\theta$$

$$= a^2 \int_0^{\pi/2} (\cos^2\theta + 2\cos\theta) d\theta \quad = a^2 \left[ \int_0^{\pi/2} \cos^2\theta d\theta + 2 \int_0^{\pi/2} \cos\theta d\theta \right]$$

$$= a^2 \left[ \frac{\pi}{4} + 2(\sin\theta)_0^{\pi/2} \right] = a^2 \left[ \frac{\pi}{4} + 2 \right] = \frac{a^2}{4} (\pi + 8) \quad \text{Ans.}$$

**Example 7.** Find by double integration, the area lying inside the circle  $r = a \sin \theta$  and outside the cardioid  $r = a(1 - \cos \theta)$ .

**Solution.** We have,

$$r = a \sin \theta \quad \dots(1)$$

$$r = a(1 - \cos \theta) \quad \dots(2)$$

Solving (1) and (2) by eliminating  $r$ , we have

$$\sin \theta = 1 - \cos \theta \Rightarrow \sin \theta + \cos \theta = 1$$

Squaring above, we get

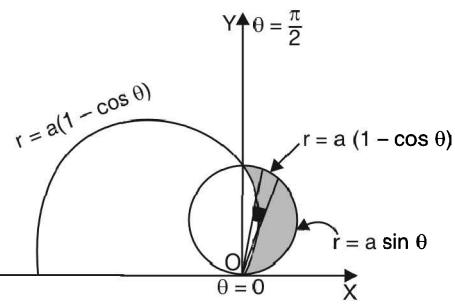

$$\sin^2\theta + \cos^2\theta + 2 \sin \theta \cos \theta = 1$$

$$\Rightarrow 1 + \sin 2\theta = 1 \Rightarrow \sin 2\theta = 0 \Rightarrow 2\theta = 0 \text{ or } \pi = \theta = 0 \text{ or } \frac{\pi}{2}$$

The required area is shaded portion in the fig.

Limits of  $r$  are  $a(1 - \cos \theta)$  and  $a \sin \theta$ , limits of  $\theta$  are 0 and  $\frac{\pi}{2}$ .

$$\begin{aligned}
 \text{Required area} &= \int_0^{\frac{\pi}{2}} \int_{a(1-\cos\theta)}^{a\sin\theta} r \, dr \, d\theta \\
 &= \int_0^{\frac{\pi}{2}} \left[ \frac{r^2}{2} \right]_{a(1-\cos\theta)}^{a\sin\theta} d\theta = \frac{1}{2} \int_0^{\frac{\pi}{2}} a^2 [\sin^2 \theta - (1 - \cos \theta)^2] d\theta \\
 &= \frac{a^2}{2} \int_0^{\frac{\pi}{2}} (\sin^2 \theta - 1 - \cos^2 \theta + 2 \cos \theta) d\theta \\
 &= \frac{a^2}{2} \int_0^{\frac{\pi}{2}} (-2 \cos^2 \theta + 2 \cos \theta) d\theta \\
 &= \frac{a^2}{2} \left[ \int_0^{\frac{\pi}{2}} -2 \cos^2 \theta \, d\theta + \int_0^{\frac{\pi}{2}} 2 \cos \theta \, d\theta \right] \\
 &= \frac{a^2}{2} \left[ \left( -2 \cdot \frac{\pi}{4} \right) + 2 (\sin \theta) \Big|_0^{\frac{\pi}{2}} \right] \\
 &= \frac{a^2}{2} \left[ -\frac{\pi}{2} + 2 \left( \sin \frac{\pi}{2} - \sin 0 \right) \right] = \frac{a^2}{2} \left[ -\frac{\pi}{2} + 2 \right] = a^2 \left( 1 - \frac{\pi}{4} \right)
 \end{aligned}$$

**Ans.**

**Example 8.** Find by double integration, the area lying inside a cardioid  $r = 1 + \cos \theta$  and outside the parabola  $r(1 + \cos \theta) = 1$ .

**Solutio.** We have,

$$r = 1 + \cos \theta \quad \dots(1)$$

$$r(1 + \cos \theta) = 1 \quad \dots(2)$$

Solving (1) and (2), we get

$$(1 + \cos \theta)(1 + \cos \theta) = 1$$

$$(1 + \cos \theta)^2 = 1$$

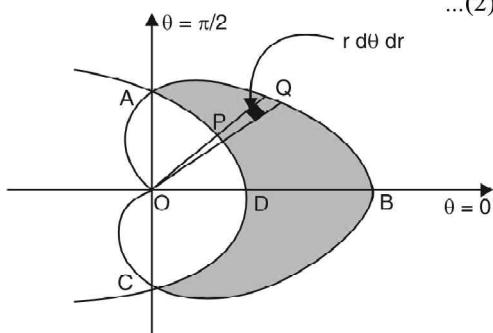

$$1 + \cos \theta = 1$$

$$\cos \theta = 0 \Rightarrow \theta = \pm \frac{\pi}{2}$$

limits of  $r$  are  $1 + \cos \theta$  and  $\frac{1}{1 + \cos \theta}$

limits of  $\theta$  are  $-\frac{\pi}{2}$  to  $\frac{\pi}{2}$ .

Required area = Area  $ADCBA$  (Shaded portion)

$$\begin{aligned}
 &= \int_{-\pi/2}^{\pi/2} \int_{\frac{1}{1+\cos\theta}}^{1+\cos\theta} r \, d\theta \, dr = \int_{-\pi/2}^{\pi/2} \left( \frac{r^2}{2} \right) \Big|_{\frac{1}{1+\cos\theta}}^{1+\cos\theta} d\theta = \frac{1}{2} \int_{-\pi/2}^{\pi/2} \left[ (1 + \cos \theta)^2 - \frac{1}{(1 + \cos \theta)^2} \right] d\theta \\
 &= \frac{1}{2} \int_{-\pi/2}^{\pi/2} \left[ (1 + \cos^2 \theta + 2 \cos \theta) - \frac{1}{(2 \cos^2 \frac{\theta}{2})^2} \right] d\theta \\
 &= 2 \times \frac{1}{2} \int_0^{\pi/2} \left[ (1 + \cos^2 \theta + 2 \cos \theta) - \frac{1}{4} \sec^4 \frac{\theta}{2} \right] d\theta
 \end{aligned}$$

$$\begin{aligned}
&= \int_0^{\pi/2} \left[ (1 + \cos^2 \theta + 2 \cos \theta) - \frac{1}{4} \left( 1 + \tan^2 \frac{\theta}{2} \right) \sec^2 \frac{\theta}{2} \right] d\theta \\
&= \int_0^{\pi/2} \left[ \left( 1 + \frac{1 + \cos 2\theta}{2} + 2 \cos \theta \right) - \frac{1}{4} \left( 1 + \tan^2 \frac{\pi}{2} \right) \sec^2 \frac{\pi}{2} \right] d\theta \\
&= \int_0^{\pi/2} \left[ 1 + \frac{1}{2} + \frac{\cos 2\theta}{2} + 2 \cos \theta - \frac{1}{4} \left( \sec^2 \frac{\theta}{2} + \tan^2 \frac{\theta}{2} \times \sec^2 \frac{\theta}{2} \right) \right] d\theta \\
&= \left[ \theta + \frac{\theta}{2} + \frac{\sin 2\theta}{4} + 2 \sin \theta - \frac{1}{4} \left( 2 \tan \frac{\theta}{2} + \frac{2}{3} \tan^3 \frac{\theta}{2} \right) \right]_0^{\pi/2} \\
&= \left[ \frac{\pi}{2} + \frac{\pi}{4} + 0 + 2 \sin \frac{\pi}{2} - \frac{1}{2} \tan \frac{\pi}{4} - \frac{1}{6} \tan^3 \frac{\pi}{4} \right] = \left[ \frac{3\pi}{4} + 2 - \frac{1}{2} - \frac{1}{6} \right] = \left[ \frac{3\pi}{4} + \frac{4}{3} \right] \quad \text{Ans.}
\end{aligned}$$

**Example 9.** Find by double integration the area included between the curves

$$r = a(\sec \theta + \cos \theta) \text{ and its asymptotes.}$$

**Solution.** We have,

$$\text{Equation of curve is, } r = a(\sec \theta + \cos \theta) \quad \dots(1)$$

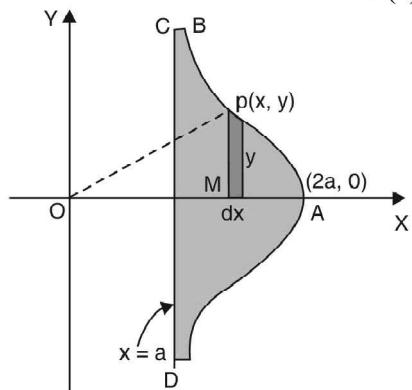

$$\text{Equation of asymptotes CD is, } r = a \sec \theta \quad \dots(2)$$

limits of  $r$  are  $a(\sec \theta + \cos \theta)$  and  $a \sec \theta$

limits of  $\theta$  are  $-\frac{\pi}{2}$  and  $\frac{\pi}{2}$

Required area = Shaded portion of the figure

$$\begin{aligned}
&= \int_{-\pi/2}^{\pi/2} \int_{a \sec \theta}^{a(\sec \theta + \cos \theta)} r dr d\theta \\
&= \int_{-\pi/2}^{\pi/2} \left( \frac{r^2}{2} \right)_{a \sec \theta}^{a(\sec \theta + \cos \theta)} d\theta \\
&= \frac{a^2}{2} \int_{-\pi/2}^{\pi/2} [(\sec \theta + \cos \theta)^2 - \sec^2 \theta] d\theta \\
&= \frac{a^2}{2} \int_{-\pi/2}^{\pi/2} (\cos^2 \theta + 2) d\theta = \frac{2a^2}{2} \int_0^{\pi/2} (\cos^2 \theta + 2) d\theta \\
&= a^2 \left( \frac{1}{2} \cdot \frac{\pi}{2} + 2 \cdot \frac{\pi}{2} \right) = a^2 \left( \frac{\pi}{4} + \pi \right) = \frac{5\pi}{4} a^2. \quad \text{Ans.}
\end{aligned}$$

**Example 10.** Find the area included between the curve

$$x = a(\theta - \sin \theta), y = a(1 - \cos \theta) \text{ and its base.}$$

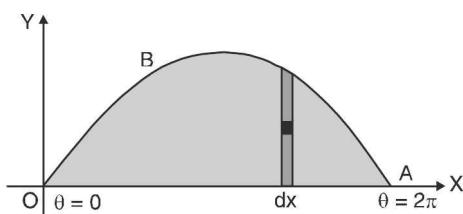

**Solution.** When  $\theta = 0$

$$\begin{aligned}
x &= a(0 - \sin 0) = a \times 0 = 0 \\
y &= a(1 - \cos 0) = a(1 - 1) = a \times 0 = 0
\end{aligned}$$

When  $\theta = 2\pi$

$$\begin{aligned}
x &= a(2\pi - \sin 2\pi) = a(2\pi - 0) = 2a\pi \\
y &= a(1 - \cos 2\pi) = a(1 - 1) = a \times 0 = 0
\end{aligned}$$

Therefore, the limits for  $\theta$  are from 0 to  $2\pi$ .

Required area = area  $OBAB$

$$\begin{aligned}
&= \int_0^{2\pi} y \frac{dx}{d\theta} d\theta = \int_0^{2\pi} a(1 - \cos \theta) a(\theta - \sin \theta) d\theta \\
&= a^2 \int_0^{2\pi} (1 - \cos \theta)^2 d\theta = 4a^2 \int_0^{2\pi} \sin^4 \frac{\theta}{2} d\theta
\end{aligned}$$

$$\begin{aligned}
 &= 8a^2 \int_0^\pi \sin^4 \phi \, d\phi \\
 &= 8a^2 \cdot 2 \int_0^{\pi/2} \sin^4 \phi \, d\phi = 16a^2 \cdot \frac{3}{4} \cdot \frac{1}{2} \frac{\pi}{2} = 3a^2\pi
 \end{aligned}
 \quad \text{Ans.}$$

**EXERCISE 8.2**

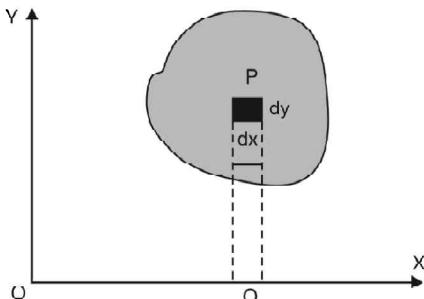

1. Find the area of cardioid  $r = a(1 + \cos \theta)$ . Ans.  $\frac{3\pi a^2}{2}$
2. Find the area of the curve  $r^2 = a^2 \cos 2\theta$ . Ans.  $a^2$
3. Find the area enclosed by the curve  $r = 2a \cos \theta$  Ans.  $\pi a^2$
4. Find the area enclosed by the curve  $r = 3 + 2 \cos \theta$ . Ans.  $11\pi$
5. Find the area enclosed by the curve  $r^3 = a^2 \cos^2 \theta + b^2 \sin^2 \theta$ . Ans.  $\frac{\pi}{2}(a^2 + b^2)$
6. Show that the area of the region included between the cardioides  $r = a(1 + \cos \theta)$  and  $r = a(1 - \cos \theta)$  is  $\frac{a^2}{2}(3\pi - 8)$ . Ans.  $(\pi + 8)$
7. Find the area outside the circle  $r = 2$  and inside the cardioid  $r = 2(1 + \cos \theta)$ . Ans.  $2a^2\left(\frac{\pi}{3} + \frac{\sqrt{3}}{4}\right)$
8. Find the area inside the circle  $r = 2a \cos \theta$  and outside the circle  $r = a$ . Ans.  $\left(\frac{8}{3}\pi + 4\sqrt{3} - 4\right)$
9. Find the area inside the circle  $r = 4 \sin \theta$  and outside the lemniscate  $r^2 = 8 \cos 2\theta$ .

**8.4 VOLUME OF SOLID BY ROTATION OF AN AREA (DOUBLE INTEGRAL)**

When the area enclosed by a curve  $y = f(x)$  is revolved about an axis, a solid is generated, we have to find out the volume of solid generated.

Volume of the solid generated about  $x$ -axis

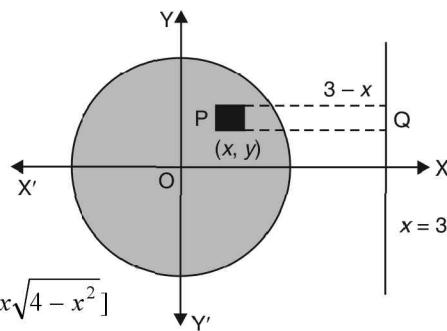

$$= \int_a^b \int_{y_1(x)}^{y_2(x)} 2\pi PQ \, dx \, dy$$

**Example 11.** Find the volume of the torus generated by revolving the circle  $x^2 + y^2 = 4$  about the line  $x = 3$ .

**Solution.**  $x^2 + y^2 = 4$

$$\begin{aligned}
 V &= \int \int (2\pi PQ) \, dx \, dy = 2\pi \int \int (3-x) \, dx \, dy \\
 &= 2\pi \int_{-2}^{+2} dx \int_{-\sqrt{4-x^2}}^{+\sqrt{4-x^2}} (3-x) \, dy \\
 &= 2\pi \int_{-2}^{+2} dx (3y - xy) \Big|_{-\sqrt{4-x^2}}^{+\sqrt{4-x^2}} \\
 &= 2\pi \int_{-2}^{+2} dx [3\sqrt{4-x^2} - x\sqrt{4-x^2} + 3\sqrt{4-x^2} - x\sqrt{4-x^2}] \\
 &= 4\pi [3\sqrt{4-x^2} - x\sqrt{4-x^2}] \, dx = 4\pi \left[ 3 \frac{x}{2} \sqrt{4-x^2} + 3 \times \frac{4}{2} \sin^{-1} \frac{x}{2} + \frac{1}{3} (4-x^2)^{3/2} \right]_{-2}^2
 \end{aligned}$$

$$= 4\pi \left[ 6 \times \frac{\pi}{2} + 6 \times \frac{\pi}{2} \right] = 24\pi^2$$

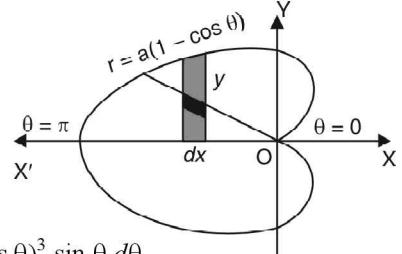

Ans.

**Example 12.** Calculate by double integration the volume generated by the revolution of the cardioid  $r = a(1 - \cos \theta)$  about its axis.  
(AMIETE, June 2010)

**Solution.**  $r = a(1 - \cos \theta)$

$$\begin{aligned} V &= 2\pi \int \int y \, dx \, dy \Rightarrow V = 2\pi \int \int (r \, d\theta \, dr) \, y \\ &= 2\pi \int d\theta \int r \, dr (r \sin \theta) \\ &= 2\pi \int_0^\pi \sin \theta \, d\theta \int_0^{a(1-\cos\theta)} r^2 \, dr \\ &= 2\pi \int_0^\pi \sin \theta \, d\theta \left[ \frac{r^3}{3} \right]_0^{a(1-\cos\theta)} = \frac{2\pi}{3} \int_0^\pi a^3 (1 - \cos \theta)^3 \sin \theta \, d\theta \\ &= \frac{2\pi a^3}{3} \left[ \frac{(1 - \cos \theta)^4}{4} \right]_0^\pi = \frac{2\pi a^3}{12} [16] = \frac{8}{3}\pi a^3 \end{aligned}$$

Ans.

**Example 13.** A pyramid is bounded by the three co-ordinate planes and the plane  $x + 2y + 3z = 6$ . Compute this volume by double integration.

**Solution.**  $x + 2y + 3z = 6 \quad \dots(1)$

$x = 0, y = 0, z = 0$  are co-ordinate planes.

The line of intersection of plane (1) and  $xy$  plane ( $z = 0$ ) is

$$x + 2y = 6 \quad \dots(2)$$

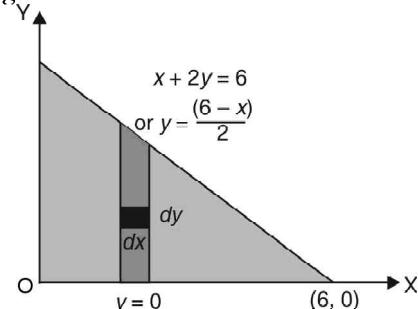

The base of the pyramid may be taken to be the triangle bounded by  $x$ -axis,  $y$ -axis and the line (2).

An elementary area on the base is  $dx \, dy$ .

Consider the elementary rod standing on this area and having height  $z$ , where

$$3z = 6 - x - 2y \text{ or } z = \frac{6 - x - 2y}{3}$$

Volume of the rod  $= dx \, dy$ ,  $z$ , Limits for  $z$  are 0 and  $\frac{6 - x - 2y}{3}$ .

Limits of  $y$  are 0 and  $\frac{6-x}{2}$  and limits of  $x$  are 0 and 6.

$$\begin{aligned} \text{Required volume} &= \int_0^6 \int_0^{\frac{6-x}{2}} z \, dx \, dy = \int_0^6 dx \int_0^{\frac{6-x}{2}} \frac{6 - x - 2y}{3} \, dy \\ &= \frac{1}{3} \int_0^6 dx \left( 6x - xy - y^2 \right)_{0}^{\frac{6-x}{2}} = \frac{1}{3} \int_0^6 \left( \frac{6(6-x)}{2} - \frac{x(6-x)}{2} - \left( \frac{6-x}{2} \right)^2 \right) dx \\ &= \frac{1}{3} \int_0^6 \left( \frac{36-6x}{2} - \frac{6x-x^2}{2} - \frac{36+x^2-12x}{4} \right) dx \\ &= \frac{1}{12} \int_0^6 (72 - 12x - 12x + 2x^2 - 36 - x^2 + 12x) dx \\ &= \frac{1}{12} \int_0^6 (x^2 - 12x + 36) dx = \frac{1}{12} \left[ \frac{x^3}{3} - \frac{12x^2}{2} + 36x \right]_0^6 \\ &= \frac{1}{12} [72 - 216 + 216] = 6 \end{aligned}$$

Ans.

**EXERCISE 8.3**

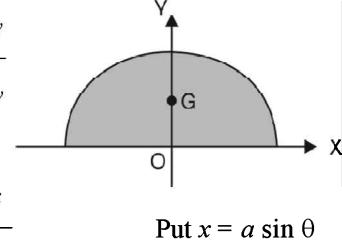

1. Find the volume of the sphere  $x^2 + y^2 + z^2 = a^2$  by revolving area of the circle  $x^2 + y^2 = a^2$ . Ans.  $\frac{4}{3}\pi a^3$

**8.5 CENTRE OF GRAVITY**

$$\bar{x} = \frac{\int \int \rho x \, dx \, dy}{\int \int \rho \, dx \, dy}, \bar{y} = \frac{\int \int \rho y \, dx \, dy}{\int \int \rho \, dx \, dy}$$

**Example 14.** Find the position of the C.G. of a semi-circular lamina of radius  $a$  if its density varies as the square of the distance from the diameter. (AMIETE, Dec. 2010)

**Solution.** Let the bounding diameter be as the  $x$ -axis and a line perpendicular to the diameter and passing through the centre is  $y$ -axis. Equation of the circle is  $x^2 + y^2 = a^2$ . By symmetry  $\bar{x} = 0$ .

$$\begin{aligned} \bar{y} &= \frac{\int \int y \rho \, dx \, dy}{\int \int \rho \, dx \, dy} = \frac{\int \int (\lambda y^2) y \, dx \, dy}{\int \int (\lambda y^2) \, dx \, dy} = \frac{\int_{-a}^a dx \int_0^{\sqrt{a^2 - x^2}} y^3 \, dy}{\int_{-a}^a dx \int_0^{\sqrt{a^2 - x^2}} y^2 \, dy} \\ &= \frac{\int_{-a}^a dx \left[ \frac{y^4}{4} \right]_0^{\sqrt{a^2 - x^2}}}{\int_{-a}^a dx \left( \frac{y^3}{3} \right)_0^{\sqrt{a^2 - x^2}}} = \frac{3 \int_{-a}^a (a^2 - x^2)^2 \, dx}{4 \int_{-a}^a (a^2 - x^2)^{3/2} \, dx} \\ &= \frac{3 \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} (a^2 - a^2 \sin^2 \theta)^2 a \cos \theta \, d\theta}{4 \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} (a^2 - a^2 \sin^2 \theta)^{3/2} a \cos \theta \, d\theta} = \frac{3 \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} a^5 \cos^5 \theta \, d\theta}{4 \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} a^4 \cos^4 \theta \, d\theta} \\ &= \frac{3a}{4} \cdot \frac{\frac{5 \times 3}{3 \times 1} \frac{\pi}{\pi}}{\frac{4 \times 2}{4 \times 2} 2} = \left( \frac{3a}{4} \right) \left( \frac{8}{15} \right) \left( \frac{16}{3\pi} \right) = \frac{32a}{15\pi} \end{aligned}$$

Put  $x = a \sin \theta$

Hence C.G. is  $\left( 0, \frac{32a}{15\pi} \right)$

Ans.

**Example 15.** Find C.G. of the area in the positive quadrant of the curve  $x^{2/3} + y^{2/3} = a^{2/3}$ .

**Solution.** For C.G. of area;  $\bar{x} = \frac{\int \int x \, dx \, dy}{\int \int dx \, dy}, \bar{y} = \frac{\int \int y \, dx \, dy}{\int \int dx \, dy}$

$$\begin{aligned} \bar{x} &= \frac{\int_0^a x \, dx \int_0^{(a^{2/3} - x^{2/3})^{3/2}} dy}{\int_0^a dx \int_0^{(a^{2/3} - x^{2/3})^{3/2}} dy} = \frac{\int_0^a x \, dx [y]_0^{(a^{2/3} - x^{2/3})^{3/2}}}{\int_0^a dx [y]_0^{(a^{2/3} - x^{2/3})^{3/2}}} \quad [\text{Put } x = a \cos^3 \theta] \\ &= \frac{\int_0^a x \, dx (a^{2/3} - x^{2/3})^{3/2}}{\int_0^a dx (a^{2/3} - x^{2/3})^{3/2}} = \frac{\int_{\frac{\pi}{2}}^0 a \cos^3 \theta (a^{2/3} - a^{2/3} \cos^2 \theta)^{3/2} (-3a \cos^2 \theta \sin \theta \, d\theta)}{\int_{\frac{\pi}{2}}^0 (a^{2/3} - a^{2/3} \cos^2 \theta)^{3/2} (-3a \cos^2 \theta \sin \theta \, d\theta)} \end{aligned}$$

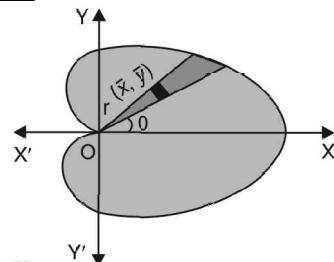

$$\begin{aligned}
 &= \frac{\int_0^{\frac{\pi}{2}} 3a^3 \cos^3 \theta \sin^3 \theta \cos^2 \theta \sin \theta d\theta}{\int_0^{\frac{\pi}{2}} 3a^2 \sin^3 \theta \cos^2 \theta \sin \theta d\theta} = \frac{a \int_0^{\frac{\pi}{2}} \sin^4 \theta \cos^5 \theta d\theta}{\int_0^{\frac{\pi}{2}} \sin^4 \theta \cos^2 \theta d\theta} = \frac{2 \overline{\left[ \begin{array}{|c|c|} \hline 5 & 6 \\ \hline 2 & 2 \\ \hline \end{array} \right] a}}{\overline{\left[ \begin{array}{|c|c|} \hline 5 & 3 \\ \hline 2 & 2 \\ \hline \end{array} \right]} \overline{\left[ \begin{array}{|c|c|} \hline 4 \\ \hline 2 \\ \hline \end{array} \right]}} \\
 &= \frac{\overline{\left[ \begin{array}{|c|c|} \hline 3 & 4 \\ \hline 2 & 11 \\ \hline \end{array} \right]} a}{\overline{\left[ \begin{array}{|c|c|} \hline 1 & 9 \\ \hline 2 & 2 \\ \hline \end{array} \right]} \cdot \overline{\left[ \begin{array}{|c|c|} \hline 7 \\ \hline 2 \\ \hline \end{array} \right]} \cdot \overline{\left[ \begin{array}{|c|c|} \hline 5 \\ \hline 2 \\ \hline \end{array} \right]} \cdot \overline{\left[ \begin{array}{|c|c|} \hline 3 \\ \hline 2 \\ \hline \end{array} \right]} \cdot \overline{\left[ \begin{array}{|c|c|} \hline 1 \\ \hline 2 \\ \hline \end{array} \right]} \pi} = \frac{256 a}{315 \pi}, \text{ Similarly, } \bar{y} = \frac{256 a}{315 \pi} \\
 \text{Hence, C.G of the area is } &\left( \frac{256 a}{315 \pi}, \frac{256 a}{315 \pi} \right).
 \end{aligned}$$

**Example 16.** Find by double integration, the centre of gravity of the area of the cardioid  $r = a(1 + \cos \theta)$ .

**Solution.** Let  $(\bar{x}, \bar{y})$  be the C.G. the cardioid

By Symmetry,  $\bar{y} = 0$ .

$$\begin{aligned}
 \bar{x} &= \frac{\int \int x dx dy}{\int \int dx dy} = \frac{\int \int x dx dy}{\int \int dx dy} \\
 &= \frac{\int_{-\pi}^{\pi} \int_0^{a(1+\cos\theta)} (r \cos \theta) (r d\theta dr)}{\int_{-\pi}^{\pi} \int_0^{a(1+\cos\theta)} r d\theta dr} = \frac{\int_{-\pi}^{\pi} \cos \theta d\theta \int_0^{a(1+\cos\theta)} r^2 dr}{\int_{-\pi}^{\pi} d\theta \int_0^{a(1+\cos\theta)} r dr} \\
 &= \frac{\int_{-\pi}^{\pi} \cos \theta d\theta \left[ \frac{r^3}{3} \right]_0^{a(1+\cos\theta)}}{\int_{-\pi}^{\pi} d\theta \left( \frac{r^2}{2} \right)_0^{a(1+\cos\theta)}} = \frac{\int_{-\pi}^{\pi} \cos \theta d\theta \cdot \frac{a^3}{3} (1+\cos\theta)^3}{\int_{-\pi}^{\pi} d\theta \frac{a^2}{2} (1+\cos\theta)^2} \\
 &= \frac{\frac{a^3}{3} \int_{-\pi}^{\pi} \left( 2 \cos^2 \frac{\theta}{2} - 1 \right) \left( 1 + 2 \cos^2 \frac{\theta}{2} - 1 \right)^3 d\theta}{\frac{a^2}{2} \int_{-\pi}^{\pi} \left( 1 + 2 \cos^2 \frac{\theta}{2} - 1 \right) d\theta} \\
 &= \frac{\frac{a^3}{3} \int_{-\pi}^{\pi} \left( 2 \cos^2 \frac{\theta}{2} - 1 \right) \left( 8 \cos^6 \frac{\theta}{2} \right) d\theta}{\frac{a^2}{2} \int_{-\pi}^{\pi} 4 \cos^4 \frac{\theta}{2} d\theta} \\
 &= \frac{8a^3}{3} \int_{-\pi}^{\pi} \left( 2 \cos^8 \frac{\theta}{2} - \cos^6 \frac{\theta}{2} \right) d\theta \div 2a^2 \int_{-\pi}^{\pi} \cos^4 \frac{\theta}{2} d\theta \\
 &= \frac{2 \times 8a^3}{3} \int_0^{\pi} \left( 2 \cos^8 \frac{\theta}{2} - \cos^6 \frac{\theta}{2} \right) d\theta \div 4a^2 \int_0^{\pi} \cos^4 \frac{\theta}{2} d\theta \\
 &= \frac{16a^3}{3} \int_0^{\pi/2} (2 \cos^8 t - \cos^6 t) (2 dt) \div 4a^2 \int_0^{\pi/2} \cos^4 t (2 dt) \\
 &= \frac{32a^3}{3} \left[ \frac{2 \times 7 \times 5 \times 3 \times 1}{8 \times 6 \times 4 \times 2} \frac{\pi}{2} - \frac{5 \times 3 \times 1}{6 \times 4 \times 2} \frac{\pi}{2} \right] \div 8a^2 \left( \frac{3 \times 1}{4 \times 2} \frac{\pi}{2} \right) \\
 &= \frac{32a^3}{3} \left( \frac{35\pi}{128} - \frac{5\pi}{32} \right) \div 8a^2 \left( \frac{3\pi}{16} \right) = \frac{8a^3}{3} \times \frac{15\pi}{128} \times \frac{16}{8a^2 \times 3\pi} = \frac{5a}{24}
 \end{aligned}$$

**Ans.**

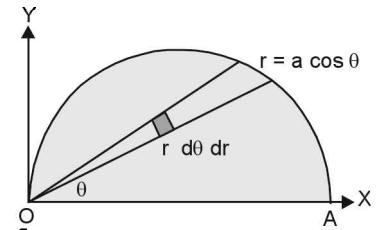

**Example 17.** *OA is the diameter of semicircular disc, the density at any point varies its distance from O. Find the position of entire of gravity given that OA = a.*

**Solution.**  $\rho \propto r \Rightarrow \rho = k r$ , where  $k$  is constant.

$r$  varies from  $r = 0$  to  $r = a \cos \theta$  and  $\theta$  varies from  $\theta = 0$  to  $\theta = \frac{\pi}{2}$ .

If  $(\bar{x}, \bar{y})$  are the coordinates of centre of gravity, then

$$\begin{aligned}\bar{x} &= \frac{\iint x \rho dA}{\iint \rho dA} = \frac{\int_0^{\frac{\pi}{2}} \int_0^{a \cos \theta} (r \cos \theta)(k r) (r d\theta dr)}{\int_0^{\frac{\pi}{2}} \int_0^{a \cos \theta} (k r) (r d\theta dr)} \\ &= \frac{\int_0^{\frac{\pi}{2}} \cos \theta d\theta \int_0^{a \cos \theta} r^3 dr}{\int_0^{a \cos \theta} r^2 dr} = \frac{\int_0^{\frac{\pi}{2}} \cos \theta d\theta \left[ \frac{r^4}{4} \right]_0^{a \cos \theta}}{\int_0^{\frac{\pi}{2}} \left[ \frac{r^3}{3} \right]_0^{a \cos \theta}} = \frac{\frac{1}{4} \int_0^{\frac{\pi}{2}} \cos \theta a \theta (a^4 \cos^4 \theta)}{\frac{1}{3} \int_0^{\frac{\pi}{2}} d\theta (a^3 \cos^3 \theta)} \\ &= \frac{3 \frac{a^4}{4a^3} \int_0^{\frac{\pi}{2}} \cos^5 \theta d\theta}{\int_0^{\frac{\pi}{2}} \cos^3 \theta d\theta} = \frac{3a}{4} \left[ \frac{\frac{4 \times 2}{5 \times 3}}{\frac{2}{3}} \right] = \frac{3a}{4} \left( \frac{4}{5} \right) = \frac{3a}{4} \\ \bar{y} &= \frac{\iint y \rho dA}{\iint \rho dA} = \frac{\int_0^{\frac{\pi}{2}} \int_0^{a \cos \theta} (r \sin \theta) k r (r d\theta dr)}{\int_0^{\frac{\pi}{2}} \int_0^{a \cos \theta} (kr) r d\theta dr} \quad \rho = kr \\ &= \frac{k \int_0^{\frac{\pi}{2}} \sin \theta d\theta \int_0^{a \cos \theta} r^3 dr}{k \int_0^{\frac{\pi}{2}} d\theta \int_0^{a \cos \theta} r^2 dr} = \frac{\int_0^{\frac{\pi}{2}} \sin \theta d\theta \left[ \frac{r^4}{4} \right]_0^{a \cos \theta}}{\int_0^{\frac{\pi}{2}} d\theta \left[ \frac{r^3}{3} \right]_0^{a \cos \theta}} \\ &= \frac{\frac{1}{4} \int_0^{\frac{\pi}{2}} \sin \theta d\theta (a^4 \cos^4 \theta)}{\frac{1}{3} \int_0^{\frac{\pi}{2}} d\theta (a^3 \cos^3 \theta)} = \frac{3a^4 \int_0^{\frac{\pi}{2}} \cos^4 \theta (\sin \theta d\theta)}{4a^3 \int_0^{\frac{\pi}{2}} \cos^3 \theta d\theta} \\ &= \frac{3a}{4} \left[ -\frac{\cos^5 \theta}{5} \right]_0^{\frac{\pi}{2}} = \frac{3}{4} \times \frac{3}{2} a \left[ -0 + \frac{1}{5} \right] = \frac{9a}{40} \text{ Hence C.G is at } \left( \frac{3a}{5}, \frac{9a}{40} \right). \text{ Ans.}\end{aligned}$$

## 8.6 CENTRE OF GRAVITY OF AN ARC

**Example 18.** *Find the C.G. of the arc of the curve*

$$x = a(\theta + \sin \theta), y = a(1 - \cos \theta) \text{ in the positive quadrant.}$$

**Solution.** We know that,  $\bar{x} = \frac{\int x ds}{\int ds}, \bar{y} = \frac{\int y ds}{\int ds}$

$$\text{Now, } ds = \sqrt{\left( \frac{dx}{d\theta} \right)^2 + \left( \frac{dy}{d\theta} \right)^2} d\theta$$

$$\begin{aligned}
&= \sqrt{\{a^2(1 + \cos \theta)^2 + a^2 \sin^2 \theta\}} d\theta = a\sqrt{1 + 2 \cos \theta + \cos^2 \theta + \sin^2 \theta} d\theta \\
&= a\sqrt{1 + 2 \cos \theta + 1} d\theta = a\sqrt{2(1 + \cos \theta)} d\theta = a\sqrt{4 \cos^2 \frac{\theta}{2}} d\theta = 2a \cos \frac{\theta}{2} d\theta \\
\bar{x} &= \frac{\int x dx}{\int ds} = \frac{\int_0^\pi a(\theta + \sin \theta) 2a \cos \frac{\theta}{2} d\theta}{\int_0^\pi 2a \cos \frac{\theta}{2} d\theta} = \frac{a \int_0^\pi \left(\theta + 2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}\right) d\theta}{\left[2 \sin \frac{\pi}{2}\right]_0^\pi} \\
&= \frac{a}{2} \int_0^\pi \left[\theta \cos \frac{\theta}{2} + 2 \sin \frac{\theta}{2} \cos^2 \frac{\theta}{2}\right] d\theta = \frac{a}{2} \int_0^\pi (2t \cos t + 2 \sin t \cos^2 t) 2 dt \\
&= 2a \left[t \sin t + \cos t - \frac{\cos^3 t}{3}\right]_0^\pi = 2a \left[\frac{\pi}{2} - 1 + \frac{1}{3}\right] = a \left[\pi - \frac{4}{3}\right] \\
\bar{y} &= \frac{\int y ds}{\int ds} = \frac{\int_0^\pi a(1 - \cos \theta) 2a \cos \frac{\theta}{2} d\theta}{\int_0^\pi 2a \cos \frac{\theta}{2} d\theta} = \frac{a \int_0^\pi 2 \sin^2 \frac{\theta}{2} \cos \frac{\theta}{2} d\theta}{\int_0^\pi \cos \frac{\theta}{2} d\theta} \\
&= \frac{a r \left[\sin^3 \frac{\theta}{2}\right]_0^\pi}{3 \left[2 \sin \frac{\theta}{2}\right]_0^\pi} = \frac{4a}{3 \times 2} = \frac{2a}{3} \text{ Hence, C.G. of the arc is } \left[a \left(\pi - \frac{4}{3}\right), \frac{2a}{3}\right] \quad \text{Ans.}
\end{aligned}$$

**EXERCISE 8.4**

1. Find the centre of gravity of the area bounded by the parabola  $y^2 = x$  and the line  $x + y = 2$ .

$$\text{Ans. } \left(\frac{8}{5}, -\frac{1}{2}\right)$$

2. Find the centroid of the tetrahedron bounded by the coordinate planes and the plane  $x + y + z = 1$ , the density at any point varying as its distance from the face  $z = 0$ . Ans.  $\left(\frac{1}{5}, \frac{1}{5}, \frac{2}{5}\right)$

3. Find the centroid of the area enclosed by the parabola  $y^2 = 4ax$ , the axis of  $x$  and latus rectum.

$$\text{Ans. } \left(\frac{3a}{20}, \frac{3a}{16}\right)$$

4. Find the centroid of the loop of curve  $r^2 = a^2 \cos 2\theta$ . Ans.  $\left(\frac{\pi a \sqrt{2}}{8}, 0\right)$

5. Find the centroid of solid formed by revolving about the  $x$ -axis that part of the area of the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  which lies in the first quadrant. Ans.  $\left(\frac{3a}{8}, 0\right)$

6. Find the average density of the sphere of radius  $a$  whose density at a distance  $r$  from the centre of the sphere is  $\rho = \rho_0 \left[1 + k \frac{r^3}{a^3}\right]$ .  $\rho_0 \left(1 + \frac{k}{2}\right)$

7. The density at a point on a circular lamina varies as the distance from a point O on the circumference. Show that the C.G. divides the diameter through O in the ratio 3 : 2.

# 9

## TRIPLE INTEGRATION

---

---

### 9.1 INTRODUCTION

In this chapter we will learn triple integration. Before that we will discuss the following coordinate systems.

1. Cartesian coordinates
  2. Spherical coordinates
  3. Cylindrical coordinates
- 1. Cartesian Coordinates**

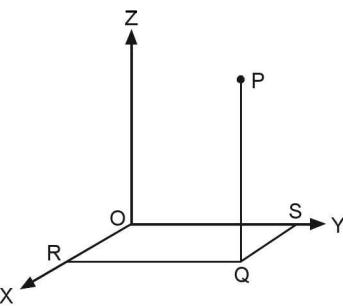

Take a point  $O$  in the space draw three mutually perpendicular lines through  $O$ .  $O$  is known as origin and these three lines are known as  $x$ -axis,  $y$ -axis,  $z$ -axis. There are three coordinate planes.

**1.  $xy$ -plane :** The plane passing through  $x$ -axis and  $y$ -axis is known as  $xy$ -plane.

**2.  $yz$ -plane :** The plane passing through  $y$ -axis and  $z$ -axis is known as  $yz$ -plane.

**3.  $zx$ -plane :** The plane passing through  $z$ -axis and  $x$ -axis is known as  $zx$ -plane.

Consider a point  $P$  in the space draw perpendicular  $PQ$  to  $xy$ -plane.  $PQ$  is known as  $z$ -coordinate; from  $Q$  draw perpendicular lines  $QR$  and  $QS$  to  $x$ -axis and  $y$ -axis respectively.  $QS$  is  $x$ -coordinate,  $QR$  is  $y$ -coordinate and small element of the solid in cartesian coordinates is  $dx dy dz$ .

**2. Spherical Coordinates**

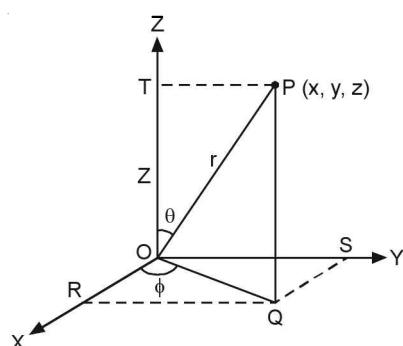

In the adjoining figure join  $OP$ ,  $OP$  is denoted by  $r$ ;  $\theta$  is called the angle between  $OP$  i.e.  $r$  and  $z$ -axis.

$\phi$  is the angle between  $x$ -axis and  $OQ$ .

Then the coordinates  $(r, \theta, \phi)$  of a point  $P$  are known as spherical coordinates.

$$\begin{aligned}
 Z &= PQ = OT = OP \cos \theta \\
 &= r \cos \theta \\
 PT &= OP \sin \theta \\
 &= r \sin \theta \\
 OQ &= r \sin \theta
 \end{aligned}$$

$\Rightarrow$

In right angled triangle  $QRO$ ,  $\angle R$  is right angle.

$$x = OR = OQ \cos \phi = r \sin \theta \cos \phi$$

Again in right angled triangle  $QSO$

$$y = OQ \sin \phi = r \sin \theta \sin \phi$$

$$\boxed{x = r \sin \theta \cos \Phi}$$

$$\boxed{y = r \sin \theta \sin \Phi}$$

$$\boxed{z = r \cos \theta}$$

Also,

$$r^2 = x^2 + y^2 + z^2$$

$$\Phi = \tan^{-1} \frac{y}{x}$$

$$\theta = \tan^{-1} \left( \frac{\sqrt{x^2 + y^2}}{z} \right)$$

If

$$J = \frac{\partial(x, y, z)}{\partial(r, \theta, \phi)}$$

$$= \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} & \frac{\partial x}{\partial \phi} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} & \frac{\partial y}{\partial \phi} \\ \frac{\partial z}{\partial r} & \frac{\partial z}{\partial \theta} & \frac{\partial z}{\partial \phi} \end{vmatrix} = r^2 \sin \theta$$

$$dx dy dz = J dr d\theta d\phi$$

$$\boxed{dx dy dz = r^2 \sin \theta dr d\theta d\phi}$$

$$x = r \sin \theta \cos \phi$$

$$y = r \sin \theta \sin \phi$$

$$z = r \cos \theta$$

### 3. Cylindrical Coordinate System

If  $PQ = z$ ,  $OQ = \rho$  and  $OQ$  makes angle  $\Phi$  with the  $x$ -axis then  $(z, \rho, \Phi)$  are called cylindrical coordinates.

$$x = \rho \cos \Phi$$

$$y = \rho \sin \Phi$$

$$z = z$$

$$\text{Also } \rho = \sqrt{x^2 + y^2}$$

$$\Phi = \tan^{-1} \left( \frac{y}{x} \right)$$

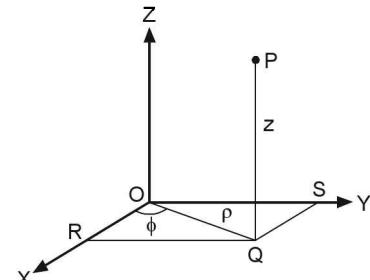

$$z = z$$

$$J = \frac{\partial(x, y, z)}{\partial(\rho, \Phi, z)} = \begin{vmatrix} \frac{\partial x}{\partial \rho} & \frac{\partial x}{\partial \Phi} & \frac{\partial x}{\partial z} \\ \frac{\partial y}{\partial \rho} & \frac{\partial y}{\partial \Phi} & \frac{\partial y}{\partial z} \\ \frac{\partial z}{\partial \rho} & \frac{\partial z}{\partial \Phi} & \frac{\partial z}{\partial z} \end{vmatrix} = \begin{vmatrix} \cos \Phi & -\rho \sin \Phi & 0 \\ \sin \Phi & \rho \cos \Phi & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

$$= \rho \cos^2 \Phi + \rho \sin^2 \Phi = \rho (\cos^2 \Phi + \sin^2 \Phi) = \rho$$

$$dx dy dz = J d\rho d\Phi dz$$

$$\boxed{dx dy dz = \rho d\rho d\Phi dz}$$

## 9.2 TRIPLE INTEGRATION

Let a function  $f(x, y, z)$  be a continuous at every point of a finite region  $S$  of three dimensional space. Consider  $n$  sub-spaces  $\delta S_1, \delta S_2, \delta S_3, \dots, \delta S_n$  of the space  $S$ .

If  $(x_r, y_r, z_r)$  be a point in the  $r$ th subspace.

The limit of the sum  $\sum_{r=1}^n f(x_r, y_r, z_r) \delta S_r$ , as  $n \rightarrow \infty, \delta S_r \rightarrow 0$  is known as the triple integral of  $f(x, y, z)$  over the space  $S$ .

Symbolically, it is denoted by

$$\iiint_S f(x, y, z) dS$$

It can be calculated as  $\int_{x_1}^{x_2} \int_{y_1}^{y_2} \int_{z_1}^{z_2} f(x, y, z) dx dy dz$ . First we integrate with respect to  $z$  treating  $x, y$  as constant between the limits  $z_1$  and  $z_2$ . The resulting expression (function of  $x, y$ ) is integrated with respect to  $y$  keeping  $x$  as constant between the limits  $y_1$  and  $y_2$ . At the end we integrate the resulting expression (function of  $x$  only) within the limits  $x_1$  and  $x_2$ .

$\int_{x_1=a}^{x_2=b} \Psi(x) dx$	$\int_{y_1=\phi_1(x)}^{y_2=\phi_2(x)} \phi(x, y) dy$	$\int_{z_1=f_1(x, y)}^{z_2=f_2(x, y)} f(x, y, z) dz$
-----------------------------------	--	--

First we integrate from inner most integral w.r.t.  $z$ , then we integrate with respect to  $y$  and finally the outer most with respect to  $x$ .

But the above order of integration is immaterial provided the limits change accordingly.

**Example 1.** Evaluate  $\iiint_R (x + y + z) dx dy dz$ , where  $R : 0 \leq x \leq 1, 1 \leq y \leq 2, 2 \leq z \leq 3$ .

**Solution.**

$$\begin{aligned} \int_0^1 dx \int_1^2 dy \int_2^3 (x + y + z) dz &= \int_0^1 dx \int_1^2 dy \left[ \frac{(x + y + z)^2}{2} \right]_2^3 \\ &= \frac{1}{2} \int_0^1 dx \int_1^2 dy [(x + y + 3)^2 - (x + y + 2)^2] = \frac{1}{2} \int_0^1 dx \int_1^2 (2x + 2y + 5) \cdot 1 \cdot dy \\ &= \frac{1}{2} \int_0^1 dx \left[ \frac{(2x + 2y + 5)^2}{4} \right]_1^2 = \frac{1}{8} \int_0^1 dx [(2x + 4 + 5)^2 - (2x + 2 + 5)^2] \\ &= \frac{1}{8} \int_0^1 (4x + 16) \cdot 2 dx = \int_0^1 (x + 4) dx = \left[ \frac{x^2}{2} + 4x \right]_0^1 = \frac{1}{2} + 4 = \frac{9}{2} \quad \text{Ans.} \end{aligned}$$

**Example 2.** Evaluate the integral :  $\int_0^{\log 2} \int_0^x \int_0^{x+\log y} e^{x+y+z} dz dy dx$ .

**Solution.**

$$\begin{aligned} &\int_0^{\log 2} \int_0^x \int_0^{x+\log y} e^{x+y+z} dz dy dx \\ &= \int_0^{\log 2} e^x dx \int_0^x e^y dy \int_0^{x+\log y} e^z dz = \int_0^{\log 2} e^x dx \int_0^x e^y dy (e^z)_0^{x+\log y} \\ &= \int_0^{\log 2} e^x dx \int_0^x e^y dy (e^{x+\log y} - 1) = \int_0^{\log 2} e^x dx \int_0^x e^y dy (e^{\log y} \cdot e^x - 1) \\ &= \int_0^{\log 2} e^x dx \int_0^x e^y (ye^x - 1) dy = \int_0^{\log 2} e^x dx \left[ (ye^x - 1)e^y - \int e^x \cdot e^y dy \right]_0^x \\ &= \int_0^{\log 2} e^x dx \left[ (ye^x - 1)e^y - e^{x+y} \right]_0^x = \int_0^{\log 2} e^x dx [(xe^x - 1)e^x - e^{2x} + 1 + e^x] \\ &= \int_0^{\log 2} e^x dx [xe^{2x} - e^x - e^{2x} + 1 + e^x] = \int_0^{\log 2} (xe^{3x} - e^{3x} + e^x) dx \end{aligned}$$

$$\begin{aligned}
&= \left[ x \frac{e^{3x}}{3} - \int 1 \cdot \frac{e^{3x}}{3} dx - \frac{e^{3x}}{3} + e^x \right]_0^{\log 2} = \left[ \frac{x}{3} e^{3x} - \frac{e^{3x}}{9} - \frac{e^{3x}}{3} + e^x \right]_0^{\log 2} \\
&= \frac{\log 2}{3} e^{3 \log 2} - \frac{e^{3 \log 2}}{9} - \frac{e^{3 \log 2}}{3} + e^{\log 2} + \frac{1}{9} + \frac{1}{3} - 1 \\
&= \frac{\log 2}{3} e^{\log 2^3} - \frac{e^{\log 2^3}}{9} - \frac{e^{\log 2^3}}{3} + e^{\log 2} + \frac{1}{9} + \frac{1}{3} - 1 \\
&= \frac{8}{3} \log 2 - \frac{8}{9} - \frac{8}{3} + 2 + \frac{1}{9} + \frac{1}{3} - 1 = \frac{8}{3} \log 2 - \frac{19}{9}
\end{aligned}$$

**Ans.**

**Example 3.** Evaluate  $\int_0^{\log 2} \int_0^x \int_0^{x+y} e^{x+y+z} dx dy dz$ .

(M.U. II Semester, 2005, 2003, 2002)

$$\begin{aligned}
\text{Solution. } I &= \int_0^{\log 2} \int_0^x e^{x+y} \left[ e^z \right]_0^{x+y} dx dy \\
&= \int_0^{\log 2} \int_0^x e^{x+y} (e^{x+y} - 1) dx dy = \int_0^{\log 2} \int_0^x \left[ e^{2(x+y)} - e^{(x+y)} \right] dx dy \\
&= \int_0^{\log 2} \left[ e^{2x} \cdot \frac{e^{2y}}{2} - e^x \cdot e^y \right]_0^x dx = \int_0^{\log 2} \left( \frac{e^{4x}}{2} - e^{2x} - \frac{e^{2x}}{2} + e^x \right) dx \\
&= \left[ \frac{e^{4x}}{8} - \frac{e^{2x}}{2} - \frac{e^{2x}}{4} + e^x \right]_0^{\log 2} = \left[ \frac{e^{4 \log 2}}{8} - \frac{e^{2 \log 2}}{2} - \frac{e^{2 \log 2}}{4} + e^{\log 2} \right] - \left( \frac{1}{8} - \frac{1}{2} - \frac{1}{4} + 1 \right) \\
&= \left( \frac{e^{\log 16}}{8} - \frac{e^{\log 4}}{2} - \frac{e^{\log 4}}{4} + e^{\log 2} \right) - \left( \frac{1}{8} - \frac{1}{2} - \frac{1}{4} + 1 \right) \\
&= \left( \frac{16}{8} - \frac{4}{2} - \frac{4}{4} + 2 \right) - \left( \frac{1}{8} - \frac{1}{2} - \frac{1}{4} + 1 \right) = \frac{5}{8}
\end{aligned}$$

**Ans.**

**Example 4.** Evaluate  $\iiint_R (x^2 + y^2 + z^2) dx dy dz$

where  $R$  denotes the region bounded by  $x = 0$ ,  $y = 0$ ,  $z = 0$  and  $x + y + z = a$ , ( $a > 0$ )

**Solution.**  $\iiint_R (x^2 + y^2 + z^2) dx dy dz$

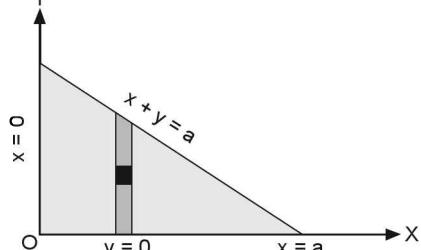

$$x + y + z = a \quad \text{or} \quad z = a - x - y$$

Upper limit of  $z = a - x - y$

On x-y plane,  $x + y + z = a$  becomes  $x + y = a$  as shown in the figure.

Upper limit of  $y = a - x$

Upper limit of  $x = a$

$$\begin{aligned}
&= \int_{x=0}^a dx \int_{y=0}^{a-x} dy \int_{z=0}^{a-x-y} (x^2 + y^2 + z^2) dz = \int_0^a dx \int_0^{a-x} dy \left( x^2 z + y^2 z + \frac{z^3}{3} \right)_{0}^{a-x-y} \\
&= \int_0^a dx \int_0^{a-x} dy \left[ x^2(a-x-y) + y^2(a-x-y) + \frac{(a-x-y)^3}{3} \right] \\
&= \int_0^a dx \int_0^{a-x} \left[ x^2(a-x) - x^2 y + (a-x) y^2 - y^3 + \frac{(a-x-y)^3}{3} \right] dy \\
&= \int_0^a dx \left[ x^2(a-x) y - \frac{x^2 y^2}{2} + (a-x) \frac{y^3}{3} - \frac{y^4}{4} - \frac{(a-x-y)^4}{12} \right]_0^{a-x}
\end{aligned}$$

$$\begin{aligned}
&= \int_0^a dx \left[ x^2(a-x)^2 - \frac{x^2}{2}(a-x)^2 + (a-x) \frac{(a-x)^3}{3} - \frac{(a-x)^4}{4} + \frac{(a-x)^4}{12} \right] \\
&= \int_0^a \left[ \frac{x^2}{2}(a-x)^2 + \frac{(a-x)^4}{6} \right] dx = \int_0^a \left[ \frac{1}{2}(a^2x^2 - 2ax^3 + x^4) + \frac{(a-x)^4}{6} \right] dx \\
&= \left[ \frac{1}{2}a^2 \frac{x^3}{3} - \frac{ax^4}{4} + \frac{x^5}{10} - \frac{(a-x)^5}{30} \right]_0^a = \frac{a^5}{6} - \frac{a^5}{4} + \frac{a^5}{10} + \frac{a^5}{30} = \frac{a^5}{20} \quad \text{Ans.}
\end{aligned}$$

**Example 5.** Compute  $\iiint \frac{dx dy dz}{(x+y+z+1)^3}$  if the region of integration is bounded by the coordinate planes and the plane  $x+y+z=1$ . (M.U., II Semester 2007, 2006)

**Solution.** Let the given region be  $R$ , then  $R$  is expressed as

$$0 \leq z \leq 1-x-y, \quad 0 \leq y \leq 1-x, \quad 0 \leq x \leq 1.$$

$$\begin{aligned}
\iiint_R \frac{dx dy dz}{(x+y+z+1)^3} &= \int_0^1 dx \int_0^{1-x} dy \int_0^{1-x-y} \frac{dz}{(x+y+z+1)^3} \\
&= \int_0^1 dx \int_0^{1-x} dy \left[ \frac{1}{-2(x+y+z+1)^2} \right]_0^{1-x-y} \\
&= -\frac{1}{2} \int_0^1 dx \int_0^{1-x} dy \left[ \frac{1}{(x+y+1-x-y+1)^2} - \frac{1}{(x+y+1)^2} \right] \\
&= -\frac{1}{2} \int_0^1 dx \int_0^{1-x} \left[ \frac{1}{4} - \frac{1}{(x+y+1)^2} \right] dy = -\frac{1}{2} \int_0^1 dx \left[ \frac{y}{4} + \frac{1}{x+y+1} \right]_0^{1-x} \\
&= -\frac{1}{2} \int_0^1 dx \left[ \frac{1-x}{4} + \frac{1}{x+1+1-x} - \frac{1}{x+1} \right] = -\frac{1}{2} \int_0^1 \left[ \frac{1-x}{4} + \frac{1}{2} - \frac{1}{x+1} \right] dx \\
&= -\frac{1}{2} \left[ -\frac{(1-x)^2}{8} + \frac{x}{2} - \log(x+1) \right]_0^1 = -\frac{1}{2} \left[ \frac{1}{2} - \log 2 + \frac{1}{8} \right] = -\frac{1}{2} \left[ \frac{5}{8} - \log 2 \right] \\
&= \frac{1}{2} \log 2 - \frac{5}{16} \quad \text{Ans.}
\end{aligned}$$

**Example 6.** Compute  $\iiint_V x^2 dx dy dz$  over volume of tetrahedron bounded by

$$x=0, \quad y=0, \quad z=0 \quad \text{and} \quad \frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1. \quad (\text{M.U. II Semester, 2008})$$

**Solution.** Here, we have

$$I = \iiint_V x^2 dx dy dz \quad \dots(1)$$

Where  $V$  is bounded by  $x=0, y=0, z=0$  and  $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$

Putting  $\frac{x}{a} = u, \frac{y}{b} = v, \frac{z}{c} = w$  so that  $dx = a du, dy = b dv, dz = c dw$   
in (1), we get

$$\begin{aligned}
I &= \int_0^1 \int_0^{1-u} \int_0^{1-u-v} a^2 u^2 (adu) (bdv) (cdw) \\
&= a^3 bc \int_0^1 u^2 du \int_0^{1-u} dv \int_0^{1-u-v} dw = a^3 bc \int_0^1 u^2 du \int_0^{1-u} dv [w]_0^{1-u-v} \\
&= a^3 bc \int_0^1 u^2 du \int_0^{1-u} (1-u-v) dv = a^3 bc \int_0^1 u^2 du \left[ v - uv - \frac{v^2}{2} \right]_0^{1-u} \\
&= a^3 bc \int_0^1 u^2 \left[ 1 - u - u(1-u) - \frac{(1-u)^2}{2} \right] du
\end{aligned}$$

$$\begin{aligned}
 &= a^3bc \int_0^1 u^2 \left[ 1 - u - u + u^2 - \frac{1}{2} - \frac{u^2}{2} + u \right] du \\
 &= a^3bc \int_0^1 u^2 \left( \frac{1}{2} - u + \frac{1}{2}u^2 \right) du = a^3bc \int_0^1 \left( \frac{u^2}{2} - u^3 + \frac{u^4}{2} \right) du \\
 &= a^3bc \left[ \frac{1}{2} \cdot \frac{u^3}{3} - \frac{u^4}{4} + \frac{1}{2} \cdot \frac{u^5}{5} \right]_0^1 = a^3bc \left[ \frac{1}{6} - \frac{1}{4} + \frac{1}{10} \right] = a^3bc \left( \frac{1}{60} \right) = \frac{a^3bc}{60} \quad \text{Ans.}
 \end{aligned}$$

**Example 7.** Evaluate  $\iiint x^2yz \, dx \, dy \, dz$  throughout the volume bounded by the planes  $x = 0$ ,

$$y = 0, z = 0, \frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1. \quad (\text{M.U. II Semester 2003, 2002, 2001})$$

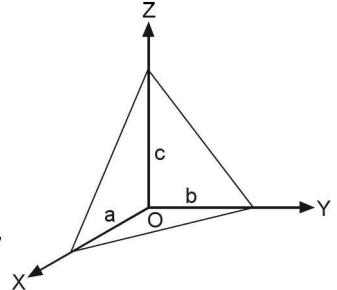

**Solution.** Here, we have

$$I = \iiint x^2yz \, dx \, dy \, dz \quad \dots(1)$$

Putting  $x = au$ ,  $y = bv$ ,  $z = cw$   
 $dx = a \, du$ ,  $dy = b \, dv$ ,  $dz = c \, dw$  in (1), we get

$$I = \iiint a^2bc u^2vw \, a \, bc \, du \, dv \, dw$$

Limits are for  $u = 0, 1$  for  $v = 0, 1 - u$  and for  $w = 0, 1 - u - v$   
 $u + v + w = 1$

$$\begin{aligned}
 I &= \int_{u=0}^1 \int_{v=0}^{1-u} \int_{w=0}^{1-u-v} a^3b^2c^2 u^2vw \, du \, dv \, dw = \int_0^1 \int_0^{1-u} a^3b^2c^2 u^2v \left[ \frac{w^2}{2} \right]_0^{1-u-v} \, du \, dv \\
 &= \frac{a^3b^2c^2}{2} \int_0^1 \int_0^{1-u} u^2v(1-u-v)^2 \, du \, dv \\
 &= \frac{a^3b^2c^2}{2} \int_0^1 \int_0^{1-u} u^2v \left[ (1-u)^2 - 2(1-u)v + v^2 \right] \, du \, dv \\
 &= \frac{a^3b^2c^2}{2} \int_0^1 \int_0^{1-u} u^2 \left[ (1-u)^2v - 2(1-u)v^2 + v^3 \right] \, du \, dv \\
 &= \frac{a^3b^2c^2}{2} \int_0^1 u^2 \left[ (1-u)^2 \frac{v^2}{2} - 2(1-u) \frac{v^3}{3} + \frac{v^4}{4} \right]_0^{1-u} \, du \\
 &= \frac{a^3b^2c^2}{2} \int_0^1 u^2 \left[ \frac{(1-u)^4}{2} - \frac{2(1-u)^4}{3} + \frac{(1-u)^4}{4} \right] \, du \\
 &= \frac{a^3b^2c^2}{2} \int_0^1 \frac{u^2(1-u)^4}{12} \, du = \frac{a^3b^2c^2}{24} \int_0^1 u^3(1-u)^5 \, du \\
 &= \frac{a^3b^2c^2}{24} \beta(3, 5) = \frac{a^3b^2c^2}{24} \cdot \frac{\sqrt{3}}{\sqrt{5}} = \frac{a^3b^2c^2}{24} \cdot \left( \frac{2!4!}{7!} \right) = \frac{a^3b^2c^2}{2520}. \quad \text{Ans.}
 \end{aligned}$$

### 9.3 INTEGRATION BY CHANGE OF CARTESIAN COORDINATES INTO SPHERICAL COORDINATES

Sometime it becomes easy to integrate by changing the cartesian coordinates into spherical coordinates.

The relations between the cartesian and spherical polar co-ordinates of a point are given by the relations

$$\begin{aligned}
 x &= r \sin \theta \cos \phi \\
 y &= r \sin \theta \sin \phi \\
 z &= r \cos \theta
 \end{aligned}$$

$$\begin{aligned} dx \, dy \, dz &= |J| \, dr \, d\theta \, d\phi \\ &= r^2 \sin \theta \, dr \, d\theta \, d\phi \end{aligned}$$

- Note.** 1. Spherical coordinates are very useful if the expression  $x^2 + y^2 + z^2$  is involved in the problem.  
 2. In a sphere  $x^2 + y^2 + z^2 = a^2$  the limits of  $r$  are 0 and  $a$  and limits of  $\theta$  are 0,  $\pi$  and that of  $\phi$  are 0 and  $2\pi$ .

**Example 8.** Evaluate the integral  $\iiint (x^2 + y^2 + z^2) \, dx \, dy \, dz$  taken over the volume enclosed by the sphere  $x^2 + y^2 + z^2 = 1$ .

**Solution.** Let us convert the given integral into spherical polar co-ordinates. By putting

$$\begin{aligned} x &= r \sin \theta \cos \phi; \quad y = r \sin \theta \sin \phi; \quad z = r \cos \theta \\ \iiint (x^2 + y^2 + z^2) \, dx \, dy \, dz &= \int_0^{2\pi} \int_0^\pi \int_0^1 r^2 (r^2 \sin \theta) \, d\theta \, d\phi \, dr \\ &= \int_0^{2\pi} d\phi \int_0^\pi \sin \theta \, d\theta \int_0^1 r^4 \, dr = \int_0^{2\pi} d\phi \int_0^\pi \sin \theta \, d\theta \left( \frac{r^5}{5} \right)_0^1 = \frac{1}{5} \int_0^{2\pi} d\phi [-\cos \theta]_0^\pi = \frac{2}{5} \int_0^{2\pi} d\phi \\ &= \frac{2}{5} (\phi)_0^{2\pi} = \frac{4\pi}{5} \end{aligned} \quad \text{Ans.}$$

**Example 9.** Evaluate  $\iiint (x^2 + y^2 + z^2) \, dx \, dy \, dz$  over the first octant of the sphere  $x^2 + y^2 + z^2 = a^2$ . (M.U. II Semester 2007)

**Solution.** Here, we have

$$I = \iiint (x^2 + y^2 + z^2) \, dx \, dy \, dz \quad \dots(1)$$

Putting  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$  and  $dx \, dy \, dz = r^2 \sin \theta \, dr \, d\theta \, d\phi$  in (1), we get

Limits of  $r$  are 0,  $a$  for  $\theta$  are 0,  $\frac{\pi}{2}$  for  $\phi$  are 0,  $\frac{\pi}{2}$ .

$$\begin{aligned} I &= \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^a r^2 \cdot r^2 \sin \theta \, dr \, d\theta \, d\phi = \int_0^{\frac{\pi}{2}} d\phi \int_0^{\frac{\pi}{2}} \sin \theta \, d\theta \int_0^a r^4 \, dr \\ &\quad \left( \begin{array}{l} x^2 + y^2 + z^2 = r^2 \sin^2 \theta \cos^2 \phi + r^2 \sin^2 \theta \sin^2 \phi + r^2 \cos^2 \theta \\ = r^2 \sin^2 \theta + r^2 \cos^2 \theta = r^2 \end{array} \right) \\ &= [\phi]_0^{\pi/2} [-\cos \theta]_0^{\pi/2} \left[ \frac{r^5}{5} \right]_0^a = \frac{\pi}{2} \cdot (1) \cdot \frac{a^5}{5} = \pi \cdot \frac{a^5}{10}. \end{aligned} \quad \text{Ans.}$$

**Example 10.** Evaluate  $\iiint \frac{dx \, dy \, dz}{x^2 + y^2 + z^2}$  throughout the volume of the sphere  $x^2 + y^2 + z^2 = a^2$ .

(M.U. II Semester 2002, 2001)

**Solution.** Here, we have

$$I = \iiint \frac{dx \, dy \, dz}{x^2 + y^2 + z^2} \quad \dots(1)$$

Putting  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$  and  $dx \, dy \, dz = r^2 \sin \theta \, dr \, d\theta \, d\phi$  in (1), we get

The limits of  $r$  are 0 and  $a$ , for  $\theta$  are 0 and  $\frac{\pi}{2}$  for  $\phi$  are 0 and  $\frac{\pi}{2}$  in first octant.

$$I = 8 \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^a \frac{r^2 \sin \theta \, dr \, d\theta \, d\phi}{r^2} \quad [\text{Sphere } x^2 + y^2 + z^2 \text{ lies in 8 quadrants}]$$

$$\begin{aligned}
 I &= 8 \int_0^{\frac{\pi}{2}} d\phi \int_0^{\frac{\pi}{2}} \sin \theta \, d\theta \int_0^a dr = 8 [\phi]_0^{\pi/2} [-\cos \theta]_0^{\pi/2} [r]_0^a = 8 \left( \frac{\pi}{2} - 0 \right) (0 + 1)(a + 0) \\
 &= 8 \frac{\pi}{2} \cdot 1 \cdot a = 4\pi a
 \end{aligned}
 \quad \text{Ans.}$$

**Example 11.** Evaluate  $\iiint \frac{z^2 dx dy dz}{x^2 + y^2 + z^2}$  over the volume of the sphere  $x^2 + y^2 + z^2 = 2$ .

(M.U. II Semester 2005, 2004)

**Solution.** Here, we have

$$I = \iiint \frac{z^2 dx dy dz}{x^2 + y^2 + z^2} \quad \dots(1)$$

Putting  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$ ,  $dx dy dz = r^2 \sin \theta \, dr \, d\theta \, d\phi$  in (1), we get

[The limits  $r$ ,  $\theta$  and  $\phi$  over the first octant of  $x^2 + y^2 + z^2 = r^2$  are 0,  $\sqrt{2}$ ; 0,  $\frac{\pi}{2}$  and 0,  $\frac{\pi}{2}$ .]

$$\begin{aligned}
 I &= 8 \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^{\sqrt{2}} \frac{r^4 \cos^2 \theta \sin \theta}{r^2} \, dr \, d\theta \, d\phi = 8 \int_0^{\frac{\pi}{2}} d\phi \int_0^{\frac{\pi}{2}} \cos^2 \theta \sin \theta \, d\theta \cdot \int_0^{\sqrt{2}} r^2 \, dr \\
 &= 8 [\phi]_0^{\pi/2} \left[ -\frac{\cos^3 \theta}{3} \right]_0^{\pi/2} \left[ \frac{r^3}{3} \right]_0^{\sqrt{2}} = 8 \frac{\pi}{2} \cdot \frac{1}{3} \cdot \frac{2\sqrt{2}}{3} = \frac{8\pi\sqrt{2}}{9}.
 \end{aligned}
 \quad \text{Ans.}$$

**Example 12.** Evaluate  $\iiint xyz \, dx \, dy \, dz$  over the positive octant of the sphere  $x^2 + y^2 + z^2 = a^2$ .

(M.U. II Semester, 2002)

**Solution.** Here, we have

$$I = \iiint xyz \, dx \, dy \, dz \text{ over the first quadrant} \quad \dots(1)$$

Putting  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$ ,  $dx \, dy \, dz = r^2 \sin \theta \, dr \, d\theta \, d\phi$  in (1), we get

$$\begin{aligned}
 I &= \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^a (r \sin \theta \cos \phi)(r \sin \theta \sin \phi)(r \cos \theta)(r^2 \sin \theta \, d\theta \, dr \, d\phi) \\
 I &= \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^a r^5 \sin^3 \theta \cos \theta \sin \phi \cos \phi \, dr \, d\theta \, d\phi \\
 &= \int_0^{\frac{\pi}{2}} \sin \phi \cos \phi \, d\phi \int_0^{\frac{\pi}{2}} \sin^3 \theta \cos \theta \, d\theta \int_0^a r^5 \, dr \\
 &= \left[ \frac{\sin^2 \phi}{2} \right]_0^{\pi/2} \left[ \frac{\sin^4 \theta}{4} \right]_0^{\pi/2} \left[ \frac{r^6}{6} \right]_0^a = \frac{1}{2} \cdot \frac{1}{4} \cdot \frac{a^6}{6} = \frac{a^6}{48}.
 \end{aligned}
 \quad \begin{array}{l} \text{In first octant of } x^2 + y^2 + z^2 = a^2 \\ \text{Limits of } r = 0 \text{ and } a \\ \text{for } \theta = 0 \text{ and } \frac{\pi}{2} \\ \text{for } \phi = 0 \text{ and } \frac{\pi}{2}. \end{array} \quad \text{Ans.}$$

**Example 13.** Evaluate  $\iiint \sqrt{x^2 + y^2} \, dx \, dy \, dz$  over the volume bounded by the right circular cone  $x^2 + y^2 = z^2$ ,  $z > 0$  and the planes  $z = 0$  and  $z = 1$ .

(M.U. II Semester, 2004, 2002)

**Solution.** Here, we have

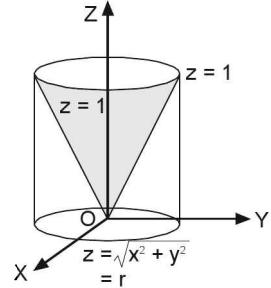

$$I = \iiint \sqrt{x^2 + y^2} \, dx \, dy \, dz \quad \dots(1)$$

Putting  $x = r \cos \theta$ ,  $y = r \sin \theta$ ,  $z = z$  (cylindrical coordinates),

$dx \, dy \, dz = r \, dr \, d\theta \, dz$  in (1), we get

[Now limits for  $r$  are 0 to 1 for  $\theta$  are 0 to  $2\pi$  for  $z$  are  $r$  to 1.]

$$\begin{aligned}
 I &= \int_0^1 r^2 dr \int_0^{2\pi} d\theta \int_r^1 dz \\
 &= \int_0^1 r^2 dr [\theta]_0^{2\pi} [z]_r^1 \\
 &= \int_0^1 r^2 \cdot 2\pi \cdot (1-r) dr \\
 &= 2\pi \left[ \frac{r^3}{3} - \frac{r^4}{4} \right]_0^1 = \frac{2\pi}{12} = \frac{\pi}{6} \quad \text{Ans.}
 \end{aligned}$$

**Example 14.** Evaluate  $\iiint xyz(x^2 + y^2 + z^2) dx dy dz$  over the first octant of the sphere  $x^2 + y^2 + z^2 = a^2$ . (M.U. II Semester 2009, 2005, 2004, 2002)

**Solution.** Here, we have

$$I = \iiint xyz(x^2 + y^2 + z^2) dx dy dz \quad \dots(1)$$

Putting  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$ ,  $dx dy dz = r^2 \sin \theta dr d\theta d\phi$  in (1), we get

$$\begin{aligned}
 &\left( x^2 + y^2 + z^2 = r^2 \sin^2 \theta \cos^2 \phi + r^2 \sin^2 \theta \sin^2 \phi + r^2 \cos^2 \theta \right) \\
 &= r^2 \sin^2 \theta + r^2 \cos^2 \theta = r^2 \\
 &\left[ \text{Limits of } r, \theta \text{ and } \phi \text{ in the first octant are } 0, a ; 0, \frac{\pi}{2} \text{ and } 0, \frac{\pi}{2} \right]
 \end{aligned}$$

$$\begin{aligned}
 I &= \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^a r^3 \sin^2 \theta \cos \theta \sin \phi \cos \phi r^2 \cdot r^2 \sin \theta dr d\theta d\phi \\
 &= \int_0^{\frac{\pi}{2}} \sin \phi \cos \phi d\phi \int_0^{\frac{\pi}{2}} \sin^3 \theta \cos \theta d\theta \int_0^a r^7 dr \\
 &= \left[ \frac{\sin^2 \phi}{2} \right]_0^{\frac{\pi}{2}} \left[ \frac{\sin^4 \theta}{4} \right]_0^{\frac{\pi}{2}} \left[ \frac{r^8}{8} \right]_0^a = \frac{1}{2} \cdot \frac{1}{4} \cdot \frac{a^8}{8} = \frac{a^8}{64} \quad \text{Ans.}
 \end{aligned}$$

**Example 15.** Evaluate  $\iiint (x^2 y^2 + y^2 z^2 + z^2 x^2) dx dy dz$  over the volume of the sphere  $x^2 + y^2 + z^2 = a^2$ . (M.U. II Semester 2003, 2002)

**Solution.** Here, we have

$$I = \iiint (x^2 y^2 + y^2 z^2 + z^2 x^2) dx dy dz \quad \dots(1)$$

Putting  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$ ,  $dx dy dz = r^2 \sin \theta dr d\theta d\phi$ , in (1), we get

$$\left[ \text{In first octant the limits of } r \text{ are } 0, a \text{ for } \theta \text{ are } 0, \frac{\pi}{2} \text{ for } \phi \text{ are } 0 \text{ and } \frac{\pi}{2} \right]$$

$$\begin{aligned}
 I &= 8 \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^a (r^4 \sin^4 \theta \sin^2 \phi \cos^2 \phi + r^4 \sin^2 \theta \cos^2 \theta \sin^2 \phi + \\
 &\quad r^4 \sin^2 \theta \cos^2 \theta \cos^2 \phi) \cdot r^2 \sin \theta dr d\theta d\phi \\
 &= 8 \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_0^a r^6 (\sin^4 \theta \sin^2 \phi \cos^2 \phi + \sin^2 \theta \cos^2 \theta) \sin \theta dr d\theta d\phi \\
 &= 8 \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} (\sin^4 \theta \sin^2 \phi \cos^2 \phi + \sin^2 \theta \cos^2 \theta) \cdot \sin \theta d\theta d\phi \int_0^a r^6 dr
 \end{aligned}$$

$$\begin{aligned}
&= \frac{8a^7}{7} \left[ \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \sin^5 \theta \sin^2 \phi \cos^2 \phi d\theta d\phi + \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \sin^3 \theta \cos^2 \theta d\theta d\phi \right] \\
&= \frac{8a^7}{7} \left[ \int_0^{\frac{\pi}{2}} \sin^5 \theta d\theta \int_0^{\frac{\pi}{2}} \sin^2 \phi \cos^2 \phi d\phi + \int_0^{\frac{\pi}{2}} \sin^3 \theta \cos^2 \theta d\theta \int_0^{\frac{\pi}{2}} d\phi \right] \\
&= \frac{8a^7}{7} \left[ \frac{1}{2} \cdot \frac{2!}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} + \frac{1}{2} \cdot \frac{1!}{2} \cdot \frac{1}{2} \cdot \frac{\pi}{2} \right] \\
&= \frac{8a^7}{7} \left[ \frac{1}{2} \cdot \frac{2!}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{\sqrt{\pi}}{2!} \cdot \frac{1}{2} \cdot \frac{\sqrt{\pi}}{2!} + \frac{1}{2} \cdot \frac{1!}{2} \cdot \frac{1}{2} \cdot \frac{\pi}{2} \right] \\
&= \frac{8a^7}{7} \left[ \frac{8}{15} \cdot \frac{1}{16} \cdot \pi + \frac{1}{15} \cdot \pi \right] = \frac{8a^7}{7} \left[ \frac{1}{30} + \frac{1}{15} \right] \pi = \frac{8a^7}{7} \cdot \frac{1}{10} \pi = \frac{4a^7 \pi}{35} \text{ Ans.}
\end{aligned}$$

**EXERCISE 9.1****Evaluate the following :**

1.  $\int_{-1}^1 \int_{-2}^2 \int_{-3}^3 dx dy dz$  (M.U., II Semester 2002) **Ans. 48**
2.  $\int_0^4 \int_0^x \int_0^{x+y} z dz dy dx$  (R.G.P.V. Bhopal I Sem. 2003) **Ans. 70**
3.  $\int_1^2 \int_0^1 \int_{-1}^1 (x^2 + y^2 + z^2) dx dy dz$  **Ans. 6**
4.  $\int_0^1 \int_0^1 \int_0^1 (x^2 + y^2 + z^2) dz dy dx$  (AMIETE, June 2006) **Ans. 1**
5.  $\int_{-1}^1 \int_0^z \int_{x-z}^{x+z} (x - y + z) dx dy dz$  (AMIETE, Summer 2004) **Ans. 0**
6.  $\iiint_R (x - y - z) dx dy dz$ , where  $R : 1 \leq x \leq 2; 2 \leq y \leq 3; 1 \leq z \leq 3$  **Ans. 2**
7.  $\int_0^2 \int_1^3 \int_1^2 xy^2 z dx dy dz$  (AMIETE, Dec. 2007) **Ans. 26**
8.  $\int_0^1 dx \int_0^2 dy \int_1^2 x^2 yz dz$  **Ans. 1**
9.  $\iiint_T x^2 yz dx dy dz$  throughout the volume bounded by  $x = 0, y = 0, z = 0, x + y + z = 1$ .  
(M.U. II Semester, 2003) **Ans.  $\frac{1}{2520}$**
10.  $\int_0^1 \int_0^{1-x} \int_0^{1-x^2-y^2} dz dy dx$  **Ans.  $\frac{1}{3}$**
11.  $\int_1^e \int_1^{\log y} \int_1^{e^x} \log z dz dx dy$  **Ans.  $\frac{1}{2}(e^2 - 8e + 13)$**
12.  $\iiint_T y dx dy dz$ , where  $T$  is the region bounded by the surfaces  $x = y^2, x = y + 2, 4z = x^2 + y^2$  and  $z = y + 3$ .  
(AMIETE Dec. 2008) **Ans.  $\frac{92}{15}$**
13.  $\int_0^2 \int_0^x \int_0^{2x+2y} e^{x+y+z} dz dy dx$  (M.U. II Semester, 2003)  
**Ans.**  $\frac{1}{3} \left[ \frac{e^{12}}{6} - \frac{e^6}{3} - \frac{1}{6} + \frac{1}{3} \right] - \frac{1}{2} [e^4 - 1] + [e^2 - 1]$

14.  $\iiint (x+y+z) \, dx \, dy \, dz$  over the tetrahedron bounded by the planes  $x = 0, y = 0, z = 0$  and

$$x + y + z = 1.$$

**Ans.**  $\frac{1}{8}$

15.  $\int_0^a \int_0^{a-x} \int_0^{a-x-y} x^2 \, dx \, dy \, dz$

**Ans.**  $\frac{a^5}{60}$

16.  $\int_{-2}^2 \int_{-\sqrt{(4-x^2)/2}}^{\sqrt{(4-x^2)/2}} \int_{x^2+3y^2}^{8-x^2-y^2} dz \, dy \, dx$

**Ans.**  $8\sqrt{2}\pi$

17.  $\int_{-1}^1 \int_0^z \int_{x-z}^{x+z} (x+y+z) \, dz \, dx \, dy$

(M.U. II Semester, 2000, 02)

**Ans.** 0

18.  $\int_0^2 \int_0^y \int_{x-y}^{x+y} (x+y+z) \, dx \, dy \, dz$

(M.U. II Semester 2004)

**Ans.** 16

19.  $\iiint \sqrt{1 - \frac{x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{c^2}} \, dx \, dy \, dz$  throughout the volume of the ellipsoid  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ .

**Ans.**  $\frac{\pi^2}{4} abc$

20.  $\iiint \sqrt{\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2}} \, dx \, dy \, dz$  over the volume of the ellipsoid  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ . **Ans.**  $\frac{4\pi}{3} abc$

21.  $\iiint x^{l-1} y^{m-1} z^{n-1} \, dx \, dy \, dz$

throughout the volume of the tetrahedron  $x \geq 0, y \geq 0, z \geq 0, x + y + z \leq 1$ .

**Ans.**  $\frac{1}{(l+m+n)} \cdot \frac{|l|m|n|}{|l+m+n|}$

22.  $\iiint \frac{dx \, dy \, dz}{\sqrt{1-x^2-y^2-z^2}}$  taken throughout the volume of the sphere  $x^2 + y^2 + z^2 = 1$ , lying in the first

octant.

**Ans.**  $\frac{\pi^2}{8}$

23.  $\int_0^\pi 2d\theta \int_0^{a(1+\cos\theta)} r \, dr \int_0^h \left[ 1 - \frac{r}{a(1+\cos\theta)} \right] dz$

**Ans.**  $\frac{\pi a^2}{2} h$

24.  $\int_0^{\pi/2} \int_0^{a\sin\theta} \int_0^{(a^2-r^2)/a} r \, dr \, d\theta \, dz$

**Ans.**  $\frac{5a^3}{64}$

25.  $\iiint z^2 \, dx \, dy \, dz$  over the volume common to the sphere  $x^2 + y^2 + z^2 = a^2$  and the cylinder

$$x^2 + y^2 + z^2 = ax.$$

**Ans.**  $\frac{2a^5\pi}{15}$

26.  $\iiint_V \frac{dx \, dy \, dz}{(1+x^2+y^2+z^2)^2}$  where  $V$  is the volume in the first octant.

**Ans.**  $\frac{\pi^2}{8}$

27.  $\iiint \frac{dx \, dy \, dz}{(x^2+y^2+z^2)^{3/2}}$  over the volume bounded by the spheres  $x^2 + y^2 + z^2 = 16$  and  $x^2 + y^2 + z^2 = 25$ . (M.U. II Semester, 2001, 03) **Ans.**  $4\pi \log(5/4)$

28.  $\iiint_T z^2 \, dx \, dy \, dz$  over the volume bounded by the cylinder  $x^2 + y^2 = a^2$  and the paraboloid

$$x^2 + y^2 = z \text{ and the plane } z = 0.$$

**Ans.**  $\frac{\pi a^8}{12}$

29.  $\iiint_T z \, dx \, dy \, dz$ , where  $T$  is region bounded by the cone  $x^2 \tan^2 \alpha + y^2 \tan^2 \beta = z^2$  and the planes  $z = 0$  to  $z = h$  in the first octant. (AMIETE, Dec. 2009)

## APPLICATION OF TRIPLE INTEGRATION

---

---

### 10.1 INTRODUCTION

In this chapter we will discuss how to find out volume, surface area, mass, C.G., moment of Inertia of solids and centre of pressure of fluids.

$$10.2 \text{ VOLUME} = \iiint dx dy dz.$$

The elementary volume  $\delta V$  is  $\delta x \cdot \delta y \cdot \delta z$  and therefore the volume of the whole solid is obtained by evaluating the triple integral.

$$\delta V = \delta x \delta y \delta z$$

$$V = \iiint_V dx dy dz.$$

**Note :** (i) Mass = volume  $\times$  density

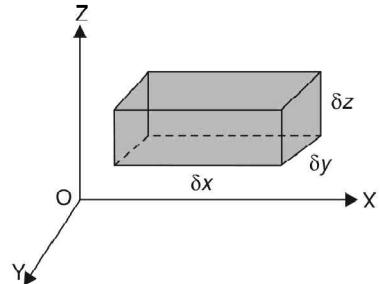

$$= \iiint_V \rho dx dy dz \text{ if } \rho \text{ is the density.}$$

(ii) In cylindrical co-ordinates, we have

$$V = \iiint_V r dr d\phi dz$$

(iii) In spherical polar co-ordinates, we have

$$V = \iiint_V r^2 \sin \theta dr d\theta d\phi$$

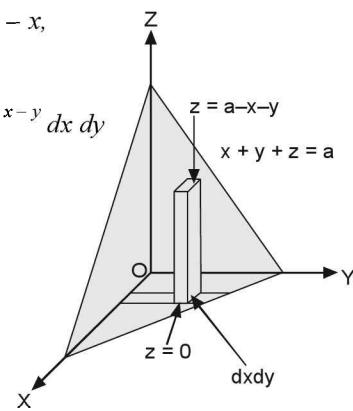

**Example 1.** Find the volume of the tetrahedron bounded by the planes  $x = 0$ ,  $y = 0$ ,  $z = 0$  and  $x + y + z = a$ .  
(M.U. II Semester, 2005, 2000)

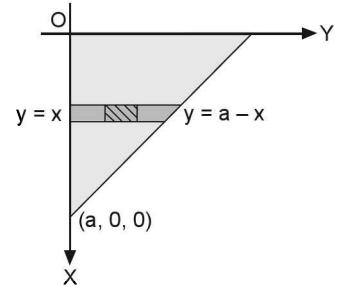

**Solution.** Here, we have a solid which is bounded by  $x = 0$ ,  $y = 0$ ,  $z = 0$  and  $x + y + z = a$  planes.

The limits of  $z$  are 0 and  $a - x - y$ , the limits of  $y$  are 0 and  $1 - x$ ,  
the limits of  $x$  are 0 and  $a$ .

$$\begin{aligned}
 V &= \int_{x=0}^a \int_{y=0}^{a-x} \int_{z=0}^{a-x-y} dx dy dz = \int_{x=0}^a \int_{y=0}^{a-x} [z]_0^{a-x-y} dx dy \\
 &= \int_{x=0}^a \int_{y=0}^{a-x} (a - x - y) dx dy \\
 &= \int_{x=0}^a \left[ ay - xy - \frac{y^2}{2} \right]_0^{a-x} dx \\
 &= \int_0^a \left[ a(a - x) - x(a - x) - \frac{(a - x)^2}{2} \right] dx
 \end{aligned}$$

$$\begin{aligned}
 &= \int_0^a \left[ a^2 - ax - ax + x^2 - \frac{a^2}{2} + ax - \frac{x^2}{2} \right] dx \\
 &= \int_0^a \left( \frac{a^2}{2} - ax + \frac{x^2}{2} \right) dx \\
 &= \left[ \frac{a^2}{2} \cdot x - \frac{ax^2}{2} + \frac{x^3}{6} \right]_0^a = a^3 \left( \frac{1}{2} - \frac{1}{2} + \frac{1}{6} \right) = \frac{a^3}{6}. \quad \text{Ans.}
 \end{aligned}$$

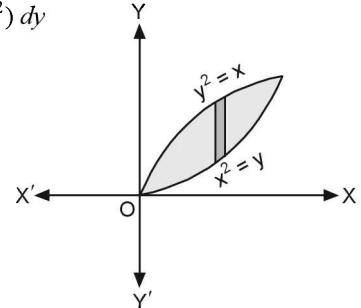

**Example 2.** Find the volume of the cylindrical column standing on the area common to the parabolas  $y^2 = x$ ,  $x^2 = y$  and cut off by the surface  $z = 12 + y - x^2$ . (U.P., II Sem., Summer 2001)

**Solution.** We have,

$$\begin{aligned}
 y^2 &= x \\
 x^2 &= y \\
 z &= 12 + y - x^2
 \end{aligned}$$

$$\begin{aligned}
 V &= \int_0^1 dx \int_{x^2}^{\sqrt{x}} dy \int_0^{12+y-x^2} dz = \int_0^1 dx \int_{x^2}^{\sqrt{x}} (12+y-x^2) dy \\
 &= \int_0^1 dx \left( 12y + \frac{y^2}{2} - x^2 y \right)_{x^2}^{\sqrt{x}} \\
 &= \int_0^1 \left( 12\sqrt{x} + \frac{x}{2} - x^{5/2} - 12x^2 - \frac{x^4}{2} + x^4 \right) dx \\
 &= \left[ \frac{2}{3} \times 12x^{3/2} + \frac{x^2}{4} - \frac{2}{7}x^{7/2} - 4x^3 - \frac{x^5}{10} + \frac{x^5}{5} \right]_0^1 \\
 &= 8 + \frac{1}{4} - \frac{2}{7} - 4 - \frac{1}{10} + \frac{1}{5} = 4 + \frac{1}{4} - \frac{2}{7} - \frac{1}{10} + \frac{1}{5} = \frac{560 + 35 - 40 - 14 + 28}{140} = \frac{569}{140} \quad \text{Ans.}
 \end{aligned}$$

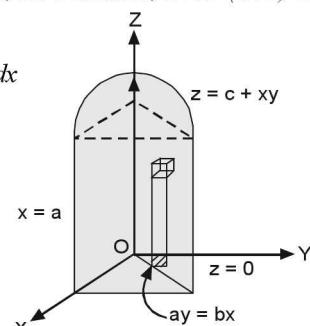

**Example 3.** A triangular prism is formed by planes whose equations are  $ay = bx$ ,  $y = 0$  and  $x = a$ . Find the volume of the prism between the planes  $z = 0$  and surface  $z = c + xy$ .

(M.U. II Semester 2000; U.P., Ist Semester, 2009 (C.O) 2003)

**Solution.** Required volume

$$\begin{aligned}
 &= \int_0^a \int_0^{\frac{bx}{a}} \int_0^{c+xy} dz dy dx \\
 &= \int_0^a \int_0^{\frac{bx}{a}} (c + xy) dy dx \\
 &= \int_0^a \left( cy + \frac{xy^2}{2} \right)_{0}^{\frac{bx}{a}} dx \\
 &= \int_0^a \left( \frac{cbx}{a} + \frac{b^2}{2a^2} x^3 \right) dx = \frac{bc}{a} \left( \frac{x^2}{2} \right)_0^a + \frac{b^2}{2a^2} \left( \frac{x^4}{4} \right)_0^a \\
 &= \frac{abc}{2} + \frac{b^2 a^2}{8} = \frac{ab}{8} (4c + ab) \quad \text{Ans.}
 \end{aligned}$$

### 10.3 VOLUME OF SOLID BOUNDED BY SPHERE OR BY CYLINDER

We use spherical coordinates  $(r, \theta, \phi)$  and the cylindrical coordinates are  $(\rho, \phi, z)$  and the relations are  $x = \rho \cos \phi, y = \rho \sin \phi$ .

**Example 4.** Find the volume of a solid bounded by the spherical surface  $x^2 + y^2 + z^2 = 4a^2$  and the cylinder  $x^2 + y^2 - 2ay = 0$ .

**Solution.**  $x^2 + y^2 + z^2 = 4a^2$  ... (1)

$$x^2 + y^2 - 2ay = 0 \quad \dots(2)$$

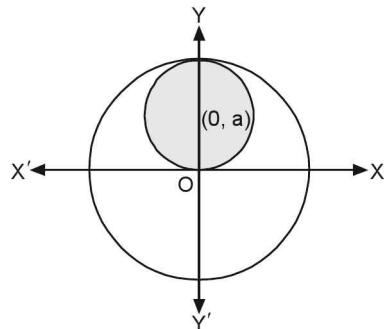

Considering the section in the positive quadrant of the  $xy$ -plane and taking  $z$  to be positive (that is volume above the  $xy$ -plane) and changing to polar co-ordinates, (1) becomes

$$r^2 + z^2 = 4a^2 \Rightarrow z^2 = 4a^2 - r^2$$

$$\therefore z = \sqrt{4a^2 - r^2}$$

(2) becomes  $r^2 - 2ar \sin \theta = 0 \Rightarrow r = 2a \sin \theta$

$$\begin{aligned} \text{Volume} &= \iiint dx dy dz \\ &= 4 \int_0^{\pi/2} d\theta \int_0^{2a \sin \theta} r dr \int_0^{\sqrt{4a^2 - r^2}} dz \quad (\text{Cylindrical coordinates}) \\ &= 4 \int_0^{\pi/2} d\theta \int_0^{2a \sin \theta} r dr [z]_0^{\sqrt{4a^2 - r^2}} = 4 \int_0^{\pi/2} d\theta \int_0^{2a \sin \theta} r dr \cdot \sqrt{4a^2 - r^2} \\ &= 4 \int_0^{\pi/2} d\theta \left[ -\frac{1}{3} (4a^2 - r^2)^{3/2} \right]_0^{2a \sin \theta} = \frac{4}{3} \int_0^{\pi/2} [-(4a^2 - 4a^2 \sin^2 \theta)^{3/2} + 8a^3] d\theta \\ &= \frac{4}{3} \int_0^{\pi/2} (-8a^3 \cos^3 \theta + 8a^3) d\theta = \frac{8 \times 4a^3}{3} \int_0^{\pi/2} (1 - \cos^3 \theta) d\theta \\ &= \frac{32a^3}{3} \int_0^{\pi/2} \left( 1 - \frac{1}{4} \cos 3\theta - \frac{3}{4} \cos \theta \right) d\theta \\ &= \frac{32a^3}{3} \left[ \theta - \frac{1}{12} \sin 3\theta - \frac{3}{4} \sin \theta \right]_0^{\pi/2} = \frac{32a^3}{3} \left( \frac{\pi}{2} + \frac{1}{12} - \frac{3}{4} \right) = \frac{32a^3}{3} \left[ \frac{\pi}{2} - \frac{2}{3} \right] \text{ Ans.} \end{aligned}$$

**Example 5.** Find the volume enclosed by the solid

$$\left(\frac{x}{a}\right)^{2/3} + \left(\frac{y}{b}\right)^{2/3} + \left(\frac{z}{c}\right)^{2/3} = 1$$

**Solution.** The equation of the solid is

$$\left(\frac{x}{a}\right)^{2/3} + \left(\frac{y}{b}\right)^{2/3} + \left(\frac{z}{c}\right)^{2/3} = 1$$

Putting  $\left(\frac{x}{a}\right)^{1/3} = u \Rightarrow x = a u^3 \Rightarrow dx = 3au^2 du$

$$\left(\frac{y}{b}\right)^{1/3} = v \Rightarrow y = b v^3 \Rightarrow dy = 3bv^2 dv$$

$$\left(\frac{z}{c}\right)^{1/3} = w \Rightarrow z = c w^3 \Rightarrow dz = 3cw^2 dw$$

The equation of the solid becomes

$$u^2 + v^2 + w^2 = 1 \quad \dots(1)$$

$$V = \iiint dx dy dz \quad \dots(2)$$

On putting the values of  $dx$ ,  $dy$  and  $dz$  in (2), we get

$$V = \iiint 27abc u^2 v^2 w^2 du dv dw \quad \dots(3)$$

(1) represents a sphere.

Let us use spherical coordinates.

$$\begin{aligned} u &= r \sin \theta \cos \phi, & v &= r \sin \theta \sin \phi, \\ w &= r \cos \theta, & du dv dw &= r^2 \sin \theta dr d\theta d\phi \end{aligned}$$

On substituting spherical coordinates in (3), we have

$$\begin{aligned} V &= 27abc \cdot 8 \int_{r=0}^1 \int_{\phi=0}^{\pi/2} \int_{\theta=0}^{\pi/2} r^2 \sin^2 \theta \cos^2 \phi \cdot r^2 \sin^2 \theta \sin^2 \phi \\ &\quad \cdot r^2 \cos^2 \theta \cdot r^2 \sin \theta dr d\theta d\phi \\ &= 216 abc \int_{r=0}^1 r^8 dr \int_{\phi=0}^{\pi/2} \sin^2 \phi \cos^2 \phi d\phi \int_{\theta=0}^{\pi/2} \sin^5 \theta \cos^2 \theta d\theta \\ &= 216 abc \left[ \frac{r^9}{9} \right]_0^1 \cdot \left( \frac{3}{2} \frac{3}{2} \right) \left( \frac{3}{2} \frac{3}{2} \right) \left( \frac{9}{2} \frac{9}{2} \right) = 24 abc \cdot \frac{1}{2} \cdot \frac{3}{2} \frac{3}{2} \cdot \frac{1}{2} \cdot \frac{3}{2} \frac{3}{2} \\ &= 6abc \cdot \frac{\left( \frac{1}{2} \frac{1}{2} \right)^2}{2!} \cdot \frac{2!}{\left( \frac{7}{2} \right) \left( \frac{5}{2} \right) \frac{3}{2} \frac{3}{2}} = 6abc \cdot \frac{1}{4} \cdot \pi \frac{1}{\left( \frac{7}{2} \right) \left( \frac{5}{2} \right) \left( \frac{3}{2} \right)} = \frac{4}{35} abc \pi \end{aligned}$$

**Ans.**

**Example 6.** Find the volume bounded above by the sphere  $x^2 + y^2 + z^2 = a^2$  and below by the cone  $x^2 + y^2 = z^2$ .  
(U.P. II Semester 2002)

**Solution.** The equation of the sphere is  $x^2 + y^2 + z^2 = a^2$  ...(1)

and that of the cone is  $x^2 + y^2 = z^2$  ...(2)

In polar coordinates  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$

The equation (1) in polar co-ordinates is

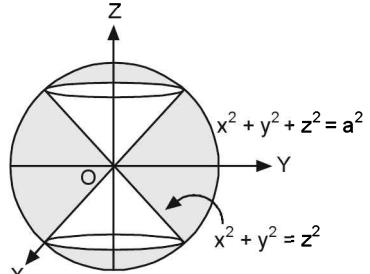

$$\begin{aligned} (r \sin \theta \cos \phi)^2 + (r \sin \theta \sin \phi)^2 + (r \cos \theta)^2 &= a^2 \\ \Rightarrow r^2 \sin^2 \theta \cos^2 \phi + r^2 \sin^2 \theta \sin^2 \phi + r^2 \cos^2 \theta &= a^2 \\ \Rightarrow r^2 \sin^2 \theta (\cos^2 \phi + \sin^2 \phi) + r^2 \cos^2 \theta &= a^2 \\ \Rightarrow r^2 \sin^2 \theta + r^2 \cos^2 \theta &= a^2 \\ \Rightarrow r^2 (\sin^2 \theta + \cos^2 \theta) &= a^2 \\ \Rightarrow r^2 = a^2 \Rightarrow r &= a \end{aligned}$$

The equation (2) in polar co-ordinates is

$$\begin{aligned} (r \sin \theta \cos \phi)^2 + (r \sin \theta \sin \phi)^2 &= (r \cos \theta)^2 \\ \Rightarrow r^2 \sin^2 \theta (\cos^2 \phi + \sin^2 \phi) &= r^2 \cos^2 \theta \Rightarrow r^2 \sin^2 \theta = r^2 \cos^2 \theta \\ \Rightarrow \tan^2 \theta = 1 \Rightarrow \tan \theta = 1 \Rightarrow \theta &= \pm \frac{\pi}{4} \end{aligned}$$

Thus equations (1) and (2) in polar coordinates are respectively,

$$r = a \quad \text{and} \quad \theta = \pm \frac{\pi}{4}$$

The volume in the first octant is one fourth only.

Limits in the first octant :  $r$  varies 0 to  $a$ ,  $\theta$  from 0 to  $\frac{\pi}{4}$  and  $\phi$  from 0 to  $\frac{\pi}{2}$ .

The required volume lies between  $x^2 + y^2 + z^2 = a^2$  and  $x^2 + y^2 = z^2$ .

$$\begin{aligned} V &= 4 \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{4}} \int_0^a r^2 \sin \theta dr d\theta d\phi = 4 \int_0^{\frac{\pi}{2}} d\phi \int_0^{\frac{\pi}{4}} \sin \theta d\theta \left[ \frac{r^3}{3} \right]_0^a \\ &= 4 \int_0^{\frac{\pi}{2}} d\phi \int_0^{\frac{\pi}{4}} \sin \theta d\theta \cdot \frac{a^3}{3} = \frac{4a^3}{3} \int_0^{\frac{\pi}{2}} d\phi \left[ -\cos \theta \right]_0^{\frac{\pi}{4}} = \frac{4a^3}{3} \left( \frac{\pi}{2} \right) \left[ -\frac{1}{\sqrt{2}} + 1 \right] \\ &= \frac{2}{3} \pi a^3 \left( 1 - \frac{1}{\sqrt{2}} \right) \end{aligned} \quad \text{Ans.}$$

#### 10.4 VOLUME OF SOLID BOUNDED BY CYLINDER OR CONE

We use cylindrical coordinates  $(r, \theta, z)$ .

**Example 7.** Find the volume of the solid bounded by the parabolic  $y^2 + z^2 = 4x$  and the plane  $x = 5$ .

**Solution.**  $y^2 + z^2 = 4x, x = 5$

$$\begin{aligned} V &= \int_0^5 dx \int_{-2\sqrt{x}}^{2\sqrt{x}} dy \int_{-\sqrt{4x-y^2}}^{\sqrt{4x-y^2}} dz = 4 \int_0^5 dx \int_0^{2\sqrt{x}} dy \int_0^{\sqrt{4x-y^2}} dz \\ &= 4 \int_0^5 dx \int_0^{2\sqrt{x}} dy [z]_0^{\sqrt{4x-y^2}} = 4 \int_0^5 dx \int_0^{2\sqrt{x}} dy \sqrt{4x-y^2} \\ &= 4 \int_0^5 dx \left[ \frac{y}{2} \sqrt{4x-y^2} + \frac{4x}{2} \sin^{-1} \frac{y}{2\sqrt{x}} \right]_0^{2\sqrt{x}} = 4 \int_0^5 \left[ 0 + 2x \left( \frac{\pi}{2} \right) \right] dx = 4\pi \int_0^5 x dx \\ &= 4\pi \left[ \frac{x^2}{2} \right]_0^5 = 50\pi \end{aligned} \quad \text{Ans.}$$

**Example 8.** Calculate the volume of the solid bounded by the following surfaces :

$$z = 0, \quad x^2 + y^2 = 1, \quad x + y + z = 3$$

$$\text{Solution.} \quad x^2 + y^2 = 1 \quad \dots(1)$$

$$x + y + z = 3 \quad \dots(2)$$

$$z = 0 \quad \dots(3)$$

$$\text{Required Volume} = \iiint dx dy dz = \iint dx dy [z]_0^{3-x-y} = \iint (3-x-y) dx dy$$

On putting  $x = r \cos \theta, y = r \sin \theta, dx dy = r d\theta dr$ , we get

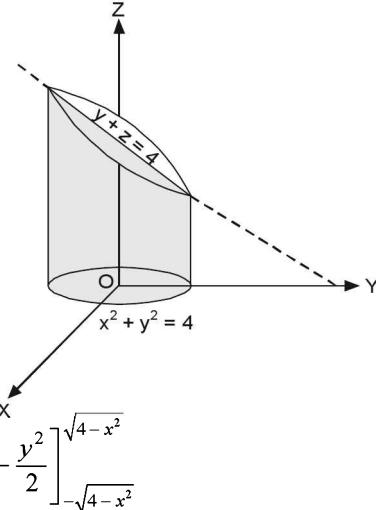

$$\begin{aligned} &= \iint (3 - r \cos \theta - r \sin \theta) r d\theta dr = \int_0^{2\pi} d\theta \int_0^1 (3r - r^2 \cos \theta - r^2 \sin \theta) dr \\ &= \int_0^{2\pi} d\theta \left( \frac{3r^2}{2} - \frac{r^3}{3} \cos \theta - \frac{r^3}{3} \sin \theta \right)_0^1 = \int_0^{2\pi} \left( \frac{3}{2} - \frac{1}{3} \cos \theta - \frac{1}{3} \sin \theta \right) d\theta \\ &= \left[ \frac{3}{2} \theta - \frac{1}{3} \sin \theta + \frac{1}{3} \cos \theta \right]_0^{2\pi} = 3\pi - \frac{1}{3} \sin 2\pi + \frac{1}{3} \cos 2\pi - \frac{1}{3} = 3\pi \end{aligned} \quad \text{Ans.}$$

**Example 9.** Find the volume bounded by the cylinder  $x^2 + y^2 = 4$  and the planes  $y + z = 4$  and  $z = 0$ .

$$\text{Solution. } x^2 + y^2 = 4 \Rightarrow y = \pm \sqrt{4 - x^2}$$

$y + z = 4 \Rightarrow z = 4 - y$  and  $z = 0$   
 $x$  varies from  $-2$  to  $+2$ .

$$\begin{aligned}
 V &= \iiint dx dy dz \\
 &= \int_{-2}^2 dx \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} dy \int_0^{4-y} dz \\
 &= \int_{-2}^2 dx \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} dy [z]_0^{4-y} \\
 &= \int_{-2}^2 dx \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} dy (4-y) = \int_{-2}^2 dx \left[ 4y - \frac{y^2}{2} \right]_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} \\
 &= \int_{-2}^2 dx \left[ 4\sqrt{4-x^2} - \frac{1}{2}(4-x^2) + 4\sqrt{4-x^2} + \frac{1}{2}(4-x^2) \right] \\
 &= 8 \int_{-2}^2 \sqrt{4-x^2} dx = 8 \left[ \frac{x}{2} \sqrt{4-x^2} + \frac{4}{2} \sin^{-1} \frac{x}{2} \right]_{-2}^2 = 16\pi \quad \text{Ans.}
 \end{aligned}$$

**Example 10.** Find the volume in the first octant bounded by the cylinder  $x^2 + y^2 = 2$  and the planes  $z = x + y$ ,  $y = x$ ,  $z = 0$  and  $x = 0$ . (M.U. II Semester 2005)

**Solution.** Here, we have the solid bounded by

$$\begin{aligned}
 x^2 + y^2 &= 2 \text{ (cylinder)} \\
 (\text{or } r^2 &= 2) \\
 z &= x + y \Rightarrow z = r(\cos \theta + \sin \theta) \quad (\text{plane}) \\
 y &= x \Rightarrow r \sin \theta = r \cos \theta \quad (\text{plane}) \\
 \Rightarrow \tan \theta &= 1 \Rightarrow \theta = \frac{\pi}{4}
 \end{aligned}$$

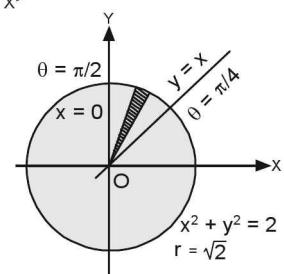

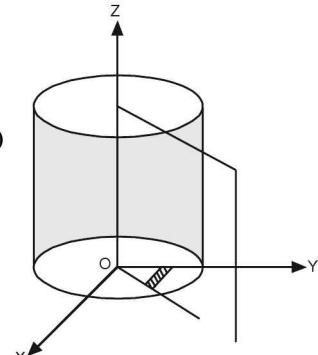

$$x = 0 \Rightarrow r \cos \theta = 0 \Rightarrow \cos \theta = 0 \Rightarrow \theta = \frac{\pi}{2}$$

$z$  varies from  $0$  to  $r(\cos \theta + \sin \theta)$

$r$  varies from  $0$  to  $\sqrt{2}$

$\theta$  varies from  $\frac{\pi}{4}$  to  $\frac{\pi}{2}$

$$\begin{aligned}
 \therefore V &= \int_{\theta=\pi/4}^{\pi/2} \int_{r=0}^{\sqrt{2}} \int_{z=0}^{r(\cos \theta + \sin \theta)} r dr d\theta dz \\
 &= \int_{\theta=\pi/4}^{\pi/2} \int_{r=0}^{\sqrt{2}} r [z]_0^{r(\cos \theta + \sin \theta)} dr d\theta \\
 &= \int_{\theta=\pi/4}^{\pi/2} \int_{r=0}^{\sqrt{2}} r^2 (\cos \theta + \sin \theta) dr d\theta \\
 &= \int_{\theta=\pi/4}^{\pi/2} (\cos \theta + \sin \theta) \left[ \frac{r^3}{3} \right]_0^{\sqrt{2}} d\theta = \frac{2\sqrt{2}}{3} \int_{\theta=\pi/4}^{\pi/2} (\cos \theta + \sin \theta) d\theta \\
 &= \frac{2\sqrt{2}}{3} [\sin \theta - \cos \theta]_{\pi/4}^{\pi/2} = \frac{2\sqrt{2}}{3} \left[ (1 - 0) - \left( \frac{1}{\sqrt{2}} - \frac{1}{\sqrt{2}} \right) \right] = \frac{2\sqrt{2}}{3} \quad \text{Ans.}
 \end{aligned}$$

**Example 11.** Show that the volume of the wedge intercepted between the cylinder  $x^2 + y^2 = 2ax$  and planes  $z = mx$ ,  $z = nx$  is  $\pi(m - n) a^3$ . (M.U. II Semester, 2000)

**Solution.** The equation of the cylinder is  $x^2 + y^2 = 2ax$

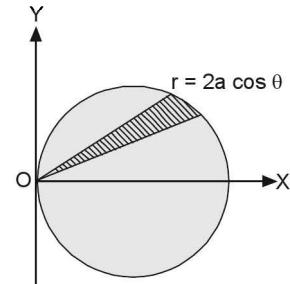

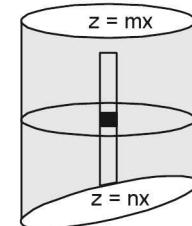

we convert the cartesian coordinates into cylindrical coordinates.

$$\begin{aligned} x &= r \cos \theta \\ y &= r \sin \theta \\ x^2 + y^2 &= 2ax \Rightarrow r^2 = 2ar \cos \theta \\ r &= 2a \cos \theta \\ r \text{ varies from } 0 &\text{ to } 2a \cos \theta \end{aligned}$$

$$\theta \text{ varies from } -\frac{\pi}{2} \text{ to } \frac{\pi}{2}$$

and  $z$  varies from  $z = nx$  ( $z = nr \cos \theta$ ) to  $z = mx$  ( $z = m r \cos \theta$ )

$$\begin{aligned} V &= 2 \int_{\theta=0}^{\pi/2} \int_{r=0}^{2a \cos \theta} \int_{z=nr \cos \theta}^{mr \cos \theta} r dr d\theta dz \\ &= 2 \int_{\theta=0}^{\pi/2} \int_{r=0}^{2a \cos \theta} r [z]_{nr \cos \theta}^{mr \cos \theta} dr d\theta \\ &= 2 \int_{\theta=0}^{\pi/2} \int_{r=0}^{2a \cos \theta} r \cdot (m-n) r \cos \theta dr d\theta \\ &= 2(m-n) \int_{\theta=0}^{\pi/2} \int_{r=0}^{2a \cos \theta} r^2 \cos \theta dr d\theta \\ &= 2(m-n) \int_{\theta=0}^{\pi/2} \left[ \frac{r^3}{3} \right]_0^{2a \cos \theta} \cos \theta d\theta = 2(m-n) \int_{\theta=0}^{\pi/2} \frac{8a^3}{3} \cos^3 \theta \cos \theta d\theta \\ &= \frac{16(m-n)}{3} a^3 \int_{\theta=0}^{\pi/2} \cos^4 \theta d\theta = \frac{16(m-n)}{3} \cdot a^3 \cdot \frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} = (m-n)\pi a^3 \quad \text{Ans.} \end{aligned}$$

**Example 12.** Find by triple integration, the volume of the region bounded by the paraboloid  $az = x^2 + y^2$  and the cylinder  $x^2 + y^2 = R^2$ . (U.P. I Semester Dec. 2008)

**Solution.** The volume bounded by the paraboloid and the cylinder is shown as shaded portion of the figure.

Transforming the given equations to the polar form, by substituting  $x = r \cos \theta$ ,  $y = r \sin \theta$

We get the equation of the cylinder

$$x^2 + y^2 = R^2 \text{ as } r = R$$

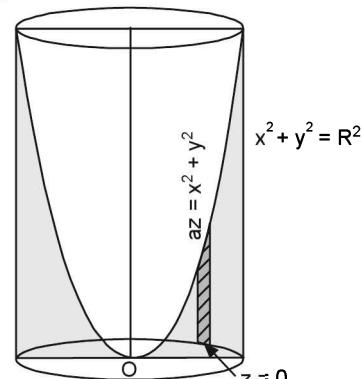

and that of the paraboloid as

$$az = r^2 \Rightarrow z = \frac{r^2}{a}$$

In the figure, only one fourth of the common volume is shown. Thus in the common region,  $z$  varies from 0 to  $\frac{r^2}{a}$  and  $r$  and  $\phi$  vary on the circle  $r = R$  (In the  $xy$  or  $r, \theta$  plane).

The variation of  $r$  is from 0 to  $R$  and that of  $\phi$  is 0 to  $\frac{\pi}{2}$ .

$$\text{Required volume } V = 4 \int_0^{\pi/2} \int_0^R \int_0^{\frac{r^2}{a}} r dz dr d\theta \quad (\text{cylindrical coordinates})$$

$$\begin{aligned}
 &= 4 \int_0^{\pi/2} \int_0^R r [z]_0^{r^2/a} dr d\theta = 4 \int_0^{\pi/2} \int_0^R r \frac{r^2}{a} dr d\theta = 4 \int_0^{\pi/2} \left[ \frac{r^4}{4a} \right]_0^R d\theta \\
 &= \frac{1}{a} \int_0^{\pi/2} R^4 d\theta = \frac{R^4}{a} \cdot \frac{\pi}{2} = \frac{\pi R^4}{2a} \quad \text{Ans.}
 \end{aligned}$$

**Example 13.** A cylindrical hole of radius  $b$  is bored through a sphere of radius  $a$ . Find the volume of the remaining solid.  
(M.U. II Semester 2004)

**Solution.** Let the equation of the sphere be

$$x^2 + y^2 + z^2 = a^2$$

Now, we will solve this problem using cylindrical coordinates

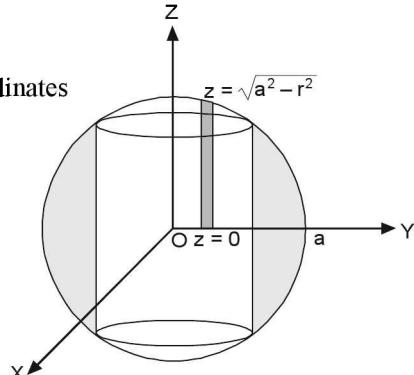

$$x = r \cos \theta$$

$$y = r \sin \theta$$

$$z = z$$

Limits of  $z$  are 0 and  $\sqrt{a^2 - (x^2 + y^2)}$  i.e.,  $\sqrt{a^2 - r^2}$

Limits of  $r$  are  $a$  and  $b$ .

and the limits of  $\theta$  are 0 and  $\frac{\pi}{2}$

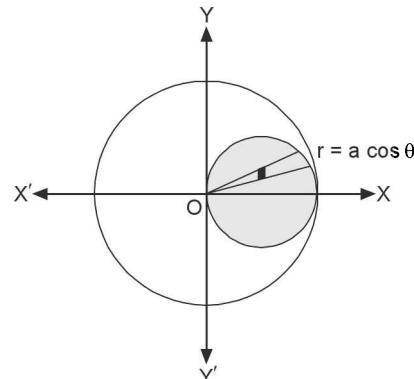

$$\begin{aligned}
 V &= 8 \int_{\theta=0}^{\pi/2} \int_{r=b}^a \int_{z=0}^{\sqrt{a^2 - r^2}} r dr d\theta dz = 8 \int_{\theta=0}^{\pi/2} \int_{r=b}^a [z]_0^{\sqrt{a^2 - r^2}} r dr d\theta \\
 &= 8 \int_{\theta=0}^{\pi/2} \int_{r=b}^a (a^2 - r^2)^{1/2} \cdot r dr d\theta \\
 &= 8 \int_{\theta=0}^{\pi/2} \left[ \frac{(a^2 - r^2)^{3/2}}{3/2} \cdot \left( -\frac{1}{2} \right) \right]_b^a d\theta = -\frac{8}{3} \int_0^{\pi/2} -(a^2 - b^2)^{\frac{3}{2}} d\theta \\
 &= \frac{8}{3} (a^2 - b^2)^{\frac{3}{2}} [\theta]_0^{\pi/2} = \frac{4\pi}{3} (a^2 - b^2)^{\frac{3}{2}} \quad \text{Ans.}
 \end{aligned}$$

**Example 14.** Find the volume cut off from the sphere  $x^2 + y^2 + z^2 = a^2$  by the cylinder  $x^2 + y^2 = ax$ .

**Solution.** Cylindrical co-ordinates

$$\begin{aligned}
 x &= r \cos \theta ; y = r \sin \theta \\
 x^2 + y^2 + z^2 &= a^2 \Rightarrow r^2 + z^2 = a^2 \\
 x^2 + y^2 &= ax \Rightarrow r^2 = ar \cos \theta \Rightarrow r = a \cos \theta
 \end{aligned}$$

$$\begin{aligned}
 \text{Volume} &= \iiint dx dy dz = \iiint (r d\theta dr) dz \\
 &= \int_{-\pi/2}^{\pi/2} d\theta \int_0^{a \cos \theta} r dr \int_{-\sqrt{a^2 - r^2}}^{\sqrt{a^2 - r^2}} dz \\
 &= 4 \int_0^{\pi/2} d\theta \int_0^{a \cos \theta} r dr \int_0^{\sqrt{a^2 - r^2}} dz \\
 &= 4 \int_0^{\pi/2} d\theta \int_0^{a \cos \theta} r dr [z]_0^{\sqrt{a^2 - r^2}} = 4 \int_0^{\pi/2} d\theta \int_0^{a \cos \theta} r dr \sqrt{a^2 - r^2} \\
 &= 4 \int_0^{\pi/2} d\theta \left[ \left( -\frac{1}{2} \right) \frac{2}{3} (a^2 - r^2)^{\frac{3}{2}} \right]_0^{a \cos \theta}
 \end{aligned}$$

$$\begin{aligned}
 &= -\frac{4}{3} \int_0^{\frac{\pi}{2}} d\theta \left[ (a^2 - a^2 \cos^2 \theta)^{\frac{3}{2}} - a^3 \right] = -\frac{4}{3} \int_0^{\frac{\pi}{2}} d\theta \left[ a^3 (1 - \cos^2 \theta)^{\frac{3}{2}} - a^3 \right] \\
 &= \frac{4}{3} \int_0^{\frac{\pi}{2}} (a^3 - a^3 \sin^3 \theta) d\theta = \frac{4a^3}{3} \int_0^{\frac{\pi}{2}} (1 - \sin^3 \theta) d\theta = \frac{4a^3}{3} \left[ \frac{\pi}{2} - \frac{2}{3} \right] \quad \text{Ans.}
 \end{aligned}$$

**Example 15.** Find the volume common to the cylinders

$$x^2 + y^2 = a^2 \text{ and } x^2 + z^2 = a^2$$

**Solution.**  $x^2 + y^2 = a^2$ ;  $x^2 + z^2 = a^2$

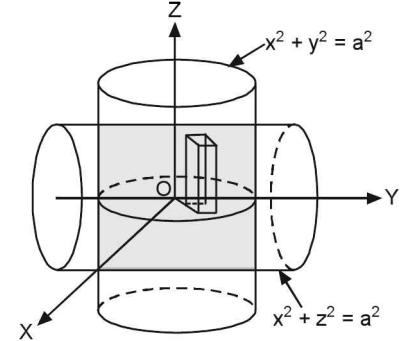

(M.U. II Semester 2004)

(i)  $z$  varies from  $-\sqrt{a^2 - x^2}$  to  $\sqrt{a^2 - x^2}$

(ii)  $y$  varies from  $-\sqrt{a^2 - x^2}$  to  $\sqrt{a^2 - x^2}$

(iii)  $x$  varies from  $-a$  to  $a$ .

$$\begin{aligned}
 \text{Required volume} &= \int_{-a}^{+a} dx \int_{-\sqrt{a^2 - x^2}}^{\sqrt{a^2 - x^2}} dy \int_{-\sqrt{a^2 - x^2}}^{\sqrt{a^2 - x^2}} dz \\
 &= \int_{-a}^{+a} dx \int_{-\sqrt{a^2 - x^2}}^{\sqrt{a^2 - x^2}} dy [z]_{-\sqrt{a^2 - x^2}}^{\sqrt{a^2 - x^2}} \\
 &= \int_{-a}^{+a} dx \int_{-\sqrt{a^2 - x^2}}^{\sqrt{a^2 - x^2}} 2 \sqrt{a^2 - x^2} dy = 2 \int_{-a}^{+a} dx \sqrt{a^2 - x^2} [y]_{-\sqrt{a^2 - x^2}}^{\sqrt{a^2 - x^2}} \\
 &= 2 \int_{-a}^{+a} dx \sqrt{a^2 - x^2} \left[ \sqrt{a^2 - x^2} + \sqrt{a^2 - x^2} \right] \\
 &= 4 \int_{-a}^{+a} (a^2 - x^2) dx = 4 \left[ a^2 x - \frac{x^3}{3} \right]_{-a}^{+a} = 4 \left[ a^3 - \frac{a^3}{3} + a^3 - \frac{a^3}{3} \right] = \frac{16a^3}{3} \quad \text{Ans.}
 \end{aligned}$$

**Example 16.** Find by triple integration the volume of a solid bounded by the sphere  $x^2 + y^2 + z^2 = 4$  and the paraboloid  $x^2 + y^2 = 3z$ .

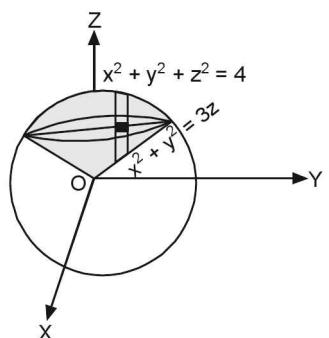

**Solution.**  $x^2 + y^2 + z^2 = 4 \Rightarrow z = \sqrt{4 - x^2 - y^2}$  ... (1)

$$\text{and } x^2 + y^2 = 3z \Rightarrow z = \frac{x^2 + y^2}{3} \quad \dots(2)$$

Limits of  $z$  are  $\sqrt{4 - x^2 - y^2}$  and  $\frac{x^2 + y^2}{3}$

Area of cross-section at the intersection of (1) and (2) is given by

$$\begin{aligned}
 4 - x^2 - y^2 &= \left( \frac{x^2 + y^2}{3} \right)^2 \\
 \Rightarrow (x^2 + y^2)^2 + 9(x^2 + y^2) - 36 &= 0 \\
 \Rightarrow (x^2 + y^2 - 3)(x^2 + y^2 + 12) &= 0 \\
 \Rightarrow x^2 + y^2 = 3, \text{ a circle in the area of cross-section} \\
 V &= \iiint dx dy dz = \iint dx dy \int_{\frac{x^2 + y^2}{3}}^{\sqrt{4 - x^2 - y^2}} dz \\
 &= \iint dx dy [z]_{\frac{x^2 + y^2}{3}}^{\sqrt{4 - x^2 - y^2}} = \iint dx dy \left[ \sqrt{4 - x^2 - y^2} - \frac{x^2 + y^2}{3} \right] \\
 &\quad (x^2 + y^2 = r^2, dx dy = r d\theta dr)
 \end{aligned}$$

Limits of  $r$  are 0 to  $\sqrt{3}$  and that of  $\theta$  are from 0 to  $2\pi$ .

$$\begin{aligned} V &= \int_0^{2\pi} \int_0^{\sqrt{3}} \left( \sqrt{4-r^2} - \frac{r^2}{3} \right) r d\theta dr = \int_0^{2\pi} d\theta \int_0^{\sqrt{3}} \left[ r(4-r^2)^{\frac{1}{2}} - \frac{r^3}{3} \right] dr \\ &= (0)_0^{2\pi} \left[ -\frac{1}{2} \times \frac{2}{3} (4-r^2)^{\frac{3}{2}} - \frac{r^4}{12} \right]_0^{\sqrt{3}} = 2\pi \left[ -\frac{1}{3} - \frac{3}{4} + \frac{8}{3} \right] = \frac{19\pi}{6} \quad \text{Ans.} \end{aligned}$$

### 10.5 VOLUME BOUNDED BY A PARABOLOID

When a volume is bounded by a paraboloid it is convenient to use cartesian coordinates again.

**Example 17.** Find the volume cut off from the paraboloid

$$x^2 + \frac{y^2}{4} + z = 1 \text{ by the plane } z = 0.$$

(M.U. II Semester 2005)

**Solution.** We have

$$x^2 + \frac{y^2}{4} + z = 1 \quad (\text{Paraboloid}) \quad \dots(1)$$

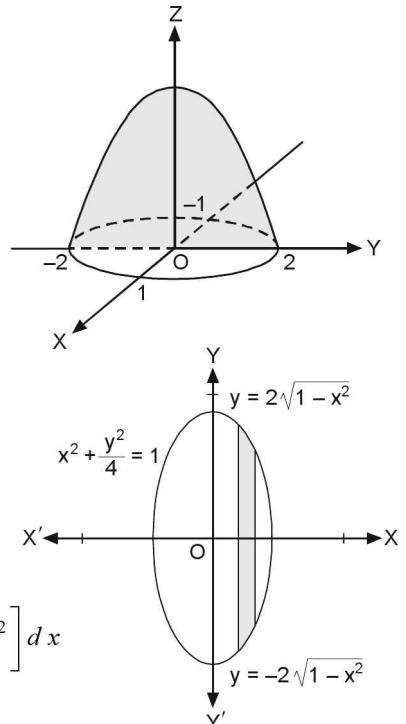

$$z = 0 \quad (\text{x-y plane}) \quad \dots(2)$$

$z$  varies from 0 to  $1 - x^2 - \frac{y^2}{4}$

$y$  varies from  $-2\sqrt{1-x^2}$  to  $2\sqrt{1-x^2}$

$x$  varies from -1 to 1.

$$\begin{aligned} V &= \iiint dx dy dz \\ &= \int_{-1}^1 dx \int_{-2\sqrt{1-x^2}}^{2\sqrt{1-x^2}} dy \int_0^{1-x^2-\frac{y^2}{4}} dz \\ &= \int_{-1}^1 \int_{-2\sqrt{1-x^2}}^{2\sqrt{1-x^2}} \left( 1 - x^2 - \frac{y^2}{4} \right) dx dy \\ &= 4 \int_0^1 \int_0^{2\sqrt{1-x^2}} \left( 1 - x^2 - \frac{y^2}{4} \right) dx dy \\ &= 4 \int_0^1 \left[ (1-x^2)y - \frac{y^3}{12} \right]_0^{2\sqrt{1-x^2}} dx \\ &= 4 \int_0^1 \left[ (1-x^2) \cdot 2\sqrt{1-x^2} - \frac{8}{12}(1-x^2)^{3/2} \right] dx \\ &= 4 \int_0^1 \left[ 2(1-x^2)^{3/2} - \frac{2}{3}(1-x^2)^{3/2} \right] dx \end{aligned}$$

On putting  $x = \sin \theta$ , we get

$$\begin{aligned} V &= 4 \int_0^1 \frac{4}{3} (1-x^2)^{3/2} dx = \frac{16}{3} \int_0^{\pi/2} (-\sin^2 \theta)^{3/2} \cos \theta d\theta \\ &= \frac{16}{3} \int_0^{\pi/2} \cos^4 \theta d\theta = \frac{16}{3} \cdot \frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} = \pi \quad \text{Ans.} \end{aligned}$$

**Example 18.** Find the volume bounded by the paraboloid  $x^2 + y^2 = az$  and the cylinder  $x^2 + y^2 = a^2$ .  
(M.U. II Semester 2007)

**Solution.** The required solid is bounded by a cylinder

$$x^2 + y^2 = a^2 \Rightarrow r^2 = a^2$$

and the paraboloid  $x^2 + y^2 = az \Rightarrow r^2 = az \Rightarrow z = \frac{r^2}{a}$

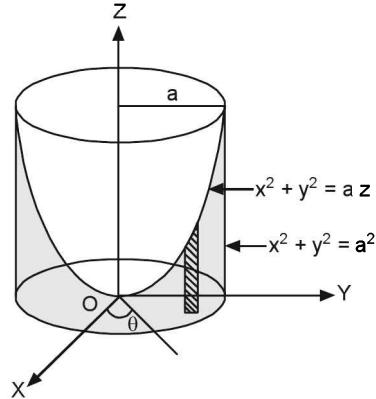

$z$  varies from 0 to  $\frac{r^2}{a}$

$r$  varies from 0 to  $a$

and  $\theta$  varies from 0 to  $\frac{\pi}{2}$

and the solid lies in four octants.

$$\begin{aligned} V &= 4 \int_{\theta=0}^{\pi/2} \int_{r=0}^a \int_{z=0}^{r^2/a} r dr d\theta dz \\ &= 4 \int_{\theta=0}^{\pi/2} \int_{r=0}^a r [z]_{z=0}^{r^2/a} dr d\theta = 4 \int_{\theta=0}^{\pi/2} \int_{r=0}^a \frac{r^3}{a} dr d\theta = \frac{4}{a} \int_{\theta=0}^{\pi/2} \left[ \frac{r^4}{4} \right]_0^a d\theta \\ &= \frac{4}{a} \int_{\theta=0}^{\pi/2} \left[ \frac{a^4}{4} \right] d\theta = a^3 \int_0^{\pi/2} d\theta = a^3 [\theta]_0^{\pi/2} = \frac{\pi}{2} a^3 \end{aligned} \quad \text{Ans.}$$

**Example 19.** Find the volume bounded by the surfaces

$$z = 4 - x^2 - \frac{1}{4}y^2 \quad \text{and} \quad z = 3x^2 + \frac{y^2}{4} \quad (\text{M.U. II Semester, 2003})$$

**Solution.** Here, we have

$$z + x^2 + \frac{y^2}{4} = 4 \quad (\text{Paraboloid}) \quad \dots(1)$$

$$z = 3x^2 + \frac{y^2}{4} \quad (\text{Paraboloid}) \quad \dots(2)$$

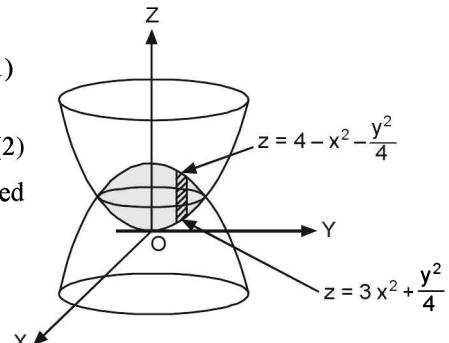

Let us find out the equation of the section intersected by (1) and (2).

Solving them, we get

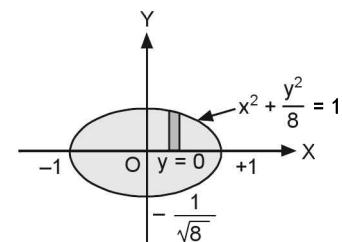

$$4 - x^2 - \frac{1}{4}y^2 = 3x^2 + \frac{y^2}{4}$$

$$\Rightarrow 4x^2 + \frac{y^2}{2} = 4 \quad \text{i.e.} \quad x^2 + \frac{y^2}{8} = 1$$

The cross-section is an ellipse in four octants

$$\begin{aligned} V &= 4 \int_{x=0}^1 \int_{y=0}^{\sqrt{8(1-x^2)}} \int_{3x^2+(y^2/4)}^{4-x^2-(y^2/4)} dz dy dx \\ &= 4 \int_{x=0}^1 \int_{y=0}^{\sqrt{8(1-x^2)}} \left( 4 - x^2 - \frac{y^2}{4} - 3x^2 - \frac{y^2}{4} \right) dy dx \\ &= 4 \int_{x=0}^1 \int_{y=0}^{\sqrt{8(1-x^2)}} \left( 4 - 4x^2 - \frac{y^2}{2} \right) dy dx \\ &= 4 \int_{x=0}^1 \left[ 4y - 4x^2y - \frac{y^3}{6} \right]_0^{\sqrt{8(1-x^2)}} dx = 4 \int_0^1 \left[ 4(1-x^2)y - \frac{y^3}{6} \right]_0^{\sqrt{8(1-x^2)}} dx \end{aligned}$$

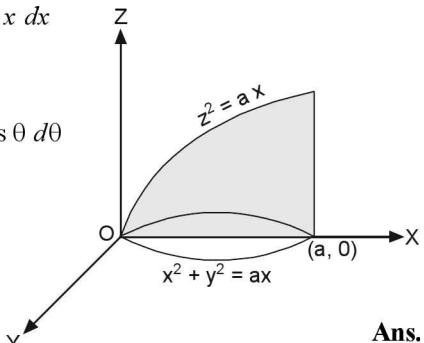

$$\begin{aligned}
 &= 4 \int_0^1 \left[ 4(1-x^2) \cdot \sqrt{8} \cdot \sqrt{1-x^2} - \frac{1}{6} 8\sqrt{8} (1-x^2)^{3/2} \right] dx = 4 \int_0^1 \left( 4\sqrt{8} - \frac{4\sqrt{8}}{3} \right) (1-x^2)^{3/2} dx \\
 &= \frac{64\sqrt{2}}{3} \int_0^1 (1-x^2)^{3/2} dx \quad [\text{Put } x = \sin \theta \Rightarrow dx = \cos \theta d\theta] \\
 &= \frac{64\sqrt{2}}{3} \int_0^{\pi/2} \cos^4 \theta d\theta = \frac{64\sqrt{2}}{3} \cdot \frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} = 4\sqrt{2} \cdot \pi \quad \text{Ans.}
 \end{aligned}$$

**Example 20.** Find the volume enclosed between the cylinders  $x^2 + y^2 = ax$ , and  $z^2 = ax$ .

**Solution.** Here, we have  $x^2 + y^2 = ax$  ... (1)  
 $z^2 = ax$  ... (2)

$$\begin{aligned}
 V &= \iiint dx dy dz \\
 &= \int_0^a dx \int_{-\sqrt{ax-x^2}}^{\sqrt{ax-x^2}} dy \int_{-\sqrt{ax}}^{\sqrt{ax}} dz = 2 \int_0^a dx \int_{-\sqrt{a^2-x^2}}^{\sqrt{ax-x^2}} dy \int_0^{\sqrt{ax}} dz \\
 &= 2 \int_0^a dx \int_{-\sqrt{ax-x^2}}^{\sqrt{ax-x^2}} dy (z)_0^{\sqrt{ax}} = 2 \int_0^a dx \int_{-\sqrt{ax-x^2}}^{\sqrt{ax-x^2}} dy \sqrt{ax} = 2 \int_0^a \sqrt{ax} dx [y]_{-\sqrt{ax-x^2}}^{\sqrt{ax-x^2}} \\
 &= 2 \int_0^a \sqrt{ax} dx (2\sqrt{ax-x^2}) = 4\sqrt{a} \int_0^a x \sqrt{a-x} dx
 \end{aligned}$$

Putting  $x = a \sin^2 \theta$  so that  $dx = 2a \sin \theta \cos \theta d\theta$ , we get

$$\begin{aligned}
 V &= 4\sqrt{a} \int_0^{\pi/2} a \sin^2 \theta \sqrt{a - a \sin^2 \theta} \cdot 2a \sin \theta \cos \theta d\theta \\
 &= 8a^3 \int_0^{\pi/2} \sin^3 \theta \cos^2 \theta d\theta \\
 &= 8a^3 \frac{\left| 2 \left[ \frac{3}{2} \right] \right|}{2 \left| \frac{7}{2} \right|} = 4a^3 \frac{\left| \frac{3}{2} \right|}{\frac{5}{2} \cdot \frac{3}{2} \left| \frac{3}{2} \right|} = \frac{16a^3}{15}
 \end{aligned}$$

### EXERCISE 10.1

1. Find the volume bounded by the coordinate planes and the plane.

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1 \quad (\text{MTU, 2012}) \quad \text{Ans. } \frac{abc}{6}$$

2. Find the volume bounded by the cylinders  $y^2 = x$  and  $x^2 = y$  between the planes  $z = 0$  and

$$x + y + z = 2. \quad \text{Ans. } \frac{11}{30}$$

3. Find the volume bounded by the co-ordinate planes and the plane.

$$lx + my + nz = 1 \quad (\text{A.M.I.E.T.E. Winter 2001}) \quad \text{Ans. } \frac{1}{6lmn}$$

4. Find the volume of the sphere  $x^2 + y^2 + z^2 = a^2$  by triple integration. (AMIETE, June 2009) Ans.  $\frac{4}{3}\pi a^3$

5. Find the volume of the ellipsoid  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$  Ans.  $\frac{4\pi abc}{3}$

6. Find the volume bounded by the cylinder  $x^2 + y^2 = a^2$  and the planes  $y + z = 2a$  and  $z = 0$ .  
(M.U. II Semester 2000, 02, 06) Ans.  $2\pi a^3$

7. Find the volume bounded by the cylinder  $x^2 + y^2 = a^2$  and the planes  $z = 0$  and  $y + z = b$ .  
**Ans.**  $\pi a^2 b$
8. Find the volume of the region bounded by  $z = x^2 + y^2$ ,  $z = 0$ ,  $x = -a$ ,  $x = a$  and  $y = -a$ ,  $y = a$ .  
**Ans.**  $\frac{8}{3}a^4$
9. Find the volume enclosed by the cylinder  $x^2 + y^2 = 9$  and the planes  $x + z = 5$  and  $z = 0$ .  
**Ans.**  $45\pi - 36$
10. Compute the volume of the solid bounded by  $x^2 + y^2 = z$ ,  $z = 2x$ . (A.M.I.E., Summer 2000)  
**Ans.**  $2\pi$
11. Find the volume cut from the paraboloid  $4z = x^2 + y^2$  by plane  $z = 4$ .  
(U.P. I Semester, Dec. 2005) **Ans.**  $32\pi$
12. By using triple integration find the volume cut off from the sphere  $x^2 + y^2 + z^2 = 16$  by the plane  $z = 0$  and the cylinder  $x^2 + y^2 = 4x$ .  
**Ans.**  $\frac{64}{9}(3\pi - 4)$
13. The sphere  $x^2 + y^2 + z^2 = a^2$  is pierced by the cylinder  $x^2 + y^2 = a^2(x^2 - y^2)$ .  
Prove that the volume of the sphere that lies inside the cylinder is  $\frac{8}{3}\left[\frac{\pi}{4} + \frac{5}{3} - \frac{4\sqrt{2}}{3}\right]a^3$ .
14. Find the volume of the solid bounded by the surfaces  $z = 0$ ,  $3z = x^2 + y^2$  and  $x^2 + y^2 = 9$ .  
(A.M.I.E.T.E., Summer 2005) **Ans.**  $\frac{27\pi}{2}$
15. Obtain the volume bounded by the surface  $z = c\left(1 - \frac{x}{a}\right)\left(1 - \frac{y}{b}\right)$  and a quadrant of the elliptic cylinder  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ,  $z > 0$  and where  $a, b > 0$ .  
(A.M.I.E.T.E., Dec. 2005) **Ans.**  $\pi abc$
16. Find the volume of the paraboloid  $x^2 + y^2 = 4z$  cut off by the plane  $z = 4$ .  
**Ans.**  $32\pi$
17. Find the volume bounded by the cone  $z^2 = x^2 + y^2$  and the paraboloid  $z = x^2 + y^2$ .  
**Ans.**  $\frac{\pi}{6}$
18. Find the volume enclosed by the cylinders  $x^2 + y^2 = 2ax$  and  $z^2 = 2a|x|$ .  
**Ans.**  $\frac{128a^3}{15}$
19. Find the volume of the solid bounded by the plane  $z = 0$ , the paraboloid  $z = x^2 + y^2 + 2$  and the cylinder  $x^2 + y^2 = 4$ .  
**Ans.**  $16\pi$
20. The triple integral  $\iiint dx dy dz$  gives  
(a) Volume of region T  
(b) Surface area of region T  
(c) Area of region T  
(d) Density of region T. (A.M.I.E.T.E., 2002) **Ans.** (a)

## 10.6 SURFACE AREA

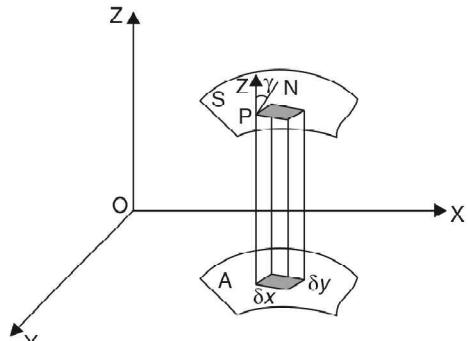

Let  $z = f(x, y)$  be the surface  $S$ . Let its projection on the  $x-y$  plane be the region  $A$ . Consider an element  $\delta x, \delta y$  in the region  $A$ . Erect a cylinder on the element  $\delta x, \delta y$  having its generator parallel to  $OZ$  and meeting the surface  $S$  in an element of area  $\delta s$ .

$$\therefore \delta x \delta y = \delta s \cos \gamma,$$

Where  $\gamma$  is the angle between the  $xy$ -plane and the tangent plane to  $S$  at  $P$ , i.e., it is the angle between the  $Z$ -axis and the normal to  $S$  at  $P$ .

The direction cosines of the normal to the surface  $F(x, y, z) = 0$  are proportional to

$$\frac{\partial F}{\partial x}, \frac{\partial F}{\partial y}, \frac{\partial F}{\partial z}$$

$\therefore$  The direction of the normal to  $S [F = f(x, y) - z]$  are proportional to  $-\frac{\partial z}{\partial x}, -\frac{\partial z}{\partial y}, 1$  and those of the Z-axis are  $0, 0, 1$ .

$$\text{Direction cosines} = \frac{-\frac{\partial z}{\partial x}}{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}}, \frac{-\frac{\partial z}{\partial y}}{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}}, \frac{1}{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}},$$

Hence

$$\cos \gamma = \frac{1}{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}} \quad (\cos \theta = l_1 l_2 + m_1 m_2 + n_1 n_2)$$

$$dS = \frac{\delta x \delta y}{\cos \gamma} = \sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1} \delta x \delta y; \quad S = \iint_A \sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1} dx dy$$

**Example 21.** Evolute  $\iint_S 6xy \, ds$ , where  $S$  is the portion of the plane  $x + y + z = 1$  that lies in front of the  $yz$ -plane. (Gujarat, I Semester, Jan. 2009)

**Solution.** Here, we have

$$\begin{aligned} I &= \iint_S 6xy \, ds \\ x + y + z &= 1, z = 1 - x - y \\ \Rightarrow \quad \frac{\partial z}{\partial x} &= -1 \quad \Rightarrow \quad \frac{\partial z}{\partial y} = -1 \end{aligned} \quad \dots (1)$$

The direction ratio of the normal to the plane (1) are  $-\frac{\partial z}{\partial x}, -\frac{\partial z}{\partial y}, 1$

Direction cosines of the normal to the surface

$$\frac{-\frac{\partial z}{\partial x}}{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}}, \frac{-\frac{\partial z}{\partial y}}{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}}, \frac{1}{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}}$$

Direction cosines of the normal (x-axis) to the plane  $1, 0, 0$

$$\cos \alpha = \frac{-\frac{\partial z}{\partial x}}{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}} \Rightarrow ds = \frac{\delta x \delta y}{\cos \alpha} = \frac{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}}{-\frac{\partial z}{\partial x}} \delta x \delta y$$

$$I = \iint 6xy \, ds = 6 \int x dx \int y \frac{\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}}{-\frac{\partial z}{\partial x}} dy$$

$$= 6 \int_0^1 x dx \int_0^{1-x} \frac{\sqrt{1+1+1}}{-1} dy = 6 \int_0^1 dx \left[ \frac{y^2}{2} \right]^{1-x} (-\sqrt{3})$$

$$= -3\sqrt{3} \int_0^{1-x} x dx (1-x)^2 = -3\sqrt{3} \int_0^1 (x^3 - 2x^2 + x) dx$$

$$= -3\sqrt{3} \left( \frac{x^4}{4} - \frac{2x^3}{3} + \frac{x^2}{2} \right)_0^1 = -3\sqrt{3} \left[ \frac{1}{4} - \frac{2}{3} + \frac{1}{2} \right] = -\frac{3\sqrt{3}}{12} = -\frac{\sqrt{3}}{4}$$

Surface Area =  $\frac{\sqrt{3}}{4}$

**Ans.****Example 22.** Find the surface area of the cylinder  $x^2 + z^2 = 4$  inside the cylinder  $x^2 + y^2 = 4$ .**Solution.**  $x^2 + y^2 = 4$ 

$$2x + 2z \frac{\partial z}{\partial x} = 0 \quad \text{or} \quad \frac{\partial z}{\partial x} = -\frac{x}{z}, \quad \frac{\partial z}{\partial y} = 0$$

$$\left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 + 1 = \frac{x^2}{z^2} + 1 = \frac{x^2 + z^2}{z^2} = \frac{4}{4-x^2}$$

Hence, the required surface area

$$\begin{aligned} &= 8 \int_0^2 \int_0^{\sqrt{4-x^2}} \sqrt{\left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 + 1} dx dy \\ &= 8 \int_0^2 \int_0^{\sqrt{4-x^2}} \frac{2}{\sqrt{4-x^2}} dx dy = 16 \int_0^2 \frac{1}{\sqrt{4-x^2}} [y]_0^{\sqrt{4-x^2}} dx = 16 \int_0^2 \frac{1}{\sqrt{4-x^2}} [\sqrt{4-x^2}] dx \\ &= 16 \int_0^2 dx = 16(x)_0^2 = 32 \end{aligned}$$

**Ans.****Example 23.** Find the surface area of the sphere  $x^2 + y^2 + z^2 = 9$  lying inside the cylinder  $x^2 + y^2 = 3y$ .**Solution.**

$$x^2 + y^2 + z^2 = 9$$

$$2x + 2z \frac{\partial z}{\partial x} = 0, \quad \frac{\partial z}{\partial x} = -\frac{x}{z}$$

$$2x + 2z \frac{\partial z}{\partial y} = 0, \quad \frac{\partial z}{\partial y} = -\frac{y}{z}$$

$$\left[ \left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 + 1 \right] = \frac{x^2}{z^2} + \frac{y^2}{z^2} + 1 = \frac{x^2 + y^2 + z^2}{z^2} = \frac{9}{9-x^2-y^2} = \frac{9}{9-r^2} \quad \begin{cases} x = r \cos \theta \\ y = r \sin \theta \end{cases}$$

$$x^2 + y^2 = 3y \quad \text{or} \quad r^2 = 3r \sin \theta \quad \text{or} \quad r = 3 \sin \theta.$$

Hence, the required surface area

$$\begin{aligned} &= \iint \sqrt{\left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 + 1} dx dy = 4 \int_0^{\pi/2} \int_0^{3 \sin \theta} \frac{3}{\sqrt{9-r^2}} r d\theta dr = 12 \int_0^{\pi/2} d\theta \int_0^{3 \sin \theta} \frac{r dr}{\sqrt{9-r^2}} \\ &= 12 \int_0^{\pi/2} d\theta [-\sqrt{9-r^2}]_0^{3 \sin \theta} = 12 \int_0^{\pi/2} [-\sqrt{9-9 \sin^2 \theta} + 3] d\theta \\ &= 36 \int_0^{\pi/2} (-\cos \theta + 1) d\theta = 36 (-\sin \theta + \theta)_0^{\pi/2} = 36 \left( -1 + \frac{\pi}{2} \right) = 18(\pi - 2) \end{aligned}$$

**Ans.****Example 24.** Find the surface area of the section of the cylinder  $x^2 + y^2 = a^2$  made by the plane  $x + y + z = a$ .**Solution.**

$$x^2 + y^2 = a^2 \quad \dots (1)$$

$$x + y + z = a \quad \dots (2)$$

The projection of the surface area on  $xy$ -plane is a circle

$$x^2 + y^2 = a^2$$

$$1 + \frac{\partial z}{\partial x} = 0 \quad \text{or} \quad \frac{\partial z}{\partial x} = -1$$

$$1 + \frac{\partial z}{\partial y} = 0 \quad \text{or} \quad \frac{\partial z}{\partial y} = -1$$

$$\sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1} = \sqrt{(-1)^2 + (-1)^2 + 1} = \sqrt{3}$$

Hence the required surface area

$$\begin{aligned} &= 4 \int_0^a \int_0^{\sqrt{a^2 - x^2}} \sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1} dx dy = 4 \int_0^a \int_0^{\sqrt{a^2 - x^2}} \sqrt{3} dx dy \\ &= 4\sqrt{3} \int_0^a [y]_0^{\sqrt{a^2 - x^2}} dx = 4\sqrt{3} \int_0^a \sqrt{a^2 - x^2} dx \\ &= 4\sqrt{3} \left[ \frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \sin^{-1} \frac{x}{a} \right]_0^a = 4\sqrt{3} \left[ 0 + \frac{a^2}{2} \frac{\pi}{2} \right] = 4\sqrt{3} \left( \frac{a^2 \pi}{4} \right) = \sqrt{3} \pi a^2 \text{ Ans.} \end{aligned}$$

**Example 25.** Find the area of that part of the surface of the paraboloid of the paraboloid  $y^2 + z^2 = 2ax$ , which lies between the cylinder,  $y^2 = ax$  and the plane  $x = a$ .

**Solution.**

$$y^2 + z^2 = 2ax \quad \dots (1)$$

$$y^2 = ax \quad \dots (2)$$

$$x = a \quad \dots (3)$$

Differentiating (1), we get

$$\begin{aligned} 2z \frac{\partial z}{\partial x} &= 2a, \quad \frac{\partial z}{\partial x} = \frac{a}{z} \\ 2y + 2z \frac{\partial z}{\partial y} &= 0, \quad \frac{\partial z}{\partial y} = -\frac{y}{z} \\ \left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 + 1 &= \frac{a^2}{z^2} + \frac{y^2}{z^2} + 1 = \frac{a^2 + y^2}{z^2} + 1 & \left[ \begin{array}{l} y^2 + z^2 = 2ax \\ z^2 = 2ax - y^2 \end{array} \right] \\ &= \frac{a^2 + y^2}{2ax - y^2} + 1 = \frac{a^2 + y^2 + 2ax - y^2}{2ax - y^2} = \frac{a^2 + 2ax}{2ax - y^2} \\ S &= \int_0^a \int_{-\sqrt{ax}}^{\sqrt{ax}} \sqrt{\left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 + 1} dx dy = \int_0^a \int_{-\sqrt{ax}}^{\sqrt{ax}} \sqrt{\frac{a^2 + 2ax}{2ax - y^2}} dx dy & \left[ \begin{array}{l} y^2 = ax \\ y = \pm \sqrt{ax} \end{array} \right] \\ &= \sqrt{a} \int_0^a \int_{-\sqrt{ax}}^{\sqrt{ax}} \sqrt{\frac{a+2x}{2ax-y^2}} dx dy = \sqrt{a} \int_0^a \sqrt{a+2x} dx \int_{-\sqrt{ax}}^{\sqrt{ax}} \frac{1}{\sqrt{2ax+y^2}} dy \\ &= \sqrt{a} \int_0^a \sqrt{a+2x} dx \left[ \sin^{-1} \frac{y}{\sqrt{2ax}} \right]_{-\sqrt{ax}}^{\sqrt{ax}} \\ &= \sqrt{a} \int_0^a \sqrt{a+2x} dx \left[ \sin^{-1} \frac{1}{\sqrt{2}} - \sin^{-1} \left( -\frac{1}{\sqrt{2}} \right) \right] = \sqrt{a} \int_0^a \sqrt{a+2x} dx \left[ \frac{\pi}{4} - \left( \frac{\pi}{4} \right) \right] \\ &= \sqrt{a} \frac{\pi}{2} \int_0^a \sqrt{a+2x} dx = \frac{\pi}{2} \cdot \frac{\sqrt{a}}{2} \cdot \frac{2}{3} [(a+2x)^{3/2}]_0^a \\ &= \frac{\pi \sqrt{a}}{6} [(3a)^{3/2} - a^{3/2}] = \frac{\pi a^2}{6} [3\sqrt{3} - 1] & \text{Ans.} \end{aligned}$$

**EXERCISE 10.2**

1. Find the surface area of sphere  $x^2 + y^2 + z^2 = 16$ . **Ans.**  $64\pi$
2. Find the surface area of the portion of the cylinder  $x^2 + y^2 = 4y$  lying inside the sphere  $x^2 + y^2 + z^2 = 16$ . **Ans.**  $64$ .
3. Show that the area of surfaces  $cz = xy$  intercepted by the cylinder  $x^2 + y^2 = b^2$

is  $\iint_A \frac{\sqrt{c^2 + x^2 + y^2}}{c} dx dy$ , where A is the area of the circle  $x^2 + y^2 = b^2, z = 0$

$$\text{Ans. } \frac{2}{3} \frac{\pi}{c} \left[ (c^2 + b^2)^{\frac{1}{2}} - c^2 \right]$$

4. Find the area of the portion of the sphere  $x^2 + y^2 + z^2 = a^2$  lying inside the cylinder  $x^2 + y^2 = ax$ . **Ans.**  $2(\pi - 2)a^2$
5. Find the area of the surface of the cone  $z^2 = 3(x^2 + y^2)$  cut out by the paraboloid  $z = x^2 + y^2$  using surface integral. **Ans.**  $6\pi$

**10.7 CALCULATION OF MASS**

We have,

$$\text{Volume} = \iint_V dx dy dz$$

$$\text{Density} = \rho = f(x, y, z)$$

[Density = Mass per unit volume]

$$\text{Mass} = \text{Volume} \times \text{Density}$$

$$\text{Mass} = \iint_V dx dy dz$$

$$\boxed{\text{Mass} = \iint_V f(x, y, z) dx dy dz}$$

**Example 26.** Find the mass of a plate which is formed by the co-ordinate planes and the plane

$$\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1, \text{ the density is given by } \rho = kxyz. \quad (\text{U.P., I Semester, Dec., 2003})$$

**Solution.** The plate is bounded by the planes  $x = 0, y = 0, z = 0$  and  $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ .

$$\begin{aligned} \text{Mass} &= \iiint dx dy dz \rho = \int_0^c \int_0^{b(1-\frac{z}{c})} \int_0^{a(1-\frac{y}{b}-\frac{z}{c})} kxyz dx dy dz \\ &= k \int_0^c z dz \int_0^{b(1-\frac{z}{c})} y dy \int_0^{a(1-\frac{y}{b}-\frac{z}{c})} x dx = k \int_0^c z dz \int_0^{b(1-\frac{z}{c})} y dy \left( \frac{x^2}{2} \right)_0^{a(1-\frac{y}{b}-\frac{z}{c})} \\ &= k \int_0^c z dz \int_0^{b(1-\frac{z}{c})} y dy \frac{a^2}{2} \left( 1 - \frac{y}{b} - \frac{z}{c} \right)^2 = \frac{k a^2}{2} \int_0^c z dz \int_0^{b(1-\frac{z}{c})} y \left[ \left( 1 - \frac{z}{c} \right) - \frac{y}{b} \right]^2 dy \\ &= \frac{k a^2}{2} \int_0^c z dz \int_0^{b(1-\frac{z}{c})} \left[ y \left( 1 - \frac{z}{c} \right)^2 + \frac{y^3}{b^2} - \frac{2y^2}{b} \left( 1 - \frac{z}{c} \right) \right] dy \\ &= \frac{k a^2}{2} \int_0^c z dz \left[ \frac{y^2}{2} \left( 1 - \frac{z}{c} \right)^2 + \frac{y^4}{4b^2} - \frac{2y^3}{3b} \left( 1 - \frac{z}{c} \right) \right]_0^{b(1-\frac{z}{c})} \\ &= \frac{k a^2}{2} \int_0^c z dz \left[ \frac{b^2}{2} \left( 1 - \frac{z}{c} \right)^4 + \frac{b^4}{4b^2} \left( 1 - \frac{z}{c} \right)^4 - \frac{2}{3} \cdot \frac{b^3}{b} \left( 1 - \frac{z}{c} \right)^4 \right] \\ &= \frac{k a^2}{2} \int_0^c z \left[ \frac{b^2}{2} + \frac{b^2}{4} - \frac{2b^2}{3} \right] \left( 1 - \frac{z}{c} \right)^4 dz = \frac{k a^2}{2} \frac{b^2}{12} \int_0^c \left( 1 - \frac{z}{c} \right)^4 dz \quad [\text{Put } z = c \sin^2 \theta] \\ &= \frac{k a^2 b^2 c^2}{12} \int_0^{\frac{\pi}{2}} c \sin^2 \theta (1 - \sin^2 \theta)^4 (2c \sin \theta \cos \theta d\theta) \end{aligned}$$

$$\begin{aligned}
 &= \frac{k^2 a^2 b^2 c^2}{12} \int_0^{\pi/2} \sin^2 \theta (\cos^3 \theta) \sin \theta \cos \theta d\theta = \frac{k^2 a^2 b^2 c^2}{12} \int_0^{\pi/2} \sin^3 \theta \cos^9 \theta d\theta \\
 &= \frac{k^2 a^2 b^2 c^2}{12} \cdot \frac{\sqrt{3+1}}{2} \cdot \frac{\sqrt{9+1}}{2} = \frac{k a^2 b^2 c^2}{12} \cdot \frac{\sqrt{2}\sqrt{5}}{2\sqrt{7}} = \frac{k a^2 b^2 c^2}{12} \cdot \frac{(1)(\sqrt{5})}{2 \times 6 \times 5 \sqrt{5}} = \frac{k a^2 b^2 c^2}{720} \text{ Ans.}
 \end{aligned}$$

**Example 27.** Find the mass of a plate in the shape of the curve  $\left(\frac{x}{a}\right)^{2/3} + \left(\frac{y}{b}\right)^{2/3} = 1$ , the density being given by  $\rho = \mu xy$ . (Nagpur University, Summer 2003)

**Solution.** Let the required mass be  $M$  which is four times the mass in the first quadrant.

$$\text{From the equation of the curve } \left(\frac{y}{b}\right)^{2/3} = 1 - \left(\frac{x}{a}\right)^{2/3} \Rightarrow y = b \left[1 - \left(\frac{x}{a}\right)^{2/3}\right]^{3/2} = y_1$$

For the region  $OAB$ ,  $x$  varies from 0 to  $a$  and  $y$  varies from 0 to  $y_1$ .

$$\begin{aligned}
 M &= 4 \int_0^a \int_0^{y_1} \rho dy dx = 4 \int_0^a \int_0^{y_1} \mu xy dy dx \\
 &= 4 \int_0^a \mu x \cdot \left[\frac{y^2}{2}\right]_0^{y_1} dx = 2\mu \int_0^a xy_1^2 dx \\
 &= 2\mu \int_0^a xb^2 \left[1 - \left(\frac{x}{a}\right)^{2/3}\right]^3 dx
 \end{aligned}$$

Put  $x = a \sin^3 \theta$ , then  $dx = 3a \sin^2 \theta \cos \theta d\theta$

$$\text{When } x = 0, \theta = 0; \text{ when } x = a, \theta = \frac{\pi}{2}$$

$$\therefore M = 2\mu b^2 \int_0^{\pi/2} a \sin^3 \theta (1 - \sin^2 \theta)^3 \cdot 3a \sin^2 \theta \cos \theta d\theta$$

$$= 6\mu a^2 b^2 \int_0^{\pi/2} \sin^5 \theta \cos^7 \theta d\theta = 6\mu a^2 b^2 \cdot \frac{4 \cdot 2 \cdot 6 \cdot 4 \cdot 2}{12 \cdot 10 \cdot 8 \cdot 6 \cdot 4 \cdot 2} = \frac{\mu a^2 b^2}{20} \text{ Ans.}$$

**Example 28.** Find the mass of a lamina in the form of the cardioid  $r = a(1 + \cos \theta)$  whose density at any point varies as the square of its distance from the initial line.

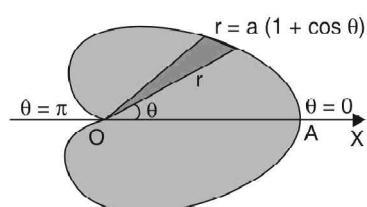

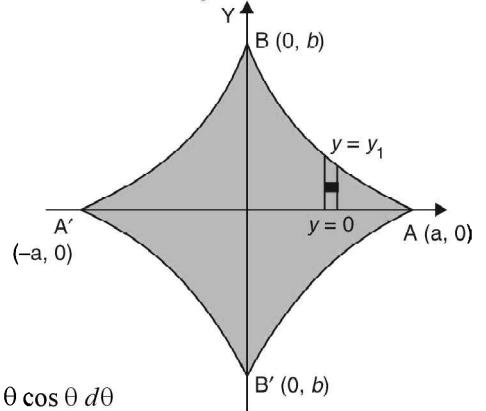

(Nagpur University, Winter 2005)

**Solution.** Let the required mass be  $M$  which is twice the mass above the initial line.

Since the distance of any point  $(r, \theta)$  from the initial line is  $r \sin \theta$ , the density at  $(r, \theta)$  is given by  $r = m(r \sin \theta)^2 = \mu r^2 \sin^2 \theta$ .

For the region above the initial line,  $\theta$  varies from 0 to  $\pi$  and  $r$  varies from 0 to  $a(1 + \cos \theta)$ .

$$\begin{aligned}
 M &= 2 \int_0^\pi \int_0^{a(1+\cos\theta)} \rho r dr d\theta \\
 &= 2 \int_0^\pi \int_0^{a(1+\cos\theta)} \mu r^3 \sin^2 \theta dr d\theta = 2 \int_0^\pi \mu \sin^2 \theta \cdot \left[\frac{r^4}{4}\right]_0^{a(1+\cos\theta)} d\theta \\
 &= \frac{\mu a^4}{2} \int_0^\pi \left(2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}\right)^2 \cdot \left(2 \cos^2 \frac{\theta}{2}\right)^4 d\theta = 32 \mu a^4 \int_0^\pi \sin^2 \frac{\theta}{2} \cos^{10} \frac{\theta}{2} d\theta
 \end{aligned}$$

Put  $\frac{\theta}{2} = t$ , then  $d\theta = 2dt$ ; when  $\theta = 0$ ,  $t = 0$ ; when  $\theta = \pi$ ,  $t = \frac{\pi}{2}$

$$\therefore M = 32 \mu a^4 \int_0^\pi 2 \sin^2 t \cos^{10} t dt = 64 \mu a^4 \cdot \frac{1 \cdot 9 \cdot 7 \cdot 5 \cdot 3 \cdot 1}{12 \cdot 10 \cdot 8 \cdot 6 \cdot 4 \cdot 2} \cdot \frac{\pi}{2} = \frac{21}{32} \mu \pi a^4 \quad \text{Ans.}$$

### 10.8 CENTRE OF GRAVITY

$$\bar{x} = \frac{\iiint_V x \rho dx dy dz}{\iiint_V \rho dx dy dz}, \bar{y} = \frac{\iiint_V y \rho dx dy dz}{\iiint_V \rho dx dy dz}, \bar{z} = \frac{\iiint_V z \rho dx dy dz}{\iiint_V \rho dx dy dz}$$

**Example 29.** Find the co-ordinates of the centre of gravity of the positive octant of the sphere  $x^2 + y^2 + z^2 = a^2$ , density being given as  $k xyz$ .

$$\text{Solution. } \bar{x} = \frac{\iiint_V x \rho dx dy dz}{\iiint_V \rho dx dy dz} = \frac{\iiint_V z \rho dx dy dz}{\iiint_V \rho dx dy dz} = \frac{\iiint_V x^2 yz dx dy dz}{\iiint_V xyz dx dy dz}$$

Converting into polar co-ordinates,  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$ ,

$$dx dy dz = r^2 \sin \theta dr d\theta d\phi$$

$$\begin{aligned} \bar{x} &= \frac{\int_0^{\pi/2} \int_0^{\pi/2} \int_0^a (r \sin \theta \cos \phi)^2 (r \sin \theta \sin \phi) (r \cos \theta) (r^2 \sin \theta dr d\theta d\phi)}{\int_0^{\pi/2} \int_0^{\pi/2} \int_0^a (r \sin \theta \cos \phi) (r \sin \theta \sin \phi) (r \cos \theta) (r^2 \sin \theta dr d\theta d\phi)} \\ &= \frac{\int_0^{\pi/2} \int_0^{\pi/2} \int_0^a r^6 \sin^4 \theta \cos^2 \theta \sin^2 \phi \cos^2 \phi dr d\theta d\phi}{\int_0^{\pi/2} \int_0^{\pi/2} \int_0^a r^5 \sin^3 \theta \cos^2 \theta \sin^2 \phi \cos^2 \phi dr d\theta d\phi} \\ &= \frac{\int_0^{\pi/2} \sin \phi \cos^2 \phi d\phi \int_0^{\pi/2} \sin^4 \theta \cos^2 \theta d\theta \int_0^a r^6 dr}{\int_0^{\pi/2} \sin \phi \cos \phi d\phi \int_0^{\pi/2} \sin^3 \theta \cos^2 \theta d\theta \int_0^a r^5 dr} \\ &= \frac{\left[ -\frac{\cos^3 \phi}{3} \right]_0^{\pi/2} \left[ \frac{\sin^5 \theta}{5} \right]_0^{\pi/2} \left[ \frac{r^7}{7} \right]_0^a}{\left[ -\frac{\cos^2 \phi}{2} \right]_0^{\pi/2} \left[ \frac{\sin^4 \theta}{4} \right]_0^{\pi/2} \left[ \frac{r^6}{6} \right]_0^a} = \frac{\left( \frac{1}{3} \right) \left( \frac{1}{5} \right) \left( \frac{a^7}{7} \right)}{\left( \frac{1}{2} \right) \left( \frac{1}{4} \right) \left( \frac{a^6}{6} \right)} = \frac{16 a}{35} \end{aligned}$$

$$\text{Similarly, } \bar{y} = \frac{16 a}{35}$$

$$\text{Hence, C.G. is } \left( \frac{16 a}{35}, \frac{16 a}{35}, \frac{16 a}{35} \right)$$

Ans.

### 10.9 MOMENT OF INERTIA OF A SOLID

Let the mass of an element of a solid of volume  $V$  be  $\rho \delta x \delta y \delta z$ .

Perpendicular distance of this element from the  $x$ -axis =  $\sqrt{y^2 + z^2}$

M.I. of this element about the  $x$ -axis =  $\rho \delta x \delta y \delta z \sqrt{y^2 + z^2}$

M.I. of the solid about  $x$ -axis =  $\iiint_V \rho (y^2 + z^2) dx dy dz$

M.I. of the solid about  $y$ -axis =  $\iiint_V \rho (x^2 + z^2) dx dy dz$

M.I. of the solid about  $z$ -axis =  $\iiint_V \rho (x^2 + y^2) dx dy dz$

**The Perpendicular Axes Theorem**

If  $I_{ox}$  and  $I_{oy}$  be the moments of inertia of a lamina about  $x$ -axis and  $y$ -axis respectively and  $I_{oz}$  be the moment of inertia of the lamina about an axis perpendicular to the lamina and passing through the point of intersection of the axes  $OX$  and  $OY$ .

$$I_{oz} = I_{ox} + I_{oy}$$

**The Parallel Axes Theorem**

M.I. of a lamina about an axis in the plane of the lamina equals the sum of the moment of inertia about a parallel centroidal axis in the plane of lamina together with the product of the mass of the lamina and square of the distance between the two axes.

$$I_{AB} = I_{XX'} + My^2$$

**Example 30.** Find M.I. of a sphere about diameter.

**Solution.** Let a circular disc of  $\delta x$  thickness be perpendicular to the given diameter  $XX'$  at a distance  $x$  from it.

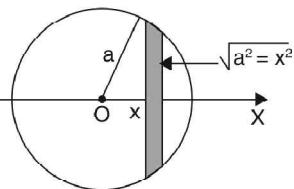

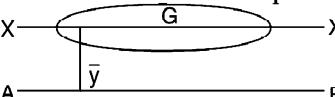

$$\text{The radius of the disc} = \sqrt{a^2 - x^2}$$

$$\text{Mass of the disc} = \rho \pi (a^2 - x^2)$$

Moment of inertia of the disc about a diameter perpendicular on it

$$= \frac{1}{2} MR^2 = \frac{1}{2} [\rho \pi (a^2 - x^2)] (a^2 - x^2) = \frac{1}{2} \rho \pi (a^2 - x^2)^2$$

$$\begin{aligned} \text{M.I. of the sphere} &= \int_{-a}^a \frac{1}{2} \rho \pi (a^2 - x^2)^2 dx = 2 \left( \frac{1}{2} \rho \pi \right) \int_0^a [a^4 - 2a^2 x^2 + x^4] dx \\ &= \rho \pi \left[ a^4 x - \frac{2a^2 x^3}{3} + \frac{x^5}{5} \right]_0^a = \rho \pi \left[ a^5 - \frac{2a^5}{3} + \frac{a^5}{5} \right] \\ &= \frac{8}{15} \pi \rho a^5 = \frac{2}{5} \left( \frac{4\pi}{3} a^3 \rho \right) a^2 = \frac{2}{5} M a^2 \quad \text{Ans.} \end{aligned}$$

**Example 31.** The mass of a solid right circular cylinder of radius  $a$  and height  $h$  is  $M$ . Find the moment of inertia of the cylinder about (i) its axis (ii) a line through its centre of gravity perpendicular to its axis (iii) any diameter through its base.

**Solution.** To find M.I. about  $OX$ . Consider a disc at a distance  $x$  from  $O$  at the base.

M.I. of the about  $OX$ ,

$$= \frac{(\pi a^2 \rho dx) a^2}{2} = \frac{\pi \rho a^4 dx}{2}$$

(i) M.I. of the cylinder about  $OX$

$$\int_0^h \frac{\pi \rho a^4 dx}{2} = \frac{\pi \rho a^4}{2} (x)_0^h = \frac{\pi \rho a^4 h}{2} = (\pi a^2 h) \rho \cdot \frac{a^2}{2} = \frac{M a^2}{2}$$

(ii) M.I. of the disc about a line through C.G. and perpendicular to  $OX$ .

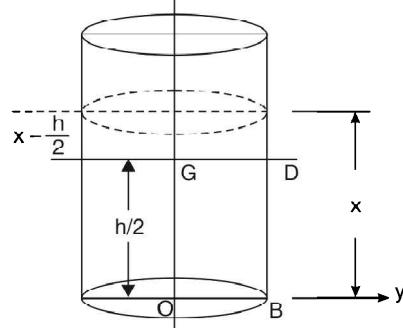

$$I_{OX} + I_{OY} = I_{OZ}$$

$$I_{OX} + I_{OZ} = I_{OZ}$$

$$I_{OX} = \frac{1}{2} I_{OZ}$$

M.I. of the disc about a line through

$$C.G. = \frac{1}{2} \left( \frac{M a^2}{2} \right) = \frac{M a^2}{4}$$

$$\text{M.I. of the disc about the diameter} = \left( \frac{\pi a^2 \rho dx}{4} \right) a^2$$

$$\text{M.I. of the disc about line } GD = \frac{\pi a^2 \rho dx}{4} + (\pi a^2 \rho dx) \left( x - \frac{h}{2} \right)^2$$

$$\begin{aligned} \text{Hence, M.I. of cylinder about } GD &= \int_0^h \frac{\pi a^2 \rho}{4} dx + \int_0^h (\pi a^2 \rho dx) \left( x - \frac{h}{2} \right)^2 \\ &= \frac{\pi a^2 \rho}{4} (x)_0^h + \left[ \frac{\pi a^2 \rho}{4} \left( x - \frac{h}{2} \right)^3 \right]_0^h = \frac{\pi a^2 \rho h}{4} + \left[ \frac{\pi a^2 \rho}{3} \left( \frac{h}{2} \right)^3 + \frac{\pi a^2 \rho}{3} \left( \frac{h}{2} \right)^3 \right] \\ &= \frac{\pi a^2 \rho h}{4} + \frac{\pi a^2 \rho h^3}{12} = \frac{M a^2}{4} + \frac{M h^2}{12} \end{aligned}$$

(iii) M.I. of cylinder about line  $OB$  (through) base

$$I_{OB} = I_G + M \left( \frac{h}{2} \right)^2 = \frac{M a^2}{4} + \frac{M h^2}{12} + \frac{M h^2}{4} = \frac{M a^2}{4} + \frac{M h^2}{3} \quad \text{Ans.}$$

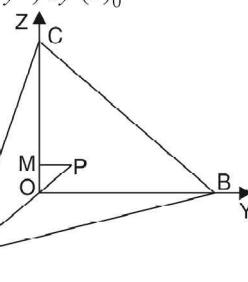

**Example 32.** Find the moment of inertia and radius of gyration about z-axis of the region in

the first octant bounded by  $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ .

**Solution.** Let  $r$  be the density.

M.I. of tetrahedron about z-axis

$$\begin{aligned} &= \iiint (\rho dx dy dz) (x^2 + y^2) \\ &= \rho \int_0^a dx \int_0^{b(1-\frac{x}{a})} (x^2 + y^2) dy \int_0^{c(1-\frac{x}{a}-\frac{y}{b})} dz = \rho \int_0^a dx \int_0^{b(1-\frac{x}{a})} (x^2 + y^2) dy (z)_0^{c(1-\frac{x}{a}-\frac{y}{b})} \\ &= \rho \int_0^a dx \int_0^{b(1-\frac{x}{a})} (x^2 + y^2) dy c c \left( 1 - \frac{x}{a} - \frac{y}{b} \right) \\ &= \rho c \int_0^a dx \int_0^{b(1-\frac{x}{a})} \left[ x^2 \left( 1 - \frac{x}{a} \right) - \frac{x^2 y}{b} + y^2 \left( 1 - \frac{x}{a} \right) - \frac{y^3}{b} \right] dy \\ &= \rho c \int_0^a dx \left[ x^2 \left( 1 - \frac{x}{a} \right) y - \frac{x^2 y^2}{2 b} + \frac{y^3}{3} \left( 1 - \frac{x}{a} \right) - \frac{y^4}{4 b} \right]_0^{b(1-\frac{x}{a})} \\ &= \rho c \int_0^a dx \left[ x^2 \left( 1 - \frac{x}{a} \right) b \left( 1 - \frac{x}{a} \right) - \frac{x^2}{2 b} b^2 \left( 1 - \frac{x}{a} \right)^2 + \frac{b^3}{3} \left( 1 - \frac{x}{a} \right)^3 \left( 1 - \frac{x}{a} \right) - \frac{b^4}{4 b} \left( 1 - \frac{x}{a} \right)^4 \right] \\ &= b \rho c \int_0^a \left[ x^2 \left( 1 - \frac{x}{a} \right)^2 - \frac{x^2}{2} \left( 1 - \frac{x}{a} \right)^2 - \frac{b^2}{3} \left( 1 - \frac{x}{a} \right)^4 - \frac{b^2}{4} \left( 1 - \frac{x}{a} \right)^4 \right] dx \\ &= \rho bc \int_0^a \left[ \frac{x^2}{2} \left( 1 - \frac{x}{a} \right)^2 + \frac{b^2}{12} \left( 1 - \frac{x}{a} \right)^4 \right] dx \\ &= \rho bc \int_0^a \left[ \frac{1}{2} \left( x^2 - \frac{2 x^3}{a} + \frac{x^4}{a^2} \right) + \frac{b^2}{12} \left( 1 - \frac{4 x}{a} + \frac{6 x^2}{a^2} - \frac{4 x^3}{a^3} + \frac{x^4}{a^4} \right) \right] dx \\ &= \rho bc \int_0^a \left[ \frac{1}{2} \left( \frac{x^3}{3} - \frac{x^4}{2 a} + \frac{x^5}{5 a^2} \right) + \frac{b^2}{12} \left( x - \frac{2 x^2}{a} + \frac{6 x^2}{a^2} - \frac{4 x^3}{a^3} + \frac{x^4}{a^4} \right) \right] dx \end{aligned}$$

$$\begin{aligned}
 &= \rho bc \int_0^a \left[ \frac{1}{2} \left( \frac{a^3}{3} - \frac{a^3}{2} + \frac{a^3}{5} \right) + \frac{b^2}{12} \left( a - 2a + 2a - a + \frac{a}{5} \right) \right] \\
 &= \rho bc \left[ \frac{a^3}{60} + \frac{ab^2}{60} \right] = \rho \frac{abc}{60} (a^2 + b^2) \\
 \text{Radius of gyration} &= \sqrt{\frac{M.I.}{\text{Mass}}} = \frac{\sqrt{\frac{\rho abc}{60} (a^2 + b^2)}}{\frac{\rho abc}{6}} = \sqrt{\frac{1}{10} (a^2 + b^2)} \quad \text{Ans.}
 \end{aligned}$$

**Example 33.** A solid body of density  $\rho$  is in the shape of the solid formed by revolution of the cardioid  $r = a(1 + \cos \theta)$  about the initial line. Show that its moment of inertia about a

straight line through the pole perpendicular to the initial line is  $\left(\frac{352}{105}\right)\pi\rho a^5$ .

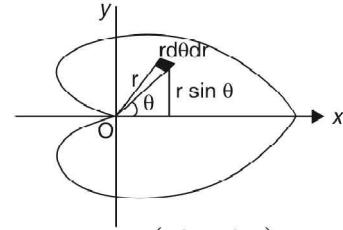

(U.P., II Semester Summer 2001)

**Solution.**  $r = a(1 + \cos \theta)$

Consider an elementary area  $r d\theta dr$ . This area when revolved about OX generates a circular ring of radius  $r \sin \theta$ .

Its mass =  $(2\pi r \sin \theta)(r d\theta dr \rho)$ .

$$(M.I. \text{ of a ring about a diameter} = \frac{Ma^2}{2})$$

$$\text{M.I. of the ring about a diameter parallel to } OY = (2\pi r \sin \theta)(r d\theta dr) P \left( \frac{r^2 \sin^2 \theta}{2} \right)$$

M.I. of the ring about  $OY$  = M.I. of the ring about a diameter parallel to  $OY$  + mass of the ring  $(r \cos \theta)^2$

$$= (2\pi r \sin \theta r d\theta dr \rho) \left( \frac{r^2 \sin^2 \theta}{2} + r^2 \cos^2 \theta \right)$$

So M.I. of the solid generated by revolution about OY

$$= 2\pi \rho \int_0^\pi \int_a^{a(1+\cos\theta)} r^4 \sin \theta \left( \frac{\sin^2 \theta}{2} + \cos^2 \theta \right) d\theta dr$$

$$= \pi \rho \int_0^\pi \sin \theta (1 + \cos^2 \theta) d\theta \int_a^{a(1+\cos\theta)} r^4 dr = \pi \rho \int_0^\pi \sin \theta (1 + \cos^2 \theta) d\theta \left( \frac{r^5}{5} \right)_0^{a(1+\cos\theta)}$$

$$= \pi \rho \int_0^\pi \sin \theta (1 + \cos^2 \theta) d\theta \frac{a^5 (1 + \cos \theta)^5}{5} = \pi \rho \frac{a^5}{5} \int_0^\pi (1 + \cos^2 \theta) (1 + \cos \theta)^5 \sin \theta d\theta$$

$$= \frac{\pi \rho a^5}{5} \int_0^\pi \left[ 1 + \left( 2 \cos^2 \frac{\theta}{2} - 1 \right)^2 \right] \left( 2 \cos^2 \frac{\theta}{5} \right)^5 2 \sin \frac{\theta}{2} \cos \frac{\theta}{2} d\theta$$

$$\text{Putting } \frac{\theta}{2} = t, d\theta = 2 dt = \frac{265 \pi \rho a^5}{5} \int_0^{\pi/2} [\cos^{11} t \sin t + 2 \cos^{15} t \sin t - 2 \cos^{13} t \sin t] dt$$

$$= \frac{265 \pi \rho a^5}{5} \left[ -\frac{\cos^{12} t}{12} - 2 \frac{\cos^{16} t}{16} + 2 \frac{\cos^{14} t}{14} \right]_0^{\pi/2} = \frac{352 \pi \rho a^5}{105} \quad \text{Proved.}$$

### 10.10 CENTRE OF PRESSURE

The centre of pressure of a plane area immersed in a fluid is the point at which the resultant force acts on the area.

Consider a plane area  $A$  immersed vertically in a homogeneous liquid. Let  $x$ -axis be the line of intersection of the plane with the free surface. Any line in this plane and perpendicular to  $x$ -axis is the  $y$ -axis.

Let  $P$  be the pressure at the point  $(x, y)$ . Then the pressure on elementary area  $\delta x \delta y$  is  $P \delta x \delta y$ .

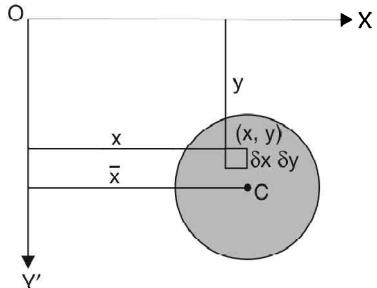

Let  $(\bar{x}, \bar{y})$  be the centre of pressure. Taking moment about  $y$ -axis.

$$\bar{x} \cdot \iint_A P dx dy = \iint_A Px dx dy$$

$$\bar{x} = \frac{\iint_A Px dx dy}{\iint_A P dx dy}$$

Similarly,

$$\bar{y} = \frac{\iint_A Py dx dy}{\iint_A P dx dy}$$

**Example 34.** A uniform semi-circular lamina is immersed in a fluid with its plane vertical and its bounding diameter on the free surface. If the density at any point of the fluid varies as the depth of the point below the free surface, find the position of the centre of pressure of the lamina.

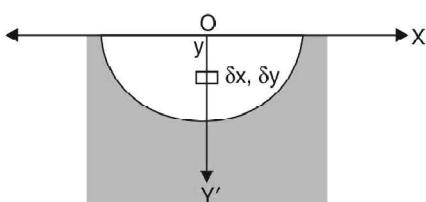

**Solution.** Let the semi-circular lamina be

$$x^2 + y^2 = a^2$$

By symmetry its centre of pressure lies on  $OY$ .

Let  $ky$  be the density of the fluid.

$$\begin{aligned} \bar{y} &= \frac{\iint_A Py dx dy}{\iint_A P dx dy} = \frac{\iint_A (py) y dx dy}{\iint_A (py) dx dy} \quad (\because p = ky) \\ &= \frac{\iint_A (ky \cdot y) y dx dy}{\iint_A (ky \cdot y) dx dy} = \frac{\iint_A y^3 dx dy}{\iint_A y^2 dx dy} = \frac{\int_{-a}^a dx \int_0^{\sqrt{a^2 - x^2}} y^3 dy}{\int_{-a}^a dx \int_0^{\sqrt{a^2 - x^2}} y^2 dy} \\ &= \frac{\int_{-a}^a dx \left[ \frac{y^4}{4} \right]_0^{\sqrt{a^2 - x^2}}}{\int_{-a}^a dx \left[ \frac{y^3}{3} \right]_0^{\sqrt{a^2 - x^2}}} = \frac{3}{4} \frac{\int_{-a}^a dx (a^2 - x^2)^2}{\int_{-a}^a dx (a^2 - x^2)^{3/2}} \\ &= \frac{3}{4} \frac{\int_{-\pi/2}^{\pi/2} (a \cos \theta d\theta) (a^2 - a^2 \sin^2 \theta)^2}{\int_{-\pi/2}^{\pi/2} (a \cos \theta d\theta) (a^2 - a^2 \sin^2 \theta)^{3/2}} \quad (\text{Put } x = a \sin \theta) \\ &= \frac{3 a}{4} \frac{\int_{-\pi/2}^{\pi/2} \cos^5 \theta d\theta}{\int_{-\pi/2}^{\pi/2} \cos^4 \theta d\theta} \\ &= \frac{3 a}{4} \frac{2 \int_0^{\pi/2} \cos^5 \theta d\theta}{2 \int_0^{\pi/2} \cos^4 \theta d\theta} = \frac{3 a}{4} \frac{\frac{4 \times 2}{5 \times 3}}{\frac{3 \times 1}{4 \times 2} \frac{\pi}{2}} = \frac{32 a}{15 \pi} \end{aligned}$$

**Ans.**

**EXERCISE 10.3**

1. Find the mass of the solid bounded by the ellipsoid  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$  and the co-ordinate planes, where the density at any point  $P(x, y, z)$  is  $kxyz$ . **Ans.**  $P$

2. If the density at a point varies as the square of the distance of the point from  $XOY$  plane, find the mass of the volume common to the sphere  $x^2 + y^2 + z^2 = a^2$  and cylinder  $x^2 + y^2 = ax$ .

$$\text{Ans. } \frac{4k}{15} a^5 \left( \frac{\pi}{2} - \frac{8}{15} \right)$$

3. Find the mass of the plate in the form of one loop of lemniscate  $r^2 = a^2 \sin 2\theta$ , where  $\rho = k r^2$ .

$$\text{Ans. } \frac{k \pi a^4}{16}$$

4. Find the mass of the plate which is inside the circle  $r = 2a \cos \theta$  and outside the circle  $r = a$ , if the density varies as the distance from the pole.

5. Find the mass of a lamina in the form of the cardioid  $r = a(1 + \cos \theta)$  whose density at any point varies

as the square of its distance from the initial line. **Ans.**  $\frac{21\pi k a^4}{32}$

6. Find the centroid of the region in the first octant bounded by  $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ . **Ans.**  $\left( \frac{a}{4}, \frac{b}{4}, \frac{c}{4} \right)$

7. Find the centroid of the region bounded by  $z = 4 - x^2 - y^2$  and  $xy$ -plane. **Ans.**  $\left( 0, 0, \frac{4}{3} \right)$

8. Find the position of C.G. of the volume intercepted between the parallelepiped  $x^2 + y^2 = a(a-z)$  and the

plane  $z = 0$ . **Ans.**  $\left( 0, 0, \frac{a}{3} \right)$

9. A solid is cut off the cylinder  $x^2 + y^2 = a^2$  by the plane  $z = 0$  and that part of the plane  $z = mx$  for which  $z$  is positive. The density of the solid cut off at any point varies as the height of the point above plane

$z = 0$ . Find C.G. of the solid. **Ans.**  $z = \frac{64ma}{45\pi}$

10. If an area is bounded by two concentric semi-circles with their common bounding diameter in a free surface, prove that the depth of the centre of pressure is  $\frac{3\pi(a+b)(a^2+b^2)}{16(a^2+ab+b^2)}$

11. An ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  is immersed vertically in a fluid with its major axis horizontal. If its centre be

at depth  $h$ , find the depth of its centre of pressure. **Ans.**  $h + \frac{b^2}{4h}$

12. A horizontal boiler has a flat bottom and its ends are plane and semi-circular. If it is just full of water, show that the depth of centre of pressure of either end is  $0.7 \times$  total depth approximately.

13. A quadrant of a circle of radius  $a$  is just immersed vertically in a homogeneous liquid with one edge in

the surface. Determine the co-ordinates of the centre of pressure. **Ans.**  $\left( \frac{3a}{8}, \frac{3\pi a}{16} \right)$

14. Find the product of inertia of an equilateral triangle about two perpendicular axes in its plane at a vertex, one of the axes being along a side.

15. Find the M.I. of a right circular cylinder of radius  $a$  and height  $h$  about axis if density varies as distance

from the axis. **Ans.**  $\frac{2}{5} k \pi a^5 h$

16. Compute the moment of inertia of a right circular cone whose altitude is  $h$  and base radius  $r$ , about (i)

the axis of symmetry (ii) the diameter of the base. **Ans.** (i)  $\frac{\pi h r^4}{10}$  (ii)  $\frac{\pi h r^2}{60} (2h^2 + 3r^2)$

17. Find the moment of inertia for the area of the cardioid  $r = a(1 - \cos \theta)$  relative to the pole.

$$\text{Ans. } \frac{35\pi a^4}{16}$$

18. Find the M.I. about the line  $\theta = \frac{\pi}{2}$  of the area enclosed by  $r = a(1 + \cos \theta)$ .

19. Find the moment of inertia of the uniform solid in the form of octant of the ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \text{ about } OX \quad \text{Ans. } \frac{M}{5} (b^2 + c^2)$$

20. Prove that the moment of inertia of the area included between the curves  $y^2 = 4ax$  and  $x^2 = 4ay$  about the  $x$ -axis is  $\frac{144}{35} M a^2$ , where  $M$  is the mass of area included between the curves.

21. A solid body of density  $p$  is the shape of solid formed by revolution of the cardioid  $r = a(1 + \cos \theta)$  about the initial line. Show that its moment of inertia about a straight line through the pole perpendicular

to the initial line is  $\left(\frac{352}{105}\right)\pi l a^5$ . *(U.P. II Semester, Summer 2001)*

22. Find the product of inertia of a disc in the form of a quadrant of a circle of radius ' $a$ ' about bounding

radii. *(U.P. II Semester, Summer 2002)* **Ans.**  $\rho \frac{a^4}{4}$

23. Show that the principal axes at the origin of the triangle enclosed by  $x = 0$ ,  $y = 0$ ,  $\frac{x}{a} + \frac{y}{b} = 1$  are inclined

at angles  $\alpha$  and  $\alpha + \frac{\pi}{2}$  to the  $x$ -axis, where  $a = \frac{1}{2} \tan^{-1} \left( \frac{ab}{a^2 - b^2} \right)$

*(U.P. II Semester Summer 2001)*

Choose the correct answer:

24. The triple integral  $\iiint_T dx dy dz$  gives

- (i) Volume of region  $T$  (ii) Surface area of region  $T$   
 (iii) Area of region  $T$  (iv) Density of region  $T$ . *(A.M.I.E.T.E. 2002)*

**Ans. (i)**

25. The volume of the solid under the surface  $az = x^2 + y^2$  and whose base  $R$  is the circle  $x^2 + y^2 = a^2$  is given as

$$(i) \frac{\pi}{2a} \quad (ii) \frac{\pi a^3}{2} \quad \text{Ans. (ii)}$$

$$(iii) \frac{4}{3}\pi a^3 \quad (iv) \text{None of the above.} \quad [\text{U.P., I. Sem. Dec. 2008}]$$

**CHAPTER**  
**11**

## DIFFERENTIAL EQUATIONS OF FIRST ORDER

---

### 11.1 DEFINITION

An equation which involves differential co-efficient is called a differential equation.

*For example,*

$$\begin{array}{lll} \text{1. } \frac{dy}{dx} = \frac{1+x^2}{1-y^2} & \text{2. } \frac{d^2y}{dx^2} = 2 \frac{dy}{dx} - 8y = 0 & \text{3. } \left[ 1 + \left( \frac{dy}{dx} \right)^2 \right]^{\frac{3}{2}} = k \frac{d^2y}{dx^2} \\ \text{4. } x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = nu, & \text{5. } \frac{\partial^2 z}{\partial x \partial y} = \frac{\partial z}{\partial y} & \end{array}$$

There are two types of differential equations :

#### (1) Ordinary Differential Equation

A differential equation involving derivatives with respect to a single independent variable is called an ordinary differential equation.

#### (2) Partial Differential Equation

A differential equation involving partial derivatives with respect to more than one independent variable is called a partial differential equation.

### 11.2 ORDER AND DEGREE OF A DIFFERENTIAL EQUATION

The *order* of a differential equation is the order of the highest differential co-efficient present in the equation. Consider

$$\begin{array}{ll} \text{1. } L \frac{d^2q}{dt^2} + R \frac{dq}{dt} + \frac{q}{c} = E \sin wt. & \text{2. } \cos x \frac{d^2y}{dx^2} + \sin x \left( \frac{dy}{dx} \right)^2 + 8y = \tan x \\ \text{3. } \left[ 1 + \left( \frac{dy}{dx} \right)^2 \right]^3 = \left( \frac{d^2y}{dx^2} \right)^2 & \end{array}$$

The order of the above equations is 2.

The degree of a differential equation is the degree of the highest derivative after removing the radical sign and fraction.

The *degree* of the equation (1) and (2) is 1. The degree of the equation (3) is 2.

### 11.3 FORMATION OF DIFFERENTIAL EQUATIONS

The differential equations can be formed by differentiating the ordinary equation and eliminating the arbitrary constants.

**Example 1.** Form the differential equation by eliminating arbitrary constants, in the following cases and also write down the order of the differential equations obtained.

$$(a) y = A x + A^2 \quad (b) y = A \cos x + B \sin x \quad (c) y^2 = Ax^2 + Bx + C.$$

(R.G.P.V. Bhopal, June 2008)

**Solution.** (a)  $y = Ax + A^2$

... (1)

On differentiation  $\frac{dy}{dx} = A$

Putting the value of  $A$  in (1), we get  $y = x \frac{dy}{dx} + \left( \frac{dy}{dx} \right)^2$

**Ans.**

On eliminating one constant  $A$  we get the differential equation of order 1.

(b)  $y = A \cos x + B \sin x$

On differentiation  $\frac{dy}{dx} = -A \sin x + B \cos x$

Again differentiating

$$\frac{d^2y}{dx^2} = -A \cos x - B \sin x \Rightarrow \frac{d^2y}{dx^2} = -(A \cos x + B \sin x)$$

$$\Rightarrow \frac{d^2y}{dx^2} = -y \Rightarrow \frac{d^2y}{dx^2} + y = 0 \quad \text{Ans.}$$

This is differential equation of order 2 obtained by eliminating two constants  $A$  and  $B$ .

(c)  $y^2 = Ax^2 + Bx + C$

On differentiation  $2y \frac{dy}{dx} = 2Ax + B$

Again differentiating  $2y \frac{d^2y}{dx^2} + 2\left(\frac{dy}{dx}\right)^2 = 2A$

On differentiating again  $y \frac{d^3y}{dx^3} + \frac{dy}{dx} \frac{d^2y}{dx^2} + 2 \frac{dy}{dx} \frac{d^2y}{dx^2} = 0 \Rightarrow y \frac{d^3y}{dx^3} + 3 \frac{dy}{dx} \frac{d^2y}{dx^2} = 0 \quad \text{Ans.}$

This is the differential equation of order 3, obtained by eliminating three constants  $A$ ,  $B$ ,  $C$ .

**Example 2.** Determine the differential equation whose set of independent solution is  $\{e^x, xe^x, x^2 e^x\}$  (U.P., II Semester, Summer 2002)

**Solution.** Here, we have

$$y = c_1 e^x + c_2 x e^x + c_3 x^2 e^x \quad \dots (1)$$

Differentiating both sides, we get

$$\begin{aligned} y' &= c_1 e^x + c_2 x e^x + c_2 e^x + c_3 x^2 e^x + c_3 2x e^x \\ &= (c_1 e^x + c_2 x e^x + c_3 x^2 e^x) + c_2 e^x + c_3 2x e^x \\ &= y + c_2 e^x + c_3 2x e^x \end{aligned} \quad [\text{Using (1)}]$$

$$\Rightarrow y' - y = c_2 e^x + c_3 2x e^x \quad \dots (2)$$

Again, differentiating both sides, we get

$$\begin{aligned} \Rightarrow y'' - y' &= c_2 e^x + 2c_3 e^x + 2x c_3 e^x \\ \Rightarrow y'' - y' &= (c_2 e^x + 2x c_3 e^x) + 2c_3 e^x \\ \Rightarrow y'' - y' &= y' - y + 2c_3 e^x \end{aligned} \quad [\text{Using (2)}]$$

$$\Rightarrow y'' - 2y' + y = 2c_3 e^x \quad \dots (3)$$

Finally, on differentiating both sides, we get

$$\Rightarrow y''' - 2y'' + y' = 2c_3 e^x$$

$$\begin{aligned}\Rightarrow & y''' - 2y'' + y' = y'' - 2y' + y && [\text{Using (3)}] \\ \Rightarrow & y''' - 2y'' - y'' + y' + 2y' - y = 0 \\ \Rightarrow & y''' - 3y'' + 3y' - y = 0 \\ \Rightarrow & (D - 1)^3 y = 0\end{aligned}$$

**Ans.**

**Example 3.** By the elimination of the constants A and B obtain the differential equation of which  $xy = Ae^x + Be^{-x} + x^2$  is the solution. (U.P.B. Pharma (C.O.) 2005)

**Solution.** We have  $xy = Ae^x + Be^{-x} + x^2$  .... (1)

On differentiating (1), we get  $x \frac{dy}{dx} + y = Ae^x - Be^{-x} + 2x$  .... (2)

Again differentiating (2), we get  $x \frac{d^2y}{dx^2} + \frac{dy}{dx} + \frac{dy}{dx} = Ae^x + Be^{-x} + 2$  .... (3)

From (1), we have  $Ae^x + Be^{-x} = xy - x^2$  .... (4)

Putting the value of  $Ae^x + Be^{-x}$  From (4) in (3), we have

$$x \frac{d^2y}{dx^2} + 2 \frac{dy}{dx} = xy - x^2 + 2, \quad x \frac{d^2y}{dx^2} + 2 \frac{dy}{dx} - xy = 2 - x^2$$

**Ans.**

### EXERCISE 11.1

1. Write the order and the degree of the following differential equations.

$$(i) \frac{d^2y}{dx^2} + a^2 x = 0; \quad (ii) \left[ 1 + \left( \frac{dy}{dx} \right)^2 \right]^{\frac{3}{2}} = \frac{d^2y}{dx^2}; \quad (iii) x^2 \left( \frac{d^2y}{dx^2} \right)^3 + y \left( \frac{dy}{dx} \right)^4 + y^4 = 0.$$

**Ans.** (i) 2,1 (ii) 2,2 (iii) 2,3

2. Give an example of each of the following type of differential equations.

(i) A linear-differential equation of second order and first degree **Ans.** Q 1 (i)

(ii) A non-linear differential equation of second order and second degree **Ans.** Q 1 (ii)

(iii) Second order and third degree. **Ans.** Q 1 (iii)

3. Obtain the differential equation of which  $y^2 = 4a(x + a)$  is a solution.

$$\text{Ans. } y^2 \left( \frac{dy}{dx} \right)^2 + 2xy \frac{dy}{dx} - y^2 = 0$$

4. Obtain the differential equation associated with the primitive  $Ax^2 + By^2 = 1$ .

$$\text{Ans. } xy \frac{d^2y}{dx^2} + x \left( \frac{dy}{dx} \right)^2 - y \frac{dy}{dx} = 0$$

5. Find the differential equation corresponding to

$$y = a e^{3x} + b e^x. \quad \text{Ans. } \frac{d^2y}{dx^2} - 4 \frac{dy}{dx} + 3y = 0$$

6. By the elimination of constants A and B, find the differential equation of which

$$y = e^x (A \cos x + B \sin x) \text{ is a solution.} \quad \text{Ans. } \frac{d^2y}{dx^2} - 2 \frac{dy}{dx} + 2y = 0$$

7. Find the differential equation whose solution is  $y = a \cos(x + 3)$ . (A.M.I.E., Summer 2000)

$$\text{Ans. } \frac{dy}{dx} = -\tan(x + 3)$$

8. Show that set of function  $\left\{ x, \frac{1}{x} \right\}$  forms a basis of the differential equation  $x^2 y'' + xy' - y = 0$ .

Obtain a particular solution when  $y(1) = 1, y'(1) = 2$ . **Ans.**  $y = \frac{3x}{2} - \frac{1}{2x}$

### 11.4 SOLUTION OF A DIFFERENTIAL EQUATION

In the example 1(b),  $y = A \cos x + B \sin x$ , on eliminating  $A$  and  $B$  we get the differential equation

$$\frac{d^2y}{dx^2} + y = 0$$

$y = A \cos x + B \sin x$  is called the solution of the differential equation  $\frac{d^2y}{dx^2} + y = 0$ .

The order of the differential equation  $\frac{d^2y}{dx^2} + y = 0$  is two and the solution

$y = A \cos x + B \sin x$  contains two arbitrary constants. The number of arbitrary constants in the solution is equal to the order of the differential equation.

An equation containing dependent variable ( $y$ ) and independent variable ( $x$ ) and free from derivative, which satisfies the differential equation, is called the solution (primitive) of the differential equation.

### 11.5 GEOMETRICAL MEANING OF THE DIFFERENTIAL EQUATION OF FIRST ORDER AND FIRST DEGREE

Let

$$f\left(x, y, \frac{dy}{dx}\right) = 0 \quad \dots (1)$$

be a differential equation of the first order and first degree.

It is known that a direction of a curve at a particular point is given by the tangent line at that point and the slope of the tangent is  $\frac{dy}{dx}$  at that point. Let  $A(x_0, y_0)$  be any initial point. From (1), we

can find  $\frac{dy}{dx}$  at  $A(x_0, y_0)$ .

With the help of  $\frac{dy}{dx}$  at  $A(x_0, y_0)$  draw the tangent at the point  $A$ . On the tangent line take a neighbouring point  $B(x_1, y_1)$ .

Find  $\frac{dy}{dx}$  at the point  $B(x_1, y_1)$  from equation (1) and draw the tangent at  $B$  with the help of  $\frac{dy}{dx}$  at  $(x_1, y_1)$ .

Take a neighbouring point  $C(x_2, y_2)$  on this tangent and in this way draw another tangent at the point  $C$ . Similarly draw, some more tangents by taking the neighbouring points on them. They form a smooth curve i.e.  $y = f_1(x)$  which is the solution (1).

Again we take another starting point  $A'(x_0', y_0')$ . We can draw another curve starting from  $A'$ . In this way we can draw a number of curves.

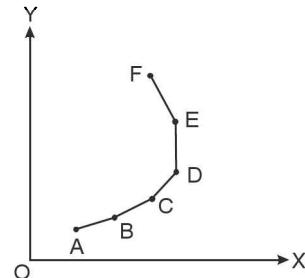

The given differential equation represents a family of curves.

### 11.6 DIFFERENTIAL EQUATIONS OF THE FIRST ORDER AND FIRST DEGREE

We will discuss the standard methods of solving the differential equations of the following types:

(i) Equations solvable by separation of the variables. (ii) Homogeneous equations.

(iii) Linear equations of the first order. (iv) Exact differential equations.

### 11.7 VARIABLES SEPARABLE

If a differential equation can be written in the form

$$f(y) dy = \phi(x) dx$$

We say that variables are separable,  $y$  on left hand side and  $x$  on right hand side.  
We get the solution by integrating both sides.

**Working Rule:**

**Step 1.** Separate the variables as  $f(y) dy = \phi(x) dx$

**Step 2.** Integrate both sides as  $\int f(y) dy = \int \phi(x) dx$

**Step 3.** Add an arbitrary constant  $C$  on R.H.S.

**Example 4.** Solve :  $\frac{dy}{dx} = \frac{x(2 \log x + 1)}{\sin y + y \cos y}$  (U.P., II, 2008, U.P.B. Pharm (C.O.) 2005)

**Solution.** We have,  $\frac{dy}{dx} = \frac{x(2 \log x + 1)}{\sin y + y \cos y}$

Separating the variables, we get

$$(\sin y + y \cos y) dy = \{x(2 \log x + 1)\} dx$$

Integrating both the sides, we get  $\int (\sin y + y \cos y) dy = \int \{x(2 \log x + 1)\} dx + C$

$$\begin{aligned} & -\cos y + y \sin y - \int (1) \cdot \sin y dy = 2 \int \log x \cdot x dx + \int x dx + C \\ \Rightarrow & -\cos y + y \sin y + \cos y = 2 \left[ \log x \cdot \frac{x^2}{2} - \int \frac{1}{x} \cdot \frac{x^2}{2} dx \right] + \frac{x^2}{2} + C \end{aligned}$$

$$\Rightarrow y \sin y = 2 \log x \cdot \frac{x^2}{2} - \int x dx + \frac{x^2}{2} + C$$

$$\Rightarrow y \sin y = 2 \log x \cdot \frac{x^2}{2} - \frac{x^2}{2} + \frac{x^2}{2} + C$$

$$\Rightarrow y \sin y = x^2 \log x + C \quad \text{Ans.}$$

**Example 5.** Solve the differential equation.

$$x^4 \frac{dy}{dx} + x^3 y = -\sec(xy). \quad (\text{A.M.I.E.T.E., Winter 2003})$$

**Solution.**  $x^4 \frac{dy}{dx} + x^3 y = -\sec(xy) \Rightarrow x^3 \left( x \frac{dy}{dx} + y \right) = -\sec xy$

$$\text{Put } v = xy, \frac{dv}{dx} = x \frac{dy}{dx} + y \Rightarrow x^3 \frac{dv}{dx} = -\sec v$$

$$\Rightarrow \frac{dv}{\sec v} = -\frac{dx}{x^3} \Rightarrow \int \cos v dv = -\int \frac{dx}{x^3} + c$$

$$\Rightarrow \sin v = \frac{1}{2x^2} + c \Rightarrow \sin xy = \frac{1}{2x^2} + c \quad \text{Ans.}$$

**Example 6.** Solve :  $\cos(x + y) dy = dx$

**Solution.**  $\cos(x + y) dy = dx \Rightarrow \frac{dy}{dx} = \sec(x + y)$

On putting

$$x + y = z$$

So that

$$\begin{aligned} 1 + \frac{dy}{dx} &= \frac{dz}{dx} \\ \frac{dz}{dx} - 1 &= \sec z \Rightarrow \frac{dz}{dx} = 1 + \sec z \end{aligned}$$

Separating the variables, we get

$$\frac{dz}{1 + \sec z} = dx$$

On integrating,

$$\begin{aligned} \int \frac{\cos z}{\cos z + 1} dz &= \int dx \Rightarrow \int \left[ 1 - \frac{1}{\cos z + 1} \right] dz = x + C \\ \int \left( 1 - \frac{1}{2 \cos^2 \frac{z}{2} - 1 + 1} \right) dz &= x + C \\ \int \left( 1 - \frac{1}{2} \sec^2 \frac{z}{2} \right) dz &= x + C \Rightarrow z - \tan \frac{z}{2} = x + C \\ x + y - \tan \frac{x+y}{2} &= x + C \\ y - \tan \frac{x+y}{2} &= C \end{aligned}$$

**Ans.**

**Example 7.** Solve the equation.

$$(2x^2 + 3y^2 - 7)x \, dx - (3x^2 + 2y^2 - 8)y \, dy = 0 \quad (\text{U.P. II Semester, Summer 2005})$$

**Solution.** We have

$$(2x^2 + 3y^2 - 7)x \, dx - (3x^2 + 2y^2 - 8)y \, dy = 0$$

$$\text{Re-arranging (1), we get } \frac{x \, dx}{y \, dy} = \frac{3x^2 + 2y^2 - 8}{2x^2 + 3y^2 - 7}$$

Applying componendo and dividendo rule, we get

$$\frac{x \, dx + y \, dy}{x \, dx - y \, dy} = \frac{5x^2 + 5y^2 - 15}{x^2 - y^2 - 1} \Rightarrow \frac{x \, dx + y \, dy}{x^2 + y^2 - 3} = 5 \left( \frac{x \, dx - y \, dy}{x^2 - y^2 - 1} \right)$$

Multiplying by 2 both the sides, we get

$$\Rightarrow \left( \frac{2x \, dx + 2y \, dy}{x^2 + y^2 - 3} \right) = 5 \left( \frac{2x \, dx - 2y \, dy}{x^2 - y^2 - 1} \right)$$

Integrating both sides, we get

$$\begin{aligned} \log(x^2 + y^2 - 3) &= 5 \log(x^2 - y^2 - 1) + \log C \\ \Rightarrow x^2 + y^2 - 3 &= C(x^2 - y^2 - 1)^5 \end{aligned}$$

**Ans.**

where  $C$  is arbitrary constant of integration.

## EXERCISE 11.2

**Solve the following differential equations :**

1.  $\frac{dx}{x} = \tan y \cdot dy \quad \text{Ans. } x \cos y = C$
2.  $\frac{dy}{dx} = \frac{\sqrt{1-y^2}}{\sqrt{1-x^2}} \quad \text{Ans. } \sin^{-1} y = \sin^{-1} x + C$
3.  $y(1+x^2)^{1/2} dy + x\sqrt{1+y^2} dx = 0 \quad \text{Ans. } \sqrt{1+y^2} + \sqrt{1+x^2} = C$
4.  $\sec^2 x \tan y \, dx + \sec^2 y \tan x \, dy = 0 \quad \text{Ans. } \tan x \tan y = C$

5.  $(1+x^2) dy - x y dx = 0$   
 6.  $(e^y + 1) \cos x dx + e^y \sin x dy = 0$   
 7.  $3 e^x \tan y dx + (1 - e^x) \sec^2 y dy = 0$   
 8.  $(e^y + 2) \sin x dx - e^y \cos x dy = 0$

$$9. \frac{dy}{dx} = e^{x-y} + x^2 e^{-y}$$

$$10. \frac{dy}{dx} = 1 + \tan(y-x) \quad [\text{Put } y-x = z]$$

$$11. (4x+y)^2 \frac{dx}{dy} = 1$$

$$12. \frac{dy}{dx} = (4x+y+1)^2 \quad [\text{Hint. Put } 4x+y+1 = z] \quad \text{Ans. } \tan^{-1} \frac{4x+y+1}{2} = 2x + C$$

- Ans.**  $y^2 = C(1+x^2)$   
**Ans.**  $(e^y + 1) \sin x = C$   
**Ans.**  $(1 - e^x)^3 = C \tan y$   
**Ans.**  $(e^y + 2) \cos x = C$

$$\text{Ans. } e^y = e^x + \frac{x^3}{3} + C$$

$$\text{Ans. } \sin(y-x) = e^{x+c}$$

$$\text{Ans. } \tan^{-1} \frac{4x+y}{2} = 2x + C$$

## 11.8 HOMOGENEOUS DIFFERENTIAL EQUATIONS

A differential equation of the form  $\frac{dy}{dx} = \frac{f(x,y)}{\phi(x,y)}$

is called a homogeneous equation if each term of  $f(x,y)$  and  $\phi(x,y)$  is of the same degree i.e.,

$$\frac{dy}{dx} = \frac{3xy + y^2}{3x^2 + xy}$$

In such case we put  $y = vx$ . and  $\frac{dy}{dx} = v + x \frac{dv}{dx}$

The reduced equation involves  $v$  and  $x$  only. This new differential equation can be solved by *variables separable* method.

### Working Rule

**Step 1.** Put  $y = vx$  so that  $\frac{dy}{dx} = v + x \frac{dv}{dx}$       **Step 2.** Separate the variables.

**Step 3.** Integrate both the sides.

**Step 4.** Put  $v = \frac{y}{x}$  and simplify.

**Example 8.** Solve the following differential equation

$$(2xy + x^2)y = 3y^2 + 2xy \quad (\text{A.M.I.E.T.E. Dec. 2006})$$

**Solution.** We have,  $(2xy + x^2) \frac{dy}{dx} = 3y^2 + 2xy \Rightarrow \frac{dy}{dx} = \frac{3y^2 + 2xy}{2xy + x^2}$

Put  $y = vx$  so that  $\frac{dy}{dx} = v + x \frac{dv}{dx}$

On substituting, the given equation becomes  $v + x \frac{dv}{dx} = \frac{3v^2x^2 + 2vx^2}{2vx^2 + x^2} = \frac{3v^2 + 2v}{2v+1}$

$$\Rightarrow x \frac{dv}{dx} = \frac{3v^2 + 2v - 2v^2 - v}{2v+1}$$

$$\Rightarrow \int \left( \frac{2v+1}{v^2+v} \right) dv = \int \frac{dx}{x}$$

$$\Rightarrow v^2 + v = cx$$

$$\Rightarrow y^2 + xy = cx^3$$

$$\Rightarrow x \frac{dv}{dx} = \frac{v^2 + v}{2v+1} \Rightarrow \left( \frac{2v+1}{v^2+v} \right) dv = \frac{dx}{x}$$

$$\Rightarrow \log(v^2 + v) \log x + \log c$$

$$\Rightarrow \frac{y^2}{x^2} + \frac{y}{x} = cx$$

**Example 9.** Solve the equation :

$$\begin{aligned}
 & \frac{dy}{dx} = \frac{y}{x} + x \sin \frac{y}{x} \\
 \text{Solution.} \quad & \frac{dy}{dx} = \frac{y}{x} + x \sin \frac{y}{x} \quad \dots (1) \\
 \text{Put} \quad & y = vx \text{ in (1) so that } \frac{dy}{dx} = v + x \frac{dv}{dx} \\
 & v + x \frac{dv}{dx} = v + x \sin v \\
 \Rightarrow & x \frac{dv}{dx} = x \sin v \quad \Rightarrow \quad \frac{dv}{dx} = \sin v \\
 \text{Separating the variable, we get} \\
 \Rightarrow & \frac{dv}{\sin v} = dx \quad \Rightarrow \quad \int \csc v dv = \int dx + C \\
 & \log \tan \frac{v}{2} = x + C \quad \Rightarrow \quad \log \tan \frac{y}{2x} = x + C \quad \text{Ans.}
 \end{aligned}$$

### EXERCISE 11.3

Solve the following differential equations:

1.  $(y^2 - xy) dx + x^2 dy = 0$  Ans.  $\frac{x}{y} = \log x + C$
2.  $(x^2 - y^2) dx + 2xy dy = 0$  (AMIE, June 2009) Ans.  $x^2 + y^2 = ax$
3.  $x(y-x) \frac{dy}{dx} = y(y+x)$ . Ans.  $\frac{y}{x} - \log xy = a$
4.  $x(x-y) dy + y^2 dx = 0$  (U.P. B. Pharm (C.O.) 2005) Ans.  $y = x \log Cy$
5.  $\frac{dy}{dx} + \frac{x-2y}{2x-y} = 0$  Ans.  $y-x = C(x+y)^3$  6.  $\frac{dy}{dx} = \tan \frac{y}{x} + \frac{y}{x}$  Ans.  $\sin \frac{y}{x} = Cx$
7.  $\frac{dy}{dx} = \frac{3xy+y^2}{3x^2}$  Ans.  $3x+y \log x + Cy = 0$  8.  $\frac{dy}{dx} = \frac{x^2-2y^2}{2xy}$  Ans.  $4y^2 - x^2 = \frac{C}{x^2}$
9.  $(x^2 + y^2) dy = xy dx$  Ans.  $-\frac{x^2}{2y^2} + \log y = C$
10.  $x^2y dx - (x^3 + y^3) dy = 0$  Ans.  $\frac{-x^3}{3y^3} + \log y = C$
11.  $(y^2 + 2xy) dx + (2x^2 + 3xy) dy = 0$  (AMIE, Summer 2004) Ans.  $xy^2(x+y) = C$
12.  $(2xy^2 - x^3) dy + (y^3 - 2yx^2) dx = 0$  Ans.  $y^2(y^2 - x^2) = Cx^{-2}$
13.  $(x^3 - 3xy^2) dx + (y^3 - 3x^2y) dy = 0$ ,  $y(0) = 1$  Ans.  $x^4 - 6x^2y^2 + y^4 = 1$
14.  $2xy^2 dy - (x^3 + 2y^3) dx = 0$  Ans.  $2y^3 = 3x^3 \log x + 3x^3 + C$
15.  $x \sin \frac{y}{x} dy = \left( y \sin \frac{y}{x} - x \right) dx$  Ans.  $\cos \frac{y}{x} = \log x + C$
16.  $\left\{ x \cos \frac{y}{x} + y \sin \frac{y}{x} \right\} y - \left\{ y \sin \frac{y}{x} - x \cos \frac{y}{x} \right\} x \frac{dy}{dx} = 0$  Ans.  $xy \cos \frac{y}{x} = a$
17.  $\frac{dy}{dx} = \frac{y + \sqrt{x^2 + y^2}}{x}$  Ans.  $y + \sqrt{x^2 + y^2} = Cx^2$

18.  $x \frac{dy}{dx} = y(\log y - \log x + 1)$  (AMIETE, Summer 2004) **Ans.**  $\log \frac{y}{x} = Cx$

19.  $xy \log \frac{x}{y} dx + \left( y^2 - x^2 \log \frac{x}{y} \right) dy = 0$  given that  $y(1) = 0$

**Ans.**  $\frac{x^2}{2y^2} \log \frac{x}{y} - \frac{x^2}{4y^2} + \log y = 1 - \frac{3}{4e^2}$

20.  $(1 + e^y) dx + e^y \left( 1 - \frac{x}{y} \right) dy = 0$  (AMIETE, June 2009) **Ans.**  $e^y + \frac{x}{y} = e^{-y} + C$

### 11.9 EQUATIONS REDUCIBLE TO HOMOGENEOUS FORM

**Case I.**  $\frac{a}{A} + \frac{b}{B}$

The equations of the form

$$\boxed{\frac{dy}{dx} = \frac{ax+by+c}{Ax+By+C}}$$

can be reduced to the homogeneous form by the substitution if  $\frac{a}{A} + \frac{b}{B}$

$x = X + h, y = Y + k$  ( $h, k$  being constants)

$$\therefore \frac{dy}{dx} = \frac{dY}{dX}$$

The given differential equation reduces to

$$\frac{dY}{dX} = \frac{a(X+h)+b(Y+k)+c}{A(X+h)+B(Y+k)+C} = \frac{aX+bY+ah+bk+c}{AX+BY+Ah+Bk+C}$$

Choose  $h, k$  so that  $a h + b k + c = 0$   
 $A h + K k + C = 0$

Then the given equation becomes homogeneous  $\frac{dY}{dX} = \frac{aX+bY}{AX+BY}$

**Case II.** If  $\frac{a}{A} = \frac{b}{B}$  then the value of  $h, k$  will not be finite.

$$\frac{a}{A} = \frac{b}{B} = \frac{1}{m} \quad (\text{say})$$

$$A = a m, B = b m$$

The given equation becomes  $\frac{dy}{dx} = \frac{ax+by+c}{m(ax+by)+c}$

Now put  $ax + by = z$  and apply the method of variables separable.

**Example 10.** Solve :  $\frac{dy}{dx} = \frac{x+2y-3}{2x+y-3}$

**Solution.** Put  $x = X + h, y = Y + k$ .  
The given equation reduces to

$$\begin{aligned} \therefore \frac{dY}{dX} &= \frac{(X+h)+2(Y+k)-3}{2(X+h)+(Y+k)-3} && \left( \frac{1}{2} \neq \frac{2}{1} \right) \\ &= \frac{X+2Y+(h+2k-3)}{2X+Y+(2h+k-3)} && \dots (1) \end{aligned}$$

Now choose  $h$  and  $k$  so that  $h + 2k - 3 = 0$ ,  $2h + k - 3 = 0$

Solving these equations we get  $h = k = 1$

$$\therefore \frac{dY}{dX} = \frac{X+2Y}{2X+Y} \quad \dots (2)$$

$$\text{Put } Y = vX, \text{ so that } \frac{dY}{dX} = v + X \frac{dv}{dX}$$

The equation (2) is transformed as

$$\begin{aligned} v + X \frac{dv}{dX} &= \frac{X+2vX}{2X+vX} = \frac{1+2v}{2+v} \\ X \frac{dv}{dX} &= \frac{1+2v}{2+v} - v = \frac{1-v^2}{2+v} \quad \Rightarrow \quad \left( \frac{2+v}{1-v^2} \right) dv = \frac{dX}{X} \\ \Rightarrow \quad \frac{1}{2} \frac{1}{(1+v)} dv + \frac{3}{2} \frac{1}{1-v} dv &= \frac{dX}{X} \quad (\text{Partial fractions}) \end{aligned}$$

On integrating, we have

$$\begin{aligned} \frac{1}{2} \log(1+v) - \frac{3}{2} \log(1-v) &= \log X + \log C \\ \Rightarrow \quad \log \frac{1+v}{(1-v)^3} &= \log C^2 X^2 \quad \Rightarrow \quad \frac{1+v}{(1-v)^3} = C^2 X^2 \\ \frac{1+\frac{Y}{X}}{\left(1-\frac{Y}{X}\right)^3} &= C^2 X^2 \quad \Rightarrow \quad \frac{X+Y}{(X-Y)^3} = C^2 \quad \text{or} \quad X+Y = C^2 (X-Y)^3 \end{aligned}$$

$$\text{Put } X = x - 1 \text{ and } Y = y - 1 \quad \Rightarrow \quad x + y - 2 = a(x-y)^3 \quad \text{Ans.}$$

**Example 11.** Solve :  $(x + 2y)(dx - dy) = dx + dy$

**Solution.**  $(x + 2y)(dx - dy) = dx + dy \Rightarrow (x + 2y - 1)dx - (x + 2y + 1)dy = 0$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{x+2y-1}{x+2y+1} \quad \dots (1)$$

$$\text{Hence} \quad \frac{a}{A} = \frac{b}{B} \quad i.e., \quad \left( \frac{1}{1} = \frac{2}{2} \right) \quad (\text{Case of failure})$$

$$\text{Now put } x + 2y = z \text{ so that } 1 + 2 \frac{dy}{dx} = \frac{dz}{dx}$$

Equation (1) becomes

$$\begin{aligned} \frac{1}{2} \frac{dz}{dx} - \frac{1}{2} &= \frac{z-1}{z+1} \quad \Rightarrow \quad \frac{dz}{dx} = 2 \frac{(z-1)}{z+1} + 1 = \frac{3z-1}{z+1} \\ \Rightarrow \quad \frac{z+1}{3z-1} dz &= dx \quad \Rightarrow \quad \left( \frac{1}{3} + \frac{4}{3} \frac{1}{3z-1} \right) dz = dx \end{aligned}$$

$$\text{On integrating,} \quad \frac{z}{3} + \frac{4}{9} \log(3z-1) = x + C$$

$$3z + 4 \log(3z-1) = 9x + 9C$$

$$\Rightarrow \quad 3(x + 2y) + 4 \log(3x + 6y - 1) = 9x + 9C$$

$$3x - 3y + a = 2 \log(3x + 6y - 1) \quad \text{Ans.}$$

**EXERCISE 11.4**

Solve the following differential equations :

1.  $\frac{dy}{dx} = \frac{2x+9y-20}{6x+2y-10}$

**Ans.**  $(2x-y)^2 = C(x+2y-5)$

2.  $\frac{dy}{dx} = \frac{y-x+1}{y+x+5}$

**Ans.**  $\log[(y+3)^2 + (x+2)^2] + 2 \tan^{-1} \frac{y+3}{x+2} = a$

3.  $\frac{dy}{dx} = \frac{x-y-2}{x+y+6}$

**Ans.**  $(y+4)^2 + 2(x+2)(y+4) - (x+2)^2 = a^2$

4.  $\frac{dy}{dx} = \frac{y+x-2}{y-x-4}$  (AMIETE, Dec. 2009)

**Ans.**  $-(y-3)^2 + 2(x+1)(y-3) + (x+1)^2 = a$

5.  $\frac{dy}{dx} = \frac{2x-5y+3}{2x+4y-6}$

**Ans.**  $(x-4y+3)(2x+y-3) = a$

6.  $(2x+y+1)dx + (4x+2y-1)dy = 0$

**Ans.**  $2(2x+y) + \log(2x+y-1) = 3x + C$

7.  $(x-y-2)dx - (2x-2y-3)dy = 0$

**Ans.**  $\log(x-y-1) = x-2y+C$

(U.P. B. Pharm (C.O.) 2005)

8.  $(6x-4y+1)dy - (3x-2y+1)dx = 0$  (A.M.I.E.T. E., Dec. 2006)

**Ans.**  $4x-8y-\log(12x-xy+1)=c$

9.  $\frac{dy}{dx} = -\frac{3y-2x+7}{7y-3x+3}$  (A.M.I.E.T.E., Summer 2004)

**Ans.**  $(x+y-1)^5(x-y-1)^2 = 1$

10.  $\frac{dy}{dx} = \frac{2y-x-4}{y-3x+3}$  (AMIETE, Dec. 2010)

**Ans.**  $X^2 - 5XY + Y^2 = c \left[ \frac{2Y + (-5 + \sqrt{21})X}{2Y - (5 + \sqrt{21})X} \right] \frac{1}{\sqrt{21}}, \quad X = x-2, \quad Y = y-3$

**11.10 LINEAR DIFFERENTIAL EQUATIONS**

A differential equation of the form

$$\boxed{\frac{dy}{dx} + P y = Q} \quad \dots (1)$$

is called a linear differential equation, where  $P$  and  $Q$ , are functions of  $x$  (but not of  $y$ ) or constants.

In such case, multiply both sides of (1) by  $e^{\int P dx}$

$$e^{\int P dx} \left( \frac{dy}{dx} + P y \right) = Q e^{\int P dx} \quad \dots (2)$$

The left hand side of (2) is

$$\frac{d}{dx} \left[ y e^{\int P dx} \right]$$

(2) becomes

$$\frac{d}{dx} \left[ y e^{\int P dx} \right] = Q e^{\int P dx}$$

Integrating both sides, we get

$$y e^{\int P dx} = \int Q e^{\int P dx} dx + C$$

This is the required solution.

**Note.**  $e^{\int P dx}$  is called the integrating factor.

Solution is

$$\boxed{y \times I.F.J = \int Q I.F.J dx + C}$$

**Working Rule**

**Step 1.** Convert the given equation to the standard form of linear differential equation

$$\text{i.e. } \frac{dy}{dx} + Py = Q$$

**Step 2.** Find the integrating factor i.e. I.F. =  $e^{\int P dx}$

**Step 3.** Then the solution is  $y(\text{I.F.}) = \int Q (\text{I.F.}) dx + C$

**Example 12.** Solve:  $(x+1) \frac{dy}{dx} - y = e^x (x+1)^2$  (A.M.I.E.T.E., Summer 2002)

$$\text{Solution. } \frac{dy}{dx} - \frac{y}{x+1} = e^x (x+1)$$

$$\text{Integrating factor} = e^{-\int \frac{dx}{x+1}} = e^{-\log(x+1)} = e^{\log(x+1)^{-1}} = \frac{1}{x+1}$$

The solution is

$$y \cdot \frac{1}{x+1} = \int e^x \cdot (x+1) \cdot \frac{1}{x+1} dx = \int e^x dx$$

$$\frac{y}{x+1} = e^x + C$$

**Ans.**

**Example 13.** Solve a differential equation

$$(x^3 - x) \frac{dy}{dx} - (3x^2 - 1)y = x^5 - 2x^3 + x. \quad (\text{Nagpur University, Summer 2008})$$

**Solution.** We have  $(x^3 - x) \frac{dy}{dx} - (3x^2 - 1)y = x^5 - 2x^3 + x$

$$\Rightarrow \frac{dy}{dx} - \frac{3x^2 - 1}{x^3 - x} y = \frac{x^5 - 2x^3 + x}{x^3 - x} \Rightarrow \frac{dy}{dx} - \frac{3x^2 - 1}{x^3 - x} y = x^2 - 1$$

$$\text{I.F.} = e^{\int \frac{3x^2 - 1}{x^3 - x} dx} = e^{-\log(x^3 - x)} = e^{\log(x^3 - x)^{-1}} = \frac{1}{x^3 - x}$$

Its solution is

$$y(\text{I.F.}) = \int Q(\text{I.F.}) dx + C \Rightarrow y\left(\frac{1}{x^3 - x}\right) = \int \frac{x^2 - 1}{x^3 - x} dx + C$$

$$\Rightarrow \frac{y}{x^3 - x} = \int \frac{x^2 - 1}{x(x^2 - 1)} dx + C \Rightarrow \frac{y}{x^3 - x} = \int \frac{1}{x} dx + C$$

$$\Rightarrow \frac{y}{x^3 - x} = \log x + C \Rightarrow y = (x^3 - x) \log x + (x^3 - x) C \quad \text{Ans.}$$

**Example 14.** Solve  $\sin x \frac{dy}{dx} + 2y = \tan^3 \left( \frac{x}{2} \right)$  (Nagpur University, Summer 2004)

**Solution.** Given equation :  $\sin x \frac{dy}{dx} + 2y = \tan^3 \frac{x}{2} \Rightarrow \frac{dy}{dx} + \frac{2}{\sin x} y = \frac{\tan^3 \frac{x}{2}}{\sin x}$

This is linear form of  $\frac{dy}{dx} + Py = Q$

$$\therefore P = \frac{2}{\sin x} \text{ and } Q = \frac{\tan^3 \frac{x}{2}}{\sin x}$$

$$\therefore \text{I.F.} = e^{\int P dx} = e^{\int \frac{2}{\sin x} dx} = e^{2 \int \csc x dx} = e^{2 \log \frac{\tan \frac{x}{2}}{2}} = \tan^2 \frac{x}{2}$$

$$\therefore \text{Solution is } y \cdot (\text{I.F.}) = \int \text{I.F.} (Q dx) + C$$

$$y \tan^2 \frac{x}{2} = \int \tan^2 \frac{x}{2} \cdot \frac{\tan^3 \frac{x}{2}}{2 \sin \frac{x}{2} \cdot \cos \frac{x}{2}} + C = \frac{1}{2} \int \frac{\tan^4 \frac{x}{2}}{\cos^2 \frac{x}{2}} dx + C$$

$$= \frac{1}{2} \int \tan^4 \frac{x}{2} \cdot \sec^2 \frac{x}{2} dx + C \quad \dots (1)$$

Putting  $\tan \frac{x}{2} = t$  so that  $\frac{1}{2} \sec^2 \frac{x}{2} dx = dt$  on R.H.S. (1), we get

$$y \tan^2 \frac{x}{2} = \frac{1}{2} \int t^4 (2dt) + C \Rightarrow y \tan^2 \frac{x}{2} = \frac{t^5}{5} + C$$

$$y \tan^2 \frac{x}{2} = \frac{\tan^5 \frac{x}{2}}{5} + C \quad \text{Ans.}$$

### EXERCISE 11.5

Solve the following differential equations:

1.  $\frac{dy}{dx} + \frac{1}{x} y = x^3 - 3$

**Ans.**  $xy = \frac{x^5}{5} - \frac{3x^2}{2} + C$

2.  $(2y - 3x) dx + x dy = 0$

**Ans.**  $y x^2 = x^3 + C$

3.  $\frac{dy}{dx} + y \cot x = \cos x$

**Ans.**  $y \sin x = \frac{\sin^2 x}{2} + C$

4.  $\frac{dy}{dx} + y \sec x = \tan x$

**Ans.**  $y = \frac{C - x}{\sec x + \tan x} + 1$

5.  $\cos^2 x \frac{dy}{dx} + y = \tan x$

**Ans.**  $y = \tan x - 1 + Ce^{-\tan x}$

6.  $(x + a) \frac{dy}{dx} - 3y = (x + a)^5$

**Ans.**  $2y = (x + a)^5 + 2C(x + a)^3$

7.  $x \cos x \frac{dy}{dx} + y(x \sin x + \cos x) = 1$

**Ans.**  $x y = \sin x + C \cos x$

8.  $x \log x \frac{dy}{dx} + y = 2 \log x$

**Ans.**  $y \log x = (\log x)^2 + C$

9.  $x \frac{dy}{dx} + 2y = x^2 \log x$

**Ans.**  $y x^2 = \frac{x^4}{4} \log x - \frac{x^4}{16} + C$

10.  $dr + (2r \cot \theta + \sin 2\theta) d\theta = 0$

**Ans.**  $r \sin^2 \theta = \frac{-\sin^4 \theta}{2} + C$

11.  $\frac{dy}{dx} + y \cos x = \frac{1}{2} \sin 2x$

**Ans.**  $y = \sin x - 1 + Ce^{-\sin x}$

12.  $(1 - x^2) \frac{dy}{dx} + 2xy = x(1 - x^2)^{1/2}$

**Ans.**  $y = \sqrt{1 - x^2} + C(1 - x^2)$

13.  $\sec x \frac{dy}{dx} = y + \sin x \quad (\text{A.M.I.E.T.E., Dec 2005})$

**Ans.**  $y = -\sin x - 1 + ce^{\sin x}$

14.  $y' + y \tan x = \cos x, y(0) = 0 \quad (\text{A.M.I.E.T.E., June 2006})$

**Ans.**  $y = x \cos x$

15. Solve  $(1 + y^2) dx = (\tan^{-1} y - x) dy \quad (\text{AMIETE, Dec. 2009})$  **Ans.**  $x = -\tan^{-1} y - 1 + ce^{\tan^{-1} y}$

16. Find the value of  $\alpha$  so that  $e^\alpha$  is an integrating factor of differential equation  $x(1 - y)$

$$dx - dy = 0. \quad (\text{A.M.I.E.T.E., Summer 2005}) \quad \text{Ans. } \alpha = \frac{1}{2}$$

## **11.11 EQUATIONS REDUCIBLE TO THE LINEAR FORM (BERNOULLI EQUATION)**

## The equation of the form

$$\frac{dy}{dx} + Py = Qy^n \quad \dots(1)$$

where  $P$  and  $Q$  are constants or functions of  $x$  can be reduced to the linear form on dividing by  $y^n$  and substituting  $\frac{1}{y^{n-1}} = z$

On dividing both sides of (1) by  $y^n$ , we get

$$\frac{1}{y^n} \frac{dy}{dx} + \frac{1}{y^{n-1}} P = Q \quad \dots(2)$$

$$\text{Put } \frac{1}{y^{n-1}} = z, \text{ so that } \frac{(1-n)}{y^n} \frac{dy}{dx} = \frac{dz}{dx} \Rightarrow \frac{1}{y^n} \frac{dy}{dx} = \frac{dz}{1-n}$$

$\therefore$  (2) becomes  $\frac{1}{1-n} \frac{dz}{dx} + Pz = Q$  or  $\frac{dz}{dx} + P(1-n)z = Q(1-n)$

which is a linear equation and can be solved easily by the previous method discussed in article 11.10 on page 217.

**Example 15.** Solve  $x^2 dy + y(x + y) dx = 0$

(U.P. II Semester Summer 2006)

**Solution.** We have,  $x^2 dy + y(x+y) dx = 0$

$$\Rightarrow \frac{dy}{dx} + \frac{y}{x} = -\frac{y^2}{x^2} \quad \Rightarrow \quad \frac{1}{y^2} \frac{dy}{dx} + \frac{1}{xy} = -\frac{1}{x^2}$$

Put  $\frac{1}{v} = z$  so that  $\frac{1}{v^2} \frac{dy}{dx} = \frac{dz}{dx}$

The given equation reduces to a linear differential equation in  $z$ .

$$\text{I.F.} = e^{-\int \frac{1}{x} dx} = e^{-\log x} = e^{\log 1/x} = \frac{1}{x}.$$

Hence the solution is

$$\begin{aligned} z \cdot \frac{1}{x} &= \int -\frac{1}{x^2} \cdot \frac{1}{x} dx + C & \Rightarrow & \frac{z}{x} = \int -x^{-3} dx + C \\ \Rightarrow & -\frac{1}{xy} = -\frac{x^{-2}}{-2} + C & \Rightarrow & \frac{1}{xy} = -\frac{1}{2x^2} - C \quad \text{Ans.} \end{aligned}$$

**Example 16.** Solve:  $x \frac{dy}{dx} + y \log y = xy e^x$  (A.M.I.E., Summer 2000)

**Solution.**  $x \frac{dy}{dx} + y \log y = xy e^x$

Dividing by  $xy$ , we get

$$\frac{1}{y} \frac{dy}{dx} + \frac{1}{x} \log y = e^x \quad \dots(1)$$

Put  $\log y = z$ , so that  $\frac{1}{y} \frac{dy}{dx} = \frac{dz}{dx}$

Equation (1) becomes,  $\frac{dz}{dx} + \frac{z}{x} = e^x$

$$\text{I.F.} = e^{\int \frac{1}{x} dx} = e^{\log x} = x$$

Solution is  $zx = \int x e^x dx + C$

$$zx = x e^x - e^x + C$$

$$\Rightarrow x \log y = x e^x - e^x + C \quad \text{Ans.}$$

**Example 17.** Solve:  $\frac{dy}{dx} - \frac{\tan y}{1+x} = (1+x)e^x \sec y$ . (Nagpur University, Summer 2000)

**Solution.**  $\frac{dy}{dx} - \frac{\tan y}{1+x} = (1+x)e^x \sec y$

$$\Rightarrow \cos y \frac{dy}{dx} - \frac{\sin y}{1+x} = (1+x)e^x \quad \dots(1)$$

Put  $\sin y = z$ , so that  $\cos y \frac{dy}{dx} = \frac{dz}{dx}$

(1) becomes  $\frac{dz}{dx} - \frac{z}{1+x} = (1+x)e^x$

$$\text{I.F.} = e^{-\int \frac{1}{1+x} dx} = e^{-\log(1+x)} = e^{\log \frac{1}{1+x}} = \frac{1}{1+x}$$

Solution is  $z \cdot \frac{1}{1+x} = \int (1+x)e^x \cdot \frac{1}{1+x} dx + C = \int e^x dx + C$

$$\frac{\sin y}{1+x} = e^x + C \quad \text{Ans.}$$

**Example 18.** Solve:  $\tan y \frac{dy}{dx} + \tan x = \cos y \cos^2 x$  (Nagpur University, Summer 2000)

**Solution.**  $\tan y \frac{dy}{dx} + \tan x = \cos y \cos^2 x$

$$\sec y \tan y \frac{dy}{dx} + \sec y \tan x = \cos^2 x$$

Writing  $z = \sec y$ , so that  $\frac{dz}{dx} = \sec y \tan y \frac{dy}{dx}$

The equation becomes  $\frac{dz}{dx} + z \tan x = \cos^2 x$

$$\text{I.F.} = e^{\int \tan x dx} = e^{\log \sec x} = \sec x$$

$\therefore$  The solution of the equation is

$$z \sec x = \int \cos^2 x \sec x dx + C$$

$$\sec y \sec x = \int \cos x dx + C = \sin x + C$$

$$\sec y = (\sin x + C) \cos x$$

**Ans.**

**Example 19.** Solve differential equation

$$\frac{dy}{dx} + \frac{1}{x} \tan y = \frac{1}{x^2} \tan y \sin y \quad (\text{Nagpur University, Summer 2000})$$

**Solution.** We have,  $\frac{dy}{dx} + \frac{1}{x} \tan y = \frac{1}{x^2} \tan y \sin y \Rightarrow \frac{1}{\tan y \sin y} \frac{dy}{dx} + \frac{1}{x \sin y} = \frac{1}{x^2}$

$$\Rightarrow \cot y \operatorname{cosec} y \frac{dy}{dx} + \frac{1}{x} \operatorname{cosec} y = \frac{1}{x^2} \quad \dots (1)$$

Putting  $\operatorname{cosec} y = z$ , and  $-\operatorname{cosec} y \cot y \frac{dy}{dx} = \frac{dz}{dx}$  in (1), we get

$$-\frac{dz}{dx} + \frac{1}{x} z = \frac{1}{x^2}$$

$$\frac{dz}{dx} - \frac{1}{x} z = -\frac{1}{x^2}$$

$$\text{I.F.} = e^{-\int \frac{1}{x} dx} = e^{-\log x} = e^{\log x^{-1}} = x^{-1} = \frac{1}{x}$$

Its solution is  $z(\text{I.F.}) = \int Q(\text{I.F.}) dx + C$

$$z \cdot \frac{1}{x} = \int \left( \frac{-1}{x^2} \right) \frac{1}{x} dx + C = -\int \frac{1}{x^3} dx + C = -\frac{x^{-2}}{-2} + C$$

$$z = \frac{1}{2x^2} + C x \Rightarrow \operatorname{cosec} y = \frac{1}{2x^2} + C x \quad \text{Ans.}$$

**Example 20.**  $x \left[ \frac{dx}{dy} + y \right] = 1 - y \quad (\text{Nagpur University, Summer 2004})$

**Solution.**  $x \left( \frac{dy}{dx} + y \right) = (1 - y)$

$$\Rightarrow \frac{dy}{dx} + y = \frac{1}{x} - \frac{y}{x} \Rightarrow \frac{dy}{dx} + \left( 1 + \frac{1}{x} \right) y = \frac{1}{x}$$

which is in linear form of  $\frac{dy}{dx} + Py = Q$ .

$$\therefore P = \left( 1 + \frac{1}{x} \right), \quad Q = \frac{1}{x}$$

$$\text{I.F.} = e^{\int P dx} = e^{\int \left( 1 + \frac{1}{x} \right) dx} = e^{x + \log x} = e^x \cdot e^{\log x} = e^x \cdot x = x e^x$$

Its solution is

$$\begin{aligned} y(\text{I.F.}) &= \int \text{I.F.}(Q dx) + C \\ y(x \cdot e^x) &= \int (x \cdot e^x) \times \frac{1}{x} dx + C \Rightarrow y(x \cdot e^x) = \int e^x dx + C \\ y(x \cdot e^x) &= e^x + C \\ \therefore y &= \frac{1}{x} + \frac{C}{x} e^{-x} \end{aligned} \quad \text{Ans.}$$

**Example 21.** Solve the differential equation.

$$y \log y dx + (x - \log y) dy = 0 \quad (\text{Uttarakhand II Semester, June 2007})$$

**Solution.** We have,

$$\begin{aligned} y \log y dx + (x - \log y) dy &= 0 \\ \Rightarrow \frac{dx}{dy} &= \frac{-x + \log y}{y \log y} \Rightarrow \frac{dx}{dy} = \frac{-x}{y \log y} + \frac{\log y}{y \log y} \\ \Rightarrow \frac{dx}{dy} + \frac{x}{y \log y} &= \frac{1}{y} \\ \text{I.F.} &= e^{\int \frac{1}{y \log y} dy} = e^{\log(\log y)} = \log y \end{aligned}$$

$$\text{Its solution is } x \cdot \log y = \int \frac{1}{y} (\log y) dy$$

$$x \cdot \log y = \frac{(\log y)^2}{2} + C \quad \text{Ans.}$$

$$\text{Example 22. } ye^y dx = (y^3 + 2xe^y) dy \quad (\text{Nagpur University, Winter 2003})$$

$$\text{Solution. } ye^y dx = (y^3 + 2xe^y) dy \Rightarrow \frac{dx}{dy} - \frac{2x}{y} = \frac{y^2}{e^y}$$

which is linear in  $x$

$$\begin{aligned} \therefore P &= \frac{-2}{y} \quad \text{and} \quad Q = \frac{y^2}{e^y} \\ \text{I.F.} &= e^{\int P dy} = e^{\int \frac{-2}{y} dy} = e^{-2 \log y} = e^{\log y^{-2}} = y^{-2} = \frac{1}{y^2} \end{aligned}$$

$$\text{Its solution is } x(\text{I.F.}) = \int Q(\text{I.F.}) dy + C \Rightarrow x \cdot \frac{1}{y^2} = \int \frac{y^2}{e^y} \times \frac{1}{y^2} dy + C$$

$$\therefore \frac{x}{y^2} = \int e^{-y} dy + C \Rightarrow \frac{x}{y^2} = -e^{-y} + C$$

$$\therefore \frac{x}{y^2} + e^{-y} = C \quad \text{Ans.}$$

$$\text{Example 23. Solve } \frac{dy}{dx} = \frac{y}{2y \log y + y - x} \quad (\text{Nagpur University, Summer 2003})$$

$$\begin{aligned} \text{Solution. } \frac{dx}{dy} &= \frac{2y \log y + y - x}{y} \\ \Rightarrow \frac{dx}{dy} + \frac{1}{y} x &= 1 + 2 \log y \end{aligned}$$

Which is of the form  $\frac{dx}{dy} + Px = Q$

Here  $P = \frac{1}{y}$  and  $Q = 1 + 2 \log y$

$$\text{I.F.} = e^{\int P dy} = e^{\int \frac{1}{y} dy} = e^{\log y} = y$$

Its solution is

$$\begin{aligned} x(\text{I.F.}) &= \int Q(\text{I.F.}) dy + C \Rightarrow xy = \int (1 + 2 \log y) y dy + C \\ \Rightarrow xy &= \int (y + 2y \log y) dy + C = \frac{y^2}{2} + 2 \left[ \log y \cdot \frac{y^2}{2} - \int \frac{1}{y} \cdot \frac{y^2}{2} dy \right] + C \\ &= \frac{y^2}{2} + 2 \left[ \frac{y^2}{2} \log y - \frac{1}{4} y^2 \right] + C = y^2 \log y + C \\ \Rightarrow x &= y \log y + \frac{C}{y} \end{aligned}$$

**Ans.**

**Example 24.** Solve :  $\frac{dy}{dx} = \frac{y+1}{(y+2)e^y - x}$  (Nagpur University, Winter 2004)

**Solution.**  $\frac{dx}{dy} = \frac{(y+2)e^y}{y+1} - \frac{x}{y+1}$

$$\Rightarrow \frac{dx}{dy} + \frac{x}{y+1} = \frac{(y+2)e^y}{y+1}$$

which is linear in  $x$

Here  $P = \frac{1}{y+1}$  and  $Q = \frac{y+2}{y+1}e^y$

$$\text{I.F.} = e^{\int P dy} = e^{\int \frac{1}{y+1} dy} = e^{\log(y+1)} = y+1$$

Its solution is

$$\begin{aligned} x(\text{I.F.}) &= \int Q(\text{I.F.}) dy + C \\ \Rightarrow x(y+1) &= \int \frac{y+2}{y+1} e^y (y+1) dy + C \\ \Rightarrow x(y+1) &= \int (y+2)e^y dy + C = (y+2)e^y - \int \frac{d}{dy}(y+2)e^y dy + C \\ \Rightarrow x(y+1) &= (y+2)e^y - \int e^y dy + C \\ \Rightarrow x(y+1) &= (y+2)e^y - e^y + C \\ \Rightarrow x(y+1) &= (y+1)e^y + C \Rightarrow x = e^y + \frac{C}{y+1} \end{aligned}$$

**Ans.**

**Example 25.** Solve:  $(1+y^2) dx = (\tan^{-1} y - x) dy$ .

(AMIETE, June 2010, 2004, R.G.P.V., Bhopal, April 2010, June 2008,  
U.P. (B. Pharm) 2005)

**Solution.**  $(1+y^2) dx = (\tan^{-1} y - x) dy$

$$\frac{dx}{dy} = \frac{\tan^{-1} y - x}{1+y^2} \Rightarrow \frac{dx}{dy} + \frac{x}{1+y^2} = \frac{\tan^{-1} y}{1+y^2}$$

This is a linear differential equation.

$$\text{I.F.} = e^{\int \frac{1}{1+y^2} dy} = e^{\tan^{-1} y}$$

$$\text{Its solution is } x \cdot e^{\tan^{-1} y} = \int e^{\tan^{-1} y} \frac{\tan^{-1} y}{1+y^2} dy + C$$

Put  $\tan^{-1} y = t$  on R.H.S., so that  $\frac{1}{1+y^2} dy = dt$

$$x \cdot e^{\tan^{-1} y} = \int e^t \cdot t dt + C = t \cdot e^t - e^t + C = e^{\tan^{-1} y} (\tan^{-1} y - 1) + C$$

$$x = (\tan^{-1} y - 1) + C e^{-\tan^{-1} y} \quad \text{Ans.}$$

**Example 26.** Solve :  $r \sin \theta - \frac{dr}{d\theta} \cos \theta = r^2$  (Nagpur University, Summer 2005)

**Solution.** The given equation can be written as  $-\frac{dr}{d\theta} \cos \theta + r \sin \theta = r^2$  ... (1)

Dividing (1) by  $r^2 \cos \theta$ , we get  $-r^{-2} \frac{dr}{d\theta} + r^{-1} \tan \theta = \sec \theta$  ... (2)

Putting  $r^{-1} = v$  so that  $-r^{-2} \frac{dr}{d\theta} = \frac{dv}{d\theta}$  in (2), we get

$$\frac{dv}{d\theta} + v \tan \theta = \sec \theta$$

$$\text{I.F.} = e^{\int \tan \theta d\theta} = e^{\log \sec \theta} = \sec \theta$$

Solution is  $v \sec \theta = \int \sec \theta, \sec \theta + C \Rightarrow v \sec \theta = \int \sec^2 \theta d\theta + C$

$$\frac{\sec \theta}{r} = \tan \theta + C \Rightarrow r^{-1} = (\sin \theta + C \cos \theta)$$

$$\therefore r = \frac{1}{\sin \theta + C \cos \theta} \quad \text{Ans.}$$

### EXERCISE 11.6

Solve the following differential equations:

1.  $\frac{1}{y^2} \frac{dy}{dx} - \frac{1}{y} = 2x e^{-x}$  **Ans.**  $e^x + x^2 y + Cy = 0$

2.  $3 \frac{dy}{dx} + 3 \frac{y}{x} = 2x^4 y^4$  **Ans.**  $\frac{1}{y^3} = x^5 + Cx^3$

3.  $\frac{dy}{dx} = y \tan x - y^2 \sec x$  **Ans.**  $\sec x = (\tan x + C) y$

4.  $\frac{dy}{dx} = 2y \tan x + y^2 \tan^2 x$ , if  $y = 1$  at  $x = 0$  **Ans.**  $\frac{1}{y} \sec^2 x = -\frac{\tan^3 x}{3} + 1$

5.  $\frac{dy}{dx} + \tan x \tan y = \cos x \sec y$  **Ans.**  $\sin y \sec x = x + C$

6.  $dy + y \tan x \cdot dx = y^2 \sec x \cdot dx$  **Ans.**  $y(x + C) + \cos x = 0$

7.  $(x^2 y^2 + xy) y dx + (x^2 y^2 - 1) x dy = 0$  **Ans.**  $x y = \log C y$

8.  $(x^2 + y^2 + x) dx + xy dy = 0$  **Ans.**  $x^2 y^2 = -\frac{x^4}{2} - \frac{2x^3}{3} + C$

9.  $\frac{dy}{dx} + y = 3e^x y^3$

**Ans.**  $\frac{1}{y^2} = 6e^x + C e^{2x}$

10.  $(x - y^2) dx + 2xy dy = 0$

**Ans.**  $\frac{y^2}{x} + \log x = C$

11.  $e^y \left( \frac{dy}{dx} + 1 \right) = e^x$

**Ans.**  $e^{x+y} = \frac{e^{2x}}{2} + C$

12.  $x^2 y - x^3 \frac{dy}{dx} = y^4 \cos x$

**Ans.**  $x^3 = y^3(3 \sin x - C)$

13.  $3 \frac{dy}{dx} + \frac{2}{x+1} \cdot y = \frac{x^2}{y^2}$

**Ans.**  $y^3(x+1)^2 = \frac{x^5}{5} + \frac{x^4}{2} + \frac{x^3}{3} + C$

14.  $\cos x \frac{dy}{dx} + 4y \sin x = 4\sqrt{y} \sec x$

**Ans.**  $\sqrt{y} \sec^2 x = 2 \left[ \tan x + \frac{\tan^3 x}{3} \right] + C$

15.  $\frac{dy}{dx} + x \sin 2y = x^3 \cos^2 y$

**Ans.**  $\tan y = \frac{1}{2}(x^2 - 1) + C e^{-x^2}$

16.  $\frac{1}{1+y^2} \frac{dy}{dx} + 2x \tan^{-1} y = x^3$

**Ans.**  $\tan^{-1} y = \frac{1}{2}(x^2 - 1) + C e^{-x^2}$

17.  $e^{-y} \sec^2 y dy = dx + x dy$

**Ans.**  $x e^y = \tan y + C$

18.  $(x+y+1) \frac{dy}{dx} = 1$

**Ans.**  $x + y + 2 = C e^y$

19.  $\frac{dy}{dx} = \frac{y^3}{e^{2x} + y^2}$

**Ans.**  $e^{-2x} y^2 + 2 \log y + C = 0$

20.  $dx - xy(1+xy^2) dy = 0$

**Ans.**  $-\frac{1}{x} = y^2 - 2 + Ce^{-y^2/2}$

21.  $\frac{dy}{dx} + \frac{y}{x} \log y = \frac{y}{x^2} (\log y)^2$

(A.M.I.E.T.E., Summer 2004, 2003, Winter 2003, 2001)

**Ans.**  $\frac{1}{x \log y} = \frac{1}{2x^2} + C$

22.  $3 \frac{dy}{dx} + xy = xy^{-2}$

(A.M.I.E.T.E., June 2009) **Ans.**  $y^3 = 1 + Ce^{-x^2/2}$

27.  $x \frac{dy}{dx} + y = x^3 y^6$

(AMIETE, June 2010) **Ans.**  $\frac{1}{y^5 x^5} = \frac{5}{2x^2} + C$

23. General solution of linear differential equation of first order  $\frac{dx}{dy} + Px = Q$  (where P and Q are constants or functions of y) is

(a)  $ye^{\int P \cdot dx} = \int Q e^{\int P \cdot dx} dx + c$  (b)  $xe^{\int P \cdot dy} = \int Q e^{\int P \cdot dy} dy + c$

(c)  $y = \int Q e^{\int P \cdot dx} dx + c$  (d)  $x = \int Q e^{\int P \cdot dy} dy + c$  (AMIETE, June, 2010) **Ans.** (b)

## 11.12 EXACT DIFFERENTIAL EQUATION

An exact differential equation is formed by directly differentiating its primitive (solution) without any other process

$$Mdx + Ndy = 0$$

is said to be an exact differential equation if it satisfies the following condition

$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$
---

where  $\frac{\partial M}{\partial y}$  denotes the differential co-efficient of  $M$  with respect to  $y$  keeping  $x$  constant and  $\frac{\partial N}{\partial x}$ , the differential co-efficient of  $N$  with respect to  $x$ , keeping  $y$  constant.

### Method for Solving Exact Differential Equations

**Step I.** Integrate  $M$  w.r.t.  $x$  keeping  $y$  constant

**Step II.** Integrate w.r.t.  $y$ , only those terms of  $N$  which do not contain  $x$ .

**Step III.** Result of I + Result of II = Constant.

**Example 27.** Solve :

$$(5x^4 + 3x^2y^2 - 2xy^3) dx + (2x^3y - 3x^2y^2 - 5y^4) dy = 0$$

**Solution.** Here,  $M = 5x^4 + 3x^2y^2 - 2xy^3$ ,  $N = 2x^3y - 3x^2y^2 - 5y^4$

$$\frac{\partial M}{\partial y} = 6x^2y - 6xy^2, \quad \frac{\partial N}{\partial x} = 6x^2y - 6xy^2$$

Since,  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$ , the given equation is exact.

Now  $\int M dx + \int (\text{terms of } N \text{ not containing } x) dy = C$  (y constant)

$$\begin{aligned} & \int (5x^4 + 3x^2y^2 - 2xy^3) dx + \int -5y^4 dy = C \\ \Rightarrow & x^5 + x^3y^2 - x^2y^3 - y^5 = C \end{aligned} \quad \text{Ans.}$$

**Example 28.** Solve:  $\{2xy \cos x^2 - 2xy + 1\} dx + \{\sin x^2 - x^2 + 3\} dy = 0$

*(Nagpur University, Summer 2000)*

**Solution.** Here we have

$$\{2xy \cos x^2 - 2xy + 1\} dx + \{\sin x^2 - x^2 + 3\} dy = 0 \quad \dots (1)$$

$$M dx + N dy = 0 \quad \dots (2)$$

Comparing (1) and (2), we get

$$M = 2xy \cos x^2 - 2xy + 1 \Rightarrow \frac{\partial M}{\partial y} = 2x \cos x^2 - 2x$$

$$N = \sin x^2 - x^2 + 3 \Rightarrow \frac{\partial N}{\partial x} = 2x \cos x^2 - 2x$$

$$\text{Here, } \therefore \frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

So the given differential equation is exact differential equation.

Hence solution is  $\int M dx + \int_{y \text{ as const}} (\text{terms of } N \text{ not containing } x) dy = C$

$$\begin{aligned} & \int (2xy \cos x^2 - 2xy + 1) dx + \int 3 dy = C \\ \Rightarrow & \int [y(2x \cos x^2) - y(2x) + 1] dx + 3 \int dy = C \end{aligned}$$

$$\Rightarrow y \int 2x \cos x^2 dx - y \int 2x dx + \int 1 dx + 3 \int y dy = C$$

Put  $x^2 = t$  so that  $2x dx = dt$

$$y \int \cos t dt - 2y \frac{x^2}{2} + x + 3y = C$$

$$\begin{aligned} \Rightarrow & y \sin t - x^2 y + x + 3y = C \\ & y \sin x^2 - yx^2 + x + 3y = C \end{aligned} \quad \text{Ans.}$$

**Example 29.** Solve :

$$(1+e^{x/y}) + e^{x/y} \left( 1 - \frac{x}{y} \right) \frac{dy}{dx} = 0$$

(Nagpur University, Summer 2008, A.M.I.E.T.E. June, 2009)

**Solution.** We have,

$$\left( 1 + e^{\frac{x}{y}} \right) + e^{\frac{x}{y}} \left( 1 - \frac{x}{y} \right) \frac{dy}{dx} = 0 \Rightarrow \left( 1 + e^{\frac{x}{y}} \right) dx + \left( e^{\frac{x}{y}} - e^{\frac{x}{y}} \frac{x}{y} \right) dy = 0$$

$$M = 1 + e^{\frac{x}{y}} \Rightarrow \frac{\partial M}{\partial y} = -\frac{x}{y^2} e^{\frac{x}{y}}$$

$$N = e^{\frac{x}{y}} - e^{\frac{x}{y}} \frac{x}{y} \Rightarrow \frac{\partial N}{\partial x} = \frac{1}{y} e^{\frac{x}{y}} - \frac{1}{y} e^{\frac{x}{y}} - \frac{x}{y^2} e^{\frac{x}{y}} = -\frac{x}{y^2} e^{\frac{x}{y}}$$

$$\Rightarrow \frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

∴ Given equation is exact.

$$\text{Its solution is } \int \left( 1 + e^{\frac{x}{y}} \right) dx + \int (\text{terms of } N \text{ not containing } x) dy = C$$

$$\Rightarrow \int \left( 1 + e^{\frac{x}{y}} \right) dx + \int 0 dy = C \Rightarrow x + ye^{\frac{x}{y}} = C \quad \text{Ans.}$$

**Example 30.** Solve :  $x dx + y dy = \frac{a^2(x dy - y dx)}{x^2 + y^2}$  (U.P. Second Semester Summer 2005)

$$\text{Solution. We have, } x dx + y dy = \frac{a^2(x dy - y dx)}{x^2 + y^2}$$

$$\Rightarrow \left( x + \frac{a^2 y}{x^2 + y^2} \right) dx + \left( y - \frac{a^2 x}{x^2 + y^2} \right) dy = 0$$

$$\text{Here, } M = x + \frac{a^2 y}{x^2 + y^2}, \quad N = y - \frac{a^2 x}{x^2 + y^2}$$

$$\text{Now, } \frac{\partial M}{\partial y} = \frac{a^2(x^2 - y^2)}{(x^2 + y^2)^2}, \quad \frac{\partial N}{\partial x} = \frac{a^2(x^2 - y^2)}{(x^2 + y^2)^2}$$

$$\text{Since, } \frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

Therefore equation is exact. Hence,

$$\int \left( x + \frac{a^2 y}{x^2 + y^2} \right) dx + \int y dy = C$$

$$\Rightarrow \frac{x^2}{2} + a^2 y \cdot \frac{1}{y} \tan^{-1} \left( \frac{x}{y} \right) + \frac{y^2}{2} = C$$

$$\Rightarrow \frac{x^2 + y^2}{2} + a^2 \tan^{-1} \left( \frac{x}{y} \right) = C \quad \text{Ans.}$$

**Example 31.** Solve:  $[1 + \log(xy)]dx + \left[1 + \frac{x}{y}\right]dy = 0$  (Nagpur University, Winter 2003)

**Solution.**  $[1 + \log xy]dx + \left[1 + \frac{x}{y}\right]dy = 0$

$$\therefore [1 + \log x + \log y]dx + \left[1 + \frac{x}{y}\right]dy = 0$$

which is in the form

$$M dx + N dy = 0$$

$$\begin{aligned} M &= [1 + \log x + \log y] \quad \text{and} \quad N = 1 + \frac{x}{y} \\ \Rightarrow \quad \frac{\partial M}{\partial y} &= \frac{1}{y} \quad \text{and} \quad \Rightarrow \quad \frac{\partial N}{\partial x} = \frac{1}{y} \\ \Rightarrow \quad \frac{\partial M}{\partial y} &= \frac{\partial N}{\partial x} \end{aligned}$$

Hence the given differential equation is exact.

$$\therefore \text{Solution is } \int_{y \text{ constant}} M dx + \int N ( \text{terms not containing } x ) dy = C$$

$y$  constant

$$\begin{aligned} \therefore \quad &\int (1 + \log x + \log y) dx + \int dy = C \\ \Rightarrow \quad &x + \int \log x dx + \int \log y dy + y = C \end{aligned} \quad \dots (1)$$

$$\begin{aligned} \text{Now, } \int \log x dx &= \int \log x \cdot (1) dx = (\log x)x - \int \left[ \frac{d}{dx}(\log x)x \right] dx = x \log x - \int \frac{1}{x} \cdot x dx \\ &= x \log x - \int dx = x \log x - x = x[\log x - 1] \end{aligned}$$

$$\therefore \text{Equation (1) becomes } \Rightarrow x + x \log x - x + x \log y + y = C$$

$$x [\log x + \log y] + y = C \Rightarrow x \log xy + y = C \quad \text{Ans.}$$

**Example 32.** Find the value of  $\lambda$ , for the differential equation

$$(xy^2 + \lambda x^2 y)dx + (x+y)x^2 dy = 0 \text{ is exact}$$

Solve the equation for this value of  $\lambda$ .

(Uttarakhand, II Summer 2010, Nagpur University, Summer 2002)

**Solution.** Here  $(xy^2 + \lambda x^2 y)dx + (x+y)x^2 dy = 0$  ... (1)

which is of the form  $M dx + N dy = 0$

Where  $M = xy^2 + \lambda x^2 y$  and  $N = (x+y)x^2 = x^3 + x^2 y$

$$\frac{\partial M}{\partial y} = 2xy + \lambda x^2, \quad \frac{\partial N}{\partial x} = 3x^2 + 2xy$$

Condition of to be exact is

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

$$2xy + \lambda x^2 = 3x^2 + 2xy$$

$$\Rightarrow \lambda x^2 = 3x^2 \Rightarrow \lambda = 3$$

If  $\lambda = 3$  then (1) becomes an exact differential equation.

$$(xy^2 + 3x^2y) dx + (x + y)x^2 dy = 0$$

Its solution is given by

$$\begin{aligned} & \int M dx + \int (\text{terms of } N \text{ not containing } x) dy = \text{constant} \\ \Rightarrow & \int (xy^2 + 3x^2y) dx + \int 0 dy = C \\ \Rightarrow & \frac{x^2y^2}{2} + \frac{3x^3y}{3} = C \quad \Rightarrow \quad \frac{x^2y^2}{2} + x^3y = C \\ & x^2y^2 + 2x^3y = C_1 \end{aligned} \quad \text{Ans.}$$

### EXERCISE 11.7

Solve the following differential equation (1 – 12).

1.  $(x + y - 10) dx + (x - y - 2) dy = 0$  Ans.  $\frac{x^2}{2} + xy - 10x - \frac{y^2}{2} - 2y = C$
2.  $(y^2 - x^2) dx + 2xy dy = 0$  Ans.  $\frac{x^3}{3} = xy^2 + C$
3.  $(1 + 3e^{x/y}) dx + 3e^{x/y} \left(1 - \frac{x}{y}\right) dy = 0$  (R.G.P.V. Bhopal, Winter 2010) Ans.  $x + 3y e^{x/y} = C$
4.  $(2x - y) dx = (x - y) dy$  Ans.  $xy = x^2 + \frac{y^2}{2} + C$
5.  $(y \sec^2 x + \sec x \tan x) dx + (\tan x + 2y) dy = 0$  Ans.  $y \tan x + \sec x + y^2 = C$
6.  $(ax + hy + g) dx + (hx + by + f) dy = 0$  Ans.  $ax^2 + 2hxy + by^2 + 2gx + 2fy + C = 0$
7.  $(x^4 - 2xy^2 + y^4) dx - (2x^2y - 4xy^3 + \sin y) dy = 0$  Ans.  $\frac{x^5}{5} - x^2y^2 + xy^4 + \cos y = C$
8.  $(2xy + e^y) dx + (x^2 + xe^y) dy = 0$  Ans.  $x^2y + xe^y = C$
9.  $(x^2 + 2ye^{2x}) dy + (2xy + 2y^2e^{2x}) dx = 0$  Ans.  $x^2y + y^2 e^{2x} = C$
10.  $\left[ y \left(1 + \frac{1}{x}\right) + \cos y \right] dx + (x + \log x - x \sin y) dy = 0$  (M.D.U., 2010) Ans.  $y(x + \log x) + x \cos y = C$
11.  $(x^3 - 3xy^2) dx + (y^3 - 3x^3y) dy = 0, y(0) = 1$  Ans.  $x^4 - 6x^2y^2 + y^4 = 1$
12. The differential equation  $M(x, y) dx + N(x, y) dy = 0$  is an exact differential equation if  
 (a)  $\frac{\partial M}{\partial y} + \frac{\partial N}{\partial x} = 0$       (b)  $\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x} = 0$       (c)  $\frac{\partial M}{\partial y} \times \frac{\partial N}{\partial x} = 1$       (d) None of the above  
(A.M.I.E.T.E. Dec. 2010, Dec 2006) Ans. (b)

### 11.13 EQUATIONS REDUCIBLE TO THE EXACT EQUATIONS

Sometimes a differential equation which is not exact may become so, on multiplication by a suitable function known as the integrating factor.

**Rule 1.** If  $\frac{\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x}}{N}$  is a function of  $x$  alone, say  $f(x)$ , then I.F. =  $e^{\int f(x) dx}$

**Example 33.** Solve  $(2x \log x - xy) dy + 2y dx = 0$

**Solution.**  $M = 2y, N = 2x \log x - xy$  ... (1)

$$\frac{\partial M}{\partial y} = 2, \quad \frac{\partial N}{\partial x} = 2(1 + \log x) - y$$

$$\text{Here, } \frac{\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x}}{N} = \frac{2 - 2 - 2 \log x + y}{2x \log x - xy} = \frac{-(2 \log x - y)}{x(2 \log x - y)} = -\frac{1}{x} = f(x)$$

$$\text{I.F.} = e^{\int f(x) dx} = e^{\int -\frac{1}{x} dx} = e^{-\log x} = e^{\log x^{-1}} = x^{-1} = \frac{1}{x}$$

On multiplying the given differential equation (1) by  $\frac{1}{x}$ , we get

$$\begin{aligned} \frac{2y}{x} dx + (2 \log x - y) dy &= 0 & \Rightarrow & \int \frac{2y}{x} dx + \int -y dy = c \\ \Rightarrow 2y \log x - \frac{1}{2} y^2 &= c & \text{Ans.} \end{aligned}$$

### EXERCISE 11.8

Solve the following differential equations:

1.  $(y \log y) dx + (x - \log y) dy = 0$

**Ans.**  $2x \log y = c + (\log y)^2$

2.  $\left(y + \frac{1}{3}y^3 + \frac{1}{2}x^2\right) dx + \frac{1}{4}(1+y^2)x dy = 0$

**Ans.**  $\frac{yx^4}{4} + \frac{y^3x^4}{12} + \frac{x^6}{12} = c$

3.  $(y - 2x^3) dx - x(1 - xy) dy = 0$

**Ans.**  $-\frac{y}{x} - x^2 + \frac{y^2}{2} = c$

4.  $(x \sec^2 y - x^2 \cos y) dy = (\tan y - 3x^4) dx$

**Ans.**  $-\frac{1}{x} \tan y - x^3 + \sin y = c$

5.  $(x - y^2) dx + 2xy dy = 0$

**Ans.**  $y^2 = cx - x \log x$

**Rule II.** If  $\frac{\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}}{M}$  is a function of  $y$  alone, say  $f(y)$ , then

$$\text{I.F.} = e^{\int f(y) dy}$$

**Example 34.** Solve  $(y^4 + 2y) dx + (xy^3 + 2y^4 - 4x) dy = 0$

**Solution.** Here  $M = y^4 + 2y, N = xy^3 + 2y^4 - 4x$  ... (1)

$$\therefore \frac{\partial M}{\partial y} = 4y^3 + 2, \quad \frac{\partial N}{\partial x} = y^3 - 4$$

$$\therefore \frac{\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}}{M} = \frac{(y^3 - 4) - (4y^3 + 2)}{y^4 + 2y} = \frac{-3(y^3 + 2)}{y(y^3 + 2)} = -\frac{3}{y} = f(y)$$

$$\text{I.F.} = e^{\int f(y) dy} = e^{\int -\frac{3}{y} dy} = e^{-3 \log y} = e^{\log y^{-3}} = y^{-3} = \frac{1}{y^3}$$

On multiplying the given equation (1) by  $\frac{1}{y^3}$  we get the exact differential equation.

$$\begin{aligned} & \left( y + \frac{2}{y^2} \right) dx + \left( x + 2y - \frac{4x}{y^3} \right) dy = 0 \\ & \int \left( y + \frac{2}{y^2} \right) dx + \int 2y dy = c \quad \Rightarrow \quad x \left( y + \frac{2}{y^2} \right) + y^2 = c \quad \text{Ans.} \end{aligned}$$

**EXERCISE 11.9**

Solve the following differential equations:

1.  $(3x^2y^4 + 2xy) dx + (2x^3y^3 - x^2) dy = 0$  Ans.  $x^3y^2 + \frac{x^2}{y} = c$
2.  $(xy^3 + y) dx + 2(x^2y^2 + x + y^4) dy = 0$  Ans.  $\frac{x^2y^4}{2} + xy^2 + \frac{y^6}{3} = c$
3.  $y(x^2y + e^x)dx - e^x dy = 0$  Ans.  $\frac{x^3}{3} + \frac{e^x}{y} = c$
4.  $(2x^4y^4e^y + 2xy^3 + y) dx + (x^2y^4e^y - x^2y^2 - 3x) dy = 0$  Ans.  $x^2e^y + \frac{x^2}{y} + \frac{x}{y^3} = c$

**Rule III.** If  $M$  is of the form  $M = y f_1(xy)$  and  $N$  is of the form  $N = x f_2(xy)$

Then  $I.F. = \frac{1}{M.x - N.y}$

**Example 35.** Solve  $y(xy + 2x^2y^2) dx + x(xy - x^2y^2) dy = 0$

**Solution.**  $y(xy + 2x^2y^2) dx + x(xy - x^2y^2) dy = 0$  ... (1)

Dividing (1) by  $xy$ , we get

$$y(1 + 2xy) dx + x(1 - xy) dy = 0 \quad \dots (2)$$

$$M = y f_1(xy), \quad N = x f_2(xy)$$

$$I.F. = \frac{1}{Mx - Ny} = \frac{1}{xy(1+2xy) - xy(1-xy)} = \frac{1}{3x^2y^2}$$

On multiplying (2) by  $\frac{1}{3x^2y^2}$ , we have an exact differential equation

$$\begin{aligned} & \left( \frac{1}{3x^2y} + \frac{2}{3x} \right) dx + \left( \frac{1}{3xy^2} - \frac{1}{3y} \right) dy = 0 \quad \Rightarrow \quad \int \left( \frac{1}{3x^2y} + \frac{2}{3x} \right) dx + \int -\frac{1}{3y} dy = c \\ & \Rightarrow \quad -\frac{1}{3xy} + \frac{2}{3} \log x - \frac{1}{3} \log y = c \quad \Rightarrow \quad -\frac{1}{xy} + 2 \log x - \log y = b \quad \text{Ans.} \end{aligned}$$

**EXERCISE 11.10**

Solve the following differential equations

1.  $(y - xy^2) dx - (x + x^2y) dy = 0$  Ans.  $\log \left( \frac{x}{y} \right) - xy = A$
2.  $y(1 + xy) dx + x(1 - xy) dy = 0$  Ans.  $xy \log \left( \frac{y}{x} \right) = cxy - 1$
3.  $y(1 + xy) dx + x(1 + xy + x^2y^2) dy = 0$  Ans.  $\frac{1}{2x^2y^2} + \frac{1}{xy} - \log y = c$

4.  $(xy \sin xy + \cos xy) y dx + (xy \sin xy - \cos xy) x dy = 0 \quad \text{Ans. } y \cos xy = cx$

**Rule IV.** For of this type of  $x^m y^n (ay dx + bx dy) + x^{m'} y^{n'} (a' y dx + b' x dy) = 0$ , the integrating factor is  $x^h y^k$ .

where

$$\frac{m+h+1}{a} = \frac{n+k+1}{b}, \quad \text{and} \quad \frac{m'+h+1}{a'} = \frac{n'+k+1}{b'}$$

**Example 36.** Solve  $(y^3 - 2x^2y) dx + (2xy^2 - x^3) dy = 0$

**Solution.**

$$(y^3 - 2x^2y) dx + (2xy^2 - x^3) dy = 0$$

$$y^2 (ydx + 2xdy) + x^2 (-2ydx + xdy) = 0$$

Here  $m = 0, h = 2, a = 1, b = 2, m' = 2, n' = 0, a' = -2, b' = -1$

$$\frac{0+h+1}{1} = \frac{2+k+1}{2} \quad \text{and} \quad \frac{2+h+1}{-2} = \frac{0+k+1}{-1}$$

$$\Rightarrow 2h + 2 = 2 + k + 1 \text{ and } h + 3 = 2k + 2$$

$$\Rightarrow 2h - k = 1 \text{ and } h - 2k = -1$$

On solving  $h = k = 1$ . Integrating Factor =  $xy$

Multiplying the given equation by  $xy$ , we get

$$(xy^4 - 2x^3y^2) dx + (2x^2y^3 - x^4y) dy = 0$$

which is an exact differential equation.

$$\int (xy^4 - 2x^3y^2) dx = C \quad \Rightarrow \quad \frac{x^2y^4}{2} - \frac{2x^4y^2}{4} = C$$

$$\Rightarrow x^2y^4 - x^4y^2 = C' \quad \Rightarrow \quad x^2y^2(y^2 - x^2) = C' \quad \text{Ans.}$$

**Example 37.** Solve  $(3y - 2xy^3) dx + (4x - 3x^2y^2) dy = 0$ . (U.P., II Semester, June 2007)

**Solution.**  $(3y - 2xy^3) dx + (4x - 3x^2y^2) dy = 0$

$$\Rightarrow (3y dx + 4x dy) + xy^2(-2y dx - 3x dy) = 0 \quad \dots(1)$$

Comparing the coefficients of (1) with

$$x^m y^n (a y dx + b x dy) + x^{m'} y^{n'} (a' y dx + b' x dy) = 0, \text{ we get}$$

$$m = 0, n = 0, a = 3, b = 4$$

$$m' = 1, n' = 2, a' = -2, b' = -3$$

**To find the integrating factor  $x^h y^k$**

$$\frac{m+h+1}{a} = \frac{n+k+1}{b} \quad \text{and} \quad \frac{m'+h+1}{a'} = \frac{n'+k+1}{b'}$$

$$\frac{0+h+1}{3} = \frac{0+k+1}{4} \quad \text{and} \quad \frac{1+h+1}{-2} = \frac{2+k+1}{-3}$$

$$\Rightarrow \frac{h+1}{3} = \frac{k+1}{4} \quad \text{and} \quad \frac{h+2}{2} = \frac{k+3}{3} \Rightarrow 4h - 3k + 1 = 0 \quad \dots(2)$$

and  $3h - 2k = 0 \quad \Rightarrow \quad h = \frac{2k}{3} \quad \dots(3)$

Putting the value of  $h$  from (3) in (2), we get

$$\frac{8k}{3} - 3k + 1 = 0 \quad \Rightarrow \quad -\frac{k}{3} + 1 = 0 \quad \Rightarrow \quad k = 3$$

Putting  $k = 3$  in (2), we get  $h = \frac{2k}{3} = \frac{2 \times 3}{3} = 2$   
I.F.  $= x^h y^k = x^2 y^3$

On multiplying the given differential equation by  $x^2 y^3$ , we get

$$\begin{aligned} x^2 y^3 (3y - 2xy^3) dx + x^2 y^3 (4x - 3x^2 y^2) dy &= 0 \\ (3x^2 y^4 - 2x^3 y^6) dx + (4x^3 y^3 - 3x^4 y^5) dy &= 0 \end{aligned}$$

This is the exact differential equation.

Its solution is  $\int (3x^2 y^4 - 2x^3 y^6) dx = 0 \Rightarrow x^3 y^4 - \frac{x^4}{2} y^6 = C$  **Ans.**

### EXERCISE 11.11

Solve the following differential equations.

1.  $(2y dx + 3x dy) + 2xy (3y dx + 4x dy) = 0$  **Ans.**  $x^2 y^3 (1 + 2xy) = c$

2.  $(y^2 + 2yx^2) dx + (2x^3 - xy) dy = 0$  **Ans.**  $4(xy)^{1/2} - \frac{2}{3} \left( \frac{y}{x} \right)^{3/2} = c$

3.  $(3x + 2y^2)y dx + 2x (2x + 3y^2) dy = 0$  **Ans.**  $x^2 y^4 (x + y^2) = c$

4.  $(2x^2 y^2 + y) dx - (x^3 y - 3x) dy = 0$  **Ans.**  $\frac{7}{5} x^{10/7} y^{-5/7} - \frac{7}{4} x^{-4/7} y^{-12/7} = c$

5.  $x (3y dx + 2x dy) + 8y^4 (y dx + 3x dy) = 0$  **Ans.**  $x^3 y^2 + 4x^2 y^6 = c$

### Rule V.

If the given equation  $M dx + N dy = 0$  is homogeneous equation and  $Mx + Ny \neq 0$ , then

$\frac{1}{Mx + Ny}$  is an integrating factor.

**Example 38.** Solve  $\frac{dy}{dx} = \frac{x^3 + y^3}{xy^2}$

**Solution.**  $(x^3 + y^3) dx - (xy^2) dy = 0$  ... (1)  
Here  $M = x^3 + y^3$ ,  $N = -xy^2$

$$\text{I.F. } = \frac{1}{Mx + Ny} = \frac{1}{x(x^3 + y^3) - xy^2(y)} = \frac{1}{x^4}$$

Multiplying (1) by  $\frac{1}{x^4}$  we get  $\frac{1}{x^4}(x^3 + y^3) dx + \frac{1}{x^4}(-xy^2) dy = 0$

$\Rightarrow \left( \frac{1}{x} + \frac{y^3}{x^4} \right) dx - \frac{y^2}{x^3} dy = 0$ , which is an exact differential equation.

$$\int \left( \frac{1}{x} + \frac{y^3}{x^4} \right) dx = c \Rightarrow \log x - \frac{y^3}{3x^3} = c \quad \text{Ans.}$$

### EXERCISE 11.12

Solve the following differential equations:

1.  $x^2 y dx - (x^3 + y^3) dy = 0$  **Ans.**  $-\frac{x^3}{3y^3} + \log y = c$

2.  $(y^3 - 3xy^2) dx + (2x^2y - xy^2) dy = 0$

**Ans.**  $\frac{y}{x} + 3 \log x - 2 \log y = c$

3.  $(x^2y - 2xy^2) dx - (x^3 - 3x^2y) dy = 0$

**Ans.**  $\frac{x}{y} - 2 \log x + 3 \log y = c$

4.  $(y^3 - 2yx^2) dx + (2xy^2 - x^3) dy = 0$

**Ans.**  $x^2y^4 - x^4y^2 = c$

### 11.14 DIFFERENTIAL EQUATIONS REDUCIBLE TO EXACT FORM (BY INSPECTION)

The following differentials, which commonly occur, help in selecting the suitable integrating factor.

(i)  $y dx + x dy = d [xy]$

(ii)  $\frac{x dy - y dx}{x^2} = d \left[ \frac{y}{x} \right]$

(iii)  $\frac{y dx - x dy}{y^2} = d \left[ \frac{x}{y} \right]$

(iv)  $\frac{x dy - y dx}{x^2 + y^2} = d \left[ \tan^{-1} \left( \frac{y}{x} \right) \right]$

(v)  $\frac{x dy - y dx}{xy} = d \left[ \log \left( \frac{y}{x} \right) \right]$

(vi)  $\frac{x dx - y dy}{x^2 + y^2} = d \left[ \frac{1}{2} \log(x^2 + y^2) \right]$

(vii)  $\frac{x dy - y dx}{x^2 - y^2} = d \left[ \frac{1}{2} \log \frac{x+y}{x-y} \right]$

(viii)  $\frac{x dy + y dx}{x^2 y^2} = d \left[ -\frac{1}{xy} \right]$

### 11.15 EQUATIONS OF FIRST ORDER AND HIGHER DEGREE

The differential equations will involve  $\frac{dy}{dx}$  in higher degree and  $\frac{dy}{dx}$  will be denoted by  $p$ .

The differential equation will be of the form  $f(x, y, p) = 0$ .

#### Case I. Equations solvable for $p$ .

**Example 39.** Solve :  $x^2 = 1 + p^2$

**Solution.**  $x^2 = 1 + p^2 \Rightarrow p^2 = x^2 - 1$

$$\Rightarrow p = \pm \sqrt{x^2 - 1} \Rightarrow \frac{dy}{dx} = \pm \sqrt{x^2 - 1} \Rightarrow dy = \pm \sqrt{x^2 - 1} dx$$

which gives on integration  $y = \pm \frac{x}{2} \sqrt{x^2 - 1} \mp \frac{1}{2} \log \left( x + \sqrt{x^2 - 1} \right) + c$

**Ans.**

#### Case II. Equations solvable for $y$ .

(i) Differentiate the given equation w.r.t. "x".

(ii) Eliminate  $p$  from the given equation and the equation obtained as above.

(iii) The eliminant is the required solution.

**Example 40.** Solve:  $y = (x - a)p - p^2$ .

**Solution.**  $y = (x - a)p - p^2$

... (1)

Differentiating (1) w.r.t. "x" we obtain

$$\frac{dy}{dx} = p + (x - a) \frac{dp}{dx} - 2p \frac{dp}{dx}$$

$$p = p + (x - a) \frac{dp}{dx} - 2p \frac{dp}{dx}$$

$$\Rightarrow 0 = (x - a) \frac{dp}{dx} - 2p \frac{dp}{dx}$$

$$\Rightarrow 0 = \frac{dp}{dx} [x - a - 2p] \Rightarrow \frac{dp}{dx} = 0$$

On integration, we get  $p = c$ .

Putting the value of  $p$  in (1), we get

$$y = (x - a) c - c^2$$

**Ans.**

### Case III. Equations solvable for $x$

- (i) Differentiate the given equation w.r.t. "y".
- (ii) Solve the equation obtained as in (1) for  $p$ .
- (iii) Eliminate  $p$ , by putting the value of  $p$  in the given equation.
- (iv) The eliminant is the required solution.

**Example 41.** Solve:  $y = 2px + yp^2$

**Solution.**  $y = 2px + yp^2$

... (1)

$$\Rightarrow 2px = y - yp^2 \Rightarrow 2x = \frac{y}{p} - yp \quad \dots (2)$$

Differentiating (2) w.r.t. "y" we get

$$\begin{aligned} 2 \frac{dx}{dy} &= \frac{1}{p} - \frac{y}{p^2} \frac{dp}{dy} - p - y \frac{dp}{dy} \\ \Rightarrow \frac{2}{p} &= \frac{1}{p} - \frac{y}{p^2} \frac{dp}{dy} - p - y \frac{dp}{dy} \Rightarrow \frac{1}{p} + p = -\frac{y}{p^2} \frac{dp}{dy} - y \frac{dp}{dy} \\ \Rightarrow \frac{1}{p} + p &= -y \left( \frac{1}{p^2} + 1 \right) \frac{dp}{dy} \Rightarrow \frac{1+p^2}{p} = -y \frac{1+p^2}{p^2} \frac{dp}{dy} \\ \Rightarrow 1 &= -\frac{y}{p} \frac{dp}{dy} \Rightarrow -\frac{dy}{y} = \frac{dp}{p} \Rightarrow -\log y = \log p + \log c' \\ \Rightarrow \log p y &= \log c \Rightarrow p y = c \Rightarrow p = \frac{c}{y} \end{aligned}$$

Putting the value of  $p$  in (1), we get

$$\begin{aligned} y &= 2 \left( \frac{c}{y} \right) x + y \left( \frac{c^2}{y^2} \right) \Rightarrow y^2 = 2cx + c^2 \\ \Rightarrow y^2 &= c(2x + c) \end{aligned}$$

**Ans.**

### Class IV. Clairaut's Equation.

The equation  $y = px + f(p)$  is known as Clairaut's equation.

... (1)

Differentiating (1) w.r.t. "x", we get

$$\begin{aligned} \frac{dy}{dx} &= p + x \frac{dp}{dx} + f'(p) \frac{dp}{dx} \\ \Rightarrow p &= p + x \frac{dp}{dx} + f'(p) \frac{dp}{dx} \Rightarrow 0 = x \frac{dp}{dx} + f'(p) \frac{dp}{dx} \\ \Rightarrow [x + f'(p)] \frac{dp}{dx} &= 0 \Rightarrow \frac{dp}{dx} = 0 \Rightarrow p = a \quad (\text{constant}) \end{aligned}$$

Putting the value of  $p$  in (1), we have

$$y = ax + f(a)$$

which is the required solution.

**Method.** In the Clairaut's equation, on replacing  $p$  by a (constant), we get the solution of the equation.

**Example 42.** Solve :  $p = \log(p x - y)$

**Solution.**  $p = \log(p x - y)$  or  $e^p = p x - y$  or  $y = p x - e^p$

Which is Clairaut's equation.

Hence its solution is  $y = a x - e^a$

**Ans.**

### EXERCISE 11.13

Solve the following differential equations.

1.  $xp^2 + x = 2yp$

**Ans.**  $2cy = c^2x^2 + 1$

2.  $x(1 + p^2) = 1$

**Ans.**  $y - c = \sqrt{(x - x^2)} - \tan^{-1} \sqrt{\frac{1-x}{x}}$

3.  $x^2p^2 + xyp - 6y^2 = 0$

**Ans.**  $y = \frac{c}{x^3}, y = c_1x^2$

4.  $\frac{dy}{dx} - \frac{dx}{dy} = \frac{x}{y} - \frac{y}{x}$

**Ans.**  $xy = c, x^2 - y^2 = c$

5.  $y = px + p^3$

**Ans.**  $y = ax + a^3$

6.  $x^2(y - px) = yp^2$

**Ans.**  $y^2 = cx^2 + c^2$

### 11.16 ORTHOGONAL TRAJECTORIES

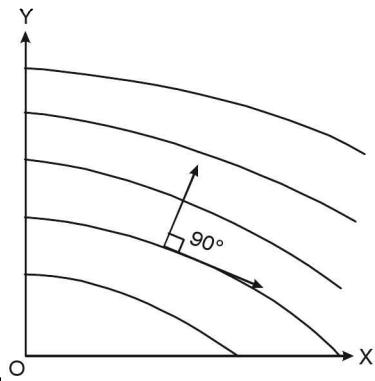

Two families of curves are such that every curve of either family cuts each curve of the other family at right angles.

They are called orthogonal trajectories of each other.

Orthogonal trajectories are very useful in engineering problems.

**For example:**

(i) The path of an electric field is perpendicular to equipotential curves.

(ii) In fluid flow, the stream lines and equipotential lines are orthogonal trajectories.

(iii) The lines of heat flow is perpendicular to isothermal curves.

**Working rule to find orthogonal trajectories of curves**

**Step 1.** By differentiating the equation of curves find the differential equations in the form

$$f\left(x, y, \frac{dy}{dx}\right) = 0$$

**Step 2.** Replace  $\frac{dy}{dx}$  by  $-\frac{dx}{dy}$  ( $M_1, M_2 = -1$ )

**Step 3.** Solve the differential equation of the orthogonal trajectories i.e.,  $f\left(x, y - \frac{dx}{dy}\right) = 0$

**Self-orthogonal.** A given family of curves is said to be ‘self-orthogonal’ if the family of orthogonal trajectory is the same as the given family of curves.

**Example 43.** Find the orthogonal trajectories of the family of curves  $xy = c$ .

**Solution.** Here, we have

$$xy = c \quad \dots (1)$$

Differentiating (1), w.r.t., “x”, we get

$$y + x \frac{dy}{dx} = 0 \quad \Rightarrow \quad \frac{dy}{dx} = -\frac{y}{x}$$

On replacing  $\frac{dy}{dx}$  by  $-\frac{dx}{dy}$ , we get

$$\begin{aligned} \Rightarrow \quad -\frac{dx}{dy} &= -\frac{y}{x} \quad \Rightarrow \quad \frac{dy}{dx} = \frac{x}{y} \\ y \, dy &= x \, dx \end{aligned} \quad \dots (2)$$

Integrating (2), we get  $\frac{y^2}{2} = \frac{x^2}{2} + c$

$$\Rightarrow y^2 - x^2 = 2c$$

**Ans.**

**Example 44.** Find the orthogonal trajectories of  $x^p + cy^p = 1$ ,  $p = \text{constant}$ .

**Solution.** Here we have  $x^p + cy^p = 1$

... (1)

Differentiating (1), we get  $px^{p-1} + pcy^{p-1} \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x^{p-1}}{cy^{p-1}}$

... (2)

Putting the value of  $\frac{1}{c}$  in (2), we get  $\frac{dy}{dx} = -\frac{x^{p-1}}{y^{p-1}} \frac{y^p}{1-x^p} \Rightarrow \frac{dy}{dx} = -\frac{x^{p-1}y}{1-x^p}$

... (3)

Replacing  $\frac{dy}{dx}$  by  $-\frac{dx}{dy}$  for orthogonal trajectory in (3), we get

$$-\frac{dx}{dy} = -\frac{x^{p-1}y}{1-x^p} \Rightarrow \frac{dy}{dx} = \frac{1-x^p}{x^{p-1}y} \quad \dots (4)$$

$$\Rightarrow y dy = \frac{1-x^p}{x^{p-1}} dx \Rightarrow \int y dy = \int x^{1-p} dx - \int x dx$$

$$\frac{y^2}{2} = \frac{x^{1-p+1}}{1-p+1} - \frac{x^2}{2} + c \Rightarrow y^2 = \frac{2x^{2-p}}{2-p} - x^2 + 2c \quad \text{Ans.}$$

Putting  $p = 2$  in (4), we get  $\frac{dy}{dx} = \frac{1-x^2}{xy} \Rightarrow y dy = \frac{1-x^2}{x} dx$

$$y dy = \left( \frac{1}{x} - x \right) dx \Rightarrow \frac{y^2}{2} = \log x - \frac{x^2}{2} + \log c$$

$$\log x + \log c = \frac{x^2 + y^2}{2} \Rightarrow 2 \log x + 2 \log c = x^2 + y^2$$

$$x^2 c^2 = e^{x^2 + y^2}$$

$$c_1 x^2 = e^{x^2 + y^2} \quad [C_1 = C^2] \quad \text{Ans.}$$

**Example 45.** Show that the family of parabolas  $y^2 = 2cx + c^2$  is "self-orthogonal."

**Solution.** Here we have

$$y^2 = 2cx + c^2 \quad \dots (1)$$

Differentiating (1), we get  $2y \frac{dy}{dx} = 2c \Rightarrow c = y \frac{dy}{dx}$

Putting the value of  $c$  in (1), we have  $y^2 = 2 \left( y \frac{dy}{dx} \right) x + \left( y \frac{dy}{dx} \right)^2$

... (2)

Putting  $\frac{dy}{dx} = p$  in (2), we get

$$y^2 = 2ypx + y^2 p^2 \quad \dots (3)$$

This is differential equation of give  $n$  family of parabolas.

For orthogonal trajectories we put  $-\frac{1}{p}$  for  $p$  in (3)

$$y^2 = 2y \left( -\frac{1}{p} \right) x + y^2 \left( -\frac{1}{p} \right)^2 \Rightarrow y^2 = -\frac{2yx}{p} + \frac{y^2}{p^2}$$

$$\Rightarrow y^2 p^2 = -2p y x + y^2$$

Rewriting, we get

$$\Rightarrow y^2 = 2p y x + y^2 p^2$$

Which is same as equation (3). Thus (2) is D.E. for the given family and its orthogonal trajectories.

Hence, the given family is self-orthogonal.

**Proved.**

**Example 46.** Show that the system of confocal conics

$$\frac{x^2}{a^2 + \lambda} + \frac{y^2}{b^2 + \lambda} = 1$$

Where  $\lambda$  is a parameter, is selforthogonal.

$$\text{Solution. Here we have } \frac{x^2}{a^2 + \lambda} + \frac{y^2}{b^2 + \lambda} = 1 \quad \dots (1)$$

Differentiating (1), we get

$$\begin{aligned} & \frac{2x}{a^2 + \lambda} + \frac{2y}{b^2 + \lambda} \frac{dy}{dx} = 0 \quad (\text{Put } \frac{dy}{dx} = p) \\ \Rightarrow & \frac{x}{a^2 + \lambda} + \frac{y p}{b^2 + \lambda} = 0 \\ \Rightarrow & x(b^2 + \lambda) + py(a^2 + \lambda) = 0 \quad \Rightarrow \quad \lambda(x + py) = -b^2 x - a^2 y p \\ \Rightarrow & \lambda = \frac{-(b^2 x + a^2 y p)}{x + py} \end{aligned}$$

$$\text{Now } a^2 + \lambda = a^2 - \frac{b^2 x + a^2 y p}{x + py} = \frac{a^2 x + a^2 y p - b^2 x - a^2 y p}{x + py} = \frac{(a^2 - b^2)x}{x + py}$$

$$\text{Again } b^2 + \lambda = b^2 - \frac{b^2 x + a^2 y p}{x + py} = \frac{b^2 x + b^2 y p - b^2 x - a^2 y p}{x + py} = \frac{-(a^2 - b^2)y p}{x + py}$$

Eliminating  $\lambda$  by putting the value of  $a^2 + \lambda$  and  $b^2 + \lambda$  in (1), we get

$$\begin{aligned} & \frac{x^2(x + py)}{(a^2 - b^2)x} + \frac{y^2(x + py)}{-(a^2 - b^2)y p} = 1 \quad \Rightarrow \quad \frac{x(x + py)}{(a^2 - b^2)} - \frac{y(x + py)}{(a^2 - b^2)p} = 1 \\ & \frac{x + py}{a^2 - b^2} \left[ x - \frac{y}{p} \right] = 1 \quad \Rightarrow \quad \frac{(x + py) \left( x - \frac{y}{p} \right)}{a^2 - b^2} = 1 \quad \Rightarrow \quad (x + py) \left( x - \frac{y}{p} \right) = a^2 - b^2 \quad \dots (2) \end{aligned}$$

Equation (2) is the differential equation of (1),

To get the differential equation of orthogonal trajectory

$$\text{Replace } p \text{ by } -\frac{1}{p} \text{ in (2)} \quad \left( x - \frac{1}{p} y \right) (x + py) = a^2 - b^2 \quad \dots (3)$$

Equation (3) is the same as eq. (2).

Thus the differential equation of the family of the orthogonal trajectory is the same as the differential equation of the family of the given curves.

Hence it is a self orthogonal family of curves.

**Ans.**

**EXERCISE 11.14**

Find the orthogonal trajectories of the following family of curves:

1.  $y^2 = cx^3$

Ans.  $(x+1)^2 + y^2 = a^2$

2.  $x^2 - y^2 = cx$

Ans.  $y(y^2 + 3x^2) = c$

3.  $x^2 - y^2 = c$

Ans.  $xy = c$

4.  $(a+x)y^2 = x^2(3a-x)$  Ans.  $(x^2 + y^2)^5 = cy^3(5x^2 + y^2)$

5.  $y = ce^{-2x} + 3x$ , passing through the point  $(0, 3)$

Ans.  $9x - 3y + 5 = -4e^{6(3-y)}$

6.  $16x^2 + y^2 = c$

Ans.  $y^{16} = kx$

7.  $y = \tan x + c$

Ans.  $2x + 4y + \sin 2x = k$

8.  $y = ax^2$

Ans.  $x^2 + 2y^2 = c$

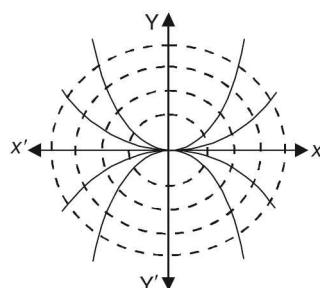

9.  $x^2 + (y - c)^2 = c^2$

Ans.  $x^2 + y^2 = cx$

10.  $x^2 + y^2 + 2gx + 2fy + c = 0$

Ans.  $x^2 + y^2 + 2fy - c = 0$

11. Family of parabolas through origin and focii on  $y$ -axis.

Ans. Ellipses with centre at the origin and focii on  $x$ -axis.

12. Show that the system of rectangular hyperbola  $x^2 - y^2 = c^2$  and  $xy = c^2$  are mutually orthogonal trajectories.  
 13. Show that the family of curves  $y^2 = 4c(c + x)$  is self orthogonal.

**11.17 POLAR EQUATION OF THE FAMILY OF CURVES**

Let the polar equation of the family of curves be  $f(r, \theta, c) = 0$

... (1)

**Working Rule**

**Step 1.** On differentiating and eliminating the arbitrary constant  $c$  between (1) and  $f'(r, \theta, c) = 0$  we get the differential equation of (1) i.e.,

$$F\left(r, \theta, \frac{dr}{d\theta}\right) = 0 \quad \dots (2)$$

**Step 2.** Replace  $\frac{dr}{d\theta}$  by  $-r^2 \frac{d\theta}{dr}$  in (2). Here we will get the differential equation of orthogonal trajectory i.e.,

$$F\left(r, \theta - r^2 \frac{d\theta}{dr}\right) = 0 \quad \dots (3)$$

**Step 3.** Integrating (3) to get the equation of the orthogonal trajectory.

**Example 47.** Find the orthogonal trajectory of the cardioids  $r = a(1 - \cos \theta)$ .

**Solution.** We have,  $r = a(1 - \cos \theta)$  ... (1)

Differentiating (1) w.r.t.  $\theta$ , we get  $\frac{dr}{d\theta} = a \sin \theta$  ... (2)

Dividing (2) by (1) to eliminate  $a$ , we get

$$\frac{1}{r} \frac{dr}{d\theta} = \frac{\sin \theta}{1 - \cos \theta} = \frac{\frac{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{2}}{1 - 1 + 2 \sin^2 \frac{\theta}{2}} = \cot \frac{\theta}{2} \quad \dots (3)$$

which is the differential equation of (1).

Replacing  $\frac{dr}{d\theta}$  by  $-r^2 \frac{d\theta}{dr}$  in (3), we get  $\frac{1}{r} \left( -r^2 \frac{d\theta}{dr} \right) = \cot \frac{\theta}{2}$

$$r \frac{d\theta}{dr} = -\cot \frac{\theta}{2}$$

Separating the variables we get  $\frac{dr}{r} = -\tan \frac{\theta}{2} d\theta$  ... (4)

Integrating (4), we get  $\log r = 2 \log \cos \frac{\theta}{2} + \log c = \log c \cos^2 \frac{\theta}{2}$

$$\Rightarrow r = c \cos^2 \frac{\theta}{2} \quad \Rightarrow \quad r = \frac{c}{2} (1 + \cos \theta) \quad \text{Ans.}$$

Which is the required trajectory.

**Example 48.** Find the orthogonal trajectory the family of curves

$$r^2 = c \sin 2\theta$$

**Solution.** We have

$$r^2 = c \sin 2\theta \quad \dots (1)$$

Differentiating (1), we get  $2r \frac{dr}{d\theta} = 2c \cos 2\theta$  ... (2)

Dividing (2) by (1), to eliminate ' $c$ ' we get  $\frac{2}{r} \frac{dr}{d\theta} = 2 \cot 2\theta$  ... (3)

Replacing  $\frac{dr}{d\theta}$  by  $-r^2 \frac{d\theta}{dr}$  in (3), we have  $\frac{2}{r} \left( -r^2 \frac{d\theta}{dr} \right) = 2 \cot 2\theta$

$$-2r \frac{d\theta}{dr} = 2 \cot 2\theta \quad \dots (4)$$

Separating the variables of (4), we obtain  $\frac{dr}{r} = -\tan 2\theta d\theta$  ... (5)

Integrating (5), we get  $\log r = \frac{1}{2} \log \cos 2\theta + \log c$

$$2 \log r = \log c \cos \theta \\ r^2 = c \cos 2\theta$$

which is the required trajectory

**Ans.**

**Example 49.** Find the orthogonal trajectory of the family of curves

$$r = c (\sec \theta + \tan \theta)$$

**Solution.** We have  $r = c (\sec \theta + \tan \theta)$  ... (1)

Differentiating (1) w.r.t. ' $\theta$ ' we get  $\frac{dr}{d\theta} = c (\sec \theta \tan \theta + \sec^2 \theta)$  ... (2)

$$\frac{dr}{d\theta} = c \sec \theta (\tan \theta + \sec \theta)$$

Dividing (2) by (1), we get  $\frac{1}{r} \frac{dr}{d\theta} = \sec \theta$  ... (3)

Separating the variables of (3), we have  $\frac{1}{r} \frac{dr}{d\theta} = \sec \theta$  ... (4)

Replacing  $\frac{dr}{d\theta}$  by  $-r^2 \frac{d\theta}{dr}$ , we obtain

$$\frac{1}{r} \left( -r^2 \frac{d\theta}{dr} \right) = \sec \theta \Rightarrow -r \frac{d\theta}{dr} = \sec \theta \quad \dots (5)$$

Separating the variables of (5), we obtain  $\frac{dr}{r} = -\cos \theta d\theta$  ... (6)

Integrating (6), we get  $\log r = -\sin \theta + c \Rightarrow r = c'e^{-\sin \theta}$   
which is the required orthogonal trajectory.

**Ans.**

### EXERCISE 11.15

Find the orthogonal trajectory of the following families of the curves:

1.  $r = ce^\theta$

**Ans.**  $r = ke^{-\theta}$

2.  $r = c\theta^2$

**Ans.**  $r = ke^{-\frac{\theta^2}{4}}$

3.  $r = a(1 + \cos \theta)$

**Ans.**  $r = c(1 - \cos \theta)$

4.  $r^n \sin n\theta = a^n$

**Ans.**  $r^n \cos n\theta = c^n$

5.  $r = a \cos^2 \theta$

**Ans.**  $r^2 = c \sin \theta$

6.  $r = 2a(\sin \theta + \cos \theta)$

**Ans.**  $r = 2c(\sin \theta - \cos \theta)$

7.  $r = c(1 + \sin^2 \theta)$

**Ans.**  $r^2 = k \cos \theta \cdot \cot \theta$

8.  $r = \frac{a}{1 + 2 \cos \theta}$

**Ans.**  $r^2 \sin^3 \theta = (1 + \cos \theta)$

# CHAPTER

# 12

## **LINEAR DIFFERENTIAL EQUATIONS OF SECOND ORDER**

---

### **12.1 LINEAR DIFFERENTIAL EQUATIONS**

If the degree of the dependent variable and all derivatives is one, such differential equations are called *linear differential equations* e.g.

$$(1) \frac{d^2y}{dx^2} + 5\frac{dy}{dx} + 6y = x^2 + x + 1 \quad (2) 2\frac{d^2x}{dt^2} - \frac{dx}{dt} - 3x = f(t)$$

### **12.2 NON LINEAR DIFFERENTIAL EQUATIONS**

If the degree of the dependent variable and / or its derivatives are of greater than 1 such differential equations are called one-linear differential equations.

$$(1) \frac{d^2y}{dx^2} + \frac{dy}{dx} + y^2 = \sin x \quad (2) \frac{d^2y}{dx^2} + 2\left(\frac{dy}{dx}\right)^2 + y^2 = e^x \quad (3) \left(\frac{d^2x}{dt^2}\right)^2 + \frac{dx}{dt} + x = f(t)$$

The order of a differential equation is the highest order of the derivative involved. All the above differential equations are of second order.

Fourier and Laplace transforms are mathematical tools to solve the differential equations.

### **12.3 LINEAR DIFFERENTIAL EQUATIONS OF SECOND ORDER WITH CONSTANT COEFFICIENTS**

The general form of the linear differential equation of second order is

$$\frac{d^2y}{dx^2} + P\frac{dy}{dx} + Qy = R$$

where  $P$  and  $Q$  are constants and  $R$  is a function of  $x$  or constant.

**Differential operator.** Symbol  $D$  stands for the operation of differential i.e.,

$$Dy = \frac{dy}{dx}, \quad D^2y = \frac{d^2y}{dx^2}$$

$\frac{1}{D}$  stands for the operation of integration.

$\frac{1}{D^2}$  stands for the operation of integration twice.

$\frac{d^2y}{dx^2} + P\frac{dy}{dx} + Qy = R$  can be written in the operator form.

$$D^2y + P Dy + Qy = R \quad \Rightarrow \quad (D^2 + PD + Q)y = R$$

### 12.4 COMPLETE SOLUTION = COMPLEMENTARY FUNCTION + PARTICULAR INTEGRAL

Let us consider a linear differential equation of the first order

$$\frac{dy}{dx} + Py = Q \quad \dots(1)$$

Its solution is  $ye^{\int P dx} = \int (Q e^{\int P dx}) dx + C$

$$\Rightarrow y = Ce^{-\int P dx} + e^{-\int P dx} \int (Q e^{\int P dx}) dx$$

$$\Rightarrow y = cu + v \text{ (say)} \quad \dots(2)$$

where  $u = e^{-\int P dx}$  and  $v = e^{-\int P dx} \int Q e^{\int P dx} dx$

(i) Now differentiating  $u = e^{-\int P dx}$  w.r.t.  $x$ , we get  $\frac{du}{dx} = -Pe^{-\int P dx} = -Pu$

$$\Rightarrow \frac{du}{dx} + Pu = 0 \quad \Rightarrow \quad \frac{d(cu)}{dx} + P(cu) = 0$$

which shows that  $y = cu$  is the solution of  $\frac{dy}{dx} + Py = 0$

(ii) Differentiating  $v = e^{-\int P dx} \int (Q e^{\int P dx}) dx$  with respect to  $x$ , we get

$$\frac{dv}{dx} = -Pe^{\int P dx} \int (Q e^{\int P dx}) dx + e^{-\int P dx} Q e^{\int P dx} \quad \Rightarrow \quad \frac{dv}{dx} = -Pv + Q$$

$$\Rightarrow \frac{dv}{dx} + Pv = Q \quad \text{which shows that } y = v \text{ is the solution of } \boxed{\frac{dy}{dx} + Py = Q}$$

Solution of the differential equation (1) is (2) consisting of two parts i.e.  $cu$  and  $v$ .  $cu$  is the solution of the differential equation whose R.H.S. is zero.  $cu$  is known as *complementary function*. Second part of (2) is  $v$  free from any arbitrary constant and is known as *particular integral*.

Complete Solution = Complementary Function + Particular Integral.

$$\Rightarrow \boxed{y = C.F. + P.I.}$$

### 12.5 METHOD FOR FINDING THE COMPLEMENTARY FUNCTION

(1) In finding the complementary function, R.H.S. of the given equation is replaced by zero.

(2) Let  $y = C_1 e^{mx}$  be the C.F. of

$$\frac{d^2y}{dx^2} + P \frac{dy}{dx} + Qy = 0 \quad \dots(1)$$

Putting the values of  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in (1) then  $C_1 e^{mx} (m^2 + Pm + Q) = 0$

$\Rightarrow m^2 + Pm + Q = 0$ . It is called **Auxiliary equation**.

(3) Solve the auxiliary equation :

**Case I : Roots, Real and Different.** If  $m_1$  and  $m_2$  are the roots, then the C.F. is

$$y = C_1 e^{m_1 x} + C_2 e^{m_2 x}$$

**Case II : Roots, Real and Equal.** If both the roots are  $m_1$ ,  $m_1$  then the C.F. is

$$y = (C_1 + C_2 x) e^{m_1 x}$$

**Proof.** Equation (1) can be written as

$$(D - m_1)(D - m_1)y = 0 \quad \dots (2)$$

Replacing  $(D - m_1)y = v$  in (2), we get

$$(D - m_1)v = 0 \quad \dots (3)$$

$$\frac{dv}{dx} - m_1v = 0 \Rightarrow \frac{dv}{v} = m_1 dx \Rightarrow \log v = m_1 x + \log c_2 \Rightarrow v = c_2 e^{m_1 x}$$

$$\text{From (3)} \quad (D - 1)y = c_2 e^{m_1 x}$$

This is the linear differential equation.

$$\text{I.F.} = e^{-\int m_1 dx} = e^{-m_1 x}$$

Solution is

$$y \cdot e^{-m_1 x} = \int (c_2 e^{m_1 x}) (e^{-m_1 x}) dx + c_1 = \int c_2 dx + c_1 = c_2 x + c_1$$

$$y = (c_2 x + c_1) e^{m_1 x}$$

$$\text{C.F.} = (c_1 + c_2 x) e^{m_1 x}$$

$$\text{Example 1. Solve: } \frac{d^2 y}{dx^2} - 8 \frac{dy}{dx} + 15y = 0.$$

**Solution.** Given equation can be written as

$$(D^2 - 8D + 15)y = 0$$

Here auxiliary equation is  $m^2 - 8m + 15 = 0$

$$\Rightarrow (m - 3)(m - 5) = 0 \quad \therefore m = 3, 5$$

Hence, the required solution is

$$y = C_1 e^{3x} + C_2 e^{5x} \quad \text{Ans.}$$

$$\text{Example 2. Solve: } \frac{d^2 y}{dx^2} - 6 \frac{dy}{dx} + 9y = 0$$

**Solution.** Given equation can be written as

$$(D^2 - 6D + 9)y = 0$$

$$\text{A.E. is } m^2 - 6m + 9 = 0 \Rightarrow (m - 3)^2 = 0 \Rightarrow m = 3, 3$$

Hence, the required solution is

$$y = (C_1 + C_2 x) e^{3x} \quad \text{Ans.}$$

$$\text{Example 3. Solve: } \frac{d^2 y}{dx^2} + 4 \frac{dy}{dx} + 5y = 0,$$

$$y = 2 \text{ and } \frac{dy}{dx} = \frac{d^2 y}{dx^2} \text{ when } x = 0.$$

**Solution.** Here the auxiliary equation is

$$m^2 + 4m + 5 = 0$$

Its root are  $-2 \pm i$

The complementary function is

$$y = e^{-2x} (A \cos x + B \sin x) \quad \dots (1)$$

On putting  $y = 2$  and  $x = 0$  in (1), we get

$$2 = A$$

On putting  $A = 2$  in (1), we have

$$y = e^{-2x} [2 \cos x + B \sin x] \quad \dots(2)$$

On differentiating (2), we get

$$\begin{aligned}\frac{dy}{dx} &= e^{-2x} [-2 \sin x + B \cos x] - 2e^{-2x} [2 \cos x + B \sin x] \\ &= e^{-2x} [(-2B - 2) \sin x + (B - 4) \cos x] \\ \frac{d^2y}{dx^2} &= e^{-2x} [(-2B - 2) \cos x - (B - 4) \sin x] \\ &\quad - 2e^{-2x} [(-2B - 2) \sin x + (B - 4) \cos x] \\ &= e^{-2x} [(-4B + 6) \cos x + (3B + 8) \sin x]\end{aligned}$$

But

$$\frac{dy}{dx} = \frac{d^2y}{dx^2}$$

$$e^{-2x} [(-2B - 2) \sin x + (B - 4) \cos x] = e^{-2x} [(-4B + 6) \cos x + (3B + 8) \sin x]$$

On putting  $x = 0$ , we get

$$B - 4 = -4B + 6 \Rightarrow B = 2$$

(2) becomes,

$$\begin{aligned}y &= e^{-2x} [2 \cos x + 2 \sin x] \\ &= 2e^{-2x} [\sin x + \cos x]\end{aligned}$$

**Ans.**

**Example 4.** The general solution of the differential equation

$$\frac{d^5y}{dx^5} - \frac{d^3y}{dx^3} = 0 \text{ is given by} \quad (\text{U.P. II Semester, 2009})$$

**Solution.** Here, we have

$$\frac{d^5y}{dx^5} - \frac{d^3y}{dx^3} = 0$$

$$\text{or} \quad D^5y - D^3y = 0 \Rightarrow (D^5 - D^3)y = 0 \Rightarrow D^3(D^2 - 1)y = 0$$

$$\text{A.E. is } m^3(m^2 - 1) = 0 \Rightarrow m = 0, 0, 0, 1, -1$$

Here the solution is

$$y = (C_1 + C_2x + C_3x^2) + C_4e^x + C_5e^{-x} \quad \text{Ans.}$$

**Case III: Roots Imaginary.** If the roots are  $\alpha \pm i\beta$ , then the solution will be

$$\begin{aligned}y &= C_1e^{(\alpha+i\beta)x} + C_2e^{(\alpha-i\beta)x} = e^{\alpha x} [C_1e^{i\beta x} + C_2e^{-i\beta x}] \\ &= e^{\alpha x} [C_1(\cos \beta x + i \sin \beta x) + C_2(\cos \beta x - i \sin \beta x)] \\ &= e^{\alpha x} [(C_1 + C_2)\cos \beta x + i(C_1 - C_2)\sin \beta x] \\ &= e^{\alpha x} [A \cos \beta x + B \sin \beta x]\end{aligned}$$

## EXERCISE 12.1

Solve the following equations :

1.  $\frac{d^2y}{dx^2} - 3\frac{dy}{dx} + 2y = 0$  **Ans.**  $y = C_1 e^x + C_2 e^{2x}$  2.  $\frac{d^2y}{dx^2} + \frac{dy}{dx} - 30y = 0$  **Ans.**  $y = C_1 e^{5x} + C_2 e^{-6x}$
3.  $\frac{d^2y}{dx^2} - 8\frac{dy}{dx} + 16y = 0$  **Ans.**  $y = (C_1 + C_2x)e^{4x}$

4.  $\frac{d^2y}{dx^2} + \mu^2 y = 0$

**Ans.**  $y = C_1 \cos \mu x + C_2 \sin \mu x$

5.  $(D^2 + 2D + 2)y = 0, y(0) = 0, y'(0) = 1$  (A.M.I.E.T.E., June 2006) **Ans.**  $y = e^{-x} \sin x$

6.  $\frac{d^3y}{dx^3} - 2\frac{d^2y}{dx^2} + 4\frac{dy}{dx} - 8y = 0$

**Ans.**  $y = C_1 e^{2x} + C_2 \cos 2x + C_3 \sin 2x$

7.  $\frac{d^4y}{dx^4} - 32\frac{d^2y}{dx^2} + 256 = 0$  (A.M.I.E.T.E., Dec. 2004) **Ans.**  $y = (C_1 + x) \cos 4x + (C_3 + C_4 x) \sin 4x$

8.  $\frac{d^4y}{dx^4} - 4\frac{d^3y}{dx^3} + 8\frac{d^2y}{dx^2} - 8\frac{dy}{dx} + 4y = 0$  **Ans.**  $y = e^x [(C_1 + C_2 x) \cos x + (C_3 + C_4 x) \sin x]$

9.  $\frac{d^4y}{dx^4} + \frac{d^2y}{dx^2} = 0, y(0) = y'(0) = y''(0) = 0, y'''(0) = 1$  **Ans.**  $y = x - \sin x$

10. The equation for the bending of a strut is  $EI \frac{d^2y}{dx^2} + Py = 0$

If  $y = 0$  when  $x = 0$ , and  $y = a$  when  $x = \frac{1}{2}$ , find  $y$ .

**Ans.**  $y = \frac{a \sin \sqrt{\frac{P}{EI}} x}{\sin \sqrt{\frac{P}{EI}} \frac{1}{2}}$

11.  $\frac{d^3y}{dx^3} + 6\frac{d^2y}{dx^2} + 12\frac{dy}{dx} + 8y = 0, y(0) = 0$ , and  $y'(0) = 0$  and  $y''(0) = 2$

(A.M.I.E.T.E. Dec. 2008) **Ans.**  $y = x^2 e^{-2x}$

12.  $\frac{d^3y}{dx^3} + \frac{d^2y}{dx^2} + \frac{4dy}{dx} + 4y = 0, y(0) = 0, y'(0) = 0, y''(0) = -5$ , **Ans.**  $y = -e^x + \cos 2x - \frac{1}{2} \sin 2x$

13.  $(D^8 + 6D^6 - 32D^2)y = 0$  (A.M.I.E.T.E., Summer 2005)

**Ans.**  $y = C_1 + C_2 x + C_3 e^{\sqrt{2}x} + C_4 e^{-\sqrt{2}x} + C_5 \cos 2x + C_6 \sin 2x$

14. Show that non-trivial solutions of the boundary value problem  $y^{(iv)} - w^4 y = 0, y(0) = 0 = y''(0)$ ,

$y(L) = 0, y''(L) = 0$  are  $y(x) = \sum_{n=1}^{\infty} D_n \sin\left(\frac{n\pi x}{L}\right)$  where  $D_n$  are constants.

(A.M.I.E.T.E. Dec. 2005)

15. Solve the initial value problem  $y''' + 6y'' + 11y' + 6y = 0, y(0) = 0, y'(0) = 1, y''(0) = -1$ .

(A.M.I.E.T.E., Dec. 2006) **Ans.**  $y = 2e^{-x} - 3e^{-2x} + e^{-3x}$ .

16. Let  $y_1, y_2$  be two linearly independent solutions of the differential equation  $yy'' - (y')^2 = 0$ .

Then,  $c_1 y_1 + c_2 y_2$ , where  $c_1, c_2$  are constants is a solution of this differential equation for

- (a)  $c_1 = c_2 = 0$  only. (b)  $c_1 = 0$  or  $c_2 = 0$  (c) no value of  $c_1, c_2$ . (d) all real  $c_1, c_2$

(A.M.I.E.T.E., Dec. 2004)

17. The solution of the differential equation  $\frac{d^2y}{dx^2} + y = 0$  satisfying the initial conditions  $y(0) = 1$ ,

$y\left(\frac{\pi}{2}\right) = 2$  is

(a)  $y = 2 \cos(x) + \sin(x)$

(b)  $y = \cos(x) + 2 \sin(x)$

(c)  $y = \cos(x) + \sin(x)$

(d)  $y = 2 \cos(x) + 2 \sin(x)$  (AMIETE, Dec. 2009) **Ans.** (b)

18. Find the complementary function of  $(D - 2)^2 = 8(e^{2x} + \sin 2x - x^2)$

- (a)  $(C_1 + C_2 e^{2x})x$       (b)  $(C_1 + C_2 x)e^{2x}$   
 (c)  $(C_1 x + C_2 x^2)e^{2x}$       (d)  $(C_1 x + C_2 e^{2x}) \cdot 2^{2x}$       (AMIETE, Dec. 2010) **Ans. (b)**

19. Solution of  $\frac{d^3y}{dx^3} + 2\frac{d^2y}{dx^2} + \frac{dy}{dx} = 0$  is

- (a)  $y = C_1 e^x + C_2 e^{2x}$       (b)  $y = C_1 + (C_2 + C_3 x)e^{-x}$   
 (c)  $y = (C_1 + C_2 x + C_3 x^2)e^{-x}$       (d)  $y = C_1 + C_2 e^{-x}$       (AMIETE, June 2009) **Ans. (b)**

## 12.6 RULES TO FIND PARTICULAR INTEGRAL

$$(i) \frac{1}{f(D)}e^{ax} = \frac{1}{f(a)}e^{ax}$$

$$\text{If } f(a) = 0 \text{ then } \frac{1}{f(D)} \cdot e^{ax} = x \cdot \frac{1}{f'(a)} \cdot e^{ax}$$

$$\text{If } f'(a) = 0 \text{ then } \frac{1}{f(D)} \cdot e^{ax} = x^2 \cdot \frac{1}{f''(a)} \cdot e^{ax}$$

$$(ii) \frac{1}{f(D)}x^n = [f(D)]^{-1}x^n \quad \text{Expand } [f(D)]^{-1} \text{ and then operate.}$$

$$(iii) \frac{1}{f(D^2)}\sin ax = \frac{1}{f(-a^2)}\sin ax \text{ and } \frac{1}{f(D^2)}\cos ax = \frac{1}{f(-a^2)}\cos ax$$

$$\text{If } f(-a^2) = 0 \text{ then } \frac{1}{f(D^2)}\sin ax = x \cdot \frac{1}{f'(-a^2)} \cdot \sin ax$$

$$(iv) \frac{1}{f(D)}e^{ax} \cdot \phi(x) = e^{ax} \cdot \frac{1}{f(D+a)}\phi(x)$$

$$(v) \frac{1}{D+a}\phi(x) = e^{-ax} \int e^{ax} \cdot \phi(x) dx$$

12.7 
$$\boxed{\frac{1}{f(D)}e^{ax} = \frac{1}{f(a)}e^{ax}}.$$

We know that,  $D.e^{ax} = a.e^{ax}, \quad D^2e^{ax} = a^2.e^{ax}, \dots, D^n e^{ax} = a^n e^{ax}$

Let  $f(D)e^{ax} = (D^n + K_1 D^{n-1} + \dots + K_n)e^{ax} = (a^n + K_1 a^{n-1} + \dots + K_n)e^{ax} = f(a)e^{ax}$ .

Operating both sides by  $\frac{1}{f(D)}$

$$\frac{1}{f(D)} \cdot f(D)e^{ax} = \frac{1}{f(D)} \cdot f(a)e^{ax}$$

$$\Rightarrow e^{ax} = f(a) \frac{1}{f(D)} \cdot e^{ax} \Rightarrow \frac{1}{f(D)}e^{ax} = \frac{1}{f(a)}e^{ax}$$

If  $f(a) = 0$ , then the above rule fails.

Then  $\frac{1}{f(D)}e^{ax} = x \cdot \frac{1}{f'(D)}e^{ax} = x \frac{1}{f'(a)}e^{ax} \Rightarrow \boxed{\frac{1}{f(D)}e^{ax} = x \cdot \frac{1}{f'(a)}e^{ax}}$

If  $f'(a) = 0$  then  $\boxed{\frac{1}{f(D)}e^{ax} = x^2 \frac{1}{f''(a)}e^{ax}}$

**Example 5.** Solve the differential equation

$$\frac{d^2x}{dt^2} + \frac{g}{t}x = \frac{g}{l}L$$

where  $g, l, L$  are constants subject to the conditions,

$$x = a, \frac{dx}{dt} = 0 \text{ at } t = 0.$$

$$\text{Solution. We have, } \frac{d^2x}{dt^2} + \frac{g}{t}x = \frac{g}{l}L \Rightarrow \left(D^2 + \frac{g}{l}\right)x = \frac{g}{l}L$$

$$\text{A.E. is } m^2 + \frac{g}{l} = 0 \Rightarrow m = \pm i\sqrt{\frac{g}{l}}$$

$$\text{C.F.} = C_1 \cos \sqrt{\frac{g}{l}} t + C_2 \sin \sqrt{\frac{g}{l}} t$$

$$\text{P.I.} = \frac{1}{D^2 + \frac{g}{l}} \cdot \frac{g}{l}L = \frac{g}{l}L \frac{1}{D^2 + \frac{g}{l}} e^{0t} = \frac{g}{l}L \frac{1}{0 + \frac{g}{l}} = L \quad [D = 0]$$

$\therefore$  General solution is = C.F. + P.I.

$$x = C_1 \cos \left( \sqrt{\frac{g}{l}} t \right) + C_2 \sin \left( \sqrt{\frac{g}{l}} t \right) + L \quad \dots(1)$$

$$\frac{dx}{dt} = -C_1 \sqrt{\frac{g}{l}} \sin \left( \sqrt{\frac{g}{l}} t \right) + C_2 \sqrt{\frac{g}{l}} \cos \left( \sqrt{\frac{g}{l}} t \right)$$

$$\text{Put } t = 0 \quad \text{and} \quad \frac{dx}{dt} = 0$$

$$0 = C_2 \sqrt{\frac{g}{l}} \quad \therefore C_2 = 0$$

$$(1) \text{ becomes } x = C_1 \cos \sqrt{\frac{g}{l}} t + L \quad \dots(2)$$

Put  $x = a$  and  $t = 0$  in (2), we get

$$a = C_1 + L \quad \text{or} \quad C_1 = a - L$$

$$\text{On putting the value of } C_1 \text{ in (2), we get } x = (a - L) \cos \left( \sqrt{\frac{g}{l}} t \right) + L \quad \text{Ans.}$$

$$\text{Example 6. Solve : } \frac{d^2y}{dx^2} + 6 \frac{dy}{dx} + 9y = 5e^{3x}$$

$$\text{Solution.} \quad (D^2 + 6D + 9)y = 5e^{3x}$$

$$\text{Auxiliary equation is } m^2 + 6m + 9 = 0 \Rightarrow (m + 3)^2 = 0 \Rightarrow m = -3, -3,$$

$$\text{C.F.} = (C_1 + C_2 x) e^{-3x}$$

$$\text{P.I.} = \frac{1}{D^2 + 6D + 9} \cdot 5e^{3x} = 5 \frac{e^{3x}}{(3)^2 + 6(3) + 9} = \frac{5e^{3x}}{36}$$

$$\text{The complete solution is } y = (C_1 + C_2 x)e^{-3x} + \frac{5e^{3x}}{36} \quad \text{Ans.}$$

**Example 7.** Solve :  $\frac{d^2y}{dx^2} - 6\frac{dy}{dx} + 9y = 6e^{3x} + 7e^{-2x} - \log 2$

$$\text{Solution. } (D^2 - 6D + 9)y = 6e^{3x} + 7e^{-2x} - \log 2$$

$$\text{A.E. is } (m^2 - 6m + 9) = 0 \Rightarrow (m - 3)^2 = 0, \Rightarrow m = 3, 3$$

$$\text{C.F.} = (C_1 + C_2x)e^{3x}$$

$$\begin{aligned}\text{P.I.} &= \frac{1}{D^2 - 6D + 9} 6e^{3x} + \frac{1}{D^2 - 6D + 9} 7e^{-2x} + \frac{1}{D^2 - 6D + 9} (-\log 2) \\ &= x \frac{1}{2D - 6} 6e^{3x} + \frac{1}{4+12+9} 7e^{-2x} - \log 2 \frac{1}{D^2 - 6D + 9} e^{0x} \\ &= x^2 \frac{1}{2} \cdot 6 \cdot e^{3x} + \frac{7}{25} e^{-2x} - \log 2 \left( \frac{1}{9} \right) = 3x^2 e^{3x} + \frac{7}{25} e^{-2x} - \frac{1}{9} \log 2\end{aligned}$$

$$\text{Complete solution is } y = (C_1 + C_2x)e^{3x} + 3x^2 e^{3x} + \frac{7}{25} e^{-2x} - \frac{1}{9} \log 2$$

**Ans.**

## EXERCISE 12.2

Solve the following differential equations:

$$1. [D^2 + 5D + 6] [y] = e^x$$

$$\text{Ans. } C_2 e^{-2x} + C_2 e^{-3x} + \frac{e^x}{12}$$

$$2. \frac{d^2y}{dx^2} - 3\frac{dy}{dx} + 2y = e^{3x}$$

$$\text{Ans. } C_1 e^x + C_2 e^{2x} + \frac{e^{3x}}{2}$$

(A.M.I.E.T.E. June 2010, 2007)

$$3. (D^3 + 2D^2 - D - 2) y = e^x$$

$$\text{Ans. } C_1 e^x + C_2 e^{-x} + C_3 e^{-2x} + \frac{x}{6} e^x$$

$$4. \frac{d^2y}{dx^2} + 2\frac{dy}{dx} + 2y = \sinh x$$

$$\text{Ans. } e^{-x} [C_1 \cos x + C_2 \sin x] + \frac{e^x}{10} - \frac{e^{-x}}{2}$$

$$5. \frac{d^2y}{dx^2} + 4\frac{dy}{dx} + 5y = -2 \cosh x$$

$$\text{Ans. } e^{-2x} (C_1 \cos x + C_2 \sin x) - \frac{1}{10} e^x - \frac{e^{-x}}{2}$$

$$6. (D^3 - 2D^2 - 5D + 6) y = e^{3x}$$

$$\text{Ans. } C_1 e^x + C_2 e^{-2x} + C_3 e^{3x} + \frac{x e^{3x}}{10}$$

$$7. \frac{d^3y}{dx^3} - \frac{d^2y}{dx^2} + 4\frac{dy}{dx} - 4y = e^x$$

$$\text{Ans. } C_1 e^x + C_2 \cos 2x + C_3 \sin 2x + \frac{x e^x}{5}$$

$$8. \frac{d^2y}{dx^2} - 6\frac{dy}{dx} + 9y = e^{3x}$$

$$\text{Ans. } (C_1 + C_2 x)e^{3x} + \frac{x^2}{2} e^{3x}$$

$$9. \frac{d^3y}{dx^3} + 3\frac{d^2y}{dx^2} + 3\frac{dy}{dx} + y = e^{-x}$$

$$\text{Ans. } (C_1 + C_2 x + C_3 x^2)e^{-x} + \frac{x^3}{6} e^{-x}$$

$$10. \frac{d^2y}{dx^2} - \frac{dy}{dx} - 6y = e^x \cosh 2x$$

$$\text{Ans. } C_1 e^{3x} + C_2 e^{-2x} + \frac{1}{10} x e^{3x} - \frac{1}{8} e^{-x}$$

$$11. (D - 2)(D + 1)^2 y = e^{2x} + e^x$$

$$\text{Ans. } C_1 e^{2x} + (C_2 + C_3 x)e^{-x} + \frac{x}{9} e^{2x} - \frac{e^x}{4}$$

$$12. (D - 1)^3 y = 16 e^{3x}$$

$$\text{Ans. } (C_1 + C_2 x + C_3 x^2) e^x + 2e^{3x}$$

13. The particular integral (PI) of differential equation  $[D^2 + 5D + 6] y = e^x$  is

$$(a) \frac{e^x + x}{12} \quad (b) \frac{e^x - x}{12} \quad (c) \frac{e^{-x}}{12} \quad (d) \frac{e^x}{12} \quad (\text{AMIETE, June 2010}) \quad \text{Ans. (d)}$$

$$12.8 \quad \boxed{\frac{1}{f(D)} x^n = [f(D)]^{-1} x^n.}$$

Expand  $[f(D)]^{-1}$  by the Binomial theorem in ascending powers of  $D$  as far as the result of operation on  $x^n$  is zero.

**Example 8.** Solve the differential equation  $\frac{d^2y}{dx^2} + a^2 y = \frac{a^2 R}{p} (l - x)$

where  $a, R, p$  and  $l$  are constants subject to the conditions  $y = 0, \frac{dy}{dx} = 0$  at  $x = 0$ .

$$\text{Solution. } \frac{d^2y}{dx^2} + a^2 y = \frac{a^2}{p} R(l - x) \Rightarrow (D^2 + a^2)y = \frac{a^2}{p} R(l - x)$$

$$\text{A.E. is } m^2 + a^2 = 0 \Rightarrow m = \pm ia$$

$$\text{C.F.} = C_1 \cos ax + C_2 \sin ax$$

$$\begin{aligned} \text{P.I.} &= \frac{1}{D^2 + a^2} \frac{a^2}{p} R(l - x) = \frac{a^2 R}{p} \frac{1}{a^2} \left[ \frac{1}{1 + \frac{D^2}{a^2}} \right] (l - x) = \frac{R}{p} \left[ 1 + \frac{D^2}{a^2} \right]^{-1} (l - x) \\ &= \frac{R}{p} \left[ 1 - \frac{D^2}{a^2} \right] (l - x) = \frac{R}{p} (l - x) \end{aligned}$$

$$y = C_1 \cos ax + C_2 \sin ax + \frac{R}{p} (l - x) \quad \dots(1)$$

$$\text{On putting } y = 0, \text{ and } x = 0 \text{ in (1), we get } 0 = C_1 + \frac{R}{p} l \Rightarrow C_1 = -\frac{R l}{p}$$

$$\text{On differentiating (1), we get } \frac{dy}{dx} = -a C_1 \sin ax + a C_2 \cos ax - \frac{R}{p} \quad \dots(2)$$

$$\text{On putting } \frac{dy}{dx} = 0 \text{ and } x = 0 \text{ in (2), we have}$$

$$0 = a C_2 - \frac{R}{p} \Rightarrow C_2 = \frac{R}{a \cdot p}$$

On putting the values of  $C_1$  and  $C_2$  in (1), we get

$$y = -\frac{R}{p} l \cos ax + \frac{R}{a \cdot p} \sin ax + \frac{R}{p} (l - x) \Rightarrow y = \frac{R}{p} \left[ \frac{\sin ax}{a} - l \cos ax + l - x \right] \quad \text{Ans.}$$

### EXERCISE 12.3

Solve the following equations :

$$1. (D^2 + 5D + 4) y = 3 - 2x \quad \text{Ans. } C_1 e^{-x} + C_2 e^{-4x} + \frac{1}{8} (11 - 4x)$$

$$2. \frac{d^2y}{dx^2} + 2 \frac{dy}{dx} + y = x \quad \text{Ans. } (C_1 + C_2 x) e^{-x} + x - 2$$

$$3. (2D^2 + 3D + 4) y = x^2 - 2x \quad \text{Ans. } e^{-\frac{3}{4}x} \left[ A \cos \frac{\sqrt{23}}{4} x + B \sin \frac{\sqrt{23}}{4} x \right] + \frac{1}{32} [8x^2 - 28x + 13]$$

$$4. (D^2 - 4D + 3) y = x^3 \quad \text{Ans. } C_1 e^x + C_2 e^{3x} + \frac{1}{27} (9x^3 + 36x^2 + 78x + 80).$$

5.  $5\frac{d^3y}{dx^3} - \frac{d^2y}{dx^2} - 6\frac{dy}{dx} = 1 + x^2$

**Ans.**  $A + Be^{-2x} + Ce^{3x} - \frac{1}{36} \left( 2x^3 - x^2 + \frac{25}{3}x \right)$

6.  $\frac{d^4y}{dx^4} + 4y = x^4$

**Ans.**  $e^x(C_1 \cos x + C_2 \sin x) + e^{-x}(C_3 \cos x + C_4 \sin x) + \frac{1}{4}(x^4 - 6)$

7.  $\frac{d^2y}{dx^2} + 2p\frac{dy}{dx} + (p^2 + q^2)y = e^{cx} + p.q x^2$

**Ans.**  $e^{-px}[C_1 \cos qx + C_2 \sin qx] + \frac{e^{Cx}}{(p+C)^2 + q^2} + \frac{p q}{p^2 + q^2} \left[ x^2 - \frac{4px}{p^2 + q^2} + \frac{6p^2 - 2q^2}{(p^2 + q^2)^2} \right]$

8.  $D^2(D^2 + 4)y = 96x^2$

**Ans.**  $C_1 + C_2 x + C_3 \cos 2x + C_4 \sin 2x + 2x^2(x^2 - 3)$

12.9 
$$\frac{1}{f(D^2)} \sin ax = \frac{\sin ax}{f(-a^2)}$$

$$\frac{1}{f(D^2)} \cdot \cos ax = \frac{\cos ax}{f(-a^2)}$$

$D(\sin ax) = a \cos ax, D^2(\sin ax) = D(a \cos ax) = -a^2 \sin ax$

$D^4(\sin ax) = D^2.D^2(\sin ax) = D^2(-a^2 \sin ax) = (-a^2)^2 \sin ax$

$(D^2)^n \sin ax = (-a^2)^n \sin ax$

Hence,  $f(D^2) \sin ax = f(-a^2) \sin ax$

$$\frac{1}{f(D^2)} \cdot f(D^2) \sin ax = \frac{1}{f(D^2)} \cdot f(-a^2) \sin ax$$

$$\sin ax = f(-a^2) \frac{1}{f(D^2)} \sin ax \Rightarrow \frac{1}{f(D^2)} \cdot \sin ax = \frac{\sin ax}{f(-a^2)}$$

Similarly,

$$\frac{1}{f(D^2)} \cos ax = \frac{\cos ax}{f(-a^2)}$$

If

$f(-a^2) = 0$  then above rule fails.

$$\frac{1}{f(D^2)} \sin ax = x \frac{\sin ax}{f'(-a^2)}$$

If  $f'(-a^2) = 0$  then,  $\frac{1}{f(D^2)} \sin ax = x^2 \frac{\sin ax}{f''(-a^2)}$

**Example 9.** Solve :  $(D^2 + 4)y = \cos 2x$

(R.G.P.V., Bhopal June, 2008, A.M.I.E.T.E. Dec 2008)

**Solution.**  $(D^2 + 4)y = \cos 2x$

Auxiliary equation is  $m^2 + 4 = 0$

$m = \pm 2i, \quad \text{C.F.} = A \cos 2x + B \sin 2x$

$$\text{P.I.} = \frac{1}{D^2 + 4} \cos 2x = x \cdot \frac{1}{2D} \cos 2x = \frac{x}{2} \left( \frac{1}{2} \sin 2x \right) = \frac{x}{4} \sin 2x$$

Complete solution is  $y = A \cos 2x + B \sin 2x + \frac{x}{4} \sin 2x$

**Ans.**

**Example 10.** Solve :  $\frac{d^3y}{dx^3} - 3\frac{d^2y}{dx^2} + 4\frac{dy}{dx} - 2y = e^x + \cos x$  (U.P., II Semester, Summer 2006, 2001)

**Solution.** Given  $(D^3 - 3D^2 + 4D - 2)y = e^x + \cos x$

$$\begin{aligned}
 & \text{A.E. is } m^3 - 3m^2 + 4m - 2 = 0 \\
 \Rightarrow & (m-1)(m^2 - 2m + 2) = 0, \text{ i.e., } m = 1, 1 \pm i \\
 \therefore & \text{C.F.} = C_1 e^x + e^x (C_2 \cos x + C_3 \sin x) \\
 \text{P.I.} &= \frac{1}{(D-1)(D^2 - 2D + 2)} e^x + \frac{1}{D^3 - 3D^2 + 4D - 2} \cos x \\
 &= \frac{1}{(D-1)(1-2+2)} e^x + \frac{1}{(-1)D-3(-1)+4D-2} \cos x \\
 &= \frac{1}{(D-1)} e^x + \frac{1}{3D+1} \cos x = x \frac{1}{1} e^x + \frac{3D-1}{9D^2-1} \cos x \\
 &= e^x \cdot x + \frac{(-3 \sin x - \cos x)}{-9-1} = e^x \cdot x + \frac{1}{10} (3 \sin x + \cos x)
 \end{aligned}$$

Hence, complete solution is

$$y = C_1 e^x + e^x (C_2 \cos x + C_3 \sin x) + x e^x + \frac{1}{10} (3 \sin x + \cos x) \quad \text{Ans.}$$

**Example 11.** Solve :  $(D^4 - 3D^2 - 4)y = 5 \sin 2x - e^{-2x}$  (Nagpur University, Summer 2001)

**Solution.** Auxiliary equation is

$$\begin{aligned}
 & m^4 - 3m^2 - 4 = 0 \\
 & (m^2 + 1)(m^2 - 4) = 0 \\
 \Rightarrow & m^2 + 1 = 0 \Rightarrow m^2 - 4 = 0 \Rightarrow m = \pm i \Rightarrow m = \pm 2 \\
 \therefore & \text{C.F.} = C_1 e^{2x} + C_2 e^{-2x} + C_3 \cos x + C_4 \sin x \\
 \text{P.I.} &= \frac{1}{D^4 - 3D^2 - 4} (5 \sin 2x - e^{-2x}) = 5 \cdot \frac{1}{D^4 - 3D^2 - 4} \sin 2x - \frac{1}{D^4 - 3D^2 - 4} e^{-2x} \\
 &= 5 \frac{1}{(-2^2)^2 - 3(-2^2) - 4} \sin 2x - \frac{1}{16 - 12 - 4} e^{-2x} \quad (\text{Rule fails}) \\
 &= \frac{5}{24} \sin 2x - x \frac{1}{4D^3 - 6D} e^{-2x} \\
 &= \frac{5}{24} \sin 2x - x \frac{1}{4(-2)^3 - 6(-2)} e^{-2x} = \frac{5}{24} \sin 2x + \frac{x e^{-2x}}{20} \quad \text{Ans.}
 \end{aligned}$$

**Example 12.** Solve :  $(D^3 + 1)y = \cos^2\left(\frac{x}{2}\right) + e^{-x}$  (Nagpur University, Summer 2004)

**Solution.**  $(D^3 + 1)y = \cos^2\left(\frac{x}{2}\right) + e^{-x}$

A.E. is  $m^3 + 1 = 0$

$$\begin{aligned}
 & (m+1)(m^2 - m + 1) = 0 \Rightarrow m = -1 \\
 \text{or} & m = \frac{-(-1) \pm \sqrt{1-4}}{2} = \frac{1 \pm i\sqrt{3}}{2} \Rightarrow m = \frac{1}{2} \pm i \frac{\sqrt{3}}{2} \\
 \therefore & \text{C.F.} = C_1 e^{-x} + e^{\frac{x}{2}} \left[ C_2 \cos \frac{\sqrt{3}}{2} x + C_3 \sin \frac{\sqrt{3}}{2} x \right] \\
 \text{P.I.} &= \frac{1}{D^3 + 1} \left[ \cos^2\left(\frac{x}{2}\right) + e^{-x} \right] = \frac{1}{D^3 + 1} \cos^2\left(\frac{x}{2}\right) + \frac{1}{D^3 + 1} e^{-x} \quad [\text{Put } D = -1]
 \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{D^3+1} \left( \frac{1+\cos x}{2} \right) + \frac{1}{3D^2+1} e^{-x} \\
&= \frac{1}{2} \frac{1}{D^3+1} e^{0x} + \frac{1}{2} \frac{1}{D^3+1} \cos x + \frac{1}{3(-1)^2+1} e^{-x} = \frac{1}{2} + \frac{1}{2} \frac{1}{D^3+1} \cos x + \frac{1}{4} e^{-x} \\
&= \frac{1}{2} - \frac{1}{2} \frac{(D+1)\cos x}{(D-1)(D+1)} + \frac{1}{4} e^{-x} = \frac{1}{2} - \frac{1}{2} \frac{(-\sin x + \cos x)}{(D^2-1)} + \frac{1}{4} e^{-x} \\
&= \frac{1}{2} + \frac{1}{2} \frac{\sin x}{(D^2-1)} - \frac{1}{2} \frac{1}{(D^2-1)} \cos x + \frac{1}{4} e^{-x}
\end{aligned}$$

Put  $D^2 = -1$

$$\begin{aligned}
&= \frac{1}{2} + \frac{1}{2} \frac{\sin x}{(-1-1)} - \frac{1}{2} \frac{1}{(-1-1)} \cos x + \frac{1}{4} e^{-x} = \frac{1}{2} - \frac{\sin x}{4} + \frac{\cos x}{4} + \frac{1}{4} e^{-x}
\end{aligned}$$

$$\text{P.I.} = \frac{1}{2} + \frac{1}{4} (\cos x - \sin x + e^{-x})$$

Hence, the complete solution is

$$y = C_1 e^{-x} + e^{\frac{x}{2}} \left[ C_2 \cos \frac{\sqrt{3}}{2} x + C_3 \sin \frac{\sqrt{3}}{2} x \right] + \frac{1}{2} + \frac{1}{4} (\cos x - \sin x + e^{-x}) \quad \text{Ans.}$$

**Example 13.** Solve the differential equation

$$\frac{d^2y}{dx^2} - 2 \frac{dy}{dx} + 2y = \sinh x + \sin \sqrt{2} x. \quad (\text{Nagpur University, Winter 2001})$$

**Solution.** A.E. is  $m^2 - 2m + 2 = 0$

$$\begin{aligned}
\therefore m &= \frac{2 \pm \sqrt{4-8}}{2} = \frac{2 \pm 2i}{2} = 1 \pm i \\
\text{C.F.} &= e^x (C_1 \cos x + C_2 \sin x) \quad \left( \sinh x = \frac{e^x - e^{-x}}{2} \right) \\
\text{P.I.} &= \frac{1}{D^2 - 2D + 2} \sinh x + \frac{1}{D^2 - 2D - 2} \sin \sqrt{2} x \\
\text{P.I.} &= \frac{1}{D^2 - 2D + 2} \left( \frac{e^x - e^{-x}}{2} \right) + \frac{1}{D^2 - 2D - 2} \sin \sqrt{2} x \\
&= \frac{1}{2} \left[ \frac{1}{1-2+2} e^x - \frac{1}{1+2+2} e^{-x} \right] + \frac{1}{-2-2D+2} \sin \sqrt{2} x \\
&= \frac{1}{2} e^x - \frac{1}{10} e^{-x} + \frac{1}{2\sqrt{2}} \cos \sqrt{2} x \quad \left( \frac{1}{D} \sin \sqrt{2} x = \int \sin \sqrt{2} x \, dx \right)
\end{aligned}$$

Hence the solution is,

$$y = e^x (C_1 \cos x + C_2 \sin x) + \frac{1}{2} e^x - \frac{1}{10} e^{-x} + \frac{1}{2\sqrt{2}} \cos \sqrt{2} x. \quad \text{Ans.}$$

## EXERCISE 12.4

Solve the following differential equations :

$$1. \frac{d^2y}{dx^2} + 6y = \sin 4x$$

$$\text{Ans. } C_1 \cos \sqrt{6}x + C_2 \sin \sqrt{6}x - \frac{1}{10} \sin 4x$$

2.  $\frac{d^2x}{dt^2} + 2\frac{dx}{dt} + 3x = \sin t$

**Ans.**  $e^{-t}[A \cos \sqrt{2}t + B \sin \sqrt{2}t] - \frac{1}{4}(\cos t - \sin t)$

3.  $\frac{d^2x}{dt^2} + 2\frac{dx}{dt} + 5x = \sin 2t$ , given that when  $t = 0$ ,  $x = 3$  and  $\frac{dx}{dt} = 0$

**Ans.**  $e^{-t}\left[\frac{55}{17} \cos 2t + \frac{53}{34} \sin 2t\right] - \frac{1}{17}(4 \cos 2t - \sin 2t)$

4.  $\frac{d^2y}{dx^2} - 7\frac{dy}{dx} + 6y = 2 \sin 3x$ , given that  $y = 1$ ,  $\frac{dy}{dx} = 0$  when  $x = 0$ .

**Ans.**  $-\frac{13}{75}e^{6x} + \frac{27}{25}e^x + \frac{1}{75}(7 \cos 3x - \sin 3x)$

5.  $(D^3 + 1)y = 2 \cos^2 x$

**Ans.**  $C_1 e^{-x} + e^{\frac{1}{2}x} \left( C_2 \cos \frac{\sqrt{3}}{2}x + C_3 \sin \frac{\sqrt{3}}{2}x \right) + 1 + \frac{1}{65}(-8 \sin 2x + \cos 2x)$

6.  $(D^2 + a^2)y = \sin ax$  (A.M.I.E.T.E., June 2009) **Ans.**  $C_1 \cos ax + C_2 \sin ax - \frac{x}{2a} \cos ax$

7.  $(D^4 + 2a^2 D^2 + a^4)y = 8 \cos ax$  **Ans.**  $(C_1 + C_2 x + C_3 \cos ax + C_4 \sin ax) - \frac{x^2}{a^2} \cos ax$

8.  $\frac{d^2y}{dx^2} + 3\frac{dy}{dx} + 2y = \sin 2x$

(A.M.I.E.T.E., Summer 2002)  
**Ans.**  $C_1 e^{-x} + C_2 e^{-2x} - \frac{1}{20}(3 \cos 2x + \sin 2x)$

9.  $\frac{d^2y}{dx^2} + y = \sin 3x \cos 2x$

**Ans.**  $C_1 \cos x + C_2 \sin x + \frac{1}{48}[-\sin 5x - 12x \cos x]$

10.  $\frac{d^2y}{dx^2} - 2\frac{dy}{dx} - 3y = 2e^{2x} + 10 \sin 3x$  given that  $y(0) = 2$  and  $y'(0) = 4$

**Ans.**  $\frac{29}{12}e^{3x} - \frac{1}{12}e^{-x} - \frac{2}{3}e^{2x} + \frac{1}{3}[\cos 3x - 2 \sin 3x]$

11.  $\frac{d^2y}{dx^2} + 3\frac{dy}{dx} + 2y = 4 \cos^2 x$

(R.G.P.V., Bhopal, I Semester, June 2007)

**Ans.**  $C_1 e^{-x} + C_2 e^{-2x} - e^{2x} + \frac{1}{10}(3 \sin 2x - \cos 2x) + 1$

12.  $\frac{d^2y}{dx^2} - 2\frac{dy}{dx} + 3y = \cos x + x^2$

**Ans.**  $e^x[C_1 \cos \sqrt{2}x + C_2 \sin \sqrt{2}x] + \frac{1}{4}(\cos x - \sin x) + \frac{1}{3}(x^2 + \frac{4}{3}x + \frac{2}{9})$

13.  $(D^3 - 3D^2 + 4D - 2)y = e^x + \cos x$

**Ans.**  $(C_1 + C_2 \cos x + C_3 \sin x)e^x + \frac{1}{10}(3 \sin x + \cos x)$

14.  $(D^3 - 4D^2 + 13D)y = 1 + \cos 2x$

**Ans.**  $C_1 + e^{2x}(C_2 \cos 3x + C_3 \sin 3x) + \frac{1}{290}(9 \sin 2x + 8 \cos 2x) + \frac{x}{13}$

15.  $(D^2 - 4D + 4)y = e^{2x} + x^3 + \cos 2x$

**Ans.**  $(C_1 + C_2 x)e^{2x} + \frac{1}{2}x^2 e^{2x} + \frac{1}{8}(2x^3 + 6x^2 + 9x + 6) - \frac{1}{8} \sin 2x$

16.  $\frac{d^2y}{dx^2} + n^2 y = h \sin px$

$(P \neq n)$

where  $h$ ,  $p$  and  $n$  are constants satisfying the conditions

$y = a$ ,  $\frac{dy}{dx} = b$  for  $x = 0$

**Ans.**  $a \cos nx + \left( \frac{b}{n} - \frac{ph}{n(n^2 - p^2)} \right) \sin nx + \frac{h \sin px}{(n^2 - p^2)}$

17.  $y'' + y' - 2y = -6 \sin 2x - 18 \cos 2x$ ,  $y(0) = 2$ ,  $y'(0) = 2$

**Ans.**  $-e^{-2x} + 3 \cos 2x$

$$12.10 \quad \boxed{\frac{1}{f(D)} \cdot e^{ax} \cdot \phi(x) = e^{ax} \cdot \frac{1}{f(D+a)} \cdot \phi(x)}$$

$$D[e^{ax}\phi(x)] = e^{ax}D\phi(x) + ae^{ax}\phi(x) = e^{ax}(D+a)\phi(x)$$

$$\begin{aligned} D^2[e^{ax}\phi(x)] &= D[e^{ax}(D+a)\phi(x)] = e^{ax}(D^2+aD)\phi(x) + ae^{ax}(D+a)\phi(x) \\ &= e^{ax}(D^2+2aD+a^2)\phi(x) = e^{ax}(D+a)^2\phi(x) \end{aligned}$$

$$\text{Similarly, } D^n[e^{ax}\phi(x)] = e^{ax}(D+a)^n\phi(x)$$

$$f(D)[e^{ax}\phi(x)] = e^{ax}f(D+a)\phi(x)$$

$$e^{ax}\phi(x) = \frac{1}{f(D)}[e^{ax}f(D+a)\phi(x)] \quad \dots(1)$$

$$\text{Put } f(D+a)\phi(x) = X, \text{ so that } \phi(x) = \frac{1}{f(D+a)}X$$

Substituting these values in (1), we get

$$e^{ax} \frac{1}{f(D+a)}X = \frac{1}{f(D)}[e^{ax}X] \Rightarrow \frac{1}{f(D)}[e^{ax}\phi(x)] = e^{ax} \frac{1}{f(D+a)}\phi(x)$$

**Example 14.** Obtain the general solution of the differential equation

$$y'' - 2y' + 2y = x + e^x \cos x. \quad (\text{U.P. II Semester Summer, 2002})$$

**Solution.**  $y'' - 2y' + 2y = x + e^x \cos x$

$$\text{A.E. is } m^2 - 2m + 2 = 0 \Rightarrow m = 1 \pm i$$

$$\text{C.F.} = e^x(A \cos x + B \sin x)$$

$$\text{P.I.} = \frac{1}{D^2 - 2D + 2}x + \frac{1}{D^2 - 2D + 2}e^x \cos x$$

$$\text{where } I_1 = \frac{1}{D^2 - 2D + 2}x = \frac{1}{2\left[1 - D + \frac{D^2}{2}\right]}x = \frac{1}{2\left[1 - \left(D - \frac{D^2}{2}\right)\right]}x$$

$$= \frac{1}{2}\left[1 - \left(D - \frac{D^2}{2}\right)\right]^{-1}x = \frac{1}{2}\left[1 + \left(D - \frac{D^2}{2}\right) + \dots\right]x = \frac{1}{2}\left[x + Dx - \frac{D^2}{2}x + \dots\right] = \frac{1}{2}[x + 1]$$

$$\text{and, } I_2 = \frac{1}{D^2 - 2D + 2}e^x \cos x = e^x \frac{1}{(D+1)^2 - 2(D+1) + 2} \cos x = e^x \frac{1}{D^2 + 1} \cos x = e^x \cdot x \frac{1}{2D} \cos x$$

$$\left[ \text{If } f(-a^2) = 0, \text{ then } \frac{1}{f(D^2)} \cos ax = x \frac{1}{f'(-a^2)} \cos ax \right]$$

$$= \frac{1}{2}xe^x \sin x$$

$$y = \text{C.F.} + \text{P.I.}$$

$$= e^x(A \cos x + B \sin x) + \frac{1}{2}(x+1) + \frac{1}{2}xe^x \sin x.$$

**Ans.**

**Example 15.** Solve :  $(D^2 - 4D + 4) y = x^3 e^{2x}$

**Solution.**  $(D^2 - 4D + 4) y = x^3 e^{2x}$

$$\text{A.E. is } m^2 - 4m + 4 = 0 \Rightarrow (m - 2)^2 = 0 \Rightarrow m = 2, 2$$

$$\text{C.F.} = (C_1 + C_2 x) e^{2x}$$

$$\begin{aligned}\text{P.I.} &= \frac{1}{D^2 - 4D + 4} x^3 \cdot e^{2x} = e^{2x} \frac{1}{(D+2)^2 - 4(D+2) + 4} x^3 \\ &= e^{2x} \frac{1}{D^2} x^3 = e^{2x} \cdot \frac{1}{D} \left( \frac{x^4}{4} \right) = e^{2x} \cdot \frac{x^5}{20}\end{aligned}$$

The complete solution is  $y = (C_1 + C_2 x) e^{2x} + e^{2x} \cdot \frac{x^5}{20}$

**Ans.**

**Example 16.** Solve :

$$\frac{d^4 y}{dx^4} - y = \cos x \cosh x \quad (\text{Nagpur University, Summer 2003})$$

**Solution.** We have,  $(D^4 - 1) y = \cos x \cosh x$

$$\text{A.E. is } m^4 - 1 = 0 \Rightarrow (m^2 - 1)(m^2 + 1) = 0 \Rightarrow m = \pm 1, \pm i$$

$$\text{C.F.} = C_1 e^x + C_2 e^{-x} + C_3 \cos x + C_4 \sin x$$

$$\begin{aligned}\text{P.I.} &= \frac{1}{D^4 - 1} \cos x \cosh x = \frac{1}{D^4 - 1} \cos x \left( \frac{e^x + e^{-x}}{2} \right) \\ &= \frac{1}{2} \left[ \frac{1}{D^4 - 1} e^x \cos x + \frac{1}{D^4 - 1} e^{-x} \cos x \right] = \frac{1}{2} \left[ e^x \frac{1}{(D+1)^4 - 1} \cos x + e^{-x} \frac{1}{(D-1)^4 - 1} \cos x \right] \\ &= \frac{1}{2} \left[ e^x \frac{1}{D^4 + 4D^3 + 6D^2 + 4D} \cos x + e^{-x} \frac{1}{D^4 - 4D^3 + 6D^2 - 4D} \cos x \right] \\ &= \frac{1}{2} \left[ e^x \frac{1}{(-1)^2 + 4D(-1) + 6(-1) + 4D} \cos x + e^{-x} \frac{1}{(-1)^2 - 4D(-1) + 6(-1) - 4D} \cos x \right] \\ &= \frac{1}{2} \left[ e^x \frac{1}{-5} \cos x + e^{-x} \frac{1}{-5} \cos x \right] = -\frac{1}{5} \left( \frac{e^x + e^{-x}}{2} \right) \cos x = -\frac{1}{5} \cosh x \cos x\end{aligned}$$

Hence, the complete solution is

$$y = C_1 e^x + C_2 e^{-x} + C_3 \cos x + C_4 \sin x - \frac{1}{5} \cos x \cosh x \quad \text{Ans.}$$

**Example 17.** Solve the differential equation :

$$\frac{d^3 y}{dx^3} - 7 \frac{d^2 y}{dx^2} + 10 \frac{dy}{dx} = e^{2x} \sin x \quad (\text{AMIETE, June 2010, Nagpur University, Summer 2005})$$

$$\text{Solution.} \quad \frac{d^3 y}{dx^3} - 7 \frac{d^2 y}{dx^2} + 10 \frac{dy}{dx} = e^{2x} \sin x$$

$$\Rightarrow D^3 y - 7D^2 y + 10 D y = e^{2x} \sin x$$

A.E. is

$$\begin{aligned}m^3 - 7m^2 + 10m &= 0 \Rightarrow (m-2)(m^2 - 5m) = 0 \\ \Rightarrow m(m-2)(m-5) &= 0 \Rightarrow m = 0, 2, 5\end{aligned}$$

$$\text{C.F.} = C_1 e^{0x} + C_2 e^{2x} + C_3 e^{5x}$$

$$\text{P.I.} = \frac{1}{D^3 - 7D^2 + 10D} e^{2x} \sin x = e^{2x} \frac{1}{(D+2)^3 - 7(D+2)^2 + 10(D+2)} \sin x$$

$$\begin{aligned}
&= e^{2x} \frac{1}{D^3 + 6D^2 + 12D + 8 - 7D^2 - 28D - 28 + 10D + 20} \sin x \\
&= e^{2x} \frac{1}{D^3 - D^2 - 6D} \sin x = e^{2x} \frac{1}{(-1^2) D - (-1^2) - 6D} \sin x \\
&= e^{2x} \frac{1}{-D + 1 - 6D} \sin x = e^{2x} \frac{1}{1 - 7D} \sin x = e^{2x} \frac{1 + 7D}{1 - 49D^2} \sin x = e^{2x} \frac{1 + 7D}{1 - 49(-1^2)} \sin x \\
&= e^{2x} \frac{1 + 7D}{50} \sin x = \frac{e^{2x}}{50} (\sin x + 7 \cos x)
\end{aligned}$$

Complete solution is

$$y = \text{C.F.} + \text{P.I.}$$

$$\Rightarrow y = C_1 + C_2 e^{2x} + C_3 e^{5x} + \frac{e^{2x}}{50} (\sin x + 7 \cos x) \quad \text{Ans.}$$

**Example 18.** A body executes damped forced vibrations given by the equation

$$\frac{d^2x}{dt^2} + 2k \frac{dx}{dt} + b^2 x = e^{-kt} \sin \omega t.$$

Solve the differential equation for both the cases when  $\omega^2 \neq b^2 - k^2$  and when  $\omega^2 = b^2 - k^2$ .

(U.P., II Semester, Summer 2002)

**Solution.** The given equation is  $(D^2 + 2kD + b^2)x = e^{-kt} \sin \omega t$ , ... (1)  
which is a linear differential equation with constant coefficients.

$$\text{A.E. is } m^2 + 2km + b^2 = 0 \text{ or } m = \frac{-2k \pm \sqrt{(4k^2 - 4b^2)}}{2} = -k \pm \sqrt{(k^2 - b^2)}$$

As the given problem is on vibration, we must have  $k^2 < b^2$

$$m = -k \pm \sqrt{-(b^2 - k^2)} = -k \pm i\sqrt{(b^2 - k^2)}$$

$$\text{C.F.} = e^{-kt} \left\{ C_1 \cos \sqrt{(b^2 - k^2)} t + C_2 \sin \sqrt{(b^2 - k^2)} t \right\}$$

$$\begin{aligned}
\text{P.I.} &= \frac{1}{D^2 + 2kD + b^2} e^{-kt} \sin \omega t = e^{-kt} \frac{1}{(D - k)^2 + 2k(D - k) + b^2} \sin \omega t \\
&= e^{-kt} \frac{1}{D^2 + (b^2 - k^2)} \sin \omega t = e^{-kt} \frac{1}{-\omega^2 + (b^2 - k^2)} \sin \omega t, \text{ if } \omega^2 \neq b^2 - k^2 \dots (2)
\end{aligned}$$

$$\text{If } \omega^2 = b^2 - k^2, \text{ then P.I.} = e^{-kt} t \frac{1}{2D} \sin \omega t = e^{-kt} \left( -\frac{t}{2\omega} \cos \omega t \right), \dots (3)$$

**Case I.** If  $\omega^2 \neq b^2 - k^2$ , the complete solution of (1) is

$$x = e^{-kt} \left\{ C_1 \cos \sqrt{(b^2 - k^2)} t + C_2 \sin \sqrt{(b^2 - k^2)} t \right\} + \frac{e^{-kt}}{(b^2 - k^2) - \omega^2} \sin \omega t \quad [\text{From (2)}]$$

**Case II.** If  $\omega^2 = b^2 - k^2$ , the complete solution of (1) is

$$x = e^{-kt} \left\{ C_1 \cos \omega t + C_2 \sin \omega t \right\} - \frac{e^{-kt} t \cos \omega t}{2\omega} \quad [\text{From (3)}] \quad \text{Ans.}$$

$$\text{Example 19. Solve } (D^2 + 6D + 9)y = \frac{e^{-3x}}{x^3}.$$

(Nagpur University, Summer 2002, A.M.I.E.T.E., June 2009)

**Solution** A.E. is  $m^2 + 6m + 9 = 0$   
 $(m + 3)^2 = 0 \quad \therefore \quad m = -3, -3$

$$\text{C.F.} = (C_1 + C_2 x) e^{-3x}$$

$$\begin{aligned}\text{P.I.} &= \frac{1}{D^2 + 6D + 9} \frac{e^{-3x}}{x^3} = e^{-3x} \frac{1}{(D+3)^2 + 6(D+3) + 9} \frac{1}{x^3} \\ &= e^{-3x} \frac{1}{D^2 - 6D + 9 + 6D - 18 + 9} \frac{1}{x^3} = e^{-3x} \frac{1}{D^2} (x^{-3}) \\ &= e^{-3x} \frac{1}{D} \left( \frac{x^{-2}}{-2} \right) = e^{-3x} \frac{x^{-1}}{(-2)(-1)} = \frac{e^{-3x} x^{-1}}{2} = \frac{e^{-3x}}{2x}\end{aligned}$$

$$\text{Hence, the solution is } y = (C_1 + C_2 x) e^{-3x} + \frac{e^{-3x}}{2x}$$

**Ans.**

**Example 20.** Solve  $(D^2 - 4D + 3) y = 2x e^{2x} + 3e^x \cos 2x$

**Solution.** The auxiliary equation is

$$m^2 - 4m + 3 = 0 \text{ which gives } m = 1, 3$$

$$\text{C.F.} = C_1 e^x + C_2 e^{3x}$$

$$\begin{aligned}\text{P.I.} &= \frac{1}{D^2 - 4D + 3} 2xe^{3x} + \frac{1}{D^2 - 4D + 3} 3e^x \cos 2x \\ &= 2e^{3x} \cdot \frac{1}{(D+3)^2 - 4(D+3) + 3} x + 3e^x \cdot \frac{1}{(D+1)^2 - 4(D+1) + 3} \cos 2x \\ &= 2e^{3x} \cdot \frac{1}{D^2 + 2D} x + 3e^x \cdot \frac{1}{D^2 - 2D} \cos 2x = 2e^{3x} \cdot \frac{1}{2D(1+D/2)} x + 3e^x \cdot \frac{1}{-4-2D} \cos 2x \\ &= e^{3x} \cdot \frac{1}{D} \left( 1 + \frac{D}{2} \right)^{-1} x - \frac{3e^x}{2} \cdot \frac{1}{2+D} \cos 2x = e^{3x} \cdot \frac{1}{D} \left( 1 - \frac{D}{2} + \frac{D^2}{4} \dots \right) x - \frac{3e^x}{2} \cdot \frac{2-D}{4-D^2} \cos 2x \\ &= e^{3x} \cdot \left( \frac{1}{D} - \frac{1}{2} + \frac{D}{4} \dots \right) x - \frac{3e^x}{2} \cdot \frac{2-D}{4+4} \cos 2x = e^{3x} \cdot \left( \frac{x^2}{2} - \frac{x}{2} + \frac{1}{4} \right) - \frac{3e^x}{16} (2\cos 2x + 2\sin 2x)\end{aligned}$$

The complete solution is

$$y = C_1 e^x + C_2 e^{3x} + e^{3x} \left( \frac{x^2}{2} - \frac{x}{2} + \frac{1}{4} \right) - \frac{3e^x}{8} (\cos 2x + \sin 2x)$$

The term  $\frac{e^{3x}}{4}$  has been omitted from the P.I., since  $C_2 e^{3x}$  is present in the C.F. **Ans.**

**Example 21.** Find the complete solution of  $\frac{d^2y}{dx^2} - 3\frac{dy}{dx} + 2y = xe^{3x} + \sin 2x$

(U.P. II Semester 2003)

**Solution.** The auxiliary equation is

$$m^2 - 3m + 2 = 0 \Rightarrow m^2 - 2m - m + 2 = 0$$

$$\Rightarrow (m-2)(m-1) = 0 \Rightarrow m = 1, 2$$

$$\text{C.F.} = C_1 e^x + C_2 e^{2x}$$

$$\begin{aligned}\text{P.I.} &= \frac{1}{D^2 - 3D + 2} (xe^{3x} + \sin 2x) = \frac{1}{D^2 - 3D + 2} xe^{3x} + \frac{1}{D^2 - 3D + 2} \sin 2x \\ &= e^{3x} \frac{1}{(D+3)^2 - 3(D+3) + 2} x + \frac{1}{-4-3D+2} \sin 2x \\ &= e^{3x} \frac{1}{D^2 + 6D + 9 - 3D - 9 + 2} x + \frac{1}{-3D-2} \sin 2x = e^{3x} \frac{1}{D^2 + 3D + 2} x - \frac{1}{3D+2} \sin 2x\end{aligned}$$

$$\begin{aligned}
&= \frac{e^{3x}}{2} \left[ 1 + \left( \frac{3D+D^2}{2} \right) \right]^{-1} x - \frac{(3D-2)}{9D^2-4} \sin 2x = \frac{e^{3x}}{2} \left[ 1 - \left( \frac{3D+D^2}{2} \right) + \dots \right] x - \frac{(3D-2)}{9(-4)-4} \sin 2x \\
&= \frac{e^{3x}}{2} \left[ x - \left( \frac{3D+D^2}{2} \right) x + \dots \right] - \frac{(3D-2)}{-36-4} \sin 2x = \frac{e^{3x}}{2} \left[ x - \frac{3}{2} \right] + \frac{3D-2}{40} \sin 2x \\
\Rightarrow \quad \text{P.I.} &= \frac{e^{3x}}{4} (2x-3) + \frac{1}{40} (6\cos 2x - 2\sin 2x) = \frac{e^{3x}}{4} (2x-3) + \frac{3}{20} \cos 2x - \frac{1}{20} \sin 2x
\end{aligned}$$

The complete solution is

$$y = \text{C.F.} + \text{P.I.}$$

$$\Rightarrow \quad y = C_1 e^x + C_2 e^{2x} + \frac{e^{3x}}{4} (2x-3) + \frac{3}{20} \cos 2x - \frac{1}{20} \sin 2x \quad \text{Ans.}$$

$$\text{Example 22. Solve : } \frac{d^2y}{dx^2} - 2 \frac{dy}{dx} + y = xe^x \sin x$$

(R.G.P.V., Bhopal, 2001, Nagpur University, Winter 2002)

**Solution.** The given equation is  $(D^2 - 2D + 1) y = xe^x \sin x$

$$\text{A.E. is } m^2 - 2m + 1 = 0 \quad \therefore m = 1, 1$$

$$\text{C.F.} = (C_1 + C_2 x) e^x$$

$$\text{P.I.} = \frac{1}{(D-1)^2} e^x \cdot x \sin x = e^x \frac{1}{(D+1-1)^2} x \sin x = e^x \frac{1}{D^2} x \sin x = e^x \cdot \frac{1}{D} \int x \sin x dx$$

Integrating by parts

$$\begin{aligned}
&= e^x \frac{1}{D} [x(-\cos x) - \int (-\cos x) dx] = e^x \cdot \frac{1}{D} (-x \cos x + \sin x) \\
&= e^x \int (-x \cos x + \sin x) dx = e^x \left\{ -x \sin x + \int 1 \cdot \sin x dx - \cos x \right\} \\
&= e^x [-x \sin x - \cos x - \cos x] = -e^x (x \sin x + 2 \cos x)
\end{aligned}$$

Hence, the complete solution is

$$y = (C_1 + C_2 x) e^x - e^x (x \sin x + 2 \cos x). \quad \text{Ans.}$$

$$\text{Example 23. Solve } (D^2 + 5D + 6) y = e^{-2x} \sec^2 x (1 + 2 \tan x) \text{ (A.M.I.E.T.E., Summer 2003)}$$

$$\text{Solution. } (D^2 + 5D + 6) y = e^{-2x} \sec^2 x (1 + 2 \tan x)$$

$$\text{Auxiliary Equation is } m^2 + 5m + 6 = 0$$

$$\Rightarrow (m+2)(m+3) = 0 \Rightarrow m = -2, \text{ and } m = -3$$

$$\text{Hence, complementary function (C.F.)} = C_1 e^{-2x} + C_2 e^{-3x}$$

$$\begin{aligned}
\text{P.I.} &= \frac{1}{D^2 + 5D + 6} e^{-2x} \sec^2 x (1 + 2 \tan x) = e^{-2x} \frac{1}{(D-2)^2 + 5(D-2) + 6} \sec^2 x (1 + 2 \tan x) \\
&= e^{-2x} \frac{1}{D^2 - 4D + 4 + 5D - 10 + 6} \sec^2 x (1 + 2 \tan x) \\
&= e^{-2x} \frac{1}{D^2 + D} \sec^2 x (1 + 2 \tan x) = e^{-2x} \left[ \frac{\sec^2 x}{D^2 + D} + \frac{2 \tan x \sec^2 x}{D^2 + D} \right] \\
&= e^{-2x} \frac{1}{D(D+1)} \sec^2 x + \frac{1}{D(D+1)} 2 \tan x \sec^2 x \\
&= e^{-2x} \left[ \left( \frac{1}{D} - \frac{1}{D+1} \right) \sec^2 x + \left( \frac{1}{D} - \frac{1}{D+1} \right) 2 \tan x \sec^2 x \right]
\end{aligned}$$

$$\begin{aligned}
 &= e^{-2x} \left[ \frac{1}{D} \sec^2 x - \frac{1}{D+1} \sec^2 x + \frac{1}{D} 2 \tan x \sec^2 x - \frac{1}{D+1} 2 \tan x \sec^2 x \right] \\
 &= e^{-2x} \left[ \tan x - e^{-x} \int ex \sec 2x dx + \tan^2 x - e^{-x} \int 2e^x \tan x \sec 2x dx \right] \\
 \text{Now, } &= e^{-2x} \int e^x \sec^2 x dx = e^x \sec^2 x - \int e^x \cdot 2 \sec x \sec x \tan x dx \\
 &= e^x \sec^2 x - 2 \int e^x \sec^2 x \tan x dx \\
 \therefore \text{ P.I.} &= e^{-2x} \left[ \tan x - e^{-x} \int e^x \sec x \tan x dx + \tan^2 x - 2e^{-x} \int e^x \sec^2 x \tan x dx \right] \\
 &= e^{-2x} [\tan x - \sec^2 x + \tan^2 x] = e^{-2x} [\tan x - (\sec^2 x - \tan 2x)] = e^{-2x} (\tan x - 1) \\
 \therefore \text{ Complete solution is}
 \end{aligned}$$

$$\Rightarrow y = C.F. + P.I. = C_1 e^{-2x} + C_2 e^{-3x} + e^{-2x} (\tan x - 1)$$

**Example 24.** Solve the differential equation  $(D^2 - 4D + 4)y = 8x^2 e^{2x} \sin 2x$

(U.P. II Semester, Summer 2008, Uttarakhand 2007, 2005, 2004; Nagpur University June 2008)

**Solution.**  $(D^2 - 4D + 4)y = 8x^2 e^{2x} \sin 2x$

$$\text{A.E. is } (m^2 - 4m + 4) = 0 \Rightarrow (m - 2)^2 = 0 \Rightarrow m = 2, 2$$

$$\text{C.F.} = (C_1 + C_2 x) e^{2x}$$

$$\begin{aligned}
 \text{P.I.} &= \frac{1}{D^2 - 4D + 4} 8x^2 e^{2x} \sin 2x = 8 \frac{1}{(D-2)^2} x^2 e^{2x} \sin 2x \\
 &= 8e^{2x} \frac{1}{(D-2+2)^2} x^2 \sin 2x = 8e^{2x} \frac{1}{D^2} x^2 \sin 2x \\
 &= 8e^{2x} \frac{1}{D} \left[ x^2 \left( \frac{-\cos 2x}{2} \right) - 2x \left( \frac{-\sin 2x}{4} \right) + 2 \frac{\cos 2x}{8} \right] = 8e^{2x} \frac{1}{D} \left[ -\frac{x^2}{2} \cos 2x + \frac{x \sin 2x}{2} + \frac{\cos 2x}{4} \right] \\
 &= 8e^{2x} \left[ -\frac{x^2}{2} \left( \frac{\sin 2x}{2} \right) - \left( \frac{-2x}{2} \right) \left( -\frac{\cos 2x}{4} \right) + (-1) \left( -\frac{\sin 2x}{8} \right) + \frac{x}{2} \left( -\frac{\cos 2x}{2} \right) - \left( \frac{1}{2} \right) \left( -\frac{\sin 2x}{4} \right) + \frac{\sin 2x}{8} \right] \\
 &= e^{2x} [-2x^2 \sin 2x - 2x \cos 2x + \sin 2x - 2x \cos 2x + \sin 2x + \sin 2x] \\
 &= e^{2x} [-2x^2 \sin 2x - 4x \cos 2x + 3 \sin 2x] = -e^{2x} [4x \cos 2x + (2x^2 - 3) \sin 2x]
 \end{aligned}$$

Complete solution is,  $y = \text{C.F.} + \text{P.I.}$

$$y = (C_1 + C_2 x) e^{2x} - e^{2x} [4x \cos 2x + (2x^2 - 3) \sin 2x]$$

**Ans.**

## EXERCISE 12.5

Solve the following equations :

1.  $(D^2 - 5D + 6)y = e^x \sin x$  **Ans.**  $y = C_1 e^{2x} + C_2 e^{3x} + \frac{e^x}{10} (3 \cos x + \sin x)$
2.  $\frac{d^2 y}{dx^2} - 7 \frac{dy}{dx} + 10y = e^{2x} \sin x$  **Ans.**  $y = C_1 e^{2x} + C_2 e^{5x} + \frac{e^{2x}}{10} (3 \cos x - \sin x)$
3.  $\frac{d^3 y}{dx^3} - 2 \frac{dy}{dx} + 4y = e^x \cos x$  **Ans.**  $y = C_1 e^{-2x} + e^x (C_2 \cos x + C_3 \sin x) + \frac{xe^x}{20} (3 \sin x - \cos x)$
4.  $(D^2 - 4D + 3)y = 2xe^{3x} + 3e^{3x} \cos 2x$   
**Ans.**  $y = C_1 e^x + C_2 e^{3x} + \frac{1}{2} e^{3x} (x^2 - x) + \frac{3}{8} e^{3x} (\sin 2x - \cos 2x)$

5.  $\frac{d^2y}{dx^2} + 2\frac{dy}{dx} + y = \frac{e^{-x}}{x^2}$

**Ans.**  $y = (C_1 + C_2 x) e^{-x} - e^{-x} \log x$

6.  $(D^2 - 4)y = x^2 e^{3x}$

**Ans.**  $y = C_1 e^{2x} + C_2 e^{-2x} + \frac{e^{3x}}{5} \left[ x^2 - \frac{12x}{5} + \frac{62}{25} \right]$

7.  $(D^2 - 3D + 2)y = 2x^2 e^{4x} + 5e^{3x}$

**Ans.**  $y = C_1 e^x + C_2 e^{2x} + \frac{e^{4x}}{54} [18x^2 - 30x + 19] + \frac{5}{2} e^{3x}$

8.  $\frac{d^2y}{dx^2} - 4y = x \sinh x$

**Ans.**  $y = C_1 e^{2x} + C_2 e^{-2x} - \frac{x}{3} \sinh x - \frac{2}{9} \cosh x$

9.  $\frac{d^2y}{dt^2} + 2h\frac{dy}{dt} + (h^2 + p^2)y = ke^{-ht} \cos pt$     **Ans.**  $y = e^{-ht} [A \cos pt + B \sin pt] + \frac{k}{2p} t e^{-ht} \sin pt$

### 12.11 TO FIND THE VALUE OF $\frac{1}{f(D)} x^n \sin ax$ .

Now  $\frac{1}{f(D)} x^n (\cos ax + i \sin ax) = \frac{1}{f(D)} x^n e^{iax} = e^{iax} \frac{1}{f(D+ia)} x^n$

$$\frac{1}{f(D)} \cdot x^n \sin ax = \text{Imaginary part of } e^{iax} \frac{1}{f(D+ia)} \cdot x^n$$

$$\frac{1}{f(D)} \cdot x^n \cos ax = \text{Real part of } e^{iax} \frac{1}{f(D+ia)} \cdot x^n$$

**Example 25.** Solve  $\frac{d^2y}{dx^2} - 2\frac{dy}{dx} + y = x \sin x$

**Solution.** Auxiliary equation is  $m^2 - 2m + 1 = 0$  or  $m = 1$ , 1

C.F. =  $(C_1 + C_2 x) e^x$

P.I. =  $\frac{1}{D^2 - 2D + 1} x \cdot \sin x$  ( $e^{ix} = \cos x + i \sin x$ )

= Imaginary part of  $\frac{1}{D^2 - 2D + 1} x(\cos x + i \sin x)$  = Imaginary part of  $\frac{1}{D^2 - 2D + 1} x \cdot e^{ix}$

= Imaginary part of  $e^{ix} \frac{1}{(D+i)^2 - 2(D+i) + 1} \cdot x$

= Imaginary part of  $e^{ix} \frac{1}{D^2 - 2(1-i)D - 2i} \cdot x$

= Imaginary part of  $e^{ix} \frac{1}{-2i} \left[ 1 - (1+i)D - \frac{1}{2i} D^2 \right]^{-1} \cdot x$

= Imaginary part of  $(\cos x + i \sin x) \left( \frac{i}{2} \right) [1 + (1+i)D] x$

= Imaginary part of  $\frac{1}{2} (i \cos x - \sin x) [x + 1 + i]$

P.I. =  $\frac{1}{2} x \cos x + \frac{1}{2} \cos x - \frac{1}{2} \sin x$

Complete solution is  $y = (C_1 + C_2 x) e^x + \frac{1}{2} (x \cos x + \cos x - \sin x)$

**Ans.**

**EXERCISE 12.6**

Solve the following differential equations :

$$1. (D^2 + 4)y = 3x \sin x$$

$$\text{Ans. } C_1 \cos 2x + C_2 \sin 2x + x \sin x - \frac{2}{3} \cos x$$

$$2. \frac{d^2y}{dx^2} - y = x \sin 3x + \cos x$$

$$\text{Ans. } C_1 e^x + C_2 e^{-x} - \frac{1}{10} \left[ \frac{3}{5} \cos 3x + x \sin 3x + 5 \cos x \right]$$

$$3. \frac{d^2y}{dx^2} - y = x \sin x + e^x + x^2 e^x$$

$$\text{Ans. } C_1 e^x + C_2 e^{-x} - \frac{1}{2} [x \sin x + \cos x] + \frac{x}{12} e^x (2x^2 - 3x + 9)$$

$$4. (D^4 + 2D^2 + 1)y = x^2 \cos x$$

$$\text{Ans. } (C_1 + C_2 x) \cos x + (C_3 + C_4 x) \sin x + \frac{1}{12} x^3 \sin x - \frac{1}{48} (x^4 - 9x^2) \cos x$$

**12.12 GENERAL METHOD OF FINDING THE PARTICULAR INTEGRAL OF ANY FUNCTION  $\phi(x)$** 

$$\text{P.I.} = \frac{1}{D-a} \phi(x) = y \quad \dots(1)$$

$$\text{or } (D-a) \frac{1}{D-a} \cdot \phi(x) = (D-a) \cdot y$$

$$\phi(x) = (D-a)y \quad \text{or} \quad \phi(x) = Dy - ay$$

$\frac{dy}{dx} - ay = \phi(x)$  which is the linear differential equation.

$$\text{Its solution is } ye^{-\int a dx} = \int e^{-\int a dx} \cdot \phi(x) dx \quad \text{or} \quad ye^{-ax} = \int e^{-ax} \cdot \phi(x) dx$$

$$y = e^{ax} \int e^{-ax} \cdot \phi(x) dx \quad \boxed{\frac{1}{D-a} \cdot \phi(x) = e^{ax} \int e^{-ax} \cdot \phi(x) dx}$$

$$\text{Example 26. Solve } \frac{d^2y}{dx^2} + 9y = \sec 3x.$$

**Solution.** Auxiliary equation is  $m^2 + 9 = 0$  or  $m = \pm 3i$ ,

$$\text{C.F.} = C_1 \cos 3x + C_2 \sin 3x$$

$$\begin{aligned} \text{P.I.} &= \frac{1}{D^2 + 9} \cdot \sec 3x = \frac{1}{(D+3i)(D-3i)} \cdot \sec 3x = \frac{1}{6i} \left[ \frac{1}{D-3i} - \frac{1}{D+3i} \right] \cdot \sec 3x \\ &= \frac{1}{6i} \cdot \frac{1}{D-3i} \cdot \sec 3x - \frac{1}{6i} \cdot \frac{1}{D+3i} \cdot \sec 3x \end{aligned} \quad \dots(1)$$

$$\text{Now, } \frac{1}{D-3i} \sec 3x = e^{3ix} \int e^{-3ix} \sec 3x dx \quad \boxed{\frac{1}{D-a} \phi(x) = e^{ax} \int e^{-ax} \phi(x) dx}$$

$$= e^{3ix} \int \frac{\cos 3x - i \sin 3x}{\cos 3x} dx = e^{3ix} \int (1 - i \tan 3x) dx = e^{3ix} \left( x + \frac{i}{3} \log \cos 3x \right)$$

$$\text{Changing } i \text{ to } -i, \text{ we have } \frac{1}{D+3i} \sec 3x = e^{-3ix} \left( x - \frac{i}{3} \log \cos 3x \right)$$

Putting these values in (1), we get

$$\begin{aligned} \text{P.I.} &= \frac{1}{6i} \left[ e^{3ix} \left( x + \frac{i}{3} \log \cos 3x \right) - e^{-3ix} \left( x - \frac{i}{3} \log \cos 3x \right) \right] \\ &= \frac{x}{6i} e^{3ix} + \frac{e^{3ix} \log \cos 3x}{18} - \frac{xe^{-3ix}}{6i} + \frac{e^{-3ix} \log \cos 3x}{18} \end{aligned}$$

$$= \frac{x}{3} \frac{e^{3ix} - e^{-3ix}}{2i} + \frac{1}{9} \cdot \frac{e^{3ix} + e^{-3ix}}{2} \log \cos 3x = \frac{x}{3} \sin 3x + \frac{1}{9} \cos 3x \cdot \log \cos 3x$$

Hence, complete solution is  $y = C_1 \cos 3x + C_2 \sin 3x + \frac{x}{3} \sin 3x + \frac{1}{9} \cos 3x \cdot \log \cos 3x$  **Ans.**

**Example 27.** Solve  $\frac{d^2y}{dx^2} + 2\frac{dy}{dx} + 2y = e^{-x} \sec^3 x$ . (Nagpur, Winter 2000)

**Solution.** Here we have

$$\begin{aligned} \frac{d^2y}{dx^2} + 2\frac{dy}{dx} + 2y &= e^{-x} \sec^3 x \\ (D^2 + 2D + 2)y &= e^{-x} \sec^3 x \end{aligned}$$

$$\text{A.E. is } m^2 + 2m + 2 = 0 \quad \Rightarrow m = \frac{-2 \pm \sqrt{4 - 8}}{2} = -1 + i$$

$$C.F. = e^{-x}(C_1 \cos x + C_2 \sin x)$$

$$\begin{aligned} P.I. &= \frac{1}{D^2 + 2D + 2} e^{-x} \sec^3 x = e^{-x} \frac{1}{(D-1)^2 + 2(D-1) + 2} \sec^3 x \\ &= e^{-x} \frac{1}{D^2 + 1} \sec^3 x = \frac{1}{(D+i)(D-i)} \sec^3 x = e^{-x} \frac{1}{2i} \left[ \frac{1}{D-i} - \frac{1}{D+i} \right] \sec^3 x \end{aligned} \quad \dots(1)$$

$$\begin{aligned} \text{Now } \frac{1}{D-i} \sec^3 x &= e^{ix} \int e^{-ix} \sec^3 x dx \quad \left[ \frac{1}{D-a} \phi(x) = e^{ax} \int e^{-ax} \phi(x) dx \right] \\ &= e^{ix} \int (\cos x - i \sin x) \sec^3 x dx = e^{ix} \int [\sec^2 x - i \tan x \sec^2 x] dx = e^{ix} \left[ \tan x - \frac{i \tan^2 x}{2} \right] \end{aligned} \quad \dots(2)$$

$$\text{Similarly } \frac{1}{D+i} \sec^3 x = e^{-ix} \left[ \tan x + i \frac{\tan^2 x}{2} \right] \quad \dots(3) \text{ [changing } i \text{ to } -i\text{]}$$

Putting the values from (2) and (3) in (1), we get

$$\begin{aligned} P.I. &= \frac{e^{-x}}{2i} \left[ e^{ix} \left( \tan x - \frac{i \tan^2 x}{2} \right) - e^{-ix} \left( \tan x + i \frac{\tan^2 x}{2} \right) \right] \\ &= e^{-x} \left[ \tan x \frac{e^{ix} - e^{-ix}}{2i} - i \frac{\tan^2 x}{2} \left( \frac{e^{ix} + e^{-ix}}{2i} \right) \right] = e^{-x} \left[ \tan x \sin x - \frac{\tan^2 x}{2} \cos x \right] \\ &= e^{-x} \left[ \tan x \sin x - \frac{\tan x}{2} \frac{\sin x}{\cos x} \cos x \right] = e^{-x} \left[ \tan x \sin x - \frac{\tan x}{2} \sin x \right] = e^{-x} \left( \frac{1}{2} \tan x \sin x \right) \\ \text{Complete solution} &= C.F. + P.I. \\ &= e^{-x} (c_1 \cos x + c_2 \sin x) + \frac{e^{-x}}{2} \tan x \sin x = e^{-x} \left[ C_1 \cos x + C_2 \sin x + \frac{\sin x \tan x}{2} \right] \text{ Ans.} \end{aligned}$$

**Example 28.** Solve  $\frac{d^2y}{dx^2} - 2\frac{dy}{dx} + 2y = e^x \tan x$ .

**Solution.** Here we have  $\frac{d^2y}{dx^2} - 2\frac{dy}{dx} + 2y = e^x \tan x$   
 $(D^2 - 2D + 2)y = e^x \tan x$

$$\text{A.E. is } m^2 - 2m + 2 = 0 \quad \Rightarrow m = \frac{2 \pm \sqrt{4 - 8}}{2} = 1 \pm i$$

$$C.F. = e^x (C_1 \cos x + C_2 \sin x)$$

$$\begin{aligned}
 P.I. &= \frac{1}{D^2 - 2D + 2} e^{-x} \tan x = e^x \frac{1}{(D+1)^2 - 2(D+1) + 2} \tan x \\
 &= e^x \frac{1}{D^2 + 1} \tan x = e^x \frac{1}{(D+i)(D-i)} \tan x = \frac{e^x}{2i} \left[ \frac{1}{D-i} - \frac{1}{D+i} \right] \tan x \quad \dots(1)
 \end{aligned}$$

$$\begin{aligned}
 \text{Now } \frac{1}{D-i} \tan x &= e^{ix} \int e^{-ix} \tan x \, dx \\
 &= e^{ix} \int (\cos x - i \sin x) \tan x \, dx = e^{ix} \int \left( \sin x - i \frac{\sin^2 x}{\cos x} \right) dx \\
 &= e^{ix} \int \left[ \sin x - \frac{i(1 - \cos^2 x)}{\cos x} \right] dx = e^{ix} \int (\sin x - i \sec x + i \cos x) dx \\
 &= e^{ix} [-\cos x + i \sin x - i \log(\sec x + \tan x)] \quad \dots(2)
 \end{aligned}$$

$$\text{Similarly } \frac{1}{D+i} \tan x = e^{-ix} [-\cos x - i \sin x + i \log(\sec x + \tan x)] \quad \dots(3)$$

On putting the values from (2) and (3) in (1), we get

$$\begin{aligned}
 P.I. &= \frac{e^x}{2i} [e^{ix} (-\cos x + i \sin x - i \log(\sec x + \tan x)) - e^{-ix} (-\cos x - i \sin x + i \log(\sec x + \tan x))] \\
 &= e^x \left[ -\cos x \frac{e^{ix} - e^{-ix}}{2i} + \sin x \frac{e^{ix} + e^{-ix}}{2} - \log(\sec x + \tan x) \frac{e^{ix} + e^{-ix}}{2} \right] \\
 &= e^x [-\cos x \sin x + \sin x \cos x - \cos x \log(\sec x + \tan x)] \\
 &= -e^x \cos x \log(\sec x + \tan x)
 \end{aligned}$$

$$\text{Complete solution} = \text{C.F.} + \text{P.I.} \\ = e^x (C_1 \cos x + C_2 \sin x) - e^x \cos x \log(\sec x + \tan x) \quad \text{Ans.}$$

### EXERCISE 12.7

Solve the following differential equations :

1.  $\frac{d^2y}{dx^2} + a^2 y = \sec ax$  (R.G.P.V., Bhopal April, 2010)  
**Ans.**  $C_1 \cos ax + C_2 \sin ax + \frac{x}{a} \sin ax + \frac{1}{a^2} \cos ax \cdot \log \cos ax$
2.  $\frac{d^2y}{dx^2} + y = \operatorname{cosec} x$  **Ans.**  $C_1 \cos x + C_2 \sin x - x \cos x + \sin x \log \sin x$
3.  $(D^2 + 4) y = \tan 2x$  **Ans.**  $C_1 \cos 2x + C_2 \sin 2x - \frac{1}{4} \cos 2x \log(\sec 2x + \tan 2x)$
4.  $\frac{d^2y}{dx^2} + y = (x - \cot x)$  (A.M.I.E. Winter 2002)  
**Ans.**  $C_1 \cos x + C_2 \sin x - x \cos^2 x - \sin x \log(\operatorname{cosec} x - \cot x)$

## CAUCHY – EULER EQUATIONS, METHOD OF VARIATION OF PARAMETERS

---

---

### 13.1 CAUCHY EULER HOMOGENEOUS LINEAR EQUATIONS

$$a_n x^n \frac{d^n y}{dx^n} + a_{n-1} x^{n-1} \frac{d^{n-1} y}{dx^{n-1}} + \dots + a_0 y = \phi(x) \quad \dots (1)$$

where  $a_0, a_1, a_2, \dots$  are constants, is called a homogeneous equation.

Put

$$x = e^z, \quad z = \log_e x, \quad \frac{d}{dz} \equiv D$$

$$\frac{dy}{dx} = \frac{dy}{dz} \cdot \frac{dz}{dx} = \frac{1}{x} \frac{dy}{dz} \Rightarrow x \frac{dy}{dx} = \frac{dy}{dz} \Rightarrow x \frac{dy}{dx} = Dy$$

Again,

$$\begin{aligned} \frac{d^2 y}{dx^2} &= \frac{d}{dx} \left( \frac{dy}{dx} \right) = \frac{d}{dx} \left( \frac{1}{x} \frac{dy}{dz} \right) = -\frac{1}{x^2} \frac{dy}{dz} + \frac{1}{x} \frac{d^2 y}{dx^2} \frac{dz}{dx} \\ &= -\frac{1}{x^2} \frac{dy}{dz} + \frac{1}{x} \frac{d^2 y}{dx^2} \frac{1}{x} = \frac{1}{x^2} \left( \frac{d^2 y}{dx^2} - \frac{dy}{dz} \right) = \frac{1}{x^2} (D^2 - D) y \end{aligned}$$

$$x^2 \frac{d^2 y}{dx^2} = (D^2 - D) y$$

or

$$x^2 \frac{d^2 y}{dx^2} = D(D-1)y$$

Similarly.

$$x^3 \frac{d^3 y}{dx^3} = D(D-1)(D-2)y$$

The substitution of these values in (1) reduces the given homogeneous equation to a differential equation with constant coefficients.

**Example 1.** Solve:  $x^2 \frac{d^2 y}{dx^2} - 2x \frac{dy}{dx} - 4y = x^4$  (A.M.I.E. Summer 2000)

**Solution.** We have,  $x^2 \frac{d^2 y}{dx^2} - 2x \frac{dy}{dx} - 4y = x^4 \quad \dots (1)$

Putting  $x = e^z$ ,  $D \equiv \frac{d}{dz}$ ,  $x \frac{dy}{dx} = Dy$ ,  $x^2 \frac{d^2 y}{dx^2} = D(D-1)y$  in (1), we get

$$D(D-1)y - 2Dy - 4y = e^{4z} \quad \text{or} \quad (D^2 - 3D - 4)y = e^{4z}$$

$$\text{A.E. is } m^2 - 3m - 4 = 0 \Rightarrow (m-4)(m+1) = 0 \Rightarrow m = -1, 4$$

$$\text{C.F.} = C_1 e^{-z} + C_2 e^{4z}$$

$$\text{P.I.} = \frac{1}{D^2 - 3D - 4} e^{4z}$$

[Rule Fails]

$$= z \frac{1}{2D-3} e^{4z} = z \frac{1}{2(4)-3} e^{4z} = \frac{z e^{4z}}{5}$$

Thus, the complete solution is given by

$$y = C_1 e^{-z} + C_2 e^{4z} + \frac{z e^{4z}}{5} \Rightarrow y = \frac{C_1}{x} + C_2 x^4 + \frac{1}{5} x^4 \log x \quad \text{Ans.}$$

$$\text{Example 2. Solve: } x^2 \frac{d^2y}{dx^2} + 4x \frac{dy}{dx} + 2y = e^x$$

(U.P., II Semester 2005; Nagpur University, Summer 2001)

$$\text{Solution. Given equation is } x^2 \frac{d^2y}{dx^2} + 4x \frac{dy}{dx} + 2y = e^x \quad \dots(1)$$

To solve (1), we put  $x = e^z$  or  $z = \log x$  and  $D \equiv \frac{d}{dz}$

$$x \frac{dy}{dx} = Dy \quad \text{and} \quad x^2 \frac{d^2y}{dx^2} = D(D-1)y$$

Substituting these values in (1), it reduces

$$[D(D-1) + 4D + 2]y = e^{e^z} \Rightarrow (D^2 + 3D + 2)y = e^{e^z}$$

$$\therefore \text{It's A.E. is } m^2 + 3m + 2 = 0$$

$$\therefore (m+1)(m+2) = 0 \quad \therefore m = -1, -2$$

$$\therefore \text{C.F.} = C_1 e^{-z} + C_2 e^{-2z} = \frac{C_1}{x} + \frac{C_2}{x^2}$$

$$\text{P.I.} = \frac{1}{D^2 + 3D + 2} e^{e^z} = \frac{1}{(D+1)(D+2)} e^{e^z}$$

$$= \left( \frac{1}{D+1} - \frac{1}{D+2} \right) e^{e^z} = \frac{1}{D+1} e^{e^z} - \frac{1}{D+2} e^{e^z}$$

$$= e^{-z} \int e^{e^z} \cdot e^z dz - e^{-2z} \int e^{e^z} \cdot e^{2z} dz \quad \left[ \text{Since } \frac{1}{D-a} X = e^{ax} \int X e^{-ax} dx \right]$$

Put  $e^z = t$  so that  $e^z dz = dt$

$$\text{P.I.} = e^{-z} \int e^t dt - e^{-2z} \int e^t \cdot t dt = e^{-z} e^t - e^{-2z} (te^t - e^t)$$

$$= e^{-z} e^{e^z} - e^{-2z} (e^z e^{e^z} - e^{e^z})$$

$$= e^{-z} e^{e^z} - e^{-z} e^{e^z} + e^{-2z} e^{e^z} = e^{-2z} e^{e^z} = x^{-2} e^x = \frac{e^x}{x^2} \quad (\because x = e^z)$$

Hence, the C.S. of (1) is  $y = \text{C.F.} + \text{P.I.}$

$$y = \frac{C_1}{x} + \frac{C_2}{x^2} + \frac{e^x}{x^2}$$

Ans.

**Example 3.** Solve  $(x^3 D^3 + x^2 D^2 - 2) y = x - \frac{1}{x^3}$  (Nagpur University, Summer 2000)

**Solution.** Put  $x = e^z$ ,  $z = \log x$

$$\text{Let } D_1 \equiv \frac{d}{dz}$$

$$\text{Then } x^2 \frac{d^2 y}{dx^2} = D_1 (D_1 - 1) y \Rightarrow x^3 \frac{d^3 y}{dx^3} = D_1 (D_1 - 1) (D_1 - 2) y$$

Substituting in the given equation, we get

$$\begin{aligned} & [D_1 (D_1 - 1) (D_1 - 2) + D_1 (D_1 - 1) - 2] y = e^z + e^{-3z} \\ \Rightarrow & [D_1^3 - 3D_1^2 + 2D_1 + D_1^2 - D_1 - 2] y = e^z + e^{-3z} \\ \Rightarrow & (D_1^3 - 2D_1^2 + D_1 - 2) y = e^z + e^{-3z} \\ & \text{A.E. is } m^3 - 2m^2 + m - 2 = 0 \\ & \quad i.e. (m-2)(m^2+1)=0 \quad i.e. \quad m=2, \pm i. \end{aligned}$$

$$\text{C.F.} = C_1 e^{2z} + C_2 \cos z + C_3 \sin z$$

$$\begin{aligned} \text{P.I.} &= \frac{1}{D_1^3 - 2D_1^2 + D_1 - 2} e^z + \frac{1}{D_1^3 - 2D_1^2 + D_1 - 2} e^{-3z} \\ &= \frac{1}{1-2+1-2} e^z + \frac{1}{-27-18-3-2} e^{-3z} \quad \left[ \begin{array}{l} D_1 = 1 \\ D_1 = -3 \end{array} \right] \\ &= -\frac{e^z}{2} - \frac{1}{50} e^{-3z} \end{aligned}$$

$$\begin{aligned} \therefore y &= C_1 e^{2z} + C_2 \cos z + C_3 \sin z - \frac{1}{2} e^z - \frac{1}{50} e^{-3z} \\ &= C_1 x^2 + C_2 \cos(\log x) + C_3 \sin(\log x) - \frac{1}{2} x - \frac{1}{50} \cdot \frac{1}{x^3} \quad \text{Ans.} \end{aligned}$$

**Example 4.** Solve  $x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + y = \sin(\log x^2)$  (Nagpur University, Summer 2005)

$$\text{Solution. We have, } x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + y = \sin(\log x^2) \quad \dots (1)$$

$$\text{Let } x = e^z, \quad \text{so that } z = \log x, \quad D \equiv \frac{d}{dz}$$

(1) becomes

$$\begin{aligned} D(D-1)y + Dy + y &= \sin(2z) \Rightarrow (D^2 + 1)y = \sin 2z \\ &\text{A.E. is } m^2 + 1 = 0 \quad \text{or} \quad m = \pm i \end{aligned}$$

$$\text{C.F.} = C_1 \cos z + C_2 \sin z$$

$$\text{P.I.} = \frac{1}{D^2 + 1} \sin 2z = \frac{1}{-4 + 1} \sin 2z = -\frac{1}{3} \sin 2z$$

$$y = \text{C.F.} + \text{P.I.} = C_1 \cos z + C_2 \sin z - \frac{1}{3} \sin 2z$$

$$= C_1 \cos(\log x) + C_2 \sin(\log x) - \frac{1}{3} \sin(\log x^2) \quad \text{Ans.}$$

**Example 5.** Solve  $x^3 \frac{d^3y}{dx^3} + 3x^2 \cdot \frac{d^2y}{dx^2} + x \frac{dy}{dx} + y = x + \log x$

(AMIETE, June 2010, U.P., II Semester, Summer, 2001)

**Solution.** Putting  $x = e^z$  or  $z = \log x$  and denoting  $\frac{d}{dz}$  by  $D$  the equation becomes

$$[D(D - 1)(D - 2) + 3D(D - 1) + D + 1] y = e^z + z$$

$$\Rightarrow [D^3 + 1] y = e^z + z$$

$$\therefore \text{A.E. is } m^3 + 1 = 0$$

$$\Rightarrow (m + 1)(m^2 - m + 1) = 0 \Rightarrow m = -1, \frac{1 \pm i\sqrt{3}}{2}$$

$$\text{C.F.} = C_1 e^{-z} + e^{\frac{1}{2}z} \left\{ C_2 \cos \frac{\sqrt{3}}{2}z + C_3 \sin \frac{\sqrt{3}}{2}z \right\}$$

$$\text{P.I.} = \frac{1}{D^3 + 1} \{e^z + z\}$$

$$= \frac{1}{D^3 + 1} e^z + \frac{1}{D^3 + 1} z = \frac{e^z}{1+1} + (1 + D^3)^{-1} z$$

$$= \frac{1}{2} e^z + (1 - D^3 + \dots) z = \frac{1}{2} e^z + z.$$

$\therefore$  Complete solution is

$$\begin{aligned} y &= C_1 e^{-z} + e^{\frac{1}{2}z} \left\{ C_2 \cos \frac{\sqrt{3}}{2}z + C_3 \sin \frac{\sqrt{3}}{2}z \right\} + \frac{1}{2} e^z + z \\ \Rightarrow y &= C_1 x^{-1} + \sqrt{x} \left\{ C_2 \cos \left( \frac{\sqrt{3}}{2} \log x \right) + C_3 \sin \left( \frac{\sqrt{3}}{2} \log x \right) \right\} + \frac{1}{2} x + \log x \quad \text{Ans.} \end{aligned}$$

**Example 6.** Solve:  $x^2 \frac{d^3y}{dx^3} + 3x \frac{d^2y}{dx^2} + \frac{dy}{dx} = x^2 \log x$  (Nagpur University, Summer 2003)

**Solution.** We have,  $x^3 \frac{d^3y}{dx^3} + 3x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} = x^3 \log x$

Let  $x = e^z$  so that  $z = \log x$ ,  $D \equiv \frac{d}{dz}$

The equation becomes after substitution

$$[D(D - 1)(D - 2) + 3D(D - 1) + D] y = z e^{3z} \Rightarrow D^3 y = z e^{3z}$$

Auxiliary equation is  $m^3 = 0 \Rightarrow m = 0, 0, 0$ .

$$\text{C.F.} = C_1 + C_2 z + C_3 z^2 = C_1 + C_2 \log x + C_3 (\log x)^2$$

$$\text{P.I.} = \frac{1}{D^3} \cdot z e^{3z} = e^{3z} \cdot \frac{1}{(D + 3)^3} \cdot z$$

$$= e^{3z} \frac{1}{27} \left( 1 + \frac{D}{3} \right)^{-3} z = \frac{e^{3z}}{27} (1 - D) z = \frac{e^{3z}}{27} (z - 1) = \frac{x^3}{27} (\log x - 1)$$

$$\text{Complete solution is } y = C_1 + C_2 \log x + C_3 (\log x)^2 + \frac{x^3}{27} (\log x - 1) \quad \text{Ans.}$$

**Example 7.** Solve the differential equation

$$x^2 \frac{d^2y}{dx^2} - 3x \frac{dy}{dx} + 5y = x \log x. \quad (\text{Nagpur University, Winter 2002, Summer 2000})$$

**Solution.** Putting  $x = e^z$  or  $z = \log x$  and  $D \equiv \frac{d}{dz}$

On putting  $x \frac{dy}{dx} = Dy$  and  $x^2 \frac{d^2y}{dx^2} = D(D-1)y$  in the given equation, we get

$$[D(D-1) - 3D + 5]y = ze^z$$

$$\text{i.e. } (D^2 - 4D + 5)y = ze^z$$

It's A.E. is  $m^2 - 4m + 5 = 0$

$$\therefore m = \frac{4 \pm \sqrt{16 - 20}}{2} = \frac{4 \pm 2i}{2} = 2 \pm i$$

$$\text{C.F.} = e^{2z} (C_1 \cos z + C_2 \sin z)$$

$$\text{P.I.} = \frac{1}{D^2 - 4D + 5} ze^z$$

$$= e^z \cdot \frac{1}{(D+1)^2 - 4(D+1) + 5} z \quad (\text{by replacing } D \text{ by } D+1)$$

$$= e^z \cdot \frac{1}{D^2 - 2D + 2} z = \frac{e^z}{2} \cdot \frac{1}{1 + \left(\frac{D^2 - 2D}{2}\right)} z$$

$$= \frac{e^z}{2} \left[ 1 + \left(\frac{D^2 - 2D}{2}\right) \right]^{-1} z = \frac{e^z}{2} \left[ 1 - \left(\frac{D^2 - 2D}{2}\right) + \dots \right] z$$

$$= \frac{e^z}{2} [z + Dz] = \frac{e^z}{2} (z + 1).$$

Hence, the solution is

$$y = e^{2z} [C_1 \cos z + C_2 \sin z] + \frac{e^z}{2} (z + 1)$$

$$y = x^2 [C_1 \cos(\log x) + C_2 \sin(\log x)] + \frac{x}{2} (1 + \log x)$$

**Ans.**

**Example 8.** Solve the homogeneous linear differential equation.

$$x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} + y = (\log x) \sin(\log x)$$

(Nagpur University, Winter 2002, U.P. II Semester, Summer 2002)

**Solution.** Since given equation is homogeneous,

$$\text{Put } x = e^z \Rightarrow \log x = z$$

$$\text{Also, } x \frac{dy}{dx} = Dy, \quad x^2 \frac{d^2y}{dx^2} = D(D-1)y, \quad D \equiv \frac{d}{dz}$$

The transformed equation is

$$D(D-1)y + Dy + y = z \sin z$$

$$(D^2 - D + D + 1)y = z \sin z$$

$$(D^2 + 1)y = z \sin z$$

A.E. is

$$m^2 + 1 = 0 \Rightarrow m = \pm i$$

$$\text{C.F.} = C_1 \cos z + C_2 \sin z$$

$$\text{P.I.} = \frac{1}{D^2 + 1} z \sin z$$

$$= \text{Imaginary part of } \frac{1}{D^2 + 1} z (\cos z + i \sin z)$$

$$= \text{Imaginary part of } \frac{1}{D^2 + 1} z e^{iz} \quad = \text{Imaginary part of } e^{iz} \frac{1}{(D+i)^2 + 1} z$$

$$= \text{Imaginary part of } e^{iz} \frac{1}{D^2 + 2iD - 1 + 1} z \quad = \text{Imaginary part of } e^{iz} \frac{1}{D^2 + 2iD} z$$

$$= \text{Imaginary part of } e^{iz} \frac{1}{2iD} \frac{1}{\left(1 + \frac{D}{2i}\right)} z \quad = \text{Imaginary part of } e^{iz} \frac{1}{2iD} \left(1 - \frac{D}{2i}\right) z$$

$$= \text{Imaginary part of } e^{iz} \frac{1}{2iD} \left(z - \frac{1}{2i}\right) \quad = \text{Imaginary part of } e^{iz} \frac{1}{2i} \left(\frac{z^2}{2} - \frac{z}{2i}\right)$$

$$= \text{Imaginary part of } \frac{1}{2i} (\cos z + i \sin z) \left(\frac{z^2}{2} - \frac{z}{2i}\right)$$

$$= \text{Imaginary part of } (\cos z + i \sin z) \left(\frac{z^2}{4i} + \frac{z}{4}\right)$$

$$= \text{Imaginary part of } (\cos z + i \sin z) \left(-i \frac{z^2}{4} + \frac{z}{4}\right) = -\frac{z^2}{4} \cos z + \frac{z}{4} \sin z$$

Complete solution is,  $y = \text{C.F.} + \text{P.I.}$ 

$$y = C_1 \cos z + C_2 \sin z - \frac{z^2}{4} \cos z + \frac{z}{4} \sin z$$

$$y = C_1 \cos(\log x) + C_2 \sin(\log x) - \frac{1}{4} (\log x)^2 \cos(\log x) + \frac{1}{4} (\log x) \sin(\log x) \text{ Ans.}$$

**Example 9.** The radial displacement in a rotating disc at a distance  $r$  from the axis is givenby  $r^2 \frac{d^2 u}{dr^2} + r \frac{du}{dr} - u + kr^3 = 0$ , where  $k$  is a constant. Solve the equation under the conditions $u = 0$  when  $r = 0$ ,  $u = 0$  when  $r = a$ .

(Nagpur University, Summer 2008)

**Solution.** Here, we have

$$r^2 \frac{d^2 u}{dr^2} + r \frac{du}{dr} - u + kr^3 = 0 \quad \dots (1)$$

On putting  $r = e^z$ ,  $r \frac{du}{dr} = Dz$ ,  $r^2 \frac{d^2 u}{dr^2} = D(D-1)z$  in (1), we get

$$D(D-1)u + Du - u = -ke^{3z} \quad \left[ D \equiv \frac{d}{dz} \right]$$

$$\Rightarrow \text{A.E. is } (D^2 - D + D - 1) u = -ke^{3z} \Rightarrow (D^2 - 1)u = -k e^{3z}$$

$$m^2 - 1 = 0 \Rightarrow m = \pm 1$$

$$\text{C.F.} = C_1 e^z + C_2 e^{-z} = C_1 r + \frac{C_2}{r}$$

$$\text{P.I.} = \frac{1}{D^2 - 1} (-ke^{3z}) = -k \frac{1}{(3)^2 - 1} e^{3z} = -\frac{k}{8} e^{3z} = \frac{-k}{8} r^3$$

$$\text{C.S.} = \text{C.F.} + \text{P.I.}$$

$$u = C_1 r + \frac{C_2}{r} - \frac{k}{8} r^3 \quad \dots (2)$$

Putting  $u = 0, r = 0$  in (2), we get

$$0 = C_2$$

Putting  $C_2 = 0$  in (2), we get

$$u = C_1 r - \frac{k}{8} r^3 \quad \dots (3)$$

Putting  $u = 0, r = a$  in (3), we get

$$0 = C_1 a - \frac{k}{8} a^3 \Rightarrow C_1 = \frac{k}{8} a^2$$

Putting  $C_1 = \frac{k}{8} a^2$  in (3), we get

$$u = \frac{k}{8} a^2 r - \frac{k}{8} r^3$$

$$u = \frac{kr}{8} (a^2 - r^2)$$

**Ans.**

### 13.2 LEGENDRE'S HOMOGENEOUS DIFFERENTIAL EQUATIONS

A linear differential equation of the form

$$(a + bx)^n \frac{d^n y}{dx^n} + a_1 (a + bx)^{n-1} \frac{d^{n-1} y}{dx^{n-1}} + \dots + a_n y = X \quad \dots (1)$$

where  $a, b, a_1, a_2, \dots, a_n$  are constants and  $X$  is a function of  $x$ , is called Legendre's linear equation.

Equation (1) can be reduced to linear differential equation with constant coefficients by the substitution.

$$a + bx = e^z \Rightarrow z = \log(a + bx)$$

$$\text{so that } \frac{dy}{dx} = \frac{dy}{dz} \cdot \frac{dz}{dx} = \frac{b}{a + bx} \cdot \frac{dy}{dz}$$

$$\Rightarrow (a + bx) \frac{dy}{dx} = b \frac{dy}{dz} = b Dy, \quad D \equiv \frac{d}{dz} \Rightarrow (a + bx) \frac{dy}{dx} = b Dy$$

$$\text{Again } \frac{d^2 y}{dx^2} = \frac{d}{dx} \left( \frac{dy}{dx} \right) = \frac{d}{dx} \left( \frac{b}{a + bx} \cdot \frac{dy}{dz} \right)$$

$$= -\frac{b^2}{(a + bx)^2} \frac{dy}{dz} + \frac{b}{(a + bx)} \cdot \frac{d^2 y}{dz^2} \cdot \frac{dz}{dx}$$

$$\begin{aligned}
 &= -\frac{b^2}{(a+bx)^2} \frac{dy}{dz} + \frac{b}{(a+bx)} \cdot \frac{d^2y}{dz^2} \cdot \frac{b}{(a+bx)} \\
 \Rightarrow (a+bx)^2 \frac{d^2y}{dx^2} &= -b^2 \frac{dy}{dz} + b^2 \frac{d^2y}{dz^2} \\
 &= b^2 \left( \frac{d^2y}{dz^2} - \frac{dy}{dz} \right) = b^2 (D^2 y - D y) = b^2 D (D-1)y \\
 \Rightarrow (a+bx)^2 \frac{d^2y}{dx^2} &= b^2 D (D-1)
 \end{aligned}$$

.....

$$(a+bx)^n \frac{d^n y}{dx^n} = b^n D (D-1) (D-2) \dots (D-n+1)y$$

Substituting these values in equation (1), we get a linear differential equation with constant coefficients, which can be solved by the method given in the previous section.

**Example 10.** Solve  $(1+x)^2 \frac{d^2y}{dx^2} + (1+x) \frac{dy}{dx} + y = \sin 2 \{\log(1+x)\}$

**Solution.** We have,  $(1+x)^2 \frac{d^2y}{dx^2} + (1+x) \frac{dy}{dx} + y = \sin 2 \{\log(1+x)\}$

Put  $1+x = e^z$  or  $\log(1+x) = z$

$(1+x) \frac{dy}{dx} = Dy$  and  $(1+x)^2 \frac{d^2y}{dx^2} = D(D-1)y$ , where  $D \equiv \frac{d}{dz}$

Putting these values in the given differential equation, we get

$$\begin{aligned}
 D(D-1)y + Dy + y &= \sin 2z \quad \text{or} \quad (D^2 - D + D + 1)y = \sin 2z \\
 (D^2 + 1)y &= \sin 2z
 \end{aligned}$$

A.E. is  $m^2 + 1 = 0 \Rightarrow m = \pm i$

C.F. =  $A \cos z + B \sin z$

$$\text{P.I.} = \frac{1}{D^2 + 1} \sin 2z = \frac{1}{-4 + 1} \sin 2z = -\frac{1}{3} \sin 2z$$

Now, complete solution is  $y = \text{C.F.} + \text{P.I.}$

$$\begin{aligned}
 \Rightarrow y &= A \cos z + B \sin z - \frac{1}{3} \sin 2z \\
 \Rightarrow y &= A \cos \{\log(1+x)\} + B \sin \{\log(1+x)\} - \frac{1}{3} \sin 2 \{\log(1+x)\} \quad \text{Ans.}
 \end{aligned}$$

**Example 11.** Solve:  $(3x+2)^2 \frac{d^2y}{dx^2} + 3(3x+2) \frac{dy}{dx} - 36y = 3x^2 + 4x + 1$ .

(Uttarakhand II, Semester, June 2007)

**Solution.** Let  $3x+2 = e^z \Rightarrow z = \log(3x+2) \quad \left[ x = \frac{e^z - 2}{3} \right]$

So that  $(3x+2) \frac{dy}{dx} = 3Dy$  and  $(3x+2)^2 \frac{d^2y}{dx^2} = 9D(D-1)y$  where  $D \equiv \frac{d}{dz}$

Putting these values in the given differential equation, we get

$$\begin{aligned}
 9D(D-1)y + 9Dy - 36y &= 3\left(\frac{e^z-2}{3}\right)^2 + 4\left(\frac{e^z-2}{3}\right) + 1 \\
 \therefore (9D^2 - 36)y &= \frac{1}{3}(e^{2z} - 4e^z + 4) + \frac{4}{3}e^z - \frac{8}{3} + 1 = \frac{e^{2z}}{3} - \frac{1}{3} \\
 \text{A.E. is } 9m^2 - 36 &= 0 \\
 m^2 - 4 &= 0 \quad \therefore m = \pm 2 \\
 \text{C.F.} &= C_1 e^{2z} + C_2 e^{-2z} \\
 \text{P.I.} &= \frac{1}{9D^2 - 36} \left[ \frac{e^{2z}}{3} - \frac{1}{3} \right] = \frac{1}{27} \frac{1}{D^2 - 4} e^{2z} - \frac{1}{3} \frac{1}{9D^2 - 36} e^{0z} \\
 &= \frac{1}{27} z \frac{1}{2D} e^{2z} - \frac{1}{3} \frac{1}{0-36} = \frac{1}{27} z \left( \frac{e^{2z}}{4} \right) + \frac{1}{108} = \frac{1}{108} [ze^{2z} + 1]
 \end{aligned}$$

Complete Solution is

$$\begin{aligned}
 y &= C.F. + P.I. = C_1 e^{2z} + C_2 e^{-2z} + \frac{1}{108} (ze^{2z} + 1) \\
 y &= C_1 (3x+2)^2 + \frac{C_2}{(3x+2)^2} + \frac{1}{108} [(3x+2)^2 \log(3x+2) + 1] \quad \text{Ans.}
 \end{aligned}$$

### EXERCISE 13.1

Solve the following differential equations:

1.  $x^2 \frac{d^2y}{dx^2} - 4x \frac{dy}{dx} + 6y = \frac{42}{x^4}$       Ans.  $C_1 x^2 + C_2 x^3 + \frac{1}{x^4}$
2.  $(x^2 D^2 - 3xD + 4)y = 2x^2$       Ans.  $(C_1 + C_2 \log x)x^2 + x^2 (\log x)^2$
3.  $x^2 \frac{d^2y}{dx^2} - x \frac{dy}{dx} + y = \log x$  (AMIETE, June 2010)      Ans.  $(C_1 + C_2 \log x)x + \log x + 2$
4.  $\frac{d^2y}{dx^2} + \frac{1}{x} \frac{dy}{dx} = \frac{12 \log x}{x^2}$       Ans.  $C_1 + C_2 \log x + 2(\log x)^3$
5.  $(x^2 D^2 - x D - 3)y = x^2 \log x$       (A.M.I.E. Winter 2001, Summer 2001)

$$\text{Ans. } \frac{C_1}{x} + C_2 x^3 - \frac{x^2}{3} \left( \log x + \frac{2}{3} \right)$$

6.  $x^2 \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + 2y = x^2 + \sin(5 \log x)$   
 Ans.  $c_1 x + c_2 x^2 + x^2 \log x + \frac{1}{754} [15 \cos(5 \log x) - 23 \sin(5 \log x)]$

7.  $x^2 \frac{d^2y}{dx^2} - 3x \frac{dy}{dx} + y = \log x \frac{\sin(\log x) + 1}{x}$  (AMIETE, Dec. 2009)  
 Ans.  $y + C_1 x^{2+\sqrt{3}} + C_2 x^{2-\sqrt{3}} + \frac{1}{x} \left[ \frac{382}{61} \cos \log x + \frac{54}{61} \sin(\log x) + 6 \log x \cos(\log x) + 5 \log x \sin(\log x) \right] + \frac{1}{6x}$

8.  $(1+x)^2 \frac{d^2y}{dx^2} + (1+x) \frac{dy}{dx} + y = 2 \sin \log(1+x)$

**Ans.**  $y = C_1 \cos \log(1+x) + C_2 \sin \log(1+x) - \log(1+x) \cos \log(1+x)$

9. Which of the basis of solutions are for the differential equation  $x^2 \frac{d^2y}{dx^2} - x \frac{dy}{dx} + y = 0$

- (a)  $x, x I_n x$ , (b)  $I_n x, e^x$ , (c)  $\frac{1}{x}, \frac{1}{x^2}$ , (d)  $\frac{1}{x^2} e^x, x I_n x$

(A.M.I.E., Winter 2001) **Ans.** (a)

10. The general solution of  $x^2 \frac{d^2y}{dx^2} - 5x \frac{dy}{dx} + 9y = 0$  is

- (a)  $(C_1 + C_2 x) e^{3x}$ , (b)  $(C_1 + C_{2n} x) x^3$ , (c)  $(C_1 + C_2 x) x^3$ , (d)  $(C_1 + C_2 I_n x) e^{x^3}$   
(AMIETE, Dec. 2009) **Ans.** (b)

11. To transform  $x \frac{d^2y}{dx^2} + \frac{dy}{dx} = \frac{1}{x}$  into a linear differential equation with constant coefficients, the required substitution is

- (a)  $x = \sin t$ , (b)  $x = t^2 + 1$ , (c)  $x = \log t$ , (d)  $x = e^t$   
(AMIETE, June 2010) **Ans.** (d)

### 13.3 METHOD OF VARIATION OF PARAMETERS

To find particular integral of

$$\frac{d^2y}{dx^2} + b \frac{dy}{dx} + c y = X \quad \dots (1)$$

Let complementary function =  $Ay_1 + By_2$ , so that  $y_1$  and  $y_2$  satisfy

$$\frac{d^2y}{dx^2} + b \frac{dy}{dx} + c y = 0 \quad \dots (2)$$

Let us assume particular integral  $y = uy_1 + vy_2$ , ... (3)

where  $u$  and  $v$  are unknown functions of  $x$ .

Differentiation (3) w.r.t.  $x$ , we have  $y' = uy'_1 + vy'_2 + u'y_1 + v'y_2$  assuming that  $u, v$  satisfy the equation

$$u'y_1 + v'y_2 = 0 \quad \dots (4)$$

then  $y' = uy'_1 + vy'_2 \quad \dots (5)$

Differentiating (5) w.r.t.  $x$ , we have  $y'' = uy''_1 + u'y'_1 + vy''_2 + v'y'_2$

Substituting the values of  $y, y'$  and  $y''$  in (1), we get

$$\begin{aligned} & (uy''_1 + u'y'_1 + vy''_2 + v'y'_2) + b(uy'_1 + vy'_2) + c(uy_1 + vy_2) = X \\ \Rightarrow & u(y''_1 + by'_1 + cy_1) + v(y''_2 + by'_2 + cy_2) + (u'y'_1 + v'y'_2) = X \end{aligned} \quad \dots (6)$$

$y_1$  and  $y_2$  will satisfy equation (1)

$$\therefore y''_1 + by'_1 + cy_1 = 0 \quad \dots (7)$$

$$\text{and } y''_2 + by'_2 + cy_2 = 0 \quad \dots (8)$$

Putting the values of expressions from (7) and (8) in (6), we get

$$\Rightarrow u'y'_1 + v'y'_2 = X \quad \dots (9)$$

Solving (4) and (9), we get

$$u' = \begin{vmatrix} 0 & y_2 \\ X & y_2' \end{vmatrix} \div \begin{vmatrix} y_1 & y_2 \\ y_1' & y_2' \end{vmatrix} = \frac{-y_2 X}{y_1 y_2' - y_1' y_2}$$

$$v' = \begin{vmatrix} y_1 & 0 \\ y_1' & X \end{vmatrix} \div \begin{vmatrix} y_1 & y_2 \\ y_1' & y_2' \end{vmatrix} = \frac{y_1 X}{y_1 y_2' - y_1' y_2}$$

$$\boxed{u = \int \frac{-y_2 X}{y_1 y_2' - y_1' y_2} dx}$$

$$\boxed{v = \int \frac{y_1 X}{y_1 y_2' - y_1' y_2} dx}$$

General solution = complementary function + particular integral.

### Working Rule

**Step 1.** Find out the C.F. i.e.,  $A y_1 + B y_2$

**Step 2.** Particular integral =  $u y_1 + v y_2$

**Step 3.** Find  $u$  and  $v$  by the formulae

$$u = \int \frac{-y_2 X}{y_1 y_2' - y_1' y_2} dx, \quad v = \int \frac{y_1 X}{y_1 y_2' - y_1' y_2} dx$$

**Example 12.** Solve  $\frac{d^2y}{dx^2} + y = \operatorname{cosec} x$ . (Nagpur University, Summer 2005)

**Solution.**  $(D^2 + 1) y = \operatorname{cosec} x$

A.E. is

$$m^2 + 1 = 0 \Rightarrow m = \pm i$$

$$\text{C.F.} = A \cos x + B \sin x$$

Here

$$y_1 = \cos x, \quad y_2 = \sin x$$

$$\text{P.I.} = y_1 u + y_2 v$$

where

$$u = \int \frac{-y_2 \cdot \operatorname{cosec} x dx}{y_1 \cdot y_2' - y_1' \cdot y_2} = \int \frac{-\sin x \cdot \operatorname{cosec} x dx}{\cos x (\cos x) - (-\sin x) (\sin x)}$$

$$= \int \frac{-\sin x \cdot \frac{1}{\sin x} dx}{\cos^2 x + \sin^2 x} = - \int dx = -x$$

$$v = \int \frac{y_1 \cdot X dx}{y_1 \cdot y_2' - y_1' \cdot y_2} = \int \frac{\cos x \cdot \operatorname{cosec} x dx}{\cos x (\cos x) - (-\sin x) (\sin x)}$$

$$= \int \frac{\cos x \cdot \frac{1}{\sin x} dx}{\cos^2 x + \sin^2 x} = \int \frac{\cot x dx}{1} = \log \sin x$$

$$\text{P.I.} = uy_1 + vy_2 = -x \cos x + \sin x (\log \sin x)$$

General solution = C.F. + P.I.

$$y = A \cos x + B \sin x - x \cos x + \sin x (\log \sin x)$$

**Ans.**

**Example 13.** Apply the method of variation of parameters to solve

$$\frac{d^2y}{dx^2} + y = \tan x \quad (\text{A. M. I. E. T. E., Dec. 2010, Winter 2001, Summer 2000})$$

**Solution.** We have,

$$\frac{d^2y}{dx^2} + y = \tan x$$

$$(D^2 + 1)y = \tan x$$

A.E. is  $m^2 = -1$  or  $m = \pm i$

C. F.  $y = A \cos x + B \sin x$

Here,

$$y_1 = \cos x, \quad y_2 = \sin x$$

$$y_1 \cdot y'_2 - y'_1 \cdot y_2 = \cos x (\cos x) - (-\sin x) \sin x = \cos^2 x + \sin^2 x = 1$$

P. I.  $= u \cdot y_1 + v \cdot y_2$  where

$$\begin{aligned} u &= \int \frac{-y_2 \tan x}{y_1 \cdot y'_2 - y'_1 \cdot y_2} dx = - \int \frac{\sin x \tan x}{1} dx \\ &= - \int \frac{\sin^2 x}{\cos x} dx = - \int \frac{1 - \cos^2 x}{\cos x} dx \\ &= \int (\cos x - \sec x) dx = \sin x - \log(\sec x + \tan x) \end{aligned}$$

$$v = \int \frac{y_1 \tan x}{y_1 \cdot y'_2 - y'_1 \cdot y_2} dx = \int \frac{\cos x \cdot \tan x}{1} dx = \int \sin x dx = -\cos x$$

$$\begin{aligned} \text{P. I. } &= u \cdot y_1 + v \cdot y_2 \\ &= [\sin x - \log(\sec x + \tan x)] \cos x - \cos x \sin x \\ &= -\cos x \log(\sec x + \tan x) \end{aligned}$$

Complete solution is

$$y = A \cos x + B \sin x - \cos x \log(\sec x + \tan x) \quad \text{Ans.}$$

**Example 14.** Use variation of parameters method to solve  $y'' + y = \sec x$

(Nagpur University, Winter, 2002, 2001, U. P. Second Semester 2002,  
AMIETE, June 2010, 2004)

**Solution.** We have,  $\frac{d^2y}{dx^2} + y = \sec x \quad \dots (1)$

A. E. is  $(m^2 + 1) = 0 \Rightarrow m^2 = -1 \Rightarrow m = \pm i$

Complementary Function of (1) is

C. F.  $= A \cos x + B \sin x$

Here  $y_1 = \cos x, \quad y_2 = \sin x$

P. I.  $= uy_1 + vy_2 \quad \dots (2)$

where  $u = \int \frac{-y_2 \sec x}{y_1 \cdot y'_2 - y'_1 \cdot y_2} dx \quad \left[ \begin{array}{l} y_1 \cdot y'_2 - y'_1 \cdot y_2 = \cos x \cos x - (-\sin x) \sin x \\ = \cos^2 x + \sin^2 x = 1 \end{array} \right]$

On putting the values of  $y_2$  and  $y_1 \cdot y'_2 - y'_1 \cdot y_2$ , we get

$$u = \int \frac{-\sin x \sec x}{1} dx = - \int \tan x dx = \log \cos x$$

$$v = \int \frac{y_1 \sec x}{y_1 y'_2 - y'_1 y_2} dx$$

On putting the values of  $y_1$  and  $y_1 y'_2 - y'_1 y_2$ , we get

$$v = \int \frac{\cos x \cdot \sec x}{1} dx = \int dx = x$$

Putting the values of  $u$  and  $v$  in (2), we get

$$P. I. = \cos x \cdot \log \cos x + x \sin x$$

Complete solution is  $y = C. F. + P. I.$

$$\Rightarrow y = A \cos x + B \sin x + \cos x \log \cos x + x \sin x \quad \text{Ans.}$$

**Example 15.** Obtain general solution of the differential equation  $x^2 y'' + xy' - y = x^3 e^x$ .

(Nagpur University, Summer 2004, U. P. II Semester, Summer 2002)

**Solution.** The given differential equation is  $x^2 y'' + xy' - y = x^3 e^x$

$$\Rightarrow x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} - y = x^3 e^x \quad \dots (1)$$

Putting  $x = e^z \Rightarrow D = \frac{d}{dz}, x \frac{dy}{dx} = Dy, x^2 \frac{d^2 y}{dx^2} = D(D-1)y$ , in (1), we get

$$D(D-1)y + D y - y = e^{3z} e^{e^z} \Rightarrow (D^2 - 1)y = e^{3z} e^{e^z}$$

$$\text{A. E. is } m^2 - 1 = 0 \Rightarrow m = \pm 1$$

$$\therefore C. F. = c_1 e^z + c_2 e^{-z}$$

$$= uy_1 + vy_2 \text{ where } y_1 = e^{-z}, y = \left[ y_1 = x, y_2 = \frac{1}{x} \right]$$

$$\text{P.I.} = uy_1 + vy_2$$

$$\begin{aligned} \text{Also } u &= - \int \frac{y_2 z}{y_1 y'_2 - y'_1 y_2} dz = - \int \frac{e^{-z} \cdot e^{3z} \cdot e^{e^z}}{e^z (-e^{-z}) - e^z (e^{-z})} dz = - \int \frac{e^{2z} e^{e^z}}{-1-1} dz \\ &= \frac{1}{2} \int e^{2z} e^{e^z} dz = \int x^2 e^x \frac{dx}{x} = \frac{1}{2} \int x e^x dx \quad \begin{cases} x = e^z, dx = e^z dz \\ dz = \frac{dx}{e^z} = \frac{dx}{x} \end{cases} \\ &= \frac{1}{2} [x e^x - (1) e^x] = \frac{1}{2} (x e^x - e^x) \end{aligned}$$

$$\begin{aligned} \text{and } v &= \int \frac{y_1 z}{y_1 y'_2 - y'_1 y_2} dz = \int \frac{e^z \cdot e^{3z} \cdot e^{e^z}}{e^z (-e^{-z}) - e^z (e^{-z})} dz = \int \frac{e^{4z} e^{e^z}}{-1-1} dz = \int \frac{x^4 e^x}{-2} \frac{dx}{x} = -\frac{1}{2} \int x^3 e^x dx \\ &= -\frac{1}{2} [x^3 e^x - 3x^2 e^x + 6x e^x - 6e^x] \end{aligned}$$

$$\begin{aligned} \text{P.I.} &= uy_1 + vy_2 = \frac{1}{2} (x e^x - e^x) x - \frac{1}{2} (x^3 e^x - 3x^2 e^x + 6x e^x - 6e^x) \frac{1}{x} \\ &= \frac{1}{2} \left[ x^2 - x - x^2 + 3x - 6 + \frac{6}{x} \right] e^x = \frac{1}{2} \left( 2x - 6 + \frac{6}{x} \right) e^x = \left( x - 3 + \frac{3}{x} \right) e^x \end{aligned}$$

Complete solution = C.F. + P.I.

$$\begin{aligned} y &= (c_1 e^z + c_2 e^{-z}) + \left( x - 3 + \frac{3}{x} \right) e^x \\ &= c_1 x + \frac{c_2}{x} + \left( x - 3 + \frac{3}{x} \right) e^x \end{aligned}$$

**Ans.**

$$\begin{aligned}
&= \frac{e^x}{2} \left[ x^4 - 3x^3 + 6x^2 - 6x - x^4 + 5x^3 - 20x^2 + 60x - 120 + \frac{120}{x} \right] \\
&= \frac{e^x}{2} \left[ 2x^3 - 14x^2 + 54x - 120 + \frac{120}{x} \right] \\
y &= C.F. + P.I. \\
&= C_1 x + \frac{C_2}{x} + \left( x^3 - 7x^2 + 27x - 60 + \frac{60}{x} \right) e^x
\end{aligned}
\tag{Ans.}$$

**Example 16.** Solve by method of variation of parameters:

$$\frac{d^2y}{dx^2} - y = \frac{2}{1+e^x} \quad (Uttarakhand, II Semester, June 2007, A.M.I.E.T.E., Summer 2001)$$

(Nagpur University, Summer 2001)

**Solution.**  $\frac{d^2y}{dx^2} - y = \frac{2}{1+e^x}$

A. E. is  $(m^2 - 1) = 0$   
 $m^2 = 1, \quad m = \pm 1$

C. F. =  $C_1 e^x + C_2 e^{-x}$

$\therefore P.I. = uy_1 + vy_2$

Here,  $y_1 = e^x, \quad y_2 = e^{-x}$

and  $y_1 \cdot y'_2 - y'_1 \cdot y_2 = -e^x \cdot e^{-x} - e^x \cdot e^{-x} = -2$

$$\begin{aligned}
u &= \int \frac{-y_2 X}{y_1 \cdot y'_2 - y'_1 \cdot y_2} dx = - \int \frac{e^{-x}}{-2} \times \frac{2}{1+e^x} dx \\
&= \int \frac{e^{-x}}{1+e^x} dx = \int \frac{dx}{e^x (1+e^x)} = \int \left( \frac{1}{e^x} - \frac{1}{1+e^x} \right) dx \\
&= \int e^{-x} dx - \int \frac{e^{-x}}{e^{-x}+1} dx = -e^{-x} + \log(e^{-x}+1)
\end{aligned}$$

$$v = \int \frac{y_1 X}{y_1 \cdot y'_2 - y'_1 \cdot y_2} dx = \int \frac{e^x}{-2} \frac{2}{1+e^x} dx = - \int \frac{e^x}{1+e^x} dx = -\log(1+e^x)$$

$$\begin{aligned}
P.I. &= u \cdot y_1 + v \cdot y_2 = [-e^{-x} + \log(e^{-x}+1)] e^x - e^{-x} \log(1+e^x) \\
&= -1 + e^x \log(e^{-x}+1) - e^{-x} \log(e^x+1)
\end{aligned}$$

Complete solution =  $y = C_1 e^x + C_2 e^{-x} - 1 + e^x \log(e^{-x}+1) - e^{-x} \log(e^x+1)$  Ans.

**Example 17.** Apply the method of variation of parameters to solve

$$\frac{d^2y}{dx^2} - 3 \frac{dy}{dx} + 2y = \frac{e^x}{1+e^x} \quad (U.P. II Semester Summer 2005)$$

**Solution.** Given equation is  $\frac{d^2y}{dx^2} - 3 \frac{dy}{dx} + 2y = \frac{e^x}{1+e^x}$

Auxiliary equation is  $m^2 - 3m + 2 = 0 \Rightarrow (m-1)(m-2) = 0 \Rightarrow m = 1, 2$

C. F. =  $C_1 e^x + C_2 e^{2x}$

$$\begin{aligned}
 &= C_1 y_1 + C_2 y_2, \quad \text{Here } y_1 = e^x, \quad y_2 = e^{2x} \\
 \text{P. I. } &= uy_1 + vy_2, \\
 u = \int \frac{-y_2 X dx}{y_1 y_2' - y_2 y_1'} &= \int \frac{-e^{2x}}{e^x(2e^{2x}) - e^{2x}(e^x)} \frac{\frac{e^x}{1+e^x}}{dx} = \int \frac{\frac{-e^{3x}}{1+e^x}}{2e^{3x} - e^{3x}} dx \\
 &= \int \frac{-e^{3x}}{e^{3x}(1+e^x)} dx = -\int \frac{1}{1+e^x} dx = -\int \frac{e^{-x}}{e^{-x}+1} dx \quad [\text{Dividing by } e^x] \\
 &= \log(e^{-x}+1) \\
 \text{Now, } v &= \int \frac{y_1 X dx}{y_1 y_2' - y_2 y_1'} = \int \frac{e^x \left( \frac{e^x}{1+e^x} \right) dx}{e^x(2e^{2x}) - e^{2x}(e^x)} = \int \frac{\frac{e^{2x}}{1+e^x}}{2e^{3x} - e^{3x}} dx = \int \frac{e^{2x}}{e^{3x}(1+e^x)} dx \\
 &= \int \frac{1}{e^x(1+e^x)} dx = \int \left( \frac{1}{e^x} - \frac{1}{1+e^x} \right) dx \quad [\text{By Partial fraction}] \\
 &= \int \left( e^{-x} - \frac{e^{-x}}{e^{-x}+1} \right) dx = -e^{-x} + \log(e^{-x}+1)
 \end{aligned}$$

$$\text{P.I. } = uy_1 + vy_2$$

$$\text{P.I. } = e^x \log(e^{-x}+1) + e^{2x} \{-e^{-x} + \log(e^{-x}+1)\}$$

$$\text{P.I. } = e^x \log(e^{-x}+1) - e^x + e^{2x} \log(e^{-x}+1)$$

Complete solution is

$$\begin{aligned}
 y &= \text{C. F.} + \text{P. I.} \\
 &= C_1 e^x + C_2 e^{2x} + e^x \log(e^{-x}+1) - e^x + e^{2x} \log(e^{-x}+1) \quad \text{Ans.}
 \end{aligned}$$

**Example 18.** Solve by method of variation of parameters.

$$\frac{d^2y}{dx^2} - y = \left(1 + \frac{1}{e^x}\right)^{-2} \quad (\text{Nagpur University, Summer 2000})$$

$$\text{Solution. } \frac{d^2y}{dx^2} - y = \left(\frac{e^x+1}{e^x}\right)^{-2} = \frac{e^{2x}}{(e^x+1)^2}$$

$$\text{A. E. is } m^2 - 1 = 0 \quad \therefore m = \pm 1$$

$$\text{C. F. } = C_1 e^{-x} + C_2 e^x$$

$$\text{Let P. I. } = uy_1 + vy_2, \quad \text{where } y_1 = e^{-x}, \quad y_2 = e^x$$

$$y_1 y_2' - y_1' y_2 = e^{-x} \cdot e^x + e^{-x} \cdot e^x = 2$$

$$u = \int \frac{-y_2 X}{y_1 y_2' - y_1' y_2} dx = \frac{1}{2} \int -e^x \cdot \frac{e^{2x}}{(1+e^x)^2} dx = -\frac{1}{2} \int \frac{e^{2x}}{(1+e^x)^2} e^x dx$$

Putting  $t = 1 + e^x$ ,  $dt = e^x dx$ , we get

$$u = -\frac{1}{2} \int (t-1)^2 \frac{dt}{t^2}$$

$$u = -\frac{1}{2} \int \left(1 - \frac{2}{t} + t^{-2}\right) dt = -\frac{1}{2}(t - 2 \log t - t^{-1})$$

$$u = -\frac{1}{2}(1 + e^x) + \log(1 + e^x) + \frac{1}{2}(1 + e^x)^{-1}$$

Now,  $v = \int \frac{y_1 X}{y_1 y_2' - y_1' y_2} dx = \frac{1}{2} \int \frac{e^{-x} \cdot e^{2x}}{(1 + e^x)^2} dx = \frac{1}{2} \int \frac{e^x dx}{(1 + e^x)^2}$

$$= \frac{1}{2} \int \frac{1}{t^2} dt = -\frac{1}{2} \frac{1}{t} = -\frac{1}{2}(1 + e^x)^{-1}$$

where  $t = 1 + e^x$ 

$$\text{P.I.} = uy_1 + vy_2$$

$$\begin{aligned} \text{P.I.} &= e^{-x} \left[ -\frac{1}{2}(1 + e^x) + \log(1 + e^x) + \frac{1}{2}(1 + e^x)^{-1} \right] - \frac{1}{2} e^x (1 + e^x)^{-1} \\ &= -\frac{1}{2}(1 + e^x)^{-1} \{e^x - e^{-x}\} + e^{-x} \left( -\frac{1}{2} \right) [(1 + e^x) + e^{-x} \log(1 + e^x)] \\ &= -(1 + e^x)^{-1} \sinh x - \frac{1}{2} e^{-x} (1 + e^x) + e^{-x} \log(1 + e^x) \end{aligned}$$

Hence the solution is

$$y = C_1 e^{-x} + C_2 e^x - (1 + e^x)^{-1} \sinh x - \frac{1}{2} e^{-x} (1 + e^x) + e^{-x} \log(1 + e^x) \quad \text{Ans.}$$

**Example 19.** Solve by method of variation of parameters

$$\frac{d^2y}{dx^2} - 2 \frac{dy}{dx} = e^x \sin x \quad (\text{U.P. II Semester, 2003})$$

**Solution.**  $\frac{d^2y}{dx^2} - 2 \frac{dy}{dx} = e^x \sin x$

$$\Rightarrow (D^2 - 2D)y = e^x \sin x$$

$$\text{A. E. is } m^2 - 2m = 0 \Rightarrow m(m-2) = 0 \Rightarrow m = 0, 2$$

$$\text{C. F.} = C_1 + C_2 e^{2x}$$

$$\text{P. I.} = uy_1 + vy_2 \text{ where, } y_1 = 1, \quad y_2 = e^{2x}$$

$$\therefore u = \int \frac{-y_2 X dx}{y_1 y_2' - y_1' y_2} = \int \frac{-e^{2x} \cdot e^x \sin x}{1(2e^{2x}) - 0(e^{2x})} dx$$

$$= -\frac{1}{2} \int e^x \sin x dx \quad \left[ \int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) \right]$$

$$= -\frac{1}{2} \frac{e^x}{1+1} \{\sin x - \cos x\} = -\frac{e^x}{4} (\sin x - \cos x)$$

$$v = \int \frac{y_1 X dx}{y_1 y_2' - y_1' y_2} = \int \frac{1 \cdot e^x \sin x dx}{1(2e^{2x}) - 0(e^{2x})} = \frac{1}{2} \int e^{-x} \sin x dx$$

$$= \frac{1}{2} \frac{e^{-x}}{(-1)^2 + (1)^2} [-\sin x - \cos x]$$

$$= -\frac{1}{2} \frac{e^{-x}}{2} (\sin x + \cos x) = -\frac{e^{-x}}{4} (\sin x + \cos x)$$

$$\begin{aligned} P. I. &= uy_1 + vy_2 = -\frac{e^x}{4}(\sin x - \cos x) 1 - \frac{e^{-x}}{4}(\sin x + \cos x) e^{2x} \\ &= -\frac{e^x}{4}[\sin x - \cos x + \sin x + \cos x] = -\frac{e^x}{2} \sin x \end{aligned}$$

The complete solution is

$$\begin{aligned} y &= C. F. + P. I. \\ \Rightarrow y &= C_1 + C_2 e^{2x} - \frac{e^x}{2} \sin x \quad \text{Ans.} \end{aligned}$$

**Example 20.** Solve :  $\frac{d^2y}{dx^2} + 3 \frac{dy}{dx} + 2y = \sin(e^x)$  (Nagpur University, Winter 2003)

**Solution.** The given equation can be written as

$$(D^2 + 3D + 2)y = \sin e^x$$

$$\begin{aligned} A. E. \text{ is } (m^2 + 3m + 2) &= 0 & \Rightarrow (m+1)(m+2) &= 0 \\ m &= -1, -2, \end{aligned}$$

$$\therefore C. F. = C_1 e^{-x} + C_2 e^{-2x}$$

$$\begin{aligned} \text{where } P. I. &= uy_1 + vy_2 \\ y_1 &= e^{-x}, \quad y_2 = e^{-2x} \end{aligned}$$

$$y'_1 = -e^{-x}, \quad y'_2 = -2e^{-2x}$$

$$y_1 y'_2 - y_2 y'_1 = e^{-x}(-2e^{-2x}) - e^{-2x}(-e^{-x}) = -2e^{-3x} + e^{-3x} = -e^{-3x}$$

$$\begin{aligned} u &= \int \frac{-y_2 X}{y_1 y'_2 - y'_1 y_2} dx = \int \frac{-e^{-2x}}{-e^{-3x}} \sin(e^x) dx \\ &= \int e^x \sin(e^x) dx = -\cos(e^x) \end{aligned}$$

$$\begin{aligned} v &= \int \frac{y_1 X}{y_1 y'_2 - y'_1 y_2} dx = \int \frac{e^{-x} \sin(e^x)}{-e^{-3x}} dx \\ &= -\int e^{2x} \sin(e^x) dx = -\int t \sin t dt \quad [t = e^x \text{ so that } dt = e^x dx] \\ &= t \cos t - \sin t = e^x \cos(e^x) - \sin(e^x) \end{aligned}$$

Putting the values of  $u$ ,  $v$ ,  $y_1$  and  $y_2$  in (1), we get

$$P.I. = e^{-x}[-\cos(e^x)] + e^{-2x}[e^x \cos(e^x) - \sin(e^x)] = -e^{-2x} \sin(e^x)$$

The solution is  $y = C_1 e^{-x} + C_2 e^{-2x} - e^{-2x} \sin(e^x)$ . Ans.

**Example 21.** Solve by method of variation of parameters:

$$\frac{d^2y}{dx^2} + y = (x - \cot x) \quad (Nagpur University, Winter 2001)$$

**Solution.** Here A. E. is  $m^2 + 1 = 0$   $\therefore m = \pm i$

$$C. F. = C_1 \cos x + C_2 \sin x = C_1 y_1 + C_2 y_2$$

$$\begin{aligned} \text{where } y_1 &= \cos x, \quad y_2 = \sin x \\ y'_1 &= -\sin x, \quad y'_2 = \cos x \end{aligned}$$

$$y_1 y'_2 - y_2 y'_1 = \cos x \cdot \cos x + \sin x \cdot \sin x = 1$$

$$\text{Let } P. I. = u y_1 + v y_2 \quad \dots (1)$$

Where

$$\begin{aligned} u &= \int \frac{-y_2 X}{y_1 y'_2 - y_2 y'_1} dx = \int \frac{-\sin x(x - \cot x)}{1} dx \\ &= \int \cos x dx - \int x \sin x dx = \sin x - \{x(-\cos x) + \sin x\} = x \cos x \\ v &= \int \frac{y_1 X}{y_1 y'_2 - y_2 y'_1} dx = \int \cos x (x - \cot x) dx \\ &= \int x \cos x dx - \int \frac{\cos^2 x}{\sin x} dx = \int x \cos x dx - \int \frac{1 - \sin^2 x}{\sin x} dx \\ &= \int x \cos x dx - \int \csc x dx + \int \sin x dx \\ &= x \sin x + \cos x - \log(\csc x - \cot x) - \cos x \\ &= x \sin x - \log(\csc x - \cot x) \end{aligned}$$

Putting the values of  $u, v, y_1, y_2$  in (1), we get

$$\begin{aligned} P. I. &= \cos x \cdot x \cos x + \sin x \{x \sin x - \log(\csc x - \cot x)\} \\ &= x \cos^2 x + x \sin^2 x - \sin x \log(\csc x - \cot x) \\ &= x - \sin x \log(\csc x - \cot x) \end{aligned}$$

Hence, complete solution is

$$y = C_1 \cos x + C_2 \sin x + x - \sin x \log(\csc x - \cot x) \quad \text{Ans.}$$

**Example 22.** Solve  $\frac{d^2 y}{dx^2} + 2 \frac{dy}{dx} + 2y = e^{-x} \sec^3 x$ . (Nagpur University, Winter 2000)

**Solution.** A. E. is  $m^2 + 2m + 2 = 0$

$$m = \frac{-2 + \sqrt{4 - 8}}{2} = \frac{-2 \pm 2i}{2} = -1 + i$$

$$C. F. = e^{-x} (C_1 \cos x + C_2 \sin x) = C_1 y_1 + C_2 y_2$$

$$\text{where } y_1 = e^{-x} \cos x \Rightarrow y'_1 = -e^{-x} \sin x - e^{-x} \cos x$$

$$y_2 = e^{-x} \sin x \Rightarrow y'_2 = -e^{-x} \sin x + e^{-x} \cos x$$

$$\begin{aligned} y_1 y'_2 - y'_1 y_2 &= e^{-x} \cos x (-e^{-x} \sin x + e^{-x} \cos x) - (-e^{-x} \cos x - e^{-x} \sin x) e^{-x} \sin x \\ &= e^{-2x} (\sin^2 x + \cos^2 x - \sin x \cos x + \sin x \cos x) \\ &= e^{-2x} (\sin^2 x + \cos^2 x) = e^{-2x} \end{aligned}$$

$$\text{Let } P.I. = u y_1 + v y_2$$

$$\begin{aligned} \text{where } u &= - \int \frac{y_2 X}{y_1 y'_2 - y'_1 y_2} dx = - \int \frac{e^{-x} \sin x \cdot e^{-x} \sec^3 x}{e^{-2x}} dx \\ &= - \int \sin x \cdot \sec^3 x dx = - \int \tan x \cdot \sec^2 x dx = - \frac{\tan^2 x}{2} \end{aligned}$$

$$v = \int \frac{y_1 X}{y_1 y'_2 - y'_1 y_2} dx = \int \frac{e^{-x} \cos x \cdot e^{-x} \sec^3 x}{e^{-2x}} dx = \int \cos x \cdot \sec^3 x dx = \int \sec^2 x dx = \tan x$$

$$P. I. = u y_1 + v y_2$$

$$= \frac{-\tan^2 x}{2} e^{-x} \cos x + \tan x \cdot e^{-x} \sin x = e^{-x} \left[ \frac{-\tan^2 x}{2} \cos x + \tan x \cdot \sin x \right]$$

$$= e^{-x} \left[ \frac{-\sin x \cdot \tan x}{2} + \tan x \cdot \sin x \right] = \frac{1}{2} e^{-x} \sin x \tan x$$

Complete solution is

$$y = C.F. + P.I.$$

$$= e^{-x} (C_1 \cos x + C_2 \sin x) + \frac{1}{2} e^{-x} \sin x \tan x$$

**Ans.**

**Example 23.** Apply the method of variation of parameters to solve

$$\frac{d^2y}{dx^2} - y = e^{-x} \sin(e^{-x}) + \cos(e^{-x}) \quad (\text{Nagpur University, Summer 2002})$$

**Solution.** The auxiliary equation is  $m^2 - 1 = 0$

$$\therefore m = \pm 1$$

$$\therefore C.F. = C_1 e^x + C_2 e^{-x} = C_1 y_1 + C_2 y_2$$

where  $y_1 = e^x$  and  $y_2 = e^{-x}$

Let P. I. =  $u y_1 + v y_2$

$$\text{where } u = \int \frac{-y_2 X}{y_1 y'_2 - y'_1 y_2} dx = \int -\frac{e^{-x} \{e^{-x} \sin(e^{-x}) + \cos(e^{-x})\}}{e^x (-e^{-x}) - e^x e^{-x}} dx$$

$$\text{i.e. } u = \frac{1}{2} \int [e^{-2x} \sin(e^{-x}) + e^{-x} \cos(e^{-x})] dx \quad (\text{Put } e^{-x} = t, -e^{-x} dx = dt)$$

$$= -\frac{1}{2} \int (t \sin t + \cos t) dt = -\frac{1}{2} \{ -t \cos t + \sin t + \sin t \}$$

$$= \frac{1}{2} [t \cos t - 2 \sin t] = \frac{1}{2} [e^{-x} \cos(e^{-x}) - 2 \sin(e^{-x})]$$

$$v = \int \frac{y_1 X}{y_1 y'_2 - y'_1 y_2} dx = \int \frac{e^x \{e^{-x} \sin(e^{-x}) + \cos(e^{-x})\}}{e^x (-e^{-x}) - e^x e^{-x}} dx$$

$$= -\frac{1}{2} \int \{ \sin(e^{-x}) + e^x \cos(e^{-x}) \} dx$$

$$\left[ e^{-x} = t \text{ and } -e^{-x} dx = dt \text{ i.e. } dx = -\frac{dt}{t} \right]$$

$$= \frac{1}{2} \int \left( \frac{\sin t}{t} + \frac{\cos t}{t^2} \right) dt = \frac{1}{2} \left\{ \frac{-\cos t}{t} - \int \frac{\cos t}{t^2} dt + \int \frac{\cos t}{t} dt \right\}$$

$$= -\frac{1}{2} \frac{\cos t}{t} = -\frac{1}{2} e^x \cos(e^{-x})$$

$$\begin{aligned} P.I. &= e^x \left\{ \frac{1}{2} e^{-x} \cos(e^{-x}) - \sin(e^{-x}) \right\} - \frac{1}{2} e^{-x} e^x \cos(e^{-x}) \\ &= -e^x \sin(e^{-x}) \end{aligned}$$

$\therefore$  Required solution is  $y = C.F. + P.I.$

$$\text{i.e. } y = C_1 e^x + C_2 e^{-x} - e^x \sin(e^{-x})$$

**Ans.**

**Example 24.** Solve  $(D^2 + 2D + 1)y = 4e^{-x} \log x$

by method of variation of parameters.

(Nagpur University, Winter 2004)

**Solution.**  $(D^2 + 2D + 1)y = 4e^{-x} \log x$

A. E. is  $m^2 + 2m + 1 = 0$

$$(m + 1)^2 = 0$$

$$\therefore m = -1, -1$$

$$\begin{aligned} C.F. &= (C_1 + C_2 x) e^{-x} \Rightarrow C.F. = C_1 e^{-x} + C_2 x e^{-x} = C_1 y_1 + C_2 y_2 \\ y_1 &= e^{-x} \Rightarrow y'_1 = -e^{-x} \\ y_2 &= x e^{-x} \Rightarrow y'_2 = -x e^{-x} + e^{-x} \\ y_1 y'_2 - y'_1 y_2 &= e^{-x} (-x e^{-x} + e^{-x}) + e^{-x} (x e^{-x}) \\ &= -x e^{-2x} + e^{-2x} + x e^{-2x} = e^{-2x} \end{aligned}$$

Let P.I. =  $u y_1 + v y_2$  ... (1)

where  $u = -\int \frac{y_2 X}{y_1 y'_2 - y'_1 y_2} dx$

$$\begin{aligned} u &= -\int \frac{x e^{-x} \cdot 4 e^{-x} \log x}{e^{-2x}} dx = -4 \int x \log x dx = -4 \left[ \log x \frac{x^2}{2} - \int \frac{1}{x} \frac{x^2}{2} dx \right] \\ &= -4 \left[ \frac{x^2}{2} \log x - \frac{1}{2} \frac{x^2}{2} \right] = -2x^2 \log x + x^2 \\ u &= x^2 (1 - 2 \log x) \end{aligned}$$

and  $v = \int \frac{y_1 X}{y_1 y'_2 - y'_1 y_2} dx$

$$\begin{aligned} v &= \int \frac{e^{-x} \cdot 4 e^{-x} \log x}{e^{-2x}} dx = 4 \int \log x dx = 4 \int 1 \cdot \log x dx = 4 \left[ (\log x) x - \int \frac{1}{x} x dx \right] \\ &= 4 [x \log x - x] \\ v &= 4x (\log x - 1) \end{aligned}$$

Putting the values of  $u$ ,  $v$ ,  $y_1$  and  $y_2$  in (1), we get

$$\text{P.I.} = x^2 (1 - 2 \log x) e^{-x} + 4x (\log x - 1) x e^{-x} = x^2 e^{-x} [1 - 2 \log x + 4 \log x - 4]$$

$$\text{P.I.} = x^2 e^{-x} [2 \log x - 3]$$

$$\text{C.S.} = \text{C.F.} + \text{P.I.}$$

$$y = (C_1 + C_2 x) e^{-x} + x^2 e^{-x} [2 \log x - 3] \quad \text{Ans.}$$

### EXERCISE 13.2

Solve the following equations by variation of parameters method.

1.  $\frac{d^2y}{dx^2} - 4y = e^{2x}$  Ans.  $y = C_1 e^{2x} + C_2 e^{-2x} + \frac{x}{4} e^{2x} - \frac{e^{2x}}{16}$
2.  $\frac{d^2y}{dx^2} + y = \sin x$  Ans.  $y = C_1 \cos x + C_2 \sin x - \frac{x}{2} \cos x + \frac{1}{4} \sin x$
3.  $\frac{d^2y}{dx^2} - 3 \frac{dy}{dx} + 2y = \sin x$  Ans.  $y = C_1 e^x + C_2 e^{2x} + \frac{1}{10} (3 \cos x + \sin x)$
4.  $\frac{d^2y}{dx^2} + y = \sec x \tan x$  Ans.  $y = C_1 \cos x + C_2 \sin x + x \cos x + \sin x \log \sec x - \sin x$
5.  $y'' - 6y' + 9y = \frac{e^{3x}}{x^2}$  (AMIETE, June 2010, 2009) Ans.  $y = (C_1 + x C_2) e^{3x} - e^{3x} \log x$

## SIMULTANEOUS LINEAR DIFFERENTIAL EQUATIONS

---

---

### 14.1 SIMULTANEOUS DIFFERENTIAL EQUATIONS

If two or more dependent variables are functions of a single independent variable, the equations involving their derivatives are called simultaneous equations, e.g.

$$\frac{dx}{dt} + 4y = t$$

$$\frac{dy}{dt} + 2x = e^t$$

The method of solving these equations is based on the process of elimination, as we solve algebraic simultaneous equations.

**Example 1.** The equations of motions of a particle are given by

$$\frac{dx}{dt} + \omega y = 0$$

$$\frac{dy}{dt} - \omega x = 0$$

Find the path of the particle and show that it is a circle.

(R.G.P.V. Bhopal, Feb. 2006, U.P. II Semester summer 2009)

**Solution.** On putting  $\frac{d}{dt} \equiv D$  in the equations, we have

$$Dx + \omega y = 0 \quad \dots(1)$$

$$-\omega x + Dy = 0 \quad \dots(2)$$

On multiplying (1) by  $w$  and (2) by  $D$ , we get

$$\omega Dx + \omega^2 y = 0 \quad \dots(3)$$

$$-\omega^2 x + D^2 y = 0 \quad \dots(4)$$

On adding (3) and (4), we obtain

$$\omega^2 y + D^2 y = 0 \Rightarrow (D^2 + \omega^2) y = 0 \quad \dots(5)$$

Now, we have to solve (5) to get the value of  $y$ .

$$\text{A.E. is } m^2 + \omega^2 = 0 \Rightarrow m^2 = -\omega^2 \Rightarrow m = \pm i\omega$$

$$\therefore y = A \cos \omega t + B \sin \omega t \quad \dots(6)$$

$$\Rightarrow Dy = -A \omega \sin \omega t + B \omega \cos \omega t$$

On putting the value of  $Dy$  in (2), we get

$$-\omega x - A \omega \sin \omega t + B \omega \cos \omega t = 0$$

$$\Rightarrow \omega x = -A \omega \sin \omega t + B \omega \cos \omega t$$

$$\Rightarrow x = -A \sin \omega t + B \cos \omega t \quad \dots(7)$$

On squaring (6) and (7) and adding , we get

$$\begin{aligned} & x^2 + y^2 = A^2(\cos^2 \omega t + \sin^2 \omega t) + B^2 (\cos^2 \omega t + \sin^2 \omega t) \\ \Rightarrow & x^2 + y^2 = A^2 + B^2 \end{aligned}$$

This is the equation of circle.

**Proved.**

**Example 2.** Solve the following differential equation

$$\frac{dx}{dt} = y + 1, \quad \frac{dy}{dt} = x + 1 \quad (\text{U.P. II Semester, 2009})$$

**Solution.** Here, we have

$$Dx - y = 1 \quad \dots(1)$$

$$-x + Dy = 1 \quad \dots(2)$$

Multiplying (1) by D, we get

$$D^2x - Dy = D \cdot 1 \quad \dots(3)$$

Adding (2) and (3), we get

$$(D^2 - 1)x = 1 + D \cdot 1 \quad \dots(4)$$

$$\Rightarrow (D^2 - 1)x = 1 \text{ or } (D^2 - 1)x = e^0 \quad [\text{D. (1)} = 0]$$

$$\text{A.E. is } m^2 - 1 = 0 \Rightarrow m = \pm 1$$

$$\therefore \text{C.F.} = c_1 e^t + c_2 e^{-t}$$

$$\text{P.I.} = \frac{1}{D^2 - 1} \cdot e^0 = \frac{1}{0 - 1} e^0 = -1$$

$$\therefore x = \text{C.F.} + \text{P.I.} = c_1 e^t + c_2 e^{-t} - 1$$

$$\text{From (1), } y = \frac{dx}{dt} - 1$$

$$\Rightarrow y = \frac{d}{dt} (c_1 e^t + c_2 e^{-t} - 1) - 1$$

$$\begin{aligned} \Rightarrow y &= c_1 e^t - c_2 e^{-t} - 1 \\ \text{and } x &= c_1 e^t + c_2 e^{-t} - 1 \end{aligned} \quad \text{Ans.}$$

**Example 3.** Solve:

$$\frac{dx}{dt} + y = \sin t$$

$$\frac{dy}{dt} + x = \cos t \quad \text{where } y(0) = 0, \quad x(0) = 2$$

(R.G.P.V., Bhopal, I Semester, April, 2010 June 2007)

**Solution.** We have,

$$\frac{dx}{dt} + y = \sin t \quad \Rightarrow \quad D x + y = \sin t \quad \dots(1)$$

$$\frac{dy}{dt} + x = \cos t \quad \Rightarrow \quad D y + x = \cos t \quad \dots(2)$$

Multiplying (2) by D, we get

$$D^2 y + Dx = D \cos t$$

$$D^2 y + Dx = -\sin t \quad \dots(3)$$

Subtracting (1) from (3), we have

$$D^2 y - y = -2 \sin t$$

$$\Rightarrow (D^2 - 1)y = -2 \sin t$$

$$\text{A.E. is } m^2 - 1 = 0 \Rightarrow m^2 = 1 \Rightarrow m = \pm 1$$

$$\text{C.I.} = C_1 e^t + C_2 e^{-t}$$

$$\text{P.I.} = \frac{1}{D^2 - 1} (-2 \sin t)$$

$$\Rightarrow \text{P.I.} = \frac{1}{-1 - 1} (-2 \sin t) = \sin t$$

Complete solution = C.I. + P.I.

$$y = C_1 e^t + C_2 e^{-t} + \sin t \quad \dots (4)$$

Putting  $y = 0$  and  $t = 0$  in (4), we get

$$0 = C_1 + C_2 \quad \text{or} \quad C_2 = -C_1$$

On putting  $C_2 = -C_1$  in (4), we get

$$y = C_1 e^t - C_1 e^{-t} + \sin t$$

On putting the value of  $y$  in (2), we get

$$D(C_1 e^t - C_1 e^{-t} + \sin t) + x = \cos t$$

$$C_1 e^t + C_1 e^{-t} + \cos t + x = \cos t$$

$$x = -C_1 e^t - C_1 e^{-t} \quad \dots (5)$$

On putting  $x = 2$ ,  $t = 0$  in (5), we get

$$2 = -C_1 - C_1 \Rightarrow C_1 = -1$$

Putting the value of  $C_1$  in (5) and (4), we have

$$x = e^t + e^{-t}$$

$$y = -e^t + e^{-t} + \sin t$$

Which is the required solution. Ans.

**Example 4.** Solve:  $\frac{dx}{dt} + 4x + 3y = t$

$$\frac{dy}{dt} + 2x + 5y = e^t$$

[U.P. II Semester, 2006]

**Solution.** Here, we have

$$(D + 4)x + 3y = t \quad \dots (1)$$

$$2x + (D + 5)y = e^t \quad \dots (2) \left( D \equiv \frac{d}{dt} \right)$$

To eliminate  $y$ , operating (1) by  $(D + 5)$  and multiplying (2) by 3 then subtracting, we get

$$(D + 5)(D + 4)x + 3(D + 5)y - 3(2x) - 3(D + 5)y = (D + 5)t - 3e^t$$

$$[(D + 4)(D + 5) - 6]x = (D + 5)t - 3e^t$$

$$(D^2 + 9D + 14)x = 1 + 5t - 3e^t$$

Auxiliary equation is

$$m^2 + 9m + 14 = 0 \Rightarrow m = -2, -7$$

$$\therefore \text{C.F.} = c_1 e^{-2t} + c_2 e^{-7t}$$

$$\text{P.I.} = \frac{1}{D^2 + 9D + 14} (1 + 5t - 3e^t)$$

$$\begin{aligned}
&= \frac{1}{D^2 + 9D + 14} e^{0t} + 5 \frac{1}{D^2 + 9D + 14} t - 3 \frac{1}{D^2 + 9D + 14} e^t \\
&= \frac{1}{0^2 + 9(0) + 14} e^{0t} + 5 \cdot \frac{1}{14 \left( 1 + \frac{9D}{14} + \frac{D^2}{14} \right)} t - 3 \frac{1}{1^2 + 9(1) + 14} e^t \\
&= \frac{1}{14} + \frac{5}{14} \left[ 1 + \left( \frac{9D}{14} + \frac{D^2}{14} \right) \right]^{-1} t - \frac{1}{8} e^t = \frac{1}{14} + \frac{5}{14} \left[ 1 - \left( \frac{9\nu}{14} + \frac{\nu}{14} \right) + \dots \right] t - \frac{1}{8} e^t \quad \dots (5) \\
&= \frac{1}{14} + \frac{5}{14} \left( t - \frac{9}{14} \right) - \frac{1}{8} e^t = \frac{5}{14} t - \frac{31}{196} - \frac{1}{8} e^t \\
x &= c_1 e^{-2t} + c_2 e^{-7t} + \frac{5}{14} t - \frac{31}{196} - \frac{1}{8} e^t \\
3y &= t - \frac{dx}{dt} - 4x \quad [\text{From (1)}] \\
&= t - \frac{d}{dt} \left[ c_1 e^{-2t} + c_2 e^{-7t} + \frac{5}{14} t - \frac{31}{196} - \frac{1}{8} e^t \right] - 4 \left[ c_1 e^{-2t} + c_2 e^{-7t} + \frac{5}{14} t - \frac{31}{196} - \frac{1}{8} e^t \right] \\
3y &= t + 2c_1 e^{-2t} + 7c_2 e^{-7t} - \frac{5}{14} + \frac{1}{8} e^t - 4c_1 e^{-2t} - 4c_2 e^{-7t} - \frac{10}{7} t + \frac{31}{49} + \frac{1}{2} e^t \\
\therefore y &= \frac{1}{3} \left[ -2c_1 e^{-2t} + 3c_2 e^{-7t} - \frac{3}{7} t + \frac{27}{98} + \frac{5}{8} e^t \right] \\
\text{Hence,} \quad x &= c_1 e^{-2t} + c_2 e^{-7t} + \frac{5}{14} t - \frac{31}{196} - \frac{1}{8} e^t \\
y &= -\frac{2}{3} c_1 e^{-2t} + c_2 e^{-7t} - \frac{1}{7} t + \frac{9}{98} + \frac{5}{24} e^t \quad \text{Ans.}
\end{aligned}$$

**Example 5.** Solve:  $\frac{dx}{dt} + 5x + y = e^t$ ,  $\frac{dy}{dt} + x + 5y = e^{5t}$ . (R.G.P.V. Bhopal, 2003)

**Solution.** Here, we have

$$(D + 5)x + y = e^t \quad \dots(1)$$

$$x + (D + 5)y = e^{5t} \quad \dots(2) \left( D \equiv \frac{d}{dt} \right)$$

Multiplying (1) by  $(D + 5)$ , we get

$$(D + 5)^2 x + (D + 5)y = (D + 5)e^t \quad \dots(3)$$

Subtracting (3) from (2), we get

$$\begin{aligned}
&\left\{ 1 - (D + 5)^2 \right\} x = e^{5t} - (D + 5)e^t \\
\Rightarrow \quad [1 - D^2 - 10D - 25]x &= e^{5t} - e^t - 5e^t \\
\Rightarrow \quad (D^2 + 10D + 24)x &= 6e^t - e^{5t}
\end{aligned}$$

Auxiliary equation is

$$\begin{aligned} m^2 + 10m + 24 &= 0 \Rightarrow (m + 4)(m + 6) = 0 \\ \Rightarrow m &= -4, -6 \\ \therefore \text{C.F.} &= c_1 e^{-4t} + c_2 e^{-6t} \\ \text{P.I.} &= \frac{1}{D^2 + 10D + 24} (6e^t - e^{5t}) \end{aligned}$$

$$= \frac{6}{1^2 + 10(1) + 24} e^t - \frac{1}{(5)^2 + 10(5) + 24} e^{5t} = \frac{6e^t}{35} - \frac{e^{5t}}{99}$$

$$\text{Thus } x = \text{C.F.} + \text{P.I.} = c_1 e^{-4t} + c_2 e^{-6t} + \frac{6e^t}{35} - \frac{e^{5t}}{99}$$

From (1),

$$\begin{aligned} y &= e^t - (D + 5)x = e^t - \frac{dx}{dt} - 5x \\ &= e^t - \frac{d}{dt} \left( c_1 e^{-4t} + c_2 e^{-6t} + \frac{6e^t}{35} - \frac{e^{5t}}{99} \right) - 5 \left( c_1 e^{-4t} + c_2 e^{-6t} + \frac{6e^t}{35} - \frac{e^{5t}}{99} \right) \\ &= e^t + 4c_1 e^{-4t} + 6c_2 e^{-6t} - \frac{6e^t}{35} + \frac{5e^{5t}}{99} - 5c_1 e^{-4t} - 5c_2 e^{-6t} - \frac{30e^t}{35} + \frac{5e^{5t}}{99} \\ y &= -\frac{1}{35} e^t - c_1 e^{-4t} + \frac{10}{99} e^{5t} + c_2 e^{-6t} \\ x &= c_1 e^{-6t} + c_2 e^{-4t} + \frac{6e^t}{35} - \frac{e^{5t}}{99} \quad \text{Ans.} \end{aligned}$$

**Example 6.** Solve the following system of differential equations

$$Dx + Dy + 3x = \sin t \text{ and}$$

$$Dx + y - x = \cos t \quad (\text{U.P. II Semester, Summer 2003})$$

**Solution.** We have,  $(D + 3)x + Dy = \sin t$  ... (1)

$$(D - 1)x + y = \cos t \quad \dots (2)$$

Operating (2) by  $D$ , we get

$$D(D - 1)x + Dy = -\sin t \quad \dots (3)$$

Subtracting (1) from (3), we get

$$\begin{aligned} &\{D(D - 1) - (D + 3)\}x = -2 \sin t \\ \Rightarrow &\{D^2 - D - D - 3\}x = -2 \sin t \\ \Rightarrow &(D^2 - 2D - 3)x = -2 \sin t \\ \text{A.E. is} &\quad m^2 - 2m - 3 = 0 \Rightarrow (m + 1)(m - 3) = 0 \\ \Rightarrow &(D - 3)(D + 1) = 0 \Rightarrow m = 3, -1 \\ \therefore &CF = c_1 e^{3t} + c_2 e^{-t} \\ P.I. &= \frac{1}{D^2 - 2D - 3}(-2 \sin t) = -2 \frac{1}{(-1) - 2D - 3} \sin t \\ &= 2 \cdot \frac{1}{2(D + 2)} \sin t = \frac{(D - 2)}{D^2 - 4} \sin t \\ &= \frac{D - 2}{-1 - 4} \sin t = \frac{\cos t - 2 \sin t}{-5} = \frac{1}{5}(2 \sin t - \cos t) \end{aligned}$$

$$x = \text{C.F.} + \text{P.I.} = c_1 e^{3t} + c_2 e^{-t} + \frac{1}{5} (2 \sin t - \cos t) \quad \dots(4)$$

From (2), we get

$$\begin{aligned} & (D - 1)x + y = \cos t \\ \Rightarrow & (D - 1) \left\{ c_1 e^{3t} + c_2 e^{-t} + \frac{1}{5} (2 \sin t - \cos t) \right\} + y = \cos t \\ \Rightarrow & y = \cos t - D \left\{ c_1 e^{3t} + c_2 e^{-t} + \frac{1}{5} (2 \sin t - \cos t) \right\} + \left\{ c_1 e^{3t} + c_2 e^{-t} + \frac{1}{5} (2 \sin t - \cos t) \right\} \\ & = \cos t - 3c_1 e^{3t} + c_2 e^{-t} - \frac{1}{5} (2 \cos t + \sin t) + c_1 e^{3t} + c_2 e^{-t} + \frac{1}{5} (2 \sin t - \cos t) \\ & = \cos t - 2c_1 e^{3t} + 2c_2 e^{-t} - \frac{1}{5} [3 \cos t - \sin t] \\ & = \frac{2}{5} \cos t + \frac{1}{5} \sin t + 2c_2 e^{-t} - 2c_1 e^{3t} \end{aligned}$$

$$\text{Here, } y = \frac{1}{5} (2 \cos t + \sin t) - 2c_1 e^{3t} + 2c_2 e^{-t} \quad \dots(5)$$

(4) and (5) are the required solutions

**Ans.**

**Example 7.** Solve the simultaneous equations

$$\frac{dx}{dt} + \frac{dy}{dt} - 2y = 2 \cos t - 7 \sin t \quad \dots(1)$$

$$\frac{dx}{dt} - \frac{dy}{dt} + 2x = 4 \cos t - 3 \sin t \quad \dots(2)$$

(U.P., B. Pharm 2005, II Semester, Summer 2001)

$$\text{Solution.} \quad Dx + (D - 2)y = 2 \cos t - 7 \sin t \quad \dots(3)$$

$$(D + 2)x - Dy = 4 \cos t - 3 \sin t \quad \dots(4)$$

Operating (3) by  $D$  (4) by  $(D - 2)$ , we get

$$\Rightarrow D^2x + D(D - 2)y = -2 \sin t - 7 \cos t \quad \dots(5)$$

$$\Rightarrow (D^2 - 4)x - D(D - 2)y = (D - 2)4 \cos t - (D - 2)3 \sin t \quad \dots(6)$$

On adding (5) and (6), we get

$$(D^2 + D^2 - 4)x = -2 \sin t - 7 \cos t - 4 \sin t - 8 \cos t - 3 \cos t + 6 \sin t$$

$$\Rightarrow (2D^2 - 4)x = -18 \cos t$$

$$\Rightarrow (D^2 - 2)x = -9 \cos t$$

A.E. is

$$m^2 - 2 = 0 \Rightarrow m = \pm\sqrt{2}, \text{ C.F.} = c_1 e^{\sqrt{2}t} + c_2 e^{-\sqrt{2}t}$$

$$\text{P.I.} = \frac{1}{D^2 - 2}(-9 \cos t) = \frac{-9}{-1 - 2} \cos t = 3 \cos t$$

$$x = c_1 e^{\sqrt{2}t} + c_2 e^{-\sqrt{2}t} + 3 \cos t \quad \dots(7)$$

Putting the value of  $x$  in (2), we get

$$\frac{dy}{dt} = \sqrt{2} c_1 e^{\sqrt{2}t} - \sqrt{2} c_2 e^{-\sqrt{2}t} - 3 \sin t + 2c_1 e^{\sqrt{2}t} + 2c_2 e^{-\sqrt{2}t} + 6 \cos t - 4 \cos t + 3 \sin t$$

$$\frac{dy}{dt} = (2 + \sqrt{2}) c_1 e^{\sqrt{2}t} + (2 - \sqrt{2}) c_2 e^{-\sqrt{2}t} + 2 \cos t$$

On integrating, we get

$$\Rightarrow y = (\sqrt{2} + 1) c_1 e^{\sqrt{2}t} - (\sqrt{2} - 1) c_2 e^{-\sqrt{2}t} + 2 \sin t + c_3 \quad \dots(8)$$

Relations (7) and (8) are the required solutions

**Ans.**

**Example 8.** Solve  $\frac{dx}{dt} = 2y, \frac{dy}{dt} = 2z, \frac{dz}{dt} = 2x$       (Uttarakhand, II Semester, June 2007)

**Solution.** Here, we have

$$\frac{dx}{dt} = 2y \Rightarrow Dx = 2y \quad \dots(1)$$

$$\frac{dy}{dt} = 2z \Rightarrow Dy = 2z \quad \dots(2)$$

$$\frac{dz}{dt} = 2x \Rightarrow Dz = 2x \quad \dots(3)$$

From (1), we have

$$\frac{dx}{dt} = 2y$$

$$\Rightarrow \frac{d^2x}{dt^2} = \frac{2dy}{dt} = 2(2z) = 4z \quad \left[ \text{Using (2), } \frac{dy}{dt} = 2z \right]$$

$$\frac{d^3x}{dt^3} = 4 \frac{dz}{dt} = 4(2x) = 8x \quad \left[ \text{Using (3), } \frac{dz}{dt} = 2x \right]$$

$$\Rightarrow \frac{d^3x}{dt^3} - 8x = 0 \Rightarrow (D^3 - 8)x = 0$$

A.E. is  $m^3 - 8 = 0 \Rightarrow (m-2)(m^2 + 2m + 4) = 0$   
 $\Rightarrow m-2=0 \Rightarrow m=2$

or  $m^2 + 2m + 4 = 0 \Rightarrow m = \frac{-2 \pm \sqrt{4-16}}{2} = \frac{-2 \pm i\sqrt{12}}{2} = -1 \pm i\sqrt{3}$

So the C.F. of  $x$  is

$$x = C_1 e^{2t} + e^{-t} (A \cos \sqrt{3}t + B \sin \sqrt{3}t) \quad \dots(4)$$

$$\begin{aligned} & [A = C_2 \cos \alpha, B = C_2 \sin \alpha] \\ & \left[ \tan \alpha = \frac{B}{A}, \alpha = \tan^{-1} \left( \frac{B}{A} \right) \right] \end{aligned}$$

$$x = C_1 e^{2t} + e^{-t} [C_2 \cos \alpha \cos \sqrt{3}t + C_2 \sin \alpha \sin \sqrt{3}t]$$

$$x = C_1 e^{2t} + e^{-t} C_2 \cos(\sqrt{3}t - \alpha) = C_1 e^{2t} + C_2 e^{-t} \cos(\sqrt{3}t - \alpha)$$

From (3), we have  $\frac{dz}{dt} = 2x$

$$\Rightarrow \frac{dz}{dt} = 2C_1 e^{2t} + 2C_2 e^{-t} \cos(\sqrt{3}t - \alpha) \quad [\text{On putting the value of } x]$$

$$z = C_1 e^{2t} + 2C_2 \frac{e^{-t}}{\sqrt{1+3}} \cos(\sqrt{3}t - \alpha - \beta) \quad \left[ \int e^{ax} \cos bx dx = \frac{e^{ax}}{\sqrt{a^2 + b^2}} \cos(bx - \beta) \right]$$

$$\Rightarrow z = C_1 e^{2t} + 2C_2 \frac{e^{-t}}{\sqrt{1+3}} \cos \left[ \sqrt{3}t - \alpha - \frac{2\pi}{3} \right] \quad \left[ \beta = \tan^{-1} \frac{\sqrt{3}}{-1} = \frac{2\pi}{3} \right]$$

$$\Rightarrow z = C_1 e^{2t} + C_2 e^{-t} \cos\left(\sqrt{3}t - \alpha + \frac{4\pi}{3}\right) \quad \dots(5) \quad \left[-\frac{2\pi}{3} = \frac{4\pi}{3}\right]$$

From (2), we have  $\frac{dy}{dx} = 2z$

$$\begin{aligned} \Rightarrow \frac{dy}{dt} &= 2C_1 e^{2t} + 2C_2 e^{-t} \cos\left(\sqrt{3}t - \alpha + \frac{4\pi}{3}\right) && [\text{On putting the value of } z] \\ \Rightarrow y &= \int 2C_1 e^{2t} dt + 2C_2 \int e^{-t} \cos\left(\sqrt{3}t - \alpha + \frac{4\pi}{3}\right) dt \\ y &= C_1 e^{2t} + 2C_2 \frac{e^{-x}}{\sqrt{1+3}} \cos\left(\sqrt{3}t - \alpha + \frac{4\pi}{3} - \gamma\right) \\ \Rightarrow y &= C_1 e^{2t} + 2C_2 \frac{e^{-t}}{\sqrt{1+3}} \cos\left(\sqrt{3}t - \alpha + \frac{4\pi}{3} - \frac{2\pi}{3}\right) \\ y &= C_1 e^{2t} + C_2 e^{-t} \cos\left(\sqrt{3}t - \alpha + \frac{2\pi}{3}\right) \end{aligned} \quad \dots(6)$$

Relations (4), (5) and (6) are the required solutions.

**Ans.**

**Example 9.** Solve the following simultaneous equations :

$$\frac{d^2x}{dt^2} - 3x - 4y = 0, \quad \frac{d^2y}{dt^2} + x + y = 0 \quad (\text{U.P. II Semester, Summer 2005})$$

**Solution.** We have,  $\frac{d^2x}{dt^2} - 3x - 4y = 0$

$$\frac{d^2y}{dt^2} + x + y = 0 \quad \dots(1)$$

$$(D^2 - 3)x - 4y = 0 \quad \dots(2)$$

$$x + (D^2 + 1)y = 0 \quad \dots(3)$$

Operating equation (2) by  $(D^2 - 3)$ , we get

$$(D^2 - 3)x + (D^2 - 3)(D^2 + 1)y = 0 \quad \dots(3)$$

Subtracting (3) from (1), we get

$$-4y - (D^2 - 3)(D^2 + 1)y = 0 \Rightarrow -4y - (D^4 - 2D^2 - 3)y = 0$$

$$\Rightarrow (D^4 - 2D^2 - 3 + 4)y = 0 \Rightarrow (D^4 - 2D^2 + 1)y = 0$$

$$\Rightarrow (D^2 - 1)^2 y = 0$$

$$\text{A.E. is } (m^2 - 1)^2 = 0 \Rightarrow (m^2 - 1) = 0 \Rightarrow m = \pm 1$$

$$y = (c_1 + c_2 t)e^t + (c_3 + c_4 t)e^{-t} \quad \dots(4)$$

From (2), we have

$$\begin{aligned} x &= -(D^2 + 1)y \\ &= -D^2 y - y \\ &= -D^2 [(c_1 + c_2 t)e^t + (c_3 + c_4 t)e^{-t}] - [(c_1 + c_2 t)e^t + (c_3 + c_4 t)e^{-t}] \\ &= -D [\{(c_1 + c_2 t)e^t + c_2 e^t\} + \{(c_3 + c_4 t)(-e^t) + c_4 e^{-t}\}] - [(c_1 + c_2 t)e^t + (c_3 + c_4 t)e^{-t}] \\ &= -[(c_1 + c_2 t)e^t + c_2 e^t + c_2 e^t + (c_3 + c_4 t)(e^{-t}) - c_4 e^{-t} - c_4 e^{-t}] - [(c_1 + c_2 t)e^t + (c_3 + c_4 t)e^{-t}] \\ &= -[(c_1 + c_2 t + 2c_2 + c_1 + c_2 t)e^t + (c_3 + c_4 t - 2c_4 + c_3 + c_4 t)e^{-t}] \\ &= -[(2c_1 + 2c_2 + 2c_2 t)e^t + (2c_3 - 2c_4 + 2c_4 t)e^{-t}] \end{aligned} \quad \dots(5)$$

Relations (4) and (5) are the required solutions.

**Ans.**

**Example 10.** A mechanical system with two degrees of freedom satisfies the equations:

$$2 \frac{d^2x}{dt^2} + 3 \frac{dy}{dt} = 4$$

$$2 \frac{d^2y}{dt^2} - 3 \frac{dx}{dt} = 0$$

Obtain expressions for  $x$  and  $y$  in terms of  $t$ , given  $x, y, \frac{dx}{dt}, \frac{dy}{dt}$  all vanish at  $t=0$

(R.G.P.V., Bhopal, 1 Sem. 2003)

$$\text{Solution. } 2D^2x + 3Dy = 4 \quad \dots (1)$$

$$-3Dx + 2D^2y = 0 \quad \dots (2)$$

Multiplying (1) by 3 and (2) by  $2D$  We get

$$6D^2x + 9Dy = 12 \quad \dots (3)$$

$$-6D^2x + 4D^3y = 0 \quad \dots (4)$$

Adding (3) and (4), we have

$$4D^3y + 9Dy = 12$$

$$\Rightarrow (4D^3 + 9D)y = 12$$

$$\text{A.E. } \rightarrow 4m^3 + 9m = 0$$

$$\rightarrow m(4m^2 + 9) = 0$$

$$m = 0, m = \frac{3}{2}i, -\frac{3}{2}i$$

$$\therefore y = c_1 + \left( c_2 \cos \frac{3}{2}t + c_3 \sin \frac{3}{2}t \right)$$

$$\text{P.I. } = \frac{12}{4D^3 + 9D} e^0 = t \cdot \frac{12}{12D^2 + 9} e^0 \Rightarrow \text{P.I. } = t \frac{12}{9} = \frac{12t}{9} = \frac{4t}{3}$$

$$\therefore \text{G.S. } = \text{C.F.} + \text{P.I.}$$

$$\Rightarrow y = c_1 + c_2 \cos \frac{3}{2}t + c_3 \sin \frac{3}{2}t + \frac{4t}{3}$$

$$y = 0, t = 0 \Rightarrow c_1 + c_2 = 0 \Rightarrow c_2 = -c_1$$

$$\therefore y = c_1 - c_1 \cos \frac{3}{2}t + c_3 \sin \frac{3}{2}t + \frac{4}{3}t$$

$$\frac{dy}{dt} = \frac{3}{2}c_1 \sin \frac{3}{2}t + \frac{3}{2}c_3 \cos \frac{3}{2}t + \frac{4}{3}$$

$$t = 0, \frac{dy}{dt} = 0 \Rightarrow 0 = \frac{3}{2}c_1 + \frac{4}{3} \Rightarrow c_1 = -\frac{8}{9}$$

$$\text{Now } y = c_1 - c_1 \cos \frac{3}{2}t - \frac{8}{9} \sin \frac{3}{2}t + \frac{4}{3}t$$

Putting the value of  $y$  in (1), we get

$$\frac{2d^2x}{dt^2} + \frac{3}{dt} \left( c_1 - c_1 \cos \frac{3}{2}t - \frac{8}{9} \sin \frac{3}{2}t + \frac{4t}{3} \right) = 4$$

$$\Rightarrow 2 \frac{d^2x}{dt^2} + 3 \left[ 0 + c_1 \frac{3}{2} \sin \frac{3}{2}t - \frac{3}{2} \times \frac{8}{9} \cos \frac{3}{2}t + \frac{4}{3} \right] = 4$$

$$\Rightarrow 2 \frac{d^2x}{dt^2} + \frac{9}{2}c_1 \sin \frac{3}{2}t - 4 \cos \frac{3}{2}t + 4 = 4$$

$$\Rightarrow 2 \frac{d^2x}{dt^2} = -\frac{9}{2}c_1 \sin \frac{3}{2}t + 4 \cos \frac{3}{2}t$$

Integrating, we get

$$\therefore 2 \frac{dx}{dt} = \frac{9}{2} c_1 \times \frac{2}{3} \cos \frac{3}{2} t + 4 \times \frac{2}{3} \sin \frac{3}{2} t + c_4$$

$$\therefore t = 0, \frac{dx}{dt} = 0 \Rightarrow 0 = 3c_1 + c_4$$

$$\Rightarrow c_4 = -3c_1$$

$$\text{Now, } 2 \frac{dx}{dt} = 3c_1 \cos \frac{3}{2} t + \frac{8}{3} \sin \frac{3}{2} t - 3c_1$$

Again integrating we have

$$\therefore 2x - 3c_1 \times \frac{2}{3} \sin \frac{3}{2} t - \frac{8}{3} \times \frac{2}{3} \cos \frac{3}{2} t - 3c_1 t + c_5$$

$$t=0, x=0 \Rightarrow 0 = -\frac{16}{9} + c_5 \Rightarrow c_5 = \frac{16}{9}$$

$$\therefore 2x = 2c_1 \sin \frac{3}{2} t - \frac{16}{9} \cos \frac{3}{2} t - 3c_1 t + \frac{16}{9}$$

$$\Rightarrow x = c_1 \sin \frac{3}{2} t - \frac{8}{9} \cos \frac{3}{2} t - \frac{3}{2} c_1 t + \frac{8}{9}$$

$$\text{Hence, } x = c_1 \sin \frac{3}{2} t - \frac{8}{9} \cos \frac{3}{2} t - \frac{3}{2} c_1 t + \frac{8}{9}$$

$$y = c_1 - c_1 \cos \frac{3}{2} t - \frac{8}{9} \sin \frac{3}{2} t + \frac{4}{3} t$$

Ans

$$\text{Example 11. Solve : } \frac{d^2x}{dt^2} + \frac{dy}{dt} + 3x = e^{-t},$$

$$\frac{d^2y}{dt^2} - 4 \frac{dx}{dt} + 3y = \sin 2t \quad (\text{U.P., II Semester, June 2007})$$

$$\text{Solution. We have, } D^2x + Dy + 3x = e^{-t} \Rightarrow (D^2 + 3)x + Dy = e^{-t} \quad \dots(1)$$

$$D^2y - 4Dx + 3y = \sin 2t \Rightarrow -4Dx + (D^2 + 3)y = \sin 2t \quad \dots(2)$$

To eliminate  $y$  operating (1) by  $(D^2 + 3)$  and (2) by  $D$ , we get

$$(D^2 + 3)^2 x + D(D^2 + 3)y = (D^2 + 3)e^{-t}$$

$$-4D^2x + D(D^2 + 3)y = D \sin 2t$$

$$(D^4 + 6D^2 + 9)x + D(D^2 + 3)y = e^{-t} + 3e^{-t} \quad \dots(3)$$

$$-4D^2x + D(D^2 + 3)y = 2 \cos 2t \quad \dots(4)$$

Subtracting (4) from (3), we get

$$(D^4 + 10D^2 + 9)x = 4e^{-t} - 2 \cos 2t$$

$$\text{A.E. is } m^4 + 10m^2 + 9 = 0 \Rightarrow (m^2 + 1)(m^2 + 9) = 0 \Rightarrow m = \pm i, m = \pm 3i$$

$$\text{C.F.} = C_1 \cos t + C_2 \sin t + C_3 \cos 3t + C_4 \sin 3t$$

$$\text{P.I.} = \frac{1}{D^4 + 10D^2 + 9} 4e^{-t} - \frac{1}{D^4 + 10D^2 + 9} (2 \cos 2t)$$

$$= \frac{4}{1+10+9} e^{-t} - \frac{1}{(-4)^2 + 10(-4) + 9} (2 \cos 2t) = \frac{e^{-t}}{5} + \frac{2}{15} \cos 2t$$

$$x = C_1 \cos t + C_2 \sin t + C_3 \cos 3t + C_4 \sin 3t + \frac{e^{-t}}{5} + \frac{2}{15} \cos 2t$$

Putting the value of  $x$  in (2), we get

$$\begin{aligned} & -4D [C_1 \cos t + C_2 \sin t + C_3 \cos 3t + C_4 \sin 3t + \frac{e^{-t}}{5} + \frac{2}{15} \cos 2t] + (D^2 + 3)y = \sin 2t \\ \Rightarrow & -4(-C_1 \sin t + C_2 \cos t - 3C_3 \sin 3t + 3C_4 \cos 3t - \frac{e^{-t}}{5} - \frac{4}{15} \sin 2t) + (D^2 + 3)y = \sin 2t \\ \Rightarrow & (D^2 + 3)y = \sin 2t - 4C_1 \sin t + 4C_2 \cos t - 12C_3 \sin 3t + 12C_4 \cos 3t - \frac{4}{5}e^{-t} - \frac{16}{15} \sin 2t \end{aligned}$$

A.E. is  $m^2 + 3 = 0 \Rightarrow m = \pm i\sqrt{3}$ ; C.F. =  $C_1 \cos \sqrt{3}t + C_2 \sin \sqrt{3}t$

$$\begin{aligned} \text{P.I.} &= \frac{1}{D^2 + 3} [\sin 2t - 4C_1 \sin t + 4C_2 \cos t - 12C_3 \sin 3t + 12C_4 \cos 3t - \frac{4}{5}e^{-t} - \frac{16}{15} \sin 2t] \\ &= \frac{1}{D^2 + 3} \left( -\frac{1}{15} \sin 2t \right) + \frac{1}{D^2 + 3} (-4C_1 \sin t) + \frac{1}{D^2 + 3} 4C_2 \cos t \\ &\quad + \frac{1}{D^2 + 3} (-12C_3 \sin 3t) + \frac{1}{D^2 + 3} (12C_4 \cos 3t) + \frac{1}{D^2 + 3} \left( \frac{-4}{5}e^{-t} \right) \\ &= \frac{1}{-4+3} \left( -\frac{1}{15} \sin 2t \right) + \frac{1}{-1+3} (-4C_1 \sin t) + \frac{1}{-1+3} 4C_2 \cos t + \frac{1}{-9+3} (-12C_3 \sin 3t) \\ &\quad + \frac{1}{-9+3} (12C_4 \cos 3t) + \frac{1}{1+3} \left( \frac{-4}{5}e^{-t} \right) \\ &= \frac{1}{15} \sin 2t - 2C_1 \sin t + 2C_2 \cos t + 2C_3 \sin 3t - 2C_4 \cos 3t - \frac{1}{5}e^{-t} \\ y &= \text{C.F.} + \text{P.I.} \\ y &= C_1 \cos \sqrt{3}t + C_2 \sin \sqrt{3}t + \frac{1}{15} \sin 2t - 2C_1 \sin t + 2C_2 \cos t + 2C_3 \sin 3t \\ &\quad - 2C_4 \cos 3t - \frac{1}{5}e^{-t} \\ x &= C_1 \cos t + C_2 \sin t + C_3 \cos 3t + C_4 \sin 3t + \frac{e^{-t}}{5} + \frac{2}{15} \cos 2t \end{aligned}$$

**Ans.**

**Example 12.** Solve the simultaneous differential equations

$$\frac{d^2x}{dt^2} - 4 \frac{dx}{dt} + 4x = y,$$

$$\frac{d^2y}{dt^2} + 4 \frac{dy}{dt} + 4y = 25x + 16e^t$$

(U.P. II Semester, 2001)

**Solution.** Here, we have

$$(D^2 - 4D + 4)x - y = 0 \quad \dots(1)$$

$$-25x + (D^2 + 4D + 4)y = 16e^t \quad \dots(2) \left( D \equiv \frac{d}{dt} \right)$$

Operating (1) by  $D^2 + 4D + 4$  and adding to (2), we get

$$\Rightarrow (D^2 + 4D + 4)(D^2 - 4D + 4)x - (D^2 + 4D + 4)y - 25x + (D^2 + 4D + 4)y = 16e^t$$

$$(D^2 - 4D + 4)(D^2 + 4D + 4)x - 25x = 16e^t \Rightarrow (D^4 - 8D^2 - 9)x = 16e^t$$

Auxiliary equation is

$$m^4 - 8m^2 - 9 = 0 \Rightarrow (m^2 - 9)(m^2 + 1) = 0 \Rightarrow m = \pm i, \pm 3$$

$$\text{C.F.} = c_1 e^{3t} + c_2 e^{-3t} + c_3 \cos t + c_4 \sin t, \quad \text{P.I.} = \frac{1}{D^4 - 8D^2 - 9}(16e^t) = -e^t$$

$$x = \text{C.F.} + \text{P.I.}$$

$$x = c_1 e^{3t} + c_2 e^{-3t} + c_3 \cos t + c_4 \sin t - e^t$$

$$\text{From (1), } y = \frac{d^2x}{dt^2} - 4 \frac{dx}{dt} + 4x$$

$$= \frac{d^2}{dt^2} (c_1 e^{3t} + c_2 e^{-3t} + c_3 \cos t + c_4 \sin t - e^t) - 4 \frac{d}{dt} (c_1 e^{3t} + c_2 e^{-3t} + c_3 \cos t + c_4 \sin t - e^t) \\ + 4(c_1 e^{3t} + c_2 e^{-3t} + c_3 \cos t + c_4 \sin t - e^t)$$

$$= \frac{d}{dt} [3c_1 e^{3t} - 3c_2 e^{-3t} + c_3 (-\sin t) + c_4 \cos t - e^t] \\ - 4 [3c_1 e^{3t} - 3c_2 e^{-3t} + c_3 (-\sin t) + c_4 \cos t - e^t] \\ + 4 [c_1 e^{3t} + c_2 e^{-3t} + c_3 \cos t + c_4 \sin t - e^t]$$

$$= 9c_1 e^{3t} + 9c_2 e^{-3t} - c_3 \cos t - c_4 \sin t - e^t + \\ [-12c_1 e^{3t} + 12c_2 e^{-3t} + 4c_3 \sin t - 4c_4 \cos t + 4e^t] \\ + [4c_1 e^{3t} + 4c_2 e^{-3t} + 4c_3 \cos t + 4c_4 \sin t - 4e^t]$$

$$y = c_1 e^{3t} + 25c_2 e^{-3t} + (3c_3 - 4c_4) \cos t + (4c_3 + 3c_4) \sin t - e^t$$

$$x = c_1 e^{3t} + c_2 e^{-3t} + c_3 \cos t + c_4 \sin t - e^t \quad [\text{From (3)}]$$

**Ans.**

### EXERCISE 14.1

Solve the following simultaneous equations:

$$1. \quad \frac{dx}{dt} + 2x - 3y = 0, \quad \frac{dy}{dt} - 3x + 2y = 0$$

$$\text{Ans. } x = c_1 e^t - c_2 e^{-5t}, \quad y = c_1 e^t + c_2 e^{-5t}$$

$$2. \quad \frac{d^2y}{dt^2} = x, \quad \frac{d^2x}{dt^2} = y$$

$$\text{Ans. } x = c_1 e^t + c_2 e^{-t} + (c_3 \cos t + c_4 \sin t)$$

$$y = c_1 e^t + c_2 e^{-t} - (c_3 \cos t + c_4 \sin t)$$

$$3. \quad \frac{dx}{dt} + 5x - 2y = t, \quad \frac{dy}{dt} + 2x + y = 0$$

$$\text{Ans. } x = -\frac{1}{27}(1+6t)e^{-3t} + \frac{1}{27}(1+3t)$$

So that  $x = y = 0$  when  $t = 0$

(AMIETE, June 2009, UP., II Semester, June 2008)

$$\text{Ans. } y = -\frac{2}{27}(2+3t)e^{-3t} + \frac{2}{27}(2-3t)$$

$$4. \quad \frac{dx}{dt} - y = t, \quad \frac{dy}{dt} = t^2 - x$$

$$\text{Ans. } x = c_1 \cos t + c_2 \sin t + t^2 - 1; \quad y = -c_1 \sin t + c_2 \cos t + t$$

$$5. \quad \frac{dx}{dt} + 2y + \sin t = 0$$

$$\frac{dy}{dt} - 2x - \cos t = 0 \quad \text{Ans. } x = c_1 \cos 2t + c_2 \sin 2t - \cos t; \quad y = c_1 \sin 2t - c_2 \cos 2t - \sin t$$

6.  $4\frac{dx}{dt} - \frac{dy}{dt} + 3x = \sin t$

$$\frac{dx}{dt} + y = \cos t$$

**Ans.**  $x = c_1 e^{-t} + c_2 e^{-3t}, y = c_1 e^{-t} + 3 c_2 e^{-3t} + \cos t$

7.  $\frac{dy}{dx} = x$  and  $\frac{dx}{dt} = y + e^{2t}$

**Ans.**  $x = C_1 e^t + C_2 e^{-t} + \frac{2}{3} e^{2t}, y = C_1 e^t - C_2 e^{-t} + \frac{1}{3} e^{2t}$

8.  $\frac{dx}{dt} = y + t, \quad \frac{dy}{dx} = -2x + 3y + 1$

**Ans.**  $x = c_1 e^t + \frac{1}{2} c_2 e^{2t} - \frac{3}{2} t - \frac{5}{4}, y = c_1 e^t + c_2 e^{2t} - t - \frac{3}{2}$

9.  $t \frac{dx}{dt} + y = 0, \quad t \frac{dy}{dx} + x = 0$

**Ans.**  $x = c_1 t + c_2 t^{-1}, y = c_2 t^{-1} - c_1 t$

given  $x(1) = 1$  and  $y(-1) = 0$

10.  $\frac{dx}{dt} + y = \sin t, \quad \frac{dy}{dt} + x = \cos t$ , given that  $x = 2, y = 0$  when  $t = 0$  (U.P., II Semester, 2004)

**Ans.**  $x = e^t + e^{-t}, y = \sin t - e^t + e^{-t}$

11.  $(D - 1)x + Dy = 2t + 1$

$$(2D + 1)x + 2Dy = t$$

**Ans.**  $x = -t - \frac{2}{3}, y = \frac{t^2}{2} + \frac{4}{3}t + C$

12.  $\frac{dx}{dt} + \frac{2}{t}(x - y) = 1,$

(U.P., II Semester, Summer (C.O.) 2005)

$$\frac{dy}{dt} + \frac{1}{t}(x + 5y) = t$$

**Ans.**  $x = At^{-4} + Bt^{-3} + \frac{t^2}{15} + \frac{3y}{10}, y = -At^{-4} - \frac{1}{2}Bt^{-3} + \frac{2t^2}{15} - \frac{t}{20}$

13.  $(D^2 - 1)x + 8Dy = 16e^t$  and  $Dx + 3(D^2 + 1)y = 0$

(Q. Bank U.P.T.U. 2001)

**Ans.**  $y = c_1 \cos \frac{t}{\sqrt{3}} + c_2 \sin \frac{t}{\sqrt{3}} + c_3 \cosh \sqrt{3}t + c_4 \sinh \sqrt{3}t + 2e^t$

$$x = \sqrt{3} c_1 \sin \frac{t}{\sqrt{3}} - \sqrt{3} c_2 \cos \frac{t}{\sqrt{3}} - 3\sqrt{3} c_3 \sinh \sqrt{3}t - 3\sqrt{3} c_4 \cosh \sqrt{3}t - 6e^t - 3t.$$

14.  $\frac{dx}{dt} + \frac{2}{t}(x - y) = 1,$

(U.P. II Semester, 2005)

$$\frac{dy}{dt} + \frac{1}{t}(x + 5y) = t.$$

**Ans.**  $x = At^{-4} + Bt^{-3} + \frac{t^2}{15} + \frac{3t}{10}, y = -At^{-4} - \frac{1}{2}Bt^{-3} + \frac{2t^2}{15} - \frac{t}{20}$

## DIFFERENTIAL EQUATION OF OTHER TYPES

---

### 15.1 INTRODUCTION

In this chapter we have to solve the following eight different types of equations:

1.  $\frac{d^n y}{dx^n} = f(x)$ .
2.  $\frac{d^n y}{dx^n} = f(y)$ .
3. Equation which do not contain  $y$  directly.
4. Equations that do not contain  $x$  directly.
5. (i) Equations whose one part ( $u$ ) of C.F. is given  
(ii) Not a single part  $u$  or  $v$  of C.F of the equation is given
6. Normal form (removal of first derivative).
7. By changing the independent variable of the different equation.
8. By variation of parameters.

### 15.2 EQUATION OF THE TYPE

$$\boxed{\frac{d^n y}{dx^n} = f(x)}$$

This type of exact differential equations are solved by successive integration.

**Example 1.** Solve  $\frac{d^2 y}{dx^2} = x^2 \sin x$ .

**Solution.** We have  $\frac{d^2 y}{dx^2} = x^2 \sin x$  ... (1)

Integrating the differential equation (1), we get

$$\frac{dy}{dx} = x^2(-\cos x) - (2x)(-\sin x) + (2)(\cos x) + c_1$$

$$\frac{dy}{dx} = x^2 \cos x + 2x \sin x + 2 \cos x + c_1$$

Integrating again, we have  $y = [(-x^2)(\sin x) - (-2x)(-\cos x) + (-2)(-\sin x)] + [(2x)(-\cos x) - 2(-\sin x)] + 2 \sin x + c_1 x + c_2$   
 $= -x^2 \sin x - 4x \cos x + 6 \sin x + c_1 x + c_2$  **Ans.**

**Example 2.** Solve  $\frac{d^3 y}{dx^3} = x + \log x$ .

**Solution.** We have,  $\frac{d^3 y}{dx^3} = x + \log x$  ... (1)

Integrating the differential equation (1), we get  $\frac{d^2 y}{dx^2} = \frac{x^2}{2} + (\log x)(x) - \int \frac{1}{x} \cdot x dx + c_1$

$$\frac{d^2y}{dx^2} = \frac{x^2}{2} + x \log x - x + c_1 \quad \dots(2)$$

Again integrating (2), we have,

$$\begin{aligned}\frac{dy}{dx} &= \frac{x^3}{6} + (\log x) \left( \frac{x^2}{2} \right) - \int \frac{1}{x} \cdot \frac{x^2}{2} dx - \frac{x^2}{2} + c_1 x + c_2 \\ \frac{dy}{dx} &= \frac{x^3}{6} + \frac{x^2}{2} \log x - \frac{x^3}{4} - \frac{x^2}{2} + c_1 x + c_2\end{aligned}\quad \dots(3)$$

Again integrating (3), we obtain

$$\begin{aligned}y &= \frac{x^4}{24} + (\log x) \frac{x^3}{6} - \int \frac{1}{x} \frac{x^3}{6} dx - \frac{x^3}{12} - \frac{x^3}{6} + c_1 \frac{x^2}{2} + c_2 x + c_3 \\ \Rightarrow y &= \frac{x^4}{24} + \frac{x^3}{6} \log x - \frac{x^3}{18} - \frac{x^3}{12} - \frac{x^3}{6} + \frac{c_1 x^2}{2} + c_2 x + c_3 \\ \Rightarrow y &= \frac{x^4}{24} + \frac{x^3}{6} \log x - \frac{11x^3}{36} + c_1 \frac{x^2}{2} + c_2 x + c_3\end{aligned}\quad \text{Ans.}$$

### EXERCISE 15.1

Solve the following differential equations:

- |  |  |
|--|--|
| 1. $\frac{d^5y}{dx^5} = x$                   | <b>Ans.</b> $y = \frac{x^6}{720} + \frac{c_1 x^4}{24} + \frac{c_2 x^3}{6} + \frac{c_3 x^2}{2} + c_4 x + c_5$ |
| 2. $\frac{d^2y}{dx^2} = x e^x$               | <b>Ans.</b> $y = (x - 2) e^x + c_1 x + c_2$  |
| 3. $\frac{d^4y}{dx^4} = x + e^{-x} - \cos x$ | <b>Ans.</b> $y = \frac{x^5}{120} + e^{-x} - \cos x + c_1 \frac{x^3}{6}$                                      |
| 4. $x^2 \frac{d^2y}{dx^2} = \log x$          | <b>Ans.</b> $y = -\frac{1}{2} (\log x)^2 + \log x - c_1 x + c_2$   |
| 5. $\frac{d^3y}{dx^3} = \log x$              | <b>Ans.</b> $y = \frac{1}{36} [6x^3 \log x - 11x^3 + c_1 x^2 + c_2 x + c_3]$                                 |
| 6. $\frac{d^3y}{dx^3} = \sin^2 x$            | <b>Ans.</b> $y = \frac{x^3}{12} + \frac{\sin 2x}{16} + c_1 \frac{x^2}{2} + c_2 x + c_3$                      |

### 15.3 EQUATION OF THE TYPE $\boxed{\frac{d^n y}{dx^n} = f(y)}$

Multiplying by  $2 \frac{dy}{dx}$ , we get  $2 \frac{dy}{dx} \frac{d^2y}{dx^2} = 2f(y) \frac{dy}{dx}$  ...(1)

Integrating (1), we have  $\left( \frac{dy}{dx} \right)^2 = 2 \int f(y) dy + c = \phi(y)$  (say)

$$\frac{dy}{dx} = \sqrt{\phi(y)} \Rightarrow \frac{dy}{\sqrt{\phi(y)}} = dx \Rightarrow \int \frac{dy}{\sqrt{\phi(y)}} = x + c$$

**Example 3.** Solve  $\frac{d^2y}{dx^2} = \sqrt{y}$ , under the condition  $y=1$ .  $\frac{dy}{dx} = \frac{2}{\sqrt{3}}$  at  $x=0$

**Solution.** We have  $\frac{d^2y}{dx^2} = \sqrt{y}$  ...(1)

Multiplying (1) by  $2 \frac{dy}{dx}$ , we get  $2 \frac{dy}{dx} \frac{d^2y}{dx^2} = 2\sqrt{y} \frac{dy}{dx}$  ... (2)

Integrating (2), we get  $\left(\frac{dy}{dx}\right)^2 = \frac{4}{3} y^{3/2} + c_1$  ... (3)

On putting  $y = 1$  and  $\frac{dy}{dx} = \frac{2}{\sqrt{3}}$ , we have  $c_1 = 0$

Equation (3) becomes  $\left(\frac{dy}{dx}\right)^2 = \frac{4}{3} y^{3/2}$  or  $\frac{dy}{dx} = \frac{2}{\sqrt{3}} y^{3/4}$  or  $y^{-3/4} dy = \frac{2}{\sqrt{3}} dx$

Again integrating  $\frac{1}{4} y^{1/4} = \frac{2}{\sqrt{3}} x + c_2 \Rightarrow 4y^{1/4} = \frac{2}{\sqrt{3}} x + c_2$  ... (4)

On putting  $x = 0, y = 1$ , we get  $c_2 = 4$

(4) becomes  $4 y^{1/4} = \frac{2}{\sqrt{3}} x + 4$  Ans.

**Example 4.** Solve  $\frac{d^2y}{dx^2} = \sec^2 y \tan y$  under the condition  $y = 0$  and  $\frac{dy}{dx} = 1$  when  $x = 0$ .

**Solution.**  $\frac{d^2y}{dx^2} = \sec^2 y \tan y \Rightarrow 2 \frac{dy}{dx} \frac{d^2y}{dx^2} = 2 \sec^2 y \tan y \frac{dy}{dx}$

$$\int 2 \frac{dy}{dx} \frac{d^2y}{dx^2} = \int 2 \sec^2 y \tan y \frac{dy}{dx}$$

$$\left(\frac{dy}{dx}\right)^2 = \tan^2 y + c_1 \quad \text{or} \quad \frac{dy}{dx} = \sqrt{\tan^2 y + c_1}$$

On putting  $y = 0$ , and  $\frac{dy}{dx} = 1$ , we get  $c_1 = 1$

Now,  $\frac{dy}{dx} = \sqrt{\tan^2 y + 1} = \sec y$

$$\Rightarrow \cos y dy = dx$$

On integrating we get  $\sin y = x + c$

On putting  $y = 0, x = 0$ , we have  $c = 0$

$$\sin y = x \Rightarrow y = \sin^{-1} x$$
 Ans.

**Example 5.** Solve  $\frac{d^2y}{dx^2} = 2(y^3 + y)$ , under the condition  $y = 0, \frac{dy}{dx} = 1$  when  $x = 0$ .

(U.P., II Semester, Summer 2003)

**Solution.**  $\frac{d^2y}{dx^2} = 2(y^3 + y)$  or  $2 \frac{dy}{dx} \frac{d^2y}{dx^2} = 4(y^3 + y) \frac{dy}{dx}$

Integrating, we get

$$\left(\frac{dy}{dx}\right)^2 = 4 \left( \frac{y^4}{4} + \frac{y^2}{2} \right) + c_1 = y^4 + 2y^2 + c_1$$
 ... (1)

On putting  $y = 0$  and  $\frac{dy}{dx} = 1$  in (1), we get  $1 = c_1$

Equation (1) becomes  $\left(\frac{dy}{dx}\right)^2 = y^4 + 2y^2 + 1 = (y^2 + 1)^2$

$$\frac{dy}{dx} = y^2 + 1 \text{ or } \frac{dy}{1+y^2} = dx$$

Again integratig, we get  $\tan^{-1} y = x + c_2$  ... (2)

On putting  $y = 0$  and  $x = 0$  in (2), we have  $0 = c_2$

Equation (2) is reduced to  $\tan^{-1} y = x \Rightarrow y = \tan x$

**Ans.**

**Example 6.** A motion is governed by  $\frac{d^2x}{dt^2} = 36x^{-2}$ , given that at  $t = 0$ ,  $x = 8$  and  $\frac{dx}{dt} = 0$ , find the displacement at any time  $t$ .

**Solution.** We have  $\frac{d^2x}{dt^2} = 36x^{-2} \Rightarrow 2 \frac{d^2x}{dt^2} \frac{dx}{dt} = 2 \times 36x^{-2} \frac{dx}{dt}$  ... (1)

Integrating (1), we haee  $\left(\frac{dx}{dt}\right)^2 = -72x^{-1} + c_1$  ... (2)

Putting  $x = 8$  and  $\frac{dx}{dt} = 0$  in (2), we get  $0 = -\frac{72}{8} + c_1$  or  $c_1 = 9$

(2) becomes  $\left(\frac{dx}{dt}\right)^2 = -\frac{72}{x} + 9$  or  $\left(\frac{dx}{dt}\right)^2 = \frac{-72+9x}{x} \Rightarrow \frac{dx}{dt} = 3 \sqrt{\frac{(x-8)}{x}}$

$$\Rightarrow \int \frac{\sqrt{x} \, dx}{\sqrt{x-8}} = 3 \int dt + c_2 \Rightarrow \int \frac{x \, dx}{\sqrt{x^2 - 8x}} = 3t + c_2$$

$$\frac{1}{2} \int \frac{2x-8+8}{\sqrt{x^2 - 8x}} \, dx = 3t + c_2$$

$$\frac{1}{2} \int \frac{2x-8}{\sqrt{x^2 - 8x}} \, dx + 4 \int \frac{1}{\sqrt{(x-4)^2 - (4)^2}} \, dx = 3t + c_2$$

$$\sqrt{x^2 - 8x} + 4 \cos h^{-1} \frac{x-4}{4} = 3t + c_2 \quad \dots (3)$$

On putting  $x = 8$  and  $t = 0$  in (3), we get  $c_2 = 0$

(3) becomes  $\sqrt{x^2 - 8x} + 4 \cos h^{-1} \frac{x-4}{4} = 3t$  **Ans.**

## EXERCISE 15.2

1.  $y^3 \frac{d^2y}{dx^2} = a$  **Ans.**  $c_1 y^2 = (c_1 x + c_2)^2$
2.  $e^{2y} \frac{d^2y}{dx^2} = 1$  **Ans.**  $c_1 e^y = \cosh(c_1 x + c_2)$
3.  $\sin^3 y \frac{d^2y}{dx^2} = \cos y$  **Ans.**  $\sin[(x+c_2)\sqrt{(1+c_1)}] + \sqrt{\left(\frac{1+c_1}{c_1}\right)} \cos y = 0$
4. A particle is acted upon by a force  $\mu \left( x + \frac{a^4}{x^3} \right)$  per unit mass towards the origin where  $x$  is the distance from the origin at time  $t$ . If it starts that it will arrive at the origin in time  $\frac{\pi}{4\sqrt{\mu}}$ .
5. In the case of a stretched elastic string which has one end fixed and a particle of mass  $m$  attached to the other end, the equation of motion is

$$\frac{d^2s}{dt^2} = -\frac{mg}{e}(s-l)$$

where  $l$  is the natural length of the string and  $e$  its elongation due to a weight  $mg$ . Find  $s$  and  $v$  determining the constants, so that  $s = s_0$  at the time  $t = 0$  and  $v = 0$  when  $t = 0$ .

$$\text{Ans. } v = -\sqrt{\left(\frac{g}{e}\right)}[(s_0 - l)^2 - (s - l)^2]^{1/2}, s - l = (s_0 - l) \cos \left[ \sqrt{\left(\frac{g}{e}\right)} \cdot t \right]$$

#### 15.4 [EQUATIONS WHICH DO NOT CONTAIN 'y' DIRECTLY]

The equation which do not contain  $y$  directly, can be written

$$f\left(\frac{d^n y}{dx^n}, \frac{d^{n-1} y}{dx^{n-1}}, \dots, \frac{dy}{dx}, x\right) = 0 \quad \dots(1)$$

On substituting  $\frac{dy}{dx} = P$  i.e.,  $\frac{d^2 y}{dx^2} = \frac{dP}{dx}$ ,  $\frac{d^3 y}{dx^3} = \frac{d^2 P}{dx^2}$  etc. in (1), we get  $f\left(\frac{d^{n-1} P}{dx^{n-1}}, \dots, P, x\right) = 0$

$$\text{Example 7. Solve } \frac{d^2 y}{dx^2} + \frac{dy}{dx} + \left(\frac{dy}{dx}\right)^3 = 0$$

**Solution.** On putting  $\frac{dy}{dx} = P$  and  $\frac{d^2 y}{dx^2} = \frac{dP}{dx}$ , equation (1) becomes

$$\frac{dP}{dx} + P + P^3 = 0 \text{ or } \frac{dP}{dx} + P(1 + P^2) = 0$$

$$\frac{dP}{dx} = -P(1 + P^2) \text{ or } \frac{dP}{P(1 + P^2)} = -dx \Rightarrow \left(\frac{1}{P} - \frac{P}{1 + P^2}\right) dP = -dx$$

On integrating, we have

$$\log P - \frac{1}{2} \log(1 + P^2) = -x + c_1 \text{ or } \log \frac{P}{\sqrt{1 + P^2}} = -x + c_1$$

$$\frac{P}{\sqrt{1 + P^2}} = e^{-x + c_1} \text{ or } \frac{P^2}{1 + P^2} = a^2 e^{-2x} \Rightarrow P^2 = (1 + P^2) a^2 e^{-2x}$$

$$\Rightarrow P^2(1 - a^2 e^{-2x}) = a^2 e^{-2x} \Rightarrow P = \frac{a e^{-x}}{\sqrt{1 - a^2 e^{-2x}}} \Rightarrow \frac{dy}{dx} = \frac{a e^{-x}}{\sqrt{1 - a^2 e^{-2x}}}$$

$$dy = \frac{a e^{-x}}{\sqrt{1 - a^2 e^{-2x}}} dx$$

On integration, we get  $y = -\sin^{-1}(a e^{-x}) + b$

**Ans.**

$$\text{Example 8. Solve } \frac{d^2 y}{dx^2} = \left[1 - \left(\frac{dy}{dx}\right)^2\right]^{1/2} \quad (\text{U.P. Second Sem., 2002})$$

$$\text{Solution. We have, } \frac{d^2 y}{dx^2} = \left[1 - \left(\frac{dy}{dx}\right)^2\right]^{1/2} \quad \dots(1)$$

$$\text{Putting } P = \frac{dy}{dx} \Rightarrow \frac{dP}{dx} = \frac{d^2 y}{dx^2} \text{ in (1), we get } \frac{dP}{dx} = \sqrt{1 - P^2} \Rightarrow \frac{dP}{\sqrt{1 - P^2}} = dx$$

On integrating, we have

$$\sin^{-1} P = x + c \Rightarrow P = \sin(x + c)$$

$$\frac{dy}{dx} = \sin(x + c)$$

On integrating, we have  $y = -\cos(x + c) + c_1$

**Ans.**

**Example 9.** Solve  $x \frac{d^2y}{dx^2} + x \left( \frac{dy}{dx} \right)^2 - \frac{dy}{dx} = 0$  (U.P. II Semester, 2010)

**Solution.** On putting  $\frac{dy}{dx} = P$  and  $\frac{d^2y}{dx^2} = \frac{dP}{dx}$  in the given equation, we get

$$x \frac{dP}{dx} + x P^2 - P = 0 \Rightarrow \frac{1}{P^2} \frac{dP}{dx} - \frac{1}{P} \frac{1}{x} = -1 \quad \dots(1)$$

Again putting  $\frac{1}{P} = z$  so that  $-\frac{1}{P^2} \frac{dP}{dx} = \frac{dz}{dx}$

Equation (1) becomes  $-\frac{dz}{dx} - \frac{z}{x} = -1 \Rightarrow \frac{dz}{dx} + \frac{z}{x} = 1$

$$\text{I.F.} = e^{\int \frac{1}{x} dx} = e^{\log x} = x$$

Hence, solution is  $z x = \int x dx + C$  or  $z x = \frac{x^2}{2} + C_1$  or  $\frac{1}{P} x = \frac{x^2}{2} + C$

$$\Rightarrow \frac{x}{P} = \frac{x^2 + 2C}{2} \Rightarrow P = \frac{2x}{x^2 + 2C_1} \Rightarrow \frac{dy}{dx} = \frac{2x}{x^2 + 2C_1} \Rightarrow dy = \frac{2x}{x^2 + 2C_1} dx$$

On integrating, we have  $y = \log(x^2 + 2C_1) + c_2$  **Ans.**

### EXERCISE 15.3

Solving the following differential equations:

$$1. (1+x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} + ax = 0 \quad \text{Ans. } y = c_2 - ax + c_1 \log[x + \sqrt{(1+x^2)}]$$

$$2. (1+x^2) \frac{d^2y}{dx^2} + 1 + \left( \frac{dy}{dx} \right)^2 = 0 \quad \text{Ans. } y = -\frac{x}{k} + \frac{1+k^2}{k^2} \log(1+kx) + a$$

$$3. \frac{d^4y}{dx^4} - \cot x \frac{d^3y}{dx^3} = 0 \quad \text{Ans. } y = c_1 \cos x + c_2 x^2 + c_3 x + c_4$$

$$4. 2x \frac{d^3y}{dx^3} \cdot \frac{d^2y}{dx^2} = \left[ \frac{d^2y}{dx^2} \right]^2 - a^2 \quad \text{Ans. } 15 c_1^2 y = 4(c_1 x + a^2)^{5/2} + c_2 x + c_3$$

$$5. e^{x^2/2} \left[ x \frac{d^2y}{dx^2} - \frac{dy}{dx} \right] = x^3 \quad \text{Ans. } y = e^{-x^2/2} + c_1 \frac{x^2}{2} + c_2$$

### 15.5 EQUATIONS THAT DO NOT CONTAIN 'x' DIRECTLY

The equations that do not contain  $x$  directly are of the form

$$f\left(\frac{d^n y}{dx^n}, \frac{d^{n-1} y}{dx^{n-1}}, \dots, \frac{dy}{dx}, y\right) = 0 \quad \dots(1)$$

On substituting  $\frac{dy}{dx} = P, \frac{d^2y}{dx^2} = \frac{dP}{dx} = \frac{dP}{dx} \cdot \frac{dy}{dx} = \frac{dP}{dy} P$  in the equation (1), we get

$$\left[ \frac{dP^{n-1}}{dy^{n-1}}, \dots, P, y \right] = 0 \quad \dots(2)$$

Equation (2) is solved for  $P$ . Let

$$P = f_1(y) \Rightarrow \frac{dy}{dx} = f_1(y) \text{ or } \frac{dy}{f_1(y)} = dx$$

$$\Rightarrow \int \frac{dy}{f_1(y)} = x + c$$

**Example 10.** Solve  $y \frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^2 = \frac{dy}{dx}$  ... (1)

**Solution.** Put  $\frac{dy}{dx} = P, \frac{d^2y}{dx^2} = \frac{dP}{dx} = \frac{dP}{dy} \cdot \frac{dy}{dx} = P \frac{dP}{dy}$  in equation (1)

$$\begin{aligned} & yP \frac{dP}{dy} + P^2 = P \Rightarrow y \frac{dP}{dy} = 1 - P \\ \Rightarrow & \frac{dp}{1-P} = \frac{dy}{y} \Rightarrow -\log(1-P) = \log y + \log c_1 \\ \Rightarrow & \frac{1}{1-P} = c_1 y \Rightarrow P = 1 - \frac{1}{c_1 y} \text{ or } \frac{dy}{dx} = \frac{c_1 y - 1}{c_1 y} \\ \Rightarrow & \frac{c_1 y}{c_1 y - 1} dy = dx \Rightarrow \left(1 + \frac{1}{c_1 y - 1}\right) dy = dx \end{aligned}$$

$$y + \frac{1}{c_1} \log(c_1 y - 1) = x + c_1 \quad \text{Ans.}$$

**Example 11.** Solve  $y \frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^2 = y^2$  ... (1)

**Solution.** Put  $\frac{dy}{dx} = P, \frac{d^2y}{dx^2} = \frac{dP}{dx} = \frac{dP}{dy} \frac{dy}{dx} = P \frac{dP}{dy}$  in (1)

$$yP \frac{dP}{dy} + P^2 = y^2 \text{ or } P \frac{dP}{dy} + \frac{P^2}{y} = y \quad \dots (2)$$

Put  $P^2 = z$  or  $2P \frac{dP}{dy} = \frac{dz}{dy}$  in (2),  $\frac{1}{2} \frac{dz}{dy} + \frac{z}{y} = y$  or  $\frac{dz}{dy} + \frac{2z}{y} = 2y$

$$\text{I.F.} = e^{\int \frac{2}{y} dy} = e^{2 \log y} = e^{\log y^2} = y^2$$

Hence, the solution is  $z y^2 = \int 2y \cdot (y^2) dy + c$

$$\Rightarrow P^2 y^2 = \frac{y^4}{2} + c$$

$$\Rightarrow 2 P^2 y^2 = y^4 + k \text{ or } \sqrt{2} y P = \sqrt{y^4 + k} \quad [\text{Put } 2c = k]$$

$$\Rightarrow \sqrt{2} y \frac{dy}{dx} = \sqrt{y^4 + k} \text{ or } \sqrt{2} \frac{y dy}{\sqrt{y^4 + k}} = dx$$

$$\Rightarrow \frac{1}{\sqrt{2}} \frac{dt}{\sqrt{t^2 + k}} = dx \quad [\text{Put } y^2 = t, 2y dy = dt] \Rightarrow \frac{1}{\sqrt{2}} \sin^{-1} \frac{t}{\sqrt{k}} = x + c$$

$$\Rightarrow \sin^{-1} \frac{y^2}{\sqrt{k}} = \sqrt{2} x + c \text{ or } y^2 = \sqrt{k} \sin h(\sqrt{2} x + c) \quad \text{Ans.}$$

#### EXERCISE 15.4

Solve the following differential equations:

$$1. \frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^2 = 1 \quad \text{Ans. } y^2 = x^2 + ax + b \quad 2. \frac{d^2y}{dx^2} - \left(\frac{dy}{dx}\right)^2 + 2 \frac{dy}{dx} = 0 \quad \text{Ans. } e^y + 2 = d e^{cx^2}$$

$$3. 2y \frac{d^2y}{dx^2} - 3\left(\frac{dy}{dx}\right)^2 - 4y^2 = 0 \quad \text{Ans. } y = a \sec^2(x + b) \quad 4. \frac{d^2y}{dx^2} + \frac{dy}{dx} + \left(\frac{dy}{dx}\right)^3 = 0 \quad \text{Ans. } y = a - \sin^{-1}(b e^{-x})$$

5.  $y \frac{d^2y}{dx^2} = \left\{ \frac{dy}{dx} \right\}^2 \left[ 1 - \frac{dy}{dx} \cos y + y \frac{dy}{dx} \sin y \right]$

**Ans.**  $x = c_1 + c_2 \log y + \sin y$

6.  $y \frac{d^2y}{dx^2} - \left( \frac{dy}{dx} \right)^2 = y^2 \log y$

**Ans.**  $\log y = b, e^x + a e^{-x}$

### 15.6 EQUATION WHOSE ONE SOLUTION IS KNOWN

If  $y = u$  is given solution belonging to the complementary function of the differential equation. Let the other solution be  $y = v$ . Then  $y = u \cdot v$  is complete solution of the differential equation.

Let  $\frac{d^2y}{dx^2} + P \frac{dy}{dx} + Qy = R$  ....(1), be the differential equation and  $u$  is the solution included in the complementary function of (1)

$$\therefore \frac{d^2u}{dx^2} + P \frac{du}{dx} + Qu = 0 \quad \dots(2)$$

$$y = u \cdot v$$

$$\frac{dy}{dx} = v \frac{du}{dx} + u \frac{dv}{dx}$$

$$\frac{d^2y}{dx^2} = v \frac{d^2u}{dx^2} + 2 \frac{dv}{dx} \frac{du}{dx} + u \frac{d^2v}{dx^2}$$

Substituting the values of  $y, \frac{dy}{dx}, \frac{d^2y}{dx^2}$  in (1), we get

$$v \frac{d^2u}{dx^2} + 2 \frac{dv}{dx} \frac{du}{dx} + u \frac{d^2v}{dx^2} + P \left( v \frac{du}{dx} + u \frac{dv}{dx} \right) + Qu \cdot v = R$$

On arranging

$$\Rightarrow v \left[ \frac{d^2u}{dx^2} + P \frac{du}{dx} + Qu \right] + u \left[ \frac{d^2v}{dx^2} + P \frac{dv}{dx} \right] + 2 \frac{du}{dx} \cdot \frac{dv}{dx} = R$$

The first bracket is zero by virtue of relation (2), and the remaining is divided by  $u$ .

$$\begin{aligned} & \frac{d^2v}{dx^2} + P \frac{dv}{dx} + \frac{2}{u} \frac{du}{dx} \frac{dv}{dx} = \frac{R}{u} \\ \Rightarrow & \frac{d^2v}{dx^2} + \left[ P + \frac{2}{u} \frac{du}{dx} \right] \frac{dv}{dx} = \frac{R}{u} \end{aligned} \quad \dots(3)$$

Let  $\frac{dv}{dx} = z$ , so that  $\frac{d^2v}{dx^2} = \frac{dz}{dx}$

Equation (3) becomes

$$\frac{dz}{dx} + \left[ P + \frac{2}{u} \frac{du}{dx} \right] z = \frac{R}{u}$$

This is the linear differential equation of first order and can be solved ( $z$  can be found), which will contain one constant.

On integration  $z = \frac{dv}{dx}$ , we can get  $v$ .

Having found  $v$ , the solution is  $y = uv$ .

**Note:** Rule to find out the integral belonging to the complementary function

Rule	Condition	$u$
1	$1 + P + Q = 0$	$e^x$
2	$1 - P + Q = 0$	$e^{-x}$
3	$1 + \frac{P}{a} + \frac{Q}{a^2} = 0$	$e^{ax}$
4	$P + Qx = 0$	$x$
5	$2 + 2Px + Qx^2 = 0$	$x^2$
6	$n(n-1) + Pnx + Qx^2 = 0$	$x^n$

**Example 12.** Solve  $y'' - 4xy' + (4x^2 - 2)y = 0$  given that  $y = e^{x^2}$  is an integral included in the complementary function. (U.P., II Semester, 2004)

**Solution.**  $y'' - 4xy' + (4x^2 - 2)y = 0$  ... (1)

On putting  $y = v \cdot e^{x^2}$  in (1), the reduced equation as in the article 15.6.

$$\begin{aligned} & \frac{d^2v}{dx^2} + \left[ P + \frac{2}{u} \frac{du}{dx} \right] \frac{dv}{dx} = 0 \quad [P = -4x, Q = 4x^2 - 2, R = 0] \\ & \Rightarrow \frac{d^2v}{dx^2} + \left[ -4x + \frac{2}{e^{x^2}} (2x e^{x^2}) \right] \frac{dv}{dx} = 0 \\ & \Rightarrow \frac{d^2v}{dx^2} + [-4x + 4x] \frac{dv}{dx} = 0 \quad \Rightarrow \quad \frac{d^2v}{dx^2} = 0 \Rightarrow \frac{dv}{dx} = c, \Rightarrow v = c_1 x + c_2 \\ & \therefore \quad y = uv \\ & \quad y = e^{x^2} (c_1 x + c_2) \quad \text{Ans.} \end{aligned}$$

**Example 13.** Solve  $x \frac{d^2y}{dx^2} - (2x-1) \frac{dy}{dx} + (x-1)y = 0$

given that  $y = e^x$  is an integral included in the complementary function.

**Solution.**  $x \frac{d^2y}{dx^2} - (2x-1) \frac{dy}{dx} + (x-1)y = 0$

$$\Rightarrow \frac{d^2y}{dx^2} - \frac{2x-1}{x} \frac{dy}{dx} + \frac{x-1}{x} y = 0 \quad [1 + P + Q = 0] \quad \dots(1)$$

By putting  $y = ve^x$  in (1), we get the reduced equation as in the article 15.6.

$$\frac{d^2v}{dx^2} + \left[ P + \frac{2}{u} \frac{du}{dx} \right] \frac{dv}{dx} = 0 \quad \dots(2)$$

Putting  $u = e^x$  and  $\frac{dv}{dx} = z$  in (2), we get  $\frac{dz}{dx} + \left[ -\frac{2x-1}{x} + \frac{2}{e^x} \right] z = 0$

$$\Rightarrow \frac{dz}{dx} + \frac{-2x+1+2x}{x} z = 0 \quad \Rightarrow \quad \frac{dz}{dx} + \frac{z}{x} = 0$$

$$\Rightarrow \frac{dz}{z} = -\frac{dx}{x} \Rightarrow \log z = -\log x + \log c_1$$

$$\Rightarrow z = \frac{c_1}{x} \quad \text{or} \quad \frac{dv}{dx} = \frac{c_1}{x} \quad \text{or} \quad dv = c_1 \frac{dx}{x} \Rightarrow v = c_1 \log x + c_2$$

$$y = u \cdot v = e^x (c_1 \log x + c_2)$$

**Ans.**

**Example 14.** Solve  $x^2 \frac{d^2y}{dx^2} - 2x[1+x] \frac{dy}{dx} + 2(1+x)y = x^3$

**Solution.**  $x^2 \frac{d^2y}{dx^2} - 2x(1+x) \frac{dy}{dx} + 2(1+x)y = x^3$

$$\Rightarrow \frac{d^2y}{dx^2} - \frac{2x(1+x)}{x^2} \frac{dy}{dx} + \frac{2(1+x)y}{x^2} = x \quad \dots(1)$$

Here  $P + Qx = -\frac{2x(1+x)}{x^2} + \frac{2(1+x)}{x^2} x = 0$

Hence  $y = x$  is a solution of the C.F. and the other solution is  $v$ .

Putting  $y = vx$  in (1), we get the reduced equation as in article 15.6

$$\begin{aligned} \frac{d^2v}{dx^2} + \left\{ P + \frac{2}{u} \frac{du}{dx} \right\} \frac{du}{dx} &= \frac{x}{u} \\ \frac{d^2v}{dx^2} + \left[ \frac{-2x(1+x)}{x^2} + \frac{2}{x} \right] \frac{dv}{dx} &= \frac{x}{x} \\ \Rightarrow \frac{d^2v}{dx^2} - 2 \frac{dv}{dx} &= 1 \Rightarrow \frac{dz}{dx} - 2z = 1 \quad \left[ \frac{dv}{dx} = z \right] \end{aligned}$$

which is a linear differential equation of first order and I.F. =  $e^{\int -2 dx} = e^{-2x}$

Its solution is  $z e^{-2x} = \int e^{-2x} dx + c_1$

$$\begin{aligned} z e^{-2x} &= \frac{e^{-2x}}{-2} + c_1 \quad \text{or} \quad z = \frac{-1}{2} + c_1 e^{2x} \\ \Rightarrow \frac{dv}{dx} &= -\frac{1}{2} + c_1 e^{2x} \quad \text{or} \quad dv = \left( -\frac{1}{2} + c_1 e^{2x} \right) dx \quad \Rightarrow \quad v = \frac{-x}{2} + \frac{c_1}{2} e^{2x} + c_2 \\ y &= uv = x \left( \frac{-x}{2} + \frac{c_1}{2} e^{2x} + c_2 \right) \quad \text{Ans.} \end{aligned}$$

**Example 15.** Verify that  $y = e^{2x}$  is a solution of  $(2x+1)y'' - 4(x+1)y' + 4y = 0$ . Hence find the general solution.

**Solution.** We have

$$(2x+1) \frac{d^2y}{dx^2} - 4(x+1) \frac{dy}{dx} + 4y = 0 \quad \dots(1)$$

$$y = e^{2x}, \quad y' = 2e^{2x}, \quad y'' = 4e^{2x}$$

Substituting the values of  $y$ ,  $y'$  and  $y''$  in (1), we get

$$(2x+1) 4e^{2x} - 4(x+1) 2e^{2x} + 4e^{2x} = 0$$

$$\text{or} \quad [8x+4 - 8x - 8 + 4] e^{2x} = 0 \quad \Rightarrow \quad 0 = 0$$

Thus  $y_1 = e^{2x}$  is a solution

Equation (1) in the standard form is

$$y'' - \frac{4(x+1)}{(2x+1)} y' + \frac{4}{(2x+1)} y = 0$$

$$\text{So} \quad P(x) = -\frac{4(x+1)}{(2x+1)}$$

$$\text{Then} \quad \omega(x) = \frac{1}{y_1^2} e^{-\int P dx}$$

Now

$$\int -P dx = - \int -\frac{4(x+1)}{(2x+1)} dx = \int \left( \frac{4x+2}{2x+1} + \frac{2}{2x+1} \right) dx \\ = 2x + 1 \ln(2x+1)$$

Then

$$\omega = \frac{1}{(e^{2x})^2} e^{2x + 1 \ln(2x+1)} = \frac{e^{2x}}{(e^{2x})^2} \cdot (2x+1) \\ \omega(x) = \frac{2x+1}{e^{2x}}$$

$$\text{Now } v(x) = \int \omega(x) dx = \int \frac{2x+1}{e^{2x}} dx$$

$$\text{Integrating by parts } v(x) = (2x+1) \frac{e^{-2x}}{-2} - 2 \cdot \frac{e^{-2x}}{4}$$

The required second solution

$$y_2(x) = y_1(x)v(x) = e^{2x} \left[ -\frac{2x+1}{2} \cdot \frac{1}{e^{2x}} - \frac{1}{2} \frac{1}{e^{2x}} \right] = -x - 1 = -(x+1)$$

Then the general solution is

$$y(x) = c_1 y_1(x) + c_2 y_2(x) = c_1 e^{2x} - c_2 (x+1) \quad \text{Ans.}$$

**Example 16.** Solve  $x^2 y'' - (x^2 + 2x)y' + (x+2)y = x^3 e^x$  given that  $y = x$  is a solution.**Solution.**  $x^2 y'' - (x^2 + 2x)y' + (x+2)y = x^3 e^x$ 

$$\Rightarrow y'' - \frac{x^2 + 2x}{x^2} y' + \frac{x+2}{x^2} y = x e^x \quad \dots(1)$$

On putting  $y = vx$  in (1), the reduced equation as in the article 20.6.

$$\frac{d^2v}{dx^2} + \left\{ P + \frac{2}{u} \frac{du}{dx} \right\} \frac{dv}{dx} = \frac{R}{u} \Rightarrow \frac{d^2v}{dx^2} + \left[ -\frac{x^2 + 2x}{x^2} + \frac{2}{x} \right] \frac{dv}{dx} = \frac{xe^x}{x} \\ \Rightarrow \frac{d^2v}{dx^2} - \frac{dv}{dx} = e^x \Rightarrow \frac{dz}{dx} - z = e^x \quad \left( z = \frac{dv}{dx} \right)$$

which is a linear differential equation

$$I.F. = e^{-\int dx} = e^{-x} \Rightarrow z e^{-x} = \int e^x \cdot e^{-x} dx + c$$

$$z e^{-x} = x + c \text{ or } z = e^x \cdot x + c e^x \Rightarrow \frac{dv}{dx} = e^x \cdot x + c e^x$$

$$v = x \cdot e^x - e^x + c e^x + c_1 \Rightarrow v = (x-1+c) e^x + c_1$$

$$y = vx = (x^2 - x + cx) e^x + c_1 x$$

**Ans.**

$$\text{Example 17. Solve } (x+2) \frac{d^2y}{dx^2} - (2x+5) \frac{dy}{dx} + 2y = (x+1)e^x$$

$$\text{Solution. } \frac{d^2y}{dx^2} - \frac{2x+5}{x+2} \frac{dy}{dx} + \frac{2y}{x+2} = \frac{(x+1)e^x}{x+2} \quad \dots(1)$$

$$\text{Here } P = \frac{2x+5}{x+2}, Q = \frac{2}{x+2}, R = \frac{(x+1)e^x}{x+2}$$

$$1 + \frac{P}{2} + \frac{Q}{4} = 0 \Rightarrow 1 - \frac{2x+5}{2x+4} + \frac{2}{4x+8} = 0 \quad \left( 1 + \frac{P}{a} + \frac{Q}{a^2} = 0, \text{ choosing } a = 2 \right)$$

Hence  $y = e^{2x}$  is a part of C.F.

Putting  $y = e^{2x}v$  in (1), the reduced equation as in the article 15.6.

$$\frac{d^2v}{dx^2} + \left[ P + \frac{2}{u} \frac{du}{dx} \right] \frac{dv}{dx} = \frac{(x+1)e^x}{u(x+2)}$$

On putting the values of  $P$ ,  $Q$  and  $R$ , we get

$$\begin{aligned} \Rightarrow \quad & \frac{d^2v}{dx^2} + \left[ -\frac{2x+5}{x+2} + \frac{2}{e^{2x}} 2e^{2x} \right] \frac{dv}{dx} = \frac{(x+1)e^x}{e^{2x}(x+2)} \\ \Rightarrow \quad & \frac{d^2v}{dx^2} + \left[ -\frac{2x+5}{x+2} + 4 \right] \frac{dv}{dx} = \frac{x+1}{x+2} e^{-x} \\ \Rightarrow \quad & \frac{dz}{dx} + \frac{2x+3}{x+2} z = \frac{x+1}{x+2} e^{-x} \quad \left( \frac{dv}{dx} = z \right) \end{aligned}$$

which is a linear differential equation,

$$I.F. = e^{\int \frac{2x+3}{x+2} dx} = e^{\int \left( 2 - \frac{1}{x+2} \right) dx} = e^{2x - \log(x+2)} = \frac{e^{2x}}{x+2}$$

$$\begin{aligned} \text{Its solution is } & z \cdot \frac{e^{2x}}{x+2} = \int \frac{e^{2x}}{x+2} \frac{x+1}{x+2} e^{-x} dx + c \\ & = \int \frac{e^x (x+1)}{(x+2)^2} dx + c = \int e^x \left[ \frac{1}{x+2} - \frac{1}{(x+2)^2} \right] dx + c = \int \frac{e^x dx}{x+2} - \int \frac{e^x dx}{(x+2)^2} + c \\ & = \frac{e^x}{x+2} + \int \frac{e^x dx}{(x+2)^2} - \int \frac{e^x dx}{(x+2)^2} + c = \frac{e^x}{x+2} + c \\ \Rightarrow \quad & z = e^{-x} + c(x+2)e^{-2x} \Rightarrow \frac{dv}{dx} = e^{-x} + c(x+2)e^{-2x} \\ & v = \int e^{-x} dx + c \int (x+2)e^{-2x} dx + c_1 = -e^{-x} + c \left[ \frac{(x+2)e^{-2x}}{-2} - \frac{e^{-2x}}{4} \right] + c_1 \\ & = -e^{-x} - \frac{ce^{-2x}}{4} [2x+5] + c_1 \\ & y = u.v \\ & y = e^{2x} \left[ -e^{-x} - \frac{ce^{-2x}}{4} (2x+5) + c_1 \right] \Rightarrow y = -e^x + \frac{c}{4} (2x+5) + c_1 e^{2x} \quad \text{Ans.} \end{aligned}$$

### EXERCISE 15.5

Solve the following differential equations:

$$1. \quad (3-x) \frac{d^2y}{dx^2} - (9-4x) \frac{dy}{dx} + (6-3x)y = 0, \text{ given } y = e^x \text{ is a solution.}$$

$$\text{Ans. } y = \frac{c_1}{8} e^{3x} (4x^3 - 42x^2 + 150x - 183) + c_2 e^x$$

$$2. \quad x \frac{d^2y}{dx^2} - \frac{dy}{dx} + (1-x)y = x^2 e^{-x} \text{ given } y = e^x \text{ is an integral included in C.F.}$$

$$\text{Ans. } y = c_2 e^x + c_1 (2x+1) e^{-x} - \frac{1}{4} (2x^2 + 2x + 1) e^{-x}$$

$$3. \quad (1-x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} - y = x(1-x^2)^{3/2}, \text{ given } y = x \text{ is part of C.F.}$$

$$\text{Ans. } y = -\frac{x}{9} (1-x^2)^{3/2} - c_1 [\sqrt{(1-x^2)} + x \sin^{-1} x] + c_2 x.$$

$$4. \quad \sin^2 x \frac{d^2y}{dx^2} = 2y, \text{ given that } y = \cot x \text{ is a solution}$$

$$\text{Ans. } cy = 1 + (c_1 - x) \cot x$$

$$5. \quad \frac{d^2y}{dx^2} - x^2 \frac{dy}{dx} + xy = x, \text{ given } y = x \text{ is a part of C.F.}$$

$$\text{Ans. } y = 1 + c_1 x \int \frac{1}{x^2} e^{\frac{x^3}{3}} dx + c_2 x$$

6.  $(x \sin x + \cos x) \frac{d^2y}{dx^2} - x \cos x \frac{dy}{dx} + y \cos x = 0$  given  $y = x$  is solution.

**Ans.**  $y = c_2 x - c_1 \cos x$

7.  $x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} - y = 0$ , given that  $y = x + \frac{1}{x}$  is one integral.

**Ans.**  $y = c_2 \left( x + \frac{1}{x} \right) + \frac{c_1}{x}$

8.  $x^2 \frac{d^2y}{dx^2} + 2x \frac{dy}{dx} - 12y = x^3 \log x$

(U.P., II Semester 2004)

[Hint.  $(n(n-1) + pnx + Qx^2 = 0)$ ,  $n = 3$ , satisfies this equation. Put  $y = vx^3, \frac{dy}{dx} = z$ ]

**Ans.**  $y = \left( c_1 x^3 + \frac{c_2}{x^4} \right) + \frac{x^3}{98} \log x (7 \log x - 2)$

### 15.7 NORMAL FORM (REMOVAL OF FIRST DERIVATIVE)

Consider the differential equation  $\frac{d^2y}{dx^2} + P \frac{dy}{dx} + Qy = R$  ... (1)

Put  $y = uv$  where  $v$  is not an integral solution of C.F.

$$\begin{aligned}\frac{dy}{dx} &= v \frac{du}{dx} + u \frac{dv}{dx} \\ \frac{d^2y}{dx^2} &= u \frac{d^2v}{dx^2} + 2 \frac{du}{dx} \frac{dv}{dx} + v \frac{d^2u}{dx^2}\end{aligned}$$

On putting the values of  $y, \frac{dy}{dx}, \frac{d^2y}{dx^2}$  in (1) we get

$$\begin{aligned}&\left( u \frac{d^2v}{dx^2} + 2 \frac{dv}{dx} \frac{du}{dx} + v \frac{d^2u}{dx^2} \right) + P \left( u \frac{du}{dx} + v \frac{du}{dx} \right) + Quv = R \\ \Rightarrow &v \frac{d^2u}{dx^2} + \frac{du}{dx} \left( Pv + 2 \frac{dv}{dx} \right) + u \left( \frac{d^2v}{dx^2} + P \frac{dv}{dx} + Qv \right) = R \\ \Rightarrow &\frac{d^2u}{dx^2} + \frac{du}{dx} \left( P + \frac{2}{u} \frac{dv}{dx} \right) + \frac{u}{v} \left( \frac{d^2v}{dx^2} + P \frac{dv}{dx} + Qv \right) = \frac{R}{v}\end{aligned} \quad \dots (2)$$

Here in the last bracket on L.H.S. is not zero  $y = v$  is not a part of C.F.

Here we shall remove the first derivative.

$$\begin{aligned}P + \frac{2}{v} \frac{dv}{dx} &= 0 \text{ or } \frac{dv}{v} = -\frac{1}{2} P dx \text{ or } \log v = -\frac{1}{2} \int P dx \\ v &= e^{-\frac{1}{2} \int P dx}\end{aligned}$$

In (2) we have to find out the value of the last bracket i.e.,  $\frac{d^2v}{dx^2} + P \frac{dv}{dx} + Qv$

$$\frac{dv}{dx} = -\frac{P}{2} e^{-\frac{1}{2} \int P dx} = -\frac{1}{2} Pv \quad \left[ \because v = e^{-\frac{1}{2} \int P dx} \right]$$

$$\frac{d^2v}{dx^2} = -\frac{1}{2} \frac{dP}{dx} v - \frac{P}{2} \frac{dv}{dx} = -\frac{1}{2} \frac{dP}{dx} v - \frac{P}{2} \left( -\frac{1}{2} Pv \right) = -\frac{1}{2} \frac{dP}{dx} v + \frac{1}{4} P^2 v$$

$$\therefore \frac{d^2v}{dx^2} + P \frac{dv}{dx} + Qv = -\frac{1}{2} \frac{dP}{dx} v + \frac{1}{4} P^2 v + P \left( -\frac{1}{2} Pv \right) + Qv = v \left[ Q - \frac{1}{2} \frac{dP}{dx} - \frac{1}{4} P^2 \right]$$

Equation (1) is transformed as

$$\frac{d^2u}{dx^2} + \frac{u}{v} v \left\{ Q - \frac{1}{2} \frac{dP}{dx} - \frac{1}{4} P^2 \right\} = \frac{R}{v}$$

$$\Rightarrow \frac{d^2u}{dx^2} + u \left\{ Q - \frac{1}{2} \frac{dP}{dx} - \frac{P^2}{4} \right\} = R e^{\frac{1}{2} \int P dx}$$

$$\frac{d^2u}{dx^2} + Q_1 u = R_1 \quad \text{where } Q_1 = \left[ Q - \frac{1}{2} \frac{dP}{dx} - \frac{P^2}{4} \right]$$

$$R_1 = R e^{\frac{1}{2} \int P dx} \quad \text{or } \frac{R}{v}$$

$$y = uv \quad \text{and} \quad v = e^{-\frac{1}{2} \int P dx} \quad \text{Ans.}$$

**Example 18.** Solve  $\frac{d}{dx} \left[ \cos^2 x \frac{dy}{dx} \right] + \cos^2 x \cdot y = 0$

**Solution.** We have,  $\frac{d}{dx} \left( \cos^2 x \frac{dy}{dx} \right) + \cos^2 x \cdot y = 0$

$$\Rightarrow \frac{d^2y}{dx^2} \cos^2 x - 2 \cos x \sin x \frac{dy}{dx} + (\cos^2 x)y = 0 \Rightarrow \frac{d^2y}{dx^2} - 2 \tan x \frac{dy}{dx} + y = 0$$

Here,  $P = -2 \tan x, Q = 1, R = 0$

$$Q_1 = Q - \frac{1}{2} \frac{dP}{dx} - \frac{P^2}{4} = 1 - \frac{1}{2} (-2 \sec^2 x) - \frac{4 \tan^2 x}{4}$$

$$= 1 + \sec^2 x - \tan^2 x = 1 + 1 = 2$$

$$R_1 = R e^{\frac{1}{2} \int P dx} = 0$$

$$v = e^{-\frac{1}{2} \int P dx} = e^{-\frac{1}{2} \int (-2 \tan x) dx} = e^{\int \tan x dx} = e^{\log \sec x} = \sec x$$

Normal equation is

$$\frac{d^2u}{dx^2} + Q_1 u = R_1$$

$$\frac{d^2u}{dx^2} + 2u = 0 \quad \text{or} \quad (D_2 + 2) u = 0 \quad \Rightarrow \quad D = \pm i \sqrt{2}$$

$$u = c_1 \cos \sqrt{2} x + c_2 \sin \sqrt{2} x$$

$$y = u \cdot v$$

$$= [c_1 \cos \sqrt{2} x + c_2 \sin \sqrt{2} x] \sec x \quad \text{Ans.}$$

**Example 19.** Solve  $x^2 \frac{d^2y}{dx^2} - 2(x^2 + x) \frac{dy}{dx} + (x^2 + 2x + 2)y = 0$

**Solution.** We have,  $\frac{d^2y}{dx^2} - \frac{2(x^2 + x)}{x^2} \frac{dy}{dx} + \left( \frac{x^2 + 2x + 2}{x^2} \right) y = 0 \quad \dots(1)$

Here  $p = -2 \left( 1 + \frac{1}{x} \right), Q = \frac{x^2 + 2x + 2}{x^2}, R = 0$

In order to remove the first derivative, we put  $y = u \cdot v$  in (1) to get the normal equation

$$\frac{d^2v}{dx^2} + Q_1 v = R_1 \quad \dots(2)$$

where  $v = e^{-\frac{1}{2} \int p dx} = e^{-\frac{1}{2} \int -2 \left( 1 + \frac{1}{x} \right) dx} = e^{\int \left( 1 + \frac{1}{x} \right) dx} = e^x \cdot e^{\log x} = x e^x$

$$\begin{aligned} Q_1 &= Q - \frac{1}{2} \frac{dp}{dx} - \frac{p^2}{4} = \frac{x^2 + 2x + 2}{x^2} - \frac{1}{2} \left( \frac{2}{x^2} \right) - \frac{4}{4} \left( 1 + \frac{1}{x} \right)^2 \\ &= 1 + \frac{2}{x} + \frac{2}{x^2} - \frac{1}{x^2} - 1 - \frac{1}{x^2} - \frac{2}{x} \\ R_1 &= R e^{\frac{1}{2} \int p dx} = 0 \end{aligned}$$

On putting the values of  $Q_1$  and  $R_1$  in (2), we get

$$\begin{aligned} \frac{d^2 u}{dx^2} + 0(u) &= 0 \Rightarrow \frac{d^2 u}{dx^2} = 0 \\ \frac{du}{dx} &= c_1 \Rightarrow u = c_1 x + c_2 \\ \therefore y &= u.v = (c_1 x + c_2) x e^x \quad \text{Ans.} \end{aligned}$$

**Example 20.** Solve  $\frac{d^2 y}{dx^2} - 4x \frac{dy}{dx} + (4x^2 - 1)y = -3e^{x^2} \sin 2x$  (U.P. II Semester, (C.O.) 2004)

**Solution.** We have,  $\frac{d^2 y}{dx^2} = 4x \frac{dy}{dx} + (4x^2 - 1)y = -3e^{x^2} \sin 2x \quad \dots(1)$

Here  $p = -4x$ ,  $Q = 4x^2 - 1$ ,  $R = -3e^{x^2} \sin 2x$

In order to remove the first derivative,  $v = e^{-\frac{1}{2} \int p dx} = e^{-\frac{1}{2} \int -4x dx} = e^{2 \int x dx} = e^{x^2}$

On putting  $y = uv$ , the normal equation is  $\frac{d^2 u}{dx^2} + Q_1 u = R_1 \quad \dots(2)$

where  $Q_1 = Q - \frac{1}{2} \frac{dp}{dx} - \frac{p^2}{4} = (4x^2 - 1) - \frac{1}{2}(-4) - \frac{16x^2}{4} = 4x^2 - 1 + 2 - 4x^2 = 1$

$$R_1 = \frac{R}{v} = \frac{-3e^{x^2} \sin 2x}{e^{x^2}} = -3 \sin 2x$$

Equation (2) becomes  $\frac{d^2 u}{dx^2} + u = -3 \sin 2x$

$$(D^2 + 1)u = -3 \sin 2x$$

A.E. is  $D^2 + 1 = 0 \Rightarrow D = \pm i \Rightarrow C.F. = c_1 \cos x + c_2 \sin x$

$$P.I. = \frac{1}{D^2 + 1} (-3 \sin 2x) = \frac{-3 \sin 2x}{-4 + 1} = \sin 2x$$

$$u = c_1 \cos x + c_2 \sin x + \sin 2x$$

$$y = u.v = (c_1 \cos x + c_2 \sin x + \sin 2x)e^{x^2} \quad \text{Ans.}$$

### EXERCISE 15.6

Solve the following differential equations:

$$1. \quad \frac{d^2 y}{dx^2} - 2 \tan x \cdot y - 5y = 0 \quad \text{Ans. } y = (a e^{2x} + e^{-3x}) \sec x$$

$$2. \quad \frac{d^2 y}{dx^2} - 4x \frac{dy}{dx} + (4x^2 - 3)y = e^{x^2} \quad \text{Ans. } y = (c_1 e^x + c_2 e^{-x} - 1)$$

$$3. \quad \frac{d^2 y}{dx^2} - 2x \frac{dy}{dx} + (x^2 + 2)y = e^{\frac{1}{2}(x^2 + 2x)} \quad \text{Ans. } y = (c_1 \cos \sqrt{3}x + c_2 \sin \sqrt{3}x) e^{\frac{x^2}{2} + \frac{1}{4}e^x \cdot e^{\frac{x^2}{2}}}$$

$$4. \quad \frac{d^2 y}{dx^2} - 2x \frac{dy}{dx} + \left(n^2 + \frac{2}{x^2}\right)y = 0 \quad \text{Ans. } y = (c_1 \cos nx + c_2 \sin nx)x$$

$$5. \quad \frac{d^2 y}{dx^2} + \frac{2}{x} \frac{dy}{dx} - n^2 y = 0 \quad \text{Ans. } y = (c_1 e^{nx} + c_2 + e^{-nx}) \frac{1}{x}$$

6.  $\frac{d^2y}{dx^2} + \frac{1}{x} \frac{dy}{dx} + \left( \frac{1}{4x^{2/3}} - \frac{1}{x^{4/3}} - \frac{6}{x^2} \right) y = 0$       Ans.  $y = (c_1 x^3 + c_2 x^{-2}) e^{-\frac{3}{4} x^{\frac{2}{3}}}$

7.  $\frac{d^2y}{dx^2} - \frac{x^3}{\sqrt{x}} \frac{dy}{dx} + \frac{y}{4x^2} (-8 + \sqrt{x} + x) = 0$       Ans.  $y = (c_1 x^2 + c_2 x^{-1}) e^{\sqrt{x}}$

### 15.8 METHOD OF SOLVING LINEAR DIFFERENTIAL EQUATIONS BY CHANGING THE INDEPENDENT VARIABLE

Consider,  $\frac{d^2y}{dx^2} + P \frac{dy}{dx} + Qy = R$  ... (1)

Let us change the independent variable  $x$  to  $z$  and  $z = f(x)$

$$\frac{dy}{dx} = \frac{dy}{dz} \frac{dz}{dx} \Rightarrow \frac{d^2y}{dx^2} = \frac{d^2y}{dz^2} \left( \frac{dz}{dx} \right)^2 + \frac{dy}{dz} \frac{d^2z}{dx^2}$$

Putting the values of  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in (1), we get

$$\begin{aligned} & \left( \frac{d^2y}{dz^2} \left( \frac{dz}{dx} \right)^2 + \frac{dy}{dz} \frac{d^2z}{dx^2} \right) + P \left( \frac{dy}{dz} \frac{d^2z}{dx^2} \right) + Qy = R \\ & \Rightarrow \frac{d^2y}{dz^2} \left( \frac{dz}{dx} \right)^2 + \left( P \frac{dz}{dx} + \frac{d^2z}{dx^2} \right) \frac{dy}{dz} + Qy = R \\ & \Rightarrow \frac{d^2y}{dz^2} + \frac{P \left( \frac{dz}{dx} + \frac{d^2z}{dx^2} \right)}{\left( \frac{dz}{dx} \right)^2} \frac{dy}{dz} + \frac{Qy}{\left( \frac{dz}{dx} \right)^2} = \frac{R}{\left( \frac{dz}{dx} \right)^2} \Rightarrow \frac{d^2y}{dz^2} + P_1 \frac{dy}{dz} + Q_1 y = R_1 \quad \dots (2) \\ & \text{where } P_1 = \frac{P \left( \frac{dz}{dx} + \frac{d^2z}{dx^2} \right)}{\left( \frac{dz}{dx} \right)^2}, \quad Q_1 = \frac{Q}{\left( \frac{dz}{dx} \right)^2}, \quad R_1 = \frac{R}{\left( \frac{dz}{dx} \right)^2} \end{aligned}$$

Equation (2) is solved either by taking  $P_1 = 0$  or  $Q_1 = a$  constant.

Equation (2) can be solved by two methods, by taking

- First Method,**  $P_1 = 0$   
**Second Method,**  $Q_1 = \text{constant}$

#### Working Rule

**Step 1.** Coefficient of  $\frac{d^2y}{dx^2}$  should be made as 1 if it is not so.

**Step 2.** To get  $P$ ,  $Q$  and  $R$ , compare the given differential equation with the standard form  
 $y'' + P y' + Qy = R$ .

**Step 3.** Find  $P_1$ ,  $Q_1$  and  $R_1$  by the following formulae.

$$P_1 = \frac{\frac{d^2y}{dx^2} + p \frac{dy}{dx}}{\left( \frac{dz}{dx} \right)^2}, \quad R_1 = \frac{R}{\left( \frac{dz}{dx} \right)^2}$$

**Step 4.** Find out the value of  $z$  by taking

**First Method,**  $P_1 = 0$       **Second Method.**  $Q_1 = \text{constant}$

**Step 5.** We get a reduced equation  $\frac{d^2y}{dz^2} + P_1 \frac{dy}{dz} + Q_1 y = R_1$

On solving this equation we can find out the value of  $y$  in terms of  $z$ .  
Then write down the solution in terms of  $x$  by replacing the value of  $z$ .

**Example 21.** Solve  $\frac{d^2y}{dx^2} + \cot x \frac{dy}{dx} + 4 y \operatorname{cosec}^2 x = 0$

**Solution.** We have,  $\frac{d^2y}{dx^2} + \cot x \frac{dy}{dx} + 4 y \operatorname{cosec}^2 x = 0$  ... (1)

Here,  $P = \cot x$ ,  $Q = 4 \operatorname{cosec}^2 x$  and  $R = 0$

Changing the independent variable from  $x$  to  $z$ , the equation becomes

$$\frac{d^2y}{dx^2} + P_1 \frac{dy}{dz} + Q_1 y = 0 \quad \dots(2)$$

where  $P_1 = \frac{P \frac{dz}{dx} + \frac{d^2z}{dx^2}}{\left(\frac{dz}{dx}\right)^2}$ ,  $Q_1 = \frac{Q}{\left(\frac{dz}{dx}\right)^2}$

**Case I.** Let us take  $P_1 = 0$

$$\frac{p \frac{dz}{dx} + \frac{d^2z}{dx^2}}{\left(\frac{dz}{dx}\right)^2} = 0 \quad \text{or} \quad p \frac{dz}{dx} + \frac{d^2z}{dx^2} = 0 \Rightarrow \frac{d^2z}{dx^2} + \cot x \frac{dz}{dx} = 0 \quad \dots(3)$$

Put

$$\frac{dz}{dx} = v, \quad \frac{d^2z}{dx^2} = \frac{dv}{dx}$$

(3) becomes  $\frac{dv}{dx} + (\cot x) v = 0 \Rightarrow \frac{dv}{v} = -\cot x \cdot dx$   
 $\Rightarrow \log v = -\log \sin x + \log c = \log c \operatorname{cosec} x \Rightarrow v = c \operatorname{cosec} x$   
 $\frac{dz}{dx} = c \operatorname{cosec} x \text{ or } dz = (c \operatorname{cosec} x) dx \Rightarrow z = c \log \tan \frac{x}{2}$

**Case II.**

Now let us take  $Q_1 = \text{Constant}$ .

$$Q_1 = \frac{Q}{\left(\frac{dz}{dx}\right)^2} = \frac{4 \operatorname{cosec}^2 x}{c^2 \operatorname{cosec}^2 x} = \frac{4}{c^2} \text{ which is constant}$$

Hence the equation (2) reduces to

$$\begin{aligned} & \frac{d^2y}{dz^2} + 0 \frac{dy}{dz} + \frac{4}{c^2} y = 0 \quad \text{or} \quad \frac{d^2y}{dz^2} + \frac{4}{c^2} y = 0 \quad \left[ \because P_1 = 0, Q_1 = \frac{4}{c^2} \right] \\ & \Rightarrow \left( D^2 + \frac{4}{c^2} \right) y = 0, \quad \text{A.E. is } m^2 + \frac{4}{c^2} = 0 \Rightarrow m = \pm i \frac{2}{c} \\ & \qquad \qquad \qquad \text{C.F.} = c_1 \cos \frac{2z}{c} + c_2 \sin \frac{2z}{c} \quad \left( z = c \log \tan \frac{x}{2} \right) \\ & \Rightarrow y = c_1 \cos \left( 2 \log \tan \frac{x}{2} \right) + c_2 \sin \left( 2 \log \tan \frac{x}{2} \right) \quad \text{Ans.} \end{aligned}$$

**Example 22.** Solve  $x^6 \frac{d^2y}{dx^2} + 3x^5 \frac{dy}{dx} + a^2 y = \frac{1}{x^2}$

**Solution.** We have,  $\frac{d^2y}{dx^2} + \frac{3}{x} \frac{dy}{dx} + a^2 \frac{y}{x^6} = \frac{1}{x^8}$  ... (1)

Here  $P = \frac{3}{x}$  and  $Q = \frac{a^2}{x^6}$

On changing the independent variable  $x$  to  $z$ , the equation (1) is reduced to

$$\frac{d^2y}{dz^2} + P_1 \frac{dy}{dz} + Q_1 y = R_1 \quad \dots(2)$$

### Using Second Method

$$\text{Let } Q_1 = a_2 \text{ (constant)} \quad Q_1 = \frac{Q}{\left(\frac{dz}{dx}\right)^2} = \frac{a^2}{x^6 \left(\frac{dz}{dx}\right)^2} = \text{constant} = a_2 \text{ (say)}$$

$$\therefore x^6 \left(\frac{dz}{dx}\right)^2 = 1 \Rightarrow x^3 \left(\frac{dz}{dx}\right) = 1 \Rightarrow \frac{dz}{dx} = \frac{1}{x^3} \Rightarrow dz = \frac{dx}{x^3} \Rightarrow z = \frac{x^{-2}}{-2} + c$$

$$\text{On differentiating twice, we have } \frac{d^2z}{dx^2} = \frac{-3}{x^4}$$

$$P_1 = \frac{P \frac{dz}{dx} + \frac{d^2z}{dx^2}}{\left(\frac{dz}{dx}\right)^2} = \frac{\frac{3}{x} \cdot \frac{1}{x^3} + \left(\frac{-3}{x^4}\right)}{\left(\frac{1}{x^3}\right)^2} = 0 \Rightarrow R_1 = \frac{R}{\left(\frac{dz}{dx}\right)^2} = \frac{\frac{1}{x^8}}{\frac{1}{x^6}} = \frac{1}{x^2} = -2z$$

On putting the values of  $P_1$ ,  $Q_1$  and  $R_1$  in (2), we get

$$\frac{d^2y}{dz^2} + a^2 y = -2z \Rightarrow (D^2 + a^2) y = -2z$$

$$\text{A.E. is } m^2 + a^2 = 0, \quad m = \pm i a, \quad \Rightarrow \quad \text{C.F.} = c_1 \cos az + c_2 \sin az$$

$$\text{P.I.} = \frac{1}{D^2 + a^2} (-2z) = \frac{1}{a^2} \left[ 1 + \frac{D^2}{a^2} \right]^{-1} (-2z) = \frac{1}{a^2} \left[ 1 - \frac{D^2}{a^2} \right] (-2z) = \frac{-2z}{a^2} = \frac{1}{a^2 x^2}$$

$$y = \text{C.F.} + \text{P.I.}$$

$$y = c_1 \cos \frac{a}{2x^2} - c_2 \sin \frac{a}{2x^2} + \frac{1}{a^2 x^2} \quad \text{Ans.}$$

**Example 23.** Solve  $\frac{d^2y}{dx^2} - \frac{1}{x} \frac{dy}{dx} + 4x^2 y = x^4$  (U.P., I Semester Summer 2003, 2002)

**Solution.** We have,  $\frac{d^2y}{dx^2} - \frac{1}{x} \frac{dy}{dx} + 4x^2 y = x^4$  ... (1)

$$\text{Hence } P = -\frac{1}{x}, \quad Q = 4x^2, \quad R = x^4$$

On changing the independent variable  $x$  to  $z$ , the equation (1) is transformed as

$$\frac{d^2y}{dz^2} + P_1 \frac{dy}{dz} + Q_1 y = R_1 \quad \dots(2)$$

### Using Second Method

$$\text{Let } Q_1 = 1 \text{ (constant)}$$

but  $Q_1 = \frac{Q}{\left(\frac{dz}{dx}\right)^2} = \frac{4x^2}{\left(\frac{dz}{dx}\right)^2} = \text{constant} = 1 \quad (\text{say})$

$$\left(\frac{dz}{dx}\right)^2 = 4x^2 \Rightarrow \frac{dz}{dx} = 2x$$

$$\Rightarrow dz = 2x dx \Rightarrow z = x^2 + c \Rightarrow x^2 = z - c \quad \dots(3)$$

$$P_1 = \frac{P\left(\frac{dz}{dx}\right) + \frac{d^2z}{dx^2}}{\left(\frac{dz}{dx}\right)^2} = \frac{-\frac{1}{x}(2x) + 2}{(2x)^2} = 0$$

$$R_1 = \frac{R}{\left(\frac{dz}{dx}\right)^2} = \frac{x^4}{4x^2} = \frac{x^2}{4} = \frac{z-c}{4} \quad [\text{Using (3)}]$$

On putting the value of  $P_1$ ,  $Q_1$  and  $R_1$  in (2), we get

$$\frac{d^2y}{dz^2} + (0)\frac{dy}{dz} + (1)y = \frac{z-c}{4} \Rightarrow \frac{d^2y}{dz^2} + y = \frac{z-c}{4} \Rightarrow (D^2 + 1)y = \frac{z-c}{4}$$

A.E. is  $m^2 + 1 = 0$ ,  $\Rightarrow m = \pm i$

C.F. =  $c_1 \cos z + c_2 \sin z$

$$\text{P.I.} = \frac{1}{D^2 + 1} \left( \frac{z-c}{4} \right) = (1+D^2)^{-1} \frac{z-c}{4} = (1-D^2) \frac{z-c}{4} = \frac{z-c}{4}$$

Now complete solution = C.F. + P.I.

$$\Rightarrow y = c_1 \cos z + c_2 \sin z + \frac{z-c}{4} \Rightarrow y = c_1 \cos x^2 + c_2 \sin x^2 + \frac{x^2}{4} \quad \text{Ans.}$$

**Example 24.** Solve the following differential equation by changing the independent variable

$$x \frac{d^2y}{dx^2} + (4x^2 - 1) \frac{dy}{dx} + 4x^3 y = 2x^3 \quad (\text{U.P., II Semester, Summer 2006})$$

**Solution.** We have

$$x \frac{d^2y}{dx^2} + (4x^2 - 1) \frac{dy}{dx} + 4x^3 y = 2x^3$$

$$\Rightarrow \frac{d^2y}{dx^2} + \left( \frac{4x^2 - 1}{x} \right) \frac{dy}{dx} + 4x^2 y = 2x^2 \quad \dots(1)$$

Here,  $P = \frac{4x^2 - 1}{x}$ ,  $Q = 4x^2$  and  $R = 2x^2$

Changing the independent variable from  $x$  to  $z$ , the equation becomes

$$\frac{d^2y}{dz^2} + P_1 \frac{dy}{dz} + Q_1 y = R_1 \quad \dots(2)$$

where  $P_1 = \frac{P \frac{dz}{dx} + \frac{d^2z}{dx^2}}{\left(\frac{dz}{dx}\right)^2}$ ,  $Q_1 = \frac{Q}{\left(\frac{dz}{dx}\right)^2}$ ,  $R_1 = \frac{R}{\left(\frac{dz}{dx}\right)^2}$

**Using Second Method**

Choose  $Q_1 = 1$  (constant) therefore  $1 = \frac{Q}{\left(\frac{dz}{dx}\right)^2}$

$$\Rightarrow \left(\frac{dz}{dx}\right)^2 = 4x^2 \quad [\because Q = 4x^2]$$

$$\Rightarrow \frac{dz}{dx} = 2x \quad \Rightarrow dz = 2x dx \Rightarrow z = x^2$$

$$\frac{d^2z}{dx^2} = 2$$

and  $P_1 = \frac{P\left(\frac{dz}{dx}\right) + \frac{d^2z}{dx^2}}{\left(\frac{dz}{dx}\right)^2} = \frac{\left(\frac{4x^2 - 1}{x}\right)(2x) + 2}{(2x)^2} \Rightarrow P_1 = \frac{8x^2 - 2 + 2}{4x^2} = 2$

$$R_1 = \frac{R}{\left(\frac{dz}{dx}\right)^2} = \frac{2x^2}{4x^2} = \frac{1}{2}$$

The equation (2) is transformed to

$$\frac{d^2y}{dz^2} + 2\frac{dy}{dz} + y = \frac{1}{2}$$

A.E. is  $m^2 + 2m + 1 = 0$   
 $\Rightarrow (m+1)^2 = 0 \Rightarrow m = -1, -1$   
 C.F. =  $(C_1 + C_2z)e^{-z}$   
 $P.I. = \frac{1}{D^2 + 2D + 1} \left(\frac{1}{2}\right) = \frac{1}{0+0+1} \left(\frac{1}{2}\right) = \frac{1}{2}$

Complete solution is

$$y = C.F. + P.I. = (c_1 + c_2z)e^{-z} + \frac{1}{2}$$

$$\Rightarrow y = (c_1 + c_2x^2)e^{-x^2} + \frac{1}{2} \quad \text{Ans.}$$

**EXERCISE 15.7**

Solve the following differential equations:

1.  $x^4 \frac{d^2y}{dx^2} + 2x^3 \frac{dy}{dx} + a^2y = 0$  Ans.  $y = c_1 \cos \frac{a}{x} + c_2 \sin \frac{a}{x}$
2.  $\cos x \frac{d^2y}{dx^2} + \frac{dy}{dx} \sin x - 2y \cos^3 x = 2 \cos^5 x$  Ans.  $y = c_1 e^{\sqrt{2} \sin x} + c_2 e^{-\sqrt{2} \sin x} + \sin^2 x$
3.  $\frac{d^2y}{dx^2} + \tan x \frac{dy}{dx} + y \cos^2 x = 0$  Ans.  $y = c_1 \cos(\sin x) + c_2 \sin(\sin x)$
4.  $x \frac{d^2y}{dx^2} - \frac{dy}{dx} - 4x^3y = 8x^2 \sin x^2$  Ans.  $y = c_1 e^{x^2} + c_2 e^{\cos x} + \frac{1}{6} e^{-\cos x}$
5.  $\frac{d^2y}{dx^2} + (3 \sin x - \cot x) \frac{dy}{dx} + 2y \sin^2 x = e^{-\cos x} \sin^2 x$  Ans.  $y = c_1 e^{2 \cos x} + c_2 e^{\cos x} + \frac{1}{6} e^{-\cos x}$
6.  $\frac{d^2y}{dx^2} + (\tan x - 1)^2 \frac{dy}{dx} - n(n-1)y \sec^4 x = 0$  Ans.  $y = C_1 e^{-n \tan x} + C_2 e^{(n-1) \tan x}$

$$7. \frac{d^2y}{dx^2} - \cot x \frac{dy}{dx} - y \sin^2 x = \cos x - \cos^3 x \quad \text{Ans. } y = C_1 e^{-\cos x} + C_2 e^{\cos x} - \cos x$$

$$8. \frac{d^2y}{dx^2} + (3 \sin x - \cot x) \frac{dy}{dx} + 2y \sin^2 x = e^{-\cos x} \sin^2 x \quad \text{Ans. } y = C_1 e^{\cos x} + C_2 e^{2\cos x} + \frac{1}{6} e^{-\cos x}$$

### 15.9 METHOD OF VARIATION OF PARAMETERS

Here, the method to find out C.F. is different from the methods discussed earlier. Now, we will find C.F. new methods and then will apply the method of variation of parameters as discussed in Article 13.3 on page 275.

**Example 25.** By the method of variation of parameters, solve the differential equation

$$\frac{d^2y}{dx^2} + (1 - \cot x) \frac{dy}{dx} - y \cot x = \sin^2 x. \quad (\text{U.P., II Semester, Summer 2002})$$

**Solution.** First we shall find the C.F. of the given equation i.e., the solution of the equation.

$$\frac{d^2y}{dx^2} + (1 - \cot x) \frac{dy}{dx} - y \cot x = 0 \quad \left[ \frac{d^2y}{dx^2} + P \frac{dy}{dx} + Q y = 0 \right] \quad \dots(1)$$

Here  $P = 1 - \cot x$ ,  $Q = -\cot x$

$\therefore 1 - P + Q = 1 - (1 - \cot x) - \cot x = 0$ ,  $\therefore y = e^{-x}$  is apart of the C.F.

$$\text{Putting } y = ve^{-x}, \quad \frac{dy}{dx} = -ve^{-x} \frac{dy}{dx}$$

$$\frac{d^2y}{dx^2} = e^{-x} \frac{d^2v}{dx^2} - 2e^{-x} \frac{dv}{dx} + ve^{-x} \quad \text{the equation (1) reduces to}$$

$$\frac{d^2v}{dx^2} - (1 + \cot x) \frac{dv}{dx} = 0 \Rightarrow \frac{dp}{dx} - (1 + \cot x)p = 0. \quad \text{where } p = \frac{dv}{dx}$$

$$\Rightarrow \frac{dp}{p} = (1 + \cot x) dx$$

$$\text{Integrating, we get} \quad \log p = x + \log \sin x + \log c_1 \Rightarrow \log \left[ \frac{p}{c_1 \sin x} \right] = x$$

$$\Rightarrow \frac{P}{c_1 \sin x} = e^x \Rightarrow P = c_1 e^x \sin x$$

$$\therefore P = \frac{dp}{dx} = c_1 e^x \sin x$$

$$\Rightarrow v = c_1 \int e^x \sin x dx = c_1 \cdot \frac{1}{2} e^x (\sin x - \cos x) + c_2$$

$\therefore$  The solution of (1) i.e., C.F. of the given equation is

$$y = ve^{-x} = c_1 \cdot \frac{1}{2} (\sin x - \cos x) + c_2 e^{-x}$$

Let  $y = A(\sin x - \cos x) + Be^{-x}$  be the complete solution of the given equation where  $A$  and  $B$  are functions of  $x$ , so chosen that the given equation will be satisfied  $\dots(2)$

$$\therefore \frac{dy}{dx} = A(\cos x + \sin x) - Be^{-x} + \frac{dA}{dx} (\sin x - \cos x) + \frac{dB}{dx} e^{-x}.$$

Let us choose  $A$  and  $B$  such that

$$\frac{dA}{dx} (\sin x - \cos x) + \frac{dB}{dx} e^{-x} = 0 \quad \dots(3)$$

$$\therefore \frac{dy}{dx} = A(\cos x + \sin x) - Be^{-x}$$

$$\text{and } \frac{d^2y}{dx^2} = \frac{dA}{dx}(\cos x + \sin x) - \frac{dB}{dx}e^{-x} + A(-\sin x + \cos x) + Be^{-x}$$

Putting these values of  $\frac{d^2y}{dx^2}$ ,  $\frac{dy}{dx}$  and  $y$  in the given equation, we get

$$\frac{dA}{dx}(\cos x + \sin x) - \frac{dB}{dx}e^{-x} = \sin^2 x. \quad \dots(4)$$

Solving (3) and (4), we get  $A = -\frac{1}{2} \cos x + c_1$

$$\begin{aligned} \text{and } B &= \frac{1}{4} \int e^x (\sin 2x - 1 + \cos 2x) dx + c_2 = \frac{1}{4} \int e^x \sin 2x dx - \frac{1}{4} \int e^x dx + \frac{1}{4} \int e^x \cos 2x dx \\ &= \frac{1}{4} \cdot \frac{e^x}{5} (\sin 2x - 2 \cos 2x) - \frac{e^x}{4} + \frac{1}{4} \cdot \frac{e^x}{5} (\cos 2x + 2 \sin 2x) + c_2 \\ &= \frac{e^x}{20} (3 \sin 2x - \cos 2x) - \frac{e^x}{4} + c_2. \end{aligned}$$

Putting the values of  $A$  and  $B$  in (2), the general solution of the given equation is

$$\begin{aligned} y &= \left( -\frac{1}{2} \cos x + c_1 \right) (\sin x - \cos x) + \left\{ \frac{e^x}{20} (3 \sin 2x - \cos 2x) - \frac{e^x}{4} + c_2 \right\} e^{-x} \\ &= -\frac{1}{2} \cos x \sin x + \frac{1}{2} \cos^2 x + c_1 \sin x - c_1 \cos x + \frac{3}{20} \sin 2x - \frac{1}{20} \cos 2x - \frac{1}{4} + c_2 e^{-x} \\ &= -\frac{1}{4} (\sin 2x) + \frac{1}{4} (\cos 2x + 1) + c_1 (\sin x - \cos x) + \frac{3}{20} \sin 2x - \frac{1}{20} \cos 2x - \frac{1}{4} + c_2 e^{-x} \\ y &= c_1 (\sin x - \cos x) + c_2 e^{-x} - \frac{1}{10} (\sin 2x - 2 \cos 2x) \end{aligned}$$

**Ans.**

## 15.10 METHOD OF UNDETERMINED COEFFICIENTS

Let  $y = A(\sin x - \cos x) + Be^{-x}$  be the complete solution of the given equation where  $A$  and  $B$  are function of  $x$ , so chosen that the given equation will be satisfied.

$$\therefore \frac{dy}{dx} = A(\cos x + \sin x) - Be^{-x} + \frac{dA}{dx}(\sin x - \cos x) + \frac{dB}{dx}e^{-x}. \quad \dots(2)$$

Let us choose  $A$  and  $B$  such that

$$\frac{dA}{dx}(\sin x - \cos x) + \frac{dB}{dx}e^{-x} = 0. \quad \dots(3)$$

Now (2) becomes

$$\therefore \frac{dy}{dx} = A(\cos x + \sin x) - Be^{-x}$$

$$\text{and } \frac{d^2y}{dx^2} = \frac{dA}{dx}(\cos x + \sin x) - \frac{dB}{dx}e^{-x} + A(-\sin x + \cos x) + Be^{-x}$$

Putting these values of  $\frac{d^2y}{dx^2}$ ,  $\frac{dy}{dx}$  and  $y$  in the given equation, we get

$$\begin{aligned} \frac{dA}{dx}(\cos x + \sin x) - \frac{dB}{dx}e^{-x} + A(-\sin x + \cos x) + Be^{-x} + (1 - \cot x) \\ [A(\cos x + \sin x) - B e^{-x}] - [A(\sin x - \cos x) + Be^{-x}] \cot x &= \sin^2 x \\ \Rightarrow \frac{dA}{dx}(\cos x + \sin x) - \frac{dB}{dx}e^{-x} &= \sin^2 x \end{aligned}$$

Solving (3) and (4), we get

$$\frac{dA}{dx} = \frac{1}{2} \sin x \quad \text{and} \quad \frac{dB}{dx} = \frac{1}{2} e^x (\sin x \cos x - \sin^2 x) = \frac{e^x}{4} (\sin 2x + \cos 2x - 1)$$

Integrating these, we get

$$A = -\frac{1}{2} \cos x + C_1$$

$$\begin{aligned} \text{and } B &= \frac{1}{4} \int e^x (\sin 2x - 1 + \cos 2x) dx = \frac{1}{4} \int e^x \sin 2x dx - \frac{1}{4} \int e^x dx + \frac{1}{4} \int e^x \cos 2x dx \\ &= \frac{1}{4} \cdot \frac{e^x}{5} (\sin 2x - 2 \cos 2x) - \frac{e^x}{4} + \frac{1}{4} \cdot \frac{e^x}{5} (\cos 2x + 2 \sin 2x) + C_3 \\ &= \frac{e^x}{20} (3 \sin 2x - \cos 2x) - \frac{e^x}{4} + C_2 \end{aligned}$$

Putting the values of  $A$  and  $B$  in (2), the general solution of the given equation is

$$\begin{aligned} y &= \left( -\frac{1}{2} \cos x + C_1 \right) (\sin x - \cos x) + \left\{ \frac{e^x}{20} (3 \sin 2x - \cos 2x) - \frac{e^x}{4} + C_2 \right\} e^{-x} \\ &= -\frac{1}{2} \cos x \sin x + \frac{1}{2} \cos^2 x + C_1 \sin x - C_1 \cos x + \frac{3}{20} \sin 2x - \frac{1}{20} \cos 2x - \frac{1}{4} + C_2 e^{-x} \\ &= -\frac{1}{4} (\sin 2x) + \frac{1}{4} (\cos 2x + 1) + C_1 (\sin x - \cos x) + \frac{3}{20} \sin 2x - \frac{1}{20} \cos 2x - \frac{1}{4} + C_2 e^{-x} \\ y &= C_1 (\sin x - \cos x) + C_2 e^{-x} - \frac{1}{10} (\sin 2x - 2 \cos 2x) \end{aligned}$$

**Ans.**

**Example 26.** Solve by the method of variation of parameters:

$$x^2 \frac{d^2y}{dx^2} - 2x(1+x) \frac{dy}{dx} + 2(1+x)y = x^3.$$

**Solution.** Dividing the given equation by  $x^2$ , we get

$$\frac{d^2y}{dx^2} - \frac{2(1+x)}{x} \frac{dy}{dx} + \frac{2(1+x)}{x^2} y = x. \quad \dots(1)$$

Firstly, we shall find the C.F. of (1) i.e., the complete solution of the following differential equation

$$\frac{d^2y}{dx^2} - \frac{2(1+x)}{x} \frac{dy}{dx} + \frac{2(1+x)}{x^2} y = 0 \quad \dots(2)$$

$$\text{Here } P = -\frac{2(1+x)}{x}, Q = \frac{2(1+x)}{x^2}, R = 0$$

$$\text{Clearly, } P + Qx = -\frac{2(1+x)}{x} + \frac{2(1+x)}{x} = 0$$

$$\therefore y = x \text{ is part of C.F}$$

$$\text{Hence, } y = x \text{ here}$$

Let  $y = vx$  be complete primitive of (2). So putting  $y = vx$  in (2), the reduced equation is

$$\frac{d^2v}{dx^2} + \left( \frac{2}{u} \frac{du}{dx} + P \right) \frac{dv}{dx} = \frac{R}{u}$$

$$\text{i.e., } \frac{d^2y}{dx^2} + \left\{ \frac{2}{x} \cdot 1 - \frac{2(1+x)}{x} \right\} \frac{dv}{dx} = 0$$

$$\Rightarrow \frac{d^2v}{dx^2} - \frac{2dv}{dx} = 0 \Rightarrow (D^2 - 2D)v = 0 \quad [D \equiv d/dx]$$

$$\Rightarrow D(D - 2)v = 0 \\ v = C_1 + C_2 e^{2x}$$

Thus from  $y = vx$ , the complete solution of (2) i.e., the C.F. of equation (1) is given by

$$y = C_1 x + C_2 x e^{2x} \Rightarrow C.F. = C_1 y_1 + C_2 y_2$$

### Method of Undetermined Coefficients

Now suppose that the complete solution of (1) is given by

$$y = Ax + B x e^{2x} \quad \dots(4)$$

where  $A$  and  $B$  are functions of  $x$ .

$$\therefore \frac{dy}{dx} = A + Be^{2x} + 2Bxe^{2x} + \frac{dA}{dx} \cdot x + \frac{dB}{dx} xe^{2x} = A + Be^{2x} + 2Bxe^{2x} \quad \dots(5)$$

$$\text{where } \frac{dA}{dx} + \frac{dB}{dx} e^{2x} = 0 \quad \dots(6)$$

Differentiating (5), we have

$$\begin{aligned} \frac{d^2y}{dx^2} &= \frac{dA}{dx} + \left( \frac{dB}{dx} e^{2x} + 2Be^{2x} \right) + \left( 2 \frac{dB}{dx} xe^{2x} + 2Be^{2x} + 4Be^{2x} \right) \\ &= \left( \frac{dA}{dx} + e^{2x} \frac{dB}{dx} \right) + \left( 4Be^{2x} + 4Bxe^{2x} + 2xe^{2x} \frac{dB}{dx} \right) \\ &= 0 + 4Be^{2x} + 4Bxe^{2x} + 2xe^{2x} \frac{dB}{dx} \end{aligned} \quad \dots(7) \text{ [Using (6)]}$$

Substituting the values of  $\frac{d^2y}{dx^2}$ ,  $\frac{dy}{dx}$  and  $y$  from (7), (5) and (4) respectively in (1), we get

$$\frac{dA}{dx} + e^{2x} (2x + 1) \frac{dB}{dx} = x \quad \dots(8)$$

Solving (6) and (8), we get

$$\frac{dA}{dx} = -\frac{1}{2}, \quad \frac{dB}{dx} = \frac{1}{2} e^{-2x}$$

$$\text{Integrating} \quad A = -\frac{1}{2}x + C_1, \quad B = -\frac{1}{4}e^{-2x} + C_2$$

Substituting values of  $A$  and  $B$  in (4), the complete solution of (1) is given by

$$y = \left( -\frac{1}{2}x + C_1 \right) x \left( -\frac{1}{4}e^{-2x} + C_2 \right) xe^{2x} = C_1 x + C_2 x e^{2x} - \frac{1}{2}x^2 - \frac{1}{4}x.$$

### EXERCISE 15.8

**Solve the following differential equations by the method of variation of parameters:**

1.  $(1-x)\frac{d^2y}{dx^2} + x\frac{dy}{dx} - y = (1-x)^2.$  **Ans.**  $y = C_1 e^x + C_2 x + x^2 + x + 1$
2.  $(1-x^2)\frac{d^2y}{dx^2} - 4x\frac{dy}{dx} - (1+x^2)y = x$  **Ans.**  $y = \frac{1}{1-x^2}(C_1 \cos x + C_2 \sin x + x)$
3.  $(1-x)\frac{d^2y}{dx^2} + x\frac{dy}{dx} - y = x(1-x^2)^{\frac{3}{2}}$  **Ans.**  $y = C_1(\sqrt{1-x^2} + x \sin^{-1} x) + C_2 x - \frac{x}{9}(1-x^2)^{3/2}$
4.  $x\frac{d^2y}{dx^2} - (2x+1)\frac{dy}{dx} + (x+1)y = (x^2 + x - 1)e^{2x}$  **Ans.**  $y = C_1 x + C_2 x^{-1} x + x \int e^x x^{-3} (x^2 - 2x + 2) dx$
5.  $x\frac{d^2y}{dx^2} - 2(x+1)\frac{dy}{dx} + (x+2)y = (x-2)e^x$  **Ans.**  $y = \frac{C_1}{3}x^3 e^x + C_2 e^x + \left( x - \frac{x^2}{2} \right) e^x.$
6.  $x^2\frac{d^2y}{dx^2} + \frac{dy}{dx} - y = x^2 e^x$  **Ans.**  $y = C_1 x + \frac{C_2}{x} + e^x, (x > 0)$

## APPLICATIONS TO DIFFERENTIAL EQUATIONS

---

### 16.1 INTRODUCTION

In this chapter, we shall study the application of differential equations to various physical problems.

### 16.2 ELECTRICAL CIRCUIT

We will consider circuits made up of

- (i) Voltage source which may be a battery or a generator.
- (ii) Resistance, inductance and capacitance.

**Table of Elements, Symbols and Units**

	Element	Symbol	Unit
1.	Charge	$q$	coulomb
2.	Current	$i$	ampere
3.	Resistance,	 R	ohm
4.	Inductance,	 L	henry
5.	Capacitance,	 C	farad
6.	Electromotive force or voltage (constant)	 constant V	volt
7.	Variable voltage	 variable V	volt

The formation of differential equation for an electric circuit depends upon the following laws.

$$(i) \quad i = \frac{dq}{dt}, \quad (ii) \quad \text{Voltage drop across resistance } R = Ri$$

$$(iii) \quad \text{Voltage drop across inductance } L = L \cdot \frac{di}{dt}$$

$$(iv) \quad \text{Voltage drop across capacitance } C = \frac{q}{C}$$

### Kirchhoff's laws

**I. Voltage law.** The algebraic sum of the voltage drop around any closed circuit is equal to the resultant electromotive force in the circuit.

**II. Current law.** At a junction or node, current coming is equal to current going.

(i) **L - R series circuit.** Let  $i$  be the current flowing in the circuit containing resistance  $R$  and inductance  $L$  in series, with voltage source  $E$ , at any time  $t$ .

$$\text{By voltage law } Ri + L \frac{di}{dt} = E \Rightarrow \frac{di}{dt} + \frac{R}{L}i = \frac{E}{L} \dots(1) \text{ (M.U. II Semester, 2009)}$$

This is the linear differential equation

$$\text{I.F.} = e^{\int \frac{R}{L} dt} = e^{\frac{R}{L}t}$$

$$\text{Its solution is } i \cdot e^{\frac{R}{L}t} = \int \frac{E}{L} e^{\frac{R}{L}t} dt + A$$

$$\Rightarrow i \cdot e^{\frac{R}{L}t} = \frac{E}{L} \times \frac{L}{R} e^{\frac{R}{L}t} + A$$

$$\Rightarrow i = \frac{E}{R} + A e^{-\frac{Rt}{L}} \dots(2)$$

$$\text{At } t = 0, \quad i = 0 \Rightarrow A = -\frac{E}{R}$$

$$\text{Thus, (2) becomes } i = \frac{E}{R} \left[ 1 - e^{-\frac{Rt}{L}} \right]$$

(ii) **C-R series circuit.** Let  $i$  be current in the circuit containing resistance  $R$ ,  $L$ , and capacitance  $C$  in series with voltage source  $E$ , at any time  $t$ .

By voltage law

$$Ri + \frac{q}{C} = E \quad \left[ i = \frac{dq}{dt} \right]$$

$$\Rightarrow R \frac{dq}{dt} + \frac{q}{C} = E$$

**Example 1.** An inductance of 2 henries and a resistance of 20 ohms are connected in series with an e.m.f.  $E$  volts. If the current is zero when  $t = 0$ , find the current at the end of 0.01 sec if  $E = 100$  Volts. (U.P., II Semester, June 2008)

**Solution.** Differential equation of the above circuit is as

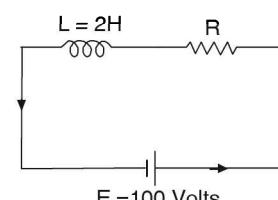

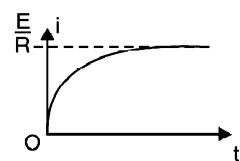

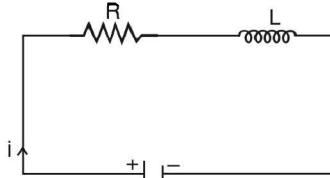

$$\text{1st case: } L \frac{di}{dt} + Ri = E \Rightarrow \frac{di}{dt} + \frac{R}{L}i = \frac{E}{L}$$

$$\text{I.F.} = e^{\int \frac{R}{L} dt} = e^{\frac{R}{L}t}$$

$$\text{Its solution is } i e^{\frac{Rt}{L}} = \frac{E}{L} \int e^{\frac{Rt}{L}} dt \Rightarrow i e^{\frac{Rt}{L}} = \frac{E}{L} \frac{L}{R} e^{\frac{Rt}{L}} + A$$

$$\Rightarrow i e^{\frac{Rt}{L}} = \frac{E}{R} e^{\frac{R}{L}t} + A \dots(1)$$

$$\text{Putting } t = 0, i = 0; \text{ in (1), we get } 0 = \frac{E}{R} + A \Rightarrow A = -\frac{E}{R}$$

$E = 100$  Volts

Putting the value of  $A$  in (1), we get

$$\begin{aligned} i e^{\frac{Rt}{L}} &= \frac{E}{R} e^{\frac{Rt}{L}} - \frac{E}{R} \quad \Rightarrow \quad i = \frac{E}{R} - \frac{E}{R} e^{-\frac{Rt}{L}} \\ i &= \frac{E}{R} \left[ 1 - e^{-\frac{Rt}{L}} \right] \end{aligned} \quad \dots(2)$$

On putting the values of  $E$ ,  $R$  and  $L$  in (2), we get

$$\begin{aligned} i &= \frac{100}{20} \left[ 1 - e^{-\frac{20}{2} t} \right] = 5 [1 - e^{-10t}] \\ &= 5 [1 - e^{-10 \times 0.01}] = 5 [1 - e^{-0.1}] = 5 \left[ 1 - \frac{1}{e^{0.1}} \right] \text{ at } [t = 0.01 \text{ sec}] \\ &= 0.475 \text{ Approx.} \end{aligned} \quad \text{Ans.}$$

**Example 2.** Solve the equation  $L \frac{di}{dt} + Ri = E_0 \sin wt$

where  $L$ ,  $R$  and  $E_0$  are constants and discuss the case when  $t$  increases indefinitely.

**Solution.**  $L \frac{di}{dt} + Ri = E_0 \sin wt$

$$\Rightarrow \quad \frac{di}{dt} + \frac{R}{L} i = \frac{E_0}{L} \sin wt$$

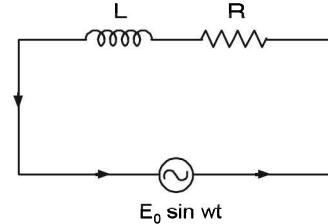

$$\text{I.F.} = e^{\int \frac{R}{L} dt} = e^{\frac{R}{L} t}$$

Solution is

$$i e^{\frac{R}{L} t} = \frac{E_0}{L} \int e^{\frac{R}{L} t} \sin wt dt + A$$

$$\left[ \int e^{ax} \sin bx dx = \frac{e^{ax}}{\sqrt{a^2 + b^2}} \sin \left( bx - \tan^{-1} \frac{b}{a} \right) \right]$$

$$\Rightarrow \quad i e^{\frac{R}{L} t} = \frac{E_0}{L} \frac{e^{\frac{R}{L} t}}{\sqrt{\frac{R^2}{L^2} + w^2}} \sin \left( wt - \tan^{-1} \frac{Lw}{R} \right) + A$$

$$i = \frac{E_0}{\sqrt{R^2 + L^2 w^2}} \sin \left( wt - \tan^{-1} \frac{Lw}{R} \right) + A e^{-\frac{R}{L} t}$$

As  $t$  increases indefinitely, then  $A e^{-\frac{Rt}{L}}$  tends to zero.

so  $i = \frac{E_0}{\sqrt{R^2 + L^2 w^2}} \sin \left( wt - \tan^{-1} \frac{Lw}{R} \right)$  Ans.

**Example 3.** A condenser of capacity  $C$  farads with  $V_0$  is discharged through a resistance  $R$  ohms. Show that if  $q$  coulomb is the charge on the condenser,  $i$  ampere the current and  $V$  the voltage at time  $t$ .

$$q = CV, V = Ri \text{ and } i = \frac{dq}{dt}, \text{ hence show that } V = V_0 e^{-\frac{t}{RC}}$$

**Solution.**

Voltage across  $R = Ri$

$$\text{Voltage drop across capacitance} = \frac{q}{C}$$

∴ The equation of discharge of condenser can be written, when after release of key the condenser gets discharged and at that time voltage across the battery gets zero so that  $V_0 = 0$

The differential equation of the above circuit is

$$\begin{aligned} Ri + \frac{q}{C} &= 0 \quad \Rightarrow \quad R \frac{dq}{dt} + \frac{q}{C} = 0 \quad \left( \text{as } i = \frac{dq}{dt} \right) \\ \Rightarrow \quad \frac{dq}{dt} + \frac{q}{RC} &= 0 \quad \Rightarrow \quad \frac{dq}{dt} = -\frac{q}{RC} \Rightarrow \frac{dq}{q} = -\frac{1}{RC} dt \end{aligned}$$

Integrating both sides, we get

$$\int \frac{dq}{q} = -\frac{1}{RC} \int dt \Rightarrow \log q = -\frac{1}{RC} t + A \quad \dots(1)$$

But at  $t = 0$ , the charge at the condenser is  $q_0$  such that

$$\log q_0 = -\frac{1}{RC}(0) + A \Rightarrow A = \log q_0 \quad \dots(2)$$

Putting the value of A from (2) in (1), we have

$$\begin{aligned} \log q &= -\frac{1}{RC}t + \log q_0 \Rightarrow \log q - \log q_0 = -\frac{1}{RC}t \\ \Rightarrow \log \frac{q}{q_0} &= -\frac{1}{RC}t \Rightarrow \frac{q}{q_0} = e^{-\frac{t}{RC}} \\ \Rightarrow q &= q_0 e^{-\frac{t}{RC}} \quad \dots(3) \end{aligned}$$

Dividing both side of (3) by  $C$ , we get

$$\frac{q}{C} = \frac{q_0}{C} e^{-\frac{t}{RC}} \Rightarrow V = V_0 e^{-\frac{t}{RC}} \quad \left[ \text{as } \frac{q}{C} = V \right] \text{Proved.}$$

**Example 4.** The equations of electromotive force in terms of current  $i$  for an electrical circuit

having resistance  $R$  and a condenser of capacity  $C$ , in series, is  $E = Ri + \int \frac{i}{C} dt$ . Find the current  $i$  at any time  $t$ , when  $E = E_0 \sin wt$ . (U.P. II Semester, Summer 2006)

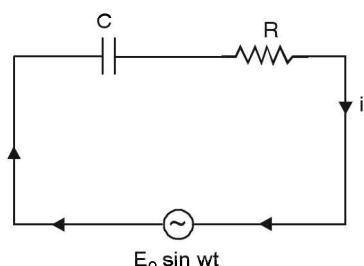

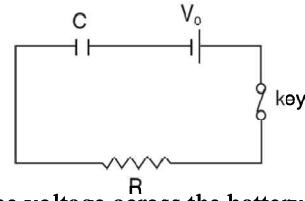

**Solution.** We have,

$$Ri + \int \frac{i}{C} dt = E_0 \sin wt$$

Differentiating both the sides, we get

$$\begin{aligned} \frac{R di}{dt} + \frac{i}{C} &= E_0 w \cos wt \\ \Rightarrow \frac{di}{dt} + \frac{i}{RC} &= \frac{E_0}{R} w \cos wt \\ I.F. &= e^{\int \frac{1}{RC} dt} = e^{\frac{t}{RC}} \end{aligned}$$

$$\text{Its solution is } i. (I.F.) = \int \frac{E_0 w}{R} \cos wt (I.F.) dt \Rightarrow i \cdot e^{\frac{t}{RC}} = \frac{E_0 w}{R} \int \cos wt \cdot e^{\frac{t}{RC}} dt + A$$

$$\begin{aligned}
 & \left[ \int e^{ax} \cos bx \, dx = \frac{e^{ax}}{a^2 + b^2} [a \cos bx + b \sin bx] \right] \\
 \Rightarrow \quad i.e^{\frac{t}{RC}} &= \frac{E_0 w}{R} \frac{e^{\frac{t}{RC}}}{\frac{1}{R^2 C^2} + w^2} \left[ \frac{1}{RC} \cos wt + w \sin wt \right] + A \\
 &= \frac{E_0 w}{R} \frac{R^2 C^2 e^{\frac{t}{RC}}}{1 + w^2 R^2 C^2} \left[ \frac{1}{RC} \cos wt + w \sin wt \right] + A \\
 i &= E_0 w \frac{RC^2}{1 + w^2 R^2 C^2} \left[ \frac{1}{RC} \cos wt + w \sin wt \right] + A e^{-\frac{t}{RC}} \\
 i &= E_0 w \frac{C}{1 + w^2 R^2 C^2} [\cos wt + w RC \sin wt] + A e^{-\frac{t}{RC}}
 \end{aligned} \tag{Ans.}$$

### EXERCISE 16.1

1. A coil having a resistance of 15 ohms and an inductance of 10 henries is connected to 90 volts supply. Determine the value of current after 2 seconds. ( $e^{-3} = 0.05$ ) **Ans.** 5.985 amp.
2. A resistance of 70 ohms, an inductance of 0.80 henry are connected in series with a battery of 10 volts. Determine the expression for current as a function of time after  $t = 0$ .

$$\text{Ans. } i = \frac{1}{7} \left( 1 - e^{-\frac{175}{2}t} \right)$$

3. A circuit consists of resistance  $R$  ohms and a condenser of  $C$  farads connected to a constant e.m.f.  $E$ ; if  $\frac{q}{C}$  is the voltage of the condenser at time  $t$  after closing the circuit Show that  $\frac{q}{C} = E - Ri$  and hence show that the voltage at time  $t$  is  $E \left( 1 - e^{-\frac{t}{CR}} \right)$ .
4. Show that the current  $i = \frac{q}{CR} e^{-\frac{t}{RC}}$  during the discharge of a condenser of charge  $Q$  coulomb through a resistance  $R$  ohms.
5. A condenser of capacity  $C$  farads with voltage  $v_0$  is discharged through a resistance  $R$  ohms. Show that if  $q$  coulomb is the charge on the condenser,  $i$  ampere the current and  $v$  the voltage at time  $t$ .

$$q = Cv, v = Ri \text{ and } i = -\frac{dq}{dt}, \text{ hence show that } v = v_0 e^{-\frac{1}{Rc}t}.$$

6. Solve  $L \frac{di}{dt} + Ri = E \cos wt$  **Ans.**  $i = \frac{E}{L^2 w^2 + R^2} (R \cos wt + Lw \sin wt - Re^{-\frac{Rt}{L}})$

7. A circuit consists of a resistance  $R$  ohms and an inductance of  $L$  henry connected to a generator of  $E \cos (wt + \alpha)$  voltage. Find the current in the circuit. ( $i = 0$ , when  $t = 0$ ).

$$\text{Ans. } i = \frac{E}{\sqrt{R^2 + L^2 w^2}} \cos [wt + \alpha - \tan^{-1} \frac{Lw}{R}] - \frac{E}{\sqrt{R^2 + L^2 w^2}} \cdot e^{-\frac{R}{L}t} \cos \left[ \alpha - \tan^{-1} \frac{Lw}{R} \right]$$

### 16.3 SECOND ORDER DIFFERENTIAL EQUATION

We have already discussed  $R - L$  and  $R - L - C$  electric circuits. Here we want to do circuit problems involving second order differential equations.

**Example 5.** The damped LCR circuit is governed by the equation

$$L \frac{d^2 q}{dt^2} + R \frac{dq}{dt} + \left( \frac{1}{C} \right) q = 0$$

where  $L, R, C$  are positive constants. Find the conditions under which the circuit is overdamped, underdamped and critically damped. Find also the critical resistance.

(U.P. II Semester, Summer 2005)

**Solution.** Given equation is

$$L \frac{d^2 q}{dt^2} + R \frac{dq}{dt} + \left( \frac{1}{C} \right) q = 0 \Rightarrow \frac{d^2 q}{dt^2} + \frac{R}{L} \frac{dq}{dt} + \left( \frac{1}{LC} \right) q = 0 \quad \dots(1)$$

$$\text{Let } \frac{R}{L} = 2p \text{ and } \frac{1}{LC} = w^2$$

Thus equation (1) becomes

$$\frac{d^2 q}{dt^2} + 2p \frac{dq}{dt} + w^2 q = 0$$

Its auxiliary equation is

$$m^2 + 2pm + w^2 = 0$$

$$\Rightarrow m = -p \pm \sqrt{p^2 - w^2}$$

**Case 1.** When  $p > w$ , roots are real and distinct solution of equation (1) is

$$q = A e^{(-p + \sqrt{p^2 - w^2})t} + B e^{(-p - \sqrt{p^2 - w^2})t}$$

In this case  $q$  is always positive, this is a condition of over damping.

Thus if  $p > w$

$$\frac{R}{2L} > \frac{1}{\sqrt{LC}}$$

$$R > 2\sqrt{\frac{L}{C}}$$

**Case 2.** When  $p < w$ , roots are imaginary

$$q = e^{-pt} (A \cos \sqrt{w^2 - p^2} t + B \sin \sqrt{w^2 - p^2} t)$$

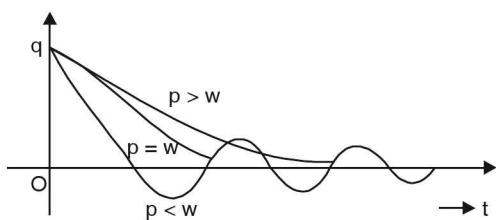

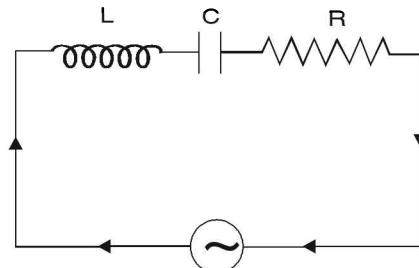

period of oscillation decreases and this condition is of under damping.

**Case 3.** When  $p = w$ , roots are equal  $q = (A + Bt)e^{-pt}$ ,

This is a condition of critically damped.

Critical resistance is given by

$$\begin{aligned} p &= w \\ \Rightarrow \frac{R}{2L} &= \frac{1}{\sqrt{LC}} \\ R &= 2\sqrt{\frac{L}{C}} \quad \text{Ans.} \end{aligned}$$

**Example 6.** A circuit consists of resistance of 5 ohms, inductance of 0.05 Henrys and capacitance of  $4 \times 10^{-4}$  farads. If  $q(0) = 0$ ,  $i(0) = 0$  find  $q(t)$  and  $i(t)$ , when an emf of 110 volts is applied. (M.D.U., 2010)

**Solution.**

$$L \frac{d^2Q}{dt^2} + R \frac{dQ}{dt} + \left(\frac{1}{C}\right) Q = 110 \quad \dots (1)$$

$$\Rightarrow \frac{d^2Q}{dt^2} + \frac{R}{L} \frac{dQ}{dt} + \frac{1}{LC} Q = \frac{110}{L}$$

$$\text{Let } \frac{R}{L} = 2p \text{ and } \frac{1}{LC} = w^2$$

Thus equation is

$$\frac{d^2Q}{dt^2} + 2p \frac{dQ}{dt} + w^2 Q = \frac{110}{0.05} \quad [L = 0.05]$$

$$\Rightarrow \frac{d^2Q}{dt^2} + 2p \frac{dQ}{dt} + w^2 Q = 2200$$

Its auxiliary equation is

$$m^2 + 2p m + w^2 = 0$$

$$m = -p \pm \sqrt{p^2 - w^2} \quad \dots (2)$$

Here, we have

$$R = 5 \text{ ohms}, L = 0.05 \text{ Henrys}, C = 4 \times 10^{-4} \text{ farads}$$

$$\therefore 2p = \frac{R}{L} = \frac{5}{0.05} = 100 \quad \Rightarrow \quad p = 50$$

$$w^2 = \frac{1}{LC} = \frac{1}{0.05 \times 4 \times 10^{-4}} = 50000$$

Putting the values of  $p$  and  $w$  in (2), we get

$$m = -50 \pm \sqrt{(50)^2 - 50000} = -50 \pm \sqrt{2500 - 50000}$$

$$\Rightarrow m = -50 \pm \sqrt{-47500} = -50 \pm 50\sqrt{-19} = -50 \pm 50\sqrt{19}i$$

$$\text{C.F.} = e^{-50t} (A \cos 50\sqrt{19}t + B \sin 50\sqrt{19}t) \quad \dots (3)$$

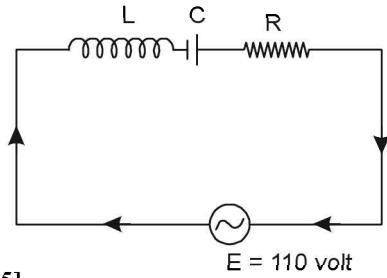

$$\text{P.I.} = \frac{1}{D^2 + 2PD + w^2} 2200$$

$$= \frac{1}{D^2 + 100D + 50000} 2200 \quad [D = 0]$$

$$= \frac{2200}{50000} = \frac{22}{500} = \frac{11}{250}$$

Complete solution = C.F. + P.I.

$$Q = e^{-50t} [A \cos 50\sqrt{19}t + B \sin 50\sqrt{19}t] + \frac{11}{250} \quad \dots (4)$$

On putting  $Q = 0$ ,  $t = 0$  in (4), we get

$$Q = A + \frac{11}{250} \Rightarrow A = -\frac{11}{250}$$

On differentiating (4), we get

$$\begin{aligned} i &= \frac{dQ}{dt} = -50 e^{-50t} [A \cos 50 \sqrt{19} t + B \sin 50 \sqrt{19} t] + \\ &\quad e^{-50t} [-50 \sqrt{19} A \sin 50 \sqrt{19} t + 50 \sqrt{19} B \cos 50 \sqrt{19} t] \end{aligned} \quad \dots (5)$$

On putting  $i = 0$ ,  $t = 0$  in (5), we get

$$0 = -50 A + 50 \sqrt{19} B \quad \dots (6)$$

On putting  $A = -\frac{11}{250}$  in (6), we get

$$\begin{aligned} 0 &= -50 \left( -\frac{11}{250} \right) + 50 \sqrt{19} B \Rightarrow B = -\frac{11}{5 \times 50 \sqrt{19}} \\ B &= -\frac{11}{250 \sqrt{19}} \end{aligned}$$

On putting the values of  $A$  and  $B$  in (4), we get

$$Q = e^{-50t} \left[ -\frac{11}{250} \cos 50 \sqrt{19} t - \frac{11}{250 \sqrt{19}} \sin 50 \sqrt{19} t \right] + \frac{11}{250}$$

On putting the values of  $A$  and  $B$  in (5), we get

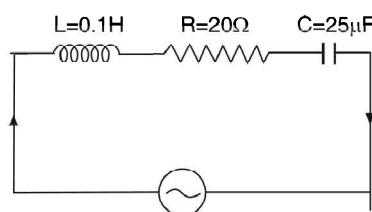

$$\begin{aligned} i &= -50 e^{-50t} \left[ \left( -\frac{11}{250} \right) \cos 50 \sqrt{19} t - \frac{11}{250 \sqrt{19}} \sin 50 \sqrt{19} t \right] + \\ &\quad e^{-50t} \left[ -50 \sqrt{19} \cdot \left( \frac{-11}{250} \right) \sin 50 \sqrt{19} t + 50 \sqrt{19} \left( \frac{-11}{250 \sqrt{19}} \right) \cos 50 \sqrt{19} t \right] \\ &= e^{-50t} \left[ \left( \frac{11}{5} - \frac{11}{5} \right) \cos 50 \sqrt{19} t + \left( \frac{11}{5 \sqrt{19}} + \frac{11 \sqrt{19}}{5} \right) \sin 50 \sqrt{19} t \right] \\ \Rightarrow i &= e^{-50t} \frac{11 + 11 \times 19}{5 \times 19} \sin 50 \sqrt{19} t \\ \Rightarrow i &= e^{-50t} \frac{44}{\sqrt{19}} \sin 50 \sqrt{19} t = \frac{44}{\sqrt{19}} e^{-50t} \sin 50 \sqrt{19} t \end{aligned} \quad \text{Ans.}$$

**Example 7.** An electric circuit consists of an inductance 0.1 henry, a resistance of 20 ohms and a condenser of capacitance 25 microfarads. Find the charge  $q$  and the current  $i$  at time  $t$ , given the initial conditions  $q = 0.05$  coulombs,  $i = 0$  when  $t = 0$

**Solution.** The differential equation of the above given circuit can be written as

$$\begin{aligned} L \frac{di}{dt} + Ri + \frac{q}{C} &= 0 \Rightarrow L \frac{d^2q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} = 0 \quad \left[ i = \frac{dq}{dt} \right] \\ \Rightarrow \frac{d^2q}{dt^2} + \frac{R}{L} \frac{dq}{dt} + \frac{q}{LC} &= 0 \end{aligned}$$

First, we will solve the equation and then put the values of  $R$ ,  $L$  and  $C$ . For convenience we put

$$\frac{R}{L} = 2b, b = \frac{R}{2L} = \frac{20}{2 \times 0.1} = 100$$

Let  $\frac{1}{LC} = k^2$

$$\Rightarrow k = \sqrt{\frac{1}{LC}} = \sqrt{\frac{1}{0.1 \times 25 \times 10^{-6}}} = \sqrt{\frac{10^7}{25}} = 632.5 \geq 100$$

Our equation reduces to

$$\frac{d^2 q}{dt^2} + 2b \frac{dq}{dt} + k^2 q = 0$$

A.E. is  $m^2 + 2b m + k^2 = 0$

So that  $m = \frac{-2b \pm \sqrt{4b^2 - 4k^2}}{2} = -b \pm \sqrt{b^2 - k^2} = -b \pm j\sqrt{k^2 - b^2}$

C.F. is  $q = e^{-bt} [A \cos \sqrt{k^2 - b^2} t + B \sin \sqrt{k^2 - b^2} t]$  ... (1)

On putting  $q = 0.05$  and  $t = 0$  in (1), we get  $0.05 = A$

On differentiating (1), we get

$$\begin{aligned} \frac{dq}{dt} &= -be^{-bt} [A \cos \sqrt{k^2 - b^2} t + B \sin \sqrt{k^2 - b^2} t] \\ &\quad + e^{-bt} [-A \sqrt{k^2 - b^2} \sin \sqrt{k^2 - b^2} t + B \sqrt{k^2 - b^2} \cos \sqrt{k^2 - b^2} t] \end{aligned} \quad \dots (2)$$

On putting  $\frac{dq}{dt} = 0$  and  $t = 0$  in (2), we get

$$0 = -bA + B\sqrt{k^2 - b^2} \Rightarrow B = \frac{bA}{\sqrt{k^2 - b^2}} = \frac{0.05 b}{\sqrt{k^2 - b^2}}$$

Substituting the values of  $A$  and  $B$  in (1), we have

$$q = e^{-bt} [0.05 \cos \sqrt{k^2 - b^2} t + \frac{0.05 b}{\sqrt{k^2 - b^2}} \sin \sqrt{k^2 - b^2} t] \quad \dots (3)$$

Now,  $\sqrt{k^2 - b^2} = \sqrt{\frac{10^7}{25} - (100)^2} = \sqrt{400000 - 10000} = \sqrt{390000} = 624.5$

On putting these values in (3), we have

$$\begin{aligned} q &= e^{-100t} [0.05 \cos 624.5t + \frac{0.05 \times 100}{624.5} \sin 624.5t] \\ \Rightarrow q &= e^{-100t} [0.05 \cos 624.5t + 0.008 \sin 624.5t] \end{aligned} \quad \dots (4) \text{ Ans.}$$

On differentiating (4), we have

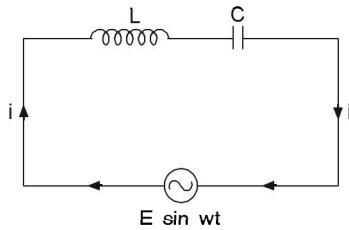

$$\begin{aligned} \frac{dq}{dt} &= -100 e^{-100t} [0.05 \cos 624.5t + 0.008 \sin 624.5t] \\ &\quad + e^{-100t} [-0.05 \times 624.5 \sin 624.5t + 0.008 \times 624.5 \cos 624.5t] \\ \Rightarrow i &= e^{-100t} [(-5 + 4.996) \cos 624.5t - (0.8 + 31.225) \sin 624.5t] \\ &= e^{-100t} [-0.004 \cos 624.5t - 32.025 \sin 624.5t] \\ &= -32 e^{-100t} \sin 624.5t. \text{ approximately} \end{aligned} \quad \text{Ans.}$$

**Example 8.** An alternating e.m.f.  $E \sin wt$  is applied to an inductance  $L$  and capacitance  $C$  in series. Show that the current in the circuit is  $\frac{Ew}{(n^2 - w^2)L} (\cos wt - \cos nt)$ , where  $n^2 = \frac{1}{LC}$ .

(U.P. II Semester, June 2010, 2009)

**Solution.** The differential equation for the above circuit is

$$\begin{aligned} L \frac{d^2q}{dt^2} + \frac{q}{C} &= E \sin wt \\ \Rightarrow \quad \frac{d^2q}{dt^2} + \frac{q}{LC} &= \frac{E}{L} \sin wt \\ \Rightarrow \quad \left(D^2 + \frac{1}{LC}\right)q &= \frac{E}{L} \sin wt \\ \text{A.E. is } m^2 + \frac{1}{LC} &= 0 \Rightarrow m^2 + n^2 = 0 \Rightarrow m = \pm i n \quad \left(\because \frac{1}{LC} = n^2\right) \\ \text{C.F.} &= A \cos nt + B \sin nt \\ \text{P.I.} &= \frac{1}{D^2 + n^2} \frac{E}{L} \sin wt \\ \Rightarrow \quad \text{P.I.} &= \frac{1}{-w^2 + n^2} \frac{E}{L} \sin wt \end{aligned}$$

Complete solution is  $q = A \cos nt + B \sin nt + \frac{E}{(n^2 - w^2)L} \sin wt$  ... (1)

On putting  $q = 0, t = 0$  in (1), we get

$$0 = A$$

On putting the value of  $A$  in (1), we get

$$q = B \sin nt + \frac{E}{(n^2 - w^2)L} \sin wt \quad \dots (2)$$

On differentiating (2) w.r.t., 't', we get

$$\begin{aligned} \frac{dq}{dt} &= B n \cos nt + \frac{Ew}{(n^2 - w^2)L} \cos wt \\ \Rightarrow \quad i &= B n \cos nt + \frac{Ew}{(n^2 - w^2)L} \cos wt \quad \dots (3) \end{aligned}$$

On putting  $i = 0, t = 0$  in (3), we get

$$0 = Bn + \frac{Ew}{(n^2 - w^2)L} \Rightarrow B = -\frac{Ew}{n(n^2 - w^2)L}$$

Putting the value of  $B$  in (3), we get

$$\begin{aligned} i &= -\frac{Ewn}{n(n^2 - w^2)L} \cos nt + \frac{Ew}{(n^2 - w^2)L} \cos wt \\ \Rightarrow \quad i &= \frac{Ew}{(n^2 - w^2)L} (\cos wt - \cos nt) \quad \text{Proved.} \end{aligned}$$

**Example 9.** For an electric circuit with circuit constants,  $L, R, C$  the charge  $q$  on a plate condenser is given by

$$L \frac{d^2q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} = E \text{ and the current by } i = \frac{dq}{dt}$$

Let  $L = 1 \text{ henry}, C = 10^{-4} \text{ farad}, R = 100 \text{ ohms}, E = 100 \text{ volts}$ ,

Suppose that no charge present and no current is flowing at time  $t = 0$ , when the e.m.f. is applied. Determine  $q$  and  $i$  at any time  $t$ .

**Solution.** The differential equation is

$$\begin{aligned} L \frac{d^2q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} &= E \\ \Rightarrow \quad \frac{d^2q}{dt^2} + \frac{R}{L} \frac{dq}{dt} + \frac{q}{LC} &= \frac{E}{L} \end{aligned}$$

Putting  $\frac{R}{L} = 2b$  and  $\frac{1}{LC} = k^2$  in (1), we have

$$\frac{d^2q}{dt^2} + 2b \frac{dq}{dt} + k^2 q = \frac{E}{L} \quad \dots(1)$$

This equation is exactly identical, we have

$$\Rightarrow \quad q = \frac{E}{k^2 L} + e^{-bt} [A \cos \sqrt{k^2 - b^2} t + B \sin \sqrt{k^2 - b^2} t] \quad \dots(2)$$

On putting  $q = 0$  and  $t = 0$  in (1), we get

$$0 = \frac{E}{k^2 L} + A \Rightarrow A = -\frac{E}{k^2 L}$$

Differentiating (2), we have

$$\begin{aligned} \frac{dq}{dt} &= -be^{-bt} [A \cos \sqrt{k^2 - b^2} t + B \sin \sqrt{k^2 - b^2} t] \\ &+ e^{-bt} [-A \sqrt{k^2 - b^2} \sin \sqrt{k^2 - b^2} t + B \sqrt{k^2 - b^2} \cos \sqrt{k^2 - b^2} t] \quad \dots(3) \end{aligned}$$

On putting  $\frac{dq}{dt} = 0$  and  $t = 0$  in (3), we have

$$0 = -bA + B\sqrt{k^2 - b^2} \Rightarrow B = \frac{bA}{\sqrt{k^2 - b^2}} = \frac{-\frac{E}{k^2 L}}{\sqrt{k^2 - b^2}} = -\frac{bE}{k^2 L \sqrt{k^2 - b^2}}$$

Substituting the values of  $A$  and  $B$  in (2), we have

$$\begin{aligned} q &= \frac{E}{k^2 L} + e^{-bt} \left[ -\frac{E}{k^2 L} \cos \sqrt{k^2 - b^2} t - \frac{bE}{k^2 L \sqrt{k^2 - b^2}} \sin \sqrt{k^2 - b^2} t \right] \\ &= \frac{E}{k^2 L} \left[ 1 - e^{-bt} \left( \cos \sqrt{k^2 - b^2} t + \frac{b}{\sqrt{k^2 - b^2}} \sin \sqrt{k^2 - b^2} t \right) \right] \quad \dots(4) \end{aligned}$$

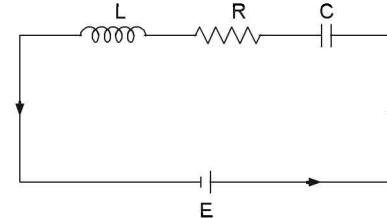

$$\text{Now, } \frac{E}{k^2 L} = \frac{E}{\frac{1}{LC} \cdot L} = EC = 100 \times 10^{-4} = \frac{1}{100}$$

$$b = \frac{R}{2L} = \frac{100}{2 \times 1} = 50$$

$$\sqrt{k^2 - b^2} = \sqrt{\frac{1}{LC} - (50)^2} = \sqrt{\frac{1}{10^{-4}} - (50)^2} = \sqrt{10000 - 2500} = \sqrt{7500} = 50\sqrt{3}$$

On putting these values in (4), we get

$$q = \frac{1}{100} \left[ 1 - e^{-50t} (\cos 50\sqrt{3} t + \frac{1}{\sqrt{3}} \sin 50\sqrt{3} t) \right] \quad \text{Ans.}$$

**Example 10.** The voltage  $V$  and the current  $i$  at a distance  $x$  from the sending end of the transmission line satisfy the equations.

$$-\frac{dV}{dx} = Ri, \quad -\frac{di}{dx} = GV$$

where  $R$  and  $G$  are constants. If  $V = V_0$  at the sending end ( $x = 0$ ) and  $V = 0$  at receiving end ( $x = l$ ).

Show that

$$V = V_0 \left\{ \frac{\sinh n(l-x)}{\sinh nl} \right\}, \text{ when } n^2 = RG$$

**Solution.** We have,  $-\frac{dV}{dx} = Ri$  ... (1)

$$-\frac{di}{dx} = GV \quad \dots(2)$$

When  $x = 0, V = V_0$ ; When  $x = l, V = 0$

Putting the value of  $i$  from (1) in (2), we get

$$\begin{aligned} -\frac{d}{dx} \left( -\frac{dV}{dx} \frac{1}{R} \right) &= GV \Rightarrow \frac{d^2 V}{dx^2} = RGV \\ \Rightarrow \frac{d^2 V}{dx^2} - (RG)V &= 0 \Rightarrow (D^2 - RG)V = 0 \quad (RG = n^2) \end{aligned}$$

A.E. is  $m^2 - n^2 = 0, m = \pm n$

$$\therefore V = A e^{nx} + B e^{-nx} \quad \dots(3)$$

Now, we have to find out the values of  $A$  and  $B$  with the help of given conditions.

On putting  $x = 0$  and  $V = V_0$  in (3), we get

$$V_0 = A + B \quad \dots(4)$$

On putting  $x = l$  and  $V = 0$  in (3), we get

$$0 = A e^{nl} + B e^{-nl} \quad \dots(5)$$

On solving (4) and (5), we have

$$A = \frac{V_0}{1 - e^{2nl}}, \quad B = \frac{-V_0 e^{2nl}}{1 - e^{2nl}}$$

Substituting the values of  $A$  and  $B$  in (3), we have

$$\begin{aligned} V &= \frac{V_0 e^{nx}}{1 - e^{2nl}} - \frac{V_0 e^{2nl} e^{-nx}}{1 - e^{2nl}} = \frac{V_0 [e^{nx} - e^{2nl-nx}]}{1 - e^{2nl}} \\ &= \frac{V_0 [e^{(nl-nx)} - e^{-(nl-nx)}]}{e^{nl} - e^{-nl}} = V_0 \left\{ \frac{\sinh n(l-x)}{\sinh nl} \right\} \quad \text{Proved.} \end{aligned}$$

## EXERCISE 16.2

- For an electric circuit with circuit constants  $L, R, C$  the charge  $q$  on the plate of the condenser is given by :

$$L \frac{d^2 q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} = 0$$

Find  $q$  at any time  $t$ .

Discuss the case when  $R$  is negligible and show that  $q$  is oscillatory. Calculate its period and frequency.

$$\text{Ans. } q = e^{-\frac{R}{2L}t} \left[ A \cos \frac{\sqrt{4CL - R^2 C^2}}{2LC} t + B \sin \frac{\sqrt{4LC - R^2 C^2}}{2LC} t \right]$$

$$q = A \cos \frac{1}{\sqrt{LC}} t + B \sin \frac{1}{\sqrt{LC}} t, \text{ Period} = 2\pi \sqrt{LC}, \text{ frequency} = \frac{1}{2\pi \sqrt{LC}}$$

2. A condenser of capacity  $C$  is discharged through an inductance  $L$  and a resistance  $R$  in series and the charge  $q$  at any time  $t$  is given by

$$L \frac{d^2q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} = 0$$

If  $L = 10$  milli henry,  $R = 200$  ohms,  $C = 0.1 \mu F$  and also when  $t = 0$ , charge  $q = 0.01$  coulomb and current  $\frac{dq}{dt} = 0$ . Find the value of  $q$  at any time  $t$  and find the frequency of the circuit if the discharge is oscillatory.

$$\text{Ans. } q = e^{-10000t} [0.01 \cos 3 \times 10^4 t + 0.33 \times 10^{-2} \sin 3 \times 10^4 t]$$

$$\text{frequency} = \frac{3 \times 10^4}{2\pi}$$

3. A condenser of capacity  $C$  is discharged through  $L$  and a resistance  $R$  in series and the charge  $q$  at any time  $t$  is given by the equation

$$L \frac{d^2q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} = 0$$

If  $L = 0.5$  henry,  $R = 300$  ohms,  $C = 2 \times 10^{-6}$  farad and also when  $t = 0$ , charge  $q = 0.01$  and current  $\frac{dq}{dt} = 0$ , find the value of  $q$  in terms of  $t$ . **Ans.**  $q = e^{-200t} [0.01 \cos 100\sqrt{91}t + 0.0031 \sin 100\sqrt{91}t]$

4. A  $10^{-3}$  farad capacitor is connected in series with 0.05 henry inductor and 10 ohms resistor. Initially, the current in the circuit is zero and the charge on the capacitor is also zero. If the e.m.f. is  $50 \sin 200t$ . Find the charge  $t$  seconds after the circuit is closed.

$$\text{Ans. } q = 0.125 e^{-100t} [\cos 100t + \sin 100t] - 25 \cos 200t + 0.125 \sin 200t$$

5. For an electric circuit with circuit constants  $L$ ,  $R$ ,  $C$ , the charge  $q$  on a plate on the condenser is given by

$$L \frac{d^2q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} = E \sin wt$$

and the current  $i = \frac{dq}{dt}$ . The circuit is tuned to resonance so that  $w^2 = \frac{1}{LC}$

If  $R^2 = \frac{4L}{C}$  and  $q = i = 0$  at  $t = 0$ , show that

$$q = \frac{E}{Rw} \left[ -\cos wt + e^{-\frac{Rt}{2L}} \left( \cos pt + \frac{R}{2LP} \sin pt \right) \right] \quad \text{where } p^2 = \frac{1}{LC} - \frac{R^2}{4L^2}$$

6. If the charge on one of the coatings of a layden jar be  $q$  when a force  $E \cos pt$  acts in the circuit connecting the coatings and the circuit contains inductance  $L$ . Resistance  $R$  and capacitance  $C$  satisfying the differential equation:

$$\left( LD^2 + RD + \frac{1}{C} \right) q = E \cos pt$$

$D = \frac{d}{dt}$ , find an expression for the charge given

$$q = \frac{dq}{dt} = 0 \text{ when } t = 0.$$

7. An e.m.f.  $E \sin pt$  is applied at  $t = 0$  to a circuit containing a condenser  $C$  and inductance  $L$  in series. The current  $x$  satisfies the equation

$$L \frac{dx}{dt} + \frac{1}{C} \int x dt = E \sin pt$$

If  $p^2 = \frac{1}{LC}$ , and initially the current  $x$  and the charge  $q$  are zero, show that the current in the circuit at time  $t$  is given by

$$x = \frac{E}{2L} t \sin pt, \text{ where } x = -\frac{dq}{dt}.$$

8. An  $L-C-R$  circuit has  $R = 180$  ohm,  $C = \frac{1}{280}$  farad,  $L = 20$  henries and an applied voltage  $E(t) = 10 \sin t$ . Assuming that no charge is present but an initial current of  $i$  ampere is flowing at  $t = 0$  when the voltage is first applied, find  $q$  and  $i = \frac{dq}{dt}$  at any time  $t$ .  $q$  is given by the differential equation

$$L \frac{d^2 q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} = E(t) \quad \text{Ans. } q = \frac{11}{50} e^{-2t} - \frac{101}{500} e^{-7t} + \frac{1}{1000} [26 \sin t - 18 \cos t]$$

## 16.4 MECHANICAL ENGINEERING PROBLEMS

### Rectilinear Motion

When a body moves in a straight line the motion is called rectilinear motion. If  $x$  be the distance of the body at any time  $t$  from starting point then we have its velocity  $v$  given by

$$\text{velocity } v = \frac{dx}{dt} \quad \boxed{v = \frac{dx}{dt}}$$

If the acceleration of the body be ' $a$ ' then

$$\text{Acceleration } a = \frac{dv}{dt} = \frac{d^2 x}{dt^2}$$

$$\text{Since } a = \frac{dv}{dt} = \frac{dv}{dx} \cdot \frac{dx}{dt} = v \frac{dv}{dx}$$

$$\boxed{a = \frac{d^2 x}{dt^2}}$$

$$\boxed{a = v \frac{dv}{dx}}$$

If mass of a body is  $m$  and the body is moving with acceleration  $a$  by a force  $F$  acting on it, then

$$\boxed{F = ma}$$

$$\boxed{F = m \frac{d^2 x}{dt^2}}$$

$$\boxed{F = mv \frac{dv}{dx}}$$

**Example 11.** A moving body is opposed by a force per unit mass of value  $cx$  and resistance per unit mass of value  $bv^2$  where  $x$  and  $v$  are the displacement and velocity of the particle at that instant. Find the velocity of the particle in terms of  $x$ , if it starts from rest.

**Solution.** By Newton's second law of motion, the equation of motion of the body is

$$v \frac{dv}{dx} = -cx - bv^2 \Rightarrow v \frac{dv}{dx} + bv^2 = -cx \quad \dots(1)$$

Putting

$$v^2 = z, \quad 2v \frac{dv}{dx} = \frac{dz}{dx}, \text{ in (1), we get}$$

$$\frac{1}{2} \frac{dz}{dx} + bz = -cx \Rightarrow \frac{dz}{dx} + 2bx = -2cx$$

$$\text{I.F.} = e^{\int 2bx dx} = e^{2bx}$$

Its solution is

$$\begin{aligned} z \cdot e^{2bx} &= \int -2cx e^{2bx} dx + A \\ &= -2c \left[ \frac{x e^{2bx}}{2b} - \int \frac{e^{2bx}}{2b} dx \right] + A' \\ &= -\frac{c}{b} x e^{2bx} + \frac{c}{b} \frac{e^{2bx}}{2b} + A' \\ \Rightarrow z &= -\frac{c}{b} x + \frac{c}{2b^2} + A' e^{-2bx} \\ v^2 &= -\frac{cx}{b} + \frac{c}{2b^2} + A' e^{-2bx} \end{aligned} \quad \dots(2)$$

Putting  $v = 0$  and  $x = 0$  in (2), we have

$$\therefore 0 = \frac{c}{2b^2} + A' \Rightarrow A' = -\frac{c}{2b^2}$$

$$\therefore \text{Equation (2) becomes } v^2 = -\frac{cx}{b} + \frac{c}{2b^2} - \frac{c}{2b^2} e^{-2bx} \quad \text{Ans.}$$

**Example 12.** A particle of mass  $m$  moves in a straight line under the action of force  $mn^2x$  which is always directed towards a fixed point  $O$  on the line. Determine the displacement  $x(t)$

if the resistance to the motion is  $2\lambda mn v$  given that initially  $x = 0$ ,  $\frac{dx}{dt} = 0$ ,  $(0 < \lambda < 1)$ .

(U.P. II Sem 2010)

**Solution.** Equation of motion is

$$mv \frac{dv}{dx} = -mn^2x - 2\lambda mn v \quad \dots(1)$$

$$\frac{dv}{dx} = -\frac{(n^2x + 2\lambda n v)}{v}$$

Let

$$v = Zx$$

$$\frac{dv}{dx} = Z + x \frac{dZ}{dx}$$

Putting the value of  $v$ ,  $\frac{dv}{dx}$  in (1), we get

$$Z + x \frac{dZ}{dx} = -\left(\frac{n^2x + 2\lambda n Zx}{Zx}\right) = -\left(\frac{n^2 + 2\lambda n Z}{Z}\right)$$

$$x \frac{dZ}{dx} = \frac{-n^2 - 2\lambda n Z - Z^2}{Z}$$

$$\int \frac{Z dZ}{n^2 + 2\lambda n Z + Z^2} = - \int \frac{dx}{x}$$

$$\begin{aligned}
&\Rightarrow \int \frac{Z dZ}{z^2 + 2\lambda n Z + n^2} = - \int \frac{dx}{x} \\
&\Rightarrow \frac{1}{2} \int \frac{2Z + 2n\lambda - 2n\lambda}{z^2 + 2\lambda n Z + n^2} dZ = - \int \frac{dx}{x} \\
&\Rightarrow \frac{1}{2} \int \frac{2Z + 2\lambda n}{z^2 + 2\lambda n Z + n^2} dZ - \int \frac{\lambda n}{z^2 + 2\lambda n Z + n^2} dZ = - \int \frac{dx}{x} \\
&\Rightarrow \frac{1}{2} \log(Z^2 + 2\lambda n Z + n^2) - \int \frac{\lambda n}{Z^2 + 2\lambda n Z + \lambda^2 n^2 + n^2 - \lambda^2 n^2} dZ = - \log x + C \\
&\Rightarrow \frac{1}{2} \log(Z^2 + 2\lambda n Z + n^2) - \lambda n \int \frac{1}{(Z + \lambda n)^2 + n^2(1 - \lambda^2)} dZ = - \log x + C \\
&\Rightarrow \frac{1}{2} \log(Z^2 + 2\lambda n Z + n^2) - \lambda n \int \frac{1}{(Z + \lambda n)^2 + \left[\frac{n}{\sqrt{1 - \lambda^2}}\right]^2} dZ = - \log x + C \\
&\Rightarrow \frac{1}{2} \log(Z^2 + 2\lambda n Z + n^2) + \log x - \frac{\lambda n}{n\sqrt{1 - \lambda^2}} \tan^{-1}\left(\frac{Z + \lambda n}{n\sqrt{1 - \lambda^2}}\right) = C \\
&\Rightarrow \log x \sqrt{Z^2 + 2\lambda n Z + n^2} - \frac{\lambda}{\sqrt{1 - \lambda^2}} \tan^{-1}\left(\frac{\frac{v}{x} + \lambda n}{n\sqrt{1 - \lambda^2}}\right) = C \\
&\Rightarrow \log x \sqrt{\frac{v^2}{x^2} + 2\lambda n \left(\frac{v}{x}\right) + n^2} - \frac{\lambda}{\sqrt{1 - \lambda^2}} \tan^{-1}\left(\frac{\frac{v}{x} + \lambda n}{n\sqrt{1 - \lambda^2}}\right) = C \\
&\Rightarrow \log \sqrt{v^2 + 2\lambda n v x + n^2 x^2} - \frac{\lambda}{\sqrt{1 - \lambda^2}} \tan^{-1}\left(\frac{v + \lambda n x}{n x \sqrt{1 - \lambda^2}}\right) = C \quad \dots(2)
\end{aligned}$$

On putting  $v = 0$  and  $x = 0$  in (2) we get

$$\log 0 - \frac{\lambda}{\sqrt{1 - \lambda^2}} \tan^{-1} 0 = C \Rightarrow C = 0$$

Putting  $C = 0$  in (2), we get

$$\log \sqrt{v^2 + 2\lambda n v x + n^2 x^2} - \frac{\lambda}{\sqrt{1 - \lambda^2}} \tan^{-1}\left(\frac{v + \lambda n x}{n x \sqrt{1 - \lambda^2}}\right) = 0$$

**Ans.**

## 16.5 VERTICAL MOTION

**Example 13.** A body falling vertically under gravity encounters resistance of the atmosphere. If the resistance varies as the velocity, show that the equation of motion is given by

$$\frac{du}{dt} = g - ku$$

where  $u$  is the velocity,  $k$  is a constant and  $g$  is the acceleration due to gravity. Show that as  $t$  increases,  $u$  approaches the value  $g/k$ . Also, if  $u = \frac{dx}{dt}$  where  $x$  is the distance fallen by the body from rest in time  $t$ , show that

$$x = \frac{gt}{k} - \frac{g}{k^2} (1 - e^{-kt})$$

**Solution.** Let the mass of the falling body be unity.

$$\text{Acceleration} = \frac{du}{dt}$$

$$\text{Force acting downward} = 1 \cdot \frac{du}{dt} = \frac{du}{dt}$$

$$\text{Force of resistance} = ku$$

$$\text{Net force acting downward} = g - ku \Rightarrow \frac{du}{dt} = g - ku \quad \dots(1) \text{Proved.}$$

$$\Rightarrow \frac{du}{g - ku} = dt$$

$$\text{Integrating, we get } \int \frac{du}{g - ku} = \int dt$$

$$\Rightarrow t = -\frac{1}{k} \log(g - ku) + \log A = \log(g - ku)^{-1/k} A$$

$$A(g - ku)^{-1/k} = e^t \Rightarrow (g - ku) = A^k e^{-kt}$$

$$\Rightarrow u = \frac{g}{k} - \frac{A^k}{k} e^{-kt}$$

$$\text{If } t \text{ increases very large then } \frac{A^k}{k} e^{-kt} = 0$$

$$\Rightarrow u = \frac{g}{k} \quad \text{when } t \rightarrow \infty \quad \text{Proved.}$$

$$\text{Given } u = \frac{dx}{dt} \Rightarrow \frac{du}{dt} = \frac{d^2x}{dt^2}$$

Putting the values of  $\frac{du}{dt}$  and  $u$  in (1), we get

$$\frac{d^2x}{dt^2} + k \frac{dx}{dt} = g \Rightarrow (D^2 + kD)x = g$$

$$\text{A.E. is } m(m+k) = 0 \Rightarrow m = 0, m = -k$$

$$\text{C.F.} = A_1 + A_2 e^{-kt}$$

$$\text{P.I.} = \frac{1}{D^2 + kD} g = t \frac{1}{2D + k} g$$

$$= \frac{t}{k} \frac{1}{\left(1 + \frac{2D}{k}\right)} g = \frac{t}{k} \left(1 + \frac{2D}{k}\right)^{-1} g = \frac{t}{k} \left(1 - \frac{2D}{k}\right) g = \frac{t}{k} g$$

$$x = A_1 + A_2 e^{-kt} + \frac{gt}{k} \quad \dots(2)$$

Putting the values of  $t = 0$  and  $x = 0$  in (2), we get

$$0 = A_1 + A_2 \Rightarrow A_2 = -A_1$$

$$(2) \text{ becomes } x = A_1 - A_1 e^{-kt} + \frac{gt}{k} \quad \dots(3)$$

$$\text{On differentiating (3), we get } \frac{dx}{dt} = A_1 k e^{-kt} + \frac{g}{k} \quad \dots(4)$$

On putting  $\frac{dx}{dt} = 0$ , when  $t = 0$  in (4), we get  $0 = A_1 k + \frac{g}{k} \Rightarrow A_1 = -\frac{g}{k^2}$

Putting the value of  $A_1$  in (3), we get

$$x = -\frac{g}{k^2} + \frac{g}{k^2} e^{-kt} + \frac{gt}{k} \Rightarrow x = \frac{gt}{k} - \frac{g}{k^2} (1 - e^{-kt}) \quad \text{Proved.}$$

**Example 14.** A particle falls under gravity in a resisting medium whose resistance varies with velocity. Find the relation between distance and velocity if initially the particle starts from rest.

(U.P., II Semester, Summer 2003)

**Solution.** By Newton's second law of motion, the equation of motion of the body is

$$\begin{aligned} m \frac{V dV}{dx} &= m g - m k V \\ \Rightarrow \quad \frac{V dV}{dx} &= g - k V \\ \Rightarrow \quad \frac{V dV}{g - k V} &= dx \quad \Rightarrow \quad \frac{-dV}{k} + \frac{g}{k} \frac{dV}{g - k V} = dx \end{aligned}$$

Integrating, we get

$$\begin{aligned} -\frac{V}{k} + \frac{g}{k} \left( -\frac{1}{k} \right) \log(g + kV) &= x + A \\ -\frac{V}{k} - \frac{g}{k^2} \log(g - kV) &= x + A \end{aligned} \quad \dots(1)$$

Initially,  $x = 0, V = 0$

$$-\frac{g}{k^2} \log g = A$$

(1) becomes

$$\begin{aligned} -\frac{V}{k} - \frac{g}{k^2} \log(g - kV) &= x - \frac{g}{k^2} \log g \\ \Rightarrow \quad -\frac{V}{k} - \frac{g}{k^2} \log \frac{g - kV}{g} &= x \end{aligned} \quad \text{Ans.}$$

**Example 15.** The acceleration and velocity of a body falling in the air approximately satisfy the equation :

Acceleration =  $g - kv^2$ , where  $v$  is the velocity of the body at any time  $t$ , and  $g, k$  are constants. Find the distance traversed as a function of the time, if the body falls from rest.

Show that value of  $v$  will never exceed  $\sqrt{\frac{g}{k}}$ .

$$\text{Solution Acceleration} = g - kv^2 \Rightarrow \frac{dv}{dt} = g - kv^2 \Rightarrow \frac{dv}{g - kv^2} = dt.$$

$$\Rightarrow \frac{1}{2\sqrt{g}} \left[ \frac{1}{\sqrt{g} + \sqrt{k} \cdot v} + \frac{1}{\sqrt{g} - \sqrt{k} \cdot v} \right] dv = dt$$

On integrating, we get

$$\begin{aligned} \frac{1}{2\sqrt{g}} \frac{1}{\sqrt{k}} \log(\sqrt{g} + \sqrt{k} \cdot v) - \frac{1}{2\sqrt{gk}} \log(\sqrt{g} - \sqrt{k} \cdot v) &= t + A \\ \Rightarrow \quad \frac{1}{2\sqrt{gk}} \log \frac{\sqrt{g} + \sqrt{k} \cdot v}{\sqrt{g} - \sqrt{k} \cdot v} &= t + A \end{aligned} \quad \dots(1)$$

On putting  $t = 0, v = 0$  in (1), we get  $\frac{1}{2\sqrt{gk}} \log 1 = 0 + A \Rightarrow A = 0$

$$\text{Equation (1) becomes } \frac{1}{2\sqrt{gk}} \log \frac{\sqrt{g} + \sqrt{k} \cdot v}{\sqrt{g} - \sqrt{k} \cdot v} = t \Rightarrow \log \frac{\sqrt{g} + \sqrt{k} \cdot v}{\sqrt{g} - \sqrt{k} \cdot v} = 2\sqrt{gk} t$$

$$\Rightarrow \frac{\sqrt{g} + \sqrt{k} \cdot v}{\sqrt{g} - \sqrt{k} \cdot v} = e^{2\sqrt{gk} t}$$

By componendo and dividendo, we have

$$\frac{\sqrt{k} \cdot v}{\sqrt{g}} = \frac{e^{2\sqrt{gk} t} - 1}{e^{2\sqrt{gk} t} + 1} = \frac{e^{\sqrt{gk} t} - e^{-\sqrt{gk} t}}{e^{\sqrt{gk} t} + e^{-\sqrt{gk} t}} = \tan h \sqrt{gk} t$$

$$\Rightarrow v = \sqrt{\frac{g}{k}} \tan h \sqrt{gk} t$$

Whatever the value of  $t$  may be  $\tanh \sqrt{gk} t \leq 1$ .

Hence the value of  $v$  will never exceed  $\sqrt{\frac{g}{k}}$ .

**Proved.**

$$\frac{dx}{dt} = \sqrt{\frac{g}{k}} \tanh \sqrt{gk} t$$

$$\begin{aligned} \text{Integrating again, we get } x &= \sqrt{\frac{g}{k}} \int \tanh \sqrt{gk} t dt \\ &= \frac{1}{k} \log \cosh \sqrt{gk} t + B \end{aligned}$$

when  $t = 0, x = 0$  then  $B = 0$

$$\therefore x = \frac{1}{k} \log \cosh \sqrt{gk} t$$

**Ans.**

### EXERCISE 16.3

1. A moving body is opposed by a force proportional to the displacement and by a resistance proportional to the square of velocity. Prove that the velocity is given by

$$V^2 = ae - \frac{cx}{b} + \frac{c}{ab^2}$$

**Hint.** Equation of motion is  $m \frac{dV}{dx} = -K_1 x - K_2 V^2$

2. A particle of mass  $m$  is projected vertically upward with an initial velocity  $v_0$ . The resisting force at any time is  $K$  times the velocity. Formulate the differential equation of motion and show that the distance  $s$  covered by the particle at any time  $t$  is given by

$$s = \left( \frac{g}{K^2} + \frac{v_0}{K} \right) (1 - e^{-Kt}) - \frac{g}{K} t$$

3. A particle falls in a vertical line under gravity (supposed constant) and the force of air resistance to its motion is proportional to its velocity. Show that its velocity cannot exceed a particular limit.

$$\text{Ans. } V = \frac{g}{K}$$

4. A body falling from rest is subjected to a force of gravity and an air resistance of  $\frac{n^2}{g}$  times the square of

velocity. Show that the distance travelled by the body in  $t$  seconds is  $\frac{g}{n^2} \log \cosh nt$ .

5. A body of mass  $m$ , falling from rest is subject to the force of gravity and an air resistance proportional to the square of the velocity  $Kv^2$ . If it falls through a distance  $x$  and possesses a velocity  $v$ , at the instant, prove that

$$\frac{2kx}{m} = \log \left( \frac{a^2}{a^2 - v^2} \right) \quad \text{where} \quad \frac{mg}{k} = a^2 \quad (\text{A.M.I.E.T.E., June 2009})$$

### 16.6 VERTICAL ELASTIC STRING

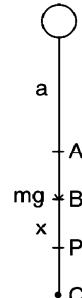

Let an elastic string  $OA$  of length  $l$  be attached to a fixed point  $O$  and a particle of mass  $m$  be attached at the other end  $A$ . When a mass  $m$  hangs freely then it pulls the string  $OA$  and it stays at  $B$ , in the position of equilibrium. The tension  $T$  in the string balances the mass  $mg$  hanging at  $A$ .

By Hooke's Law

$$\frac{\text{Stress } (T)}{\text{Strain}} = \text{Constant} = \text{Modulus of Elasticity } (E)$$

and  $\text{Strain} = \frac{\text{Extension in length}}{\text{Original length}} = \frac{a}{l}$

$$T = \frac{Ea}{l} \quad \text{or} \quad mg = \frac{Ea}{l} \quad \dots(1)$$

The string is further pulled down to a point  $C$  and then released. Then the particle at the lower end  $C$  will make motion up and down between  $B$  and  $C$ . Let the particle be at  $P$  at any time  $t$ , where  $BP = x$ .

The downward force  $= mg$

Upward force  $=$  Tension  $T$

$$T = E \left( \frac{a+x}{l} \right) \quad \dots(2) \quad (\text{Extension} = a+x)$$

$$\text{Resultant downward force} = mg - T = mg - E \left( \frac{a+x}{l} \right)$$

$$= mg - \frac{Ea}{l} - \frac{Ex}{l} = mg - mg - \frac{Ex}{l} = \frac{-Ex}{l}$$

$$\text{Downward Acceleration} = -\frac{Ex}{ml}$$

$$\text{Equation of motion is} \quad \frac{d^2x}{dt^2} = -\frac{Ex}{ml}, \text{ which is a S.H.M.}$$

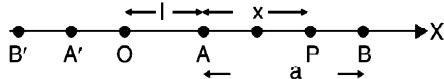

$$\text{Its time period} \quad T = \frac{2\pi}{\sqrt{\frac{E}{ml}}} = 2\pi \sqrt{\frac{ml}{E}}$$

### 16.7 HORIZONTAL ELASTIC STRING

If one end of the elastic string be fixed at  $O$  on a table. The other end  $A$  of the elastic string of length  $l$  is attached to a particle of mass  $m$ .

The string is stretched to a point  $B$  and then released. The particle comes into motion. Let the particle be at a distance  $x$  from  $A$  at any time  $t$ . The weight  $mg$  of the particle is acting downward and is balanced by the reaction  $R$  of the table.

The only force acting upon the particle is the tension of the string.

By Hook's Law

$$\frac{\text{stress}}{\text{strain}} = \text{constant of elasticity}$$

$$T = E \frac{x}{l} \quad (x = \text{Extension of the length of the string}) \\ (E = \text{Modulus of elasticity})$$

$$\text{Equation of motion is } m \frac{d^2x}{dt^2} = -\frac{Ex}{l}$$

$$\Rightarrow \frac{d^2x}{dt^2} = -\left(\frac{E}{ml}\right)x \quad \dots(1)$$

The motion of the equation is S.H.M.

On multiplying (1) by  $\frac{2dx}{dt}$ , we get

$$\frac{2d^2x}{dt^2} \frac{dx}{dt} = \frac{-2Ex}{ml} \frac{dx}{dt}$$

$$\text{On integrating, we get } \left(\frac{dx}{dt}\right)^2 = \frac{-Ex^2}{ml} + A \Rightarrow v^2 = \frac{-Ex^2}{ml} + A \quad \dots(2)$$

If the velocity of the particle is zero at  $S$ , amplitude  $AB = a$ . The particle moves from  $A$  to  $B$  and back  $B$  to  $A$  will be a S.H.M. The particle moves towards  $O$ . Then it moves with uniform velocity upto  $A'$ .

$$\text{On putting } v = 0, x = a, \text{ we get } 0 = \frac{-Ea^2}{ml} + A \Rightarrow A = \frac{Ea^2}{ml}$$

$$v^2 = \frac{E}{ml} (a^2 - x^2)$$

At  $A, x = 0, v = \sqrt{\left(\frac{E}{\lambda_1}\right)} a$ . This is the maximum velocity. The particle moves from  $A$  to  $A'$  with this velocity. After that the string again stretches and motion becomes S.H.M.

Periodic Time of S.H.M. (from  $A$  to  $B$ ,  $B$  to  $A$ ,  $A'$  to  $B'$ ,  $B'$  to  $A'$ ) + time taken by the particle

from  $A$  to  $A'$  and  $A'$  to  $A$  with constant velocity  $\sqrt{\left(\frac{E}{l}\right)} a$ .

$$= \frac{2\pi}{\sqrt{\left(\frac{E}{lm}\right)}} + \frac{4l}{\sqrt{\left(\frac{E}{lm}\right)} a} = \sqrt{\left(\frac{2lm}{E}\right)} \left(\pi + \frac{2l}{a}\right)$$

**Example 16.** A light elastic string of original length  $l$  is hung by one end to the other end are tied successively particles of masses  $m, m'$ . If  $t_1$  and  $t_2$  be the periods of small oscillations corresponding to these weights are  $c_1, c_2$  the statical extensions, prove that

$$g(t_1^2 - t_2^2) = 4\pi^2 (c_1 - c_2)$$

**Solution.**

$$mg = T_1 \quad \dots(1)$$

$$mg = E \frac{c_1}{l} \quad \dots(2)$$

$$m'g = \frac{E c_2}{l} \quad \dots(3)$$

Equation of motion of first particle,  $m \frac{d^2x}{dt^2} = mg - E \frac{(x + c_1)}{l}$

$$\Rightarrow m \frac{d^2x}{dt^2} = mg - E \frac{c_1}{l} - E \frac{x}{l} = -E \frac{x}{l} \quad \left[ \text{From (2), } mg = E \frac{c_1}{l} \right]$$

Motion of S.H.M. with  $t_1 = \frac{2\pi}{\sqrt{\frac{E}{lm}}}$  similarly,  $t_2 = \frac{2\pi}{\sqrt{\frac{E}{lm'}}$

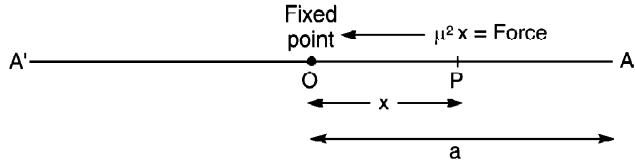

$$\therefore t_1^2 - t_2^2 = 4\pi^2 \frac{l}{E} (m - m') = 4\pi^2 \left( \frac{c_1}{g} - \frac{c_2}{g} \right) \quad [\text{Using (2) and (3)}]$$

$$\Rightarrow g(t_1^2 - t_2^2) = 4\pi^2 (c_1 - c_2) \quad \text{Ans.}$$

## 16.8 SIMPLE HARMONIC MOTION

If a particle moves in a straight line such that its acceleration is always directed towards a fixed point in the line and is proportional to the distance of the particle from the fixed point.

Let  $O$  be the fixed point in the line  $A'A$ . Let the position of the particle be  $P$  at time  $t$ . Since the acceleration is always directed towards  $O$ , i.e., the acceleration is in the direction opposite to that in which  $x$  increases, then

$$\frac{d^2x}{dt^2} = -\mu^2 x \quad \dots(1) \quad (\mu \text{ is constant, } OP = x)$$

$$D^2 x = -\mu^2 x \Rightarrow (D^2 + \mu^2)x = 0$$

$$\text{A.E. is } m^2 + \mu^2 = 0, \quad m = \pm i \mu \quad x = A \cos \mu t + B \sin \mu t \quad \dots(2)$$

The solution of (1) is

$$\text{Velocity of particle at } P = \frac{dx}{dt} = -A \mu \sin \mu t + B \mu \cos \mu t \quad \dots(3)$$

$$\text{At } A, \text{ velocity } = \frac{dx}{dt} = 0, x = a, t = 0$$

Putting  $x = a$ ,  $t = 0$  in (2), we get  $a = A$

$$\text{Putting } \frac{dx}{dt} = 0, t = 0 \text{ in (3), we get } 0 = 0 + B \mu \Rightarrow B = 0$$

Equation (2) becomes  $x = a \cos \mu t$

$$\text{Equation (3) becomes } \frac{dx}{dt} = -a \mu \sin \mu t$$

$$\begin{aligned} \text{velocity} &= -a \mu \sqrt{1 - \cos^2 \mu t} = -a \mu \sqrt{1 - \left(\frac{x}{a}\right)^2} \quad (x = a \cos \mu t) \\ &= -\mu \sqrt{a^2 - x^2} \end{aligned} \quad \dots(4)$$

At  $A$ ,  $x = a$  and  $v = 0$

At  $O$ ,  $x = 0$ , and acceleration = 0, velocity is maximum.

$O$  is called the centre of motion or the mean position.

**Amplitude.** In S.H.M. the distance from the centre to the position of maximum displacement is called the amplitude of the motion.  $OA$  is the maximum distance and is called the amplitude.

$$\text{From (4), } -\frac{dx}{\sqrt{a^2 - x^2}} = \mu dt$$

$$\text{Integrating, we get } \cos^{-1} \frac{x}{a} = \mu t + A \quad \dots(5)$$

Putting  $t = 0$ ,  $x = a$  in (5), we get

$$0 = 0 + A \Rightarrow A = 0$$

$$\text{On putting the value of } A, (5) \text{ becomes, } \cos^{-1} \frac{x}{a} = \mu t \Rightarrow x = a \cos \mu t$$

Particle will reach  $O$  in time  $t_1$ ,

$$\begin{aligned} 0 &= a \cos \mu t_1 \Rightarrow 0 = \cos \mu t_1 \\ \Rightarrow \quad \cos \frac{\pi}{2} &= \cos \mu t_1, \quad \Rightarrow \quad \frac{\pi}{2} = \mu t_1 \Rightarrow t_1 = \frac{\pi}{2\mu} \end{aligned}$$

**Time period:** In a S.H.M., the time taken to make a complete oscillation is called time period.

**Frequency:** The number of complete oscillations per second is called the frequency of motion. If  $\eta$  is the frequency and  $T$  is the time period.

$$\text{Time period} = T = 4 \left( \frac{\pi}{2\mu} \right) = \frac{2\pi}{\mu}$$

$$\text{Frequency} = n = \frac{1}{T} = \frac{\mu}{2\pi}$$

(i) The equation of S.H.M. is  $\frac{d^2x}{dt^2} = -\omega^2 x$

(ii) The velocity  $v$  at a distance  $x$  from the centre at time  $t$  is

$$v^2 = \omega^2 (a^2 - x^2)$$

$x = a \cos \omega t$ , where  $a$  is the amplitude and  $\omega$  is the angular velocity.

(iii) Maximum acceleration =  $\omega^2 a$  (At the extreme point)

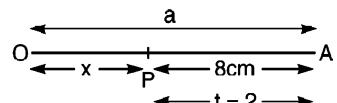

(iv) Maximum velocity =  $\omega a$  (at the centre)

(v) Time period =  $T = \frac{2\pi}{\omega}$

**Example 17.** A particle moves with S.H.M. of period 12 secs, travels 8 cm from the position of rest in 2 secs. Find the amplitude, the maximum velocity and the velocity at the end of 2 secs.

**Solution.**

$$T = \frac{2\pi}{\sqrt{\mu}} = 12 \Rightarrow \sqrt{\mu} = \frac{\pi}{6}$$

Let  $a$  be the amplitude  $OA$

$$AP = 8 \text{ cm}, OP = x = a - 8, t = 2 \text{ secs.}$$

We know that

$$x = a \cos \sqrt{\mu} t$$

$$a - 8 = a \cos 2\sqrt{\mu} \quad \left( \sqrt{\mu} = \frac{\pi}{6} \right)$$

$$= a \cos \frac{\pi}{3} = \frac{a}{2} \Rightarrow a = 16$$

$$\text{Maximum velocity} = \sqrt{\mu} a = \frac{\pi}{6} \times 16 = \frac{8\pi}{3} = 4.619 \text{ cm/sec.}$$

$$\begin{aligned} \text{Velocity } v \text{ at the end of two seconds} &= \sqrt{\mu} \sqrt{a^2 - x^2} = \frac{\pi}{6} \sqrt{256 - 64} \\ &= \frac{\pi}{6} \sqrt{192} = \frac{4\pi\sqrt{3}}{3} \text{ cm/sec.} \end{aligned}$$

Ans.

**Example 18.** A particle is performing a simple harmonic motion of period  $T$  about a centre  $O$  and it passes through a point  $P$  where  $OP = b$  with velocity  $v$  in the direction  $OP$ . Prove that the time which elapses before it returns to  $P$  is

$$\frac{T}{\pi} \tan^{-1} \frac{vT}{2\pi b}.$$

**Solution.** We have to find time taken from  $P$  to  $A$  and then  $A$  to  $P$

$$t = 2 \text{ (time from } A \text{ to } P)$$

$$\begin{aligned} &= 2 \int_0^t dt = 2 \int_a^b \frac{dx}{\sqrt{\mu} \sqrt{a^2 - x^2}} \text{ (Ignoring -ve sign)} \left( \frac{dx}{dt} = -\sqrt{\mu} \sqrt{a^2 - x^2} \right) \\ &= \frac{2}{\sqrt{\mu}} \left[ \cos^{-1} \frac{x}{a} \right]_a^b = \frac{2}{\sqrt{\mu}} \left[ \cos^{-1} \frac{b}{a} - \cos^{-1} \frac{a}{b} \right] = \frac{2}{\sqrt{\mu}} \cos^{-1} \frac{b}{a} \\ \Rightarrow t &= \frac{2}{\sqrt{\mu}} \tan^{-1} \left( \frac{\sqrt{a^2 - b^2}}{b} \right) \quad \begin{array}{c} \text{Diagram of a right-angled triangle with hypotenuse } a, \text{ base } b, \text{ and angle } \theta \text{ at the bottom-left vertex.} \\ \text{The vertical leg is labeled } \sqrt{a^2 - b^2}. \end{array} \\ &= \frac{2}{\sqrt{\mu}} \tan^{-1} \left( \frac{v}{b\sqrt{\mu}} \right) \quad \begin{bmatrix} v^2 = \mu(a^2 - b^2) \\ \Rightarrow v = \sqrt{\mu} \sqrt{(a^2 - b^2)} \\ \Rightarrow \frac{v}{\sqrt{\mu}} = \sqrt{a^2 - b^2} \end{bmatrix} \\ &= \frac{2}{\frac{2\pi}{T}} \tan^{-1} \left[ \frac{v}{b \left( \frac{2\pi}{T} \right)} \right] \quad \left[ T = \frac{2\pi}{\sqrt{\mu}} \Rightarrow \sqrt{\mu} = \frac{2\pi}{T} \right] = \frac{T}{\pi} \tan^{-1} \left[ \frac{vT}{2\pi b} \right] \quad \text{Proved.} \end{aligned}$$

**Example 19.** At the end of three successive seconds, the distances of a point moving with S.H.M. from its mean position are  $x_1, x_2, x_3$ . Show that the time of complete oscillation is

$$\frac{2\pi}{\cos^{-1} \left( \frac{x_1 + x_3}{2x_2} \right)}$$

**Solution.** Let  $x$  be the distance from the centre at any time  $t$ ,

$$x = a \sin \sqrt{\mu} t$$

$$x_1 = a \sin \sqrt{\mu} t, x_2 = a \sin \sqrt{\mu} (t+1), x_3 = a \sin \sqrt{\mu} (t+2)$$

$$\Rightarrow x_1 + x_3 = a [\sin \sqrt{\mu} t + \sin \sqrt{\mu} (t+2)]$$

$$\begin{aligned}
 &= 2a \sin \sqrt{\mu} (t+1) \cos \sqrt{\mu} = 2x_2 \cdot \cos \sqrt{\mu} \\
 \Rightarrow \quad \frac{x_1 + x_3}{2x_2} &= \cos \sqrt{\mu} \Rightarrow \sqrt{\mu} = \cos^{-1} \cdot \frac{x_1 + x_3}{2x_2} \\
 \text{Time period} &= \frac{2\pi}{\sqrt{\mu}} = \frac{2\pi}{\cos^{-1} \frac{x_1 + x_3}{2x_2}}
 \end{aligned}
 \tag{Proved.}$$

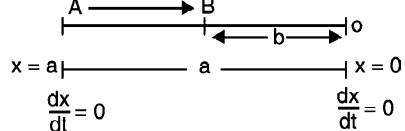

**Example 20.** A point moves in a straight line towards a centre of force  $\mu$  / (distance)<sup>3</sup>, starting from rest at a distance 'a' from the centre of force; show that the time of reaching a point

distant  $b$  from the centre of force is  $(a/\sqrt{\mu}) \sqrt{(a^2 - b^2)}$ , and that its velocity is  $\frac{\sqrt{\mu}}{ab} \sqrt{(a^2 - b^2)}$ .

(U.P., II Semester, Summer 2001)

**Solution.** Let a point move from A towards the centre of force O.

$$\begin{aligned}
 \therefore \quad \frac{m \mu}{x^3} &= -m \frac{d^2 x}{dt^2} \Rightarrow \frac{d^2 x}{dt^2} = -\frac{\mu}{x^3} \\
 \Rightarrow \quad 2 \frac{dx}{dt} \cdot \frac{d^2 x}{dt^2} &= -2 \frac{\mu}{x^3} \cdot \frac{dx}{dt}
 \end{aligned}$$

$x = a$   
 $\frac{dx}{dt} = 0$

$x = 0$   
 $\frac{dx}{dt} = 0$

Integrating, we get

$$\begin{aligned}
 \left( \frac{dx}{dt} \right)^2 &= -2 \cdot \mu \frac{x^{-2}}{-2} + C \\
 \Rightarrow \quad V^2 &= \frac{\mu}{x^2} + C \tag{...1}
 \end{aligned}$$

$$\text{At } A, V = 0 \text{ and } x = a, \quad \therefore 0 = \frac{\mu}{a^2} + C \quad \Rightarrow C = -\frac{\mu}{a^2}$$

On putting the value of  $C$ , (1) becomes

$$V^2 = \frac{\mu}{x^2} - \frac{\mu}{a^2} = \mu \left( \frac{a^2 - x^2}{x^2 a^2} \right) \tag{...2}$$

Therefore velocity when  $x = b$  is given by

$$\begin{aligned}
 V^2 &= \mu \left( \frac{a^2 - b^2}{a^2 b^2} \right) \Rightarrow V = \pm \sqrt{\mu} \frac{\sqrt{a^2 - b^2}}{ab} \\
 \Rightarrow \quad V &= -\sqrt{\mu} \frac{\sqrt{a^2 - b^2}}{ab}
 \end{aligned}$$

$$\begin{aligned}
 \text{From (2),} \quad \left( \frac{dx}{dt} \right)^2 &= \mu \frac{(a^2 - x^2)}{x^2 a^2} \Rightarrow \frac{dx}{dt} = -\sqrt{\mu} \frac{\sqrt{a^2 - x^2}}{xa} \\
 dt &= -\frac{1}{\sqrt{\mu}} \frac{xa}{\sqrt{a^2 - x^2}} dx
 \end{aligned}$$

Integrating, we get

$$\begin{aligned}
 t &= -\frac{1}{\sqrt{\mu}} \int \frac{xa}{\sqrt{a^2 - x^2}} dx \\
 \text{Let} \quad a^2 - x^2 &= z^2 \Rightarrow -2x dx = 2z dz
 \end{aligned}$$

$$t = \frac{a}{\sqrt{\mu}} \int \frac{z \, dz}{z} = \frac{a}{\sqrt{\mu}} \int dz = \frac{a}{\sqrt{\mu}} z + C_1 = \frac{a}{\sqrt{\mu}} \sqrt{a^2 - x^2} + C_1 \quad \dots(3)$$

At  $A$ ,  $t = 0$ ,  $x = a$ ,

On putting  $t = 0$ ,  $x = a$  in (3), we get  $0 = 0 + C_1 \Rightarrow C_1 = 0$

On putting the value of  $C_1$  in (3), we have

$$t = \frac{a}{\sqrt{\mu}} \sqrt{a^2 - x^2}$$

$$\text{At } B, x = b, t = \frac{a}{\sqrt{\mu}} \sqrt{a^2 - b^2}$$

**Proved.**

**Example 21.** The radial displacement ' $u$ ' in a rotating disc at a distance  $r$  from the axis is given by

$$\frac{d^2u}{dr^2} + \frac{1}{r} \frac{du}{dr} - \frac{u}{r^2} + kr = 0$$

Find the displacement if  $u = 0$  at  $r = 0$  and at  $r = a$ .

(M.U. II Semester, 2008)

**Solution.** Here, we have

$$\begin{aligned} & \frac{d^2u}{dr^2} + \frac{1}{r} \frac{du}{dr} - \frac{u}{r^2} + kr = 0 \\ \Rightarrow & r^2 \frac{d^2u}{dr^2} + r \frac{du}{dr} - u = -kr^3 \end{aligned} \quad \dots(1)$$

This is the homogeneous equation.

On putting  $z = \log r \Rightarrow r = e^z$  and  $r^2 \frac{d^2u}{dr^2} = D(D-1)u$ ,  $r \frac{du}{dr} = Du$  in (1), we get

$$D(D-1)u + Du - u = -k e^{3z}$$

$$\Rightarrow (D^2 - D + D - 1)u = -k e^{3z}$$

$$\Rightarrow (D^2 - 1)u = -k e^{3z}$$

$$\text{A.E. is } m^2 - 1 = 0 \Rightarrow m = 1, m = -1$$

$$\text{C.F.} = A e^z + B e^{-z}$$

$$\text{P.I.} = \frac{1}{D^2 - 1} (-k e^{3z}) = -k \frac{1}{(3)^2 - 1} e^{3z} = -\frac{k}{8} e^{3z}$$

Complete solution is  $u = \text{C.F.} + \text{P.I.}$

$$\Rightarrow u = A e^z + B e^{-z} - \frac{k}{8} e^{3z}$$

$$\Rightarrow u = A r + \frac{B}{r} - \frac{k}{8} r^3 \quad \text{Ans.}$$

#### EXERCISE 16.4

1. At what distance from the centre the velocity in a S.H.M. will be one fourth of the maximum?

$$\text{Ans. } x = \pm \frac{\sqrt{15} a}{4}$$

2. A particle moving in a straight line with S.H.M. has velocities 3m/sec. and 2m/sec. respectively when it is at distances 1 metre and 1.3 metre from the centre of its path. Find its period and acceleration at the greatest distance from the centre of motion.

3. A particle moves with S.H.M. If, when at a distance of 3 and 4 cm from the centre of the path, its velocities are 8 and 6 cm per sec. respectively. Find its period, maximum velocity and acceleration when at its greatest distance from the centre. **Ans.**  $\pi$  secs, 10 cm/sec, 20 cm/sec<sup>2</sup>.
4. A point executes S.H.M. such that in two of its positions, the velocities are  $u$ ,  $v$  and the corresponding accelerations  $\alpha$ ,  $\beta$ . Show that the distance between the positions is  $\frac{v^2 - u^2}{\alpha + \beta}$ , and find the amplitude of the motion.
5. A particle of mass  $m$  is oscillating in a straight line about a centre of force,  $O$  towards which when at a distance  $r$  the force is  $m n^2 r$  and  $a$  is the amplitude of oscillation, when at a distance  $\frac{a\sqrt{3}}{2}$  from  $O$ , the particle receives a blow in the direction of motion which generates a velocity  $na$ . If this velocity be away from  $O$ , show that the new amplitude is  $a\sqrt{3}$ .
6. The speed  $v$  of the point  $P$  which moves in a line is given by the relation  $v^2 = a + 2bx - cx^2$  where  $x$  is the distance of the point  $P$  from a fixed point on the path, and  $a$ ,  $b$ ,  $c$  are constants the motion is simple harmonic if  $c$  is positive; determine the period and the amplitude of the motion.

$$\text{Ans. } T = \frac{2\pi}{\sqrt{c}}, \text{ Amplitude} = \frac{\sqrt{b^2 + ab}}{c}$$

7. In the case of a stretched elastic string which has one end fixed and a particle of mass  $m$  attached to the other end, the equation of motion is

$$\frac{d^2s}{dt^2} = -\frac{mg}{e}(s - l)$$

where  $l$  is the natural length of the string and  $e$  its elongation due to a weight  $mg$ . Find  $s$  and  $v$  determining the constants, so that  $s = s_0$  at the time  $t = 0$  and  $v = 0$  when  $t = 0$ .

$$\text{Ans. } v = -\sqrt{\left(\frac{g}{e}\right)} [(s_0 - l)^2 - (s - l)^2]^{1/2}, s - l = (s_0 - l) \cos \left[ \sqrt{\left(\frac{g}{e}\right)} \cdot t \right]$$

## 16.9 THE SIMPLE PENDULUM

A particle of mass  $m$  suspended vertically by a light inextensible string oscillating under gravity constitutes a simple pendulum.

Let  $l$  be the length of the string,  $O$  be the fixed point.  $A$  be the initial position of the bob.

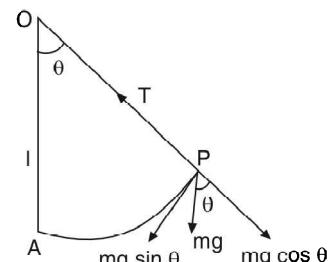

In the displaced position  $P$  at any time  $t$ , then forces acting on the bob are

(i) weight  $mg$  acting vertically downward

(ii) the tension  $T$  in the string.

$$mg \cos \theta = T$$

$$\text{Restoring force} = m \frac{d^2x}{dt^2} = -mg \sin \theta \quad (x = AP) \quad (x = l \sin \theta)$$

$$\Rightarrow \frac{d^2x}{dt^2} = -g \sin \theta \\ = -g \theta \quad (\sin \theta = \theta \text{ if } \theta \text{ is small}) \\ = -g \frac{x}{l}$$

$$\Rightarrow D^2x + \frac{g}{l}x = 0 \Rightarrow \left(D^2 + \frac{g}{l}\right)x = 0$$

$$\text{A.E. is } m^2 + \frac{g}{l} = 0 \Rightarrow m^2 = -\frac{g}{l}, m = \pm i\sqrt{\frac{g}{l}}$$

$$\therefore x = c_1 \cos \sqrt{\frac{g}{l}} t + c_2 \sin \sqrt{\frac{g}{l}} t$$

Thus, the motion of the bob is simple harmonic and

$$\text{Period of Oscillation} = \frac{2\pi}{\sqrt{\frac{g}{l}}} = 2\pi \sqrt{\frac{l}{g}}$$

**Note.** The motion of the bob from one end to the other end is half oscillation and is called a **beat or swing**.

In a second pendulum, the time of one beat is one second. The number of beats in a day  
 $= 24 \times 60 \times 60 = 86400$ .

## 16.10 OSCILLATIONS OF A SPRING

(a) **Free oscillations.** Let a spring be fixed at  $O$  and a mass  $m$  is suspended from the lower end  $A$ .

Let  $S (= AB)$  be the elongation produced by the mass  $m$  hanging.  $B$  is called the position of static equilibrium and  $S$  is called the static extension.

We choose the downward direction as the positive direction and regard forces which act down as positive and upward forces as negative.

If  $k$  be the restoring force per unit stretch of the spring due to elasticity.

Equilibrium at  $B$   $mg = ks$

Let the mass  $m$  be displaced through a further distance  $x (= BP)$  from the equilibrium position  $B$ .

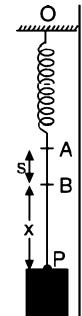

Weight  $mg$  is acting downward

Restoring force  $k(s + x)$  is acting upward.

$$\begin{aligned} \text{Equation of motion is } m \frac{d^2x}{dt^2} &= mg - K(s + x) \\ &= mg - ks - kx \quad (mg = ks) \\ &= mg - mg - kx = -kx \end{aligned}$$

$$\Rightarrow \frac{d^2x}{dt^2} = -\frac{k}{m} x \quad \Rightarrow \quad \frac{d^2x}{dt^2} + \frac{k}{m} x = 0$$

$$\Rightarrow \frac{d^2x}{dt^2} + \omega^2 x = 0 \quad \left( \omega^2 = \frac{k}{m} \right)$$

**Example 22.** A spring of negligible weight hangs vertically. A mass  $m$  is attached to the other end. If the mass is moving with velocity  $u$  when the spring is unstretched, find the velocity  $v$  as a function of the stretch  $x$ .

**Solution.** If  $x$  is the increase in length of the spring when velocity of the mass  $m$  is  $v$ , then the equation of motion is

$$m \cdot v \frac{dv}{dx} = mg - T$$

where  $T = kx$ , by Hooke's law,  $k$  being Young's modulus

$$\therefore mv \frac{dv}{dx} = mg - kx \quad \Rightarrow \quad mv dv = (mg - kx) dx$$

Integrating, we get  $m \frac{v^2}{2} = mgx - k \frac{x^2}{2} + c$

Now,  $v = u$  when  $x = 0 \Rightarrow c = m \frac{u^2}{2}$

$$\therefore m \frac{v^2}{2} = mgx - k \frac{x^2}{2} + m \frac{u^2}{2} \Rightarrow mv^2 = 2mgx - kx^2 + mu^2$$

$$\Rightarrow v^2 = 2gx + u^2 - \frac{k}{m}x^2 \quad \text{Ans.}$$

**Example 23.** A spring for which stiffness  $k = 700$  Newtons/m hangs in a vertical position with its upper end fixed. A mass of 7 kg is attached to the lower end. After coming to rest, the mass is pulled down 0.05 m and released. Discuss the resulting motion of the mass, neglecting air resistance.

**Solution.** The equation of motion is  $m \frac{d^2x}{dt^2} = -kx$

$$\Rightarrow 7 \frac{d^2x}{dt^2} = -700x \Rightarrow \frac{d^2x}{dt^2} + 100x = 0 \Rightarrow D^2x + 100x = 0$$

A.E. is  $m^2 + 100 = 0 \Rightarrow m = \pm i 10$

Its solution is  $x = C_1 \cos 10t + C_2 \sin 10t \quad \dots(1)$

Putting  $t = 0$ ,  $x = 0.05$  in (1), we get  $0.05 = C_1$

Differentiating (1), we have  $\frac{dx}{dt} = -10C_1 \sin 10t + 10C_2 \cos 10t \quad \dots(2)$

On putting  $v = \frac{dx}{dt} = 0$  and  $t = 0$  in (2),  $0 = 10C_2 \Rightarrow C_2 = 0$

On substituting the values of  $C_1$  and  $C_2$  in (1), we obtain

$$x = 0.05 \cos 10t$$

This is S.H.M. Period =  $\frac{2\pi}{\omega} = \frac{2\pi}{10} = 0.628$  secs.

$$\text{Frequency} = \frac{10}{2\pi} = 1.59 \text{ cycle/sec}$$

Amplitude = 0.50 m

**Ans.**

**Example 24.** A mass  $M$  suspended from the end of a helical spring is subjected to a periodic force  $f = F \sin \omega t$  in the direction of its length. The force  $f$  is measured positive vertically downwards and at zero time  $M$  is at rest. If the spring stiffness is  $S$ , prove that the displacement of  $M$  at time  $t$  from the commencement of motion is given by

$$x = \frac{F}{M(P^2 - \omega^2)} \left[ \sin \omega t - \frac{\omega}{P} \sin pt \right] \text{ where } P^2 = \frac{S}{M}$$

and damping effects are neglected.

**Solution.** Let  $x$  be the displacement from the equilibrium position, the equation of motion

is  $M \frac{d^2x}{dt^2} = -Sx + F \sin \omega t$

$$\frac{d^2x}{dt^2} + \frac{S}{M}x = \frac{F}{M} \sin \omega t \Rightarrow \frac{d^2x}{dt^2} + P^2x = \frac{F}{M} \sin \omega t \quad \left( \because \frac{S}{M} = P^2 \right)$$

$$\Rightarrow (D^2 + P^2) = \frac{F}{M} \sin wt$$

A.E. is  $m^2 + P^2 = 0, m = \pm iP$

∴ C.F. =  $(c_1 \cos pt + c_2 \sin pt)$

$$\text{P.I.} = \frac{1}{D^2 + P^2} \frac{F}{M} \sin \omega t = \frac{F}{M} \frac{1}{\omega^2 - P^2} \sin \omega t$$

∴  $x = c_1 \cos pt + c_2 \sin pt + \frac{F}{M} \frac{1}{P^2 - \omega^2} \sin \omega t \quad \dots(1)$

Putting  $t = 0$  and  $x = 0$  in (1), we get,  $0 = c_1$

Equation (1) becomes  $x = c_2 \sin pt + \frac{F}{M} \frac{1}{P^2 - \omega^2} \sin \omega t \quad \dots(2)$

Differentiating (2), we obtain  $\frac{dx}{dt} = c_2 p \cos pt + \frac{F}{M} \frac{\omega}{P^2 - \omega^2} \cos \omega t \quad \dots(3)$

Putting  $\frac{dx}{dt} = 0$  and  $t = 0$  in (3), we have

$$0 = c_2 P + \frac{F}{M} \frac{\omega}{P^2 - \omega^2} \Rightarrow c_2 = - \frac{F \omega}{PM (P^2 - \omega^2)}$$

On substituting the value of  $c_2$  in (2), we get

$$\begin{aligned} x &= - \frac{\omega}{P} \frac{F}{M (P^2 - \omega^2)} \sin pt + \frac{F}{M} \frac{1}{P^2 - \omega^2} \sin \omega t \\ &= \frac{F}{M (P^2 - \omega^2)} \left[ \sin \omega t - \frac{\omega}{P} \sin pt \right] \end{aligned}$$

**Proved.**

**(b) Damped Free Oscillation.** If the motion of the mass  $m$  be opposed by some resistance,

proportional to the velocity ( $= K_1 \frac{dx}{dt}$ ), the oscillations are said to be damped.

The equation of motion is  $m \frac{d^2 x}{dt^2} = mg - k(x + s) - k_1 \frac{dx}{dt} \quad [mg = ks]$

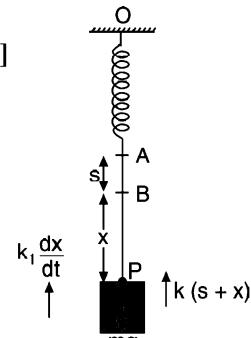

$$\Rightarrow m \frac{d^2 x}{dt^2} = mg - mg - kx - k_1 \frac{dx}{dt} \Rightarrow m \frac{d^2 x}{dt^2} = -kx - k_1 \frac{dx}{dt}$$

$$\Rightarrow \frac{d^2 x}{dt^2} + \frac{k_1}{m} \frac{dx}{dt} + \frac{k}{m} x = 0$$

On putting  $\frac{k_1}{m} = 2\lambda, \frac{k}{m} = \mu^2$ , we get

$$\Rightarrow \frac{d^2 x}{dt^2} + 2\lambda \frac{dx}{dt} + \mu^2 x = 0 \Rightarrow (D^2 + 2\lambda D + \mu^2)x = 0$$

A.E. is  $m^2 + 2\lambda m + \mu^2 = 0$

... (1)

$$\Rightarrow m = \frac{-2\lambda \pm \sqrt{4\lambda^2 - 4\mu^2}}{2} \Rightarrow m = -\lambda \pm \sqrt{\lambda^2 - \mu^2} \quad \dots(2)$$

**Case I.** If  $\lambda > \mu$

Then  $m$  is real and distinct.

Hence, the solution of (1) is  $x = c_1 e^{[-\lambda + \sqrt{\lambda^2 - \mu^2}]t} + c_2 e^{[-\lambda - \sqrt{\lambda^2 - \mu^2}]t}$  ... (3)

From (3), it is obvious that  $x$  is positive and decreases to zero as  $t \Rightarrow \infty$ .

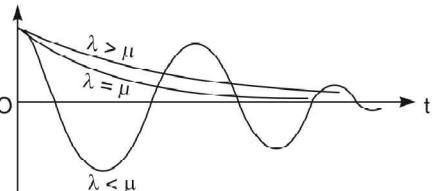

The restoring force, in this case, so great that the motion is non-oscillatory and is known as **over damped or dead beat motion.**

**Case II.** If  $\lambda = \mu$

From (2),  $m = -\lambda \pm \sqrt{\mu^2 - \mu^2} \Rightarrow m = -\lambda$

The roots of (1) are real and equal.

$$\therefore x = (c_1 + c_2 t)e^{-\lambda t}$$

Here also  $x$  is non-oscillatory and  $x \Rightarrow 0$  as  $t \Rightarrow \infty$ . This is the critical damping. There is no oscillatory term in the solution hence motion becomes a periodic or non-oscillatory.

**Case III.** If  $\lambda < \mu$

From (2),  $m = -\lambda \pm \sqrt{\lambda^2 - \mu^2}$

$$m = -\lambda \pm i\sqrt{\mu^2 - \lambda^2}$$

$$\therefore x = e^{-\lambda t} [c_1 \cos \sqrt{\mu^2 - \lambda^2} t + c_2 \sin \sqrt{\mu^2 - \lambda^2} t]$$

$$x = e^{-\lambda t} r \sin (\sqrt{\mu^2 - \lambda^2} t + \alpha) \quad [c_1 = r \sin \alpha, c_2 = r \cos \alpha]$$

Hence, the motion is oscillatory.

The periodic time of the oscillation =  $T = \frac{2\pi}{\sqrt{\mu^2 - \lambda^2}}$  which is greater than the periodic time in

case of free oscillations which is  $\frac{2\pi}{\mu}$ . Thus, the effect of damping is to increase the periodic time of oscillation.

**Example 25.** A spring fixed at the upper end supports a weight of 980 gm at its lower end.

The spring stretches  $\frac{1}{2}$  cm under a load of 10 gm and the resistance (in gm wt) to the motion

of the weight is numerically equal to  $\frac{1}{10}$  of the speed of the weight in cm/sec. The weight is

pulled down  $\frac{1}{4}$  cm below its equilibrium position and then released. Find the expression for the distance of weight from its equilibrium position at time  $t$  during its first upward motion. Also find the time  $t$  it takes the damping factor to

drop to  $\frac{1}{10}$  of its initial value.

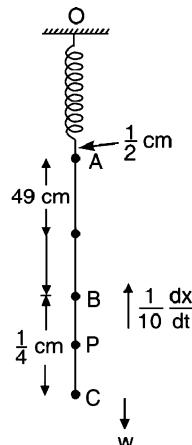

**Solution.** Let  $OA$  be a spring fixed at  $O$  and a load of 10 gm is attached at

A. The spring is stretched by  $\frac{1}{2}$  cm.

$$mg = T_0 \Rightarrow 10 = T_0 = k \cdot \frac{1}{2} \Rightarrow k = 20 \text{ gm/cm}$$

Let  $B$  be the equilibrium after attaching a weight 980 gm at  $A$ .

$$mg = kx \text{ where } x = AB$$

$$980 = 20x \Rightarrow x = AB = \frac{980}{20} = 49 \text{ cm}$$

After static equilibrium the weight is pulled down to  $C$  and released.  $\left( BC = \frac{1}{4} \text{ cm} \right)$ . After release, the weight be at  $P$  after time  $t$ .

$$BP = x$$

$$T = K \cdot AP = 20 (49 + x) = 980 + 20x$$

Equation of motion is  $m \frac{d^2x}{dt^2} = \omega - T - \frac{1}{10} \frac{dx}{dt}$  (Resistance  $= \frac{1}{10} \frac{dx}{dt}$ )

$$\frac{980}{g} \frac{d^2x}{dt^2} = 980 - (980 + 20x) - \frac{1}{10} \frac{dx}{dt} \quad [g = 980 \text{ cm/sec}^2]$$

$$\Rightarrow 10 \frac{d^2x}{dt^2} + \frac{dx}{dt} + 200x = 0 \Rightarrow 10 D^2x + Dx + 200x = 0$$

A.E. is  $10 m^2 + m + 200 = 0$

$$\Rightarrow m = \frac{-1 \pm \sqrt{1 - 8000}}{20} = \frac{-1 \pm i 89.4}{20}$$

$$\Rightarrow m = -0.05 \pm i 4.5$$

$$\therefore \text{C.F. } x = e^{-0.05t} [c_1 \cos 4.5t + c_2 \sin 4.5t] \quad \dots(1)$$

On putting  $t = 0$  and  $x = \frac{1}{4}$  in (1), we get  $\frac{1}{4} = c_1$

On differentiating (1), we get

$$\frac{dx}{dt} = -0.05 e^{-0.05t} [c_1 \cos 4.5t + c_2 \sin 4.5t] + e^{-0.05t} [-4.5 c_1 \sin 4.5t + 4.5 c_2 \cos 4.5t] \dots(2)$$

On putting  $\frac{dx}{dt} = 0$  and  $t = 0$  in (2), we have

$$0 = -0.05 c_1 + 4.5 c_2 \Rightarrow c_2 = \frac{0.05}{4.5} c_1 = \frac{0.05}{4.5} \left( \frac{1}{4} \right) = 0.0028$$

On substituting the values of  $c_1$  and  $c_2$  in (1), we obtain

$$x = e^{-0.05t} [0.25 \cos 4.5t + 0.0028 \sin 4.5t]$$

Damping factor  $= b e^{-0.05t}$  ( $b$  = constant of proportionality)

Initial value of damping factor  $= b e^0 = b$

Let damping factor after time  $t$  be  $\frac{b}{10}$ .

$$\frac{b}{10} = b e^{-0.05t} \Rightarrow e^{\frac{t}{20}} = 10 \Rightarrow \frac{t}{20} = \log_e 10$$

$$\Rightarrow t = 20 \log_e 10 \Rightarrow t = 20 \frac{\log_{10} 10}{\log_{10} e} = \frac{20}{\log_{10} e} = 20 \times 2.3 = 46 \text{ secs.} \quad \text{Ans.}$$

### (c) Forced Oscillations (without damping)

If an external force is applied on the point of support of the spring, it oscillates. The motion is called the forced oscillatory motion.

Let the external force be  $q \cos nt$ .

Equation of motion is  $m \frac{d^2x}{dt^2} = mg - ks - kx + q \cos nt \quad (mg = ks)$

$$\Rightarrow m \frac{d^2x}{dt^2} = -kx + q \cos nt \Rightarrow \frac{d^2x}{dt^2} = -\frac{k}{m}x + \frac{q}{m} \cos nt \quad \dots(1)$$

Let  $\frac{k}{m} = \mu^2$  and  $\frac{q}{m} = e$ , then (1) becomes

$$\begin{aligned} & \frac{d^2x}{dt^2} = -\mu^2x + e \cos nt \\ \Rightarrow & \frac{d^2x}{dt^2} + \mu^2x = e \cos nt \\ \Rightarrow & (D^2 + \mu^2)x = e \cos nt \end{aligned} \quad \dots(2)$$

A.E. is  $m^2 + \mu^2 = 0 \Rightarrow m = \pm i \mu$

$$\text{C.F.} = c_1 \cos \mu t + c_2 \sin \mu t$$

$$\text{P.I.} = \frac{1}{D^2 + \mu^2} e \cos nt$$

**Case (a).** If  $\mu \neq n$ ,  $\text{P.I.} = e \frac{1}{-\mu^2 + n^2} \cos nt$

Complete solution of (1) is  $x = c_1 \cos \mu t + c_2 \sin \mu t + \frac{e}{\mu^2 - n^2} \cos nt \quad \left[ \begin{array}{l} c_1 = A \cos \alpha \\ c_2 = A \sin \alpha \end{array} \right]$

$$x = A \cos(\mu t + \alpha) + \frac{e}{\mu^2 - n^2} \cos nt \quad \dots(3)$$

Equation (2) shows that the motion is the resultant of two oscillatory motions, i.e., the first due to  $A \cos(\mu t + \alpha)$  gives free oscillation of period  $\frac{2\pi}{\mu}$  and the second due to  $\frac{e}{\mu^2 - n^2} \cos nt$  gives forced oscillations of period  $\frac{2\pi}{n}$ . If  $\mu$  is large, then the frequency of free oscillations is very

high, then the amplitude  $\frac{e}{\mu^2 - n^2}$  of forced oscillations is small.

**Case (b).** If  $\mu = n$   $\text{P.I.} = \frac{1}{D^2 + \mu^2} e \cos nt = e \cdot t \frac{1}{2D} \cos nt = \frac{et}{2} \int \cos nt dt$

$$\text{P.I.} = \frac{et}{2} \left( \frac{\sin nt}{n} \right)$$

$$\begin{aligned} x &= c_1 \cos \mu t + c_2 \sin \mu t + \frac{et \sin nt}{2n} \\ &= c_1 \cos \mu t + c_2 \sin \mu t + e \frac{t}{2\mu} \sin \mu t \end{aligned} \quad (n = \mu)$$

$$= c_1 \cos \mu t + \left( c_2 + \frac{et}{2\mu} \right) \sin \mu t$$

Let  $c_1 = r \sin \phi$  and  $\left( c_2 + \frac{et}{2\mu} \right) = r \cos \phi$

$$\Rightarrow x = r \sin \phi \cos \mu t + r \cos \phi \sin \mu t$$

$$= r \sin(\mu t + \phi)$$

The period of oscillation =  $\frac{2\pi}{\mu}$

$$\left[ \begin{array}{l} r = \sqrt{c_1^2 + \left( c_2 + \frac{et}{2\mu} \right)^2} \\ \phi = \tan^{-1} \left( \frac{c_1}{c_2 + \frac{et}{2\mu}} \right) \end{array} \right]$$

$$\text{Amplitude} = \sqrt{c_1^2 + \left(c_2 + \frac{et}{2\mu}\right)^2} \text{ and it increases as } t \text{ increases.}$$

After long time, the amplitude of the oscillation may become abnormally large causing over strain and consequently break down the system. But it does not happen as there is always some resistance in the system.

**Resonance.** If the frequency due to external periodic force becomes equal to the natural frequency of the system, the phenomenon is known as *resonance*.

In designing a machine or structure, occurrence of the resonance is always to be avoided so that the system may not break down. While marching over a bridge, the soldiers avoid that their steps may not be in rhythm with the natural frequency of the bridge. Resonance may cause the collapse of the bridge.

#### (d) Forced Oscillations (with damping)

If there is an additional damping force, proportional to velocity, then equation of motion is

$$\begin{aligned} m \frac{d^2x}{dt^2} &= mg - ks - kx - k_1 \frac{dx}{dt} + q \cos nt \quad (mg = ks) \\ \Rightarrow m \frac{d^2x}{dt^2} &= -kx - k_1 \frac{dx}{dt} + q \cos nt \\ \Rightarrow \frac{d^2x}{dt^2} &= -\frac{k}{m}x - \frac{k_1}{m} \frac{dx}{dt} + \frac{q}{m} \cos nt \quad \dots(1) \end{aligned}$$

On putting  $\frac{k}{m} = \mu^2$ ,  $\frac{k_1}{m} = 2\lambda$ ,  $\frac{q}{m} = e$  in equation (1), we get

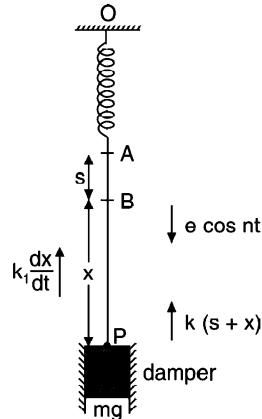

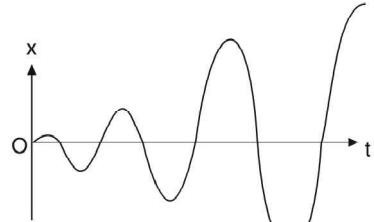

$$\begin{aligned} \Rightarrow \frac{d^2x}{dt^2} &= -\mu^2 x - 2\lambda \frac{dx}{dt} + e \cos nt \\ \Rightarrow \frac{d^2x}{dt^2} + 2\lambda \frac{dx}{dt} + \mu^2 x &= e \cos nt \quad \dots(2) \\ \Rightarrow (D^2 + 2\lambda D + \mu^2)x &= e \cos nt \end{aligned}$$

A.E. is  $m^2 + 2\lambda m + \mu^2 = 0 \Rightarrow m = \frac{-2\lambda \pm \sqrt{4\lambda^2 - 4\mu^2}}{2}$

$$m = -\lambda \pm \sqrt{\lambda^2 - \mu^2}$$

$$\text{C.F.} = c_1 e^{[-\lambda + \sqrt{\lambda^2 - \mu^2}]t} + c_2 e^{[-\lambda - \sqrt{\lambda^2 - \mu^2}]t} = e^{-\lambda t} [c_1 e^{\sqrt{\lambda^2 - \mu^2}t} + c_2 e^{-\sqrt{\lambda^2 - \mu^2}t}]$$

$$\begin{aligned} \text{P.I.} &= \frac{1}{D^2 + 2\lambda D + \mu^2} e \cos nt = e \frac{1}{-\nu^2 + 2\lambda D + \mu^2} \cos nt \\ &= e \frac{1}{(\mu^2 - \nu^2) + 2\lambda D} \cos nt = e \frac{(\mu^2 - \nu^2) - 2\lambda D}{(\mu^2 - \nu^2)^2 - 4\lambda^2 D^2} \cos nt \\ &= e \frac{(\mu^2 - \nu^2) - 2\lambda D}{(\mu^2 - \nu^2)^2 - 4\lambda^2 (-\nu^2)} \cos nt = e \frac{(\mu^2 - \nu^2) \cos nt + 2n \lambda \sin nt}{(\mu^2 - \nu^2)^2 + 4\lambda^2 n^2} \end{aligned}$$

Put  $\mu^2 - n^2 = r \cos \phi$  and  $2n\lambda = r \sin \phi$

$$\begin{aligned} \text{P.I.} &= e \frac{r \cos \phi \cos nt + r \sin \phi \sin nt}{(\mu^2 - n^2)^2 + 4\lambda^2 n^2} \\ &= e \frac{r \cos(nt - \phi)}{r^2} = \frac{e}{r} \cos(nt - \phi) \end{aligned}$$

$$\left[ \begin{array}{l} r = \sqrt{(\mu^2 - n^2)^2 + 4n^2 \lambda^2} \\ \phi = \tan^{-1} \frac{2n\lambda}{\mu^2 - n^2} \end{array} \right]$$

Complete solution is  $x = \text{C.F.} + \text{P.I.}$

$$x = e^{-\lambda t} [c_1 e^{\sqrt{\lambda^2 - \mu^2} t} + c_2 e^{-\sqrt{\lambda^2 - \mu^2} t}] + \frac{e}{r} \cos(nt - \phi) \quad \dots(3)$$

C.F. in (3) represents free oscillations of the system, which die out as  $t \rightarrow \infty$ , due to  $e^{-\lambda t}$ .

$\frac{e}{r} \cos(nt - \phi)$  represents the forced oscillation.

Its constant amplitude  $= \frac{e}{r} = \frac{e}{\sqrt{(\mu^2 - n^2)^2 + 4n^2 \lambda^2}}$

Its period  $= \frac{2\pi}{n}$  which is the same as that of impressed force. As  $t$  increases, the free oscillations (given in the C.F.) die out while the forced oscillations persist giving the steady state of motion.

**Example 26.** A body executes damped forced vibrations given by the equation

$$\frac{d^2x}{dt^2} + 2k \frac{dx}{dt} + b^2 x = e^{-kt} \sin \omega t. \text{ Solve the equation for both the cases, when } w^2 \neq b^2 - k^2 \text{ and when } w^2 = b^2 - k^2.$$

(Uttarakhand, II Semester, June 2007)

**Solution.** We have,

$$\begin{aligned} \frac{d^2x}{dt^2} + 2k \frac{dx}{dt} + b^2 x &= e^{-kt} \sin \omega t \\ \Rightarrow (D^2 + 2kD + b^2)x &= e^{-kt} \sin \omega t \end{aligned} \quad \dots(1)$$

Which is a linear differential equation with constant coefficients.

$$\text{A.E. is } m^2 + 2km + b^2 = 0 \quad \Rightarrow \quad m = \frac{-2k \pm \sqrt{4k^2 - 4b^2}}{2} = -k \pm \sqrt{k^2 - b^2}$$

As the given problem is on vibrations, we must have  $k^2 < b^2$

$$\begin{aligned} \therefore m &= -k \pm \sqrt{(b^2 - k^2)} = -k \pm i \sqrt{(b^2 - k^2)} \\ \therefore \quad \Rightarrow \quad \text{C.F.} &= e^{-kt} [C_1 \cos \sqrt{b^2 - k^2} t + C_2 \sin \sqrt{b^2 - k^2} t] \\ &= e^{-kt} A \cos \{\sqrt{b^2 - k^2} t + \beta\} \end{aligned}$$

where A and B are arbitrary constants.

$$\begin{aligned} \text{P.I.} &= \frac{1}{D^2 + 2kD + b^2} e^{-kt} \sin \omega t = e^{-kt} \frac{1}{(D - k)^2 + 2k(D - k) + b^2} \sin \omega t \\ &= e^{-kt} \frac{1}{D^2 + (b^2 - k^2)} \sin \omega t = e^{-kt} \frac{1}{-\omega^2 + (b^2 - k^2)} \sin \omega t \text{ if } \omega^2 \neq b^2 - k^2 \end{aligned}$$

**When  $\omega^2 - (b^2 - k^2) = 0$**

$$\text{P.I.} = e^{-kt} t \frac{1}{2D} \sin \omega t = e^{-kt} \left( -\frac{t}{2\omega} \cos \omega t \right),$$

**Case I.** If  $w^2 \neq b^2 - k^2$ , the complete solution of (1) is

$$x = Ae^{-kt} \cos \{\sqrt{(b^2 - k^2)} t + \beta\} + \frac{e^{-kt}}{(b^2 - k^2) - \omega^2} \sin \omega t$$

**Case II.** If  $\omega^2 = b^2 - k^2$ , the complete solution of (1) is

$$x = Ae^{-kt} \cos (\sqrt{b^2 - k^2} t + \beta) + \frac{-e^{-kt} t \cos \omega t}{2\omega} \quad (b^2 - k^2 = \omega^2)$$

$$x = Ae^{-kt} \cos (\omega t + \beta) - \frac{e^{-kt} t \cos \omega t}{2\omega} \quad \text{Ans.}$$

**Example 27.** A spring of negligible weight which stretches 1 inch under tension of 2 lb is fixed at one end and is attached to a weight of  $w$  lb at the other. It is found that resonance occurs when an axial periodic force  $2 \cos 2t$  lb acts on the weight. Show that when the free vibrations have died out, the forced vibrations are given by  $x = ct \sin 2t$  and find values of  $w$  and  $c$ .  
(Uttarakhand, II Semester, June 2007)

**Solution.** When a weight of 2 lb is attached to A, spring stretches by  $\frac{1}{12}$  ft.

Stress =  $k$  strain

$$\therefore 2 = k \cdot \frac{1}{12} \Rightarrow k = 24 \text{ lb/ft.}$$

Let B be the position of the weight  $w$  attached to A then,

Stress =  $k$  strain

$$\omega = k \times AB \Rightarrow \omega = 24 AB \Rightarrow AB = \frac{\omega}{24} \text{ ft.}$$

At any time  $t$ , let the weight  $T_p$  be at P where  $BP = x$ .

$$\begin{aligned} \text{Tension at } P, \quad T_p &= k \times AP = 24 \left( \frac{\omega}{24} + x \right) \\ &\quad [AP = AB + BP] \\ T_p &= \omega + 24x \end{aligned}$$

Its equation of motion is

$$\begin{aligned} \frac{\omega}{g} \cdot \frac{d^2x}{dt^2} &= -T + \omega + 2 \cos 2t && [\text{Mass} \times \text{acceleration} = \text{Force}] \\ &= -\omega - 24x + \omega + 2 \cos 2t && [T = \omega + 24x] \end{aligned}$$

$$\Rightarrow \omega \frac{d^2x}{dt^2} + 24gx = 2g \cos 2t \quad \dots(1)$$

The phenomenon of resonance occurs when the period of free oscillations is equal to the period of forced oscillations,

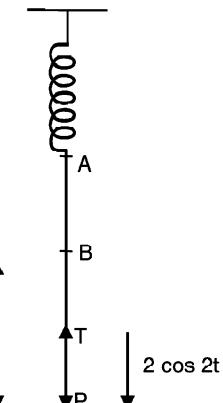

$$\text{From (1),} \quad \frac{d^2x}{dt^2} + \mu^2 x = \frac{2g}{\omega} \cos 2t \quad \dots(2) \left[ \text{where } \mu^2 = \frac{24g}{\omega} \right]$$

The period of free oscillations is found as  $\frac{2\pi}{\mu}$

and the period of the force  $\left(\frac{2g}{\omega}\right) \cos 2t$  is  $\pi$ .

$$\therefore \frac{2\pi}{\mu} = \pi \Rightarrow \mu = 2$$

$$\text{On putting the value of } \mu \text{ in } \mu^2 = \frac{24g}{\omega}, \text{ we get } 4 = \frac{24g}{\omega} \Rightarrow \omega = 6g$$

On putting the values of  $\mu$  and  $w$  in (2), we get

$$\frac{d^2x}{dt^2} + 4x = \frac{1}{3} \cos 2t \quad \dots(3) [\because \omega = 6g \text{ and } \mu = 2]$$

We know that the free oscillations are given by the C.F. and the forced oscillations are given by P.I. Thus, when the free oscillations have died out, the forced oscillations are given by the P.I. of (3).

$$\text{P.I.} = \frac{1}{3} \left( \frac{1}{D^2 + 4} \cos 2t \right) = \frac{1}{3} t \cdot \frac{1}{2D} \cos 2t = \frac{t}{12} \sin 2t$$

Hence,  $c = \frac{1}{12}$ .

**Ans.**

### EXERCISE 16.5

1. A mass of 30 kg is attached to a spring for which  $k = 750$  Newton/m and brought to rest. Find the position of the mass at time  $t$  if a force equal to  $20 \sin 2t$  is applied to it.

**Ans.**  $x = -0.013 \sin 5t + 0.032 \sin 2t$

2. A body weighing 4.9 kg is hung from a spring. A pull of 10 kg will stretch the spring to 5 cm. The body is pulled down 6 cm below the static equilibrium position and then released. Find the displacement of the body from its equilibrium position at time  $t$  seconds, the maximum velocity and the period of oscillation.

**Ans.**  $0.06 \cos 20t$  m; 1.2 m/sec; 0.314 sec.

3. A spring is such that it would stretch 72 mm by a mass of 15 kg. A mass of 30 kg is attached and brought to rest. The resistance of the medium is numerically equal to  $20 \frac{dx}{dt}$  Newtons. Find the equation of the motion of the weight if it is pulled down 140 mm and given an upward velocity 3m/sec.

**Ans.**  $x = e^{-2t} (0.14 \cos 8t - 0.34 \sin 8t)$

4. A body weighing 10 kg is hung from a spring. A pull of 20 kg wt. will stretch the spring to 10 cm. The body is pulled down to 20 cm below the static equilibrium position and then released. Find the displacement of the body from its equilibrium position at time  $t$  sec, the maximum velocity and the period of oscillation.

**Ans.**  $x = 0.2 \cos 14t$ , Max. Vel = 2.8 m/sec, period of oscillation = 0.45 sec

5. A particle of mass  $m$  is attached to one end of a light spring of modulus  $\lambda$ , the other end being fixed and the spring vertical. Prove that the velocity of the particle when it has traversed a distance ' $a$ ' is

$$\sqrt{2ag - \frac{\lambda a^2}{m}}$$

### 16.11 BEAM

A bar whose length is much greater than its cross-section and its thickness is called a *beam*.

**Supported beam.** If a beam may just rest on a support like a knife edge is called a *supported beam*.

**Fixed beam.** If one or both ends of a beam are firmly fixed then it is called *fixed beam*.

**Cantilever.** If one end of a beam is fixed and the other end is loaded, it is called a *cantilever*.

**Bending of Beam.** Let a beam be fixed at one end and the other end is loaded. Then the upper surface is elongated and therefore under tension and the lower surface is shortened so under compression.

**Neutral Surface.** In between the lower and upper surface there is a surface which is neither stretched nor compressed. It is known as a *neutral surface*.

**Bending Moment.** Whenever a beam is loaded it deflects from its original position. If  $M$  is the bending moment of the forces acting on it, then

$$M = \frac{EI}{R} \quad \dots(1)$$

where  $E$  = Modulus of elasticity of the beam,

$I$  = Moment of inertia of the cross-section of beam about neutral axis.

$R$  = Radius of curvature of the curved beam

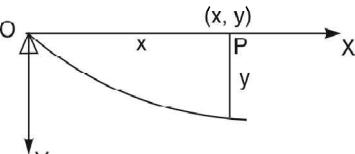

$$R = \frac{\frac{d^2y}{dx^2}}{\left[1 + \left(\frac{dy}{dx}\right)^2\right]^{3/2}} = \frac{1}{\frac{d^2y}{dx^2}} \quad \left[\text{neglecting } \frac{dy}{dx}\right]$$

Thus equation (1) becomes  $M = EI \frac{d^2y}{dx^2}$

### Boundary Conditions

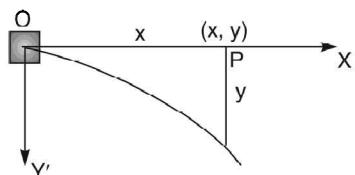

(i) *End freely supported.* At the freely supported end there will be no deflection and no bending moment.

$$y = 0, \quad \frac{d^2y}{dx^2} = 0$$

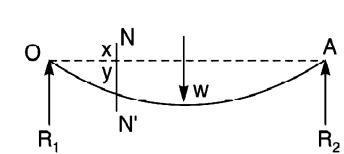

(ii) *Fixed end horizontally.* Deflection and slope of the beam are zero.

$$y = 0, \quad \frac{dy}{dx} = 0$$

(iii) *Perfectly free end.* At the free end there is no bending moment or shear force.

$$\frac{d^2y}{dx^2} = 0, \quad \frac{d^3y}{dx^3} = 0$$

### Convention of signs

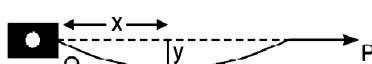

The sign of the moment about  $NN'$  on the left  $NN'$  is positive if anticlockwise and negative if clockwise.

The downward deflection is positive and length  $x$  on right-side is also positive. Slope  $\frac{dy}{dx}$  is positive if downward.

**Example 28.** The differential equation satisfied by a beam uniformly loaded ( $W$  kg/metre), with one end fixed and the second end subjected to tensile force  $P$ , is given by

$$E.I. \frac{d^2y}{dx^2} = Py - \frac{1}{2} Wx^2$$

Show that the elastic curve for the beam with conditions

$$y = 0 = \frac{dy}{dx} \text{ at } x = 0, \text{ is given by}$$

$$y = \frac{W}{Pn^2} (1 - \cosh nx) + \frac{Wx^2}{2P} \text{ where } n^2 = \frac{P}{EI}$$

**Solution.** We have,  $E.I. \frac{d^2y}{dx^2} = Py - \frac{1}{2}Wx^2$  ... (1)

$$\Rightarrow \frac{d^2y}{dx^2} - \frac{P}{E.I.}y = -\frac{W}{2E.I.}x^2 \Rightarrow \left(D^2 - \frac{P}{E.I.}\right)y = -\frac{W}{2E.I.}x^2$$

A.E. is  $m^2 - \frac{P}{E.I.} = 0 \Rightarrow m^2 = \frac{P}{E.I.} = n^2 \Rightarrow m = \pm n \quad \left(n^2 = \frac{P}{EI}\right)$

C.F.  $= c_1 e^{nx} + c_2 e^{-nx}$

$$\begin{aligned} \text{P.I.} &= \frac{1}{D^2 - \frac{P}{E.I.}} \left( -\frac{W}{2E.I.} \right) x^2 = -\frac{W}{2E.I.} \frac{1}{D^2 - n^2} x^2 \\ &= \frac{W}{2n^2 E.I.} \left( 1 - \frac{D^2}{n^2} \right)^{-1} x^2 = \frac{W}{2n^2 E.I.} \left( 1 + \frac{D^2}{n^2} \right) x^2 = \frac{W}{2n^2 E.I.} \left( x^2 + \frac{2}{n^2} \right) \\ \therefore y &= c_1 e^{nx} + c_2 e^{-nx} + \frac{W}{2n^2 E.I.} \left( x^2 + \frac{2}{n^2} \right) \end{aligned} \quad \dots (2)$$

Differentiating (2) w.r.t.  $x$ , we get

$$\frac{dy}{dx} = nc_1 e^{nx} - nc_2 e^{-nx} + \frac{W}{2n^2 E.I.} (2x) \quad \dots (3)$$

Putting  $x = 0$ ,  $\frac{dy}{dx} = 0$  in (3), we get

$$0 = nc_1 - nc_2 \Rightarrow c_1 = c_2$$

Putting  $x = 0$ ,  $y = 0$  in (2), we get

$$0 = c_1 + c_2 + \frac{W}{2n^2 E.I.} \frac{2}{n^2} \Rightarrow 0 = c_1 + c_2 + \frac{W}{n^4 E.I.} \quad \dots (4)$$

Putting  $c_1 = c_2$  in (4), we get  $0 = 2c_1 + \frac{W}{n^4 E.I.} \Rightarrow c_1 = -\frac{W}{2n^4 E.I.}$ ,

Now,  $n^2 = \frac{P}{E.I.} \Rightarrow n^2 E.I. = P$

$$\Rightarrow c_1 = c_2 = -\frac{W}{2n^2 P}$$

Putting the values of  $c_1$  and  $c_2$  in (2), we get

$$y = \frac{-W}{2n^2 P} (e^{nx} + e^{-nx}) + \frac{W}{2P} \left( x^2 + \frac{2}{n^2} \right)$$

$$y = \frac{-W}{n^2 P} \cosh nx + \frac{W}{2P} x^2 + \frac{W}{P n^2}$$

$$y = \frac{W}{P n^2} (1 - \cosh nx) + \frac{W x^2}{2P}$$

**Ans.**

### EXERCISE 16.6

1. A beam of length  $l$  and of uniform cross-section has the differential equation of its elastic curve as

$$E.I. \frac{d^2y}{dx^2} = \frac{w}{2} \left( \frac{l^2}{4} - x^2 \right)$$

where  $E$  is the modulus of elasticity,  $I$  is the moment of inertia of the cross-section,  $w$  is weight per unit length and  $x$  is measured from the centre of span.

If at  $x=0$ ,  $\frac{dy}{dx}=0$ . Prove that the equation of the elastic curve is

$$y = \frac{1}{2} \cdot \frac{2}{E.I.} \left( \frac{l^3 \cdot x^2}{8} - \frac{x^4}{12} \right) + \frac{5w \cdot l^4}{384 E.I.}$$

2. A horizontal tie rod of length  $l$  is freely pinned at each end. It carries a uniform load  $w$  kg per unit length and has a horizontal pull  $P$ . Find the central deflection and the maximum bending moment, taking the

origin at one of its ends.

$$\text{Ans. } \frac{w}{a} \left( \sec h \frac{al}{2} - 1 \right) \text{ where } a^2 = \frac{P}{EI}$$

3. A light horizontal strut  $AB$  is freely pinned at  $A$  and  $B$ . It is under the action of equal and opposite compressive forces  $P$  at its ends and it carries a load  $W$  at its centre. Then for  $0 < x < \frac{l}{2}$ ,

$$EI \frac{d^2y}{dx^2} + Py + \frac{1}{2} Wx = 0$$

Also  $y = 0$  at  $x = 0$  and  $\frac{dy}{dx} = 0$  at  $x = \frac{l}{2}$ . Prove that  $y = \frac{W}{2P} \left( \frac{\sin ax}{a \cos \frac{al}{2}} - x \right)$ , where  $a^2 = \frac{P}{EI}$

4. A horizontal tie-rod of length  $2l$  with concentrated load  $W$  at its centre and ends freely hinged satisfies

the differential equation  $EI \frac{d^2y}{dx^2} = Py - \frac{W}{2} x$ . With conditions  $x = 0$ ,  $y = 0$  and  $x = l$ ,  $\frac{dy}{dx} = 0$ . Prove that

the deflection  $\delta$  and bending moment  $M$  at the centre ( $x = l$ ) are given by  $\delta = \frac{W}{2Pn} (nl - \tan nl)$  and

$$M = -\frac{W}{2n} \tan h nl, \text{ where } n^2 EI = P.$$

### 16.12 PROJECTILE

**Example 29.** A particle is projected with velocity  $u$  making an angle  $\alpha$  with the horizontal. Neglecting air resistance, show that the equation of its path is the parabola.

$$y = x \tan \alpha - \frac{gx^2}{2u^2 \cos^2 \alpha}.$$

Find the time of flight, the greatest height attained and the range on the horizontal plane.

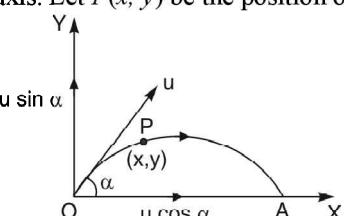

**Solution.** If a particle of mass  $m$  is projected from  $O$  with velocity  $u$  in a direction making an angle  $\alpha$  with the horizontal.

Let horizontal line and vertical line be taken as  $x$ -axis and  $y$ -axis. Let  $P(x, y)$  be the position of the particle at time  $t$ .

Horizontal component of  $u = u \cos \alpha$

Vertical component of  $u = u \sin \alpha$

The force acting on the particle = weight =  $mg$

The equations of motion are

$$\text{Horizontal components: } m \frac{d^2x}{dt^2} = 0 \Rightarrow \frac{d^2x}{dt^2} = 0 \quad \dots(1)$$

$$\text{Vertical components: } m \frac{d^2y}{dx^2} = -mg \Rightarrow \frac{d^2y}{dx^2} = -g \quad \dots(2)$$

$$\text{Integrating (1), we have } \frac{dx}{dt} = c_1 \quad \dots(3)$$

Initially  $\frac{dx}{dt} = u \cos \alpha$ , time  $t = 0$ , putting in (3), we get

$$u \cos \alpha = c_1$$

On putting the value of  $c_1$  in (3), we get

$$\frac{dx}{dt} = u \cos \alpha \quad \dots(4)$$

$$\text{Integrating (4), we have } x = (u \cos \alpha) t + c_2 \quad \dots(5)$$

Putting (initial condition)  $t = 0, \alpha = 0$ , we get  $c_2 = 0$

$$(5) \text{ becomes, } x = (u \cos \alpha) t \quad \dots(6)$$

$$\text{Integrating (2), we have } \frac{dy}{dt} = -gt + c_3 \quad \dots(7)$$

Putting (initial condition)  $t = 0, \frac{dy}{dt} = u \sin \alpha$  in (7), we get

$$u \sin \alpha = c_3$$

(7) becomes  $\frac{dy}{dt} = -gt + u \sin \alpha \quad \dots(8)$

$$\text{Integrating (8), we get } y = -g \frac{t^2}{2} + (u \sin \alpha) t + c_4 \quad \dots(9)$$

Putting (initial condition),  $t = 0, y = 0$ , we obtain  $0 = c_4$

$$(9) \text{ becomes, } y = -\frac{gt^2}{2} + (u \sin \alpha) t \quad \dots(10)$$

Equation (6) and (10) give the position of the particle at any time  $t$ . The equation of the path described by the particle is obtained by eliminating  $t$ , between the equations (6) and (10),

$$\text{From (6), } t = \frac{x}{u \cos \alpha}$$

Substituting this value of  $t$  in (10), we get

$$y = (u \sin \alpha) \frac{x}{u \cos \alpha} - \frac{g}{2} \left( \frac{x^2}{u^2 \cos^2 \alpha} \right)$$

$$y = x \tan \alpha - \frac{gx^2}{2u^2 \cos^2 \alpha}$$

which is the equation of the projectile, the path is parabola.

**Time of flight.** At the point  $A, y = 0$

On putting  $y = 0$  in (10), we get

$$0 = -\frac{gt^2}{2} + (u \sin \alpha)t \Rightarrow t = \frac{2u \sin \alpha}{g}$$

### Greatest Height

At the highest point, the vertical component becomes zero, i.e.,  $\frac{dy}{dt} = 0$

$$\text{Putting } \frac{dy}{dt} = 0 \text{ in (8), we get } 0 = -gt + u \sin \alpha \Rightarrow t = \frac{u \sin \alpha}{g}$$

For the highest point, we substitute the value of  $t$  in (10), we get

$$y = -\frac{g}{2} \left( \frac{u \sin \alpha}{g} \right)^2 + u \sin \alpha \left( \frac{u \sin \alpha}{g} \right) = -\frac{u^2 \sin^2 \alpha}{2g} + \frac{u^2 \sin^2 \alpha}{g} = \frac{u^2 \sin^2 \alpha}{2g}$$

**Range**, i.e.,  $OA$  is the horizontal distance covered during flight.

Putting the value of  $t = \frac{2u \sin \alpha}{g}$  in (6), we get

$$\text{Range} = (u \cos \alpha) \left( \frac{2u \sin \alpha}{g} \right) = \frac{u^2 \sin 2\alpha}{g}$$

$$\text{Maximum range} = \frac{u^2}{g} \text{ if } \sin 2\alpha = 1 \Rightarrow \alpha = \frac{\pi}{4}$$

**Ans.**

**Example 30.** The equation of motion under certain conditions are

$$m \frac{d^2x}{dt^2} + eh \frac{dy}{dt} = eE \quad \dots(1)$$

$$m \frac{d^2y}{dt^2} - eh \frac{dx}{dt} = 0 \quad \dots(2)$$

With condition  $x = \frac{dx}{dt} = y = \frac{dy}{dt} = 0$  when  $t = 0$ , find the path of electron.

**Solution.** Multiplying (2) by  $k$  and adding to (1), we get

$$\begin{aligned} m \frac{d^2x}{dt^2} + mk \frac{d^2y}{dt^2} + eh \frac{dy}{dt} - ehk \frac{dx}{dt} &= eE \\ \Rightarrow m \frac{d^2}{dt^2} (x + ky) - ehk \frac{d}{dt} \left( -\frac{y}{k} + x \right) &= eE \end{aligned} \quad \dots(3)$$

Let us choose  $k$  such that  $x + ky = x - \frac{y}{k}$

$$\Rightarrow k = -\frac{1}{k} \Rightarrow k^2 = -1 \Rightarrow k = \pm i$$

Putting  $x + ky = u$  in (3), we have

$$m \frac{d^2u}{dt^2} - ehk \frac{du}{dt} = eE \Rightarrow \frac{d^2u}{dt^2} - wk \frac{du}{dt} = \frac{eE}{m} \quad \left( w = \frac{eh}{m} \right)$$

$$\Rightarrow D^2 u - wk Du = \frac{eE}{m}$$

A.E. is  $m^2 - wkm = 0 \Rightarrow m(m - wk) = 0 \Rightarrow m = 0 \text{ or } m = wk$

$$\text{C.F.} = c_1 + c_2 e^{wkt}$$

$$\begin{aligned} \text{P.I.} &= \frac{1}{D^2 - wkD} \frac{eE}{m} = \frac{eE}{m} \frac{1}{D^2 - wkD} e^{0t} \\ &= \frac{eEt}{m} \frac{1}{2D - wk} e^{0t} = \frac{wEt}{h} \frac{1}{0 - wk} = -\frac{Et}{hk} \quad \left( w = \frac{eh}{m} \right) \end{aligned}$$

The complete solution is

$$u = c_1 + c_2 e^{wkt} - \frac{Et}{h \cdot k} \text{ or } x + ky = c_1 + c_2 e^{wkt} - \frac{Et}{hk} \quad \dots(4)$$

Putting the value of  $k$ , i.e.,  $i$ ,  $-i$  in (4), we get

$$x + iy = c_1 + c_2 e^{iwt} - \frac{Et}{ih} \quad \dots(5)$$

$$x - iy = c_3 + c_4 e^{-iwt} + \frac{Et}{ih} \quad \dots(6)$$

Differentiating (5) and (6), we get

$$\frac{dx}{dt} + i \frac{dy}{dt} = c_2 iwe^{iwt} + \frac{iE}{h} \quad \dots(7)$$

$$\frac{dx}{dt} - i \frac{dy}{dt} = -iwc_4 e^{-iwt} - \frac{iE}{h} \quad \dots(8)$$

Initial conditions  $x = y = \frac{dx}{dt} = \frac{dy}{dt} = 0$  when  $t = 0$

Putting these values in (5), (6), (7) and (8), we get

$$0 = c_1 + c_2 \Rightarrow c_2 = -c_1$$

$$0 = c_3 + c_4 \Rightarrow c_4 = -c_3$$

$$0 = iwc_2 + \frac{iE}{h} \Rightarrow c_2 = -\frac{E}{wh}$$

$$0 = -iwc_4 - \frac{iE}{h} \Rightarrow c_4 = -\frac{E}{wh}$$

On substituting the values of  $c_1$ ,  $c_2$ ,  $c_3$  and  $c_4$  in (5) and (6), we get

$$x + iy = \frac{E}{wh} - \frac{E}{hw} e^{iwt} + i \frac{Et}{h} \quad \dots(9)$$

$$x - iy = \frac{E}{wh} - \frac{E}{wh} e^{-iwt} - i \frac{Et}{h} \quad \dots(10)$$

On adding (9) and (10), we get

$$2x = \frac{2E}{hw} - \frac{E}{hw} (e^{iwt} + e^{-iwt})$$

$$x = \frac{E}{hw} - \frac{E}{hw} \cos wt$$

$$x = \frac{E}{hw} (1 - \cos wt)$$

Subtracting (10) from (9), we obtain

$$\begin{aligned} 2iy &= -\frac{E}{hw} (e^{iwt} - e^{-iwt}) + \frac{2iEt}{h} \\ \Rightarrow y &= -\frac{E}{wh} \left( \frac{e^{iwt} - e^{-iwt}}{2i} \right) + \frac{Et}{h} = -\frac{E}{wh} \sin wt + \frac{Et}{h} \Rightarrow y = \frac{E}{hw} (wt - \sin wt) \text{ Ans.} \end{aligned}$$

**Example 31.** Assuming that a spherical rain drop evaporates at rate proportional to its surface area and if its radius originally is 3 mm and one hour later has been reduced to 2 mm, find an expression for the radius of the rain drop at any time.

**Solution.** Evaporation  $\propto$  surface area

$$\frac{dV}{dt} \propto S \Rightarrow \frac{dV}{dt} = kS$$

$$V = \frac{4}{3}\pi r^3 \Rightarrow \frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$$

Putting the value of  $\frac{dV}{dt}$  from (1) in (2), we have

$$4\pi r^2 \frac{dr}{dt} = kS \Rightarrow S \frac{dr}{dt} = kS \Rightarrow \frac{dr}{dt} = k$$

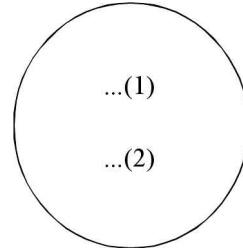

$$r = kt + c \quad \dots(3) [S = 4\pi r^2]$$

Putting  $t = 0, r = 3$  in (3), we get  $3 = c$

$$(3) \text{ becomes } r = kt + 3 \quad \dots(4)$$

Putting  $t = 1$  and  $r = 2$  in (4), we get  $2 = k + 3 \Rightarrow k = -1$

$$(4) \text{ becomes } r = -t + 3 \quad \text{Ans.}$$

## EXERCISE 16.7

1. The current  $i_1$  and  $i_2$  in mesh are given by the differential equations

$$\frac{di_1}{dt} - wi_2 = a \cos pt, \frac{di_2}{dt} + wi_1 = a \sin pt$$

Find the currents  $i_1$  and  $i_2$  if  $i_1 = i_2 = 0$  at  $t = 0$ .

$$\text{Ans. } i_1 = \frac{a}{P+w} \sin pt, i_2 = \frac{a}{P+w} \cos pt$$

2. A particle moving in a plane is subjected to a force directed towards a fixed point O and proportional to the distance of the particle from O. Show that the differential equations of motion are of the form

$$\frac{d^2x}{dt^2} = -k^2 x, \frac{d^2y}{dt^2} = -k^2 y. \text{ Find the cartesian equation of the path of the particle if } x = 1, y = 0,$$

$$\frac{dx}{dt} = 0 \text{ and } \frac{dy}{dt} = 2 \text{ when } t = 0. \quad \text{Ans. } 4x^2 + k^2 y^2 = 4$$

3. A projectile of mass  $m$  is fired into the air with initial velocity  $v_0$  at an angle  $\theta$  with the ground. Neglecting all forces except gravity and the resistance of air, assumed proportional to velocity. Find the position of the projectile at time  $t$ .

$$x = \frac{1}{k} (v_0 \cos \theta) (1 - e^{-kt}), \quad y = \frac{1}{k} \left\{ \frac{g}{k} + v_0 \sin \theta (1 - e^{-kt}) - gt \right\}$$

4. A particle of unit mass is projected with velocity  $u$  at an inclination  $\alpha$  above the horizon in a medium whose resistance is  $k$  times the velocity. Show that its direction will again make an angle  $\alpha$  with the

$$\text{horizon after a time } \frac{1}{k} \log \left\{ 1 + \frac{2ku}{g} \sin \alpha \right\}.$$

5. An inclined plane makes angle  $\alpha$  with the horizontal. A projectile is launched from the bottom of the inclined plane with speed  $v$  in a direction making an angle  $\beta$  with the horizontal. Set up the differential equations and find

- (i) the range on the incline    (ii) the maximum range up the incline.

$$\text{Ans. (i)} \frac{2u^2 \sin(\alpha - \beta) \cos \alpha}{g \cos^2 \beta} \quad \text{(ii)} u^2 g(1 + \sin \beta)$$

**CHAPTER**  
**17**

## DETERMINANTS

---

### 17.1 INTRODUCTION

With the help of determinants, we can solve a system of simultaneous equations by Cramer's Rule. Determinants are also used in calculating inverse of a square matrix.

### 17.2 DETERMINANT AS ELIMINANT

Consider the following three equations having three unknowns,  $x, y$  and  $z$ .

$$a_1 x + b_1 y + c_1 z = 0 \quad \dots(1)$$

$$a_2 x + b_2 y + c_2 z = 0 \quad \dots(2)$$

$$a_3 x + b_3 y + c_3 z = 0 \quad \dots(3)$$

From (2) and (3) by cross-multiplication; we get

$$\frac{x}{b_2 c_3 - b_3 c_2} = \frac{y}{a_3 c_2 - a_2 c_3} = \frac{z}{a_2 b_3 - a_3 b_2} = k \text{ (say)}$$

$$x = (b_2 c_3 - b_3 c_2) k$$

$$y = (a_3 c_2 - a_2 c_3) k$$

and

$$z = (a_2 b_3 - a_3 b_2) k$$

Substituting the values of  $x, y$  and  $z$  in (1), we get the eliminant

$$a_1 (b_2 c_3 - b_3 c_2) k + b_1 (a_3 c_2 - a_2 c_3) k + c_1 (a_2 b_3 - a_3 b_2) k = 0$$

$$\text{or } a_1 (b_2 c_3 - b_3 c_2) - b_1 (a_2 c_3 - a_3 c_2) + c_1 (a_2 b_3 - a_3 b_2) = 0 \quad \dots(4)$$

From (1), (2) and (3) by suppressing  $x, y, z$  the remaining can be written in the determinant as

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0 \quad \dots(5)$$

This is the determinant of third order.

As (4) and (5) both are the eliminant of the same equations.

$$\therefore \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 (b_2 c_3 - b_3 c_2) - b_1 (a_2 c_3 - a_3 c_2) + c_1 (a_2 b_3 - a_3 b_2) = 0$$

$$\text{or } \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - b_1 \begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix} + c_1 \begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix}$$

### 17.3. MINOR

The minor of an element is defined as a determinant obtained by deleting the row and column containing the element.

Thus the minors of  $a_1$ ,  $b_1$  and  $c_1$  are respectively.

$$\begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix}, \begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix} \text{ and } \begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix}$$

$$\text{Thus } \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 (\text{minor of } a_1) - b_1 (\text{minor of } b_1) + c_1 (\text{minor of } c_1).$$

### 17.4. COFACTOR

$$\text{Cofactor} = (-1)^{r+c} \text{ Minor}$$

where  $r$  is the number of rows of the element and  $c$  is the number of columns of the element.

The cofactor of any element of  $i$ th row and  $j$ th column is

$$(-1)^{i+j} \text{ minor}$$

Thus the cofactor of  $a_1 = (-1)^{1+1} (b_2 c_3 - b_3 c_2) = + (b_2 c_3 - b_3 c_2)$

The cofactor of  $b_1 = (-1)^{1+2} (a_2 c_3 - a_3 c_2) = - (a_2 c_3 - a_3 c_2)$

The cofactor of  $c_1 = (-1)^{1+3} (a_2 b_3 - a_3 b_2) = + (a_2 b_3 - a_3 b_2)$

**The determinant**  $= a_1 (\text{cofactor of } a_1) + a_2 (\text{cofactor of } a_2) + a_3 (\text{cofactor of } a_3)$ .

**Example 1.** Write down the minors and co-factors of each element and also evaluate the determinant:

$$\text{Solution. } M_{11} = \text{Minor of element (1)} = \begin{vmatrix} 1 & 3 & -2 \\ 4 & -5 & 6 \\ 3 & 5 & 2 \end{vmatrix} = \begin{vmatrix} 1 & \dots & 3 & \dots & -2 \\ \vdots & & \vdots & & \vdots \\ 4 & -5 & 6 \\ 3 & 5 & 2 \end{vmatrix}$$

By eliminating the row and column of (1), the remaining is minor of (1)

$$= \begin{vmatrix} -5 & 6 \\ 5 & 2 \end{vmatrix} = (-5) \times 2 - (6 \times 5) = -10 - 30 = -40$$

Cofactor of element (1)  $= A_{11} = (-1)^{1+1} M_{11} = (-1)^2 (-40) = -40$

$M_{12}$  = Minor of element (3)

By eliminating the row and column of (3), we get

$$= \begin{vmatrix} 1 & \dots & 3 & \dots & -2 \\ 4 & -5 & 6 \\ 3 & 5 & 2 \end{vmatrix} = \begin{vmatrix} 4 & 6 \\ 3 & 2 \end{vmatrix} = (4 \times 2) - (3 \times 6) = 8 - 18 = -10$$

$\Rightarrow$  Cofactor of element (-2)  $= A_{12} = (-1)^{1+2} (-10) = 10$

$M_{13}$  = Minor of element (-2)

$$= \begin{vmatrix} 1 & \dots & 3 & \dots & -2 \\ 4 & -5 & 6 \\ 3 & 5 & 2 \end{vmatrix} = \begin{vmatrix} 4 & -5 \\ 3 & 5 \end{vmatrix} = (4 \times 5) - (-5) \times 3 = 20 + 15 = 35$$

$$\Rightarrow M_{21} = \text{Minor of element } (4) \quad \text{Cofactor of element } (-2) = A_{13} = (-1)^{1+3} M_{13} = (-1)^4 35 = 35$$

$$= \begin{vmatrix} 1 & 3 & -2 \\ \vdots & \vdots & \vdots \\ 4 & \dots & 5 & \dots & 6 \\ \vdots & & \vdots & & \vdots \\ 3 & 5 & 2 \end{vmatrix} = \begin{vmatrix} 3 & -2 \\ 5 & 2 \end{vmatrix} = (3 \times 2) - (-2) \times 5 = 6 + 10 = 16$$

$$\Rightarrow M_{22} = \text{Minor of element } (-5) \quad \text{Cofactor of element } (4) = A_{21} = (-1)^{2+1} M_{21} = (-1)^{2+1} (16) = -16$$

$$= \begin{vmatrix} 1 & 3 & -2 \\ \vdots & \vdots & \vdots \\ 4 & \dots & 5 & \dots & 6 \\ \vdots & & \vdots & & \vdots \\ 3 & 5 & 2 \end{vmatrix} = \begin{vmatrix} 1 & -2 \\ 3 & 2 \end{vmatrix} = (1 \times 2) - (-2) \times 3 = 2 + 6 = 8$$

$$\Rightarrow M_{23} = \text{Minor of element } (6) \quad \text{Cofactor of element } (-5) = A_{22} = (-1)^{2+2} M_{22} = (-1)^{2+2} (8) = 8$$

$$= \begin{vmatrix} 1 & 3 & -2 \\ \vdots & \vdots & \vdots \\ 4 & \dots & 5 & \dots & 6 \\ \vdots & & \vdots & & \vdots \\ 3 & 5 & 2 \end{vmatrix} = \begin{vmatrix} 1 & 3 \\ 3 & 5 \end{vmatrix} = (1 \times 5) - 3 \times 3 = 5 - 9 = -4$$

$$\Rightarrow M_{31} = \text{Minor of element } (3) \quad \text{Cofactor of element } (6) = A_{23} = (-1)^{2+3} M_{23} = (-1)^{2+3} (-4) = 4$$

$$= \begin{vmatrix} 1 & 3 & -2 \\ \vdots & \vdots & \vdots \\ 4 & -5 & 6 \\ \vdots & \vdots & \vdots \\ 3 & \dots & 5 & \dots & 2 \end{vmatrix} = \begin{vmatrix} 3 & -2 \\ -5 & 6 \end{vmatrix} = (3 \times 6) - (-2) \times (-5) = 18 - 10 = 8$$

$$\Rightarrow M_{32} = \text{Minor of element } (5) \quad \text{Cofactor of element } (3) = A_{31} = (-1)^{3+1} M_{31} = (-1)^{3+1} 8 = 8$$

$$= \begin{vmatrix} 1 & 3 & -2 \\ \vdots & \vdots & \vdots \\ 4 & -5 & 6 \\ \vdots & \vdots & \vdots \\ 3 & \dots & 5 & \dots & 2 \end{vmatrix} = \begin{vmatrix} 1 & -2 \\ 4 & 6 \end{vmatrix} = (1 \times 6) - (-2) \times 4 = 6 + 8 = 14$$

$$\Rightarrow M_{33} = \text{Minor of element } (2) \quad \text{Cofactor of element } (5) = A_{32} = (-1)^{3+2} M_{32} = (-1)^{3+2} 14 = -14$$

$$= \begin{vmatrix} 1 & 3 & -2 \\ \vdots & \vdots & \vdots \\ 4 & -5 & 6 \\ \vdots & \vdots & \vdots \\ 3 & \dots & 5 & \dots & 2 \end{vmatrix} = \begin{vmatrix} 1 & 3 \\ 4 & -5 \end{vmatrix} = 1 \times (-5) - (4 \times 3) = -5 - 12 = -17$$

$$\text{Cofactor of element } (2) = A_{33} = (-1)^{3+3} M_{33} = (-1)^{3+3} (-17) = -17.$$

$$\begin{vmatrix} 1 & 3 & -2 \\ 4 & -5 & 6 \\ 3 & 5 & 2 \end{vmatrix} = 1 \times (\text{cofactor of } 1) + 3 \times (\text{cofactor of } 3) + (-2) \times [\text{cofactor of } (-2)].$$

$$= 1 \times (-40) + 3 \times (10) + (-2) \times (35) = -40 + 30 - 70 = -80 \quad \text{Ans.}$$

**Example 2.** Evaluate the determinants :

$$\begin{vmatrix} 3 & -1 & -2 \\ 0 & 0 & -1 \\ 3 & -5 & 0 \end{vmatrix}$$

**Solution.** We have, two zero entries in the second row. So, expanding along 2nd row:

$$\begin{vmatrix} 3 & -1 & -2 \\ 0 & 0 & -1 \\ 3 & -5 & 0 \end{vmatrix} = -0 \begin{vmatrix} -1 & -2 \\ -5 & 0 \end{vmatrix} + 0 \begin{vmatrix} 3 & -2 \\ 3 & 0 \end{vmatrix} - (-1) \begin{vmatrix} 3 & -1 \\ 3 & -5 \end{vmatrix}$$

$$= -0 + 0 + 1 (-15 + 3) = -12$$

**Ans.**

**Example 3.** Prove that the determinant  $\begin{vmatrix} x & \sin \theta & \cos \theta \\ -\sin \theta & -x & 1 \\ \cos \theta & 1 & x \end{vmatrix}$  is independent of  $\theta$ .

**Solution.** We have,

$$\begin{aligned} \begin{vmatrix} x & \sin \theta & \cos \theta \\ -\sin \theta & -x & 1 \\ \cos \theta & 1 & x \end{vmatrix} &= x \begin{vmatrix} -x & 1 \\ 1 & x \end{vmatrix} - \sin \theta \begin{vmatrix} \cos \theta & 1 \\ \cos \theta & x \end{vmatrix} + \cos \theta \begin{vmatrix} -\sin \theta & -x \\ \cos \theta & 1 \end{vmatrix} \\ &= x(-x^2 - 1) - \sin \theta(-x \sin \theta - \cos \theta) + \cos \theta(-\sin \theta + x \cos \theta) \\ &= -x^3 - x + x \sin^2 \theta + \sin \theta \cos \theta - \sin \theta \cos \theta + x \cos^2 \theta \\ &= -x^3 - x + x(\sin^2 \theta + \cos^2 \theta) = -x^3 - x + x \end{aligned}$$

Thus, the determinant is independent of  $\theta$ .

**Proved.**

**Example 4.** Evaluate the determinant  $\begin{vmatrix} 1 & 0 & 4 \\ 3 & 5 & -1 \\ 0 & 1 & 2 \end{vmatrix}$ .

(i) With the help of second row, (ii) with the help of third column.

**Solution.**

$$\begin{aligned} (i) \quad \begin{vmatrix} 1 & 0 & 4 \\ 3 & 5 & -1 \\ 0 & 1 & 2 \end{vmatrix} &= 3 \times (\text{cofactor of } 3) + 5 \times (\text{cofactor of } 5) + (-1) \times (\text{cofactor of } -1) \\ &= 3 \times (-1)^{2+1} \begin{vmatrix} 0 & 4 \\ 1 & 2 \end{vmatrix} + 5 \times (-1)^{2+2} \begin{vmatrix} 1 & 4 \\ 0 & 2 \end{vmatrix} + (-1) \times (-1)^{2+3} \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} \\ &= -3 \times (0 - 4) + 5(2 - 0) + (1 - 0) = 12 + 10 + 1 = 23 \quad \text{Ans.} \end{aligned}$$

$$\begin{aligned} (ii) \quad \begin{vmatrix} 1 & 0 & 4 \\ 3 & 5 & -1 \\ 0 & 1 & 2 \end{vmatrix} &= 4 \times (\text{cofactor of } 4) + (-1) \times (\text{cofactor of } -1) + 2 \times (\text{cofactor of } 2) \\ &= 4 \times (-1)^{1+3} \begin{vmatrix} 3 & 5 \\ 0 & 1 \end{vmatrix} + (-1) \times (-1)^{2+3} \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} + 2 \times (-1)^{3+3} \begin{vmatrix} 1 & 0 \\ 3 & 5 \end{vmatrix} \\ &= 4 \times (3 - 0) + (1 - 0) + 2(5 - 0) = 12 + 1 + 10 = 23 \quad \text{Ans.} \end{aligned}$$

### EXERCISE 17.1

Write the minors and co-factors of each element of the following determinants and also evaluate the determinant in each case :

$$1. \quad \begin{vmatrix} 42 & 1 & 6 \\ 28 & 7 & 4 \\ 14 & 3 & 2 \end{vmatrix}$$

$$\begin{aligned} \text{Ans. } M_{11} &= 2, & M_{12} &= 0, & M_{13} &= -14, & M_{21} &= -16, & M_{22} &= 0 \\ M_{23} &= 112, & M_{31} &= -38, & M_{32} &= 0, & M_{33} &= 266 \\ A_{11} &= 2, & A_{12} &= 0, & A_{13} &= -14, & A_{21} &= 16, & A_{22} &= 0 \\ A_{23} &= -112, & A_{31} &= -38, & A_{32} &= 0, & A_{33} &= 266 & |A| &= 0 \end{aligned}$$

$$2. \quad \begin{vmatrix} 1 & a & bc \\ 1 & b & ca \\ 1 & c & ab \end{vmatrix}$$

$$\text{Ans. } M_{11} = (ab^2 - ac^2), \quad M_{12} = (ab - ac), \quad M_{13} = (c - b), \quad M_{21} = a^2b - bc^2$$

$$\begin{aligned}
 M_{22} &= (ab - bc), & M_{23} &= (c - a), & M_{31} &= (ca^2 - cb^2), & M_{32} &= ca - bc, & M_{33} &= (b - a), \\
 A_{11} &= (ab^2 - ac^2), & A_{12} &= (ac - ab), & A_{13} &= (c - b), & A_{21} &= bc^2 - a^2b \\
 A_{22} &= (ab - bc), & A_{23} &= (a - c), & A_{31} &= (ca^2 - cb^2), & A_{32} &= (bc - ca), & A_{33} &= (b - a) \\
 |A| &= (a - b)(b - c)(c - a).
 \end{aligned}$$

**Expand the following determinants :**

$$\begin{array}{ll}
 3. \quad \left| \begin{array}{ccc} 2 & -3 & 4 \\ 5 & 1 & -6 \\ -7 & 8 & -9 \end{array} \right| & \text{Ans. } |A| = 5 \\
 4. \quad \left| \begin{array}{ccc} 5 & 0 & 7 \\ 8 & -6 & -4 \\ 2 & 3 & 9 \end{array} \right| & \text{Ans. } |A| = 42 \\
 5. \quad \left| \begin{array}{ccc} a & h & g \\ h & b & f \\ g & f & c \end{array} \right| & \text{Ans. } |A| = abc + 2fgh - af^2 - bg^2 - ch^2
 \end{array}$$

**Expand the following determinants by two methods :**

(i) along the-third row. (ii) along the-third column.

$$\begin{array}{ll}
 6. \quad \left| \begin{array}{ccc} 1 & -3 & 2 \\ 4 & -1 & 2 \\ 3 & 5 & 2 \\ 2 & 3 & -2 \end{array} \right| & \text{Ans. } |A| = 40 \\
 7. \quad \left| \begin{array}{ccc} 3 & -2 & 4 \\ 1 & 2 & 1 \\ 0 & 1 & -1 \end{array} \right| & \text{Ans. } |A| = -7 \\
 8. \quad \left| \begin{array}{ccc} 1 & 2 & 3 \\ -2 & 1 & -3 \end{array} \right| & \text{Ans. } |A| = -37
 \end{array}$$

## 17.5. PROPERTIES OF DETERMINANTS

**Property (i).** The value of a determinant remains unaltered; if the rows are interchanged into columns (or the columns into rows).

$$\text{Verification. Let } \Delta = \left| \begin{array}{ccc} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{array} \right|$$

Expanding along first row, we get

$$\begin{aligned}
 \Delta &= a_1 \left| \begin{array}{cc} b_2 & b_3 \\ c_2 & c_3 \end{array} \right| - a_2 \left| \begin{array}{cc} b_1 & b_3 \\ c_1 & c_3 \end{array} \right| + a_3 \left| \begin{array}{cc} b_1 & b_2 \\ c_1 & c_2 \end{array} \right| \\
 &= a_1(b_2c_3 - b_3c_2) - a_2(b_1c_3 - b_3c_1) + a_3(b_1c_2 - b_2c_1) \quad \dots(1)
 \end{aligned}$$

By interchanging the rows and columns of  $\Delta$ , we get the determinant

$$\begin{aligned}
 \Delta_1 &= \left| \begin{array}{ccc} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{array} \right| \\
 &= a_1(b_2c_3 - b_3c_2) - b_1(a_2c_3 - a_3c_2) + c_1(a_2b_3 - a_3b_2) \\
 &= a_1b_2c_3 - a_1b_3c_2 - a_2b_1c_3 + a_3b_1c_2 + a_2b_3c_1 - a_3b_2c_1 \\
 &= (a_1b_2c_3 - a_1b_3c_2) - (a_2b_1c_3 - a_2b_3c_1) + (a_3b_1c_2 - a_3b_2c_1) \\
 &= a_1(b_2c_3 - b_3c_2) - a_2(b_1c_3 - b_3c_1) + a_3(b_1c_2 - b_2c_1) \quad \dots(2)
 \end{aligned}$$

From (1) and (2), we have

$$\Delta = \Delta_1.$$

It follows: The value of determinant remains unaltered, if the rows are interchanged into columns (or the columns into rows). **Proved.**

**Property (ii).** If two rows (or two columns) of a determinant are interchanged, the sign of the value of the determinant changes.

**Verification.** Let  $\Delta = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$

$$= a_1(b_2c_3 - b_3c_2) - a_2(b_1c_3 - b_3c_1) + a_3(b_1c_2 - b_2c_1) \quad \dots (1)$$

Interchanging first and third rows, the new determinant obtained is given by

$$\Delta_1 = \begin{vmatrix} c_1 & c_2 & c_3 \\ b_1 & b_2 & b_3 \\ a_1 & a_2 & a_3 \end{vmatrix}$$

Expanding along third row, we get

$$\Delta_1 = a_1(c_2b_3 - b_2c_3) - a_2(c_1b_3 - c_3b_1) + a_3(b_2c_1 - b_1c_2) \\ = -[a_1(b_2c_3 - b_3c_2) - a_2(b_1c_3 - b_3c_1) + a_3(b_1c_2 - b_2c_1)] \quad \dots (2)$$

From (1) and (2), we have

$$\Delta_1 = -\Delta$$

Hence, property (ii) is verified.

**Proved.**

**Example 5.** Verify property (ii) for  $\begin{vmatrix} 1 & 2 & 3 \\ 4 & 0 & 6 \\ 7 & 8 & 9 \end{vmatrix}$

$$\text{Solution. Let } \Delta = \begin{vmatrix} 1 & 2 & 3 \\ 4 & 0 & 6 \\ 7 & 8 & 9 \end{vmatrix} = 1(0 - 48) - 2(36 - 42) + 3(32 - 0) \\ = -48 + 12 + 96 = 60$$

Interchanging second the third rows, we have

$$\Delta_1 = \begin{vmatrix} 1 & 2 & 3 \\ 7 & 8 & 9 \\ 4 & 0 & 6 \end{vmatrix} = 1(48 - 0) - 2(42 - 36) + 3(0 - 32) \\ = 48 - 12 - 96 = -60$$

$$\text{Thus, } \Delta_1 = \Delta$$

Hence property (ii) is verified.

**Verified.**

**Property (iii).** If two rows (or columns) of a determinant are identical, the value of the determinant is zero.

**Verification.** Let  $\Delta = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_1 & b_1 & c_1 \\ a_3 & b_3 & c_3 \end{vmatrix}$ , so that the first two rows are identical.

By interchanging the first two rows, we get the same determinant D.

By property (ii), on interchanging the rows, the sign of the determinant changes.

or  $\Delta = -\Delta$  or  $2\Delta = 0$  or  $\Delta = 0$  **Proved.**

**Example 6.** Evaluate :  $\Delta = \begin{vmatrix} 2 & 3 & 4 \\ 2 & 3 & 4 \\ 1 & 5 & 6 \end{vmatrix}$

**Solution.** Expanding along first row, we have

$$\Delta = 2(18 - 20) - 3(12 - 4) + 4(10 - 3) \\ = 2 \times (-2) - 3(8) + 4(7) = -4 - 24 + 28 = 0$$

Here,  $R_1$  and  $R_2$  are identical.

**Verified.**

**Property (iv).** If the elements of any row (or column) of a determinant be each multiplied by the same number, the determinant is multiplied by that number.

**Verification.** Let  $\Delta = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$

and  $\Delta_1$  be the determinant obtained by multiplying the elements of the first row by  $k$ . Then

$$\begin{aligned}\Delta_1 &= \begin{vmatrix} ka_1 & kb_1 & kc_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \\ &= ka_1(b_2c_3 - b_3c_2) - kb_1(a_2c_3 - a_3c_2) + kc_1(a_2b_3 - a_3b_2) \\ &= k[a_1(b_2c_3 - b_3c_2) - b_1(a_2c_3 - a_3c_2) + c_1(a_2b_3 - a_3b_2)] \\ &= k \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = k \Delta.\end{aligned}$$

Hence,  $\begin{vmatrix} ka_1 & kb_1 & kc_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = k \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$

**Proved.**

**Example 7.** Verify the property (iv) by

$$\Delta = \begin{vmatrix} 2 & 5 & 8 \\ 3 & 7 & 1 \\ 2 & 0 & 2 \end{vmatrix}$$

**Solution.**  $\Delta = \begin{vmatrix} 2 & 5 & 8 \\ 3 & 7 & 1 \\ 2 & 0 & 2 \end{vmatrix} = 2(14 - 0) - 5(6 - 2) + 8(0 - 14) = 28 - 20 - 112 = - 104$

Multiplying the first column by 5, we get

$$\begin{aligned}\Delta_1 &= \begin{vmatrix} 10 & 5 & 8 \\ 15 & 7 & 1 \\ 10 & 0 & 2 \end{vmatrix} = 10(14 - 0) - 5(30 - 10) + 8(0 - 70) \\ &= 140 - 100 - 560 = - 520 = 5(- 104) \\ \Delta_1 &= 5 \Delta\end{aligned}$$

Property (iv) is verified.

**Verified.**

**Property (v).** The value of the determinant remains unaltered if to the elements of one row (or column) be added any constant multiple of the corresponding elements of any other row (or column) respectively.

**Verification.** Let  $\Delta = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$

On multiplying the second column by  $l$  and the third column by  $m$  and adding to the first column, we get

$$\begin{aligned}\Delta' &= \begin{vmatrix} a_1 + lb_1 + mc_1 & b_1 & c_1 \\ a_2 + lb_2 + mc_2 & b_2 & c_2 \\ a_3 + lb_3 + mc_3 & b_3 & c_3 \end{vmatrix} = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} + l \begin{vmatrix} b_1 & b_1 & c_1 \\ b_2 & b_2 & c_2 \\ b_3 & b_3 & c_3 \end{vmatrix} + m \begin{vmatrix} c_1 & b_1 & c_1 \\ c_2 & b_2 & c_2 \\ c_3 & b_3 & c_3 \end{vmatrix} \\ &= \Delta + 0 + 0 \quad (\text{Since columns are identical}) \\ &= \Delta\end{aligned}$$

**Proved.****Example 8.** Verify the property (v) by

$$\Delta = \begin{vmatrix} 1 & 2 & 4 \\ 3 & 2 & 5 \\ 0 & 4 & 6 \end{vmatrix}$$

$$\text{Solution. } \Delta = \begin{vmatrix} 1 & 2 & 4 \\ 3 & 2 & 5 \\ 0 & 4 & 6 \end{vmatrix} = 1(12 - 20) - 2(18 - 0) + 4(12 - 0) = -8 - 36 + 48 = 4$$

On multiplying the second column by 5 and third column by 6 and adding to the first column, we get

$$\begin{aligned}\Delta_1 &= \begin{vmatrix} 1+10+24 & 2 & 4 \\ 3+10+30 & 2 & 5 \\ 0+20+36 & 4 & 6 \end{vmatrix} = \begin{vmatrix} 35 & 2 & 4 \\ 43 & 2 & 5 \\ 56 & 4 & 6 \end{vmatrix} = 35(12 - 20) - 2(258 - 280) + 4(172 - 112) \\ &= 35(-8) - 2(-22) + 4(60) = -280 + 44 + 240 = 284 - 280 = 4 \\ \Delta_1 &= \Delta\end{aligned}$$

**Verified.****Example 9.** Show that

$$\Delta = \begin{vmatrix} b-c & c-a & a-b \\ c-a & a-b & b-c \\ a-b & b-c & c-a \end{vmatrix} = 0$$

$$\text{Solution. Let } \Delta = \begin{vmatrix} b-c & c-a & a-b \\ c-a & a-b & b-c \\ a-b & b-c & c-a \end{vmatrix}$$

Applying  $C_1 \rightarrow C_1 + C_2 + C_3$ , we get

$$\Delta = \begin{vmatrix} 0 & c-a & a-b \\ 0 & a-b & b-c \\ 0 & b-c & c-a \end{vmatrix} = 0 \quad [:\ C_1 \text{ consists of all zeroes.}]$$

**Proved.****Example 10.** Without expanding, evaluate the determinant

$$\begin{vmatrix} \sin\alpha & \cos\alpha & \sin(\alpha+\delta) \\ \sin\beta & \cos\beta & \sin(\beta+\delta) \\ \sin\gamma & \cos\gamma & \sin(\gamma+\delta) \end{vmatrix}$$

$$\text{Solution. Let } \Delta = \begin{vmatrix} \sin\alpha & \cos\alpha & \sin(\alpha+\delta) \\ \sin\beta & \cos\beta & \sin(\beta+\delta) \\ \sin\gamma & \cos\gamma & \sin(\gamma+\delta) \end{vmatrix}$$

$$\Rightarrow \Delta = \begin{vmatrix} \sin\alpha & \cos\alpha & \sin\alpha\cos\delta + \cos\alpha\sin\delta \\ \sin\beta & \cos\beta & \sin\beta\cos\delta + \cos\beta\sin\delta \\ \sin\gamma & \cos\gamma & \sin\gamma\cos\delta + \cos\gamma\sin\delta \end{vmatrix}$$

$$\Rightarrow \Delta = \begin{vmatrix} \sin \alpha & \cos \alpha & 0 \\ \sin \beta & \cos \beta & 0 \\ \sin \gamma & \cos \gamma & 0 \end{vmatrix} \quad [\text{Applying } C_3 \rightarrow C_3 - \cos \delta \cdot C_1 - \sin \delta \cdot C_2]$$

$$\Rightarrow \Delta = 0 \quad [ \because C_3 \text{ consists of all zeroes.}] \quad \text{Ans.}$$

**Example 11.** By using property of determinants prove that :

$$\begin{vmatrix} 1 & x & x^2 \\ x^2 & 1 & x \\ x & x^2 & 1 \end{vmatrix} = (1 - x^3)^2$$

**Solution.** L.H.S. =  $\begin{vmatrix} 1 & x & x^2 \\ x^2 & 1 & x \\ x & x^2 & 1 \end{vmatrix} = \begin{vmatrix} 1+x+x^2 & x & x^2 \\ 1+x+x^2 & 1 & x \\ 1+x+x^2 & x^2 & 1 \end{vmatrix} \quad [\text{Applying } C_1 \rightarrow C_1 + C_2 + C_3]$

$$= (1+x+x^2) \begin{vmatrix} 1 & x & x^2 \\ 1 & 1 & x \\ 1 & x^2 & 1 \end{vmatrix}$$

$$= (1+x+x^2) \begin{vmatrix} 1 & x & x^2 \\ 0 & 1-x & x-x^2 \\ 0 & x^2-x & 1-x^2 \end{vmatrix} \quad [\text{Applying } R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - R_1]$$

$$= (1+x+x^2) (1) \{(1-x)(1-x^2) - (x^2-x)(x-x^2)\}$$

$$= (1+x+x^2) (1-x)^2 \{1+x+x^2\} = \{(1-x)(1+x+x^2)\}^2 = (1-x^3)^2 = \text{R.H.S.}$$

**Proved.**

**Example 12.** Using properties of determinants, prove that

$$\begin{vmatrix} x & y & z \\ x^2 & y^2 & z^2 \\ x^3 & y^3 & z^3 \end{vmatrix} = xyz(x-y)(y-z)(z-x).$$

**Solution.** Let  $\Delta = \begin{vmatrix} x & y & z \\ x^2 & y^2 & z^2 \\ x^3 & y^3 & z^3 \end{vmatrix} = xyz \begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ x^2 & y^2 & z^2 \end{vmatrix}$

Operate :  $C_1 \rightarrow C_1 - C_2 ; C_2 \rightarrow C_2 - C_3$ .

$$\Delta = xyz \begin{vmatrix} 0 & 0 & 1 \\ x-y & y-z & z \\ x^2-y^2 & y^2-z^2 & z^2 \end{vmatrix} = xyz \begin{vmatrix} x-y & y-z & z \\ x^2-y^2 & y^2-z^2 & z^2 \end{vmatrix} \quad (\text{On expanding by } R_1)$$

$$= xyz(x-y)(y-z) \begin{vmatrix} 1 & 1 \\ x+y & y+z \end{vmatrix} = xyz(x-y)(y-z)(z-x). \quad \text{Proved.}$$

**Example 13.** Using the properties of determinants, show that

$$\begin{vmatrix} a+x & y & z \\ x & a+y & z \\ x & y & a+z \end{vmatrix} = a^2(a+x+y+z).$$

**Solution.** Let  $\Delta = \begin{vmatrix} a+x & y & z \\ x & a+y & z \\ x & y & a+z \end{vmatrix}$

Operate :  $C_1 \rightarrow C_1 + C_2 + C_3$

$$\Delta = \begin{vmatrix} a+x+y+z & y & z \\ a+x+y+z & a+y & z \\ a+x+y+z & y & a+z \end{vmatrix}$$

Taking  $(a+x+y+z)$  common from Ist column, we get

$$= (a+x+y+z) \begin{vmatrix} 1 & y & z \\ 1 & a+y & z \\ 1 & y & a+z \end{vmatrix}$$

Operate :  $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$

$$= (a+x+y+z) \begin{vmatrix} 1 & y & z \\ 0 & a & 0 \\ 0 & 0 & a \end{vmatrix} = (a+x+y+z) \times 1 \begin{vmatrix} a & 0 \\ 0 & a \end{vmatrix} \quad [\text{Expanding along } C_1]$$

$$= (a+x+y+z) a^2 = a^2(a+x+y+z)$$

**Proved.**

**Example 14.** If  $w$  is the one of the imaginary cube roots of unity, find the value of the determinant:

$$\begin{vmatrix} 1 & w & w^2 \\ w & w^2 & 1 \\ w^2 & 1 & w \end{vmatrix}$$

**Solution.** The given determinant =  $\begin{vmatrix} 1 & w & w^2 \\ w & w^2 & 1 \\ w^2 & 1 & w \end{vmatrix}$

By  $R_1 \rightarrow R_1 + R_2 + R_3$ , we get

$$= \begin{vmatrix} 1+w+w^2 & 1+w+w^2 & 1+w+w^2 \\ w & w^2 & 1 \\ w^2 & 1 & w \end{vmatrix} = \begin{vmatrix} 0 & 0 & 0 \\ w & w^2 & 1 \\ w^2 & 1 & w \end{vmatrix} \quad [ \because 1+w+w^2 = 0 ]$$

= 0 (Since each entry in  $R_1$  is zero.)

**Ans.**

**Example 15.** Without expanding the determinant, show that  $(a+b+c)$  is a factor of the

determinant  $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$ .

**Solution.** Let  $\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$  Operate :  $C_1 \rightarrow C_1 + C_2 + C_3$

$$\Rightarrow \Delta = \begin{vmatrix} a+b+c & b & c \\ a+b+c & c & a \\ a+b+c & a & b \end{vmatrix} = (a+b+c) \begin{vmatrix} 1 & b & c \\ 1 & c & a \\ 1 & a & b \end{vmatrix}$$

$$\Rightarrow (a+b+c) \text{ is a factor of } \Delta. \quad \text{Proved.}$$

**Example 16.** Without expanding the determinant, prove that  $\begin{vmatrix} 1 & a & b+c \\ 1 & b & c+a \\ 1 & c & a+b \end{vmatrix} = 0$ .

**Solution.** Let  $\Delta = \begin{vmatrix} 1 & a & b+c \\ 1 & b & c+a \\ 1 & c & a+b \end{vmatrix}$

Operate :  $C_3 \rightarrow C_3 + C_2$ .

$$\therefore \Delta = \begin{vmatrix} 1 & a & a+b+c \\ 1 & b & a+b+c \\ 1 & c & a+b+c \end{vmatrix} = (a+b+c) \begin{vmatrix} 1 & a & 1 \\ 1 & b & 1 \\ 1 & c & 1 \end{vmatrix}$$

$$= 0 \quad (\because C_1 \text{ and } C_3 \text{ are identical}). \quad \text{Proved.}$$

**Example 17.** Without expanding the determinant, prove that

**Solution.** Let  $\Delta = \begin{vmatrix} \frac{1}{a} & a^2 & bc \\ \frac{1}{b} & b^2 & ca \\ \frac{1}{c} & c^2 & ab \end{vmatrix}$

Multiply  $R_1$  by  $a$ ,  $R_2$  by  $b$  and  $R_3$  by  $c$ .

$$\Delta = \frac{1}{abc} \begin{vmatrix} 1 & a^3 & abc \\ 1 & b^3 & abc \\ 1 & c^3 & abc \end{vmatrix} = \frac{1}{abc} \cdot abc \begin{vmatrix} 1 & a^3 & 1 \\ 1 & b^3 & 1 \\ 1 & c^3 & 1 \end{vmatrix} = 1 \times 0 = 0.$$

(Since  $C_1$  and  $C_3$  are identical) **Proved.**

**Example 18.** Using properties of determinants, prove that :

**Solution.** Let  $\Delta = \begin{vmatrix} 1 & a & a^3 \\ 1 & b & b^3 \\ 1 & c & c^3 \end{vmatrix} = (a-b)(b-c)(c-a)(a+b+c)$

Operate :  $R_1 \rightarrow R_1 - R_2 ; R_2 \rightarrow R_2 - R_3$

$$\Delta = \begin{vmatrix} 0 & a-b & a^3 - b^3 \\ 0 & b-c & b^3 - c^3 \\ 1 & c & c^3 \end{vmatrix} = 1 \cdot \begin{vmatrix} a-b & a^3 - b^3 \\ b-c & b^3 - c^3 \end{vmatrix} \quad (\text{Expand along } C_1)$$

$$= (a-b)(b-c) \begin{vmatrix} 1 & a^2 + ab + b^2 \\ 1 & b^2 + bc + c^2 \end{vmatrix}$$

Operate :  $R_1 \rightarrow R_1 - R_2$

$$\Delta = (a-b)(b-c) \begin{vmatrix} 0 & (a^2 - c^2) + (ab - bc) \\ 1 & b^2 + bc + c^2 \end{vmatrix}$$

$$= (a-b) \cdot (b-c) \cdot (-1) [(a^2 - c^2) + b(a-c)]$$

$$= (a-b) \cdot (b-c) (c-a) (a+b+c).$$

**Proved.**

[Note : It can also be proved by factor Theorem easily]

**Example 19.** Evaluate

$$\begin{vmatrix} a-b-c & 2a & 2a \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

**Solution.** By  $R_1 \rightarrow R_1 + R_2 + R_3$ , we get

$$\begin{vmatrix} a+b+c & a+b+c & a+b+c \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix} = (a+b+c) \begin{vmatrix} 1 & 1 & 1 \\ 2b & b-c-a & 2b \\ 2c & 2c & c-a-b \end{vmatrix}$$

$$= (a+b+c) \begin{vmatrix} 1 & 0 & 0 \\ 2b & -(a+b+c) & 0 \\ 2c & 0 & -(a+b+c) \end{vmatrix} \begin{matrix} C_2 - C_1 \\ C_3 - C_1 \end{matrix}$$

On expanding by first row  $= (a+b+c)(a+b+c)^2 = (a+b+c)^3$ .

**Ans.**

**Example 20.** By using properties of determinants prove that:

$$\begin{vmatrix} 1+a^2-b^2 & 2ab & -2b \\ 2ab & 1-a^2+b^2 & 2a \\ 2b & -2a & 1-a^2-b^2 \end{vmatrix} = (1+a^2+b^2)^3$$

**Solution.** Let  $\Delta = \begin{vmatrix} 1+a^2-b^2 & 2ab & -2b \\ 2ab & 1-a^2+b^2 & 2a \\ 2b & -2a & 1-a^2-b^2 \end{vmatrix}$

Applying  $C_1 \rightarrow C_1 - bC_3$ ,  $C_2 \rightarrow C_2 + aC_3$ , we get

$$\Delta = \begin{vmatrix} 1+a^2+b^2 & 0 & -2b \\ 0 & 1+a^2+b^2 & 2a \\ b(1+a^2+b^2) & -a(1+a^2+b^2) & 1-a^2-b^2 \end{vmatrix}$$

Taking  $(1 + a^2 + b^2)$  common from  $C_1$  and  $C_2$ , we get

$$\Delta = (1 + a^2 + b^2)^2 \begin{vmatrix} 1 & 0 & -2b \\ 0 & 1 & 2a \\ b & -a & 1 - a^2 - b^2 \end{vmatrix}$$

Applying  $C_3 \rightarrow C_3 + 2b C_1$ , we get

$$\Delta = (1 + a^2 + b^2)^2 \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 2a \\ b & -a & 1 - a^2 + b^2 \end{vmatrix}$$

Expanding along  $R_1$ , we get

$$\begin{aligned} \Delta &= (1 + a^2 + b^2)^2 \begin{vmatrix} 1 & 2a \\ -a & 1 - a^2 + b^2 \end{vmatrix} = (1 + a^2 + b^2)^2 (1 - a^2 + b^2 + 2a^2) \\ &= (1 + a^2 + b^2)^3 \end{aligned}$$

**Proved.**

**Example 21.** Prove that

$$\begin{vmatrix} \alpha & \beta & \gamma \\ \alpha^2 & \beta^2 & \gamma^2 \\ \beta + \gamma & \gamma + \alpha & \alpha + \beta \end{vmatrix} = (\alpha - \beta)(\beta - \gamma)(\gamma - \alpha)(\alpha + \beta + \gamma)$$

**Solution.** Let  $\Delta = \begin{vmatrix} \alpha & \beta & \gamma \\ \alpha^2 & \beta^2 & \gamma^2 \\ \beta + \gamma & \gamma + \alpha & \alpha + \beta \end{vmatrix}$ .

Applying  $R_3 \rightarrow R_1 + R_3$ , we get

$$\begin{aligned} \Delta &= \begin{vmatrix} \alpha & \beta & \gamma \\ \alpha^2 & \beta^2 & \gamma^2 \\ \alpha + \beta + \gamma & \alpha + \beta + \gamma & \alpha + \beta + \gamma \end{vmatrix} \\ &= (\alpha + \beta + \gamma) \begin{vmatrix} \alpha & \beta & \gamma \\ \alpha^2 & \beta^2 & \gamma^2 \\ 1 & 1 & 1 \end{vmatrix} \quad [\text{Taking out } (\alpha + \beta + \gamma) \text{ common from } R_3] \\ &= (\alpha + \beta + \gamma) \begin{vmatrix} \alpha & \beta - \alpha & \gamma - \alpha \\ \alpha^2 & \beta^2 - \alpha^2 & \gamma^2 - \alpha^2 \\ 1 & 0 & 0 \end{vmatrix} \quad \begin{array}{l} \text{Applying } C_2 \rightarrow C_2 - C_1 \\ C_3 \rightarrow C_3 - C_1 \end{array} \\ &= (\alpha + \beta + \gamma)(\beta - \alpha)(\gamma - \alpha) \begin{vmatrix} \alpha & 1 & 1 \\ \alpha^2 & \beta + \alpha & \gamma + \alpha \\ 1 & 0 & 0 \end{vmatrix} \\ &= (\alpha + \beta + \gamma)(\beta - \alpha)(\gamma - \alpha) \cdot 1 \begin{vmatrix} 1 & 1 \\ \beta + \alpha & \gamma + \alpha \end{vmatrix} \quad [\text{Expanding along } R_3] \\ &= (\alpha + \beta + \gamma)(\beta - \alpha)(\gamma - \alpha)(\gamma + \alpha - \beta - \alpha) \\ &= (\alpha + \beta + \gamma)(\beta - \gamma)(\gamma - \alpha)(\alpha - \beta) \end{aligned}$$

**Proved.**

**Example 22.** Prove that

$$\begin{vmatrix} -a^2 & ab & ac \\ ba & -b^2 & bc \\ ac & bc & -c^2 \end{vmatrix} = 4 a^2 b^2 c^2$$

**Solution.** Let  $\Delta = \begin{vmatrix} -a^2 & ab & ac \\ ba & -b^2 & bc \\ ac & bc & -c^2 \end{vmatrix}$

Taking  $a, b, c$  common from  $C_1, C_2$  and  $C_3$  respectively, we get

$$\begin{aligned} \Delta &= abc \begin{vmatrix} -a & a & a \\ b & -b & b \\ c & c & -c \end{vmatrix} \\ &= a^2 b^2 c^2 \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix} \quad [\text{Taking } a, b, c \text{ common from } R_1, R_2 \text{ and } R_3 \text{ respectively}] \\ &= a^2 b^2 c^2 \begin{vmatrix} -1 & 0 & 0 \\ 1 & 0 & 2 \\ 1 & 2 & 0 \end{vmatrix} \quad [\text{Applying } C_2 \rightarrow C_2 + C_1, C_3 \rightarrow C_3 + C_1] \\ &= a^2 b^2 c^2 (-1) \begin{vmatrix} 0 & 2 \\ 2 & 0 \end{vmatrix} \\ &= a^2 b^2 c^2 (-1) (0 - 4) = 4 a^2 b^2 c^2 \quad [\text{Expanding along } R_1] \text{ Proved.} \end{aligned}$$

**Example 23.** Using properties of determinants, prove the following:

$$\begin{vmatrix} a & b & c \\ a-b & b-c & c-a \\ b+c & c+a & a+b \end{vmatrix} = a^3 + b^3 + c^3 - 3abc.$$

**Solution.** We have,

$$\begin{aligned} \begin{vmatrix} a & b & c \\ a-b & b-c & c-a \\ b+c & c+a & a+b \end{vmatrix} &= \begin{vmatrix} a+b+c & b & c \\ a-b+b-c+c-a & b-c & c-a \\ b+c+c+a+a+b & c+a & a+b \end{vmatrix} \\ &\quad \text{By applying } C_1 \rightarrow C_1 + C_2 + C_3 \\ &= \begin{vmatrix} a+b+c & b & c \\ 0 & b-c & c-a \\ 2(a+b+c) & c+a & a+b \end{vmatrix} = \begin{vmatrix} a+b+c & b & c \\ 0 & b-c & c-a \\ 0 & c+a-2b & a+b-2c \end{vmatrix} \quad \text{By } R_3 \rightarrow R_3 - 2R_1 \end{aligned}$$

Expanding along  $C_1$ , we get

$$\begin{aligned} &= (a+b+c) \{(b-c)(a+b-2c) - (c-a)(c+a-2b)\} \\ &= (a+b+c) \{(ab+b^2-2bc-ac-bc+2c^2) - (c^2+ac-2bc-ac-a^2+2ab)\} \\ &= (a+b+c) \{ab+b^2-2bc-ac-bc+2c^2-c^2-ac+2bc+ac+a^2-2ab\} \\ &= (a+b+c) (a^2+b^2+c^2-ab-bc-ca) = a^3 + b^3 + c^3 - 3abc \quad \text{Proved.} \end{aligned}$$

**Example 24.** If  $\begin{vmatrix} a & a^2 & a^3 - 1 \\ b & b^2 & b^3 - 1 \\ c & c^2 & c^3 - 1 \end{vmatrix} = 0$ , prove that  $abc = 1$ .

**Solution.**

$$\begin{aligned} & \left| \begin{array}{ccc} a & a^2 & a^3 - 1 \\ b & b^2 & b^3 - 1 \\ c & c^2 & c^3 - 1 \end{array} \right| = 0 \Rightarrow \left| \begin{array}{ccc} a & a^2 & a^3 \\ b & b^2 & b^3 \\ c & c^2 & c^3 \end{array} \right| + \left| \begin{array}{ccc} a & a^2 & -1 \\ b & b^2 & -1 \\ c & c^2 & -1 \end{array} \right| = 0 \\ \Rightarrow & abc \left| \begin{array}{ccc} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{array} \right| - \left| \begin{array}{ccc} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{array} \right| = 0 \end{aligned}$$

(Taking out common  $a, b, c$  from  $R_1, R_2$  and  $R_3$  from 1st determinant)

$$\begin{aligned} \Rightarrow & abc \left| \begin{array}{ccc} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{array} \right| + \left| \begin{array}{ccc} a & 1 & a^2 \\ b & 1 & b^2 \\ c & 1 & c^2 \end{array} \right| = 0 \quad (\text{Interchanging } C_2 \text{ and } C_3) \\ \Rightarrow & abc \left| \begin{array}{ccc} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{array} \right| - \left| \begin{array}{ccc} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{array} \right| = 0 \end{aligned}$$

(Interchanging  $C_1$  and  $C_2$  of the second determinant)

$$\Rightarrow (abc - 1) \left| \begin{array}{ccc} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{array} \right| = 0 \Rightarrow abc - 1 = 0 \Rightarrow abc = 1 \quad \text{Proved.}$$

**Example 25.** Show that

$$\left| \begin{array}{ccc} b+c & c+a & a+b \\ q+r & r+p & p+q \\ y+z & z+x & x+y \end{array} \right| = 2 \left| \begin{array}{ccc} a & b & c \\ p & q & r \\ x & y & z \end{array} \right|$$

**Solution.** The above determinant can be expressed as the sum of 8 determinants as given below:

$$\begin{aligned} & \left| \begin{array}{ccc} b+c & c+a & a+b \\ q+r & r+p & p+q \\ y+z & z+x & x+y \end{array} \right| = \left| \begin{array}{ccc} b & c & a \\ q & r & p \\ y & z & x \end{array} \right| + \left| \begin{array}{ccc} b & a & a \\ q & p & p \\ y & x & x \end{array} \right| + \left| \begin{array}{ccc} b & c & b \\ q & r & q \\ y & z & y \end{array} \right| + \left| \begin{array}{ccc} b & a & b \\ q & p & q \\ y & x & y \end{array} \right| \\ & + \left| \begin{array}{ccc} c & c & a \\ r & r & p \\ z & z & x \end{array} \right| + \left| \begin{array}{ccc} c & a & a \\ r & p & p \\ z & x & x \end{array} \right| + \left| \begin{array}{ccc} c & c & b \\ r & r & q \\ z & z & y \end{array} \right| + \left| \begin{array}{ccc} c & a & b \\ r & p & q \\ z & x & y \end{array} \right| \\ & = \left| \begin{array}{ccc} b & c & a \\ q & r & p \\ y & z & x \end{array} \right| + 0 + 0 + 0 + 0 + 0 + 0 + \left| \begin{array}{ccc} c & a & b \\ r & p & q \\ z & x & y \end{array} \right| \\ & = (-1)^2 \left| \begin{array}{ccc} a & b & c \\ p & q & r \\ x & y & z \end{array} \right| + (-1)^2 \left| \begin{array}{ccc} a & b & c \\ p & q & r \\ x & y & z \end{array} \right| = 2 \left| \begin{array}{ccc} a & b & c \\ p & q & r \\ x & y & z \end{array} \right| \quad \text{Proved.} \end{aligned}$$

**Example 26.** If  $a, b, c$  are in A.P; then find the determinant:

$$\begin{vmatrix} x+2 & x+3 & x+2a \\ x+3 & x+4 & x+2b \\ x+4 & x+5 & x+2c \end{vmatrix}$$

**Solution.** Applying  $R_1 \rightarrow R_1 + R_3 - 2R_2$  to the given determinant, we have

$$\begin{aligned} & \begin{vmatrix} (x+2)+(x+4)-2(x+3) & (x+3)+(x+5)-2(x+4) & (x+2a)+(x+2c)-2(x+2b) \\ x+3 & x+4 & x+2b \\ x+4 & x+5 & x+2c \end{vmatrix} \\ &= \begin{vmatrix} 0 & 0 & 2a+2c-4b \\ x+3 & x+4 & x+2b \\ x+4 & x+5 & x+2c \end{vmatrix} \\ &= \begin{vmatrix} 0 & 0 & 0 \\ x+3 & x+4 & x+2b \\ x+4 & x+5 & x+2c \end{vmatrix} = 0 \quad \begin{array}{l} \because a, b, c \text{ are in A.P.} \\ \Rightarrow 2b = a+c \\ \Rightarrow 2a+2c = 4b \end{array} \\ & \quad [\because R_1 \text{ consists of all zeroes.}] \quad \text{Ans.} \end{aligned}$$

**Example 27.** Prove that

$$\begin{vmatrix} 2\alpha & \alpha + \beta & \alpha + \gamma \\ \beta + \alpha & 2\beta & \beta + \gamma \\ \gamma + \alpha & \gamma + \beta & 2\gamma \end{vmatrix} = 0$$

$$\text{Solution. Given determinant} = \begin{vmatrix} \alpha + \alpha & \alpha + \beta & \alpha + \gamma \\ \beta + \alpha & \beta + \beta & \beta + \gamma \\ \gamma + \alpha & \gamma + \beta & \gamma + \gamma \end{vmatrix}$$

The above determinant can be expressed as the sum of 8 determinants.

Each of the 8 determinants has either two identical columns or identical rows.

$\therefore$  Each of the resulting determinant is zero. Hence the result.

**Proved.**

**Example 28.** Using properties of determinants, prove that:

$$\begin{vmatrix} 3a & -a+b & -a+c \\ -b+a & 3b & -b+c \\ -c+a & -c+b & 3c \end{vmatrix} = 3(a+b+c)(ab+bc+ca)$$

**Solution.**

$$\begin{vmatrix} 3a & -a+b & -a+c \\ -b+a & 3b & -b+c \\ -c+a & -c+b & 3c \end{vmatrix} = \begin{vmatrix} a+b+c & -a+b & -a+c \\ a+b+c & 3b & -b+c \\ a+b+c & -c+b & 3c \end{vmatrix} \quad (\text{Applying } C_1 \rightarrow C_1 + C_2 + C_3)$$

$$\begin{aligned} &= (a+b+c) \begin{vmatrix} 1 & -a+b & -a+c \\ 1 & 3b & -b+c \\ 1 & -c+b & 3c \end{vmatrix} = (a+b+c) \begin{vmatrix} 1 & -a+b & -a+c \\ 0 & a+2b & a-b \\ 0 & a-c & a+2c \end{vmatrix} \quad R_2 \rightarrow R_2 - R_1 \\ &\quad R_3 \rightarrow R_3 - R_1 \end{aligned}$$

$$= (a+b+c) \cdot 1 \cdot \{(a+2b)(a+2c) - (a-c)(a-b)\} \quad [\text{Expanding along } C_1]$$

$$= (a+b+c) \{(a^2 + 2ac + 2ab + 4bc) - (a^2 - ab - ac + bc)\}$$

$$= (a+b+c)(3ab + 3bc + 3ca) = 3(a+b+c)(ab+bc+ca)$$

**Proved.**

**Example 29.** Show that  $x = -(a + b + c)$  is one root of the equation:

$$\begin{vmatrix} x+a & b & c \\ b & x+c & a \\ c & a & x+b \end{vmatrix} = 0$$

and solve the equation completely.

**Solution.** By  $C_1 \rightarrow C_1 + C_2 + C_3$ , we get  $\begin{vmatrix} x+a+b+c & b & c \\ x+a+b+c & x+c & a \\ x+a+b+c & a & x+b \end{vmatrix} = 0$

$$\Rightarrow (x+a+b+c) \begin{vmatrix} 1 & b & c \\ 1 & x+c & a \\ 1 & a & x+b \end{vmatrix} = 0$$

$$\Rightarrow (x+a+b+c) \begin{vmatrix} 1 & b & c \\ 0 & x-b+c & a-c \\ 0 & a-b & x+b-c \end{vmatrix} = 0, R_2 \rightarrow R_2 - R_1; R_3 \rightarrow R_3 - R_1$$

On expanding by first column, we get

$$(x+a+b+c) [(x-b+c)(x+b-c) - (a-b)(a-c)] = 0$$

$$\Rightarrow (x+a+b+c) [x^2 - (b-c)^2 - (a^2 - ac - ab + bc)] = 0$$

$$\Rightarrow (x+a+b+c) (x^2 - b^2 - c^2 + 2bc - a^2 + ac + ab - bc) = 0$$

$$\Rightarrow (x+a+b+c) (x^2 - a^2 - b^2 - c^2 + ab + bc + ca) = 0$$

Either  $x+a+b+c = 0 \Rightarrow x = -(a+b+c)$   
or  $x^2 - a^2 - b^2 - c^2 + ab + bc + ca = 0$

$$\Rightarrow x = \pm \sqrt{a^2 + b^2 + c^2 - ab - bc - ca}$$

Hence,  $x = -(a+b+c)$  is one root of the given equation.

**Proved.**

**Example 30.** Find the value of

$$\begin{vmatrix} (b+c)^2 & a^2 & a^2 \\ b^2 & (c+a)^2 & b^2 \\ c^2 & c^2 & (a+b)^2 \end{vmatrix}$$

**Solution.** By  $C_1 \rightarrow C_1 - C_3, C_2 \rightarrow C_2 - C_3$ , we get

$$\begin{aligned} & \begin{vmatrix} (b+c)^2 - a^2 & a^2 - a^2 & a^2 \\ b^2 - b^2 & (c+a)^2 - b^2 & b^2 \\ c^2 - (a+b)^2 & c^2 - (a+b)^2 & (a+b)^2 \end{vmatrix} \\ &= \begin{vmatrix} (a+b+c)(b+c-a) & 0 & a^2 \\ 0 & (a+b+c)(c+a-b) & b^2 \\ (a+b+c)(c-a-b) & (a+b+c)(c-a-b) & (a+b)^2 \end{vmatrix} \end{aligned}$$

On taking out  $(a+b+c)$  as common from 1st and 2nd columns, we get

$$= (a+b+c)^2 \begin{vmatrix} b+c-a & 0 & a^2 \\ 0 & c+a-b & b^2 \\ c-a-b & c-a-b & (a+b)^2 \end{vmatrix}$$

$$\begin{aligned}
 &= (a+b+c)^2 \begin{vmatrix} -a+b+c & 0 & a^2 \\ 0 & a-b+c & b^2 \\ -2b & -2a & 2ab \end{vmatrix} \quad R_3 \rightarrow R_3 - (R_1 + R_2) \\
 &= -2(a+b+c)^2 \begin{vmatrix} -a+b+c & 0 & a^2 \\ 0 & a-b+c & b^2 \\ b & a & -ab \end{vmatrix}
 \end{aligned}$$

On expanding by first row, we get

$$\begin{aligned}
 &= -2(a+b+c)^2 [(-a+b+c)\{-ab(a-b+c)-ab^2\} + a^2\{0-b(a-b+c)\}] \\
 &= -2(a+b+c)^2 [(-a+b+c)(-a^2b-abc)-a^2b(a-b+c)] \\
 &= -2ab(a+b+c)^2 [(-a+b+c)(-a-c)-a(a-b+c)] \\
 &= -2ab(a+b+c)^2 [a^2+ac-ab-bc-ac-c^2-a^2+ab-ac] \\
 &= -2ab(a+b+c)^2 (-bc-ac-c^2) = 2abc(a+b+c)^2(b+a+c) \\
 &= 2abc(a+b+c)^3.
 \end{aligned}$$

**Ans.**

**Example 31.** Using properties of determinants, solve for  $x$ :

$$\begin{vmatrix} a+x & a-x & a-x \\ a-x & a+x & a-x \\ a-x & a-x & a+x \end{vmatrix} = 0$$

**Solution.** Given that,

$$\begin{vmatrix} a+x & a-x & a-x \\ a-x & a+x & a-x \\ a-x & a-x & a+x \end{vmatrix} = 0$$

Applying  $C_1 \rightarrow C_1 + C_2 + C_3$ , we get

$$\begin{aligned}
 &\begin{vmatrix} 3a-x & a-x & a-x \\ 3a-x & a+x & a-x \\ 3a-x & a-x & a+x \end{vmatrix} = 0 \\
 \Rightarrow &(3a-x) \begin{vmatrix} 1 & a-x & a-x \\ 1 & a+x & a-x \\ 1 & a-x & a+x \end{vmatrix} = 0
 \end{aligned}$$

Now applying  $R_2 \rightarrow R_2 - R_1$  and  $R_3 \rightarrow R_3 - R_1$ , we get

$$\Rightarrow (3a-x) \begin{vmatrix} 1 & a-x & a-x \\ 0 & 2x & 0 \\ 0 & 0 & 2x \end{vmatrix} = 0$$

Expanding along  $C_1$ , we get

$$\Rightarrow (3a-x)(4x^2 - 0) = 0$$

$$\Rightarrow 4x^2(3a-x) = 0 \Rightarrow \text{If } 4x^2 = 0, \text{ then } x = 0$$

$$\Rightarrow \text{If } 3a-x = 0, \text{ then } x = 3a \quad \text{Hence, } x = 0 \quad \text{or} \quad 3a$$

**Ans.**

**Example 32.** Using properties of determinants, prove the following

$$\begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+b & 1 \\ 1 & 1 & 1+c \end{vmatrix} = abc \left( \frac{1}{a} + \frac{1}{b} + \frac{1}{c} + 1 \right)$$

**Solution.** Let  $\Delta = \begin{vmatrix} 1+a & 1 & 1 \\ 1 & 1+b & 1 \\ 1 & 1 & 1+c \end{vmatrix}$

Taking  $a, b$  and  $c$  common from  $R_1, R_2$  and  $R_3$  rows respectively.

$$\Delta = abc \begin{vmatrix} \frac{1+a}{a} & \frac{1}{a} & \frac{1}{a} \\ \frac{1}{b} & \frac{1+b}{b} & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & \frac{1+c}{c} \end{vmatrix} = abc \begin{vmatrix} 1+\frac{1}{a} & \frac{1}{a} & \frac{1}{a} \\ \frac{1}{b} & 1+\frac{1}{b} & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & 1+\frac{1}{c} \end{vmatrix}$$

$$= abc \begin{vmatrix} 1+\frac{1}{a}+\frac{1}{b}+\frac{1}{c} & 1+\frac{1}{a}+\frac{1}{b}+\frac{1}{c} & 1+\frac{1}{a}+\frac{1}{b}+\frac{1}{c} \\ \frac{1}{b} & 1+\frac{1}{b} & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & 1+\frac{1}{c} \end{vmatrix} R_1 \rightarrow R_1 + R_2 + R_3$$

Taking  $\left(1+\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right)$  common from  $R_1$ , we get

$$\Delta = abc \left(1+\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) \begin{vmatrix} 1 & 1 & 1 \\ \frac{1}{b} & 1+\frac{1}{b} & \frac{1}{b} \\ \frac{1}{c} & \frac{1}{c} & 1+\frac{1}{c} \end{vmatrix}$$

Operate :  $C_2 \rightarrow C_2 - C_1 ; C_3 \rightarrow C_3 - C_1$

$$\Delta = abc \left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}+1\right) \begin{vmatrix} 1 & 0 & 0 \\ \frac{1}{b} & 1 & 0 \\ \frac{1}{c} & 0 & 1 \end{vmatrix} = abc \left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}+1\right)$$

(On expanding by  $R_1$ ). **Proved.**

**Example 33.** Prove that :

$$\begin{vmatrix} a & a^2 & bc \\ b & b^2 & ac \\ c & c^2 & ab \end{vmatrix} = (a-b)(b-c)(c-a)(ab+bc+ac).$$

**Solution.** Let

$$\Delta = \begin{vmatrix} a & a^2 & bc \\ b & b^2 & ac \\ c & c^2 & ab \end{vmatrix}$$

$$= \frac{1}{abc} \begin{vmatrix} a^2 & a^3 & abc \\ b^2 & b^3 & abc \\ c^2 & c^3 & abc \end{vmatrix} = \frac{1}{abc} \cdot abc \begin{vmatrix} a^2 & a^3 & 1 \\ b^2 & b^3 & 1 \\ c^2 & c^3 & 1 \end{vmatrix}$$

$$\begin{aligned}\Delta &= \begin{vmatrix} a^2 - b^2 & a^3 - b^3 & 0 \\ b^2 - c^2 & b^3 - c^3 & 0 \\ c^2 & c^3 & 1 \end{vmatrix} R_1 \rightarrow R_1 - R_2 \\ &\quad R_2 \rightarrow R_2 - R_3 \\ &= (a-b)(b-c) \begin{vmatrix} a+b & a^2 + ab + b^2 & 0 \\ b+c & b^2 + bc + c^2 & 0 \\ c^2 & c^3 & 1 \end{vmatrix}\end{aligned}$$

Expand by  $C_3$

$$\begin{aligned}&= (a-b)(b-c) \cdot 1 \begin{vmatrix} a+b & a^2 + ab + b^2 \\ b+c & b^2 + bc + c^2 \end{vmatrix} \\ &= (a-b)(b-c) \begin{vmatrix} a+b & a^2 + ab + b^2 \\ c-a & bc+c^2 - a^2 - ab \end{vmatrix} R_2 \rightarrow R_2 - R_1 \\ &= (a-b)(b-c) \begin{vmatrix} a+b & a^2 + ab + b^2 \\ c-a & b(c-a) + (c^2 - a^2) \end{vmatrix} \\ &= (a-b)(b-c)(c-a) \begin{vmatrix} a+b & a^2 + ab + b^2 \\ 1 & b+c+a \end{vmatrix} \\ &= (a-b)(b-c)(c-a) [(a+b)(a+b+c) - 1 \cdot (a^2 + ab + b^2)] \\ &= (a-b)(b-c)(c-a)(ab + bc + ac). \quad \text{Proved.}\end{aligned}$$

### EXERCISE 17.2

*Expand the following determinants, using properties of the determinants :*

$$1. \begin{vmatrix} 1 & 3 & 7 \\ 4 & 9 & 1 \\ 2 & 7 & 6 \end{vmatrix}$$

Ans. 51.

$$2. \begin{vmatrix} x & a & a \\ a & x & a \\ a & a & x \end{vmatrix}$$

Ans.  $(x+2a)(x-a)^2$

$$3. \text{ Show that } \begin{vmatrix} 0 & x-a & x-b \\ x-a & 0 & x-c \\ x-b & x-c & 0 \end{vmatrix} = 2(x-a)(x-b)(x-c). \quad 4. \begin{vmatrix} \frac{1}{a} & a & bc \\ \frac{1}{b} & b & ca \\ \frac{1}{c} & c & ab \end{vmatrix} = 0$$

$$5. \begin{vmatrix} x+y & y+z & z+x \\ z & x & y \\ 1 & 1 & 1 \end{vmatrix} = 0.$$

$$6. \begin{vmatrix} x+4 & 2x & 2x \\ 2x & x+4 & 2x \\ 2x & 2x & x+4 \end{vmatrix} = (5x+4)(4-x)^2$$

$$7. \begin{vmatrix} a+b+2c & a & b \\ c & b+c+2a & b \\ c & a & c+a+2b \end{vmatrix} = 2(a+b+c)^3$$

$$8. \begin{vmatrix} 1 & x+y & x^2+y^2 \\ 1 & y+z & y^2+z^2 \\ 1 & z+x & z^2+x^2 \end{vmatrix} = (x-y)(y-z)(z-x).$$

$$9. \begin{vmatrix} b^2c^2 & bc & b+c \\ c^2a^2 & ca & c+a \\ a^2b^2 & ab & a+b \end{vmatrix} = 0$$

$$11. \begin{vmatrix} a & a+b & a+b+c \\ 2a & 3a+2b & 4a+3b+2c \\ 3a & 6a+3b & 10a+6b+3c \end{vmatrix} = a^3.$$

$$13. \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = \begin{vmatrix} 1 & a & bc \\ 1 & b & ca \\ 1 & c & ab \end{vmatrix}$$

$$14. \begin{vmatrix} a+b+c & -c & -b \\ -c & a+b+c & -a \\ -b & -a & a+b+c \end{vmatrix} = 2(a+b)(b+c)(c+a).$$

$$15. \begin{vmatrix} a^2 & bc & ac+c^2 \\ a^2+ab & b^2 & ac \\ ab & b^2+bc & c^2 \end{vmatrix} = 4a^2b^2c^2$$

$$16. \begin{vmatrix} 3a & -a+b & -a+c \\ -b+a & 3b & -b+c \\ -c+a & -c+b & 3c \end{vmatrix} = 3(a+b+c)(ab+bc+ca)$$

$$10. \begin{vmatrix} 1 & a & a^2-bc \\ 1 & b & b^2-ca \\ 1 & c & c^2-ab \end{vmatrix} = 0.$$

$$12. \begin{vmatrix} 1 & a & bc \\ 1 & b & ca \\ 1 & c & ab \end{vmatrix} = (a-b)(b-c)(c-a).$$

## 17.6 FACTOR THEOREM

If the elements of a determinant are polynomials in a variable  $x$  and if the substitution  $x = a$  makes two rows (or columns) identical then  $(x - a)$  is a factor of the determinant.

When two rows are identical, the value of the determinant is zero. The expansion of a determinant being polynomial in  $x$  vanishes on putting  $x = a$ , then  $x - a$  is its factor by the Remainder theorem.

**Example 34.** Show that

$$\begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ x^2 & y^2 & z^2 \end{vmatrix} = (x-y)(y-z)(z-x)$$

**Solution.** If we put  $x = y$ ,  $y = z$  and  $z = x$  then in each case two columns become identical and the determinant vanishes.

$\therefore (x-y)$ ,  $(y-z)$ , and  $(z-x)$  are the factors.  
Since the determinant is of third degree, the other factor can be numerical only  $k$  (say).

$$\begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ x^2 & y^2 & z^2 \end{vmatrix} = k(x-y)(y-z)(z-x) \quad \dots (1)$$

This leading term (product of the elements of the diagonal elements) L.H.S. of (1) is  $yz^2$  and in the expansion of R.H.S. i.e.  $k(x-y)(y-z)(z-x)$  we get  $kyz^2$

Equating the coefficient of  $yz^2$  on both sides of (1), we have

$$k = 1$$

Hence, the expansion =  $(x-y)(y-z)(z-x)$ .

**Proved.**

**Example 35.** Using properties of determinants, prove that

$$\begin{vmatrix} x & x^2 & 1+px^3 \\ y & y^2 & 1+py^3 \\ z & z^2 & 1+pz^3 \end{vmatrix} = (1+pxyz)(x-y)(y-z)(z-x), \text{ where } p \text{ is any scalar.}$$

**Solution.** We have,

$$\begin{aligned} \begin{vmatrix} x & x^2 & 1+px^3 \\ y & y^2 & 1+py^3 \\ z & z^2 & 1+pz^3 \end{vmatrix} &= \begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} + \begin{vmatrix} x & x^2 & px^3 \\ y & y^2 & py^3 \\ z & z^2 & pz^3 \end{vmatrix} = \begin{vmatrix} x & x^2 & 1 \\ y & y^2 & 1 \\ z & z^2 & 1 \end{vmatrix} + pxyz \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} \\ &= \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} + pxyz \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} = (1+pxyz) \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} \quad \dots (1) \end{aligned}$$

If we put  $x = y$  then two rows become identical and the determinant vanishes.

$\Rightarrow (x - y)$  is a factor.

If we put  $y = z$  then two rows become identical and the determinant vanishes.

$\Rightarrow (y - z)$  is a factor.

If we put  $z = x$ , then two rows become identical and the determinant vanishes.

$\Rightarrow (z - x)$  is also a factor.

Since the determinant is of the third degree, the other factor can be numerical  $k$ ,

$$\begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} = k(x-y)(y-z)(z-x) \quad \dots (2)$$

This leading term (product of the diagonal elements) L.H.S of (2) is  $yz^2$  and in the expansion of R.H.S. i.e.,  $k(x-y)(y-z)(z-x)$  we get  $kyz^2$ .

Equating the coefficients of  $yz^2$ , we have  $k = 1$

$$\text{Hence, } \begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix} = (x-y)(y-z)(z-x) \quad \dots (3)$$

From (1) and (3), we have

$$\text{The given determinant} = \begin{vmatrix} x & x^2 & 1+px^3 \\ y & y^2 & 1+py^3 \\ z & z^2 & 1+pz^3 \end{vmatrix} = (1+pxyz)(x-y)(y-z)(z-x) \quad \text{Proved.}$$

**Example 36.** Factorize

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ a^2 & b^2 & c^2 \\ a^3 & b^3 & c^3 \end{vmatrix}$$

**Solution.** Putting  $a = b$ ,  $C_1 = C_2$  and hence  $\Delta = 0$ .

$\therefore a - b$  is a factor of  $\Delta$ .

Similarly,  $b - c$ ,  $c - a$  are also factors of  $\Delta$ .

$\therefore (a-b)(b-c)(c-a)$  is a third degree factor of  $\Delta$  which itself is of the fifth degree as is

judged from the leading term  $b^2c^3$ .

∴ The remaining factor must be of the second degree. As  $\Delta$  is symmetrical in  $a, b, c$  the remaining factor must, therefore, be of the form

$$k(a^2 + b^2 + c^2) + l(ab + bc + ca)$$

$$\therefore \Delta = (a - b)(b - c)(c - a)\{k(a^2 + b^2 + c^2) + l(ab + bc + ca)\}$$

If  $k \neq 0$ , we shall get terms like  $a^4b, b^4c$  etc. which do not occur in  $\Delta$ . Hence,  $k$  must be zero.

$$\therefore \Delta = (a - b)(b - c)(c - a)\{0 + l(ab + bc + ca)\}$$

$$\text{or } \Delta = l(a - b)(b - c)(c - a)(ab + bc + ca)$$

The leading term in  $\Delta = b^2c^3$

The corresponding term on R.H.S. =  $l b^2c^3$

$$\therefore l = 1$$

$$\text{Hence, } \Delta = (a - b)(b - c)(c - a)(ab + bc + ca).$$

**Ans.**

### EXERCISE 17.3

1. Evaluate, without expanding

$$\begin{vmatrix} a & a^2 & 1+a^3 \\ b & b^2 & 1+b^3 \\ c & c^2 & 1+c^3 \end{vmatrix}$$

$$\text{Ans. } (a - b)(b - c)(c - a)(1 + abc)$$

2. Solve the equation

$$\begin{vmatrix} x^3 - a^3 & x^2 & x \\ b^3 - a^3 & b^2 & b \\ c^3 - a^3 & c^2 & c \end{vmatrix} = 0, b \neq c, c \neq 0, b \neq 0.$$

$$\text{Ans. } x = \frac{a^3}{bc}, x = b, x = c$$

3. Without expanding, show that

$$\Delta = \begin{vmatrix} (a - x)^2 & (a - y)^2 & (a - z)^2 \\ (b - x)^2 & (b - y)^2 & (b - z)^2 \\ (c - x)^2 & (c - y)^2 & (c - z)^2 \end{vmatrix} = 2(a - b)(b - c)(c - a)(x - y)(y - z)(z - x).$$

4. Show (without expanding) that

$$\begin{vmatrix} bc & a^2 & a^2 \\ b^2 & ca & b^2 \\ c^2 & c^2 & ab \end{vmatrix} = \begin{vmatrix} bc & ab & ca \\ ab & ca & bc \\ ca & bc & ab \end{vmatrix}$$

$$= -\frac{1}{2}(ab + bc + ca)[(ab - bc)^2 + (bc - ca)^2 + (ca - ab)^2]$$

### 17.7 SPECIAL TYPES OF DETERMINANTS

(i) **Ortho-symmetric Determinant.** If every element of the leading diagonal is the same and the equidistant elements from the diagonal are equal, then the determinant is said to be ortho-symmetric determinant.

$$\begin{vmatrix} a & h & g \\ h & a & f \\ g & f & a \end{vmatrix}$$

(ii) **Skew-Symmetric Determinant.** If the elements of the leading diagonal are all zero and every other element is equal to its conjugate with sign changed, the determinant is said to be Skew-symmetric.

$$\begin{vmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{vmatrix}$$

**Property 1.** A Skew-symmetric determinant of odd order vanishes.  
**Example 37.** Prove that

$$= \begin{vmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{vmatrix} = 0$$

**Solution.** Taking out  $(-1)$  common from each of the three columns

$$\Delta = (-1)^3 \begin{vmatrix} 0 & a & b \\ -a & 0 & c \\ -b & -c & 0 \end{vmatrix}$$

Changing rows into columns

$$\Delta = (-1)^3 \begin{vmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{vmatrix} = (-1)^3 \Delta = -\Delta \quad \text{or} \quad 2\Delta = 0 \quad \text{or} \quad \Delta = 0$$

## 17.8 APPLICATION OF DETERMINANTS

**Area of triangle.** We know that the area of a triangle, whose vertices are  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$  is given by

$$\begin{aligned} \Delta &= \frac{1}{2} [x_1(y_2 - y_3) - x_2(y_1 - y_3) + x_3(y_1 - y_2)] \\ &= \frac{1}{2} \left[ x_1 \begin{vmatrix} y_2 & 1 \\ y_3 & 1 \end{vmatrix} - x_2 \begin{vmatrix} y_1 & 1 \\ y_3 & 1 \end{vmatrix} + x_3 \begin{vmatrix} y_1 & 1 \\ y_2 & 1 \end{vmatrix} \right] = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} \end{aligned}$$

**Note.** Since area is always a positive quantity, therefore we always take the absolute value of the determinant for the area.

**Condition of collinearity of three points.** Let  $A(x_1, y_1)$ ,  $B(x_2, y_2)$  and  $C(x_3, y_3)$  be three points. Then,  $A, B, C$  are collinear

$\Leftrightarrow$  area of triangle  $ABC = 0$

$$\Leftrightarrow \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0 \Leftrightarrow \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

**Proved.**

**Example 38.** Using determinants, find the area of the triangle with vertices  $(-2, -3)$ ,  $(3, 2)$  and  $(-1, -8)$ .

$$\begin{aligned} \text{Solution.} \quad \text{The area of the given triangle} &= \frac{1}{2} \begin{vmatrix} -2 & -3 & 1 \\ 3 & 2 & 1 \\ -1 & -8 & 1 \end{vmatrix} \\ &= \frac{1}{2} \begin{vmatrix} -2 & -3 & 1 \\ 5 & 5 & 0 \\ 1 & -5 & 0 \end{vmatrix} \quad R_2 \rightarrow R_2 - R_1 \\ &\quad R_3 \rightarrow R_3 - R_1 \end{aligned}$$

Expand by  $C_3$  we get

$$= \frac{1}{2} \cdot 1 \cdot \begin{vmatrix} 5 & 5 \\ 1 & -5 \end{vmatrix} = \frac{1}{2} (-25 - 5) = \frac{|-30|}{2} = 15 \text{ sq. units} \quad \text{Ans.}$$

**Example 39.** If area of triangle is 35 sq. units with vertices  $(2, -6)$ ,  $(5, 4)$  and  $(k, 4)$ . Then find  $k$ .

**Solution.** Let the vertices of triangle be  $A(2, -6)$ ,  $B(5, 4)$  and  $C(k, 4)$ . Since the area of the triangle  $ABC$  is 35 sq. units, we have

$$\begin{aligned}
 & \frac{1}{2} \begin{vmatrix} 2 & -6 & 1 \\ 5 & 4 & 1 \\ k & 4 & 1 \end{vmatrix} = \pm 35 \\
 \Rightarrow & \frac{1}{2} \begin{vmatrix} 2 & -6 & 1 \\ 3 & 10 & 0 \\ k-2 & 10 & 0 \end{vmatrix} = \pm 35 \quad [\text{Applying } R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - R_1] \\
 \Rightarrow & \frac{1}{2} \begin{vmatrix} 3 & 10 \\ k-2 & 10 \end{vmatrix} = \pm 35 \Rightarrow \frac{1}{2} \{30 - 10(k-2)\} = \pm 35 \quad [\text{Exanding along } C_3] \\
 \Rightarrow & 30 - 10k + 20 = \pm 70 \\
 \Rightarrow & 10k = 50 \mp 70 \Rightarrow k = 12 \quad \text{or} \quad k = -2 \quad \text{Ans.}
 \end{aligned}$$

**Example 40.** Show that points  $A(a, b+c)$ ,  $B(b, c+a)$ ,  $C(c, a+b)$  are collinear.

**Solution.** The area of the triangle formed by the given points:

$$= \frac{1}{2} \begin{vmatrix} a & b+c & 1 \\ b & c+a & 1 \\ c & a+b & 1 \end{vmatrix}$$

Operate :  $R_2 \rightarrow R_2 - R_1, R_3 \rightarrow R_3 - R_1$

$$\begin{aligned}
 &= \frac{1}{2} \begin{vmatrix} a & b+c & 1 \\ b-a & a-b & 0 \\ c-a & a-c & 0 \end{vmatrix} = \frac{1}{2} (1) \{(b-a)(a-c) - (a-b)(c-a)\} \quad [\text{Expanding along } C_3] \\
 &= \frac{1}{2} [ab - bc - a^2 + ac - ac + a^2 + bc - ab] = \frac{1}{2} [0] = 0
 \end{aligned}$$

Hence, the given points are collinear. **Proved.**

**Example 41.** Using determinants, show that the points  $(11, 7)$ ,  $(5, 5)$  and  $(-1, 3)$  are collinear.

**Solution.** The area of the triangle formed by the given points

$$= \frac{1}{2} \begin{vmatrix} 11 & 7 & 1 \\ 5 & 5 & 1 \\ -1 & 3 & 1 \end{vmatrix}$$

Operate :  $R_1 \rightarrow R_1 - R_2 ; R_2 \rightarrow R_2 - R_3$

$$= \frac{1}{2} \begin{vmatrix} 6 & 2 & 0 \\ 6 & 2 & 0 \\ -1 & 3 & 1 \end{vmatrix} = \frac{1}{2} \cdot 0 = 0. \quad (\therefore R_1 \text{ and } R_2 \text{ are identical})$$

Hence, the given points are collinear. **Proved.**

**Example 42.** Using determinants, find the area of the triangle whose vertices are  $(1, 4)$ ,  $(2, 3)$  and  $(-5, -3)$ . Are the given points collinear?

**Solution.** Area of the required triangle

$$= \frac{1}{2} \begin{vmatrix} 1 & 4 & 1 \\ 2 & 3 & 1 \\ -5 & -3 & 1 \end{vmatrix} = \frac{1}{2} [1(3+3) - 4(2+5) + 1(-6+15)] = \frac{1}{2} [6 - 28 + 9] = \frac{13}{2} \neq 0$$

Hence, the given points are not collinear. **Ans.**

**Example 43.** Find the equation of line joining  $A(1, 2)$  and  $B(3, 6)$  using determinants.

**Solution.** Let  $P(x, y)$  be any point on  $AB$ . Then, area of triangle  $ABP$  is zero. So,

$$\begin{aligned}
 & \frac{1}{2} \begin{vmatrix} 1 & 2 & 1 \\ 3 & 6 & 1 \\ x & y & 1 \end{vmatrix} = 0 \\
 \Rightarrow & \frac{1}{2} \begin{vmatrix} 1 & 2 & 1 \\ 2 & 4 & 0 \\ x-1 & y-2 & 0 \end{vmatrix} = 0 \quad [\text{Applying } R_2 \rightarrow R_2 - R_1 \text{ and } R_3 \rightarrow R_3 - R_1] \\
 \Rightarrow & \frac{1}{2} (1) \{2(y-2) - 4(x-1)\} = 0 \quad [\text{Expanding along } C_3] \\
 \Rightarrow & y-2-2x+2=0 \Rightarrow y=2x \quad \text{Ans.}
 \end{aligned}$$

**EXERCISE 17.4**

1. Using determinants, find the area of the triangle with vertices  $(2, -7)$ ,  $(1, 3)$ ,  $(10, 8)$ . **Ans.**  $A = \frac{95}{2}$
2. Using determinants, show that the points  $(3, 8)$ ,  $(-4, 2)$  and  $(10, 14)$  are collinear.
3. Using determinants, find the area of the triangle whose vertices are  $(-2, 4)$ ,  $(2, -6)$  and  $(5, 4)$ . Are the given points collinear ? **Ans.** Area = 35, not collinear
4. Using determinants, find the area of the triangle whose vertices are  $(-1, -3)$ ,  $(2, 4)$  and  $(3, -1)$ . Are the given points collinear ? **Ans.** Area = 11, not collinear
5. Using determinants, find the area of the triangle whose vertices are  $(1, -1)$ ,  $(2, 4)$  and  $(-3, 5)$ . Are the given points collinear ? **Ans.** Area = 13, not collinear
6. Find the value of  $\alpha$ , so that the points  $(1, -5)$ ,  $(-4, 5)$  and  $(\alpha, 7)$  are collinear. **Ans.**  $\alpha = -5$
7. Find the value of  $x$ , if the area of triangle is 35 square cms with vertices  $(x, 4)$ ,  $(2, -6)$ ,  $(5, 4)$ . **Ans.**  $x = -2, 12$
8. Using determinants find the value of  $k$ , so that the points  $(k, 2-2k)$ ,  $(-k+1, 2k)$  and  $(-4-k, 6-2k)$  may be collinear. **Ans.**  $k = -1, \frac{1}{2}$
9. If the points  $(x, -2)$ ,  $(5, 2)$  and  $(8, 8)$  are collinear, find  $x$  using determinants. **Ans.**  $x = 3$
10. If the points  $(3, -2)$ ,  $(x, 2)$  and  $(8, 8)$  are collinear, find  $x$  using determinants. **Ans.**  $x = 5$

### 17.9 SOLUTION OF SIMULTANEOUS LINEAR EQUATIONS BY DETERMINANTS (CRAMER'S RULE)

Let us solve the following equations.

$$a_1x + b_1y + c_1z = d_1$$

$$a_2x + b_2y + c_2z = d_2$$

$$a_3x + b_3y + c_3z = d_3$$

$$\text{Let } D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \text{ or } x \cdot D = \begin{vmatrix} a_1x & b_1 & c_1 \\ a_2x & b_2 & c_2 \\ a_3x & b_3 & c_3 \end{vmatrix}$$

Multiplying the 2nd column by  $y$  and 3rd column by  $z$  and adding to the 1st column, we get

$$x \cdot D_1 = \begin{vmatrix} a_1x + b_1y + c_1z & b_1 & c_1 \\ a_2x + b_2y + c_2z & b_2 & c_2 \\ a_3x + b_3y + c_3z & b_3 & c_3 \end{vmatrix}, \quad x \cdot D_1 = \begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix} \Rightarrow x = \frac{\begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}} = \frac{D_1}{D}$$

$$\text{Similarly, } y = \frac{D_2}{D} = \frac{\begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}} \Rightarrow z = \frac{D_3}{D} = \frac{\begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}}$$

$$\text{Thus, } x = \frac{D_1}{D}, \quad y = \frac{D_2}{D}, \quad z = \frac{D_3}{D} \quad \text{Ans.}$$

**Example 44.** Solve the following system of equations using Cramer's rule :

$$5x - 7y + z = 11$$

$$6x - 8y - z = 15$$

$$3x + 2y - 6z = 7$$

**Solution.** The given equations are

$$5x - 7y + z = 11$$

$$6x - 8y - z = 15$$

$$3x + 2y - 6z = 7$$

$$\text{Here, } D = \begin{vmatrix} 5 & -7 & 1 \\ 6 & -8 & -1 \\ 3 & 2 & -6 \end{vmatrix} = 5(48 + 2) + 7(-36 + 3) + 1(12 + 24) = 55$$

$$D_1 = \begin{vmatrix} 11 & -7 & 1 \\ 15 & -8 & -1 \\ 7 & 2 & -6 \end{vmatrix} = 11(48 + 2) + 7(-90 + 7) + 1(30 + 56) = 55$$

$$D_2 = \begin{vmatrix} 5 & 11 & 1 \\ 6 & 15 & -1 \\ 3 & 7 & -6 \end{vmatrix} = 5(-90 + 7) - 11(-36 + 3) + 1(42 - 45) = -55$$

$$D_3 = \begin{vmatrix} 5 & -7 & 11 \\ 6 & -8 & 15 \\ 3 & 2 & 7 \end{vmatrix} = 5(-56 - 30) + 7(42 - 45) + 11(12 + 24) = -55 \quad \text{Proved.}$$

By Cramer's Rule

$$x = \frac{D_1}{D} = \frac{55}{55} = 1, \quad y = \frac{D_2}{D} = \frac{-55}{55} = -1, \quad z = \frac{D_3}{D} = \frac{-55}{55} = -1$$

$$\text{Hence, } x = 1, y = -1, z = -1 \quad \text{Ans.}$$

**Example 45.** Solve, by determinants, the following set of simultaneous equations :

$$5x - 6y + 4z = 15$$

$$7x + 4y - 3z = 19$$

$$2x + y + 6z = 46$$

$$\text{Solution. } D = \begin{vmatrix} 5 & -6 & 4 \\ 7 & 4 & -3 \\ 2 & 1 & 6 \end{vmatrix} = 419 \quad D_1 = \begin{vmatrix} 15 & -6 & 4 \\ 19 & 4 & -3 \\ 46 & 1 & 6 \end{vmatrix} = 1257$$

$$D_2 = \begin{vmatrix} 5 & 15 & 4 \\ 7 & 19 & -3 \\ 2 & 46 & 6 \end{vmatrix} = 1676 \quad D_3 = \begin{vmatrix} 5 & -6 & 15 \\ 7 & 4 & 19 \\ 2 & 1 & 46 \end{vmatrix} = 2514$$

By Cramer's Rule

$$x = \frac{D_1}{D} = \frac{1257}{419} = 3 \quad y = \frac{D_2}{D} = \frac{1676}{419} = 4. \quad z = \frac{D_3}{D} = \frac{2514}{419} = 6.$$

Hence  $x = 3, y = 4, z = 6$

**Ans.**

**Example 46.** Solve, using Cramer's rule

$$3x - 2y + 4z = 5$$

$$x + y + 3z = 2$$

$$-x + 2y - z = 1$$

<b>Solution.</b>	$D = \begin{vmatrix} 3 & -2 & 4 \\ 1 & 1 & 3 \\ -1 & 2 & -1 \end{vmatrix} = -5$	$D_1 = \begin{vmatrix} 5 & -2 & 4 \\ 2 & 1 & 3 \\ 1 & 2 & -1 \end{vmatrix} = -33$
	$D_2 = \begin{vmatrix} 3 & 5 & 4 \\ 1 & 2 & 3 \\ -1 & 1 & -1 \end{vmatrix} = -13$	$D_3 = \begin{vmatrix} 3 & -2 & 5 \\ 1 & 1 & 2 \\ -1 & 2 & 1 \end{vmatrix} = 12$

By Cramer's Rule

$$x = \frac{D_1}{D} = \frac{-33}{-5} = \frac{33}{5} \quad y = \frac{D_2}{D} = \frac{-13}{-5} = \frac{13}{5} \quad z = \frac{D_3}{D} = \frac{12}{-5} = \frac{-12}{5}$$

Hence,  $x = \frac{33}{5}, \quad y = \frac{13}{5}, \quad z = \frac{-12}{5}$

**Ans.**

**Example 47.** Solve the following system of equations by using determinants :  
 $x + y + z = 1$

$$ax + by + cz = k$$

$$a^2x + b^2y + c^2z = k^2$$

**Solution.** We have,

$$\begin{aligned} D &= \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 \\ a & b-a & c-a \\ a^2 & b^2-a^2 & c^2-a^2 \end{vmatrix} \quad [\text{Applying } C_2 \rightarrow C_2 - C_1 \text{ and } C_3 \rightarrow C_3 - C_1] \\ &= (b-a)(c-a) \begin{vmatrix} 1 & 0 & 0 \\ a & 1 & 1 \\ a^2 & b+a & c+a \end{vmatrix} \\ &= (b-a)(c-a).1 \begin{vmatrix} 1 & 1 \\ b+a & c+a \end{vmatrix} \quad [\text{Expanding along } R_1] \\ &= (b-a)(c-a)(c+a-b-a) = (b-c)(c-a)(a-b) \quad \dots(1) \end{aligned}$$

$$D_1 = \begin{vmatrix} 1 & 1 & 1 \\ k & b & c \\ k^2 & b^2 & c^2 \end{vmatrix} = (b-c)(c-k)(k-b) \quad [\text{Replacing } a \text{ by } k \text{ in (1)}]$$

$$D_2 = \begin{vmatrix} 1 & 1 & 1 \\ a & k & c \\ a^2 & k^2 & c^2 \end{vmatrix} = (k - c)(c - a)(a - k) \quad [\text{Replacing } b \text{ by } k \text{ in (1)}]$$

and  $D_3 = \begin{vmatrix} 1 & 1 & 1 \\ a & b & k \\ a^2 & b^2 & k^2 \end{vmatrix} = (a - b)(b - k)(k - a) \quad [\text{Replacing } c \text{ by } k \text{ in (1)}]$

$$\therefore x = \frac{D_1}{D} = \frac{(b - c)(c - k)(k - b)}{(b - c)(c - a)(a - b)} = \frac{(c - k)(k - b)}{(c - a)(a - b)},$$

$$y = \frac{D_2}{D} = \frac{(k - c)(c - a)(a - k)}{(b - c)(c - a)(a - b)} = \frac{(k - c)(a - k)}{(b - c)(a - b)},$$

and  $z = \frac{D_3}{D} = \frac{(a - b)(b - k)(k - a)}{(a - b)(b - c)(c - a)} = \frac{(b - k)(k - a)}{(b - c)(c - a)}$

Hence,  $x = \frac{(c - k)(k - b)}{(c - a)(a - b)}, \quad y = \frac{(k - c)(a - k)}{(b - c)(a - b)} \quad \text{and} \quad z = \frac{(b - k)(k - a)}{(b - c)(c - a)} \quad \text{Ans.}$

### EXERCISE 17.6

**Using Cramer's Rule, solve the following system of equations :**

1.  $2x - 3y = 7$  Ans.  $x = \frac{3}{5}, y = -\frac{29}{15}$
2.  $2x + y = 1$  Ans.  $x = 2, y = -3$
3.  $7x - 3y = 10$  Ans.  $x = \frac{16}{3}, y = -\frac{2}{9}$
4.  $5x + 2y = 3$  Ans.  $x = -1, y = 4$
5.  $x + 6y = 4.$  Ans.  $x = -3, y = -7$
6.  $2x - y = 1.$  Ans.  $x = -6, y = -5$
7.  $x - 4y - z = 11$  Ans.  $x = -1, y = -5, z = 8$
8.  $2x - 5y + 2z = 39$  Ans.  $x = 1, y = 2, z = 1$
9.  $-3x + 2y + z = 1.$  Ans.  $x = 4, y = 2, z = 3$
10.  $2x + y + 2z = 5$  Ans.  $x = \frac{1}{3}, y = 1, z = -\frac{1}{3}$
11.  $2x + y + 4z = 8$  Ans.  $x = 5, y = -3, z = -6$
12.  $6x + y - 3z = 5$  Ans.  $x = 4, y = 2, z = 3$
13.  $3x + y + 5z = 23$  Ans.  $x = 4, y = 2, z = 3$
14.  $3x + y + 4z = 26$  Ans.  $x = 4, y = 2, z = 3$
15.  $6x + y + 7z = 47$  Ans.  $x = 4, y = 2, z = 3$
16.  $x + y + z = 1$  Ans.  $x = \frac{1}{3}, y = 1, z = -\frac{1}{3}$
17.  $3x + 5y + 6z = 4$  Ans.  $x = \frac{1}{3}, y = 1, z = -\frac{1}{3}$
18.  $9x + 2y - 36z = 17$  Ans.  $x = \frac{1}{3}, y = 1, z = -\frac{1}{3}$
19.  $2y - z = 0$  Ans.  $x = 5, y = -3, z = -6$
20.  $x + 3y = -4$  Ans.  $x = 5, y = -3, z = -6$
21.  $3x + 4y = 3$  Ans.  $x = 5, y = -3, z = -6$
22.  $x + y + z = -1$  Ans.  $x = 1, y = -1, z = -1$
23.  $x + 2y + 3z = -4$  Ans.  $x = 1, y = -1, z = -1$
24.  $x + 3y + 4z = -6$  Ans.  $x = 1, y = -1, z = -1$
25.  $x + y + z = 1$  Ans.  $x = \frac{(2 - k)(3 - k)}{2}, y = \frac{(1 - k)(3 - k)}{-1}, z = \frac{(1 - k)(2 - k)}{2}$

$$\begin{aligned}x + 2y + 3z &= k \\1^2x + 2^2y + 3^2z &= k^2\end{aligned}$$

14. Show that there are three real values of  $\lambda$  for which the equations:

$$\begin{aligned}(a - \lambda)x + by + cz &= 0 \\bx + (c - \lambda)y + az &= 0 \\cx + ay + (b - \lambda)z &= 0\end{aligned}$$

are simultaneously true, and that the product of these values of  $\lambda$  is  $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$

### 17.10 RULE FOR MULTIPLICATION OF TWO DETERMINANTS

Multiply the elements of the first row of  $\Delta_1$  with the corresponding elements of the first, the second and the third row of  $\Delta_2$  respectively.

Their respective sums form the elements of the first row of  $\Delta_1\Delta_2$ . Similarly multiply the elements of the second row of  $\Delta_1$  with the corresponding elements of first, second and third row of the  $\Delta_2$  to from the second row of  $\Delta_1\Delta_2$  and so on.

**Example 48.** Find the product

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \times \begin{vmatrix} \alpha_1 & \beta_1 & \gamma_1 \\ \alpha_2 & \beta_2 & \gamma_2 \\ \alpha_3 & \beta_3 & \gamma_3 \end{vmatrix}$$

**Solution.** Product of the given determinants

$$= \begin{vmatrix} a_1\alpha_1 + b_1\beta_1 + c_1\gamma_1 & a_1\alpha_2 + b_1\beta_2 + c_1\gamma_2 & a_1\alpha_3 + b_1\beta_3 + c_1\gamma_3 \\ a_2\alpha_1 + b_2\beta_1 + c_2\gamma_1 & a_2\alpha_2 + b_2\beta_2 + c_2\gamma_2 & a_2\alpha_3 + b_2\beta_3 + c_2\gamma_3 \\ a_3\alpha_1 + b_3\beta_1 + c_3\gamma_1 & a_3\alpha_2 + b_3\beta_2 + c_3\gamma_2 & a_3\alpha_3 + b_3\beta_3 + c_3\gamma_3 \end{vmatrix} \quad \text{Ans.}$$

**Example 49.** Find

$$\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} \times \begin{vmatrix} -a & c & b \\ -b & a & c \\ -c & b & a \end{vmatrix} \text{ and hence show that}$$

$$= \begin{vmatrix} 2bc - a^2 & c^2 & b^2 \\ c^2 & 2ca - b^2 & a^2 \\ b^2 & a^2 & 2ab - c^2 \end{vmatrix} = (a^3 + b^3 + c^3 - 3abc)^2$$

**Solution.** Product of the given determinants

$$= \begin{vmatrix} -a^2 + bc + bc & -ab + ab + c^2 & -ac + b^2 + ac \\ -ab + c^2 + ab & -b^2 + ac + ac & -bc + bc + a^2 \\ -ca + ca + b^2 & -bc + a^2 + bc & -c^2 + ab + ab \end{vmatrix} = \begin{vmatrix} 2bc - a^2 & c^2 & b^2 \\ c^2 & 2ca - b^2 & a^2 \\ b^2 & a^2 & 2ab - c^2 \end{vmatrix}$$

Now  $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = (-1)^2 \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = a(bc - a^2) - b(b^2 - ac) + c(ab - c^2)$

$$= -(a^3 + b^3 + c^3 - 3abc)$$

Product  $= (a^3 + b^3 + c^3 - 3abc)^2$

**Proved**

**Example 50.** Prove that the determinant

$$\begin{vmatrix} 2b_1 + c_1 & c_1 + 3a_1 & 2a_1 + 3b_1 \\ 2b_2 + c_2 & c_2 + 3a_2 & 2a_2 + 3b_2 \\ 2b_3 + c_3 & c_3 + 3a_3 & 2a_3 + 3b_3 \end{vmatrix}$$

is a multiple of the determinant  $\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$  and find the other factor.

**Solution.**  $\begin{vmatrix} 2b_1 + c_1 & c_1 + 3a_1 & 2a_1 + 3b_1 \\ 2b_2 + c_2 & c_2 + 3a_2 & 2a_2 + 3b_2 \\ 2b_3 + c_3 & c_3 + 3a_3 & 2a_3 + 3b_3 \end{vmatrix} = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \times \begin{vmatrix} 0 & 2 & 1 \\ 3 & 0 & 1 \\ 2 & 3 & 0 \end{vmatrix}$

**Ans.**

**Example 51.** Prove that  $\begin{vmatrix} 1 & \cos(\beta - \alpha) & \cos(\gamma - \alpha) \\ \cos(\alpha - \beta) & 1 & \cos(\gamma - \beta) \\ \cos(\alpha - \gamma) & \cos(\beta - \gamma) & 1 \end{vmatrix} = 0$

**Solution.**  $\begin{vmatrix} \cos \alpha & \sin \alpha & 0 \\ \cos \beta & \sin \beta & 0 \\ \cos \gamma & \sin \gamma & 0 \end{vmatrix} \times \begin{vmatrix} \cos \alpha & \sin \alpha & 0 \\ \cos \beta & \sin \beta & 0 \\ \cos \gamma & \sin \gamma & 0 \end{vmatrix} = 0$

$$\Rightarrow \begin{vmatrix} \cos^2 \alpha + \sin^2 \alpha & \cos \alpha \cos \beta + \sin \alpha \sin \beta & \cos \alpha \cos \gamma + \sin \alpha \sin \gamma \\ \cos \beta \cos \alpha + \sin \beta \sin \alpha & \cos^2 \beta + \sin^2 \beta & \cos \beta \cos \gamma + \sin \beta \sin \gamma \\ \cos \gamma \cos \alpha + \sin \gamma \sin \alpha & \cos \gamma \cos \beta + \sin \gamma \sin \beta & \cos^2 \gamma + \sin^2 \gamma \end{vmatrix} = 0$$

The above determinant can be split into eight determinants and each determinants having identical column is zero. **Proved.**

# CHAPTER

# 18

## ALGEBRA OF MATRICES

---

### 18.1 DEFINITION

Let us consider a set of simultaneous equations,

$$x + 2y + 3z + 5t = 0$$

$$4x + 2y + 5z + 7t = 0$$

$$3x + 4y + 2z + 6t = 0.$$

Now we write down the coefficients of  $x, y, z, t$  of the above equations and enclose them within brackets and then we get

$$A = \begin{bmatrix} 1 & 2 & 3 & 5 \\ 4 & 2 & 5 & 7 \\ 3 & 4 & 2 & 6 \end{bmatrix}$$

The above system of numbers, arranged in a rectangular array in rows and columns and bounded by the brackets, is called a matrix.

It has got 3 rows and 4 columns and in all  $3 \times 4 = 12$  elements. It is termed as  $3 \times 4$  matrix, to be read as [3 by 4 matrix]. In the double subscripts of an element, the first subscript determines the row and the second subscript determines the column in which the element lies,  $a_{ij}$  lies in the  $i$ th row and  $j$ th column.

### 18.2 VARIOUS TYPES OF MATRICES

(i) **Row Matrix.** If a matrix has only one row and any number of columns, it is called a *Row matrix*, e.g.,

$$\begin{bmatrix} 2 & 7 & 3 & 9 \end{bmatrix}$$

(b) **Column Matrix.** A matrix, having one column and any number of rows, is called a *Column*

*matrix*, e.g., 
$$\begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

(c) **Null Matrix or Zero Matrix.** Any matrix, in which all the elements are zeros, is called a *Zero matrix* or *Null matrix* e.g.,

$$\begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

(d) **Square Matrix.** A matrix, in which the number of rows is equal to the number of columns, is called a square matrix e.g.,

$$\begin{bmatrix} 2 & 5 \\ 1 & 4 \end{bmatrix}$$

- (e) **Diagonal Matrix.** A square matrix is called a diagonal matrix, if all its non-diagonal elements are zero e.g.,

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 4 \end{bmatrix}$$

- (f) **Scalar matrix.** A diagonal matrix in which all the diagonal elements are equal to a scalar, say ( $k$ ) is called a scalar matrix.

For example;

$$\begin{bmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{bmatrix}, \begin{bmatrix} -6 & 0 & 0 & 0 \\ 0 & -6 & 0 & 0 \\ 0 & 0 & -6 & 0 \\ 0 & 0 & 0 & -6 \end{bmatrix}$$

i.e.,  $A = [a_{ij}]_{n \times n}$  is a scalar matrix if  $a_{ij} = \begin{cases} 0, & \text{when } i \neq j \\ k, & \text{when } i = j \end{cases}$

- (g) **Unit or Identity Matrix.** A square matrix is called a unit matrix if all the diagonal elements are unity and non-diagonal elements are zero e.g.,

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

- (h) **Symmetric Matrix.** A square matrix will be called symmetric, if for all values of  $i$  and  $j$ ,  $a_{ij} = a_{ji}$  i.e.,  $A' = A$

$$\text{e.g., } \begin{bmatrix} a & h & g \\ h & b & f \\ g & f & c \end{bmatrix}$$

- (i) **Skew Symmetric Matrix.** A square matrix is called skew symmetric matrix, if  
 (1)  $a_{ij} = -a_{ji}$  for all values of  $i$  and  $j$ , or  $A' = -A$   
 (2) All diagonal elements are zero, e.g.,

$$\begin{bmatrix} 0 & -h & -g \\ h & 0 & -f \\ g & f & 0 \end{bmatrix}$$

- (j) **Triangular Matrix.** (Echelon form) A square matrix, all of whose elements below the leading diagonal are zero, is called an *upper triangular matrix*. A square matrix, all of whose elements above the leading diagonal are zero, is called a *lower triangular matrix* e.g.,

$$\begin{bmatrix} 1 & 3 & 2 \\ 0 & 4 & 1 \\ 0 & 0 & 6 \end{bmatrix}$$

Upper triangular matrix

$$\begin{bmatrix} 2 & 0 & 0 \\ 4 & 1 & 0 \\ 5 & 6 & 7 \end{bmatrix}$$

Lower triangular matrix

- (k) **Transpose of a Matrix.** If in a given matrix  $A$ , we interchange the rows and the corresponding columns, the new matrix obtained is called the transpose of the matrix  $A$  and is denoted by  $A'$  or  $A^T$  e.g.,

$$A = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 0 & 5 \\ 6 & 7 & 8 \end{bmatrix}, A' = \begin{bmatrix} 2 & 1 & 6 \\ 3 & 0 & 7 \\ 4 & 5 & 8 \end{bmatrix}$$

(l) **Orthogonal Matrix.** A square matrix  $A$  is called an orthogonal matrix if the product of the matrix  $A$  and the transpose matrix  $A'$  is an identity matrix e.g.,

$$\begin{aligned} A \cdot A' &= I \\ \text{if } |A| &= 1, \text{ matrix } A \text{ is proper.} \end{aligned}$$

(m) **Conjugate of a Matrix**

Let

$$A = \begin{bmatrix} 1+i & 2-3i & 4 \\ 7+2i & -i & 3-2i \end{bmatrix}$$

Conjugate of matrix  $A$  is  $\bar{A}$

$$\bar{A} = \begin{bmatrix} 1-i & 2+3i & 4 \\ 7-2i & i & 3+2i \end{bmatrix}$$

(n) **Matrix  $A^0$ .** Transpose of the conjugate of a matrix  $A$  is denoted by  $A^0$ .

Let

$$A = \begin{bmatrix} 1+i & 2-3i & 4 \\ 7+2i & -i & 3-2i \end{bmatrix}$$

$$\bar{A} = \begin{bmatrix} 1-i & 2+3i & 4 \\ 7-2i & +i & 3+2i \end{bmatrix}$$

$$(\bar{A})' = \begin{bmatrix} 1-i & 7-2i \\ 2+3i & i \\ 4 & 3+2i \end{bmatrix}$$

$$A^0 = \begin{bmatrix} 1-i & 7-2i \\ 2+3i & i \\ 4 & 3+2i \end{bmatrix}$$

(o) **Unitary Matrix.** A square matrix  $A$  is said to be unitary if

$$A^0 A = I$$

e.g.  $A = \begin{bmatrix} \frac{1+i}{2} & \frac{-1+i}{2} \\ \frac{1+i}{2} & \frac{1-i}{2} \end{bmatrix}, \quad A^0 = \begin{bmatrix} \frac{1-i}{2} & \frac{1-i}{2} \\ \frac{-1-i}{2} & \frac{1+i}{2} \end{bmatrix}, \quad A \cdot A^0 = I$

(p) **Hermitian Matrix.** A square matrix  $A = (a_{ij})$  is called Hermitian matrix, if every  $i$ - $j$ th element of  $A$  is equal to conjugate complex  $j$ - $i$ th element of  $A$ .

In other words,  $a_{ij} = \bar{a}_{ji}$

e.g.  $\begin{bmatrix} 1 & 2+3i & 3+i \\ 2-3i & 2 & 1-2i \\ 3-i & 1+2i & 5 \end{bmatrix}$

Necessary and sufficient condition for a matrix  $A$  to be Hermitian is that  $A = A^0$  i.e. conjugate transpose of  $A$

$$\Rightarrow A = (\bar{A})'$$

(q) **Skew Hermitian Matrix.** A square matrix  $A = (a_{ij})$  will be called a Skew Hermitian matrix if every  $i$ - $j$ th element of  $A$  is equal to negative conjugate complex of  $j$ - $i$ th element of  $A$ .

In other words,  $a_{ij} = -\bar{a}_{ji}$

All the elements in the principal diagonal will be of the form

$$a_{ii} = -\bar{a}_{ii} \quad \text{or} \quad a_{ii} + \bar{a}_{ii} = 0$$

If  $a_{ii} = a + ib$  then  $\bar{a}_{ii} = a - ib$   
 $(a + ib) + (a - ib) = 0 \Rightarrow 2a = 0 \Rightarrow a = 0$

So,  $a_{ii}$  is pure imaginary  $\Rightarrow a_{ii} = 0$ .

Hence, all the diagonal elements of a Skew Hermitian Matrix are either zeros or pure imaginary.

e.g. 
$$\begin{bmatrix} i & 2-3i & 4+5i \\ -(2+3i) & 0 & 2i \\ -(4-5i) & 2i & -3i \end{bmatrix}$$

The necessary and sufficient condition for a matrix  $A$  to be Skew Hermitian is that

$$A^0 = -A$$

$$(\bar{A})' = -A$$

(r) **Idempotent Matrix.** A matrix, such that  $A^2 = A$  is called Idempotent Matrix.

e.g.  $A = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix}, A^2 = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} = \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix} = A$

(s) **Periodic Matrix.** A matrix  $A$  will be called a Periodic Matrix, if

$$A^{k+1} = A$$

where  $k$  is a +ve integer. If  $k$  is the least +ve integer, for which  $A^{k+1} = A$ , then  $k$  is said to be the period of  $A$ . If we choose  $k = 1$ , we get  $A^2 = A$  and we call it to be idempotent matrix.

(t) **Nilpotent Matrix.** A matrix will be called a Nilpotent matrix, if  $A^k = 0$  (null matrix) where  $k$  is a +ve integer ; if however  $k$  is the least +ve integer for which  $A^k = 0$ , then  $k$  is the index of the nilpotent matrix.

e.g.,  $A = \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix}, A^2 = \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix} \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = 0$

$A$  is nilpotent matrix whose index is 2.

(u) **Involuntary Matrix.** A matrix  $A$  will be called an Involuntary matrix, if  $A^2 = I$  (unit matrix). Since  $I^2 = I$  always  $\therefore$  Unit matrix is involuntary.

(v) **Equal Matrices.** Two matrices are said to be equal if

(i) They are of the same order.

(ii) The elements in the corresponding positions are equal.

Thus if  $A = \begin{bmatrix} 2 & 3 \\ 1 & 4 \end{bmatrix}, B = \begin{bmatrix} 2 & 3 \\ 1 & 4 \end{bmatrix}$

Here  $A = B$

(w) **Singular Matrix.** If the determinant of the matrix is zero, then the matrix is known as

singular matrix e.g.  $A = \begin{bmatrix} 1 & 2 \\ 3 & 6 \end{bmatrix}$  is singular matrix, because  $|A| = 6 - 6 = 0$ .

**Example 1.** Find the values of  $x, y, z$  and 'a' which satisfy the matrix equation.

$$\begin{bmatrix} x+3 & 2y+x \\ z-1 & 4a-6 \end{bmatrix} = \begin{bmatrix} 0 & -7 \\ 3 & 2a \end{bmatrix}$$

**Solution.** As the given matrices are equal, so their corresponding elements are equal.

$$x + 3 = 0 \Rightarrow x = -3 \quad \dots(1)$$

$$2y + x = -7 \quad \dots(2)$$

$$z - 1 = 3 \Rightarrow z = 4 \quad \dots(3)$$

$$4a - 6 = 2a \Rightarrow a = 3 \quad \dots(4)$$

Putting the value of  $x = -3$  from (1) into (2), we have

$$2y - 3 = -7 \Rightarrow y = -2$$

Hence,  $x = -3, y = -2, z = 4, a = 3$

**Ans.**

### 18.3 ADDITION OF MATRICES

If  $A$  and  $B$  be two matrices of the same order, then their sum,  $A + B$  is defined as the matrix, each element of which is the sum of the corresponding elements of  $A$  and  $B$ .

Thus if

$$A = \begin{bmatrix} 4 & 2 & 5 \\ 1 & 3 & -6 \end{bmatrix}, B = \begin{bmatrix} 1 & 0 & 2 \\ 3 & 1 & 4 \end{bmatrix}$$

then

$$A + B = \begin{bmatrix} 4+1 & 2+0 & 5+2 \\ 1+3 & 3+1 & -6+4 \end{bmatrix} = \begin{bmatrix} 5 & 2 & 7 \\ 4 & 4 & -2 \end{bmatrix}$$

If

$$A = [a_{ij}], B = [b_{ij}] \text{ then } A + B = [a_{ij} + b_{ij}]$$

**Example 2.** Show that any square matrix can be expressed as the sum of two matrices, one symmetric and the other anti-symmetric.

**Solution.** Let  $A$  be a given square matrix.

$$\text{Then } A = \frac{1}{2}(A + A') + \frac{1}{2}(A - A')$$

$$\text{Now, } (A + A')' = A' + A = A + A'.$$

$\therefore A + A'$  is a symmetric matrix.

$$\text{Also, } (A - A')' = A' - A = -(A - A')$$

$\therefore A - A'$  or  $\frac{1}{2}(A - A')$  is an anti-symmetric matrix.

$$A = \frac{1}{2}(A + A') + \frac{1}{2}(A - A')$$

Square matrix = Symmetric matrix + Anti-symmetric matrix **Proved.**

**Example 3.** Write matrix  $A$  given below as the sum of a symmetric and a skew symmetric matrix.

$$A = \begin{pmatrix} 1 & 2 & 4 \\ -2 & 5 & 3 \\ -1 & 6 & 3 \end{pmatrix}$$

$$\text{Solution. } A = \begin{bmatrix} 1 & 2 & 4 \\ -2 & 5 & 3 \\ -1 & 6 & 3 \end{bmatrix} \text{ On transposing, we get } A' = \begin{bmatrix} 1 & -2 & -1 \\ 2 & 5 & 6 \\ 4 & 3 & 3 \end{bmatrix}$$

On adding  $A$  and  $A'$ , we have

$$A + A' = \begin{bmatrix} 1 & 2 & 4 \\ -2 & 5 & 3 \\ -1 & 6 & 3 \end{bmatrix} + \begin{bmatrix} 1 & -2 & -1 \\ 2 & 5 & 6 \\ 4 & 3 & 3 \end{bmatrix} = \begin{bmatrix} 2 & 0 & 3 \\ 0 & 10 & 9 \\ 3 & 9 & 6 \end{bmatrix} \quad \dots(1)$$

On subtracting  $A'$  from  $A$ , we get

$$A - A' = \begin{bmatrix} 1 & 2 & 4 \\ -2 & 5 & 3 \\ -1 & 6 & 3 \end{bmatrix} - \begin{bmatrix} 1 & -2 & -1 \\ 2 & 5 & 6 \\ 4 & 3 & 3 \end{bmatrix} = \begin{bmatrix} 0 & 4 & 5 \\ -4 & 0 & -3 \\ -5 & 3 & 0 \end{bmatrix} \quad \dots(2)$$

On adding (1) and (2), we have

$$2A = \begin{bmatrix} 2 & 0 & 3 \\ 0 & 10 & 9 \\ 3 & 9 & 6 \end{bmatrix} + \begin{bmatrix} 0 & 4 & 5 \\ -4 & 0 & -3 \\ -5 & 3 & 0 \end{bmatrix}$$

$$A = \begin{bmatrix} 1 & 0 & \frac{3}{2} \\ 0 & 5 & \frac{9}{2} \\ \frac{3}{2} & \frac{9}{2} & 3 \end{bmatrix} + \begin{bmatrix} 0 & 2 & \frac{5}{2} \\ -2 & 0 & -\frac{3}{2} \\ -\frac{5}{2} & \frac{3}{2} & 0 \end{bmatrix}$$

$A = [\text{Symmetric matrix}] + [\text{Skew symmetric matrix.}] \quad \text{Ans.}$

**Example 4.** Express  $A = \begin{bmatrix} 1 & -2 & -3 \\ 3 & 0 & 5 \\ 5 & 6 & 1 \end{bmatrix}$  as the sum of a lower triangular matrix and upper triangular matrix.

**Solution.** Let  $A = L + U$

$$\begin{bmatrix} 1 & -2 & -3 \\ 3 & 0 & 5 \\ 5 & 6 & 1 \end{bmatrix} = \begin{bmatrix} a & 0 & 0 \\ b & c & 0 \\ d & e & f \end{bmatrix} + \begin{bmatrix} 1 & p & q \\ 0 & 1 & r \\ 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -2 & -3 \\ 3 & 0 & 5 \\ 5 & 6 & 1 \end{bmatrix} = \begin{bmatrix} a+1 & 0+p & 0+q \\ b+0 & c+1 & 0+r \\ d+0 & e+0 & f+1 \end{bmatrix}$$

Equating the corresponding elements on both the sides, we get

$$\begin{array}{lcl} a+1=1 & p=-2 & q=-3 \\ b=3 & c+1=0 & r=5 \\ d=5 & e=6 & f+1=1 \end{array}$$

On solving these equations, we get

$$\begin{array}{lll} a=0 & p=-2 & q=-3 \\ b=3 & c=-1 & r=5 \\ d=5 & e=6 & f=0 \end{array}$$

Hence,  $L = \begin{bmatrix} 0 & 0 & 0 \\ 3 & -1 & 0 \\ 5 & 6 & 0 \end{bmatrix}$  and  $U = \begin{bmatrix} 1 & -2 & -3 \\ 0 & 1 & 5 \\ 0 & 0 & 1 \end{bmatrix}$

**Ans.**

## 18.4 PROPERTIES OF MATRIX ADDITION

Only matrices of the same order can be added or subtracted.

- (i) **Commutative Law.**  $A + B = B + A$ .
- (ii) **Associative law.**  $A + (B + C) = (A + B) + C$ .

### 18.5 SUBTRACTION OF MATRICES

The difference of two matrices is a matrix, each element of which is obtained by subtracting the elements of the second matrix from the corresponding element of the first.

$$A - B = [a_{ij} - b_{ij}]$$

Thus

$$\begin{aligned} & \begin{bmatrix} 8 & 6 & 4 \\ 1 & 2 & 0 \end{bmatrix} - \begin{bmatrix} 3 & 5 & 1 \\ 7 & 6 & 2 \end{bmatrix} \\ & = \begin{bmatrix} 8-3 & 6-5 & 4-1 \\ 1-7 & 2-6 & 0-2 \end{bmatrix} = \begin{bmatrix} 5 & 1 & 3 \\ -6 & -4 & -2 \end{bmatrix} \quad \text{Ans.} \end{aligned}$$

### 18.6 SCALAR MULTIPLE OF A MATRIX

If a matrix is multiplied by a scalar quantity  $k$ , then each element is multiplied by  $k$ , i.e.

$$\begin{aligned} A &= \begin{bmatrix} 2 & 3 & 4 \\ 4 & 5 & 6 \\ 6 & 7 & 9 \end{bmatrix} \\ 3A &= 3 \begin{bmatrix} 2 & 3 & 4 \\ 4 & 5 & 6 \\ 6 & 7 & 9 \end{bmatrix} = \begin{bmatrix} 3 \times 2 & 3 \times 3 & 3 \times 4 \\ 3 \times 4 & 3 \times 5 & 3 \times 6 \\ 3 \times 6 & 3 \times 7 & 3 \times 9 \end{bmatrix} = \begin{bmatrix} 6 & 9 & 12 \\ 12 & 15 & 18 \\ 18 & 21 & 27 \end{bmatrix} \end{aligned}$$

### EXERCISE 18.1

1. (i) If  $A = \begin{bmatrix} -1 & 7 & 1 \\ 2 & 3 & 4 \\ 5 & 0 & 5 \end{bmatrix}$ , represent it as  $A = B + C$  where  $B$  is a symmetric and  $C$  is a skew-symmetric matrix.

- (b) Express  $\begin{bmatrix} 1 & 2 & 0 \\ 3 & 7 & 1 \\ 5 & 9 & 3 \end{bmatrix}$  as a sum of symmetric and skew-symmetric matrix.

$$\text{Ans. (i)} \quad A = \begin{bmatrix} -1 & \frac{9}{2} & 3 \\ \frac{9}{2} & 3 & 2 \\ 3 & 2 & 5 \end{bmatrix} + \begin{bmatrix} 0 & \frac{5}{2} & -2 \\ -\frac{5}{2} & 0 & 2 \\ 2 & -2 & 0 \end{bmatrix} \quad \text{(b)} \quad A = \begin{bmatrix} 1 & \frac{5}{2} & \frac{5}{2} \\ \frac{5}{2} & 7 & 5 \\ \frac{5}{2} & 5 & 3 \end{bmatrix} + \begin{bmatrix} 0 & -\frac{1}{2} & -\frac{5}{2} \\ \frac{1}{2} & 0 & -4 \\ \frac{5}{2} & 4 & 0 \end{bmatrix}$$

2. Matrices  $A$  and  $B$  are such that

$$3A - 2B = \begin{bmatrix} 2 & 1 \\ -2 & -1 \end{bmatrix} \text{ and } -4A + B = \begin{bmatrix} -1 & 2 \\ -4 & 3 \end{bmatrix}$$

Find  $A$  and  $B$ .

$$\text{Ans. } A = \begin{bmatrix} 0 & -1 \\ 2 & -1 \end{bmatrix}, B = \begin{bmatrix} -1 & -2 \\ 4 & -1 \end{bmatrix}$$

3. Given  $3 \begin{bmatrix} x & y \\ z & w \end{bmatrix} = \begin{bmatrix} x & 6 \\ -1 & 2w \end{bmatrix} + \begin{bmatrix} 4 & x+y \\ z+w & 3 \end{bmatrix}$

Find  $x, y, z$  and  $w$ .

$$\text{Ans. } x = 2, y = 4, z = 1, w = 3$$

4. If  $A = \begin{bmatrix} 0 & 2 & 0 \\ 1 & 0 & 3 \\ 1 & 1 & 2 \end{bmatrix}$ ,  $B = \begin{bmatrix} 1 & 2 & 1 \\ 2 & 1 & 0 \\ 0 & 0 & 3 \end{bmatrix}$

$$\text{Ans. (i)} = \begin{bmatrix} 3 & 10 & 3 \\ 8 & 3 & 6 \\ 2 & 2 & 13 \end{bmatrix}, \text{ (ii)} = \begin{bmatrix} -4 & -2 & -4 \\ -5 & -4 & 9 \\ 3 & 3 & -6 \end{bmatrix}$$

Find (i)  $2A + 3B$  (ii)  $3A - 4B$ .

### 18.7 MULTIPLICATION

The product of two matrices  $A$  and  $B$  is only possible if the number of columns in  $A$  is equal to the number of rows in  $B$ .

Let  $A = [a_{ij}]$  be an  $m \times n$  matrix and  $B = [b_{ij}]$  be an  $n \times p$  matrix. Then the product  $AB$  of these matrices is an  $m \times p$  matrix  $C = [c_{ij}]$  where

$$c_{ij} = a_{i1} b_{1j} + a_{i2} b_{2j} + a_{i3} b_{3j} + \dots + a_{in} b_{nj}$$

### 18.8 $(AB)' = B'A'$

If  $A$  and  $B$  are two matrices conformal for product  $AB$ , then show that  $(AB)' = B'A'$ , where dash represents transpose of a matrix.

**Solution.** Let  $A = (a_{ij})$  be an  $m \times n$  matrix and  $B = (b_{ij})$  be  $n \times p$  matrix.

Since  $AB$  is  $m \times p$  matrix,  $(AB)'$  is a  $p \times m$  matrix.

Further  $B'$  is  $p \times n$  matrix and  $A'$  an  $n \times m$  matrix and therefore  $B' A'$  is a  $p \times m$  matrix.

Then  $(AB)'$  and  $B' A'$  are matrices of the same order.

$$\text{Now the } (j, i)\text{th element of } (AB)' = (i, j)\text{th element of } (AB) = \sum_{k=1}^n a_{ik} b_{kj} \quad \dots(1)$$

Also the  $j$ th row of  $B'$  is  $b_{1j}, b_{2j}, \dots, b_{nj}$  and  $i$ th column of  $A'$  is  $a_{i1}, a_{i2}, a_{i3}, \dots, a_{in}$ .

$$\therefore (j, i)\text{th element of } B' A' = \sum_{k=1}^n b_{kj} a_{ik} \quad \dots(2)$$

From (1) and (2), we have  $(j, i)\text{th element of } (AB)' = (j, i)\text{th element of } B' A'$ .

As the matrices  $(AB)'$  and  $B' A'$  are of the same order and their corresponding elements are equal, we have  $(AB)' = B' A'$ . **Proved.**

### 18.9 PROPERTIES OF MATRIX MULTIPLICATION

1. Multiplication of matrices is not commutative.

$$AB \neq BA$$

2. Matrix multiplication is associative, if conformability is assured.

$$A(BC) = (AB)C$$

3. Matrix multiplication is distributive with respect to addition.

$$A(B+C) = AB + AC$$

4. Multiplication of matrix  $A$  by unit matrix.

$$AI = IA = A$$

5. Multiplicative inverse of a matrix exists if  $|A| \neq 0$ .

$$A \cdot A^{-1} = A^{-1} \cdot A = I$$

6. If  $A$  is a square then  $A \times A = A^2, A \times A \times A = A^3$ .

$$A^0 = I$$

8.  $I^n = I$ , where  $n$  is positive integer.

**Example 5.** If  $A = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 2 & 3 & 4 \end{bmatrix}$  and  $B = \begin{bmatrix} 1 & -2 \\ -1 & 0 \\ 2 & -1 \end{bmatrix}$

obtain the product  $AB$  and explain why  $BA$  is not defined.

**Solution.** The number of columns in  $A$  is 3 and the number of rows in  $B$  is also 3, therefore the product  $AB$  is defined.

$$AB = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 2 & 3 & 4 \end{bmatrix} R_1 \times \begin{bmatrix} C_1 & C_2 \\ 1 & -2 \\ -1 & 0 \\ 2 & -1 \end{bmatrix} = \begin{bmatrix} R_1 C_1 & R_1 C_2 \\ R_2 C_1 & R_2 C_2 \\ R_3 C_1 & R_3 C_2 \end{bmatrix}$$

$R_1, R_2, R_3$  are rows of  $A$  and  $C_1, C_2$  are columns of  $B$ .

$$= \begin{bmatrix} \boxed{0 1 2} & \boxed{1} & \boxed{-2} \\ \boxed{1 2 3} & \boxed{-1} & \boxed{0 1 2} \\ \boxed{2 3 4} & \boxed{2} & \boxed{0} \end{bmatrix} \begin{bmatrix} 1 \\ -1 \\ 2 \\ 1 \\ -1 \\ 2 \\ 1 \\ -1 \\ 2 \end{bmatrix} \begin{bmatrix} -2 \\ 0 \\ -1 \\ -2 \\ 0 \\ -1 \\ -2 \\ 0 \\ -1 \end{bmatrix}$$

For convenience of multiplication, we write the columns in horizontal rectangles.

$$\begin{aligned} &= \begin{bmatrix} \boxed{0 1 2} & \boxed{0 1 2} \\ \boxed{1 -1 2} & \boxed{-2 0 -1} \\ \boxed{1 1 3} & \boxed{1 2 3} \\ \boxed{1 -1 2} & \boxed{-2 0 -1} \\ \boxed{2 3 4} & \boxed{2 3 4} \\ \boxed{1 -1 2} & \boxed{-2 0 -1} \end{bmatrix} \\ &= \begin{bmatrix} 0 \times 1 + 1 \times (-1) + 2 \times 2 & 0 \times (-2) + 1 \times 0 + 2 \times (-1) \\ 1 \times 1 + 2 \times (-1) + 3 \times 2 & 1 \times (-2) + 2 \times 0 + 3 \times (-1) \\ 2 \times 1 + 3 \times (-1) + 4 \times 2 & 2 \times (-2) + 3 \times 0 + 4 \times (-1) \end{bmatrix} \\ &= \begin{bmatrix} 0 - 1 + 4 & 0 + 0 - 2 \\ 1 - 2 + 6 & -2 + 0 - 3 \\ 2 - 3 + 8 & -4 + 0 - 4 \end{bmatrix} = \begin{bmatrix} 3 & -2 \\ 5 & -5 \\ 7 & -8 \end{bmatrix} \quad \text{Ans.} \end{aligned}$$

Since, the number of columns of  $B$  is (2)  $\neq$  the number of rows of  $A$  is 3,  $BA$  is not defined.

$$\text{Example 6. If } A = \begin{bmatrix} 1 & -2 & 3 \\ 2 & 3 & -1 \\ -3 & 1 & 2 \end{bmatrix} \text{ and } B = \begin{bmatrix} 1 & 0 & 2 \\ 0 & 1 & 2 \\ 1 & 2 & 0 \end{bmatrix}$$

from the products  $AB$  and  $BA$ , and show that  $AB \neq BA$ .

$$\begin{aligned} \text{Solution. Here, } AB &= \begin{bmatrix} 1 & -2 & 3 \\ 2 & 3 & -1 \\ -3 & 1 & 2 \end{bmatrix} \begin{bmatrix} 1 & 0 & 2 \\ 0 & 1 & 2 \\ 1 & 2 & 0 \end{bmatrix} \\ &= \begin{bmatrix} 1 - 0 + 3 & 0 - 2 + 6 & 2 - 4 + 0 \\ 2 + 0 - 1 & 0 + 3 - 2 & 4 + 6 - 0 \\ -3 + 0 + 2 & 0 + 1 + 4 & -6 + 2 + 0 \end{bmatrix} = \begin{bmatrix} 4 & 4 & -2 \\ 1 & 1 & 10 \\ -1 & 5 & -4 \end{bmatrix} \end{aligned}$$

$$BA = \begin{bmatrix} 1 & 0 & 2 \\ 0 & 1 & 2 \\ 1 & 2 & 0 \end{bmatrix} \begin{bmatrix} 1 & -2 & 3 \\ 2 & 3 & -1 \\ -3 & 1 & 2 \end{bmatrix} = \begin{bmatrix} 1+0-6 & -2+0+2 & 3-0+4 \\ 0+2-6 & 0+3+2 & 0-1+4 \\ 1+4+0 & -2+6+0 & 3-2+0 \end{bmatrix} = \begin{bmatrix} -5 & 0 & 7 \\ -4 & 5 & 3 \\ 5 & 4 & 1 \end{bmatrix}$$

$$AB \neq BA$$

**Proved.**

$$\text{Example 7. If } A = \begin{bmatrix} 1 & 2 \\ -2 & 3 \end{bmatrix}, B = \begin{bmatrix} 2 & 1 \\ 2 & 3 \end{bmatrix} \text{ and } C = \begin{bmatrix} -3 & 1 \\ 2 & 0 \end{bmatrix}$$

Verify that  $(AB)C = A(BC)$  and  $A(B+C) = AB + AC$ .

$$\begin{aligned} \text{Solution. We have, } AB &= \begin{bmatrix} 1 & 2 \\ -2 & 3 \end{bmatrix} \times \begin{bmatrix} 2 & 1 \\ 2 & 3 \end{bmatrix} \\ &= \begin{bmatrix} (1)(2)+(2)(2) & (1)(1)+(2)(3) \\ (-2)(2)+(3)(2) & (-2)(1)+(3)(3) \end{bmatrix} = \begin{bmatrix} 6 & 7 \\ 2 & 7 \end{bmatrix} \\ BC &= \begin{bmatrix} 2 & 1 \\ 2 & 3 \end{bmatrix} \times \begin{bmatrix} -3 & 1 \\ 2 & 0 \end{bmatrix} = \begin{bmatrix} -6+2 & 2+0 \\ -6+6 & 2+0 \end{bmatrix} = \begin{bmatrix} -4 & 2 \\ 0 & 2 \end{bmatrix} \\ AC &= \begin{bmatrix} 1 & 2 \\ -2 & 3 \end{bmatrix} \times \begin{bmatrix} -3 & 1 \\ 2 & 0 \end{bmatrix} = \begin{bmatrix} -3+4 & 1+0 \\ 6+6 & -2+0 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 12 & -2 \end{bmatrix} \\ B+C &= \begin{bmatrix} 2+(-3) & 1+1 \\ 2+2 & 3+0 \end{bmatrix} = \begin{bmatrix} -1 & 2 \\ 4 & 3 \end{bmatrix} \end{aligned}$$

$$(i) \quad (AB)C = \begin{bmatrix} 6 & 7 \\ 2 & 7 \end{bmatrix} \times \begin{bmatrix} -3 & 1 \\ 2 & 0 \end{bmatrix} = \begin{bmatrix} -18+14 & 6+0 \\ -6+14 & 2+0 \end{bmatrix} = \begin{bmatrix} -4 & 6 \\ 8 & 2 \end{bmatrix} \quad \dots(1)$$

$$\text{and } A(BC) = \begin{bmatrix} 1 & 2 \\ -2 & 3 \end{bmatrix} \begin{bmatrix} -4 & 2 \\ 0 & 2 \end{bmatrix} = \begin{bmatrix} -4+0 & 2+4 \\ 8+0 & -4+6 \end{bmatrix} = \begin{bmatrix} -4 & 6 \\ 8 & 2 \end{bmatrix} \quad \dots(2)$$

Thus from (1) and (2), we get

$$(AB)C = A(BC)$$

$$\begin{aligned} (ii) \quad A(B+C) &= \begin{bmatrix} 1 & 2 \\ -2 & 3 \end{bmatrix} \begin{bmatrix} -1 & 2 \\ 4 & 3 \end{bmatrix} \\ &= \begin{bmatrix} -1+8 & 2+6 \\ 2+12 & -4+9 \end{bmatrix} = \begin{bmatrix} 7 & 8 \\ 14 & 5 \end{bmatrix} \quad \dots(3) \\ AB+AC &= \begin{bmatrix} 6+1 & 7+1 \\ 2+12 & 7-2 \end{bmatrix} = \begin{bmatrix} 7 & 8 \\ 14 & 5 \end{bmatrix} \quad \dots(4) \end{aligned}$$

Thus from (3) and (4), we get

$$A(B+C) = AB + AC$$

**Verified.**

**Example 8.** If  $A = \begin{pmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{pmatrix}$  show that  $A^2 - 4A - 5I = 0$  where  $I$ ,  $0$  are the unit matrix and the null matrix of order 3 respectively. Use this result to find  $A^{-1}$ . (A.M.I.E., Summer 2004)

$$\text{Solution. Here, we have } A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix}$$

$$\begin{aligned}
 A^2 &= \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} = \begin{bmatrix} 9 & 8 & 8 \\ 8 & 9 & 8 \\ 8 & 8 & 9 \end{bmatrix} \\
 A^2 - 4A - 5I &= \begin{bmatrix} 9 & 8 & 8 \\ 8 & 9 & 8 \\ 8 & 8 & 9 \end{bmatrix} - 4 \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} - 5 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \\
 A^2 - 4A - 5I &= \begin{bmatrix} 9-4-5 & 8-8-0 & 8-8-0 \\ 8-8-0 & 9-4-5 & 8-8-0 \\ 8-8-0 & 8-8-0 & 9-4-5 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \\
 A^2 - 4A - 5I &= 0 \quad \Rightarrow \quad 5I = A^2 - 4A
 \end{aligned}$$

Multiplying by  $A^{-1}$ , we get

$$\begin{aligned}
 5A^{-1} &= A - 4I \\
 &= \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} - 4 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -3 & 2 & 2 \\ 2 & -3 & 2 \\ 2 & 2 & -3 \end{bmatrix} \\
 A^{-1} &= \frac{1}{5} \begin{bmatrix} -3 & 2 & 2 \\ 2 & -3 & 2 \\ 2 & 2 & -3 \end{bmatrix} \quad \text{Ans.}
 \end{aligned}$$

**Example 9.** Show by means of an example that in matrices  $AB = 0$  does not necessarily mean that either  $A = 0$  or  $B = 0$ , where 0 stands for the null matrix.

$$\begin{aligned}
 \text{Solution. Let } A &= \begin{bmatrix} 1 & -1 & 1 \\ -3 & 2 & -1 \\ -2 & 1 & 0 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & 6 \\ 1 & 2 & 3 \end{bmatrix} \\
 AB &= \begin{bmatrix} 1-2+1 & 2-4+2 & 3-6+3 \\ -3+4-1 & -6+8-2 & -9+12-3 \\ -2+2+0 & -4+4+0 & -6+6+0 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \\
 AB &= 0.
 \end{aligned}$$

But here neither  $A = 0$  nor  $B = 0$ .

**Proved.**

**Example 10.** If  $AB = AC$ , it is not necessarily true that  $B = C$  i.e. like ordinary algebra, the equal matrices in the identity cannot be cancelled.

$$\begin{aligned}
 \text{Solution. Let } AB &= \begin{bmatrix} 1 & -3 & 2 \\ 2 & 1 & -3 \\ 4 & -3 & -1 \end{bmatrix} \begin{bmatrix} 1 & 4 & 1 & 0 \\ 2 & 1 & 1 & 1 \\ 1 & -2 & 1 & 2 \end{bmatrix} = \begin{bmatrix} -3 & -3 & 0 & 1 \\ 1 & 15 & 0 & -5 \\ -3 & 15 & 0 & -5 \end{bmatrix} \\
 AC &= \begin{bmatrix} 1 & -3 & 2 \\ 2 & 1 & -3 \\ 4 & -3 & -1 \end{bmatrix} \begin{bmatrix} 2 & 1 & -1 & -2 \\ 3 & -2 & -1 & -1 \\ 2 & -5 & -1 & 0 \end{bmatrix} = \begin{bmatrix} -3 & -3 & 0 & 1 \\ 1 & 15 & 0 & -5 \\ -3 & 15 & 0 & -5 \end{bmatrix} \quad \text{Proved.}
 \end{aligned}$$

Here,  $AB = AC$ . But  $B \neq C$ .

**Example 11.** Represent each of the transformations

$$x_1 = 3y_1 + 2y_2, \quad y_1 = z_1 + 2z_2 \quad \text{and} \quad x_2 = -y_1 + 4y_2, \quad y_2 = 3z_1$$

by the use of matrices and find the composite transformation which expresses  $x_1, x_2$  in terms of  $z_1, z_2$ .

**Solution.** The equations in the matrix form are

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 3 & 2 \\ -1 & 4 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} \quad \dots(1)$$

$$\begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} \quad \dots(2)$$

Substituting the values of  $y_1, y_2$  in (1), we get

$$\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 3 & 2 \\ -1 & 4 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} = \begin{bmatrix} 9 & 6 \\ 11 & -2 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} = \begin{bmatrix} 9z_1 + 6z_2 \\ 11z_1 - 2z_2 \end{bmatrix}$$

$$x_1 = 9z_1 + 6z_2, \quad x_2 = 11z_1 - 2z_2$$

**Ans.**

**Example 12.** Prove that the product of two matrices

$$\begin{bmatrix} \cos^2 \theta & \cos \theta \sin \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix} \text{ and } \begin{bmatrix} \cos^2 \phi & \cos \phi \sin \phi \\ \cos \phi \sin \phi & \sin^2 \phi \end{bmatrix}$$

is zero when  $\theta$  and  $\phi$  differ by an odd multiple of  $\frac{\pi}{2}$ .

$$\begin{aligned} \text{Solution.} &= \begin{bmatrix} \cos^2 \theta & \cos \theta \sin \theta \\ \cos \theta \sin \theta & \sin^2 \theta \end{bmatrix} \times \begin{bmatrix} \cos^2 \phi & \cos \phi \sin \phi \\ \cos \phi \sin \phi & \sin^2 \phi \end{bmatrix} \\ &= \begin{bmatrix} \cos^2 \theta \cos^2 \phi + \cos \theta \sin \theta \cos \phi \sin \phi & \cos^2 \theta \cos \phi \sin \phi + \cos \theta \sin \theta \sin^2 \phi \\ \cos \theta \sin \theta \cos^2 \phi + \sin^2 \theta \cos \phi \sin \phi & \cos \theta \sin \theta \cos \phi \sin \phi + \sin^2 \theta \sin^2 \phi \end{bmatrix} \\ &= \begin{bmatrix} \cos \theta \cos \phi (\cos \theta \cos \phi + \sin \theta \sin \phi) & \cos \theta \sin \phi (\cos \theta \cos \phi + \sin \theta \sin \phi) \\ \sin \theta \cos \phi (\cos \theta \cos \phi + \sin \theta \sin \phi) & \sin \theta \sin \phi (\cos \theta \cos \phi + \sin \theta \sin \phi) \end{bmatrix} \\ &= \begin{bmatrix} \cos \theta \cos \phi \cos(\theta - \phi) & \cos \theta \sin \phi \cos(\theta - \phi) \\ \sin \theta \cos \phi \cos(\theta - \phi) & \sin \theta \sin \phi \cos(\theta - \phi) \end{bmatrix} \end{aligned}$$

$$\text{Given} \quad \theta - \phi = (2n + 1) \frac{\pi}{2}$$

$$\cos(\theta - \phi) = \cos((2n + 1) \frac{\pi}{2}) = 0$$

$$\therefore \text{The product} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = 0.$$

**Proved.**

**Example 13.** Verify that

$$A = \frac{1}{3} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ -2 & 2 & -1 \end{bmatrix} \text{ is orthogonal.}$$

$$\text{Solution.} \quad A = \frac{1}{3} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ -2 & 2 & -1 \end{bmatrix} \therefore A' = \frac{1}{3} \begin{bmatrix} 1 & 2 & -2 \\ 2 & 1 & 2 \\ 2 & -2 & -1 \end{bmatrix}$$

$$AA' = \frac{1}{9} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ -2 & 2 & -1 \end{bmatrix} \begin{bmatrix} 1 & 2 & -2 \\ 2 & 1 & 2 \\ 2 & -2 & -1 \end{bmatrix} = \frac{1}{9} \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I$$

Hence,  $A$  is an orthogonal matrix.

**Verified.**

**Example 14.** Determine the values of  $\alpha, \beta, \gamma$  when

$$\begin{bmatrix} 0 & 2\beta & \gamma \\ \alpha & \beta & -\gamma \\ \alpha & -\beta & \gamma \end{bmatrix} \text{ is orthogonal.}$$

**Solution.** Let  $A = \begin{bmatrix} 0 & 2\beta & \gamma \\ \alpha & \beta & -\gamma \\ \alpha & -\beta & \gamma \end{bmatrix}$

On transposing  $A$ , we have

$$A' = \begin{bmatrix} 0 & \alpha & \alpha \\ 2\beta & \beta & -\beta \\ \gamma & -\gamma & \gamma \end{bmatrix}$$

If  $A$  is orthogonal, then  $AA' = I$

$$\begin{bmatrix} 0 & 2\beta & \gamma \\ \alpha & \beta & -\gamma \\ \alpha & -\beta & \gamma \end{bmatrix} \begin{bmatrix} 0 & \alpha & \alpha \\ 2\beta & \beta & -\beta \\ \gamma & -\gamma & \gamma \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 4\beta^2 + \gamma^2 & 2\beta^2 - \gamma^2 & -2\beta^2 + \gamma^2 \\ 2\beta^2 - \gamma^2 & \alpha^2 + \beta^2 + \gamma^2 & \alpha^2 - \beta^2 - \gamma^2 \\ -2\beta^2 + \gamma^2 & \alpha^2 - \beta^2 - \gamma^2 & \alpha^2 + \beta^2 + \gamma^2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Equating the corresponding elements, we have

$$\left. \begin{array}{l} 4\beta^2 + \gamma^2 = 1 \\ 2\beta^2 - \gamma^2 = 0 \end{array} \right\} \Rightarrow \beta = \pm \frac{1}{\sqrt{6}}, \gamma = \pm \frac{1}{\sqrt{3}}$$

But  $\alpha^2 + \beta^2 + \gamma^2 = 1$  as  $\beta = \pm \frac{1}{\sqrt{6}}, \gamma = \pm \frac{1}{\sqrt{3}}, \alpha = \pm \frac{1}{\sqrt{2}}$

**Ans.**

**Example 15.** Prove that

$$(AB)^n = A^n \cdot B^n, \text{ if } A \cdot B = B \cdot A$$

**Solution.**  $(AB)^1 = AB = (A) \cdot (B)$

$$\begin{aligned} (AB)^2 &= (AB) \cdot (AB) = (ABA) \cdot B = \{ A (AB) \} \cdot B \\ &= (A^2 B) \cdot B = A^2 (B \cdot B) = A^2 B^2 \end{aligned}$$

Suppose that

$$\begin{aligned} (AB)^n &= A^n \cdot B^n \\ (AB)^{n+1} &= (AB)^n \cdot (AB) = (A^n \cdot B^n) \cdot (AB) = A^n \cdot (B^n A) \cdot B \\ &= A^n \cdot (B^{n-1} \cdot BA) \cdot B = A^n \cdot (B^{n-1} \cdot AB) \cdot B \\ &= A^n \cdot (B^{n-2} \cdot B \cdot AB) \cdot B = A^n \cdot (B^{n-2} \cdot AB \cdot B) \cdot B \\ &= A^n \cdot (B^{n-2} \cdot AB^2) \cdot B, \text{ continuing the process } n \text{ times.} \\ &= A^n \cdot (A \cdot B^n) \cdot B = A^n \cdot (A \cdot B^{n+1}) = A^{n+1} \cdot B^{n+1} \end{aligned}$$

Hence, taking the above to be true for  $n = n$ , we have shown that it is true for  $n = n + 1$  and also it was true for  $n = 1, 2, \dots$  so it is universally true. **Proved.**

## EXERCISE 18.2

1. Compute  $AB$ , if

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \text{ and } B = \begin{bmatrix} 2 & 5 & 3 \\ 3 & 6 & 4 \\ 4 & 7 & 5 \end{bmatrix}$$

**Ans.**  $\begin{bmatrix} 20 & 38 & 26 \\ 47 & 92 & 62 \end{bmatrix}$

2. If  $A = \begin{bmatrix} 1 & 3 & 0 \\ -1 & 2 & 1 \\ 0 & 0 & 2 \end{bmatrix}$ ,  $B = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 2 & 3 \\ -1 & 1 & 2 \end{bmatrix}$ . From the product  $AB$  and  $BA$ . Show that  $AB \neq BA$ .

3. If  $A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$ ,  $B = \begin{bmatrix} 0 & 0 & 0 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$

(i) Calculate  $AB$  and  $BA$ . Hence evaluate  $A^2 B + B^2 A$

(ii) Show that for any number  $k$ ,  $(A + kB^2)^3 = kI$ , where  $I$  is the unit matrix.

4. If  $A = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}$  choose  $\alpha$  and  $\beta$  so that  $(\alpha I + \beta A)^2 = A$

$$\text{Ans. } \alpha = \beta = \pm \frac{1}{\sqrt{2}}$$

5. Write the following transformation in matrix form :

$$x_1 = \frac{\sqrt{3}}{2}y_1 + \frac{1}{2}y_2 ; x_2 = -\frac{1}{2}y_1 + \frac{\sqrt{3}}{2}y_2$$

Hence, find the transformation in matrix form which expresses  $y_1, y_2$  in terms of  $x_1, x_2$ .

$$\text{Ans. } y_1 = \frac{\sqrt{3}}{2}x_1 - \frac{1}{2}x_2, y_2 = \frac{1}{2}x_1 + \frac{\sqrt{3}}{2}x_2$$

6. If  $A = \begin{bmatrix} 0 & -\tan \frac{\alpha}{2} \\ \tan \frac{\alpha}{2} & 0 \end{bmatrix}$  and  $I$  is a unit matrix, show that  $I + A = (I - A)\begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}$

7. If  $f(x) = x^3 - 20x + 8$ , find  $f(A)$  where  $A = \begin{bmatrix} 1 & 1 & 3 \\ 1 & 3 & -3 \\ -2 & -4 & -4 \end{bmatrix}$

**Ans. 0**

8. Show that  $\begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} = \begin{bmatrix} 1 & -\tan \frac{\theta}{2} \\ \tan \frac{\theta}{2} & 1 \end{bmatrix} \begin{bmatrix} 1 & \tan \frac{\theta}{2} \\ -\tan \frac{\theta}{2} & 1 \end{bmatrix}^{-1}$

9. If  $A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$  then show that  $A^3 = A^{-1}$ .

10. Verify whether the matrix  $A = \frac{1}{3}\begin{bmatrix} 2 & 2 & 1 \\ 2 & -1 & 2 \\ -1 & 2 & 2 \end{bmatrix}$  is orthogonal.

11. Show that  $\begin{bmatrix} \cos \phi & 0 & \sin \phi \\ \sin \theta \sin \phi & \cos \theta & -\sin \theta \cos \phi \\ -\cos \theta \sin \phi & \sin \theta & \cos \theta \cos \phi \end{bmatrix}$  is an orthogonal matrix.

12. Show that  $A = \begin{bmatrix} \cos \theta & 0 & \sin \theta \\ 0 & 1 & 0 \\ -\sin \theta & 0 & \cos \theta \end{bmatrix}$  is an orthogonal matrix. *(A.M.I.E., Summer 2004)*

13. If  $A$  and  $B$  are square matrices of the same order, explain in general

(i)  $(A + B)^2 \neq A^2 + 2AB + B^2$  (ii)  $(A - B)^2 \neq A^2 - 2AB + B^2$  (iii)  $(A + B)(A - B) \neq A^2 - B^2$

## 18.10 ADJOINT OF A SQUARE MATRIX

Let the determinant of the square matrix  $A$  be  $|A|$ .

If  $A = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix}$ , Then  $|A| = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix}$ .

The matrix formed by the co-factors of the elements in

$$|A| \text{ is } \begin{bmatrix} A_1 & A_2 & A_3 \\ B_1 & B_2 & B_3 \\ C_1 & C_2 & C_3 \end{bmatrix}.$$

$$\text{where } A_1 = \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix} = b_2c_3 - b_3c_2, \quad A_2 = -\begin{vmatrix} b_1 & b_3 \\ c_1 & c_3 \end{vmatrix} = -b_1c_3 + b_3c_1$$

$$A_3 = \begin{vmatrix} b_1 & b_2 \\ c_1 & c_2 \end{vmatrix} = b_1c_2 - b_2c_1, \quad B_1 = -\begin{vmatrix} a_2 & a_3 \\ c_2 & c_3 \end{vmatrix} = -a_2c_3 + a_3c_2$$

$$B_2 = \begin{vmatrix} a_1 & a_3 \\ c_1 & c_3 \end{vmatrix} = a_1c_3 - a_3c_1, \quad B_3 = -\begin{vmatrix} a_1 & a_2 \\ c_1 & c_2 \end{vmatrix} = -a_1c_2 + a_2c_1$$

$$C_1 = \begin{vmatrix} a_2 & a_3 \\ b_2 & b_3 \end{vmatrix} = a_2b_3 - a_3b_2, \quad C_2 = -\begin{vmatrix} a_1 & a_3 \\ b_1 & b_3 \end{vmatrix} = -a_1b_3 + a_3b_1$$

$$C_3 = \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1$$

Then the transpose of the matrix of co-factors

$$\begin{bmatrix} A_1 & B_1 & C_1 \\ A_2 & B_2 & C_2 \\ A_3 & B_3 & C_3 \end{bmatrix}$$

is called the adjoint of the matrix  $A$  and is written as  $\text{adj } A$ .

### 18.11 MATHEMATICAL INDUCTION

By mathematical induction we can prove results for all positive integers. If the result to be proved for the positive integer  $n$  then we apply the following method.

**Working Rule:**

**Step 1.** Verify the result for  $n = 1$

**Step 2.** Assume the result to be true for  $n = k$  and then prove that it is true for  $n = k + 1$ .

**Explanation.** By step 1, the result is true for  $n = k = 1$

By step 2, the result is true for  $n = k + 1 = 1 + 1 = 2$   $(k = 1)$

Again, the result is also true for  $n = k + 1 = 2 + 1 = 3$   $(k = 2)$

Similarly, the result is also true for  $n = k + 1 = 3 + 1 = 4$   $(k = 3)$

Hence, in this way the result is true for all positive integer  $n$ .

**Example 16.** By mathematical induction,

$$\text{if } A = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}, \text{ show that } A^n = \begin{bmatrix} \cos n\alpha & \sin n\alpha \\ -\sin n\alpha & \cos n\alpha \end{bmatrix}$$

Where  $n$  is a positive integer.

**Solution.** We prove the result by mathematical induction :

$$A^n = \begin{bmatrix} \cos n\alpha & \sin n\alpha \\ -\sin n\alpha & \cos n\alpha \end{bmatrix}$$

Let us verify the result for  $n = 1$ .

$$A^1 = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix} = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix} = A \quad [\text{Given}]$$

The result is true when  $n = 1$ .

Let us assume that the result is true for any positive integer  $k$ .

$$A^k = \begin{bmatrix} \cos k\alpha & \sin k\alpha \\ -\sin k\alpha & \cos k\alpha \end{bmatrix}$$

$$\begin{aligned} \text{Now, } A^{k+1} &= A^k \cdot A = \begin{bmatrix} \cos k\alpha & \sin k\alpha \\ -\sin k\alpha & \cos k\alpha \end{bmatrix} \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix} \\ &= \begin{bmatrix} \cos k\alpha \cos \alpha - \sin k\alpha \sin \alpha & \cos k\alpha \sin \alpha + \sin k\alpha \cos \alpha \\ -\sin k\alpha \cos \alpha - \cos k\alpha \sin \alpha & -\sin k\alpha \sin \alpha + \cos k\alpha \cos \alpha \end{bmatrix} \\ &= \begin{bmatrix} \cos(k\alpha + \alpha) & \sin(k\alpha + \alpha) \\ -\sin(k\alpha + \alpha) & \cos(k\alpha + \alpha) \end{bmatrix} = \begin{bmatrix} \cos((k+1)\alpha) & \sin((k+1)\alpha) \\ -\sin((k+1)\alpha) & \cos((k+1)\alpha) \end{bmatrix} \end{aligned}$$

The result is true for  $n = k + 1$ .

Hence, by mathematical induction the result is true for all positive integer  $n$ . Proved.

**Example 17.** Factorise the matrix  $A = \begin{bmatrix} 5 & -2 & 1 \\ 7 & 1 & -5 \\ 3 & 7 & 4 \end{bmatrix}$  into the form  $LU$ , where  $L$  is lower triangular and  $U$  is upper triangular matrix.

**Solution.** Let  $A = LU$

$$\begin{aligned} \Rightarrow \begin{bmatrix} 5 & -2 & 1 \\ 7 & 1 & -5 \\ 3 & 7 & 4 \end{bmatrix} &= \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} \quad \dots (1) \\ \Rightarrow \begin{bmatrix} 5 & -2 & 1 \\ 7 & 1 & -5 \\ 3 & 7 & 4 \end{bmatrix} &= \begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12} + l_{22} & l_{21}u_{13} + l_{22}u_{23} \\ l_{31} & l_{31}u_{12} + l_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} \end{bmatrix} \end{aligned}$$

Equating the corresponding elements of equal matrices, we get

$$\begin{aligned} \Rightarrow l_{11} &= 5 & l_{11}u_{12} &= -2 & l_{11}u_{13} &= 1 \\ l_{21} &= 7 & l_{21}u_{12} + l_{22} &= 1 & l_{21}u_{13} + l_{22}u_{23} &= -5 \\ l_{31} &= 3 & l_{31}u_{12} + l_{32} &= 7 & l_{31}u_{13} + l_{32}u_{23} + l_{33} &= 4 \end{aligned}$$

Let us solve the above equations along first column.

$$l_{11} = 5$$

$$l_{21} = 7$$

$$l_{31} = 3$$

Let us solve along first row.

$$l_{11}u_{12} = -2 \quad \Rightarrow 5u_{12} = -2 \quad \Rightarrow u_{12} = -\frac{2}{5}$$

$$l_{11}u_{13} = 1 \quad \Rightarrow 5u_{13} = 1 \quad \Rightarrow u_{13} = \frac{1}{5}$$

Let us solve along second column.

$$l_{21} u_{12} + l_{22} = 1 \Rightarrow 7\left(-\frac{2}{5}\right) + l_{22} = 1 \Rightarrow l_{22} = 1 + \frac{14}{5} = \frac{19}{5}$$

$$l_{31} u_{12} + l_{32} = 7 \Rightarrow 3\left(-\frac{2}{5}\right) + l_{32} = 7 \Rightarrow l_{32} = 7 + \frac{6}{5} = \frac{41}{5}$$

Let us solve along second row,

$$l_{21} u_{13} + l_{22} u_{23} = -5 \Rightarrow 7\left(\frac{1}{5}\right) + \frac{19}{5} u_{23} = -5 \Rightarrow u_{23} = \left(-5 - \frac{7}{5}\right) \frac{5}{19} = -\frac{32}{19}$$

Let us solve along third column,

$$l_{31} u_{13} + l_{32} u_{23} + l_{33} = 4 \Rightarrow 3\left(\frac{1}{5}\right) + \left(\frac{41}{5}\right)\left(-\frac{32}{19}\right) + l_{33} = 4 \Rightarrow l_{33} = 4 - \frac{3}{5} + \frac{1312}{95} = \frac{327}{19}$$

Putting the values of  $l_{11}, l_{21}, l_{22}, l_{31}, l_{32}, l_{33}, u_{12}, u_{13}, u_{23}$  in (1), we get

$$\begin{bmatrix} 5 & -2 & 1 \\ 7 & 1 & -5 \\ 3 & 7 & 4 \end{bmatrix} = \begin{bmatrix} 5 & 0 & 0 \\ 7 & \frac{19}{5} & 0 \\ 3 & \frac{41}{5} & \frac{327}{19} \end{bmatrix} \begin{bmatrix} 1 & -\frac{2}{5} & \frac{1}{5} \\ 0 & 1 & -\frac{32}{19} \\ 0 & 0 & 1 \end{bmatrix}$$

**Ans.**

### 18.12 PROPERTY OF ADJOINT MATRIX

The product of a matrix  $A$  and its adjoint is equal to unit matrix multiplied by the determinant  $A$ .

**Proof.** If  $A$  be a square matrix, then  $(\text{Adjoint } A) \cdot A = A \cdot (\text{Adjoint } A) = |A| \cdot I$

$$\text{Let } A = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix} \text{ and } \text{adj. } A = \begin{bmatrix} A_1 & B_1 & C_1 \\ A_2 & B_2 & C_2 \\ A_3 & B_3 & C_3 \end{bmatrix}$$

$$A \cdot (\text{adj. } A) = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix} \times \begin{bmatrix} A_1 & B_1 & C_1 \\ A_2 & B_2 & C_2 \\ A_3 & B_3 & C_3 \end{bmatrix}$$

$$\begin{aligned} &= \begin{bmatrix} a_1 A_1 + a_2 A_2 + a_3 A_3 & a_1 B_1 + a_2 B_2 + a_3 B_3 & a_1 C_1 + a_2 C_2 + a_3 C_3 \\ b_1 A_1 + b_2 A_2 + b_3 A_3 & b_1 B_1 + b_2 B_2 + b_3 B_3 & b_1 C_1 + b_2 C_2 + b_3 C_3 \\ c_1 A_1 + c_2 A_2 + c_3 A_3 & c_1 B_1 + c_2 B_2 + c_3 B_3 & c_1 C_1 + c_2 C_2 + c_3 C_3 \end{bmatrix} \\ &= \begin{bmatrix} |A| & 0 & 0 \\ 0 & |A| & 0 \\ 0 & 0 & |A| \end{bmatrix} = |A| \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = |A| I \end{aligned} \quad (\text{A.M.I.E., Summer 2004})$$

### 18.13 INVERSE OF A MATRIX

If  $A$  and  $B$  are two square matrices of the same order, such that

$$AB = BA = I \quad (I = \text{unit matrix})$$

then  $B$  is called the inverse of  $A$  i.e.  $B = A^{-1}$  and  $A$  is the inverse of  $B$ .

Condition for a square matrix  $A$  to possess an inverse is that matrix  $A$  is non-singular, i.e.,  $|A| \neq 0$

If  $A$  is a square matrix and  $B$  be its inverse, then  $AB = I$

Taking determinant of both sides, we get

$$|AB| = |I| \text{ or } |A||B| = I$$

From this relation it is clear that  $|A| \neq 0$

i.e. the matrix  $A$  is non-singular.

### To find the inverse matrix with the help of adjoint matrix

We know that  $A \cdot (\text{Adj. } A) = |A|I$

$$\Rightarrow A \cdot \frac{1}{|A|}(\text{Adj. } A) = I \quad [\text{Provided } |A| \neq 0] \quad \dots(1)$$

$$\text{and } A \cdot A^{-1} = I \quad \dots(2)$$

From (1) and (2), we have

$$\therefore A^{-1} = \frac{1}{|A|}(\text{Adj. } A)$$

$$\text{Example 18. If } A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}, \text{ find } A^{-1}. \quad (\text{A.M.I.E. Summer 2004})$$

$$\text{Solution. } A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$$

$$|A| = 3(-3+4) + 3(2-0) + 4(-2-0) = 3+6-8=1$$

The co-factors of elements of various rows of  $|A|$  are

$$\begin{bmatrix} (-3+4) & (-2-0) & (-2-0) \\ (3-4) & (3-0) & (3-0) \\ (-12+12) & (-12+8) & (-9+6) \end{bmatrix}$$

Therefore, the matrix formed by the co-factors of  $|A|$  is

$$\begin{bmatrix} 1 & -2 & -2 \\ -1 & 3 & 3 \\ 0 & -4 & -3 \end{bmatrix}, \text{ Adj. } A = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix}$$

$$\therefore A^{-1} = \frac{1}{|A|} \text{Adj. } A = \frac{1}{1} \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix} \quad \text{Ans.}$$

$$\text{Example 19. If } A = \frac{1}{9} \begin{bmatrix} -8 & 1 & 4 \\ 4 & 4 & 7 \\ 1 & -8 & 4 \end{bmatrix}, \text{ prove that } A^{-1} = A', A' \text{ being the transpose of } A. \quad (\text{A.M.I.E., Winter 2000})$$

$$\text{Solution. We have, } A = \frac{1}{9} \begin{bmatrix} -8 & 1 & 4 \\ 4 & 4 & 7 \\ 1 & -8 & 4 \end{bmatrix}, \quad A' = \frac{1}{9} \begin{bmatrix} -8 & 4 & 1 \\ 1 & 4 & -8 \\ 4 & 7 & 4 \end{bmatrix}$$

$$AA' = \frac{1}{9} \begin{bmatrix} -8 & 1 & 4 \\ 4 & 4 & 7 \\ 1 & -8 & 4 \end{bmatrix} \cdot \frac{1}{9} \begin{bmatrix} -8 & 4 & 1 \\ 1 & 4 & -8 \\ 4 & 7 & 4 \end{bmatrix}$$

$$= \frac{1}{81} \begin{bmatrix} 64+1+16 & -32+4+28 & -8-8+16 \\ -32+4+28 & 16+16+49 & 4-32+28 \\ -8-8+16 & 4-32+28 & 1+64+16 \end{bmatrix}$$

$$= \frac{1}{81} \begin{bmatrix} 81 & 0 & 0 \\ 0 & 81 & 0 \\ 0 & 0 & 81 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \text{ or } AA' = I$$

$A' = A^{-1}$

**Proved.****Example 20.** If  $A$  and  $B$  are non-singular matrices of the same order then,

$$(AB)^{-1} = B^{-1} \cdot A^{-1}$$

Hence prove that  $(A^{-1})^m = (A^m)^{-1}$  for any positive integer  $m$ .**Solution.** We know that,

$$\begin{aligned} (AB) \cdot (B^{-1} A^{-1}) &= [(AB) B^{-1}] \cdot A^{-1} = [A (BB^{-1})] \cdot A^{-1} \\ &= [AI] A^{-1} = A \cdot A^{-1} = I \end{aligned}$$

$$\begin{aligned} \text{Also, } B^{-1} A^{-1} \cdot (AB) &= B^{-1}[A^{-1} \cdot (AB)] = B^{-1}[(A^{-1} A) \cdot B] \\ &= B^{-1}[I \cdot B] = B^{-1} \cdot B = I \end{aligned}$$

By definition of the inverse of a matrix,  $B^{-1} A^{-1}$  is inverse of  $AB$ .

$$\begin{aligned} \Rightarrow B^{-1} A^{-1} &= (AB)^{-1} && \text{Proved.} \\ (A^m)^{-1} &= [A \cdot A^{m-1}]^{-1} = (A^{m-1})^{-1} A^{-1} \\ &= (A \cdot A^{m-2})^{-1} \cdot A^{-1} = [(A^{m-2})^{-1} \cdot A^{-1}] \cdot A^{-1} = (A^{m-2})^{-1} (A^{-1})^2 \\ &= (A \cdot A^{m-3})^{-1} \cdot (A^{-1})^2 = [(A^{m-3})^{-1} \cdot A^{-1}] (A^{-1})^2 = (A^{m-3})^{-1} (A^{-1})^3 \\ &= A^{-1} (A^{-1})^{m-1} = (A^{-1})^m && \text{Proved.} \end{aligned}$$

**Example 21.** Find  $A$  satisfying the Matrix equation.

$$\begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} = \begin{bmatrix} -2 & 4 \\ 3 & -1 \end{bmatrix}$$

$$\text{Solution. } \begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} = \begin{bmatrix} -2 & 4 \\ 3 & -1 \end{bmatrix}$$

Both sides of the equation are pre-multiplied by the inverse of  $\begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix}$  i.e.,  $\begin{bmatrix} 2 & -1 \\ -3 & 2 \end{bmatrix}$ 

$$\begin{bmatrix} 2 & -1 \\ -3 & 2 \end{bmatrix} \begin{bmatrix} 2 & 1 \\ 3 & 2 \end{bmatrix} A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} = \begin{bmatrix} 2 & -1 \\ -3 & 2 \end{bmatrix} \begin{bmatrix} -2 & 4 \\ 3 & -1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} = \begin{bmatrix} -7 & 9 \\ 12 & -14 \end{bmatrix}$$

$$A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} = \begin{bmatrix} -7 & 9 \\ 12 & -14 \end{bmatrix}$$

Again both sides are post-multiplied by the inverse of  $\begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix}$  i.e.  $\begin{bmatrix} 3 & 2 \\ 5 & 3 \end{bmatrix}$ 

$$A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} \begin{bmatrix} 3 & 2 \\ 5 & 3 \end{bmatrix} = \begin{bmatrix} -7 & 9 \\ 12 & -14 \end{bmatrix} \begin{bmatrix} 3 & 2 \\ 5 & 3 \end{bmatrix}$$

$$A \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 24 & 13 \\ -34 & -18 \end{bmatrix} \Rightarrow A = \begin{bmatrix} 24 & 13 \\ -34 & -18 \end{bmatrix}$$

**Ans.****EXERCISE 18.3**

Find the adjoint and inverse of the following matrices: (1 - 3)

1.  $\begin{bmatrix} 2 & 5 & 3 \\ 3 & 1 & 2 \\ 1 & 2 & 1 \end{bmatrix}$       Ans.  $\frac{1}{4} \begin{bmatrix} -3 & 1 & 7 \\ -1 & -1 & 5 \\ 5 & 1 & -13 \end{bmatrix}$
2.  $\begin{bmatrix} 1 & 1 & 2 \\ 1 & 9 & 3 \\ 1 & 4 & 2 \end{bmatrix}$       Ans.  $-\frac{1}{3} \begin{bmatrix} 6 & 6 & -15 \\ 1 & 0 & -1 \\ -5 & -3 & 8 \end{bmatrix}$
3.  $\begin{bmatrix} 1 & 0 & -1 \\ 3 & 4 & 5 \\ 0 & -6 & -7 \end{bmatrix}$       Ans.  $\frac{1}{20} \begin{bmatrix} 2 & 6 & 4 \\ 21 & -7 & -8 \\ -18 & 6 & 4 \end{bmatrix}$
4. If  $A = \begin{bmatrix} 3 & -4 \\ 1 & -1 \end{bmatrix}$ , then show that  $A^n = \begin{bmatrix} 1+2n & -4n \\ n & 1-2n \end{bmatrix}$
5. If  $A = \begin{bmatrix} 1 & 1 & -2 \\ -1 & 2 & 1 \\ 0 & 1 & -1 \end{bmatrix}$ ,  $P = \begin{bmatrix} 1 & 1 & 3 \\ 0 & 3 & 2 \\ 1 & 1 & 1 \end{bmatrix}$ , show that  $P^{-1}AP = \begin{bmatrix} -1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{bmatrix}$
6. If  $A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 4 & 9 \end{bmatrix}$ ,  $B = \begin{bmatrix} 2 & 5 & 3 \\ 3 & 1 & 2 \\ 1 & 2 & 1 \end{bmatrix}$ , show that  $(AB)^{-1} = B^{-1}A^{-1}$ .
7. Given the matrix  $A = \begin{bmatrix} 3 & 2 & 2 \\ 1 & 3 & 1 \\ 5 & 3 & 4 \end{bmatrix}$  compute  $\det(A)$ ,  $A^{-1}$  and the matrix  $B$  such that  $AB = \begin{bmatrix} 3 & 4 & 2 \\ 1 & 6 & 1 \\ 5 & 6 & 4 \end{bmatrix}$   
Also compute  $BA$ . Is  $AB = BA$ ?
- Ans.  $5, \frac{1}{5} \begin{bmatrix} 9 & -2 & -4 \\ 1 & 2 & -1 \\ -12 & 1 & 7 \end{bmatrix}, B = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{bmatrix}, AB \neq BA$
8. Find the condition of  $k$  such that the matrix  $A = \begin{bmatrix} 1 & 3 & 4 \\ 3 & k & 6 \\ -1 & 5 & 1 \end{bmatrix}$  has an inverse. Obtain  $A^{-1}$  for  $k = 1$ . Ans.  $k \neq -\frac{3}{5}, A^{-1} = \frac{1}{8} \begin{bmatrix} -29 & 17 & 14 \\ -9 & 5 & 6 \\ 16 & -8 & -8 \end{bmatrix}$
9. Prove that  $(A^{-1})^T = (A^T)^{-1}$ .
10. If  $A \begin{bmatrix} 0 & 1 \\ 2 & -1 \end{bmatrix} = \begin{bmatrix} 2 & 1 \\ -1 & 0 \end{bmatrix}$  where  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ , then  $A$  is  
(a)  $\begin{bmatrix} 2 & 1 \\ 0 & 0 \end{bmatrix}$     (b)  $\begin{bmatrix} 0 & 1 \\ 2 & -1 \end{bmatrix}$     (c)  $\begin{bmatrix} 2 & 1 \\ -1 & 0 \end{bmatrix}$     (d)  $\begin{bmatrix} 2 & 1 \\ -\frac{1}{2} & -\frac{1}{2} \end{bmatrix}$  (AMIETE, June 2010) Ans. (d)

### 18.14 ELEMENTARY TRANSFORMATIONS

Any one of the following operations on a matrix is called an elementary transformation.

- Interchanging any two rows (or columns). This transformation is indicated by  $R_{ij}$  if the  $i$ th and  $j$ th rows are interchanged.
- Multiplication of the elements of any row  $R_i$  (or column) by a non-zero scalar quantity  $k$  is denoted by  $(kR_i)$ .
- Addition of constant multiplication of the elements of any row  $R_j$  to the corresponding elements of any other row  $R_i$  is denoted by  $(R_i + kR_j)$ .

If a matrix  $B$  is obtained from a matrix  $A$  by one or more E-operations, then  $B$  is said to be equivalent to  $A$ . The symbol  $\sim$  is used for equivalence.

i.e.,  $A \sim B$ .

**Example 22.** Reduce the following matrix to upper triangular form (Echelon form) :

$$\begin{bmatrix} 1 & 2 & 3 \\ 2 & 5 & 7 \\ 3 & 1 & 2 \end{bmatrix}$$

**Solution.** *Upper triangular matrix.* If in a square matrix, all the elements below the principal diagonal are zero, the matrix is called an upper triangular matrix.

$$\begin{bmatrix} 1 & 2 & 3 \\ 2 & 5 & 7 \\ 3 & 1 & 2 \end{bmatrix} \sim \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 1 \\ 0 & -5 & -7 \end{bmatrix} \begin{array}{l} R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - 3R_1 \end{array} \sim \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 1 \\ 0 & 0 & -2 \end{bmatrix} \begin{array}{l} R_3 \rightarrow R_3 + 5R_2 \end{array} \quad \text{Ans.}$$

**Example 23.** Transform  $\begin{bmatrix} 1 & 3 & 3 \\ 2 & 4 & 10 \\ 3 & 8 & 4 \end{bmatrix}$  into a unit matrix. (Q. Bank U.P., 2001)

**Solution.**  $\begin{bmatrix} 1 & 3 & 3 \\ 2 & 4 & 10 \\ 3 & 8 & 4 \end{bmatrix} \sim \begin{bmatrix} 1 & 3 & 3 \\ 0 & -2 & 4 \\ 0 & -1 & -5 \end{bmatrix} \begin{array}{l} R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - 3R_1 \end{array}$

$$\sim \begin{bmatrix} 1 & 3 & 3 \\ 0 & 1 & -2 \\ 0 & -1 & -5 \end{bmatrix} R_2 \rightarrow -\frac{1}{2}R_2 \sim \begin{bmatrix} 1 & 0 & 9 \\ 0 & 1 & -2 \\ 0 & 0 & -7 \end{bmatrix} R_1 \rightarrow R_1 - 3R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 9 \\ 0 & 1 & -2 \\ 0 & 0 & 1 \end{bmatrix} R_3 \rightarrow -\frac{1}{7}R_3 \sim \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} R_1 \rightarrow R_1 - 9R_3$$

$$R_2 \rightarrow R_2 + 2R_3$$

### 18.15 ELEMENTARY MATRICES

A matrix obtained from a unit matrix by a single elementary transformation is called elementary matrix.

$$I = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Consider the matrix obtained by  $R_2 + 3R_1$

$$\begin{bmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

is called the elementary matrix.

### 18.16 THEOREM

Every elementary row transformation of a matrix can be affected by pre-multiplication with the corresponding elementary matrix.

Consider the matrix  $A = \begin{bmatrix} 2 & 3 & 4 \\ 5 & 6 & 7 \\ 3 & 5 & 9 \end{bmatrix}$

Let us apply row transformation  $R_3 + 4R_1$  and we get a matrix  $B$ .

$$B = \begin{bmatrix} 2 & 3 & 4 \\ 5 & 6 & 7 \\ 11 & 17 & 25 \end{bmatrix}$$

Now we shall show that pre-multiplication of  $A$  by corresponding elementary matrix  $R_3 + 4R_1$  will give us  $B$ .

$$\text{Now, if } I = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \text{ then, Elementary matrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 4 & 0 & 1 \end{bmatrix}_{(R_3 + 4R_1)}$$

$$\therefore \text{Elementary matrix} \times A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 4 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} 2 & 3 & 4 \\ 5 & 6 & 7 \\ 3 & 5 & 9 \end{bmatrix} = \begin{bmatrix} 2 & 3 & 4 \\ 5 & 6 & 7 \\ 11 & 17 & 25 \end{bmatrix} = B$$

Similarly, we can show that every elementary column transformation of a matrix can be affected by post-multiplication with the corresponding elementary matrix.

### 18.17 TO COMPUTE THE INVERSE OF A MATRIX FROM ELEMENTARY MATRICES (Gauss-Jordan Method)

If  $A$  is reduced to  $I$  by elementary transformation then

$$PA = I \quad \text{where} \quad P = P_n P_{n-1} \dots P_2 P_1 \\ \therefore P = A^{-1} \quad = \text{Elementary matrix.}$$

**Working rule.** Write  $A = IA$ . Perform elementary row transformation on  $A$  of the left side and on  $I$  of the right hand side so that  $A$  is reduced to  $I$  and  $I$  of right hand side is reduced to  $P$  getting  $I = PA$ .

Then  $P$  is the inverse of  $A$ .

### 18.18 THE INVERSE OF A SYMMETRIC MATRIX

The elementary transformations are to be transformed so that the property of being symmetric is preserved. This requires that the transformations occur in pairs, a row transformation must be followed immediately by the same column transformation.

**Example 24.** Find the inverse of the following matrix employing elementary transformations:

$$\begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix} \quad (\text{U.P., I Semester, Compartment 2002})$$

$$\text{Solution. The given matrix is } A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \Rightarrow \begin{bmatrix} 1 & -1 & \frac{4}{3} \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix} = \begin{bmatrix} \frac{1}{3} & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \quad R_1 \rightarrow \frac{R_1}{3}$$

$$\begin{aligned}
 & \Rightarrow \begin{bmatrix} 1 & -1 & \frac{4}{3} \\ 0 & -1 & \frac{4}{3} \\ 0 & -1 & 1 \end{bmatrix} = \begin{bmatrix} \frac{1}{3} & 0 & 0 \\ -\frac{2}{3} & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \quad R_2 \rightarrow R_2 - 2R_1 \quad \Rightarrow \begin{bmatrix} 1 & -1 & \frac{4}{3} \\ 0 & 1 & -\frac{4}{3} \\ 0 & -1 & 1 \end{bmatrix} = \begin{bmatrix} \frac{1}{3} & 0 & 0 \\ \frac{2}{3} & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \quad R_2 \rightarrow -R_2 \\
 & \Rightarrow \begin{bmatrix} 1 & -1 & \frac{4}{3} \\ 0 & 1 & -\frac{4}{3} \\ 0 & 0 & -\frac{1}{3} \end{bmatrix} = \begin{bmatrix} \frac{1}{3} & 0 & 0 \\ \frac{2}{3} & -1 & 0 \\ \frac{2}{3} & -1 & 1 \end{bmatrix} A \quad \Rightarrow \begin{bmatrix} 1 & -1 & \frac{4}{3} \\ 0 & 1 & -\frac{4}{3} \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} \frac{1}{3} & 0 & 0 \\ \frac{2}{3} & -1 & 0 \\ -2 & 3 & -3 \end{bmatrix} A \quad R_3 \rightarrow -3R_3 \\
 & \Rightarrow \begin{bmatrix} 1 & -1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 3 & -4 & 4 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix} A \quad R_1 \rightarrow R_1 - \frac{4}{3}R_3 \quad R_2 \rightarrow R_2 + \frac{4}{3}R_3 \\
 & \Rightarrow \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix} A \quad R_1 \rightarrow R_1 + R_2 \\
 & \text{Hence, } A^{-1} = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix} \quad \text{Ans.}
 \end{aligned}$$

**Example 25.** Find by elementary row transformation the inverse of the matrix.

$$\begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & 1 & 1 \end{bmatrix} \quad (\text{U.P., I Semester, Winter 2003, 2000})$$

$$\text{Solution. Let } A = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & 1 & 1 \end{bmatrix}$$

Elementary row transformation, which will reduce  $A = IA$  to  $I = PA$ , then matrix  $P$  will be the inverse of matrix  $A$ .

$$\begin{aligned}
 & \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \quad \Rightarrow \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 2 \\ 3 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \quad R_1 \leftrightarrow R_2 \\
 & \Rightarrow \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & -5 & -8 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & -3 & 1 \end{bmatrix} A \quad R_3 \rightarrow R_3 - 3R_1 \quad \Rightarrow \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & 0 & 2 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 5 & -3 & 1 \end{bmatrix} A \quad R_3 \rightarrow R_3 + 5R_2
 \end{aligned}$$

$$\begin{aligned}
 \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & 0 & 1 \end{bmatrix} &= \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ \frac{5}{2} & -\frac{3}{2} & \frac{1}{2} \end{bmatrix} A \quad R_3 \rightarrow \frac{1}{2}R_3 \\
 &\Rightarrow \begin{bmatrix} 1 & 2 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -\frac{15}{2} & \frac{11}{2} & -\frac{3}{2} \\ -4 & 3 & -1 \\ \frac{5}{2} & -\frac{3}{2} & \frac{1}{2} \end{bmatrix} A \quad R_1 \rightarrow R_1 - 3R_3 \\
 &\Rightarrow \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} \frac{1}{2} & -\frac{1}{2} & \frac{1}{2} \\ -4 & 3 & -1 \\ \frac{5}{2} & -\frac{3}{2} & \frac{1}{2} \end{bmatrix} A \\
 I = PA &\Rightarrow P = A^{-1} \\
 A^{-1} &= \begin{bmatrix} \frac{1}{2} & -\frac{1}{2} & \frac{1}{2} \\ -4 & 3 & -1 \\ \frac{5}{2} & -\frac{3}{2} & \frac{1}{2} \end{bmatrix} \quad \text{Ans.}
 \end{aligned}$$

**Example 26.** Find the inverse of the matrix  $M$  by applying elementary transformations

$$\begin{bmatrix} 0 & 2 & 1 & 3 \\ 1 & 1 & -1 & -2 \\ 1 & 2 & 0 & 1 \\ -1 & 1 & 2 & 6 \end{bmatrix}. \quad [U.P.T.U.(C.O.) 2003]$$

**Solution.** Here, we have  $A = \begin{bmatrix} 0 & 2 & 1 & 3 \\ 1 & 1 & -1 & -2 \\ 1 & 2 & 0 & 1 \\ -1 & 1 & 2 & 6 \end{bmatrix}$

Let  $\begin{bmatrix} 0 & 2 & 1 & 3 \\ 1 & 1 & -1 & -2 \\ 1 & 2 & 0 & 1 \\ -1 & 1 & 2 & 6 \end{bmatrix} \sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} A$

$$\begin{bmatrix} 1 & 1 & -1 & -2 \\ 0 & 2 & 1 & 3 \\ 1 & 2 & 0 & 1 \\ -1 & 1 & 2 & 6 \end{bmatrix} \sim \begin{bmatrix} 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} A \quad R_1 \leftrightarrow R_2$$

$$\begin{bmatrix} 1 & 1 & -1 & -2 \\ 0 & 2 & 1 & 3 \\ 0 & 1 & 1 & 3 \\ 0 & 2 & 1 & 4 \end{bmatrix} \sim \begin{bmatrix} 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & -1 & 1 & 0 \\ 0 & 1 & 0 & 1 \end{bmatrix} A \quad R_3 \rightarrow R_3 - R_1 \\
 R_4 \rightarrow R_4 + R_1$$

$$\begin{bmatrix} 1 & 1 & -1 & -2 \\ 0 & 1 & 1 & 3 \\ 0 & 2 & 1 & 3 \\ 0 & 2 & 1 & 4 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & -1 & 1 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 1 \end{bmatrix} A$$

$R_3 \leftrightarrow R_2$

$$\begin{bmatrix} 1 & 1 & -1 & -2 \\ 0 & 1 & 1 & 3 \\ 0 & 0 & -1 & -3 \\ 0 & 0 & -1 & -2 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & -1 & 1 & 0 \\ 1 & 2 & -2 & 0 \\ 0 & 3 & -2 & 1 \end{bmatrix} A$$

$R_3 \rightarrow R_3 - 2R_2$   
 $R_4 \rightarrow R_4 - 2R_2$

$$\begin{bmatrix} 1 & 1 & -1 & -2 \\ 0 & 1 & 1 & 3 \\ 0 & 0 & -1 & -3 \\ 0 & 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & -1 & 1 & 0 \\ 1 & 2 & -2 & 0 \\ -1 & 1 & 0 & 1 \end{bmatrix} A$$

$R_4 \rightarrow R_4 - R_3$

$$\begin{bmatrix} 1 & 1 & -1 & -2 \\ 0 & 1 & 1 & 3 \\ 0 & 0 & 1 & 3 \\ 0 & 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & -1 & 1 & 0 \\ -1 & -2 & 2 & 0 \\ -1 & 1 & 0 & 1 \end{bmatrix} A$$

$R_3 \rightarrow -R_3$

$$\begin{bmatrix} 1 & 1 & -1 & 0 \\ 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -2 & 3 & 0 & 2 \\ 3 & -4 & 1 & -3 \\ 2 & -5 & 2 & -3 \\ -1 & 1 & 0 & 1 \end{bmatrix} A$$

$R_1 \rightarrow R_1 + 2R_4$   
 $R_2 \rightarrow R_2 - 3R_4$   
 $R_3 \rightarrow R_3 - 3R_4$

$$\begin{bmatrix} 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -2 & 2 & -1 \\ 1 & 1 & -1 & 0 \\ 2 & -5 & 2 & -3 \\ -1 & 1 & 0 & 1 \end{bmatrix} A$$

$R_1 \rightarrow R_1 + R_3$   
 $R_2 \rightarrow R_2 - R_3$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} -1 & -3 & 3 & -1 \\ 1 & 1 & -1 & 0 \\ 2 & -5 & 2 & -3 \\ -1 & 1 & 0 & 1 \end{bmatrix} A$$

$R_1 \rightarrow R_1 - R_2$

$$I = A^{-1} A$$

Hence,

$$A^{-1} = \begin{bmatrix} -1 & -3 & 3 & -1 \\ 1 & 1 & -1 & 0 \\ 2 & -5 & 2 & -3 \\ -1 & 1 & 0 & 1 \end{bmatrix}$$

**Ans.**

#### EXERCISE 18.4

Reduce the matrices to triangular form:

$$1. A = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 5 & 7 \\ 3 & 1 & 2 \end{bmatrix} \quad \text{Ans. } \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 1 \\ 0 & 0 & -2 \end{bmatrix}$$

$$2. \begin{bmatrix} 3 & 1 & 4 \\ 1 & 2 & -5 \\ 0 & 1 & 5 \end{bmatrix} \quad \text{Ans. } \begin{bmatrix} 0 & 1 & 4 \\ 0 & 5 & -19 \\ 0 & 0 & 22 \end{bmatrix}$$

**Find the inverse of the following matrices:**

3. 
$$\begin{bmatrix} 1 & 3 & 3 \\ 1 & 4 & 3 \\ 1 & 3 & 4 \end{bmatrix}$$

Ans. 
$$\begin{bmatrix} 7 & -3 & -3 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix}$$

4. 
$$\begin{bmatrix} 1 & -1 & 1 \\ 4 & 1 & 0 \\ 8 & 1 & 1 \end{bmatrix}$$

Ans. 
$$\begin{bmatrix} 1 & 2 & -1 \\ -4 & -7 & 4 \\ -4 & -9 & 5 \end{bmatrix}$$

5. Use elementary row operations to find inverse of  $A = \begin{bmatrix} 1 & 1 & 3 \\ 1 & 3 & -3 \\ -2 & -4 & -4 \end{bmatrix}$

Ans. 
$$\frac{1}{4} \begin{bmatrix} 12 & 4 & 6 \\ -5 & -1 & -3 \\ -1 & -1 & -1 \end{bmatrix}$$

(AMIEETE, June 2010)

6. 
$$\begin{bmatrix} 2 & 1 & -1 & 2 \\ 1 & 3 & 2 & -3 \\ -1 & 2 & 1 & -1 \\ 2 & -3 & -1 & 4 \end{bmatrix}$$

Ans. 
$$\frac{1}{18} \begin{bmatrix} 2 & 5 & -7 & 1 \\ 5 & -1 & 5 & -2 \\ -7 & 5 & 11 & 10 \\ 1 & -2 & 10 & 5 \end{bmatrix}$$

7. 
$$\begin{bmatrix} 1 & 2 & 3 & 1 \\ 1 & 3 & 3 & 2 \\ 2 & 4 & 3 & 3 \\ 1 & 1 & 1 & 1 \end{bmatrix}$$
 (Q. Bank U.P. II Semester 2001)

Ans. 
$$\begin{bmatrix} 1 & -2 & 1 & 0 \\ 1 & -2 & 2 & -3 \\ 0 & 1 & -1 & 1 \\ -2 & 3 & -2 & 3 \end{bmatrix}$$

8. 
$$\begin{bmatrix} 2 & 1 & -1 & 2 \\ 1 & 3 & 2 & -3 \\ -1 & 2 & 1 & -1 \\ 2 & -3 & -1 & 4 \end{bmatrix}$$

Ans. 
$$\frac{1}{18} \begin{bmatrix} 2 & 5 & -7 & 1 \\ 5 & -1 & 5 & -2 \\ -7 & 5 & 11 & 10 \\ 1 & -2 & 10 & 5 \end{bmatrix}$$

9. 
$$\begin{bmatrix} 2 & -6 & -2 & -3 \\ 5 & -13 & -4 & -7 \\ -1 & 4 & 1 & 2 \\ 0 & 1 & 0 & 1 \end{bmatrix}$$

Ans. 
$$\begin{bmatrix} -2 & 1 & 0 & 1 \\ 1 & 0 & 2 & -1 \\ -4 & 1 & -3 & 1 \\ -1 & 0 & -2 & 2 \end{bmatrix}$$

10. 
$$\begin{bmatrix} 1 & 3 & 3 & 2 & 1 \\ 1 & 4 & 3 & 3 & -1 \\ 1 & 3 & 4 & 1 & 1 \\ 1 & 1 & 1 & 1 & -1 \\ 1 & -2 & -1 & 2 & 2 \end{bmatrix}$$

Ans. 
$$\frac{1}{15} \begin{bmatrix} 30 & -20 & -15 & 25 & -5 \\ 30 & -11 & -18 & 7 & -8 \\ -30 & 12 & 21 & -9 & 6 \\ -15 & 12 & 6 & -9 & 6 \\ 15 & -7 & -6 & -1 & -1 \end{bmatrix}$$

11. If  $X, Y$  are non-singular matrices and  $B = \begin{bmatrix} X & O \\ O & Y \end{bmatrix}$ , show that  $B^{-1} = \begin{bmatrix} X^{-1} & O \\ O & Y^{-1} \end{bmatrix}$  where  $O$  is a null matrix.

**CHAPTER**

## RANK OF MATRIX

---

---

### 19.1 RANK OF A MATRIX

The rank of a matrix is said to be  $r$  if

- (a) It has at least one non-zero minor of order  $r$ .
- (b) Every minor of  $A$  of order higher than  $r$  is zero.

**Note:** (i) Non-zero row is that row in which all the elements are not zero.

(ii) The rank of the product matrix  $AB$  of two matrices  $A$  and  $B$  is less than the rank of either of the matrices  $A$  and  $B$ .

(iii) Corresponding to every matrix  $A$  of rank  $r$ , there exist non-singular matrices  $P$  and  $Q$  such

that  $PAQ = \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}$

### 19.2 NORMAL FORM (CANONICAL FORM)

By performing elementary transformation, any non-zero matrix  $A$  can be reduced to one of the following four forms, called the Normal form of  $A$ :

(i)  $I_r$

(ii)  $[I_r \ 0]$

(iii)  $\begin{bmatrix} I_r \\ 0 \end{bmatrix}$

(iv)  $\begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}$

The number  $r$  so obtained is called the rank of  $A$  and we write  $\rho(A) = r$ . The form  $\begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}$  is called first canonical form of  $A$ . Since both row and column transformations may be used here, the element 1 of the first row obtained can be moved in the first column. Then both the first row and first column can be cleared of other non-zero elements. Similarly, the element 1 of the second row can be brought into the second column, and so on.

**Example 1.** Find the rank of the following matrix by reducing it to normal form –

$$A = \begin{bmatrix} 1 & 2 & -1 & 3 \\ 4 & 1 & 2 & 1 \\ 3 & -1 & 1 & 2 \\ 1 & 2 & 0 & 1 \end{bmatrix} \quad (\text{U.P. I Sem., Com. 2002, Winter 2001})$$

**Solution.**  $\begin{bmatrix} 1 & 2 & -1 & 3 \\ 4 & 1 & 2 & 1 \\ 3 & -1 & 1 & 2 \\ 1 & 2 & 0 & 1 \end{bmatrix} \sim \begin{bmatrix} 1 & 2 & -1 & 3 \\ 0 & -7 & 6 & -11 \\ 0 & -7 & 4 & -7 \\ 0 & 0 & 1 & -2 \end{bmatrix} \quad R_2 \rightarrow R_2 - 4R_1$   
 $R_3 \rightarrow R_3 - 3R_1$   
 $R_4 \rightarrow R_4 - R_1$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -7 & 6 & -11 \\ 0 & -7 & 4 & -7 \\ 0 & 0 & 1 & -2 \end{bmatrix} \sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -7 & 6 & -11 \\ 0 & 0 & -2 & 4 \\ 0 & 0 & 1 & -2 \end{bmatrix} \quad R_3 \rightarrow R_3 - R_2$$

$$C_2 \rightarrow C_2 - 2C_1, C_3 \rightarrow C_3 + C_1, C_4 \rightarrow C_4 - 3C_1$$

$$\sim \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & -7 & 0 & 0 \\ 0 & 0 & -2 & 4 \\ 0 & 0 & 1 & -2 \end{array} \right] \sim \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & -7 & 0 & 0 \\ 0 & 0 & -2 & 4 \\ 0 & 0 & 0 & 0 \end{array} \right] R_4 \rightarrow R_4 + \frac{1}{2}R_3$$

$$C_3 \rightarrow C_3 + \frac{6}{7}C_2, C_4 \rightarrow C_4 - \frac{11}{7}C_2,$$

$$C_4 \rightarrow C_4 + 2C_3 \sim \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & -7 & 0 & 0 \\ 0 & 0 & -2 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] \sim \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] R_2 \rightarrow -1/7R_2$$

$$R_3 \rightarrow -1/2R_3$$

Rank of  $A = 3$

**Ans.**

**Example 2.** For which value of ' $b$ ' the rank of the matrix

$$A = \begin{bmatrix} 1 & 5 & 4 \\ 0 & 3 & 2 \\ b & 13 & 10 \end{bmatrix} \text{ is } 2, \quad (\text{U.P., I Semester, 2008})$$

**Solution.** Here, we have

$$A = \begin{bmatrix} 1 & 5 & 4 \\ 0 & 3 & 2 \\ b & 13 & 10 \end{bmatrix} \sim \begin{bmatrix} 1 & 5 & 4 \\ 0 & 3 & 2 \\ 0 & 13 - 5b & 10 - 4b \end{bmatrix} R_3 \rightarrow R_3 - bR_1$$

$$\sim \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 2 \\ 0 & 13 - 5b & 10 - 4b \end{bmatrix} C_2 \rightarrow C_2 - 5C_1 \sim \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 2 \\ 0 & 0 & \frac{2(2-b)}{3} \end{bmatrix} R_3 \rightarrow R_3 - \frac{13-5b}{3}R_2$$

If rank of  $A$  is 2, then  $\frac{2(2-b)}{3}$  must be zero.

$$\text{i.e. } \frac{2(2-b)}{3} = 0 \Rightarrow 2 - b = 0 \Rightarrow b = 2$$

**Ans.**

**Example 3.** Reduce the matrix to normal form and find its rank.

$$\begin{bmatrix} 2 & 3 & 4 & 5 \\ 3 & 4 & 5 & 6 \\ 4 & 5 & 6 & 7 \\ 9 & 10 & 11 & 12 \end{bmatrix}$$

(R.G.P.V., Bhopal, I Sem. April 2009, 2003)

**Solution.**

$$\begin{bmatrix} 2 & 3 & 4 & 5 \\ 3 & 4 & 5 & 6 \\ 4 & 5 & 6 & 7 \\ 9 & 10 & 11 & 12 \end{bmatrix} \sim \begin{bmatrix} 2 & 3 & 4 & 5 \\ 0 & -\frac{1}{2} & -1 & \frac{-3}{2} \\ 0 & -1 & -2 & -3 \\ 0 & \frac{-7}{2} & -7 & \frac{-21}{2} \end{bmatrix} R_2 \rightarrow R_2 - \frac{3}{2}R_1$$

$$R_3 \rightarrow R_3 - 2R_1$$

$$R_4 \rightarrow R_4 - \frac{9}{2}R_1$$

$$\sim \left[ \begin{array}{cccc} 2 & 0 & 0 & 0 \\ 0 & -\frac{1}{2} & -1 & \frac{-3}{2} \\ 0 & -1 & -2 & -3 \\ 0 & \frac{-7}{2} & -7 & \frac{-21}{2} \end{array} \right] C_2 \rightarrow C_2 - \frac{3}{2}C_1 \quad C_3 \rightarrow C_3 - 2C_1 \quad C_4 \rightarrow C_4 - \frac{5}{2}C_1$$

$$\sim \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 2 & 3 \\ 0 & 1 & 2 & 3 \\ 0 & 1 & 2 & 3 \end{array} \right] R_1 \rightarrow \frac{1}{2}R_1 \quad R_2 \rightarrow -2R_2 \quad R_3 \rightarrow -R_3 \quad R_4 \rightarrow \frac{-2}{7}R_4$$

$$\sim \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] R_3 \rightarrow R_3 - R_2 \quad R_4 \rightarrow R_4 - R_2$$

$$\sim \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] C_3 \rightarrow C_3 - 2C_2 \quad C_4 \rightarrow C_4 - 3C_2 = \left[ \begin{array}{ccc} I_2 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{array} \right]$$

Hence its rank = 2

**Ans.**

**Example 4.** Find the rank of the matrix.

$$A = \begin{bmatrix} 1 & 3 & 4 & 2 \\ 2 & -1 & 3 & 2 \\ 3 & -5 & 2 & 2 \\ 6 & -3 & 8 & 6 \end{bmatrix}, \text{ by reducing it to normal form.}$$

(Uttarakhand, I semester, Dec. 2006)

**Solution.** We have,  $A = \begin{bmatrix} 1 & 3 & 4 & 2 \\ 2 & -1 & 3 & 2 \\ 3 & -5 & 2 & 2 \\ 6 & -3 & 8 & 6 \end{bmatrix} = \begin{bmatrix} 1 & 3 & 4 & 2 \\ 0 & -7 & -5 & -2 \\ 0 & -14 & -10 & -4 \\ 0 & -21 & -16 & -6 \end{bmatrix}$   $R_2 \rightarrow R_2 - 2R_1$   
 $R_3 \rightarrow R_3 - 3R_1$   
 $R_4 \rightarrow R_4 - 6R_1$

$$\begin{aligned}
 &= \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & \textcircled{-7} & -5 & -2 \\ 0 & -14 & -10 & -4 \\ 0 & -21 & -16 & -6 \end{array} \right] C_2 \rightarrow C_2 - 3C_1 \\
 &= \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & -7 & -5 & -2 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 \end{array} \right] R_3 \rightarrow R_3 - 2R_2 = \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & -7 & -5 & -2 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] R_3 \leftrightarrow R_4 \\
 &= \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & -7 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] C_3 \rightarrow C_3 - \frac{5}{7}C_2 = \left[ \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array} \right] R_2 \rightarrow -\frac{1}{7}R_2 \\
 &\quad C_4 \rightarrow C_4 - \frac{2}{7}C_2 = \left[ \begin{array}{cccc} I_3 & 0 \\ 0 & 0 \end{array} \right] \text{ which is normal form.}
 \end{aligned}$$

Hence, Rank (A) = 3.

**Ans.**

**Example 5.** Reduce the matrix  $A$  to its normal form, when

$$A = \begin{bmatrix} 1 & 2 & -1 & 4 \\ 2 & 4 & 3 & 4 \\ 1 & 2 & 3 & 4 \\ -1 & -2 & 6 & -7 \end{bmatrix}$$

Hence, find the rank of  $A$ .

(U.P., I Semester, Dec. 2004, Winter 2001)

**Solution.** The given matrix is  $A = \begin{bmatrix} 1 & 2 & -1 & 4 \\ 2 & 4 & 3 & 4 \\ 1 & 2 & 3 & 4 \\ -1 & -2 & 6 & -7 \end{bmatrix}$

$$\sim \begin{bmatrix} 1 & 2 & -1 & 4 \\ 0 & 0 & 5 & -4 \\ 0 & 0 & 4 & 0 \\ 0 & 0 & 5 & -3 \end{bmatrix} \begin{array}{l} R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - R_1 \\ R_4 \rightarrow R_4 + R_1 \end{array} \sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 5 & -4 \\ 0 & 0 & 4 & 0 \\ 0 & 0 & 5 & -3 \end{bmatrix} \begin{array}{l} C_2 \rightarrow C_2 - 2C_1 \\ C_3 \rightarrow C_3 + C_1 \\ C_4 \rightarrow C_4 - 4C_1 \end{array}$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 5 & 0 & -4 \\ 0 & 4 & 0 & 0 \\ 0 & 5 & 0 & -3 \end{bmatrix} \begin{array}{l} C_3 \leftrightarrow C_2 \end{array} \sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 5 & 0 & -4 \\ 0 & 0 & 0 & \frac{16}{5} \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{array}{l} R_3 \rightarrow R_3 - \frac{4}{5}R_2 \\ R_4 \rightarrow R_4 - R_2 \end{array}$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 5 & -4 & 0 \\ 0 & 0 & \frac{16}{5} & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{array}{l} C_4 \leftrightarrow C_3 \end{array} \sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 5 & 0 & 0 \\ 0 & 0 & \frac{16}{5} & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \begin{array}{l} R_2 \rightarrow R_2 + \frac{5}{4}R_3 \\ R_4 \rightarrow R_4 - \frac{5}{16}R_3 \end{array}$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \begin{array}{l} R_2 \rightarrow 1/5R_2 \\ R_3 \rightarrow 5/16R_3 \end{array} \sim \begin{bmatrix} I_3 & 0 \\ 0 & 0 \end{bmatrix}$$

Which is the required normal form.

And since, the non-zero rows are 3 hence, the rank of the given matrix is 3.

**Ans.**

**Example 6.** Find non-singular matrices  $P, Q$  so that  $PAQ$  is a normal form where

$$A = \begin{bmatrix} 2 & 1 & -3 & -6 \\ 3 & -3 & 1 & 2 \\ 1 & 1 & 1 & 2 \end{bmatrix} \quad (\text{R.G.P.V., Bhopal, April, 2010, U.P., I Sem. Winter 2002})$$

and hence find its rank.

**Solution.** Order of  $A$  is  $3 \times 4$

Total number of rows in  $A = 3$ ;  $\therefore$  Consider unit matrix  $I_3$ .

Total number of columns in  $A = 4$

Hence, consider unit matrix  $I_4$ .

$$\therefore A_{3 \times 4} = I_3 A I_4$$

$$\begin{bmatrix} 2 & 1 & -3 & -6 \\ 3 & -3 & 1 & 2 \\ 1 & 1 & 1 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & 1 & 2 \\ 3 & -3 & 1 & 2 \\ 2 & 1 & -3 & -6 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} R_1 \leftrightarrow R_3$$

$$\begin{bmatrix} 1 & 1 & 1 & 2 \\ 0 & -6 & -2 & -4 \\ 0 & -1 & -5 & -10 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & -3 \\ 1 & 0 & -2 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} R_2 \rightarrow R_2 - 3R_1 \\ R_3 \rightarrow R_3 - 2R_1 \\ C_2 \rightarrow C_2 - C_1, C_3 \rightarrow C_3 - C_1, C_4 \rightarrow C_4 - 2C_1$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -6 & -2 & -4 \\ 0 & -1 & -5 & -10 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & -3 \\ 1 & 0 & -2 \end{bmatrix} A \begin{bmatrix} 1 & -1 & -1 & -2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 6 & 2 & 4 \\ 0 & 1 & 5 & 10 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & -1 & 3 \\ -1 & 0 & 2 \end{bmatrix} A \begin{bmatrix} 1 & -1 & -1 & -2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} R_2 \rightarrow (-1)R_2 \\ R_3 \rightarrow (-1)R_3$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 5 & 10 \\ 0 & 6 & 2 & 4 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ -1 & 0 & 2 \\ 0 & -1 & 3 \end{bmatrix} A \begin{bmatrix} 1 & -1 & -1 & -2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} R_2 \leftrightarrow R_3$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 5 & 10 \\ 0 & 0 & -28 & -56 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ -1 & 0 & 2 \\ 6 & -1 & -9 \end{bmatrix} A \begin{bmatrix} 1 & -1 & -1 & -2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} R_3 \rightarrow R_3 - 6R_2$$

$$C_3 \rightarrow C_3 - 5C_2, \quad C_4 \rightarrow C_4 - 10C_2$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -28 & -56 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ -1 & 0 & 2 \\ 6 & -1 & -9 \end{bmatrix} A \begin{bmatrix} 1 & -1 & 4 & 8 \\ 0 & 1 & -5 & -10 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 2 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ -1 & 0 & 2 \\ -\frac{6}{28} & \frac{1}{28} & \frac{9}{28} \end{bmatrix} A \begin{bmatrix} 1 & -1 & 4 & 8 \\ 0 & 1 & -5 & -10 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} R_3 \rightarrow -\frac{1}{28}R_3$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ -1 & 0 & 2 \\ -\frac{6}{28} & \frac{1}{28} & \frac{9}{28} \end{bmatrix} A \begin{bmatrix} 1 & -1 & 4 & 0 \\ 0 & 1 & -5 & 0 \\ 0 & 0 & 1 & -2 \\ 0 & 0 & 0 & 1 \end{bmatrix} C_4 \rightarrow C_4 - 2C_3$$

$$N = PAQ$$

$$P = \begin{bmatrix} 0 & 0 & 1 \\ -1 & 0 & 2 \\ -\frac{3}{14} & \frac{1}{28} & \frac{9}{28} \end{bmatrix}, Q = \begin{bmatrix} 1 & -1 & 4 & 0 \\ 0 & 1 & -5 & 0 \\ 0 & 0 & 1 & -2 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

**Ans.****Note.**  $P$  and  $Q$  are not unique.

Normal form of the given matrix is  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$

The number of non zero rows in the normal matrix = 3  
Hence Rank = 3

**Ans.**

**Example 7.** If  $A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$ , Find two non singular matrices  $P$  and  $Q$  such that  $PAQ = I$ . Hence find  $A^{-1}$ .

**Solution.**  $A_{3 \times 3} = I_3 A I_3$ 

$$\begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} R_1 \rightarrow R_1 - R_2$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} R_3 \rightarrow R_2 - 2R_1$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 4 \\ 0 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix} C_2 \rightarrow -C_2$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 3 & 4 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ 0 & 0 & 1 \\ -2 & 3 & 0 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix} R_2 \leftrightarrow R_3$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ 0 & 0 & 1 \\ -2 & 3 & -3 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix} R_3 \rightarrow R_3 - 3R_2$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 0 \\ 0 & 0 & 1 \\ -2 & 3 & -3 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 1 \\ 0 & 0 & 1 \end{bmatrix} C_3 \rightarrow C_3 - C_2$$

$$I_3 = PAQ$$

$$A^{-1} = QP, \quad A^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & -1 & 0 \\ 0 & 0 & 1 \\ -2 & 3 & -3 \end{bmatrix} \quad \begin{cases} I = P A Q \\ P^{-1} = A Q \\ P^{-1} Q^{-1} = A \\ (P^{-1} Q^{-1})^{-1} = A^{-1} \\ QP = A^{-1} \end{cases}$$

$$\Rightarrow A^{-1} = \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix} \quad \text{Ans.}$$

### 19.3 RANK OF MATRIX BY TRIANGULAR FORM

Rank = Number of non-zero row in upper triangular matrix.

**Note.** Non-zero row is that row which does not contain all the elements as zero.

**Example 8.** Find the rank of the matrix

$$\begin{bmatrix} 1 & 2 & 3 & 2 \\ 2 & 3 & 5 & 1 \\ 1 & 3 & 4 & 5 \end{bmatrix} \quad (\text{U.P., I Semester, Winter 2003, 2000})$$

**Solution.**

$$\begin{bmatrix} 1 & 2 & 3 & 2 \\ 2 & 3 & 5 & 1 \\ 1 & 3 & 4 & 5 \end{bmatrix} \sim \begin{bmatrix} 1 & 2 & 3 & 2 \\ 0 & -1 & -1 & -3 \\ 0 & 1 & 1 & 3 \end{bmatrix} \quad \begin{aligned} R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - R_1 \end{aligned}$$

$$\sim \begin{bmatrix} 1 & 2 & 3 & 2 \\ 0 & -1 & -1 & -3 \\ 0 & 0 & 0 & 0 \end{bmatrix} \quad R_3 \rightarrow R_3 + R_2$$

Rank = Number of non zero rows = 2.

**Ans.**

**Example 9.** Find the rank of the matrix

$$\begin{bmatrix} -1 & 2 & 3 & -2 \\ 2 & -5 & 1 & 2 \\ 3 & -8 & 5 & 2 \\ 5 & -12 & -1 & 6 \end{bmatrix}$$

**Solution.**

$$\begin{bmatrix} -1 & 2 & 3 & -2 \\ 2 & -5 & 1 & 2 \\ 3 & -8 & 5 & 2 \\ 5 & -12 & -1 & 6 \end{bmatrix} \sim \begin{bmatrix} -1 & 2 & 3 & -2 \\ 0 & -1 & 7 & -2 \\ 0 & -2 & 14 & -4 \\ 0 & -2 & 14 & -4 \end{bmatrix} \quad \begin{aligned} R_2 \rightarrow R_2 + 2R_1 \\ R_3 \rightarrow R_3 + 3R_1 \\ R_4 \rightarrow R_4 + 5R_1 \end{aligned}$$

$$\sim \begin{bmatrix} -1 & 2 & 3 & -2 \\ 0 & -1 & 7 & -2 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} \quad \begin{aligned} R_3 \rightarrow R_3 - 2R_2 \\ R_4 \rightarrow R_4 - 2R_2 \end{aligned}$$

Here the 4th order and 3rd order minors are zero. But a minor of second order

$$\begin{vmatrix} 3 & -2 \\ 7 & -2 \end{vmatrix} = -6 + 14 = 8 \neq 0$$

Rank = Number of non-zero rows = 2.

**Ans.**

**Example 10.** Find the rank of matrix

$$\begin{bmatrix} 2 & 3 & -2 & 4 \\ 3 & -2 & 1 & 2 \\ 3 & 2 & 3 & 4 \\ -2 & 4 & 0 & 5 \end{bmatrix} \quad (\text{U.P., I Semester, Dec., 2006})$$

**Solution.** Multiplying  $R_1$  by  $\frac{1}{2}$ , we get 1 as pivotal element

$$\sim \begin{bmatrix} \textcircled{1} & \frac{3}{2} & -1 & 2 \\ 3 & -2 & 1 & 2 \\ 3 & 2 & 3 & 4 \\ -2 & 4 & 0 & 5 \end{bmatrix}$$

$$\sim \begin{bmatrix} \textcircled{1} & \frac{3}{2} & -1 & 2 \\ 0 & -\frac{13}{2} & 4 & -4 \\ 0 & -\frac{5}{2} & 6 & -2 \\ 0 & 7 & -2 & 9 \end{bmatrix} \quad R_2 \rightarrow R_2 - 3R_1$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \textcircled{1} & -\frac{8}{13} & \frac{8}{13} \\ 0 & 0 & \frac{58}{13} & -\frac{6}{13} \\ 0 & 0 & \frac{30}{13} & \frac{61}{13} \end{bmatrix} \quad R_2 \rightarrow -\frac{2}{13}R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & \frac{58}{13} & -\frac{6}{13} \\ 0 & 0 & \frac{30}{13} & \frac{61}{13} \end{bmatrix} \quad C_2 \rightarrow C_2 - \frac{3}{2}C_1$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & \textcircled{1} & -\frac{3}{29} \\ 0 & 0 & 0 & \frac{143}{29} \end{bmatrix} \quad C_3 \rightarrow C_3 + C_1$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & \textcircled{1} & -\frac{3}{29} \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad C_4 \rightarrow C_4 - 2C_1$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad R_4 \rightarrow R_4 - 7R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad R_4 \rightarrow R_4 - \frac{30}{13}R_3$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad C_4 \rightarrow C_4 + \frac{3}{29}C_3$$

$$\simeq I_4$$

Hence, the rank of the given matrix = 4

**Ans.**

**Example 11.** Use elementary transformation to reduce the following matrix  $A$  to triangular form and hence find the rank of  $A$ .

$$A = \begin{bmatrix} 2 & 3 & -1 & -1 \\ 1 & -1 & -2 & -4 \\ 3 & 1 & 3 & -2 \\ 6 & 3 & 0 & -7 \end{bmatrix}$$

(R.G.P.V., Bhopal, June 2007, Winter 2003, U.P., I Semester, Dec. 2005)

**Solution.** We have,

$$\begin{aligned} A &= \begin{bmatrix} 2 & 3 & -1 & -1 \\ 1 & -1 & -2 & -4 \\ 3 & 1 & 3 & -2 \\ 6 & 3 & 0 & -7 \end{bmatrix} \approx \begin{bmatrix} 1 & -1 & -2 & -4 \\ 2 & 3 & -1 & -1 \\ 3 & 1 & 3 & -2 \\ 6 & 3 & 0 & -7 \end{bmatrix} R_1 \leftrightarrow R_2 \\ &\approx \begin{bmatrix} 1 & -1 & -2 & -4 \\ 0 & 5 & 3 & 7 \\ 0 & 4 & 9 & 10 \\ 0 & 9 & 12 & 17 \end{bmatrix} R_2 \rightarrow R_2 - 2R_1 \approx \begin{bmatrix} 1 & -1 & -2 & -4 \\ 0 & 5 & 3 & 7 \\ 0 & 0 & 33/5 & 22/5 \\ 0 & 0 & 33/5 & 22/5 \end{bmatrix} R_3 \rightarrow R_3 - 4/5 R_2 \\ &\approx \begin{bmatrix} 1 & -1 & -2 & -4 \\ 0 & 5 & 3 & 7 \\ 0 & 0 & 33/5 & 22/5 \\ 0 & 0 & 0 & 0 \end{bmatrix} R_4 \rightarrow R_4 - 6R_1 \end{aligned}$$

$R(A) =$  Number of non-zero rows.

$$\Rightarrow R(A) = 3 \quad \text{Ans.}$$

**Example 12.** Prove that the points  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$  are collinear if and only if the

rank of the matrix  $\begin{bmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{bmatrix}$  is less than three.

**Solution. Necessary condition.**

Since the points  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$  are collinear. Therefore, the area of the triangle formed by these points is zero.

$$\therefore \frac{1}{2} \begin{bmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{bmatrix} = 0 \quad \Rightarrow \begin{bmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{bmatrix} = 0$$

$$\Rightarrow \text{The rank of matrix } \begin{bmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{bmatrix} \text{ is less than 3.}$$

Given, the three points are collinear and we have proved that the rank of matrix is less than 3.

Hence, the condition is necessary.

**Sufficient condition.**

**Given :** The rank of the following matrix is less than 3.

$$\text{Rank of } \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} \leq 3 \Rightarrow \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0 \Rightarrow \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Thus, the three points  $(x_1, y_1)$ ,  $(x_2, y_2)$  and  $(x_3, y_3)$  are collinear. Given, the rank of matrix is less than 3 and we have proved that the points are collinear.

Hence, the condition is sufficient.

**Proved.**

**Theorem**

The rank of the product matrix  $AB$  of two matrices  $A$  and  $B$  is less than the rank of the either of the matrices  $A$  and  $B$ .

**Proof.** Let  $r_1$  and  $r_2$  be the ranks of the matrices  $A$  and  $B$  respectively.

Since  $r_1$  is the rank of the matrix  $A$ , therefore

$$A \sim \begin{bmatrix} I_{r_1} & 0 \\ 0 & 0 \end{bmatrix} \quad \dots (1)$$

Where  $I_{r_1}$  is the unit matrix of order  $r_1$  and contains  $r_1$  rows.

Post multiplying (1) by  $B$ , we get

$$AB \sim \begin{bmatrix} I_{r_1} & 0 \\ 0 & 0 \end{bmatrix} B$$

But  $\begin{bmatrix} I_{r_1} & 0 \\ 0 & 0 \end{bmatrix}$   $B$  can have  $r_1$  non-zero rows at the most.

$$\text{Rank of } AB = \text{Rank of } \begin{bmatrix} I_{r_1} & 0 \\ 0 & 0 \end{bmatrix} B$$

$$\text{Rank of } AB = \text{Rank } \begin{bmatrix} I_{r_1} & 0 \\ 0 & 0 \end{bmatrix} B \leq r_1$$

$\text{Rank of } AB \leq \text{Rank of } A$

Similarly we can prove that,

$\text{Rank of } AB \leq \text{Rank of } B$ .

**Proved.**

### EXERCISE 19.1

**Find the rank of the following matrices:**

1.  $\begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & 7 \\ 3 & 6 & 10 \end{bmatrix}$

**Ans. 2**

2.  $\begin{bmatrix} 1 & 2 & 1 \\ -1 & 0 & 2 \\ 2 & 1 & -3 \end{bmatrix}$

**Ans. 3**

3.  $\begin{bmatrix} 0 & 1 & 2 & -2 \\ 4 & 0 & 2 & 6 \\ 2 & 1 & 3 & 1 \end{bmatrix}$

**Ans. 2**

4.  $\begin{bmatrix} 2 & 4 & 3 & -2 \\ -3 & -2 & -1 & 4 \\ 6 & -1 & 7 & 2 \end{bmatrix}$

**Ans. 3**

5.  $\begin{bmatrix} 3 & 4 & 1 & 1 \\ 2 & 4 & 3 & 6 \\ -1 & -2 & 6 & 4 \\ 1 & -1 & 2 & -3 \end{bmatrix}$

**Ans. 4**

6.  $\begin{bmatrix} 1 & 4 & 3 & -2 & 1 \\ -2 & -3 & -1 & 4 & 3 \\ -1 & 6 & 7 & 2 & 9 \\ -3 & 3 & 6 & 6 & 12 \end{bmatrix}$

**Ans. 2**

Reduce the following matrices to Echelon form and find out the rank:

7.  $\begin{bmatrix} 1 & 1 & 2 \\ 1 & 2 & 2 \\ 2 & 2 & 3 \end{bmatrix}$  **Ans.**  $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ , Rank = 3    8.  $\begin{bmatrix} 1 & 2 & 3 & 0 \\ 2 & 4 & 3 & 2 \\ 3 & 2 & 1 & 3 \\ 6 & 8 & 7 & 5 \end{bmatrix}$  **Ans.**  $\begin{bmatrix} I_3 & 0 \\ 0 & 0 \end{bmatrix}$ , Rank = 3

9.  $\begin{bmatrix} 3 & 2 & 5 & 7 & 12 \\ 1 & 1 & 2 & 3 & 5 \\ 3 & 3 & 6 & 9 & 15 \end{bmatrix}$  **Ans.**  $\begin{bmatrix} I_2 & 0 \\ 0 & 0 \end{bmatrix}$ , Rank = 2    10.  $\begin{bmatrix} 2 & -4 & 3 & 1 & 0 \\ 1 & -2 & 1 & -4 & 2 \\ 0 & 1 & -1 & 3 & 1 \\ 4 & -7 & 4 & -4 & 5 \end{bmatrix}$  **Ans.**  $\begin{bmatrix} I_3 & 0 \\ 0 & 0 \end{bmatrix}$ , Rank = 3

Using elementary transformations, reduce the following matrices to the canonical form (or row-reduced Echelon form):

11.  $A = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 2 & 3 & 4 \\ 0 & 2 & 3 & 4 & 1 \\ 0 & 3 & 4 & 1 & 2 \end{bmatrix}$  **Ans.**  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$     12.  $A = \begin{bmatrix} 0 & 4 & -12 & 8 & 9 \\ 0 & 2 & -6 & 2 & 5 \\ 0 & 1 & -3 & 6 & 4 \\ 0 & -8 & 24 & 3 & 1 \end{bmatrix}$  **Ans.**  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$

Using elementary transformations, reduce the following matrices to the normal form:

13.  $A = \begin{bmatrix} 1 & 2 & 0 & -1 \\ 3 & 4 & 1 & 2 \\ -2 & 3 & 2 & 5 \end{bmatrix}$  **Ans.**  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$     14.  $A = \begin{bmatrix} 1 & 2 & 3 & 4 \\ 3 & 4 & 1 & 2 \\ 4 & 3 & 1 & 2 \end{bmatrix}$  **Ans.**  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$

Obtain a matrix  $N$  in the normal form equivalent to

15.  $A = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 \\ 0 & 4 & 5 & 0 & 0 \\ 0 & 9 & 1 & -1 & 2 \\ 0 & 10 & 0 & 1 & 11 \end{bmatrix}$

Hence find non-singular matrices  $P$  and  $Q$  such that  $PAQ = N$ .

16.  $\begin{bmatrix} 1 & -3 & 1 & 2 \\ 0 & 1 & 2 & 3 \\ 3 & 4 & 1 & -2 \end{bmatrix}$

Find the rank of the following matrix by reducing it into normal form:

17.  $A = \begin{bmatrix} 1 & 3 & 2 & 5 & 1 \\ 2 & 2 & -1 & 6 & 3 \\ 1 & 1 & 2 & 3 & -1 \\ 0 & 2 & 5 & 2 & -3 \end{bmatrix}$  **Ans.** 4    18.  $A = \begin{bmatrix} 1 & 2 & 3 & 1 \\ 1 & 3 & 3 & 2 \\ 2 & 4 & 3 & 3 \\ 1 & 1 & 1 & 1 \end{bmatrix}$  **Ans.** 3

Choose the correct answer:

19. Rank of matrix  $A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 4 & 2 \\ 2 & 6 & 5 \end{bmatrix}$  is  
 (a) 0    (b) 1    (c) 3    (d) 2    (AMIETE, June 2009) **Ans.** (d)

20. For which value of 'b' the rank of the matrix  $A = \begin{bmatrix} 1 & 5 & 4 \\ 0 & 3 & 2 \\ b & 13 & 10 \end{bmatrix}$  is  
 (a) 1    (b) 2    (c) 3    (d) 0    (AMIETE, Dec. 2009) **Ans.** (b)

**CHAPTER**  
**20**

## CONSISTENCY OF LINEAR SYSTEM OF EQUATIONS AND THEIR SOLUTION (LINEAR DEPENDENCE)

---

---

### 20.1 SOLUTION OF SIMULTANEOUS EQUATIONS

The matrix of the coefficients of  $x, y, z$  is reduced into Echelon form by elementary row transformations. At the end of the row transformation the value of  $z$  is calculated from the last equation and value of  $y$  and the value of  $x$  are calculated by the backward substitution.

**Example 1.** Solve the following equations

$$x - y + 2z = 3, \quad x + 2y + 3z = 5, \quad 3x - 4y - 5z = -13$$

**Solution.** In the matrix form, the equations are written in the following form.

$$\begin{bmatrix} 1 & -1 & 2 \\ 1 & 2 & 3 \\ 3 & -4 & -5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ 5 \\ -13 \end{bmatrix} \text{ or } \begin{bmatrix} 1 & -1 & 2 \\ 0 & 3 & 1 \\ 0 & -1 & -11 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \\ -22 \end{bmatrix} \begin{array}{l} R_2 \rightarrow R_2 - R_1 \\ R_3 \rightarrow R_3 - 3R_1 \end{array}$$

$$\begin{bmatrix} 1 & -1 & 2 \\ 0 & 3 & 1 \\ 0 & 0 & -\frac{32}{3} \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \\ -\frac{64}{3} \end{bmatrix} \begin{array}{l} R_3 \rightarrow R_3 + \frac{1}{3}R_2 \\ x - y + 2z = 3 \end{array} \dots(1)$$

$$3y + z = 2 \dots(2)$$

$$\frac{-32}{3}z = \frac{-64}{3} \Rightarrow z = 2$$

Putting the value of  $z$  in (2), we get

$$3y + 2 = 2 \Rightarrow y = 0$$

Putting the value of  $y, z$  in (1), we get

$$x - 0 + 4 = 3 \Rightarrow x = -1$$

$$x = -1, y = 0, z = 2$$

**Ans.**

**Example 2.** Find all the solutions of the system of equations

$$x_1 + 2x_2 - x_3 = 1, \quad 3x_1 - 2x_2 + 2x_3 = 2, \quad 7x_1 - 2x_2 + 3x_3 = 5$$

**Solution.**  $\begin{bmatrix} 1 & 2 & -1 \\ 3 & -2 & 2 \\ 7 & -2 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 5 \end{bmatrix}$

$$R_2 \rightarrow R_2 - 3R_1, R_3 \rightarrow R_3 - 7R_1$$

$$\begin{bmatrix} 1 & 2 & -1 \\ 0 & -8 & 5 \\ 0 & -16 & 10 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ -2 \end{bmatrix}, \begin{bmatrix} 1 & 2 & -1 \\ 0 & -8 & 5 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix}$$

$$R_3 \rightarrow R_3 - 2R_2 \quad \dots(1)$$

$$x_1 + 2x_2 - x_3 = 1 \quad \dots(1)$$

$$-8x_2 + 5x_3 = -1 \quad \dots(2)$$

Let

$$x_3 = k$$

Putting  $x_3 = k$  in (2), we get

$$-8x_2 + 5k = -1 \Rightarrow x_2 = \frac{1}{8}(5k + 1)$$

Substituting the values of  $x_3, x_2$  in (1), we get

$$x_1 + \frac{1}{4}(5k + 1) - k = 1$$

$$\therefore x_1 = 1 + k - \frac{5k}{4} - \frac{1}{4} = -\frac{k}{4} + \frac{3}{4}$$

$$\therefore x_1 = -\frac{k}{4} + \frac{3}{4}, x_2 = \frac{5k}{8} + \frac{1}{8}, x_3 = k$$

The equations have infinite solution.

**Ans.**

**Example 3.** Express the following system of equations in matrix form and solve them by the elimination method (Gauss Jordan Method)

$$\begin{aligned} 2x_1 + x_2 + 2x_3 + x_4 &= 6 \\ 6x_1 - 6x_2 + 6x_3 + 12x_4 &= 36 \\ 4x_1 + 3x_2 + 3x_3 - 3x_4 &= -1 \\ 2x_1 + 2x_2 - x_3 + x_4 &= 10 \end{aligned}$$

**Solution.** The equations are expressed in matrix form as

$$\begin{aligned} &\begin{bmatrix} 2 & 1 & 2 & 1 \\ 6 & -6 & 6 & 12 \\ 4 & 3 & 3 & -3 \\ 2 & 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 6 \\ 36 \\ -1 \\ 10 \end{bmatrix} \\ \Rightarrow &\begin{bmatrix} 2 & 1 & 2 & 1 \\ 0 & -9 & 0 & 9 \\ 0 & 1 & -1 & -5 \\ 0 & 1 & -3 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 6 \\ 18 \\ -13 \\ 4 \end{bmatrix} \\ &R_2 \rightarrow R_2 - 3R_1 \\ &R_3 \rightarrow R_3 - 2R_1 \\ &R_4 \rightarrow R_4 - R_1 \\ &\begin{bmatrix} 2 & 1 & 2 & 1 \\ 0 & 1 & 0 & -1 \\ 0 & 1 & -1 & -5 \\ 0 & 1 & -3 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 6 \\ -2 \\ -13 \\ 4 \end{bmatrix} \\ &R_2 \rightarrow \frac{R_2}{-9} \\ &\begin{bmatrix} 2 & 1 & 2 & 1 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & -1 & -4 \\ 0 & 0 & -3 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 6 \\ -2 \\ -11 \\ 6 \end{bmatrix} \\ &R_3 \rightarrow R_3 - R_2 \\ &R_4 \rightarrow R_4 - R_2 \end{aligned}$$

$$\begin{bmatrix} 2 & 1 & 2 & 1 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & -1 & -4 \\ 0 & 0 & 0 & 13 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 6 \\ -2 \\ -11 \\ 39 \end{bmatrix} \quad R_4 \rightarrow R_4 - 3R_3$$

$$2x_1 + x_2 + 2x_3 + x_4 = 6 \quad \dots(1)$$

$$x_2 - x_4 = -2 \quad \dots(2)$$

$$-x_3 - 4x_4 = -11 \quad \dots(3)$$

$$13x_4 = 39 \Rightarrow x_4 = 3$$

Putting the value of  $x_4$  in (3), we get

$$-x_3 - 12 = -11 \Rightarrow x_3 = -1$$

Putting the value of  $x_4$  in (2), we get

$$x_2 - 3 = -2 \Rightarrow x_2 = 1$$

Substituting the values of  $x_4$ ,  $x_3$  and  $x_2$  in (1), we get

$$2x_1 + 1 - 2 + 3 = 6 \text{ or } 2x_1 = 4 \Rightarrow x_1 = 2$$

$$\therefore x_1 = 2, x_2 = 1, x_3 = -1, x_4 = 3 \quad \text{Ans.}$$

**Example 4.** Find the general solution of the system of equations:

$$\begin{aligned} 3x_1 + 2x_3 + 2x_4 &= 0 \\ -x_1 + 7x_2 + 4x_3 + 9x_4 &= 0 \\ 7x_1 - 7x_2 - 5x_4 &= 0 \end{aligned}$$

**Solution.** The system of equations in the matrix form is expressed as

$$\begin{bmatrix} 3 & 0 & 2 & 2 \\ -1 & 7 & 4 & 9 \\ 7 & -7 & 0 & -5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 7 & 4 & 9 \\ 3 & 0 & 2 & 2 \\ 7 & -7 & 0 & -5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad R_1 \leftrightarrow R_2$$

$$\begin{bmatrix} -1 & 7 & 4 & 9 \\ 0 & 21 & 14 & 29 \\ 0 & 42 & 28 & 58 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad R_2 \rightarrow R_2 + 3R_1$$

$$\begin{bmatrix} -1 & 7 & 4 & 9 \\ 0 & 21 & 14 & 29 \\ 0 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad R_3 \rightarrow R_3 - 2R_2$$

$$-x_1 + 7x_2 + 4x_3 + 9x_4 = 0 \quad \dots(1)$$

$$21x_2 + 14x_3 + 29x_4 = 0 \quad \dots(2)$$

Let

$$x_4 = a, x_3 = b$$

$$\text{From (2), } 21x_2 + 14b + 29a = 0 \text{ or } x_2 = -\frac{2b}{3} - \frac{29a}{21}$$

$$\text{From (1), } -x_1 + 7\left(-\frac{2b}{3} - \frac{29a}{21}\right) + 4b + 9a = 0$$

$$x_1 = -\frac{2a}{3} - \frac{2b}{3}$$

$$x_1 = -\frac{2}{3}(a+b), x_2 = -\frac{1}{21}(29a+14b)$$

$x_3 = b, x_4 = a$

**Ans.**

## 20.2 TYPES OF LINEAR EQUATIONS

- (1) **Consistent.** A system of equations is said to be *consistent*, if they have one or more solution i.e.

$$\begin{array}{l} x + 2y = 4 \\ 3x + 2y = 2 \end{array}$$

Unique solution      Infinite solution

- (2) **Inconsistent.** If a system of equation has no solution, it is said to be inconsistent i.e.

$$\begin{array}{l} x + 2y = 4 \\ 3x + 6y = 5 \end{array}$$

## 20.3 CONSISTENCY OF A SYSTEM OF LINEAR EQUATIONS

$$\begin{array}{l} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2 \end{array}$$

$$\Rightarrow \left[ \begin{array}{cccc|c} a_{11} & a_{12} & \dots & a_{1n} & b_1 \\ a_{21} & a_{22} & \dots & a_{2n} & b_2 \\ \dots & \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} & b_m \end{array} \right] \quad \text{and } C = [A, B] = \left[ \begin{array}{cccc|c} a_{11} & a_{12} & \dots & a_{1n} & b_1 \\ a_{21} & a_{22} & \dots & a_{2n} & b_2 \\ \dots & \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} & b_m \end{array} \right]$$

$$\Rightarrow AX = B$$

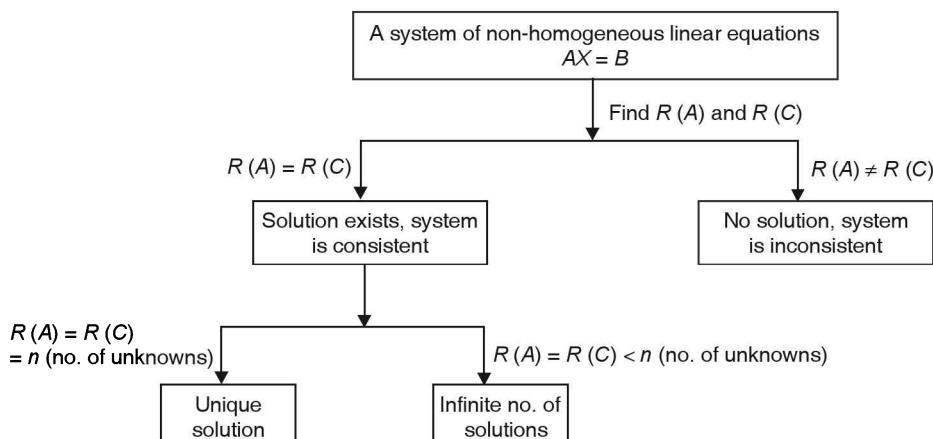

is called the **augmented matrix**.

$$[A:B] = C$$

- (a) **Consistent equations.** If Rank  $A$  = Rank  $C$

(i) *Unique solution:* Rank  $A$  = Rank  $C = n$  where  $n$  = number of unknowns.(ii) *Infinite solution:* Rank  $A$  = Rank  $C = r$ ,  $r < n$ 

- (b) **Inconsistent equations.** If Rank  $A \neq$  Rank  $C$ .

**In Brief :**

**Example 5.** Show that the equations

$$2x + 6y = -11, \quad 6x + 20y - 6z = -3, \quad 6y - 18z = -1$$

are not consistent.

**Solution.** Augmented matrix  $C = [A, B]$

$$\begin{aligned} &= \left[ \begin{array}{ccc|c} 2 & 6 & 0 & -11 \\ 6 & 20 & -6 & -3 \\ 0 & 6 & -18 & -1 \end{array} \right] \sim \left[ \begin{array}{ccc|c} 2 & 6 & 0 & -11 \\ 0 & 2 & -6 & 30 \\ 0 & 6 & -18 & -1 \end{array} \right] R_2 \rightarrow R_2 - 3R_1 \\ &\quad \sim \left[ \begin{array}{ccc|c} 2 & 6 & 0 & -11 \\ 0 & 2 & -6 & 30 \\ 0 & 0 & 0 & -91 \end{array} \right] R_3 \rightarrow R_3 - 3R_2 \end{aligned}$$

The rank of  $C$  is 3 and the rank of  $A$  is 2.

Rank of  $A \neq$  Rank of  $C$ . The equations are not consistent.

**Ans.**

**Example 6.** Test the consistency and hence solve the following set of equation.

$$\begin{aligned} x_1 + 2x_2 + x_3 &= 2 \\ 3x_1 + x_2 - 2x_3 &= 1 \\ 4x_1 - 3x_2 - x_3 &= 3 \\ 2x_1 + 4x_2 + 2x_3 &= 4 \end{aligned}$$

(U.P., I Semester, Compartment 2002)

**Solution.** The given set of equations is written in the matrix form:

$$\left[ \begin{array}{ccc|c} 1 & 2 & 1 \\ 3 & 1 & -2 \\ 4 & -3 & -1 \\ 2 & 4 & 2 \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 3 \\ 4 \end{bmatrix}$$

$$AX = B$$

$$\text{Here, we have augmented matrix } C = [A : B] \sim \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 2 \\ 3 & 1 & -2 & 1 \\ 4 & -3 & -1 & 3 \\ 2 & 4 & 2 & 4 \end{array} \right]$$

$$\begin{aligned} &\sim \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 2 \\ 0 & -5 & -5 & -5 \\ 0 & -11 & -5 & -5 \\ 0 & 0 & 0 & 0 \end{array} \right] R_2 \rightarrow R_2 - 3R_1 \quad R_3 \rightarrow R_3 - 4R_1 \quad R_4 \rightarrow R_4 - 2R_1 \\ &\sim \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 2 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 6 & 6 \\ 0 & 0 & 0 & 0 \end{array} \right] R_3 \rightarrow R_3 + 11R_2 \quad \sim \left[ \begin{array}{ccc|c} 1 & 2 & 1 & 2 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{array} \right] R_3 \rightarrow \frac{1}{6}R_3 \end{aligned}$$

Number of non-zero rows = Rank of matrix.

$$\Rightarrow R(C) = R(A) = 3$$

Hence, the given system is consistent and possesses a unique solution. In matrix form the system reduces to

$$\left[ \begin{array}{ccc|c} 1 & 2 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 1 \\ 0 \end{bmatrix}$$

$$\begin{aligned}x_1 + 2x_2 + x_3 &= 2 & \dots(1) \\x_2 + x_3 &= 1 & \dots(2) \\x_3 &= 1\end{aligned}$$

From (2),  $x_2 + 1 = 1 \Rightarrow x_2 = 0$   
 From (1),  $x_1 + 0 + 1 = 2 \Rightarrow x_1 = 1$   
 Hence,  $x_1 = 1, x_2 = 0$  and  $x_3 = 1$  Ans.

**Example 7.** Test for consistency and solve :

$$5x + 3y + 7z = 4, 3x + 26y + 2z = 9, 7x + 2y + 10z = 5$$

**Solution.** The augmented matrix  $C = [A, B]$  (R.G. P.V. Bhopal I. Sem. April 2009-08-03)

$$\sim \left[ \begin{array}{ccc|c} 5 & 3 & 7 & 4 \\ 3 & 26 & 2 & 9 \\ 7 & 2 & 10 & 5 \end{array} \right] \sim \left[ \begin{array}{ccc|c} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 3 & 26 & 2 & 9 \\ 7 & 2 & 10 & 5 \end{array} \right] R_1 \rightarrow \frac{1}{5}R_1$$

$$\sim \left[ \begin{array}{ccc|c} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 0 & \frac{121}{5} & -\frac{11}{5} & \frac{33}{5} \\ 0 & -\frac{11}{5} & \frac{1}{5} & -\frac{3}{5} \end{array} \right] R_2 \rightarrow R_2 - 3R_1 \sim \left[ \begin{array}{ccc|c} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 0 & \frac{121}{5} & -\frac{11}{5} & \frac{33}{5} \\ 0 & 0 & 0 & 0 \end{array} \right] R_3 \rightarrow R_3 - 7R_1 \sim \left[ \begin{array}{ccc|c} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 0 & \frac{121}{5} & -\frac{11}{5} & \frac{33}{5} \\ 0 & 0 & 0 & 0 \end{array} \right] R_3 \rightarrow R_3 + \frac{1}{11}R_2$$

Rank of  $A = 2 =$  Rank of  $C$

Hence, the equations are consistent. But the rank is less than 3 i.e. number of unknowns. So its solutions are infinite.

$$\left[ \begin{array}{ccc} 1 & \frac{3}{5} & \frac{7}{5} \\ 0 & \frac{121}{5} & -\frac{11}{5} \\ 0 & 0 & 0 \end{array} \right] \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} \frac{4}{5} \\ \frac{33}{5} \\ 0 \end{bmatrix}$$

$$\begin{aligned}x + \frac{3}{5}y + \frac{7}{5}z &= \frac{4}{5} \\ \frac{121}{5}y - \frac{11}{5}z &= \frac{33}{5} \text{ or } 11y - z = 3\end{aligned}$$

$$\text{Let } z = k \text{ then } 11y - k = 3 \text{ or } y = \frac{3}{11} + \frac{k}{11}$$

$$x + \frac{3}{5} \left[ \frac{3}{11} + \frac{k}{11} \right] + \frac{7}{5}k = \frac{4}{5} \text{ or } x = -\frac{16}{11}k + \frac{7}{11}$$

**Ans.**

**Example 8.** Test the consistency of following system of linear equations and hence find the solution.

$$\begin{aligned}4x_1 - x_2 &= 12 \\ -x_1 + 5x_2 - 2x_3 &= 0 \\ -2x_2 + 4x_3 &= -8\end{aligned}$$

(U.P., I semester Dec. 2005)

**Solution.** The given equation in the matrix form is

$$\left[ \begin{array}{ccc} 4 & -1 & 0 \\ -1 & 5 & -2 \\ 0 & -2 & 4 \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 12 \\ 0 \\ -8 \end{bmatrix}$$

$AX = B$

where,  $A = \begin{bmatrix} 4 & -1 & 0 \\ -1 & 5 & -2 \\ 0 & -2 & 4 \end{bmatrix}$ ,  $X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$ ,  $B = \begin{bmatrix} 12 \\ 0 \\ -8 \end{bmatrix}$

$$C = [A, B]$$

$$C = \left[ \begin{array}{ccc|c} 4 & -1 & 0 & : & 12 \\ -1 & 5 & -2 & : & 0 \\ 0 & -2 & 4 & : & -8 \end{array} \right] \sim \left[ \begin{array}{ccc|c} -1 & 5 & -2 & : & 0 \\ 4 & -1 & 0 & : & 12 \\ 0 & -2 & 4 & : & -8 \end{array} \right] R_1 \leftrightarrow R_2$$

$$\sim \left[ \begin{array}{ccc|c} -1 & 5 & -2 & : & 0 \\ 0 & 19 & -8 & : & 12 \\ 0 & -2 & 4 & : & -8 \end{array} \right] R_2 \rightarrow R_2 + 4R_1$$

$$\sim \left[ \begin{array}{ccc|c} -1 & 5 & -2 & : & 0 \\ 0 & 19 & -8 & : & 12 \\ 0 & 0 & \frac{60}{19} & : & \frac{-128}{19} \end{array} \right] R_3 \rightarrow R_3 + \frac{2}{19}R_2$$

Here, rank of  $A$  is 3 and Rank of  $C$  is also 3.

$$R(A) = R(C) = 3$$

Hence, the equations are consistent with unique solution.

$$\left[ \begin{array}{ccc|c} -1 & 5 & -2 & 0 \\ 0 & 19 & -8 & 12 \\ 0 & 0 & \frac{60}{19} & -\frac{128}{19} \end{array} \right]$$

$$-x_1 + 5x_2 - 2x_3 = 0 \quad \dots(1)$$

$$19x_2 - 8x_3 = 12 \quad \dots(2)$$

$$\frac{60}{19}x_3 = \frac{-128}{19} \Rightarrow x_3 = -\frac{128}{19} \times \frac{19}{60} \Rightarrow x_3 = \frac{-32}{15}$$

On putting the value of  $x_3$  in (2), we get

$$19x_2 - 8\left(\frac{-32}{15}\right) = 12 \Rightarrow 19x_2 = 12 - \frac{256}{15} = \frac{-76}{15}$$

$$\Rightarrow x_2 = \frac{-76}{15 \times 19} = -\frac{4}{15}$$

On putting the values of  $x_2$  and  $x_3$  in (1), we get

$$-x_1 + 5\left(-\frac{4}{15}\right) - 2\left(\frac{-32}{15}\right) = 0$$

$$\Rightarrow -x_1 = \frac{20}{15} - \frac{64}{15} = \frac{-44}{15} \Rightarrow x_1 = \frac{44}{15}$$

Hence,  $x_1 = \frac{44}{15}$ ,  $x_2 = \frac{-4}{15}$  and  $x_3 = \frac{-32}{15}$ .

**Ans.**

**Example 9.** Test for consistency the following system of equations and, if consistent, solve them.

$$\begin{aligned}x_1 + 2x_2 - x_3 &= 3 \\3x_1 - x_2 + 2x_3 &= 1 \\2x_1 - 2x_2 + 3x_3 &= 2 \\x_1 - x_2 + x_3 &= -1\end{aligned}$$

(U.P. I Semester, Winter 2002)

**Solution.** The augmented matrix  $C = [A, B]$

$$\sim \left[ \begin{array}{ccc|c} 1 & 2 & -1 & 3 \\ 3 & -1 & 2 & 1 \\ 2 & -2 & 3 & 2 \\ 1 & -1 & 1 & -1 \\ \hline 1 & 2 & -1 & 3 \\ 0 & -7 & 5 & -8 \\ 0 & 0 & \frac{5}{7} & \frac{20}{7} \\ 0 & 0 & \frac{-1}{7} & \frac{-4}{7} \end{array} \right] \sim \left[ \begin{array}{ccc|c} 1 & 2 & -1 & 3 \\ 0 & -7 & 5 & -8 \\ 0 & 0 & \frac{5}{7} & \frac{20}{7} \\ 0 & 0 & 0 & 0 \end{array} \right] \begin{array}{l} R_2 \rightarrow R_2 - 3R_1 \\ R_3 \rightarrow R_3 - 2R_1 \\ R_4 \rightarrow R_4 - R_1 \\ \\ R_3 \rightarrow R_3 - \frac{6}{7}R_2 \\ R_4 \rightarrow R_4 - \frac{3}{7}R_2 \\ \\ R_4 \rightarrow R_4 + \frac{1}{5}R_3 \end{array}$$

Rank of  $C = 3 = \text{Rank of } A$

Hence, the system of equations is consistent with unique solution.

$$\text{Now, } \left[ \begin{array}{ccc|c} 1 & 2 & -1 & 3 \\ 0 & -7 & 5 & -8 \\ 0 & 0 & \frac{5}{7} & \frac{20}{7} \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 3 \\ -8 \\ \frac{20}{7} \end{bmatrix}$$

$$\begin{aligned}x_1 + 2x_2 - x_3 &= 3 & \dots(1) \\-7x_2 + 5x_3 &= -8 & \dots(2) \\ \frac{5}{7}x_3 &= \frac{20}{7} \Rightarrow x_3 = 4\end{aligned}$$

From (2),  $-7x_2 + 5 \times 4 = -8 \Rightarrow -7x_2 = -28 \Rightarrow x_2 = 4$

From (1),  $x_1 + 2 \times 4 - 4 = 3 \Rightarrow x_1 = 3 - 8 + 4 = -1$

Hence,  $x_1 = -1, x_2 = 4, x_3 = 4$

**Ans.**

**Example 10.** Discuss the consistency of the following system of equations

$$2x + 3y + 4z = 11, \quad x + 5y + 7z = 15, \quad 3x + 11y + 13z = 25.$$

If found consistent, solve it.

(A.M.I.E.T.E., Winter 2001)

**Solution.** The augmented matrix  $C = [A, B]$

$$\left[ \begin{array}{cccc|c} 2 & 3 & 4 & 11 \\ 1 & 5 & 7 & 15 \\ 3 & 11 & 13 & 25 \end{array} \right] \sim \left[ \begin{array}{cccc|c} 1 & 5 & 7 & 15 \\ 2 & 3 & 4 & 11 \\ 3 & 11 & 13 & 25 \end{array} \right] R_1 \leftrightarrow R_2$$

$$R_2 \rightarrow R_2 - 2R_1, \quad R_3 \rightarrow R_3 - 3R_1, \quad R_2 \rightarrow -\frac{1}{7}R_2, \quad R_3 \rightarrow -\frac{1}{4}R_3, \quad R_3 \rightarrow R_3 - R_2$$

$$\left[ \begin{array}{cccc|c} 1 & 5 & 7 & 15 \\ 0 & -7 & -10 & -19 \\ 0 & -4 & -8 & -20 \end{array} \right] \sim \left[ \begin{array}{cccc|c} 1 & 5 & 7 & 15 \\ 0 & 1 & \frac{10}{7} & \frac{19}{7} \\ 0 & 1 & 2 & 5 \end{array} \right] \sim \left[ \begin{array}{cccc|c} 1 & 5 & 7 & 15 \\ 0 & 1 & \frac{10}{7} & \frac{19}{7} \\ 0 & 0 & \frac{4}{7} & \frac{16}{7} \end{array} \right]$$

Rank of  $C = 3 = \text{Rank of } A$

Hence, the system of equations is consistent with unique solution.

$$\begin{array}{l} \text{Now, } \begin{bmatrix} 1 & 5 & 7 \\ 0 & 1 & \frac{10}{7} \\ 0 & 0 & \frac{4}{7} \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 15 \\ \frac{19}{7} \\ \frac{16}{7} \end{bmatrix} \\ \Rightarrow x + 5y + 7z = 15 \quad \dots(1) \\ y + \frac{10z}{7} = \frac{19}{7} \quad \dots(2) \\ \frac{4z}{7} = \frac{16}{7} \Rightarrow z = 4 \end{array}$$

$$\text{From (2), } y + \frac{10}{7} \times 4 = \frac{19}{7} \Rightarrow y = -3$$

$$\text{From (1), } x + 5(-3) + 7(4) = 15 \Rightarrow x = 2$$

**Ans.**

**Example 11.** Test for the consistency of the following system of equations :

$$\begin{aligned} x_1 + 2x_2 + 3x_3 + 4x_4 &= 5 \\ 6x_1 + 7x_2 + 8x_3 + 9x_4 &= 10 \\ 11x_1 + 12x_2 + 13x_3 + 14x_4 &= 15 \\ 16x_1 + 17x_2 + 18x_3 + 19x_4 &= 20 \\ 21x_1 + 22x_2 + 23x_3 + 24x_4 &= 25 \end{aligned}$$

**Solution.** The given equations are written in the matrix form.

$$\begin{bmatrix} 1 & 2 & 3 & 4 \\ 6 & 7 & 8 & 9 \\ 11 & 12 & 13 & 14 \\ 16 & 17 & 18 & 19 \\ 21 & 22 & 23 & 24 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 5 \\ 10 \\ 15 \\ 20 \\ 25 \end{bmatrix}$$

$$AX = B$$

$$\begin{aligned} C = [A : B] &= \left[ \begin{array}{ccccc} 1 & 2 & 3 & 4 & : & 5 \\ 6 & 7 & 8 & 9 & : & 10 \\ 11 & 12 & 13 & 14 & : & 15 \\ 16 & 17 & 18 & 19 & : & 20 \\ 21 & 22 & 23 & 24 & : & 25 \end{array} \right] = \left[ \begin{array}{ccccc} 1 & 2 & 3 & 4 & 5 \\ 0 & 5 & 10 & 15 & 20 \\ 0 & 10 & 20 & 30 & 40 \\ 0 & 15 & 30 & 45 & 60 \\ 0 & 20 & 40 & 60 & 80 \end{array} \right] \begin{array}{l} R_2 \rightarrow R_2 - 6R_1 \\ R_3 \rightarrow R_3 - 11R_1 \\ R_4 \rightarrow R_4 - 16R_1 \\ R_5 \rightarrow R_5 - 21R_1 \end{array} \\ &= \left[ \begin{array}{ccccc} 1 & 2 & 3 & 4 & 5 \\ 0 & 5 & 10 & 15 & 20 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{array} \right] \begin{array}{l} R_3 \rightarrow R_3 - 2R_2 \\ R_4 \rightarrow R_4 - 3R_2 \\ R_5 \rightarrow R_5 - 4R_2 \end{array} \end{aligned}$$

Number of non zero rows is only 2.

So Rank (A) = Rank (C) = 2

Since Rank (A) = Rank (C) < Number of unknowns.

The given system of equations is consistent and has infinite number of solutions.

**Ans.**

**Example 12.** For what values of  $k$ , the equations  $x + y + z = 1$ ,  $2x + y + 4z = k$ ,  $4x + y + 10z = k^2$  has a solution? (Q. Bank U.P. T.U. 2001)

**Solution.** Here, we have

$$\begin{aligned} & \begin{array}{l} x + y + z = 1 \\ 2x + y + 4z = k \\ 4x + y + 10z = k^2 \end{array} \\ \Rightarrow & \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 2 & 1 & 4 & k \\ 4 & 1 & 10 & k^2 \end{array} \right] \sim \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 0 & -1 & 2 & k-2 \\ 0 & -3 & 6 & k^2-4 \end{array} \right] \begin{array}{l} R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - 4R_1 \end{array} \\ & C = [A : B] = \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 0 & -1 & 2 & k-2 \\ 0 & 0 & 0 & k^2-3k+2 \end{array} \right] \sim \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 0 & -1 & 2 & k-2 \\ 0 & 0 & 0 & k^2-3k+2 \end{array} \right] \begin{array}{l} R_3 \rightarrow R_3 - 3R_2 \end{array} \Rightarrow \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 1 \\ 0 & -1 & 2 & k-2 \\ 0 & 0 & 0 & k^2-3k+2 \end{array} \right] \end{aligned}$$

If the given system has solutions, then  $R(A) = R(C)$  But  $R(A) = 2$

$R(C) = 2$  if  $k^2 - 3k + 2 = 0 \Rightarrow (k-1)(k-2) = 0 \Rightarrow k = 1, k = 2$

**Case I.** When  $k = 1$ , we have

$$x + y + z = 1 \quad \dots(1)$$

$$-y + 2z = 1 - 2 = -1 \quad \dots(2)$$

Let

$$z = \lambda$$

Putting the value of  $z = \lambda$  in (2), we have

$$-y + 2\lambda = -1 \Rightarrow y = 2\lambda + 1$$

Putting the values of  $y$  and  $z$  in (1), we have

$$x + (2\lambda + 1) + \lambda = 1 \Rightarrow x = -3\lambda$$

Hence solution is

$$x = -3\lambda$$

$$y = 2\lambda + 1$$

$$z = \lambda$$

( $\lambda$  is an arbitrary constant)

**Case II.** When  $k = 2$ , we have

$$x + y + z = 1 \quad \dots(3)$$

$$-y + 2z = 4 - 6 + 2 \Rightarrow -y + 2z = 0 \quad \dots(4)$$

Let

$$z = c$$

Putting the value of  $z = c$  in (4), we have

$$-y + 2c = 0 \Rightarrow y = 2c$$

Putting the values of  $y$  and  $z$  in (1), we have

$$x + 2c + c = 1 \Rightarrow x = -3c + 1$$

Hence the solution is

$$x = 1 - 3c, y = 2c, z = c, \text{ where } c \text{ is an arbitrary constant.}$$

**Ans.**

**Example 13.** Investigate the values of  $\lambda$  and  $\mu$  so that the equations:

$$2x + 3y + 5z = 9$$

$$7x + 3y - 2z = 8$$

$$2x + 3y + \lambda z = \mu$$

have (i) no solution (ii) a unique solution

(iii) an infinite number of solutions.

(R.G.P.V. Bhopal, I Semester, June 2007)

**Solution.** Here, we have,

$$2x + 3y + 5z = 9$$

$$7x + 3y - 2z = 8$$

$$2x + 3y + \lambda z = \mu$$

The above equations are written in the matrix form

$$\begin{bmatrix} 2 & 3 & 5 \\ 7 & 3 & -2 \\ 2 & 3 & \lambda \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 9 \\ 8 \\ \mu \end{bmatrix}$$

$$AX = B$$

$$C = [A : B] = \begin{bmatrix} 2 & 3 & 5 & : & 9 \\ 7 & 3 & -2 & : & 8 \\ 2 & 3 & \lambda & : & \mu \end{bmatrix} = \begin{bmatrix} 2 & 3 & 5 & : & 9 \\ 0 & -\frac{15}{2} & -\frac{39}{2} & : & -\frac{47}{2} \\ 0 & 0 & \lambda - 5 & : & \mu - 9 \end{bmatrix}$$

$$R_2 \rightarrow R_2 - \frac{7}{2}R_1$$

$$R_3 \rightarrow R_3 - R_1$$

(i) **No solution.** Rank (A) ≠ Rank (C)

$$\lambda - 5 = 0 \text{ or } \lambda = 5 \text{ and } \mu - 9 \neq 0 \Rightarrow \mu \neq 9$$

(ii) **A unique solution.** Rank (A) = R (C) = Number of unknowns

$$\lambda - 5 \neq 0 \Rightarrow \lambda \neq 5 \text{ and } \mu \neq 9$$

(iii) **An infinite number of solutions.** Rank (A) = Rank (C) = 2

$$\lambda - 5 = 0 \text{ and } \mu - 9 = 0$$

$$\lambda = 5 \text{ and } \mu = 9$$

**Ans.**

**Example 14.** Determine for what values of  $\lambda$  and  $\mu$  the following equations have (i) no solution;

(ii) a unique solution; (iii) infinite number of solutions.

$$x + y + z = 6, \quad x + 2y + 3z = 10, \quad x + 2y + \lambda z = \mu \quad (\text{U.P., I Sem. Winter 2001})$$

$$\begin{array}{l} \text{Solution.} \quad \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 2 & \lambda \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 6 \\ 10 \\ \mu \end{bmatrix} \\ \quad \quad \quad AX = B \end{array}$$

$$C = (A, B) = \begin{bmatrix} 1 & 1 & 1 & : & 6 \\ 1 & 2 & 3 & : & 10 \\ 1 & 2 & \lambda & : & \mu \end{bmatrix} \sim \begin{bmatrix} 1 & 1 & 1 & : & 6 \\ 0 & 1 & 2 & : & 4 \\ 0 & 1 & \lambda - 1 & : & \mu - 6 \end{bmatrix}$$

$$R_2 \rightarrow R_2 - R_1$$

$$R_3 \rightarrow R_3 - R_1$$

$$\sim \begin{bmatrix} 1 & 1 & 1 & : & 6 \\ 0 & 1 & 2 & : & 4 \\ 0 & 0 & \lambda - 3 & : & \mu - 10 \end{bmatrix}$$

$$R_3 \rightarrow R_3 - R_2$$

(i) There is no solution if  $R (A) \neq R (C)$

$$\text{i.e. } \lambda - 3 = 0 \text{ or } \lambda = 3 \text{ and } \mu - 10 \neq 0 \text{ or } \mu \neq 10$$

(ii) There is a unique solution if  $R (A) = R (C) = 3$

$$\text{i.e. } \lambda - 3 \neq 0 \text{ or } \lambda \neq 3, \mu \text{ may have any value.}$$

(iii) There are infinite solutions if  $R (A) = R (C) = 2$

$$\lambda - 3 = 0 \text{ or } \lambda = 3 \text{ and } \mu - 10 = 0 \text{ or } \mu = 10$$

**Ans.**

**Example 15.** Find for what values of  $\lambda$  and  $\mu$  the system of linear equations:

$$x + y + z = 6$$

$$x + 2y + 5z = 10$$

$$2x + 3y + \lambda z = \mu$$

has (i) a unique solution (ii) no solution

(iii) infinite solutions. Also find the solution for  $\lambda = 2$  and  $\mu = 8$ .

(Uttarakhand, 1st semester, Dec. 2006)

**Solution.** 
$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 5 \\ 2 & 3 & \lambda \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 6 \\ 10 \\ \mu \end{bmatrix}$$

$$AX = B$$

$$C = (A, B) = \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 6 \\ 1 & 2 & 5 & 10 \\ 2 & 3 & \lambda & \mu \end{array} \right] \sim \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 6 \\ 0 & 1 & 4 & 4 \\ 0 & 1 & \lambda - 2 & \mu - 12 \end{array} \right] R_2 \rightarrow R_2 - R_1$$

$$\sim \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 6 \\ 0 & 1 & 4 & 4 \\ 0 & 0 & \lambda - 6 & \mu - 16 \end{array} \right] R_3 \rightarrow R_3 - 2R_1$$

$$\dots(1)$$

**(i) A unique solution**

If  $R(A) = R(C) = 3$

then  $\lambda - 6 \neq 0 \Rightarrow \lambda \neq 6$  and  $\mu - 16 \neq 0 \Rightarrow \mu \neq 16$

**(ii) No solutions**

If  $R(A) \neq R(C)$ , then  $R(A) = 2$  and  $R(C) = 3$

$\lambda - 6 = 0 \Rightarrow \lambda = 6$  and  $\mu - 16 \neq 0 \Rightarrow \mu \neq 16$

**(iii) Infinite solutions**

If  $R(A) = R(C) = 2$

then  $\lambda - 6 = 0$  and  $\mu - 16 = 0$

$\Rightarrow \lambda = 6$  and  $\mu = 16$

**(iv) Putting  $\lambda = 2$  and  $\mu = 8$  in (1), we get**

$$\left[ \begin{array}{ccc|c} 1 & 1 & 1 & 6 \\ 0 & 1 & 4 & 4 \\ 0 & 0 & -4 & -8 \end{array} \right] \Rightarrow \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 6 \\ 0 & 1 & 4 & 4 \\ 0 & 0 & -4 & -8 \end{array} \right] \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 6 \\ 4 \\ -8 \end{bmatrix}$$

$$\begin{aligned} x + y + z &= 6 \\ y + 4z &= 4 \\ -4z &= -8 \end{aligned} \Rightarrow z = 2$$

Putting  $z = 2$  in (3), we get

$$y + 8 = 4 \Rightarrow y = -4$$

Putting  $y = -4$ ,  $z = 2$  in (2), we get

$$x - 4 + 2 = 6 \Rightarrow x = 8$$

Hence,  $x = 8$ ,  $y = -4$ ,  $z = 2$

**Ans.**

**Example 16. Show that the equations**

$$-2x + y + z = a$$

$$x - 2y + z = b$$

$$x + y - 2z = c$$

have no solution unless  $a + b + c = 0$ . In which case they have infinitely many solutions?

Find these solutions when  $a = 1$ ,  $b = 1$  and  $c = -2$ .

**Solution.** Augmented matrix,

$$C = [A : B] = \left[ \begin{array}{ccc|c} -2 & 1 & 1 & a \\ 1 & -2 & 1 & b \\ 1 & 1 & -2 & c \end{array} \right]$$

[Rank  $(A) = 2$ ]

$$\begin{array}{l}
 \sim \left[ \begin{array}{cccc|c} 1 & 1 & -2 & : & c \\ 1 & -2 & 1 & : & b \\ -2 & 1 & 1 & : & a \end{array} \right] R_1 \leftrightarrow R_3 \quad \sim \left[ \begin{array}{cccc|c} 1 & 1 & -2 & : & c \\ 0 & -3 & 3 & : & b-c \\ 0 & 3 & -3 & : & a+2c \end{array} \right] R_2 \rightarrow R_2 - R_1 \\
 \sim \left[ \begin{array}{cccc|c} 1 & 1 & -2 & : & c \\ 0 & -3 & 3 & : & b-c \\ 0 & 0 & 0 & : & a+b+c \end{array} \right] R_3 \rightarrow R_3 + R_2
 \end{array} \dots (1)$$

**Case I.** If  $a + b + c \neq 0$

Rank of  $C = 3$ .

But Rank of  $A = 2$

$\Rightarrow R(C) \neq R(A)$  where  $A$  is the coefficient matrix.

Hence, the system being inconsistent, have no solution.

**Case II.** If  $a + b + c = 0$

Rank of  $C = 2$  and  $R(A) = 2$

$\Rightarrow R(C) = R(A)$

Hence, the system has infinite number of solutions.

**Case III.** On putting  $a = 1$ ,  $b = 1$  and  $c = -2$  in (1), we get

$$\begin{array}{l}
 \left[ \begin{array}{ccc|c} 1 & 1 & -2 & : & -2 \\ 0 & -3 & 3 & : & 3 \\ 0 & 0 & 0 & : & 0 \end{array} \right] \\
 x + y - 2z = -2 \quad \dots(2) \\
 -3y + 3z = 3 \quad \dots(3)
 \end{array}$$

Let  $z = k$ ,  $k$  being an arbitrary constant.

From (3)  $-3y + 3k = 3 \Rightarrow y = k - 1$

Putting  $y = k - 1$  and  $z = k$  in (2), we get

$$x + (k - 1) - 2k = -2 \Rightarrow x = k - 1$$

Hence, the solutions are  $x = k - 1$ ,  $y = k - 1$ ,  $z = k$

**Ans.**

**Example 17.** Find for what values of  $k$  the set of equations

$$2x - 3y + 6z - 5t = 3, \quad y - 4z + t = 1, \quad 4x - 5y + 8z - 9t = k$$

has (i) no solution (ii) infinite number of solutions. (A.M.I.E.T.E., Summer 2004)

**Solution.** The augmented matrix  $C = [A, B]$

$$\begin{array}{l}
 \left[ \begin{array}{ccccc|c} 2 & -3 & 6 & -5 & : & 3 \\ 0 & 1 & -4 & 1 & : & 1 \\ 4 & -5 & 8 & -9 & : & k \end{array} \right] \sim \left[ \begin{array}{ccccc|c} 2 & -3 & 6 & -5 & : & 3 \\ 0 & 1 & -4 & 1 & : & 1 \\ 0 & 1 & -4 & 1 & : & k-6 \end{array} \right] \\
 \sim \left[ \begin{array}{ccccc|c} 2 & -3 & 6 & -5 & : & 3 \\ 0 & 1 & -4 & 1 & : & 1 \\ 0 & 0 & 0 & 0 & : & k-7 \end{array} \right] R_3 \rightarrow R_3 - R_2
 \end{array}$$

(i) There is no solution if  $R(A) \neq R(C)$

$$k - 7 \neq 0 \text{ or } k \neq 7, R(A) = 2 \text{ and } R(C) = 3.$$

(ii) There are infinite solutions if  $R(A) = R(C) = 2$

$$k - 7 = 0 \Rightarrow k = 7$$

**Ans.**

$$\left[ \begin{array}{cccc} 2 & -3 & 6 & -5 \\ 0 & 1 & -4 & 1 \end{array} \right] \begin{bmatrix} x \\ y \\ z \\ t \end{bmatrix} = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

$$2x - 3y + 6z - 5t = 3 \quad \dots(1)$$

$$y - 4z + t = 1 \quad \dots(2)$$

Let  $t = k_1$  and  $z = k_2$ .

From (2),  $y - 4k_2 + k_1 = 1$  or  $y = 1 + 4k_2 - k_1$

From (1),  $2x - 3 - 12k_2 + 3k_1 + 6k_2 - 5k_1 = 3$

$$\Rightarrow \begin{aligned} 2x = 6 + 6k_2 + 2k_1 &\Rightarrow x = 3 + 3k_2 + k_1 \\ y = 1 + 4k_2 - k_1 &\Rightarrow z = k_2, \quad t = k_1 \end{aligned}$$

**Ans.**

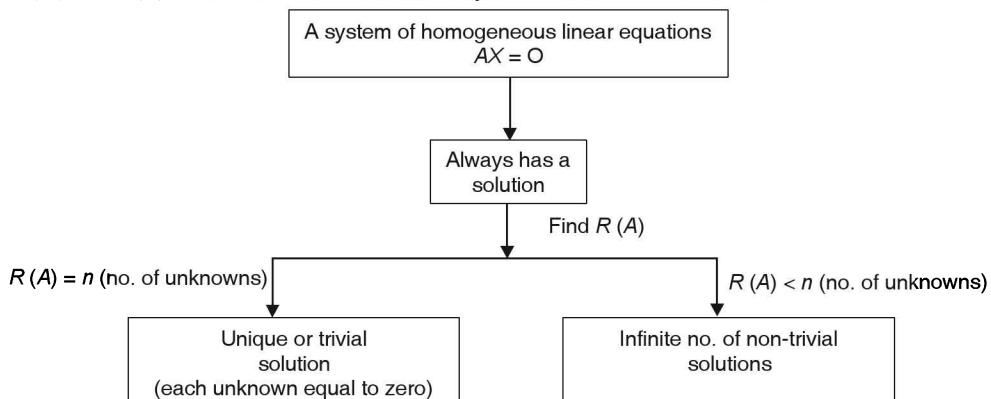

#### 20.4. HOMOGENEOUS EQUATIONS

For a system of homogeneous linear equations  $AX = O$

- (i)  $X = O$  is always a solution. This solution in which each unknown has the value zero is called the **Null Solution** or the **Trivial solution**. Thus a homogeneous system is always consistent.

A system of homogeneous linear equations has either the trivial solution or an infinite number of solutions.

- (ii) If  $R(A) = \text{number of unknowns}$ , the system has only the trivial solution.  
(iii) If  $R(A) < \text{number of unknowns}$ , the system has an infinite number of non-trivial solutions.

**Example 18.** Determine 'b' such that the system of homogeneous equations

$$2x + y + 2z = 0 ;$$

$$x + y + 3z = 0 ;$$

$$4x + 3y + bz = 0$$

has (i) Trivial solution

(ii) Non-Trivial solution. Find the Non-Trivial solution using matrix method.

(U.P., I Sem Dec 2008)

**Solution.** Here, we have

$$2x + y + 2z = 0$$

$$x + y + 3z = 0$$

$$4x + 3y + bz = 0$$

(i) **For trivial solution:** We know that  $x = 0$ ,  $y = 0$  and  $z = 0$ . So,  $b$  can have any value.

(ii) **For non-trivial solution:** The given equations are written in the matrix form as :

$$\begin{bmatrix} 2 & 1 & 2 \\ 1 & 1 & 3 \\ 4 & 3 & b \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$AX = B$$

$$R_1 \leftrightarrow R_2, \quad R_2 \rightarrow R_2 - 2R_1, \quad R_3 \rightarrow R_3 - 4R_1, \quad R_3 \rightarrow R_3 - R_2$$

$$C = \begin{bmatrix} 2 & 1 & 2 & : & 0 \\ 1 & 1 & 3 & : & 0 \\ 4 & 3 & b & : & 0 \end{bmatrix} \sim \begin{bmatrix} 1 & 1 & 3 & : & 0 \\ 2 & 1 & 2 & : & 0 \\ 4 & 3 & b & : & 0 \end{bmatrix} \sim \begin{bmatrix} 1 & 1 & 3 & : & 0 \\ 0 & -1 & -4 & : & 0 \\ 0 & -1 & b-12 & : & 0 \end{bmatrix} \sim \begin{bmatrix} 1 & 1 & 3 & : & 0 \\ 0 & -1 & -4 & : & 0 \\ 0 & 0 & b-8 & : & 0 \end{bmatrix}$$

For non trivial solution or infinite solutions  $R(C) = R(A) = 2 <$  Number of unknowns

$$b-8=0, \quad b=8$$

**Ans.**

**Example 19.** Find the values of  $k$  such that the system of equations

$$x + ky + 3z = 0, \quad 4x + 3y + kz = 0, \quad 2x + y + 2z = 0$$

has non-trivial solution.

**Solution.** The set of equations is written in the form of matrices

$$\begin{bmatrix} 1 & k & 3 \\ 4 & 3 & k \\ 2 & 1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}, \quad AX = B, \quad C = [A : B] = \begin{bmatrix} 1 & k & 3 & : & 0 \\ 4 & 3 & k & : & 0 \\ 2 & 1 & 2 & : & 0 \end{bmatrix}$$

On interchanging first and third rows, we have

$$\begin{bmatrix} 2 & 1 & 2 & : & 0 \\ 4 & 3 & k & : & 0 \\ 1 & k & 3 & : & 0 \end{bmatrix}$$

$$R_2 \rightarrow R_2 - 2R_1, \quad R_3 \rightarrow R_3 - \frac{1}{2}R_1 \quad R_3 \rightarrow R_3 - \left(k - \frac{1}{2}\right)R_2$$

$$\sim \begin{bmatrix} 2 & 1 & 2 & : & 0 \\ 0 & 1 & k-4 & : & 0 \\ 0 & k - \frac{1}{2} & 2 & : & 0 \end{bmatrix} \sim \begin{bmatrix} 2 & 1 & 2 & : & 0 \\ 0 & 1 & k-4 & : & 0 \\ 0 & 0 & 2 - \left(k - \frac{1}{2}\right)(k-4) & : & 0 \end{bmatrix}$$

For a non-trivial solution or for infinite solution,  $R(A) = R(C) = 2$

$$\text{so} \quad 2 - \left(k - \frac{1}{2}\right)(k-4) = 0 \Rightarrow 2 - k^2 + 4k + \frac{k}{2} - 2 = 0$$

$$\Rightarrow -k^2 + \frac{9}{2}k = 0 \Rightarrow k\left(-k + \frac{9}{2}\right) = 0 \Rightarrow k = \frac{9}{2}, k = 0$$

**Ans.**

## 20.5 CRAMER'S RULE

$$a_1x + b_1y + c_1z = d_1$$

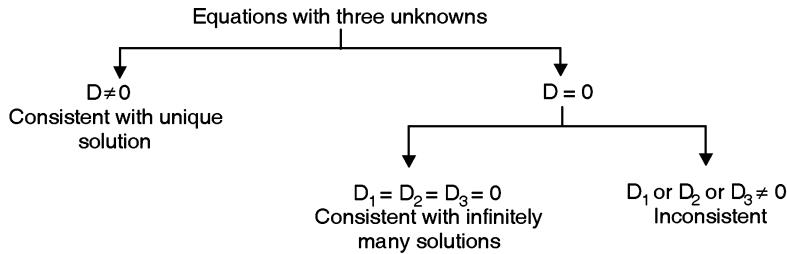

$$a_2x + b_2y + c_2z = d_2$$

$$a_3x + b_3y + c_3z = d_3$$

$$\text{then } D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}, \quad D_1 = \begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}$$

$$D_2 = \begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix}, \quad D_3 = \begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix}$$

$$x = \frac{D_1}{D}, \quad y = \frac{D_2}{D}, \quad z = \frac{D_3}{D}$$

**Example 20.** Show that the homogeneous system of equations

$$\begin{aligned} x + y \cos \gamma + z \cos \beta &= 0; & x \cos \gamma + y + z \cos \alpha &= 0; & x \cos \beta + y \cos \alpha + z &= 0 \\ \text{has non-trivial solution if } \alpha + \beta + \gamma &= 0. & & & & (Q. Bank U.P.T.U. 2001) \end{aligned}$$

**Solution.** If the system has only non-trivial solutions, then

$$\begin{aligned} &\left| \begin{array}{ccc|c} 1 & \cos \gamma & \cos \beta & \\ \cos \gamma & 1 & \cos \alpha & \\ \cos \beta & \cos \alpha & 1 & \end{array} \right| = 0 \\ \Rightarrow & 1 - \cos^2 \alpha + \cos \gamma (\cos \alpha \cos \beta - \cos \gamma) + \cos \beta (\cos \gamma \cos \alpha - \cos \beta) = 0 \\ \Rightarrow & \sin^2 \alpha - \cos^2 \beta - \cos^2 \gamma + 2 \cos \alpha \cos \beta \cos \gamma = 0 \\ \Rightarrow & -(\cos^2 \beta - \sin^2 \alpha) - \cos^2 \gamma + 2 \cos \alpha \cos \beta \cos \gamma = 0 \\ \Rightarrow & -\cos(\alpha + \beta) \cos(\beta - \alpha) - \cos^2 \gamma + 2 \cos \alpha \cos \beta \cos \gamma = 0 \\ & \quad [\text{if } \alpha + \beta + \gamma = 0] \\ \Rightarrow & -\cos(-\gamma) \cos(\beta - \alpha) - \cos^2 \gamma + 2 \cos \alpha \cos \beta \cos \gamma = 0 \\ \Rightarrow & -\cos \gamma [\cos(\beta - \alpha) + \cos(\beta + \alpha)] + 2 \cos \alpha \cos \beta \cos \gamma = 0 \\ \Rightarrow & -2 \cos \beta \cos \alpha \cos \gamma + 2 \cos \alpha \cos \beta \cos \gamma = 0 \end{aligned}$$

which is true.

Hence, the given homogeneous system of equations has non-trivial solution if  $\alpha + \beta + \gamma = 0$ .

**Proved.**

**Example 21.** Find values of  $\lambda$  for which the following system of equations is consistent and has non-trivial solutions. Solve equations for all such values of  $\lambda$ .

$$\begin{aligned} (\lambda - 1)x + (3\lambda + 1)y + 2\lambda z &= 0 \\ (\lambda - 1)x + (4\lambda - 2)y + (\lambda + 3)z &= 0 \\ 2x + (3\lambda + 1)y + 3(\lambda - 1)z &= 0 \end{aligned} \quad (A.M.I.E.T.E., Summer 2010, 2001)$$

**Solution.** 
$$\left[ \begin{array}{ccc|c} (\lambda - 1) & (3\lambda + 1) & 2\lambda & x \\ (\lambda - 1) & (4\lambda - 2) & (\lambda + 3) & y \\ 2 & (3\lambda + 1) & (3\lambda - 3) & z \end{array} \right] \left[ \begin{array}{c} x \\ y \\ z \end{array} \right] = \left[ \begin{array}{c} 0 \\ 0 \\ 0 \end{array} \right] \quad \dots(1)$$

$$AX = 0$$

For infinite solutions,  $|A| = 0$

$$\begin{aligned} \left| \begin{array}{ccc} \lambda - 1 & 3\lambda + 1 & 2\lambda \\ \lambda - 1 & 4\lambda - 2 & \lambda + 3 \\ 2 & 3\lambda + 1 & 3\lambda - 3 \end{array} \right| &= 0, \quad \left| \begin{array}{ccc} 0 & -\lambda + 3 & \lambda - 3 \\ \lambda - 1 & 4\lambda - 2 & \lambda + 3 \\ 2 & 3\lambda + 1 & 3\lambda - 3 \end{array} \right| = 0, \quad R_1 \rightarrow R_1 - R_2 \\ \left| \begin{array}{ccc} 0 & 0 & \lambda - 3 \\ \lambda - 1 & 5\lambda + 1 & \lambda + 3 \\ 2 & 6\lambda - 2 & 3\lambda - 3 \end{array} \right| &= 0, \quad C_2 \rightarrow C_2 + C_3 \end{aligned}$$

$$(\lambda - 3)[(\lambda - 1)(6\lambda - 2) - 2(5\lambda + 1)] = 0$$

$$[6\lambda^2 - 8\lambda + 2 - 10\lambda - 2] = 0 \text{ or } 6\lambda^2 - 18\lambda = 0 \text{ or } 6\lambda(\lambda - 3) = 0, \lambda = 3$$

On putting  $\lambda = 3$  in (1), we get

$$\begin{bmatrix} 2 & 10 & 6 \\ 2 & 10 & 6 \\ 2 & 10 & 6 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 2 & 10 & 6 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$2x + 10y + 6z = 0 \Rightarrow x + 5y + 3z = 0$$

$$\text{Let } x = k_1, y = k_2, 3z = -k_1 - 5k_2 \Rightarrow z = \frac{-k_1}{3} - \frac{5k_2}{3} \quad \text{Ans.}$$

### EXERCISE 20.1

Test the consistency of the following equations and solve them if possible.

$$1. \quad 3x + 3y + 2z = 1, \quad x + 2y = 4, \quad 10y + 3z = -2, \quad 2x - 3y - z = 5 \quad \text{Ans. Consistent, } x = 2, y = 1, z = -4 \quad (\text{R.G.P.V. Bhopal 1st Sem 2001})$$

$$2. \quad x_1 - x_2 + x_3 - x_4 + x_5 = 1, \quad 2x_1 - x_2 + 3x_3 + 4x_5 = 2, \\ 3x_1 - 2x_2 + 2x_3 + x_4 + x_5 = 1, \quad x_1 + x_3 + 2x_4 + x_5 = 0 \quad (\text{A.M.I.E.T.E., Winter 2003})$$

$$\text{Ans. } x_1 = -3k_1 + k_2 - 1, x_2 = -3k_1 - 1, x_3 = k_1 - 2k_2 + 1, x_4 = k_1, x_5 = k_2$$

$$3. \quad \text{Find the value of } k \text{ for which the following system of equations is consistent.}$$

$$3x_1 - 2x_2 + 2x_3 = 3, \quad x_1 + kx_2 - 3x_3 = 0, \quad 4x_1 + x_2 + 2x_3 = 7 \quad \text{Ans. } k = \frac{1}{4}$$

$$4. \quad \text{Find the value of } \lambda \text{ for which the system of equations}$$

$$x + y + 4z = 1, \quad x + 2y - 2z = 1, \quad \lambda x + y + z = 1 \quad \text{will have a unique solution.} \quad (\text{A.M.I.E., Winter 2000}) \quad \text{Ans. } \lambda \neq \frac{7}{10}$$

$$5. \quad \text{Determine the values of } a \text{ and } b \text{ for which the system} \quad \begin{bmatrix} 3 & -2 & 1 \\ 5 & -8 & 9 \\ 2 & 1 & a \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} b \\ 3 \\ -1 \end{bmatrix}$$

(i) has a unique solution, (ii) has no solution and, (iii) has infinitely many solutions.

$$\text{Ans. (i) } a \neq -3, \text{ (ii) } a = -3, b \neq \frac{1}{3}, \text{ (iii) } a = -3, b = \frac{1}{3}$$

$$6. \quad \text{Choose } \lambda \text{ that makes the following system of linear equations consistent and find the general solution of the system for that } \lambda.$$

$$x + y - z + t = 2, \quad 2y + 4z + 2t = 3, \quad x + 2y + z + 2t = \lambda$$

$$\text{Ans. } \lambda = \frac{7}{2}, \quad x = \frac{1}{2} + 3k_2, \quad y = \frac{3}{2} - 2k_2 - k_1, \quad z = k_2, \quad t = k_1$$

$$7. \quad \text{Show that the equations}$$

$$3x + 4y + 5z = a, \quad 4x + 5y + 6z = b, \quad 5x + 6y + 7z = c$$

don't have a solution unless  $a + c = 2b$ .

Solve the equations when  $a = b = c = -1$  (MTU, Dec. 2012)  $\text{Ans. } x = k + 1, y = -2k - 1, z = k$

$$8. \quad \text{Find the values of } k, \text{ such that the system of equations}$$

$$4x_1 + 9x_2 + x_3 = 0, \quad kx_1 + 3x_2 + kx_3 = 0, \quad x_1 + 4x_2 + 2x_3 = 0$$

has non-trivial solution. Hence, find the solution of the system.

$$\text{Ans. } k = 1, \quad x_1 = 2\lambda, \quad x_2 = -\lambda, \quad x_3 = \lambda$$

$$9. \quad \text{Find values of } \lambda \text{ for which the following system of equations has a non-trivial solution.}$$

$$3x_1 + x_2 - \lambda x_3 = 0, \quad 2x_1 + 4x_2 + \lambda x_3 = 0, \quad 8x_1 - 4x_2 - 6x_3 = 0 \quad \text{Ans. } \lambda = 1$$

$$10. \quad \text{Find value of } \lambda \text{ so that the following system of homogeneous equations have exactly two linearly independent solutions}$$

$$\lambda x_1 - x_2 - x_3 = 0, \quad -x_1 + \lambda x_2 - x_3 = 0, \quad -x_1 - x_2 + \lambda x_3 = 0, \quad \text{Ans. } \lambda = -1$$

$$11. \quad \text{Find the values of } k \text{ for which the following system of equations has a non-trivial solution.}$$

$$(3k - 8)x + 3y + 3z = 0, \quad 3x + (3k - 8)y + 3z = 0, \quad 3x + 3y + (3k - 8)z = 0 \quad (\text{AMIEETE, June 2010})$$

$$\text{Ans. } k = \frac{2}{3}, \frac{11}{3}$$

12. Solve the homogeneous system of equations :

$$4x + 3y - z = 0, \quad 3x + 4y + z = 0, \quad x - y - 2z = 0, \quad 5x + y - 4z = 0$$

**Ans.**  $x = k, y = -k, z = k$

13. If  $A = \begin{bmatrix} -1 & 2 & 1 \\ 3 & -1 & 2 \\ 0 & 1 & \lambda \end{bmatrix}$

**Ans.** (i)  $\lambda \neq 1$ , (ii)  $\lambda = 1$

find the values of  $\lambda$  for which equation  $AX = 0$  has (i) a unique solution, (ii) more than one solution.

14. Show that the following system of equations:

$$x + 2y - 2u = 0, \quad 2x - y - u = 0, \quad x + 2z - u = 0, \quad 4x - y + 3z - u = 0$$

do not have a non-trivial solution.

15. Determine the values of  $\lambda$  and  $\mu$  such that the following system has (i) no solution (ii) a unique solution (iii) infinite number of solutions:

$$2x - 5y + 2z = 8, \quad 2x + 4y + 6z = 5, \quad x + 2y + \lambda z = \mu$$

**Ans.** (i)  $\lambda = 3, \mu \neq \frac{5}{2}$  (ii)  $\lambda \neq 3, \mu = \frac{5}{2}$  (iii)  $\lambda = 3, \mu = \frac{5}{2}$

16. Test the following system of equations for consistency. If possible, solve for non-trivial solutions.

$$3x + 4y - z - 6t = 0, \quad 2x + 3y + 2z - 3t = 0, \quad 2x + y - 14z - 9t = 0, \quad x + 3y + 13z + 3t = 0$$

(A.M.I.E.T.E., Winter 2000) **Ans.**  $x = 11k_1 + 6k_2, y = -8k_1 - 3k_2, z = k_1, t = k_2$

17. Given the following system of equations

$$2x - 2y + 5z + 3z = 0, \quad 4x - y + z + w = 0, \quad 3x - 2y + 3z + 4w = 0, \quad x - 3y + 7z + 6w = 0$$

Reduce the coefficient matrix A into Echelon form and find the rank utilising the property of rank, test the given system of equation for consistency and if possible find the solution of the given system.

(A.M.I.E.T.E., Summer 2001) **Ans.**  $x = 5k, y = 36k, z = 7k, w = 9k$

18. Find the values of  $\lambda$  for which the equations

$$(2 - \lambda)x + 2y + 3 = 0, \quad 2x + (4 - \lambda)y + 7 = 0, \quad 2x + 5y + (6 - \lambda) = 0$$

are consistent and find the values of  $x$  and  $y$  corresponding to each of these values of  $\lambda$ .

(R.G.P.V, Bhopal I sem. 2003, 2001) **Ans.**  $\lambda = 1, -1, 12$ .

## 20.6 VECTORS

A  $n$ -tuple is a set of  $n$  similar things. If the place of every members of a set is fixed then it is called an *ordered* set. Any ordered  $n$ -tuple of numbers is called a  *$n$ -vector*. Thus the coordinates of a point in space is called 3-vector  $(x, y, z)$ . The members of a set are called the components of a vector so  $x, y, z$  in a 3-vector are called components.

$x_1, x_2, x_3, \dots, x_n$  are the components of a  $n$ -vector  $X = (x_1, x_2, x_3, \dots, x_n)$ .

Each row of a matrix is a vector and each column of the matrix is also a vector.

## 20.7 LINEAR DEPENDENCE AND INDEPENDENCE OF VECTORS

Vectors (matrices)  $X_1, X_2, \dots, X_n$  are said to be dependent if

(1) all the vectors (row or column matrices) are of the same order.

(2)  $n$  scalars  $\lambda_1, \lambda_2, \dots, \lambda_n$  (not all zero) exist such that

$$\lambda_1 X_1 + \lambda_2 X_2 + \lambda_3 X_3 + \dots + \lambda_n X_n = 0$$

Otherwise they are linearly independent.

**Remember:** If in a set of vectors, any vector of the set is the combination of the remaining vectors, then the vectors are called dependent vectors.

**Example 22.** Examine the following vectors for linear dependence and find the relation if it exists.

$$X_1 = (1, 2, 4), X_2 = (2, -1, 3), X_3 = (0, 1, 2), X_4 = (-3, 7, 2) \quad (\text{U.P., I Sem. Winter 2002})$$

**Solution.** Consider the matrix equation

$$\lambda_1 X_1 + \lambda_2 X_2 + \lambda_3 X_3 + \lambda_4 X_4 = 0$$

$$\Rightarrow \lambda_1 (1, 2, 4) + \lambda_2 (2, -1, 3) + \lambda_3 (0, 1, 2) + \lambda_4 (-3, 7, 2) = 0$$

$$\begin{aligned}\lambda_1 + 2\lambda_2 + 0\lambda_3 - 3\lambda_4 &= 0 \\ 2\lambda_1 - \lambda_2 + \lambda_3 + 7\lambda_4 &= 0 \\ 4\lambda_1 + 3\lambda_2 + 2\lambda_3 + 2\lambda_4 &= 0\end{aligned}$$

This is the homogeneous system

$$\begin{bmatrix} 1 & 2 & 0 & -3 \\ 2 & -1 & 1 & 7 \\ 4 & 3 & 2 & 2 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \\ \lambda_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \text{ or } A \lambda = 0$$

$$\begin{bmatrix} 1 & 2 & 0 & -3 \\ 0 & -5 & 1 & 13 \\ 0 & -5 & 2 & 14 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \\ \lambda_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - 4R_1$$

$$\begin{bmatrix} 1 & 2 & 0 & -3 \\ 0 & -5 & 1 & 13 \\ 0 & 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \\ \lambda_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad R_3 \rightarrow R_3 - R_2$$

$$\begin{aligned}\lambda_1 + 2\lambda_2 - 3\lambda_4 &= 0 \\ -5\lambda_2 + \lambda_3 + 13\lambda_4 &= 0 \\ \lambda_3 + \lambda_4 &= 0\end{aligned}$$

Let  $\lambda_4 = t, \lambda_3 + t = 0, \lambda_3 = -t$

$$-5\lambda_2 - t + 13t = 0, \lambda_2 = \frac{12t}{5}$$

$$\lambda_1 + \frac{24t}{5} - 3t = 0 \text{ or } \lambda_1 = \frac{-9t}{5}$$

Hence, the given vectors are linearly dependent.

Substituting the values of  $\lambda$  in (1), we get

$$\begin{aligned}-\frac{9tX_1}{5} + \frac{12t}{5}X_2 - tX_3 + tX_4 &= 0 \Rightarrow -\frac{9X_1}{5} + \frac{12X_2}{5} - X_3 + X_4 = 0 \\ \Rightarrow 9X_1 - 12X_2 + 5X_3 - 5X_4 &= 0 \quad \text{Ans.}\end{aligned}$$

**Example 23.** Define linear dependence and independence of vectors.

Examine for linear dependence [1, 0, 2, 1], [3, 1, 2, 1], [4, 6, 2, -4], [-6, 0, -3, -4] and find the relation between them, if possible.

**Solution.** Consider the matrix equation

$$\lambda_1 X_1 + \lambda_2 X_2 + \lambda_3 X_3 + \lambda_4 X_4 = 0 \quad \dots(1)$$

$$\lambda_1 (1, 0, 2, 1) + \lambda_2 (3, 1, 2, 1) + \lambda_3 (4, 6, 2, -4) + \lambda_4 (-6, 0, -3, -4) = 0$$

$$\lambda_1 + 3\lambda_2 + 4\lambda_3 - 6\lambda_4 = 0$$

$$0\lambda_1 + \lambda_2 + 6\lambda_3 + 0\lambda_4 = 0$$

$$2\lambda_1 + 2\lambda_2 + 2\lambda_3 - 3\lambda_4 = 0$$

$$\lambda_1 + \lambda_2 - 4\lambda_3 - 4\lambda_4 = 0$$

$$\begin{bmatrix} 1 & 3 & 4 & -6 \\ 0 & 1 & 6 & 0 \\ 2 & 2 & 2 & -3 \\ 1 & 1 & -4 & -4 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \\ \lambda_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 3 & 4 & -6 \\ 0 & 1 & 6 & 0 \\ 0 & -4 & -6 & 9 \\ 0 & -2 & -8 & 2 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \\ \lambda_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} \quad R_3 \rightarrow R_3 - 2R_1 \\ R_4 \rightarrow R_4 - R_1$$

$$\begin{bmatrix} 1 & 3 & 4 & -6 \\ 0 & 1 & 6 & 0 \\ 0 & 0 & 18 & 9 \\ 0 & 0 & 4 & 2 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \\ \lambda_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} \quad R_3 \rightarrow R_3 + 4R_2 \\ R_4 \rightarrow R_4 + 2R_2$$

$$\begin{bmatrix} 1 & 3 & 4 & -6 \\ 0 & 1 & 6 & 0 \\ 0 & 0 & 18 & 9 \\ 0 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \\ \lambda_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} \quad R_4 \rightarrow R_4 - \frac{2}{9}R_3$$

$$\begin{aligned} \lambda_1 + 3\lambda_2 + 4\lambda_3 - 6\lambda_4 &= 0 \\ \lambda_2 + 6\lambda_3 &= 0 \\ 18\lambda_3 + 9\lambda_4 &= 0 \end{aligned}$$

$$\text{Let } \lambda_4 = t, \quad 18\lambda_3 + 9t = 0 \text{ or } \lambda_3 = \frac{-t}{2} \\ \lambda_2 - 3t = 0 \text{ or } \lambda_2 = 3t \\ \lambda_1 + 9t - 2t - 6t = 0 \\ \lambda_1 = -t$$

Substituting the values of  $\lambda_1, \lambda_2, \lambda_3$  and  $\lambda_4$  in (1), we get

$$-tX_1 + 3tX_2 - \frac{t}{2}X_3 + tX_4 = 0 \text{ or } 2X_1 - 6X_2 + X_3 - 2X_4 = 0$$

**Ans.**

**Example 24.** Show that row vectors of the matrix

$$\begin{bmatrix} 1 & 2 & -2 \\ -1 & 3 & 0 \\ 0 & -2 & 1 \end{bmatrix} \text{ are linearly independent.} \quad (\text{U.P., I Sem, Dec 2009})$$

**Solution.** Here, we have three vectors

$$\begin{aligned} X_1 &= (1, 2, -2)' \\ X_2 &= (-1, 3, 0)' \\ X_3 &= (0, -2, 1)' \\ X_1 &= \begin{bmatrix} 1 \\ 2 \\ -2 \end{bmatrix}, X_2 = \begin{bmatrix} -1 \\ 3 \\ 0 \end{bmatrix}, X_3 = \begin{bmatrix} 0 \\ -2 \\ 1 \end{bmatrix} \end{aligned}$$

Consider the equation

$$\lambda_1 X_1 + \lambda_2 X_2 + \lambda_3 X_3 = 0 \quad \dots(1)$$

$$\begin{aligned} \lambda_1 \begin{bmatrix} 1 \\ 2 \\ -2 \end{bmatrix} + \lambda_2 \begin{bmatrix} -1 \\ 3 \\ 0 \end{bmatrix} + \lambda_3 \begin{bmatrix} 0 \\ -2 \\ 1 \end{bmatrix} &= \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\ \lambda_1 - \lambda_2 + 0\lambda_3 &= 0 \\ 2\lambda_1 + 3\lambda_2 - 2\lambda_3 &= 0 \end{aligned}$$

$$-2\lambda_1 + 0\lambda_2 + \lambda_3 = 0$$

which is the system of homogeneous equations

$$\begin{bmatrix} 1 & -1 & 0 \\ 2 & 3 & -2 \\ -2 & 0 & 1 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 1 & -1 & 0 \\ 0 & 5 & -2 \\ 0 & -2 & 1 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$R_2 \rightarrow R_2 - 2R_1$

$R_3 \rightarrow R_3 + 2R_1$

$$\begin{bmatrix} 1 & -1 & 0 \\ 0 & 5 & -2 \\ 0 & 0 & \frac{1}{5} \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$R_3 \rightarrow R_3 + \frac{2}{5}R_2$

$$\lambda_1 - \lambda_2 = 0 \quad \dots(2)$$

$$5\lambda_2 - 2\lambda_3 = 0 \quad \dots(3)$$

$$\frac{1}{5}\lambda_3 = 0 \Rightarrow \lambda_3 \quad \dots(4)$$

Putting the value of  $\lambda_3$  in (3), we get

$$5\lambda_2 - 2(0) = 0 \Rightarrow \lambda_2 = 0$$

Putting the value of  $\lambda_2$  in (2), we get

$$\lambda_1 - 0 = 0 \Rightarrow \lambda_1 = 0$$

Thus non zero values of  $\lambda_1, \lambda_2, \lambda_3$  do not exist which can satisfy (1). Hence by definition the given system of vectors is linearly independent. **Proved.**

## 20.8 LINEARLY DEPENDENCE AND INDEPENDENCE OF VECTORS BY RANK METHOD

1. If the rank of the matrix of the given vectors is equal to number of vectors, then the vectors are linearly independent.
2. If the rank of the matrix of the given vectors is less than the number of vectors, then the vectors are linearly dependent.

**Example 25.** Show using a matrix that the set of vectors

$$X = [1, 2, -3, 4], Y = [3, -1, 2, 1], Z = [1, -5, 8, -7] \text{ is linearly dependent.}$$

**Solution.** Here, we have

$$X = [1, 2, -3, 4], Y = [3, -1, 2, 1], Z = [1, -5, 8, -7]$$

Let us form a matrix of the above vectors

$$\begin{bmatrix} 1 & 2 & -3 & 4 \\ 3 & -1 & 2 & 1 \\ 1 & -5 & 8 & -7 \end{bmatrix} \sim \begin{bmatrix} 1 & 2 & -3 & 4 \\ 0 & -7 & 11 & -11 \\ 0 & -7 & 11 & -11 \end{bmatrix} R_2 \rightarrow R_2 - 3R_1 \sim \begin{bmatrix} 1 & 2 & -3 & 4 \\ 0 & -7 & 11 & -11 \\ 0 & 0 & 0 & 0 \end{bmatrix} R_3 \rightarrow R_3 - R_1 \sim \begin{bmatrix} 1 & 2 & -3 & 4 \\ 0 & -7 & 11 & -11 \\ 0 & 0 & 0 & 0 \end{bmatrix} R_3 \rightarrow R_3 - R_2$$

Here the rank of the matrix = 2 < Number of vectors

Hence, vectors are linearly dependent. **Proved.**

**Example 26.** Show using a matrix that the set of vectors : [2, 5, 2, -3], [3, 6, 5, 2], [4, 5, 14, 14], [5, 10, 8, 4] is linearly independent.

**Solution.** Here, the given vectors are

$$[2, 5, 2, -3], [3, 6, 5, 2], [4, 5, 14, 14], [5, 10, 8, 4]$$

Let us form a matrix of the above vectors :

$$\begin{bmatrix} 2 & 5 & 2 & -3 \\ 3 & 6 & 5 & 2 \\ 4 & 5 & 14 & 14 \\ 5 & 10 & 8 & 4 \end{bmatrix} \sim \begin{bmatrix} 2 & 5 & 2 & -3 \\ 1 & 1 & 3 & 5 \\ 1 & -1 & 9 & 12 \\ 1 & 5 & -6 & -10 \end{bmatrix} R_2 \rightarrow R_2 - R_1$$

$R_3 \rightarrow R_3 - R_2$

$R_4 \rightarrow R_4 - R_3$

$$\begin{array}{l}
 \sim \left[ \begin{array}{cccc} 1 & 1 & 3 & 5 \\ 2 & 5 & 2 & -3 \\ 1 & -1 & 9 & 12 \\ 1 & 5 & -6 & -10 \end{array} \right] R_1 \leftrightarrow R_2 \quad \sim \left[ \begin{array}{cccc} 1 & 1 & 3 & 5 \\ 0 & 3 & -4 & -13 \\ 0 & -2 & 6 & 7 \\ 0 & 4 & -9 & -15 \end{array} \right] R_2 \rightarrow R_2 - 2R_1 \\
 \sim \left[ \begin{array}{cccc} 1 & 1 & 3 & 5 \\ 0 & 3 & -4 & -13 \\ 0 & 0 & \frac{10}{3} & -\frac{5}{3} \\ 0 & 0 & -\frac{11}{3} & \frac{7}{3} \end{array} \right] R_3 \rightarrow R_3 + \frac{2}{3}R_2 \quad \sim \left[ \begin{array}{cccc} 1 & 1 & 3 & 5 \\ 0 & 3 & -4 & -13 \\ 0 & 0 & \frac{10}{3} & -\frac{5}{3} \\ 0 & 0 & 0 & \frac{1}{2} \end{array} \right] R_4 \rightarrow R_4 + \frac{11}{10}R_3
 \end{array}$$

Here, the rank of the matrix = 4 = Number of vectors  
Hence, the vectors are linearly independent.

**Proved.**

### EXERCISE 20.2

Examine the following system of vectors for linear dependence. If dependent, find the relation between them.

1.  $X_1 = (1, -1, 1), X_2 = (2, 1, 1), X_3 = (3, 0, 2)$ . **Ans.** Dependent,  $X_1 + X_2 - X_3 = 0$
2.  $X_1 = (1, 2, 3), X_2 = (2, -2, 6)$ . **Ans.** Independent
3.  $X_1 = (3, 1, -4), X_2 = (2, 2, -3), X_3 = (0, -4, 1)$ . **Ans.** Dependent,  $2X_1 - 3X_2 - X_3 = 0$
4.  $X_1 = (1, 1, 1, 3), X_2 = (1, 2, 3, 4), X_3 = (2, 3, 4, 7)$ . **Ans.** Dependent,  $X_1 + X_2 - X_3 = 0$
5.  $X_1 = (1, 1, -1, 1), X_2 = (1, -1, 2, -1), X_3 = (3, 1, 0, 1)$ . **Ans.** Dependent,  $2X_1 + X_2 - X_3 = 0$
6.  $X_1 = (1, -1, 2, 0), X_2 = (2, 1, 1, 1), X_3 = (3, -1, 2, -1), X_4 = (3, 0, 3, 1)$ . **Ans.** Dependent,  $X_1 + X_2 - X_4 = 0$
7. Show that the column vectors of following matrix A are linearly independent:

$$A = \begin{bmatrix} 1 & 0 & 0 \\ 6 & 2 & 1 \\ 4 & 3 & 2 \end{bmatrix}$$

8. Show that the vectors  $x_1 = (2, 3, 1, -1), x_2 = (2, 3, 1, -2), x_3 = (4, 6, 2, 1)$  are linearly dependent. Express one of the vectors as linear combination of the others.
9. Find whether or not the following set of vectors are linearly dependent or independent:  
(i)  $(1, -2), (2, 1), (3, 2)$       (ii)  $(1, 1, 1, 1), (0, 1, 1, 1), (0, 0, 1, 1), (0, 0, 0, 1)$ .  
**Ans.** (i) Dependent (ii) Independent
10. Show that the vectors  $x_1 = (a_1, b_1), x_2 = (a_2, b_2)$  are linearly dependent if  $a_1 b_2 - a_2 b_1 = 0$ .

### 20.9 ANOTHER METHOD (ADJOINT METHOD) TO SOLVE LINEAR EQUATIONS

Let the equations be

$$\begin{aligned}
 a_1 x + a_2 y + a_3 z &= d_1 \\
 b_1 x + b_2 y + b_3 z &= d_2 \\
 c_1 x + c_2 y + c_3 z &= d_3
 \end{aligned}$$

We write the above equations in the matrix form

$$\begin{bmatrix} a_1 x + a_2 y + a_3 z \\ b_1 x + b_2 y + b_3 z \\ c_1 x + c_2 y + c_3 z \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix} \text{ or } \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix} \quad AX = B \quad \dots(1)$$

$$\text{where } A = \begin{bmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{bmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } B = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$$

Multiplying (1) by  $A^{-1}$ .

$$A^{-1}AX = A^{-1}B \text{ or } IX = A^{-1}B \text{ or } X = A^{-1}B.$$

**Example 27.** Solve, with the help of matrices, the simultaneous equations

$$x + y + z = 3, \quad x + 2y + 3z = 4, \quad x + 4y + 9z = 6 \quad (\text{A.M.I.E., Summer 2004, 2003})$$

**Solution.** The given equations in the matrix form are written as below:

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 4 & 9 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ 4 \\ 6 \end{bmatrix}$$

$$AX = B$$

where

$$A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 4 & 9 \end{bmatrix}, \quad X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}, \quad B = \begin{bmatrix} 3 \\ 4 \\ 6 \end{bmatrix}$$

Now we have to find out the  $A^{-1}$ .

$$|A| = 1 \times 6 + 1 \times (-6) + 1 \times 2 = 6 - 6 + 2 = 2$$

$$\text{Matrix of co-factors} = \begin{bmatrix} 6 & -6 & 2 \\ -5 & 8 & -3 \\ 1 & -2 & 1 \end{bmatrix}, \quad \text{Adjoint } A = \begin{bmatrix} 6 & -5 & 1 \\ -6 & 8 & -2 \\ 2 & -3 & 1 \end{bmatrix}$$

$$A^{-1} = \frac{1}{|A|} \text{Adjoint } A = \frac{1}{2} \begin{bmatrix} 6 & -5 & 1 \\ -6 & 8 & -2 \\ 2 & -3 & 1 \end{bmatrix}$$

$$X = A^{-1}B = \frac{1}{2} \begin{bmatrix} 6 & -5 & 1 \\ -6 & 8 & -2 \\ 2 & -3 & 1 \end{bmatrix} \begin{bmatrix} 3 \\ 4 \\ 6 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \frac{1}{2} \begin{bmatrix} 18 - 20 + 6 \\ -18 + 32 - 12 \\ 6 - 12 + 6 \end{bmatrix} = \frac{1}{2} \begin{bmatrix} 4 \\ 2 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 0 \end{bmatrix}$$

$$x = 2, y = 1, z = 0$$

Ans.

**Example 28.** Given the matrices

$$A \equiv \begin{bmatrix} 1 & 2 & 3 \\ 3 & -1 & 1 \\ 4 & 2 & 1 \end{bmatrix}, \quad X \equiv \begin{bmatrix} x \\ y \\ z \end{bmatrix} \text{ and } C \equiv \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

Write down the linear equations given by  $AX = C$  and solve for  $x, y, z$  by the matrix method.

**Solution.**

$$AX = C$$

$$\begin{bmatrix} 1 & 2 & 3 \\ 3 & -1 & 1 \\ 4 & 2 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

$$X = A^{-1} \cdot C$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 & 2 & 3 \\ 3 & -1 & 1 \\ 4 & 2 & 1 \end{bmatrix}^{-1} \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

$$\text{Matrix of co-factors of } A = \begin{bmatrix} -3 & 1 & 10 \\ 4 & -11 & 6 \\ 5 & 8 & -7 \end{bmatrix}$$

$$|A| = 1(-3) + 2(1) + 3(10) = -3 + 2 + 30 = 29$$

$$\text{Adj. } A = \begin{bmatrix} -3 & 4 & 5 \\ 1 & -11 & 8 \\ 10 & 6 & -7 \end{bmatrix}$$

$$A^{-1} = \frac{1}{|A|} \text{Adj. } A = \frac{1}{29} \begin{bmatrix} -3 & 4 & 5 \\ 1 & -11 & 8 \\ 10 & 6 & -7 \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \frac{1}{29} \begin{bmatrix} -3 & 4 & 5 \\ 1 & -11 & 8 \\ 10 & 6 & -7 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \frac{1}{29} \begin{bmatrix} -3 & +8 & +15 \\ 1 & -22 & +24 \\ 10 & +12 & -21 \end{bmatrix} = \frac{1}{29} \begin{bmatrix} 20 \\ 3 \\ 1 \end{bmatrix} = \begin{bmatrix} \frac{20}{29} \\ \frac{3}{29} \\ \frac{1}{29} \end{bmatrix}$$

Hence,  $x = \frac{20}{29}, y = \frac{3}{29}, z = \frac{1}{29}$  Ans.

**Example 29.** By the method of matrix, inversion, solve the system.

$$\begin{bmatrix} 1 & 1 & 1 \\ 2 & 5 & 7 \\ 2 & 1 & -1 \end{bmatrix} \begin{bmatrix} x & u \\ y & v \\ z & w \end{bmatrix} = \begin{bmatrix} 9 & 2 \\ 52 & 15 \\ 0 & -1 \end{bmatrix}$$

$$\text{Solution. } \begin{bmatrix} 1 & 1 & 1 \\ 2 & 5 & 7 \\ 2 & 1 & -1 \end{bmatrix} \begin{bmatrix} x & u \\ y & v \\ z & w \end{bmatrix} = \begin{bmatrix} 9 & 2 \\ 52 & 15 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} x & u \\ y & v \\ z & w \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \\ 2 & 5 & 7 \\ 2 & 1 & -1 \end{bmatrix}^{-1} \begin{bmatrix} 9 & 2 \\ 52 & 15 \\ 0 & -1 \end{bmatrix}$$

$$= \frac{-1}{4} \begin{bmatrix} -12 & 2 & 2 \\ 16 & -3 & -5 \\ -8 & 1 & 3 \end{bmatrix} \begin{bmatrix} 9 & 2 \\ 52 & 15 \\ 0 & -1 \end{bmatrix} = \frac{-1}{4} \begin{bmatrix} -4 & 4 \\ -12 & -8 \\ -20 & -4 \end{bmatrix} = \begin{bmatrix} 1 & -1 \\ 3 & 2 \\ 5 & 1 \end{bmatrix}$$

$$x = 1, \quad u = -1$$

$$y = 3, \quad v = 2$$

$$z = 5, \quad w = 1$$

Ans.

### EXERCISE 20.3

Solve the following equations

1.  $3x + y + 2z = 3, 2x - 3y - z = -3, x + 2y + z = 4$

(A.M.I.E. Winter 2001)

Ans.  $x = 1, y = 2, z = -1$

2.  $x + 2y + 3z = 1, 2x + 3y + 8z = 2, x + y + z = 3$

Ans.  $x = \frac{9}{2}, y = -1, z = -\frac{1}{2}$

3.  $4x + 2y - z = 9, x - y + 3z = -4, 2x + z = 1$

Ans.  $x = 1, y = 2, z = -1$

4.  $5x + 3y + 3z = 48, 2x + 6y - 3z = 18, 8x - 3y + 2z = 21$

Ans.  $x = 3, y = 5, z = 6$

5.  $x + y + z = 6, x - y + 2z = 5, 3x + y + z = 8$

Ans.  $x = 1, y = 2, z = 3$

6.  $x + 2y + 3z = 1, 3x - 2y + z = 2, 4x + 2y + z = 3$  **Ans.**  $x = \frac{7}{10}, y = \frac{3}{40}, z = \frac{1}{20}$
7.  $9x + 4y + 3z = -1, 5x + y + 2z = 1, 7x + 3y + 4z = 1$  **Ans.**  $x = 0, y = -1, z = 1$
8.  $x + y + z = 8, x - y + 2z = 6, 9x + 5y - 7z = 14$  **Ans.**  $x = 5, y = \frac{5}{3}, z = \frac{4}{3}$
9.  $3x + 2y + 4z = 7, 2x + y + z = 4, x + 3y + 5z = 2$  **Ans.**  $x = \frac{9}{4}, y = -\frac{9}{8}, z = \frac{5}{8}$
10. Represent each of the transformations  
 $x_1 = 3y_1 + 2y_2, x_2 = -y_1 + 4y_2$  and  $y_1 = z_1 + 2z_2, y_2 = -3z_1$   
by the use of matrices, find the composite transformation which expresses  $x_1, x_2$  in terms  
of  $z_1, z_2$ . **Ans.**  $x_1 = -3z_1 + 6z_2, x_2 = -13z_1 - 2z_2$

## 20.10 PARTITIONING OF MATRICES

**Sub matrix.** A matrix obtained by deleting some of the rows and columns of a matrix  $A$  is said to be sub matrix.

For example,  $A = \begin{bmatrix} 4 & 1 & 0 \\ 5 & 2 & 1 \\ 6 & 3 & 4 \end{bmatrix}$ , then  $\begin{bmatrix} 4 & 1 \\ 5 & 2 \end{bmatrix}, \begin{bmatrix} 5 & 2 \\ 6 & 3 \end{bmatrix}, \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}$  are the sub matrices.

**Partitioning:** A matrix may be subdivided into sub matrices by drawing lines parallel to its rows and columns. These sub matrices may be considered as the elements of the original matrix.

For example,

$$A = \begin{bmatrix} 2 & 1 & : & 0 & 4 & 1 \\ 1 & 0 & : & 2 & 3 & 4 \\ \dots & \dots & : & \dots & \dots & \dots \\ 4 & 5 & : & 1 & 6 & 5 \end{bmatrix}$$

$$A_{11} = \begin{bmatrix} 2 & 1 \\ 1 & 0 \end{bmatrix}, \quad A_{12} = \begin{bmatrix} 0 & 4 & 1 \\ 2 & 3 & 4 \end{bmatrix}$$

$$A_{21} = [4 \ 5], \quad A_{22} = [1 \ 6 \ 5]$$

Then we may write  $A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}$

So, the matrix is partitioned. The dotted lines divide the matrix into sub-matrices.  $A_{11}, A_{12}, A_{21}, A_{22}$  are the sub-matrices but behave like elements of the original matrix  $A$ . The matrix  $A$  can be partitioned in several ways.

**Addition by submatrices:** Let  $A$  and  $B$  be two matrices of the same order and are partitioned identically.

For example;

$$A = \begin{bmatrix} 2 & 3 & 4 & : & 5 \\ 0 & 1 & 2 & : & 3 \\ \dots & \dots & \dots & : & \dots \\ 3 & 4 & 5 & : & 6 \\ \dots & \dots & \dots & : & \dots \\ 4 & 5 & 0 & : & 1 \end{bmatrix} \quad B = \begin{bmatrix} 3 & 1 & 4 & : & 6 \\ 2 & 1 & 0 & : & 4 \\ \dots & \dots & \dots & : & \dots \\ 4 & 5 & 1 & : & 2 \\ \dots & \dots & \dots & : & \dots \\ 1 & 3 & 4 & : & 5 \end{bmatrix}$$

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \\ A_{31} & A_{32} \end{bmatrix}, \quad B = \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \\ B_{31} & B_{32} \end{bmatrix}$$

$$A + B = \begin{bmatrix} A_{11} + B_{11} & A_{12} + B_{12} \\ A_{21} + B_{21} & A_{22} + B_{22} \\ A_{31} + B_{31} & A_{32} + B_{32} \end{bmatrix}$$

### 20.11 MULTIPLICATION BY SUB-MATRICES

Two matrices  $A$  and  $B$ , which are conformable to the product  $AB$  are partitioned in such a way that the columns of  $A$  partitioned in the same way as the rows of  $B$  are partitioned. But the rows of  $A$  and columns of  $B$  can be partitioned in any way.

*For example,* Here  $A$  is a  $3 \times 4$  matrix and  $B$  is  $4 \times 3$  matrix.

$$A = \begin{bmatrix} 1 & 2 & 3 & : & 4 \\ 0 & 1 & 2 & : & 3 \\ 1 & 4 & 1 & : & 2 \end{bmatrix} \text{ and } B = \begin{bmatrix} 4 & 5 & 6 \\ 3 & 2 & 1 \\ 1 & 0 & 4 \\ \dots & \dots & \dots \\ 2 & 5 & 3 \end{bmatrix}$$

The partitioning of the columns of  $A$  is the same as the partitioning of the rows of  $B$ . Here,  $A$  is partitioned after third column,  $B$  has been partitioned after third row.

**Example 30.** If  $C$  and  $D$  are two non-singular matrices, show that if

$$A = \begin{bmatrix} C & 0 \\ 0 & D \end{bmatrix}, \text{ then } A^{-1} = \begin{bmatrix} C^{-1} & 0 \\ 0 & D^{-1} \end{bmatrix}$$

**Solution.** Let  $A^{-1} = \begin{bmatrix} E & F \\ G & H \end{bmatrix}$  ... (1)

Then  $AA^{-1} = \begin{bmatrix} C & 0 \\ 0 & D \end{bmatrix} \begin{bmatrix} E & F \\ G & H \end{bmatrix} = \begin{bmatrix} CE + 0G & CF + 0H \\ 0E + DG & 0F + DH \end{bmatrix}$

So that  $\begin{bmatrix} CE + 0G & CF + 0H \\ 0E + DG & 0F + DH \end{bmatrix} = \begin{bmatrix} I & 0 \\ 0 & I \end{bmatrix}$

$$CE + 0G = I \Rightarrow CE = I$$

$$CF + 0H = 0 \Rightarrow CF = 0$$

$$0E + DG = 0 \Rightarrow DG = 0$$

$$0F + DH = I \Rightarrow DH = I$$

Since,  $C$  is non singular and  $CF = 0$ ,  $\therefore F = 0$

$$CE = I \Rightarrow E = C^{-1}$$

Similarly,  $D$  is non singular and  $DG = 0 \Rightarrow G = 0$  and  $DH = I \Rightarrow H = D^{-1}$

Putting these values in (1), we get

$$A^{-1} = \begin{bmatrix} C^{-1} & 0 \\ 0 & D^{-1} \end{bmatrix}$$

**Proved.**

**Inverse By Partitioning:** Let the matrix  $B$  be the inverse of the matrix  $A$ . Matrices  $A$  and  $B$  are partitioned as

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}, \quad B = \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix}$$

Since,

$$AB = BA = I$$

$$\begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} = \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} = \begin{bmatrix} I & 0 \\ 0 & I \end{bmatrix}$$

$$\begin{bmatrix} A_{11}B_{11} + A_{12}B_{21} & A_{11}B_{12} + A_{12}B_{22} \\ A_{21}B_{11} + A_{22}B_{21} & A_{21}B_{12} + A_{22}B_{22} \end{bmatrix} = \begin{bmatrix} B_{11}A_{11} + B_{12}A_{21} & B_{11}A_{12} + B_{12}A_{22} \\ B_{21}A_{11} + B_{22}A_{21} & B_{21}A_{12} + B_{22}A_{22} \end{bmatrix} = \begin{bmatrix} I & 0 \\ 0 & I \end{bmatrix}$$

Let us solve the equations for  $B_{11}, B_{12}, B_{21}$  and  $B_{22}$ .

Let,

$$B_{22} = M^{-1}$$

From (2),

$$B_{12} = -A_{11}^{-1}(A_{22}B_{22}) = -(A_{11}^{-1}A_{22})M^{-1}$$

From (3),

$$B_{21} = -(B_{22}A_{21})A_{11}^{-1} = -M^{-1}(A_{21}A_{11}^{-1})$$

From (1),

$$\begin{aligned} B_{11} &= A_{11}^{-1} - A_{11}^{-1}(A_{12}B_{21}) = A_{11}^{-1} - (A_{11}^{-1}A_{12})B_{21} \\ &= A_{11}^{-1} + (A_{11}^{-1}A_{12})M^{-1}(A_{21}A_{11}^{-1}) \end{aligned}$$

Here

$$M = A_{22} - A_{21}(A_{11}^{-1}A_{22})$$

**Note:** A is usually taken of order  $n - 1$ .

**Example 31.** Find the inverse of the following matrix by partitioning

$$\begin{bmatrix} 1 & 3 & 3 \\ 1 & 4 & 3 \\ 1 & 3 & 4 \end{bmatrix}$$

**Solution.** Let the matrix be partitioned into four submatrices as follows:

$$\text{Let } A = \begin{bmatrix} 1 & 3 & 3 \\ 1 & 4 & 3 \\ 1 & 3 & 4 \end{bmatrix}$$

$$A_{11} = \begin{bmatrix} 1 & 3 \\ 1 & 4 \end{bmatrix}; A_{12} = \begin{bmatrix} 3 \\ 3 \end{bmatrix}$$

$$A_{21} = [1 \ 3]; A_{22} = [4]$$

We have to find  $A^{-1} = \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix}$  where

$$B_{11} = A_{11}^{-1} + (A_{11}^{-1}A_{12})(M^{-1})(A_{21}A_{11}^{-1})$$

$$B_{21} = -M^{-1}(A_{21}A_{11}^{-1})$$

$$B_{12} = -A_{11}^{-1}A_{12}M^{-1}; B_{22} = M^{-1}$$

and

$$M = A_{22} - A_{21}(A_{11}^{-1}A_{22})$$

Now

$$A_{11}^{-1} = \begin{bmatrix} 4 & -3 \\ -1 & 1 \end{bmatrix}; A_{11}^{-1}A_{12} = \begin{bmatrix} 4 & -3 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 3 \\ 3 \end{bmatrix} = \begin{bmatrix} 3 \\ 0 \end{bmatrix}$$

$$A_{21}A_{11}^{-1} = [1 \ 3] \begin{bmatrix} 4 & -3 \\ -1 & 1 \end{bmatrix} = [1 \ 0]$$

$$M = [4] - [1 \ 3] \begin{bmatrix} 3 \\ 0 \end{bmatrix} = [4] - [3] = [1]$$

$$M^{-1} = [1]$$

$$\therefore \begin{aligned} B_{11} &= \begin{bmatrix} 4 & -3 \\ -1 & 1 \end{bmatrix} + \begin{bmatrix} 3 \\ 0 \end{bmatrix} [1 \ 0] = \begin{bmatrix} 4 & -3 \\ -1 & 1 \end{bmatrix} + \begin{bmatrix} 3 & 0 \\ 0 & 0 \end{bmatrix} \Rightarrow B_{11} = \begin{bmatrix} 7 & -3 \\ -1 & 1 \end{bmatrix} \\ B_{21} &= -[1] [1 \ 0] = -[1 \ 0] \\ B_{12} &= -\begin{bmatrix} 3 \\ 0 \end{bmatrix} \\ B_{22} &= [1] \\ A^{-1} &= \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} = \begin{bmatrix} 7 & -3 & -3 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix} \end{aligned}$$

**Ans.**

**Example 32.** Find the inverse of  $A = \begin{bmatrix} 1 & 2 & 3 & 1 \\ 1 & 3 & 3 & 2 \\ 2 & 4 & 3 & 3 \\ 1 & 1 & 1 & 1 \end{bmatrix}$  by partitioning.

**Solution.** (a) Take  $G_3 = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 3 \end{bmatrix}$  and partition so that

$$A_{11} = \begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix}, A_{12} = \begin{bmatrix} 3 \\ 3 \end{bmatrix}, A_{21} = [2 \ 4], \text{ and } A_{22} = [3]$$

Now,  $A_{11}^{-1} = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix}, A_{11}^{-1} A_{12} = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 3 \\ 3 \end{bmatrix} = \begin{bmatrix} 3 \\ 0 \end{bmatrix}$ ,

$$A_{21} A_{11}^{-1} = [2 \ 4] \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix} = [2 \ 0]$$

$$M = A_{22} - A_{21} (A_{11}^{-1} A_{12}) = [3] - [2 \ 4] \begin{bmatrix} 3 \\ 0 \end{bmatrix} = [-3], \text{ And } M^{-1} = [-1/3]$$

Then

$$\begin{aligned} B_{11} &= A_{11}^{-1} + (A_{11}^{-1} A_{12}) M^{-1} (A_{21} A_{11}^{-1}) = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix} + \begin{bmatrix} 3 \\ 0 \end{bmatrix} \begin{bmatrix} -1 \\ 3 \end{bmatrix} [2 \ 0] = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix} - \begin{bmatrix} 2 & 0 \\ 0 & 0 \end{bmatrix} \\ &= \frac{1}{3} \begin{bmatrix} 3 & -6 \\ -3 & 3 \end{bmatrix} \end{aligned}$$

$$B_{12} = -(A_{11}^{-1} A_{12}) M^{-1} = \frac{1}{3} \begin{bmatrix} 3 \\ 0 \end{bmatrix}$$

$$B_{21} = -M^{-1} (A_{21} A_{11}^{-1}) = \frac{1}{3} [2 \ 0]$$

$$B_{22} = M^{-1} = \begin{bmatrix} -1 \\ 3 \end{bmatrix}$$

and

$$G_3^{-1} = \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} = \frac{1}{3} \begin{bmatrix} 3 & -6 & 3 \\ -3 & 3 & 0 \\ 2 & 0 & -1 \end{bmatrix}$$

(b) Partition  $A$  so that  $A_{11} = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 3 \end{bmatrix}, A_{12} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}, A_{21} = [1 \ 1 \ 1], \text{ and } A_{22} = [1]$ .

Now,  $A_{11}^{-1} = \frac{1}{3} \begin{bmatrix} 3 & -6 & 3 \\ -3 & 3 & 0 \\ 2 & 0 & -1 \end{bmatrix}$ ,  $A_{11}^{-1} A_{12} = \frac{1}{3} \begin{bmatrix} 0 \\ 3 \\ -1 \end{bmatrix}$ ,  $A_{21} A_{11}^{-1} = \frac{1}{3} \begin{bmatrix} 2 & -3 & 2 \end{bmatrix}$

$$M = [1] - [1 \ 1 \ 1] \left( \frac{1}{3} \begin{bmatrix} 1 \\ 3 \\ -1 \end{bmatrix} \right) = \begin{bmatrix} 1 \\ 3 \\ -1 \end{bmatrix} \text{ and } M^{-1} = [3]$$

Then  $B_{11} = \frac{1}{3} \begin{bmatrix} 3 & -6 & 3 \\ -3 & 3 & 0 \\ 2 & 0 & -1 \end{bmatrix} + \frac{1}{3} \begin{bmatrix} 0 \\ 3 \\ -1 \end{bmatrix} [3] \frac{1}{3} \begin{bmatrix} 2 & -3 & 2 \end{bmatrix}$

$$= \frac{1}{3} \begin{bmatrix} 3 & -6 & 3 \\ -3 & 3 & 0 \\ 2 & 0 & -1 \end{bmatrix} + \frac{1}{3} \begin{bmatrix} 0 & 0 & 0 \\ 6 & -9 & 6 \\ -2 & 3 & -2 \end{bmatrix} = \begin{bmatrix} 1 & -2 & 1 \\ 1 & -2 & 2 \\ 0 & 1 & -1 \end{bmatrix}$$

$$B_{12} = \begin{bmatrix} 0 \\ -3 \\ 1 \end{bmatrix}, \quad B_{21} = [-2 \ 3 \ -2], \quad B_{22} = [3]; \quad A^{-1} = \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} = \begin{bmatrix} 1 & -2 & 2 & -3 \\ 0 & 1 & -1 & 1 \\ -2 & 3 & -2 & 3 \end{bmatrix} \text{ Ans.}$$

**EXERCISE 20.4**

1. Compute  $A + B$  using partitioning

$$A = \begin{bmatrix} 4 & 1 & 0 & 5 \\ 6 & 7 & 8 & 1 \\ 0 & 2 & 1 & 1 \\ 1 & 2 & 0 & 1 \end{bmatrix}, \quad B = \begin{bmatrix} 3 & 2 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 2 & 1 & 2 & 1 \\ 0 & 1 & 2 & 3 \end{bmatrix}$$

$$\text{Ans. } \begin{bmatrix} 7 & 3 & 1 & 6 \\ 7 & 7 & 9 & 2 \\ 2 & 3 & 3 & 2 \\ 1 & 3 & 2 & 4 \end{bmatrix}$$

2. Compute  $AB$  using partitioning

$$A = \begin{bmatrix} 1 & 2 & 0 & 1 \\ 4 & 1 & 3 & 2 \\ 2 & 1 & 3 & 0 \end{bmatrix}, \quad B = \begin{bmatrix} 2 & 3 & 1 \\ 0 & 1 & 4 \\ 4 & 1 & 2 \\ 2 & 1 & 2 \end{bmatrix}$$

$$\text{Ans. } \begin{bmatrix} 4 & 6 & 11 \\ 24 & 18 & 18 \\ 16 & 10 & 12 \end{bmatrix}$$

3. Find the inverse of  $\begin{bmatrix} A & B \\ C & 0 \end{bmatrix}$  where  $B, C$  are non-singular.

$$\text{Ans. } \begin{bmatrix} 0 & C^{-1} \\ B^{-1} & -B^{-1} AC^{-1} \end{bmatrix}$$

**Find the inverse of the following metrics by partitioning:**

$$4. \begin{bmatrix} 2 & 1 & -1 \\ 1 & 3 & 2 \\ -1 & 2 & 1 \end{bmatrix}$$

$$6. \begin{bmatrix} 2 & 3 & 4 \\ 4 & 3 & 1 \\ 1 & 2 & 4 \end{bmatrix}$$

$$8. \begin{bmatrix} 3 & 4 & 2 & 7 \\ 2 & 3 & 3 & 2 \\ 52 & 7 & 3 & 9 \\ 2 & 3 & 2 & 3 \end{bmatrix}$$

$$\text{Ans. } \frac{1}{10} \begin{bmatrix} 1 & 3 & -5 \\ 3 & -1 & 5 \\ -5 & 5 & -5 \end{bmatrix}$$

$$\text{Ans. } \frac{1}{5} \begin{bmatrix} -10 & 4 & 9 \\ 15 & -4 & -14 \\ -5 & 1 & 6 \end{bmatrix}$$

$$\text{Ans. } \begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & 5 \\ 3 & 5 & 6 \end{bmatrix}$$

$$5. \begin{bmatrix} 1 & 2 & -1 \\ -1 & 1 & 2 \\ 2 & -1 & 1 \end{bmatrix}$$

$$7. \begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & 5 \\ 3 & 5 & 6 \end{bmatrix}$$

$$\text{Ans. } \begin{bmatrix} 3 & -1 & 5 \\ 5 & 3 & -1 \\ -1 & 5 & 3 \end{bmatrix}$$

$$\text{Ans. } \begin{bmatrix} 1 & -3 & 2 \\ -3 & 3 & -1 \\ 2 & -1 & 0 \end{bmatrix}$$

$$\text{Ans. } \frac{1}{14} \begin{bmatrix} -1 & 11 & 7 & -26 \\ -1 & -7 & -3 & 16 \\ 1 & 1 & -1 & 0 \\ 1 & -1 & -1 & 2 \end{bmatrix}$$

**Choose the correct answer:**

9. If  $3x + 2y + z = 0$ ,  $x + 4y + z = 0$ ,  $2x + y + 4z = 0$ , be a system of equations then

(i) System is inconsistent      (ii) it has only trivial solution

(iii) it can be reduced to a single equation thus solution does not exist

(iv) Determinant of the coefficient matrix is zero.

(AMIETE, June 2010) **Ans. (ii)**

**21**

**EIGEN VALUES, EIGEN VECTOR, CAYLEY HAMILTON  
THEOREM, DIAGONALISATION  
(COMPLEX AND UNITARY MATRICES, APPLICATION)**

---

---

### 21.1 INTRODUCTION

Eigen values and eigen vectors are used in the study of ordinary differential equations, analysing population growth and finding powers of matrices.

### 21.2 EIGEN VALUES

$$\text{Let } \begin{bmatrix} a_{11} & a_{12} & a_{13} & \cdots & a_{1n} \\ a_{21} & a_{22} & a_{23} & \cdots & a_{2n} \\ a_{31} & a_{32} & a_{33} & \cdots & a_{3n} \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ a_{n1} & a_{n2} & a_{n3} & \cdots & a_{nn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ \vdots \\ y_n \end{bmatrix}$$

$$AX = Y \quad \dots(1)$$

Where  $A$  is the matrix,  $X$  is the column vector and  $Y$  is also column vector.

Here column vector  $X$  is transformed into the column vector  $Y$  by means of the square matrix  $A$ .

Let  $X$  be a such vector which transforms into  $\lambda X$  by means of the transformation (1). Suppose the linear transformation  $Y = AX$  transforms  $X$  into a scalar multiple of itself i.e.  $\lambda X$ .

$$\begin{aligned} AX &= Y = \lambda X \\ AX - \lambda IX &= 0 \\ (A - \lambda I)X &= 0 \end{aligned} \quad \dots(2)$$

Thus the unknown scalar  $\lambda$  is known as an eigen value of the matrix  $A$  and the corresponding non zero vector  $X$  as **eigen vector**.

The eigen values are also called characteristic values or proper values or latent values.

$$\text{Let } A = \begin{bmatrix} 2 & 2 & 1 \\ 1 & 3 & 1 \\ 1 & 2 & 2 \end{bmatrix}$$

$$A - \lambda I = \begin{bmatrix} 2 & 2 & 1 \\ 1 & 3 & 1 \\ 1 & 2 & 2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 2-\lambda & 2 & 1 \\ 1 & 3-\lambda & 1 \\ 1 & 2 & 2-\lambda \end{bmatrix} \quad \text{characteristic matrix}$$

(b) **Characteristic Polynomial:** The determinant  $|A - \lambda I|$  when expanded will give a polynomial, which we call as characteristic polynomial of matrix  $A$ .

For example; 
$$\begin{vmatrix} 2-\lambda & 2 & 1 \\ 1 & 3-\lambda & 1 \\ 1 & 2 & 2-\lambda \end{vmatrix}$$

$$= (2 - \lambda)(6 - 5\lambda + \lambda^2 - 2) - 2(2 - \lambda - 1) + 1(2 - 3 + \lambda)$$

$$= -\lambda^3 + 7\lambda^2 - 11\lambda + 5$$

- (c) **Characteristic Equation:** The equation  $|A - \lambda I| = 0$  is called the characteristic equation of the matrix  $A$  e.g.

$$\lambda^3 - 7\lambda^2 + 11\lambda - 5 = 0$$

- (d) **Characteristic Roots or Eigen Values:** The roots of characteristic equation  $|A - \lambda I| = 0$  are called characteristic roots of matrix  $A$ . e.g.

$$\lambda^3 - 7\lambda^2 + 11\lambda - 5 = 0$$

$$\Rightarrow (\lambda - 1)(\lambda - 1)(\lambda - 5) = 0 \quad \therefore \lambda = 1, 1, 5$$

Characteristic roots are 1, 1, 5.

### Some Important Properties of Eigen Values

(AMIETE, Dec. 2009)

- (1) Any square matrix  $A$  and its transpose  $A'$  have the same eigen values.

**Note.** The sum of the elements on the principal diagonal of a matrix is called the **trace** of the matrix.

- (2) The sum of the eigen values of a matrix is equal to the **trace** of the matrix.

- (3) The product of the eigen values of a matrix  $A$  is equal to the **determinant** of  $A$ .

- (4) If  $\lambda_1, \lambda_2, \dots, \lambda_n$  are the eigen values of  $A$ , then the eigen values of

$$(i) kA \text{ are } k\lambda_1, k\lambda_2, \dots, k\lambda_n \quad (ii) A^m \text{ are } \lambda_1^m, \lambda_2^m, \dots, \lambda_n^m$$

$$(iii) A^{-1} \text{ are } \frac{1}{\lambda_1}, \frac{1}{\lambda_2}, \dots, \frac{1}{\lambda_n}.$$

**Example 1.** Find the characteristic roots of the matrix  $\begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$

**Solution.** The characteristic equation of the given matrix is

$$\begin{vmatrix} 6-\lambda & -2 & 2 \\ -2 & 3-\lambda & -1 \\ 2 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (6 - \lambda)(9 - 6\lambda + \lambda^2 - 1) + 2(-6 + 2\lambda + 2) + 2(2 - 6 + 2\lambda) = 0$$

$$\Rightarrow -\lambda^3 + 12\lambda^2 - 36\lambda + 32 = 0$$

By trial,  $\lambda = 2$  is a root of this equation.

$$\Rightarrow (\lambda - 2)(\lambda^2 - 10\lambda + 16) = 0 \Rightarrow (\lambda - 2)(\lambda - 2)(\lambda - 8) = 0$$

$\Rightarrow \lambda = 2, 2, 8$  are the characteristic roots or Eigen values.

**Ans.**

**Example 2.** Find the eigen values of the matrix :

$$\begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 1 \end{bmatrix}$$

(R.G.P.V. Bhopal, I Semester, June 2007)

**Solution.** Let  $A = \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 1 \end{bmatrix}$

The characteristic equation of  $A$  is

$$\begin{vmatrix} 2-\lambda & 1 & 1 \\ 1 & 2-\lambda & 1 \\ 0 & 0 & 1-\lambda \end{vmatrix} = 0$$

Expanding the determinant with the help of third row, we have

$$\begin{aligned} \Rightarrow (1-\lambda)[(2-\lambda)^2 - 1] &= 0 \Rightarrow (1-\lambda)(\lambda^2 - 4\lambda + 4 - 1) = 0 \\ \Rightarrow (1-\lambda)(\lambda^2 - 4\lambda + 3) &= 0 \Rightarrow (1-\lambda)(\lambda-3)(\lambda-1) = 0 \\ \Rightarrow \lambda &= 1, 1, 3 \end{aligned}$$

The eigen values of the given matrix are 1, 1 and 3.

**Ans.**

**Example 3.** The matrix  $A$  is defined as  $A = \begin{bmatrix} 1 & 2 & -3 \\ 0 & 3 & 2 \\ 0 & 0 & -2 \end{bmatrix}$

Find the eigen values of  $3A^3 + 5A^2 - 6A + 2I$ .

**Solution.**  $|A - \lambda I| = 0$

$$\begin{vmatrix} 1-\lambda & 2 & -3 \\ 0 & 3-\lambda & 2 \\ 0 & 0 & -2-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (1-\lambda)(3-\lambda)(-2-\lambda) = 0 \text{ or } \lambda = 1, 3, -2$$

Eigen values of  $A^3 = 1, 27, -8$ ; Eigen values of  $A^2 = 1, 9, 4$

Eigen values of  $A = 1, 3, -2$ ; Eigen values of  $I = 1, 1, 1$

$\therefore$  Eigen values of  $3A^3 + 5A^2 - 6A + 2I$

First eigen value  $= 3(1)^3 + 5(1)^2 - 6(1) + 2(1) = 4$

Second eigen value  $= 3(27) + 5(9) - 6(3) + 2(1) = 110$

Third eigen value  $= 3(-8) + 5(4) - 6(-2) + 2(1) = 10$

Required eigen values are 4, 110, 10

**Ans.**

**Example 4.** Show that for any square matrix  $A$ , the product of all the eigen values of  $A$  is equal to  $\det(A)$ , and the sum of all the eigen values of  $A$  is equal to the sum of the diagonal elements.  
(U.P., I Semester, Winter 2003)

**Solution.** Let  $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$ ,  $|A - \lambda I| = \begin{vmatrix} a_{11} - \lambda & a_{12} & a_{13} \\ a_{21} & a_{22} - \lambda & a_{23} \\ a_{31} & a_{32} & a_{33} - \lambda \end{vmatrix}$

$$\begin{aligned} |A - \lambda I| &= (a_{11} - \lambda)[(a_{22} - \lambda)(a_{33} - \lambda) - a_{32}a_{23}] - a_{12}[a_{21}(a_{33} - \lambda) - a_{31}a_{23}] + \\ &\quad a_{13}[a_{21}a_{32} - a_{31}(a_{22} - \lambda)] \\ &= (a_{11} - \lambda)[a_{22}a_{33} - (a_{22} + a_{33})\lambda + \lambda^2 - a_{32}a_{23}] - a_{12}[a_{21}a_{33} - a_{21}\lambda - a_{31}a_{23}] + \\ &\quad a_{13}(a_{21}a_{32} - a_{31}a_{22} + a_{31}\lambda) \\ &= a_{11}a_{22}a_{33} + (-a_{11}a_{22} - a_{11}a_{33})\lambda + a_{11}\lambda^2 - a_{11}a_{32}a_{23} + (-a_{22}a_{33} + a_{32}a_{23})\lambda + \\ &\quad (a_{22} + a_{33})\lambda^2 - \lambda^3 - a_{12}a_{21}a_{33} + a_{12}a_{31}a_{23} + a_{12}a_{21}\lambda + \\ &\quad a_{13}a_{21}a_{32} - a_{13}a_{31}a_{22} + a_{13}a_{31}\lambda \\ &= -\lambda^3 + \lambda^2(a_{11} + a_{22} + a_{33}) + \lambda(-a_{11}a_{22} - a_{11}a_{33} + a_{12}a_{21} - a_{22}a_{33} + a_{23}a_{32} + a_{13}a_{31}) \\ &\quad - [a_{11}(a_{22}a_{33} - a_{23}a_{32}) - a_{12}(a_{21}a_{33} - a_{23}a_{31}) + a_{13}(a_{21}a_{32} - a_{31}a_{22})] \dots(1) \end{aligned}$$

If  $\lambda_1, \lambda_2, \lambda_3$  be the roots of the equation (1) then

Sum of the roots  $= \lambda_1 + \lambda_2 + \lambda_3 = a_{11} + a_{22} + a_{33}$  = Sum of the diagonal elements.

Product of the roots

$$= \lambda_1 \lambda_2 \lambda_3 = [a_{11}(a_{22}a_{33} - a_{23}a_{32}) - a_{12}(a_{21}a_{33} - a_{23}a_{31}) + a_{13}(a_{21}a_{32} - a_{22}a_{31})] \\ = \text{Determinant } A. \quad \text{Proved.}$$

**Example 5.** Let  $\lambda$  be an eigen value of a matrix  $A$ . Then prove that

(i)  $\lambda + k$  is an eigen value of  $A + kI$

(ii)  $k\lambda$  is an eigen value of  $kA$ . (Gujarat, II Semester, June 2009)

**Solution.** Here,  $A$  has eigen value  $\lambda$ .  $\Rightarrow |A - \lambda I| = 0$  ... (1)

(ii) Adding and subtracting  $kI$  from (1) we get

$$|A + kI - \lambda I - kI| = 0 \\ \Rightarrow |(A + kI) - (\lambda + k)I| = 0 \Rightarrow A + kI \text{ has } \lambda + k \text{ eigen value.}$$

(i) Multiplying (1), by  $k$ , we get

$$k|A - \lambda I| = 0 \Rightarrow |kA - k\lambda I| = 0 \\ \Rightarrow kA \text{ has eigen value } k\lambda. \quad \text{Proved.}$$

**Example 6.** If  $\lambda_1, \lambda_2, \dots, \lambda_n$  are the eigen values of  $A$ , find the eigen values of the martrix  $(A - \lambda I)^2$ .

**Solution.**  $(A - \lambda I)^2 = A^2 - 2\lambda AI + \lambda^2 I^2 = A^2 - 2\lambda A + \lambda^2 I$

Eigen values of  $A^2$  are  $\lambda_1^2, \lambda_2^2, \lambda_3^2, \dots, \lambda_n^2$

Eigen values of  $2\lambda A$  are  $2\lambda \lambda_1, 2\lambda \lambda_2, 2\lambda \lambda_3, \dots, 2\lambda \lambda_n$ .

Eigen values of  $\lambda^2 I$  are  $\lambda^2$ .

$\therefore$  Eigen values of  $A^2 - 2\lambda A + \lambda^2 I$

$$\lambda_1^2 - 2\lambda \lambda_1 + \lambda^2, \lambda_2^2 - 2\lambda \lambda_2 + \lambda^2, \lambda_3^2 - 2\lambda \lambda_3 + \lambda^2, \dots \\ \Rightarrow (\lambda_1 - \lambda)^2, (\lambda_2 - \lambda)^2, (\lambda_3 - \lambda)^2, \dots, (\lambda_n - \lambda)^2 \quad \text{Ans.}$$

**Example 7.** Prove that a matrix  $A$  and its transpose  $A'$  have the same characteristic roots.

**Solution.** Characteristic equation of matrix  $A$  is

$$|A - \lambda I| = 0 \quad \dots (1)$$

Characteristic equation of matrix  $A'$  is

$$|A' - \lambda I| = 0 \quad \dots (2)$$

Clearly both (1) and (2) are same, as we know that

$$|A| = |A'|$$

i.e., a determinant remains unchanged when rows be changed into columns and columns into rows. **Proved.**

**Example 8.** If  $A$  and  $P$  be square matrices of the same type and if  $P$  be invertible, show that the matrices  $A$  and  $P^{-1}AP$  have the same characteristic roots.

**Solution.** Let us put  $B = P^{-1}AP$  and we will show that characteristic equations for both  $A$  and  $B$  are the same and hence they have the same characteristic roots.

$$B - \lambda I = P^{-1}AP - \lambda I = P^{-1}AP - P^{-1}\lambda IP = P^{-1}(A - \lambda I)P \\ \therefore |B - \lambda I| = |P^{-1}(A - \lambda I)P| = |P^{-1}| |A - \lambda I| |P| \\ = |A - \lambda I| |P^{-1}| |P| = |A - \lambda I| |P^{-1}P| \\ = |A - \lambda I| |I| = |A - \lambda I| \text{ as } |I| = 1$$

Thus the matrices  $A$  and  $B$  have the same characteristic equations and hence the same characteristic roots. **Proved.**

**Example 9.** If  $A$  and  $B$  be two square invertible matrices, then prove that  $AB$  and  $BA$  have the same characteristic roots.

**Solution.** Now  $AB = IAB = B^{-1}B(AB) = B^{-1}(BA)B$  ... (1)

But by Ex. 8, matrices  $BA$  and  $B^{-1}(BA)B$  have same characteristic roots or matrices  $BA$  and  $AB$  by (1) have same characteristic roots. **Proved.**

**Example 10.** If  $A$  and  $B$  be  $n$  rowed square matrices and if  $A$  be invertible, show that the matrices  $A^{-1}B$  and  $BA^{-1}$  have the same characteristics roots.

**Solution.**  $A^{-1}B = A^{-1}BI = A^{-1}B(A^{-1}A) = A^{-1}(BA^{-1})A$  ... (1)

But by Ex. 8, matrices  $BA^{-1}$  and  $A^{-1}(BA^{-1})A$  have same characteristic roots or matrices  $BA^{-1}$  and  $A^{-1}B$  by (1) have same characteristic roots. **Proved.**

**Example 11.** Show that 0 is a characteristic root of a matrix, if and only if, the matrix is singular.

**Solution.** Characteristic equation of matrix  $A$  is given by

$$|A - \lambda I| = 0$$

If  $\lambda = 0$ , then from above it follows that  $|A| = 0$  i.e. Matrix  $A$  is singular.

Again if Matrix  $A$  is singular i.e.,  $|A| = 0$  then

$$|A - \lambda I| = 0 \Rightarrow |A| - \lambda |I| = 0, 0 - \lambda \cdot 1 = 0 \Rightarrow \lambda = 0. \quad \text{Proved.}$$

**Example 12.** Show that characteristic roots of a triangular matrix are just the diagonal elements of the matrix.

**Solution.** Let us consider the triangular matrix.

$$A = \begin{bmatrix} a_{11} & 0 & 0 & 0 \\ a_{21} & a_{22} & 0 & 0 \\ a_{31} & a_{32} & a_{33} & 0 \\ a_{41} & a_{42} & a_{43} & a_{44} \end{bmatrix}$$

Characteristic equation is  $|A - \lambda I| = 0$

$$\text{or } \begin{vmatrix} a_{11} - \lambda & 0 & 0 & 0 \\ a_{21} & a_{22} - \lambda & 0 & 0 \\ a_{31} & a_{32} & a_{33} - \lambda & 0 \\ a_{41} & a_{42} & a_{43} & a_{44} - \lambda \end{vmatrix} = 0$$

On expansion it gives

$$(a_{11} - \lambda)(a_{22} - \lambda)(a_{33} - \lambda)(a_{44} - \lambda) = 0$$

$\therefore \lambda = a_{11}, a_{22}, a_{33}, a_{44}$

which are diagonal elements of matrix  $A$ . **Proved.**

**Example 13.** If  $\lambda$  is an eigen value of an orthogonal matrix, then  $\frac{1}{\lambda}$  is also eigen value.

[Hint:  $AA' = I$  if  $\lambda$  is the eigen value of  $A$ , then  $\lambda^2 = 1, \lambda = \frac{1}{\lambda}$ ]

**Example 14.** Find the eigen values of the orthogonal matrix.

$$B = \frac{1}{3} \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ 2 & -2 & 1 \end{bmatrix}$$

**Solution.** The characteristic equation of

$$A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ 2 & -2 & 1 \end{bmatrix} \quad \text{is} \quad \begin{vmatrix} 1-\lambda & 2 & 2 \\ 2 & 1-\lambda & -2 \\ 2 & -2 & 1-\lambda \end{vmatrix} = 0$$

$$\begin{aligned} \Rightarrow & (1-\lambda)[(1-\lambda)(1-\lambda)-4] - 2[2(1-\lambda)+4] + 2[-4-2(1-\lambda)] = 0 \\ \Rightarrow & (1-\lambda)(1-2\lambda+\lambda^2-4) - 2(2-2\lambda+4) + 2(-4-2+2\lambda) = 0 \\ \Rightarrow & \lambda^3 - 3\lambda^2 - 9\lambda + 27 = 0 \\ \Rightarrow & (\lambda-3)^2(\lambda+3) = 0 \end{aligned}$$

The eigen values of  $A$  are 3, 3, -3, so the eigen values of  $B = \frac{1}{3}A$  are 1, 1, -1.

**Note.** If  $\lambda = 1$  is an eigen value of  $B$  then its reciprocal  $\frac{1}{\lambda} = \frac{1}{1} = 1$  is also an eigen value of  $B$ . **Ans.**

### EXERCISE 21.1

Show that, for any square matrix  $A$ .

1. If  $\lambda$  be an eigen value of a non singular matrix  $A$ , show that  $\frac{|A|}{\lambda}$  is an eigen value of the matrix

$\text{adj } A$ .

2. There are infinitely many eigen vectors corresponding to a single eigen value.

3. Find the product of the eigen values of the matrix  $\begin{bmatrix} 3 & -3 & 3 \\ 2 & 1 & 1 \\ 1 & 5 & 6 \end{bmatrix}$  **Ans.** 18

4. Find the sum of the eigen values of the matrix  $\begin{bmatrix} 3 & 2 & 1 \\ 1 & 3 & 2 \\ 4 & 1 & 5 \end{bmatrix}$  **Ans.** 11

5. Find the eigen value of the inverse of the matrix  $\begin{bmatrix} 4 & 6 & 6 \\ 1 & 3 & 2 \\ -1 & -4 & -3 \end{bmatrix}$  **Ans.**  $-1, 1, \frac{1}{4}$

6. Find the eigen values of the square of the matrix  $\begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$  **Ans.** 1, 4, 9

7. Find the eigen values of the matrix  $\begin{bmatrix} 3 & 1 & 4 \\ 0 & 2 & 6 \\ 0 & 0 & 5 \end{bmatrix}^3$  **Ans.** 8, 27, 125

8. The sum and product of the eigen values of the matrix  $A = \begin{bmatrix} 2 & 2 & 1 \\ 1 & 3 & 1 \\ 1 & 2 & 2 \end{bmatrix}$  are respectively  
 (a) 7 and 7      (b) 7 and 5      (c) 7 and 6      (d) 7 and 8    (AMIEETE, June 2010) **Ans.** (b)

### 21.3 CAYLEY-HAMILTON THEOREM

**Statement.** Every square matrix satisfies its own characteristic equation.

If  $|A - \lambda I| = (-1)^n (\lambda^n + a_1 \lambda^{n-1} + a_2 \lambda^{n-2} + \dots + a_n)$  be the characteristic polynomial of  $n \times n$  matrix  $A = (a_{ij})$ , then the matrix equation

$X^n + a_1 X^{n-1} + a_2 X^{n-2} + \dots + a_n I = 0$  is satisfied by  $X = A$  i.e.,

$A^n + a_1 A^{n-1} + a_2 A^{n-2} + \dots + a_n I = 0$

**Proof.** Since the elements of the matrix  $A - \lambda I$  are at most of the first degree in  $\lambda$ , the elements of  $\text{adj. } (A - \lambda I)$  are at most degree  $(n-1)$  in  $\lambda$ . Thus,  $\text{adj. } (A - \lambda I)$  may be written as a matrix polynomial in  $\lambda$ , given by

$$\text{Adj}(A - \lambda I) = B_0 \lambda^{n-1} + B_1 \lambda^{n-2} + \dots + B_{n-1}$$

where  $B_0, B_1, \dots, B_{n-1}$  are  $n \times n$  matrices, their elements being polynomial in  $\lambda$ .

We know that

$$(A - \lambda I) \text{Adj}(A - \lambda I) = |A - \lambda I| I$$

$$(A - \lambda I)(B_0 \lambda^{n-1} + B_1 \lambda^{n-2} + \dots + B_{n-1}) = (-1)^n (\lambda^n + a_1 \lambda^{n-1} + \dots + a_n) I$$

Equating coefficient of like power of  $\lambda$  on both sides, we get

$$-IB_0 = (-1)^n I$$

$$AB_0 - IB_1 = (-1)^n a_1 I$$

$$AB_1 - IB_2 = (-1)^n a_2 I$$

.....

$$AB_{n-1} = (-1)^n a_n I$$

On multiplying the equation by  $A^n, A^{n-1}, \dots, I$  respectively and adding, we obtain

$$0 = (-1)^n [A^n + a_1 A^{n-1} + \dots + a_n I]$$

Thus  $A^n + a_1 A^{n-1} + \dots + a_n I = 0$

for example, Let  $A$  be square matrix and if

$$\lambda^3 - 2\lambda^2 + 3\lambda - 4 = 0 \quad \dots(1)$$

be its characteristic equation, then according to Cayley Hamilton Theorem (1) is satisfied by  $A$ .

$$A^3 - 2A^2 + 3A - 4I = 0 \quad \dots(2)$$

We can find out  $A^{-1}$  from (2). On premultiplying (2) by  $A^{-1}$ , we get

$$A^2 - 2A + 3I - 4A^{-1} = 0$$

$$A^{-1} = \frac{1}{4} [A^2 - 2A + 3I]$$

**Example 15.** Verify Cayley-Hamilton theorem for the matrix

$$A = \begin{pmatrix} 1 & 2 \\ 2 & -1 \end{pmatrix} \text{ and hence find } A^{-1}. \quad (\text{U.P., I Sem., Dec 2008})$$

**Solution.** The characteristic equation of the matrix is  $|A - \lambda I| = 0$

$$\begin{vmatrix} 1-\lambda & 2 \\ 2 & -1-\lambda \end{vmatrix} = 0$$

$$(1-\lambda)(-1-\lambda) - 4 = 0 \Rightarrow -1 + \lambda^2 - 4 = 0 \Rightarrow \lambda^2 - 5 = 0$$

By Cayley-Hamilton Theorem,

$$A^2 - 5I = 0 \quad \dots(1)$$

$$\text{Now, } A^2 = A \cdot A = \begin{bmatrix} 1 & 2 \\ 2 & -1 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 2 & -1 \end{bmatrix} = \begin{bmatrix} 5 & 0 \\ 0 & 5 \end{bmatrix}$$

$$A^2 - 5I = \begin{bmatrix} 5 & 0 \\ 0 & 5 \end{bmatrix} - 5 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 5 & 0 \\ 0 & 5 \end{bmatrix} + \begin{bmatrix} -5 & 0 \\ 0 & -5 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = 0 \quad \dots(2)$$

From (1) and (2), Cayley-Hamilton theorem is verified.

Again from (1), we have

$$A^2 - 5I = 0$$

Multiplying by  $A^{-1}$ , we get

$$A - 5A^{-1} = 0 \Rightarrow A^{-1} = \frac{1}{5}A \Rightarrow A^{-1} = \frac{1}{5} \begin{bmatrix} 1 & 2 \\ 2 & -1 \end{bmatrix} = \begin{bmatrix} \frac{1}{5} & \frac{2}{5} \\ \frac{2}{5} & -\frac{1}{5} \end{bmatrix} \quad \text{Ans.}$$

**Example 16.** Find the characteristic equation of the matrix  $A$ .

$$A = \begin{bmatrix} 4 & 3 & 1 \\ 2 & 1 & -2 \\ 1 & 2 & 1 \end{bmatrix}$$

Hence find  $A^{-1}$ .

(R.G.P.V., Bhopal, Feb. 2006)

**Solution** Characteristic equation is

$$\begin{vmatrix} 4-\lambda & 3 & 1 \\ 2 & 1-\lambda & -2 \\ 1 & 2 & 1-\lambda \end{vmatrix} = 0$$

$$(4-\lambda)[1+\lambda^2-2\lambda+4] - 3(2-2\lambda+2) + 1(4-1+\lambda) = 0$$

$$\Rightarrow (4-\lambda)(\lambda^2-2\lambda+5) - 3(-2\lambda+4) + (3+\lambda) = 0$$

$$\Rightarrow 4\lambda^2 - 8\lambda + 20 - \lambda^3 + 2\lambda^2 - 5\lambda + 6\lambda - 12 + 3 + \lambda = 0$$

$$\Rightarrow -\lambda^3 + 6\lambda^2 - 6\lambda + 11 = 0 \quad \text{or} \quad \lambda^3 - 6\lambda^2 + 6\lambda - 11 = 0$$

By Cayley-Hamilton Theorem

$$A^3 - 6A^2 + 6A - 11I = 0 \quad \dots(1)$$

Multiplying (1) by  $A^{-1}$ , we get

$$\begin{aligned} A^2 - 6A + 6I - 11A^{-1} &= 0 \quad \text{or} \quad 11A^{-1} = A^2 - 6A + 6I \\ 11A^{-1} &= \begin{bmatrix} 4 & 3 & 1 \\ 2 & 1 & -2 \\ 1 & 2 & 1 \end{bmatrix} \begin{bmatrix} 4 & 3 & 1 \\ 2 & 1 & -2 \\ 1 & 2 & 1 \end{bmatrix} - 6 \begin{bmatrix} 4 & 3 & 1 \\ 2 & 1 & -2 \\ 1 & 2 & 1 \end{bmatrix} + 6 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \\ &= \begin{bmatrix} 23 & 17 & -1 \\ 8 & 3 & -2 \\ 9 & 7 & -2 \end{bmatrix} + \begin{bmatrix} -24 & -18 & -6 \\ -12 & -6 & 12 \\ -6 & -12 & -6 \end{bmatrix} + \begin{bmatrix} 6 & 0 & 0 \\ 0 & 6 & 0 \\ 0 & 0 & 6 \end{bmatrix} = \begin{bmatrix} 5 & -1 & -7 \\ -4 & 3 & 10 \\ 3 & -5 & -2 \end{bmatrix} \\ \therefore A^{-1} &= \frac{1}{11} \begin{bmatrix} 5 & -1 & -7 \\ -4 & 3 & 10 \\ 3 & -5 & -2 \end{bmatrix} \end{aligned}$$

**Ans.**

**Example 17.** Find the characteristic equation of the matrix  $A = \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 2 \end{bmatrix}$

Verify Cayley Hamilton Theorem and hence prove that :

$$A^8 - 5A^7 + 7A^6 - 3A^5 + A^4 - 5A^3 + 8A^2 - 2A + I = \begin{bmatrix} 8 & 5 & 5 \\ 0 & 3 & 0 \\ 5 & 5 & 8 \end{bmatrix}$$

(Gujarat, II Semester, June 2009)

**Solution.** Characteristic equation of the matrix  $A$  is

$$\begin{vmatrix} 2-\lambda & 1 & 1 \\ 0 & 1-\lambda & 0 \\ 1 & 1 & 2-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (2-\lambda)[(1-\lambda)(2-\lambda)] - 1(0) + 1(0-1+\lambda) = 0$$

$$\Rightarrow \lambda^3 - 5\lambda^2 + 7\lambda - 3 = 0$$

According to Cayley-Hamilton Theorem

$$A^3 - 5A^2 + 7A - 3I = 0 \quad \dots(1)$$

We have to verify the equation (1).

$$\begin{aligned} A^2 &= \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 2 \end{bmatrix} \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 2 \end{bmatrix} = \begin{bmatrix} 5 & 4 & 4 \\ 0 & 1 & 0 \\ 4 & 4 & 5 \end{bmatrix} \\ A^3 &= A^2 \cdot A = \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 2 \end{bmatrix} \begin{bmatrix} 5 & 4 & 4 \\ 0 & 1 & 0 \\ 4 & 4 & 5 \end{bmatrix} = \begin{bmatrix} 14 & 13 & 13 \\ 0 & 1 & 0 \\ 13 & 13 & 14 \end{bmatrix} \\ A^3 - 5A^2 + 7A - 3I &= \begin{bmatrix} 14 & 13 & 13 \\ 0 & 1 & 0 \\ 13 & 13 & 14 \end{bmatrix} - 5 \begin{bmatrix} 5 & 4 & 4 \\ 0 & 1 & 0 \\ 4 & 4 & 5 \end{bmatrix} + 7 \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 2 \end{bmatrix} - 3 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \\ &= \begin{bmatrix} 14 - 25 + 14 - 3 & 13 - 20 + 7 + 0 & 13 - 20 + 7 + 0 \\ 0 + 0 + 0 + 0 & 1 - 5 + 7 - 3 & 0 - 0 + 0 - 0 \\ 13 - 20 + 7 + 0 & 13 - 20 + 7 - 0 & 14 - 25 + 14 - 3 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} = 0 \end{aligned}$$

Hence Cayley Hamilton Theorem is verified.

$$\begin{aligned} \text{Now, } A^8 - 5A^7 + 7A^6 - 3A^5 + A^4 - 5A^3 + 8A^2 - 2A + I &= A^5(A^3 - 5A^2 + 7A - 3I) + A(A^3 - 5A^2 + 7A - 3I) + A^2 + A + I \\ &= A^5 \times O + A \times O + A^2 + A + I = A^2 + A + I \\ &= \begin{bmatrix} 5 & 4 & 4 \\ 0 & 1 & 0 \\ 4 & 4 & 5 \end{bmatrix} + \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 2 \end{bmatrix} + \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \\ &= \begin{bmatrix} 5+2+1 & 4+1+0 & 4+1+0 \\ 0+0+0 & 1+1+1 & 0+0+0 \\ 4+1+0 & 4+1+0 & 5+2+1 \end{bmatrix} = \begin{bmatrix} 8 & 5 & 5 \\ 0 & 3 & 0 \\ 5 & 5 & 8 \end{bmatrix} \end{aligned}$$

**Proved.**

## 21.4 POWER OF MATRIX (by Cayley Hamilton Theorem)

Any positive integral power  $A^m$  of matrix  $A$  is linearly expressible in terms of those of lower degree, where  $m$  is a positive integer and  $n$  is the degree of characteristic equation such that  $m > n$ .

**Example 18.** Find  $A^4$  with the help of Cayley Hamilton Theorem, if

$$A = \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$$

**Solution.** Here, we have

$$A = \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$$

Characteristic equation of the matrix  $A$  is

$$\begin{vmatrix} 1-\lambda & 0 & -1 \\ 1 & 2-\lambda & 1 \\ 2 & 2 & 3-\lambda \end{vmatrix} = 0 \Rightarrow \begin{aligned} \lambda^3 - 6\lambda^2 - 11\lambda - 6 &= 0 \\ (\lambda-1)(\lambda-2)(\lambda-3) &= 0 \end{aligned}$$

Eigen values of  $A$  are 1, 2, 3.

$$\text{Let } \lambda^4 = (\lambda^3 - 6\lambda^2 - 11\lambda - 6)Q(\lambda) + (a\lambda^2 + b\lambda + c) \quad \dots(1)$$

(where  $Q(\lambda)$  is quotient)

$$\text{Put } \lambda = 1 \text{ in (1), } (1)^4 = a + b + c \Rightarrow a + b + c = 1 \quad \dots(2)$$

$$\text{Put } \lambda = 2 \text{ in (1), } (2)^4 = 4a + 2b + c \Rightarrow 4a + 2b + c = 16 \quad \dots(3)$$

$$\text{Put } \lambda = 3 \text{ in (1), } (3)^4 = 9a + 3b + c \Rightarrow 9a + 3b + c = 81 \quad \dots(4)$$

Solving (2), (3) and (4), we get

$$a = 25, \quad b = -60, \quad c = 36$$

Replacing  $\lambda$  by matrix  $A$  in (1), we get

$$\begin{aligned} A^4 &= (A^3 - 6A^2 + 11A - 6)Q(A) + (aA^2 + bA + c) \\ &= O + aA^2 + bA + cI = 25A^2 - 60A + 36I \\ &= 25 \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix} \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix} + (-60) \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix} + 36 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \\ &= \begin{bmatrix} -25 & -50 & -100 \\ 125 & 150 & 100 \\ 250 & 250 & 225 \end{bmatrix} + \begin{bmatrix} -60 & 0 & 60 \\ -60 & -120 & -60 \\ -120 & -120 & -180 \end{bmatrix} + \begin{bmatrix} 36 & 0 & 0 \\ 0 & 36 & 0 \\ 0 & 0 & 36 \end{bmatrix} \\ &= \begin{bmatrix} -25 - 60 + 36 & -50 + 0 + 0 & -100 + 60 + 0 \\ 125 - 60 + 0 & 150 - 120 + 36 & 100 - 60 + 0 \\ 250 - 120 + 0 & 250 - 120 + 0 & 225 - 180 + 36 \end{bmatrix} = \begin{bmatrix} -49 & -50 & -40 \\ 65 & 66 & 40 \\ 130 & 130 & 81 \end{bmatrix} \end{aligned}$$

(It is also solved by diagonalization method on page 496 Example 38.)

## EXERCISE 21.2

1. Find the characteristic polynomial of the matrix

$$A = \begin{bmatrix} 3 & 1 & 1 \\ -1 & 5 & -1 \\ 1 & -1 & 3 \end{bmatrix}$$

Verify Cayley-Hamilton Theorem for this matrix. Hence find  $A^{-1}$ .

$$\text{Ans. } A^{-1} = \frac{1}{20} \begin{bmatrix} 7 & -2 & -3 \\ 1 & 4 & 1 \\ -2 & 2 & 8 \end{bmatrix}$$

2. Use Cayley-Hamilton Theorem to find the inverse of the matrix

$$\begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}$$

$$\text{Ans. } \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix}$$

3. Using Cayley-Hamilton Theorem, find  $A^{-1}$ , given that

$$A = \begin{bmatrix} 2 & -1 & 3 \\ 1 & 0 & 2 \\ 4 & -2 & 1 \end{bmatrix}$$

$$\text{Ans. } -\frac{1}{5} \begin{bmatrix} 4 & -5 & -2 \\ 7 & -10 & -1 \\ -2 & 0 & 1 \end{bmatrix}$$

4. Find the characteristic equation of the matrix

$$A = \begin{bmatrix} 1 & 3 & 7 \\ 4 & 2 & 3 \\ 1 & 2 & 1 \end{bmatrix}$$

(R.G.P.V., Bhopal, Summer 2004)

and show that the equation is also satisfied by  $A$ .

$$\text{Ans. } \lambda^3 - 4\lambda^2 - 20\lambda - 35 = 0$$

5. Using, Cayley-Hamilton Theorem obtain the inverse of the matrix

$$\begin{bmatrix} 1 & 1 & 3 \\ 1 & 3 & -3 \\ -2 & -4 & -4 \end{bmatrix} \quad (R.G.P.V. Bhopal, I Sem., 2003)$$

**Ans.**  $\frac{1}{8} \begin{bmatrix} 24 & 8 & 12 \\ -10 & -2 & -6 \\ -2 & -2 & -2 \end{bmatrix}$

6. Show that the matrix  $A = \begin{bmatrix} 1 & -2 & 2 \\ 1 & 2 & 3 \\ 0 & -1 & 2 \end{bmatrix}$

satisfies its characteristic equation. Hence find  $A^{-1}$ .

**Ans.**  $\frac{1}{9} \begin{bmatrix} 7 & 2 & -10 \\ -2 & 2 & -1 \\ -1 & 1 & 4 \end{bmatrix}$

7. Verify Cayley-Hamilton Theorem for the matrix

$$A = \begin{bmatrix} 1 & 1 & 2 \\ 3 & 1 & 1 \\ 2 & 3 & 1 \end{bmatrix}$$

Hence evaluate  $A^{-1}$ .

**Ans.**  $\frac{1}{11} \begin{bmatrix} -2 & 5 & -1 \\ -1 & -3 & 5 \\ 7 & -1 & -2 \end{bmatrix}$

8. Verify Cayley-Hamilton theorem for the matrix

$$A = \begin{bmatrix} 1 & -2 & 3 \\ 2 & 4 & -2 \\ -1 & 1 & 2 \end{bmatrix}$$

9. Find adj.  $A$  by using Cayley-Hamilton theorem where  $A$  is given by

$$A = \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \\ 3 & -1 & 1 \end{bmatrix} \quad (R.G.P.V. Bhopal, April 2010) \quad \text{Ans.} \quad \begin{bmatrix} 0 & -3 & -3 \\ -3 & -2 & 1 \\ -3 & 7 & 1 \end{bmatrix}$$

10. If a matrix  $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 1 & 0 & 1 \end{bmatrix}$ , find the matrix  $A^{32}$ , using Cayley Hamilton Theorem. **Ans.**  $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 32 & 0 & 1 \end{bmatrix}$

## 21.5 CHARACTERISTIC VECTORS OR EIGEN VECTORS

As we have discussed in Art 21.2,

A column vector  $X$  is transformed into column vector  $Y$  by means of a square matrix  $A$ .

Now we want to multiply the column vector  $X$  by a scalar quantity  $\lambda$  so that we can find the same transformed column vector  $Y$ .

i.e.,  $AX = \lambda X$

$X$  is known as eigen vector.

**Example 19.** Show that the vector  $(1, 1, 2)$  is an eigen vector of the matrix

$$A = \begin{bmatrix} 3 & 1 & -1 \\ 2 & 2 & -1 \\ 2 & 2 & 0 \end{bmatrix} \quad \text{corresponding to the eigen value 2.}$$

**Solution.** Let  $X = (1, 1, 2)$ .

$$\text{Now, } AX = \begin{bmatrix} 3 & 1 & -1 \\ 2 & 2 & -1 \\ 2 & 2 & 0 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix} = \begin{bmatrix} 3+1-2 \\ 2+2-2 \\ 2+2+0 \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \\ 4 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix} = 2X$$

Corresponding to each characteristic root  $\lambda$ , we have a corresponding non-zero vector  $X$  which satisfies the equation  $[A - \lambda I]X = 0$ . The non-zero vector  $X$  is called characteristic

vector or Eigen vector.

### 21.6 PROPERTIES OF EIGEN VECTORS

1. The eigen vector  $X$  of a matrix  $A$  is not unique.
2. If  $\lambda_1, \lambda_2, \dots, \lambda_n$  be distinct eigen values of an  $n \times n$  matrix then corresponding eigen vectors  $X_1, X_2, \dots, X_n$  form a linearly independent set.
3. If two or more eigen values are equal it may or may not be possible to get linearly independent eigen vectors corresponding to the equal roots.
4. Two eigen vectors  $X_1$  and  $X_2$  are called orthogonal vectors if  $X_1^T X_2 = 0$ .
5. Eigen vectors of a symmetric matrix corresponding to different eigen values are orthogonal.

**Normalised form of vectors.** To find normalised form of  $\begin{bmatrix} a \\ b \\ c \end{bmatrix}$ , we divide each element by

$$\sqrt{a^2 + b^2 + c^2}.$$

For example, normalised form of  $\begin{bmatrix} 1 \\ 2 \\ 2 \end{bmatrix}$  is  $\begin{bmatrix} 1/3 \\ 2/3 \\ 2/3 \end{bmatrix}$   $\left[ \sqrt{1^2 + 2^2 + 2^2} = 3 \right]$

### 21.7 ORTHOGONAL VECTORS

Two vectors  $X$  and  $Y$  are said to be orthogonal if  $X_1^T X_2 = X_2^T X_1 = 0$ .

**Example 20.** Determine whether the eigen vectors of the matrix

$$A = \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$$

are orthogonal.

**Solution.** Characteristic equation is

$$\begin{vmatrix} 1-\lambda & 0 & -1 \\ 1 & 2-\lambda & 1 \\ 2 & 2 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (1-\lambda)[(2-\lambda)(3-\lambda)-2] - 1[2-2(2-\lambda)] = 0$$

$$\Rightarrow (1-\lambda)(6-5\lambda+\lambda^2-2) - (2-4+2\lambda) = 0 \Rightarrow (\lambda-1)(\lambda^2-5\lambda+4) + 2(\lambda-1) = 0$$

$$\Rightarrow (1-\lambda)(\lambda^2-5\lambda+4) - 2(\lambda-1) = 0 \Rightarrow (\lambda-1)[\lambda^2-5\lambda+4+2] = 0$$

$$\Rightarrow (\lambda-1)(\lambda^2-5\lambda+6) = 0 \Rightarrow (\lambda-1)(\lambda-2)(\lambda-3) = 0$$

So,  $\lambda = 1, 2, 3$  are three distinct eigen values of  $A$ .

For  $\lambda = 1$

$$\begin{bmatrix} 1-\lambda & 0 & -1 \\ 1 & 2-\lambda & 1 \\ 2 & 2 & 3-\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 1-1 & 0 & -1 \\ 1 & 2-1 & 1 \\ 2 & 2 & 3-1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 0 & 0 & -1 \\ 1 & 1 & 1 \\ 2 & 2 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\Rightarrow \begin{matrix} x_3 = 0 \\ x_1 + x_2 + x_3 = 0 \Rightarrow x_2 = -x_3 - x_1 \end{matrix}$$

Let  $x_1 = k$  then  $x_2 = 0 - k = -k$

$$X_1 = \begin{bmatrix} k \\ -k \\ 0 \end{bmatrix} \Rightarrow X_1 = k \begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix}$$

**For  $\lambda = 2$**

$$\begin{aligned} & \begin{bmatrix} 1-2 & 0 & -1 \\ 1 & 2-2 & 1 \\ 2 & 2 & 3-2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} -1 & 0 & -1 \\ 1 & 0 & 1 \\ 2 & 2 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\ & \Rightarrow \begin{cases} x_1 + 0x_2 + x_3 = 0 \\ 2x_1 + 2x_2 + x_3 = 0 \\ \frac{x_1}{0-2} = \frac{x_2}{2-1} = \frac{x_3}{2-0} = k \end{cases} \\ & \Rightarrow x_1 = 2k, \quad x_2 = -k, \quad x_3 = -2k \\ & X_2 = k \begin{bmatrix} 2 \\ -1 \\ -2 \end{bmatrix} \end{aligned}$$

**For  $\lambda = 3$**

$$\begin{aligned} & \begin{bmatrix} 1-3 & 0 & -1 \\ 1 & 2-3 & 1 \\ 2 & 2 & 3-3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} -2 & 0 & -1 \\ 1 & -1 & 1 \\ 2 & 2 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\ & \Rightarrow \begin{cases} -2x_1 + 0x_2 - x_3 = 0 \\ x_1 - x_2 + x_3 = 0 \end{cases} \Rightarrow \frac{x_1}{0-1} = \frac{x_2}{-1+2} = \frac{x_3}{2-0} = k \\ & \Rightarrow x_1 = k, \quad x_2 = -k, \quad x_3 = -2k \\ & X_3 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} k \\ -k \\ -2k \end{bmatrix} = k \begin{bmatrix} 1 \\ -1 \\ -2 \end{bmatrix} \end{aligned}$$

$$X'_1 X_2 = [1, -1, 0] \begin{bmatrix} 2 \\ -1 \\ -2 \end{bmatrix} = 3, \quad X'_2 X_3 = [2, -1, -2] \begin{bmatrix} 1 \\ -1 \\ -2 \end{bmatrix} = 7, \quad X'_3 X_1 = [1, -1, -2] \begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix} = 2$$

Since  $X_1^T X_2 = 3 \neq 0$ ,  $X_2^T X_3 = 7 \neq 0$ ,  $X_3^T X_1 = 2 \neq 0$

Thus, there are three distinct eigen vectors. So  $X_1, X_2, X_3$  are not orthogonal eigen vectors.

## 21.8 NON-SYMMETRIC MATRICES WITH NON-REPEATED EIGEN VALUES

**Example 21.** Show that if  $\lambda_1, \lambda_2, \dots, \lambda_n$  be the eigen values of the matrix  $A$ , then  $A^n$  has the eigen values  $\lambda_1^n, \lambda_2^n, \dots, \lambda_n^n$ .

**Solution.** Let  $\lambda$  be an eigen value of the matrix  $A$ .

Therefore,  $AX = \lambda X$  ... (1)

By premultiplying both sides of (1) by  $A^{n-1}$ , we get

$$A^{n-1}(AX) = A^{n-1}(\lambda X) \Rightarrow A^n X = \lambda(A^{n-1}X) \quad \dots (2)$$

But  $A^2 X = A(AX) = A(\lambda X)$

$$= \lambda(AX) = \lambda(\lambda X) = \lambda^2 X \quad (\text{From (1) } AX = \lambda X)$$

$$A^3 X = A(A^2 X) = \lambda(\lambda^2 X) = \lambda^3 X$$

Similarly,

$$A^4 X = \lambda^4 X$$

.....

$$A^n X = \lambda^n X$$

Hence, if  $\lambda_1, \lambda_2, \dots$

**Example 22.** If  $\lambda$  be an eigen value of matrix  $A$  (non-zero matrix), show that  $\lambda^{-1}$  is an eigen

**Solution.** We have,  $\lambda$  is an eigen value of matrix  $A$ .

$$\text{Solution: We have, } \lambda \text{ is an eigen value of matrix } A \text{ if } AX = \lambda X$$

... (1)

where  $\lambda$  is eigen value

Premultiplying both sides of (1) by  $A^{-1}$ , we get

$$A^{-1}(AX) = A^{-1}(\lambda X) \quad \Rightarrow \quad (A^{-1}A)X = \lambda(A^{-1}X)$$

$$\Rightarrow IX = \lambda(A^{-1}X) \quad \Rightarrow \quad X = \lambda(A^{-1}X)$$

$$\Rightarrow \frac{1}{\lambda}X = A^{-1}X \quad \Rightarrow \quad A^{-1}X = \lambda^{-1}X$$

Hence,  $\lambda^{-1}$  is an eigen value of  $A^{-1}$ .

**Proved.**

**Example 23.** Find the eigen value and corresponding eigen vectors of the matrix

$$A = \begin{pmatrix} -5 & 2 \\ 2 & -2 \end{pmatrix} \quad (U.P.I Sem., Dec 2008)$$

**Solution.**  $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} -5-\lambda & 2 \\ 2 & -2-\lambda \end{vmatrix} = 0 \Rightarrow (-5-\lambda)(-2-\lambda) - 4 = 0$$

$$\Rightarrow \lambda^2 + 7\lambda + 10 - 4 = 0 \Rightarrow \lambda^2 + 7\lambda + 6 = 0$$

$$(\lambda + 1)(\lambda + 6) = 0 \Rightarrow \lambda = -1, -6$$

The eigen values of the given matrix are – 1 and – 6.

(i) When  $\lambda = -1$ , the corresponding eigen vectors are

$$[-5+1 \quad -2] [x_1] \quad [0] \quad [-4 \quad -2] [x_2] \quad [0]$$

$$\begin{bmatrix} 3+1 & -2 \\ 2 & -2+1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 4 & -2 \\ 2 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\Rightarrow 2x_1 - x_2 = 0 \Rightarrow x_1 = \frac{1}{2}x_2$$

Let  $x_1 = k$ , then  $x_2 = 2k$ . Hence, eigen vector  $X_1 = \begin{bmatrix} k \\ 2k \end{bmatrix}$

(ii) When  $\lambda = -6$ , the corresponding eigen vectors are given by

$$\Rightarrow \begin{bmatrix} -5+6 & 2 \\ 2 & -2+6 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 1 & 2 \\ 2 & 4 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Let  $x_1 = k_1$ , then  $x_2 = -\frac{1}{2}k_1$

Hence eigen vector  $X_2 = \begin{bmatrix} k_1 \\ -\frac{k_1}{2} \end{bmatrix}$  or  $\begin{bmatrix} 2k_1 \\ -k_1 \end{bmatrix}$

Hence eigen vectors are  $\begin{bmatrix} k \\ 2k_1 \\ -k_1 \end{bmatrix}$  and  $\begin{bmatrix} 2k_1 \\ -k_1 \end{bmatrix}$  Ans.

**Example 24.** Find the eigen values and eigen vectors of matrix  $A = \begin{bmatrix} 3 & 1 & 4 \\ 0 & 2 & 6 \\ 0 & 0 & 5 \end{bmatrix}$

**Solution.**  $|A - \lambda I| = \begin{vmatrix} 3-\lambda & 1 & 4 \\ 0 & 2-\lambda & 6 \\ 0 & 0 & 5-\lambda \end{vmatrix} = (3-\lambda)(2-\lambda)(5-\lambda)$  (AMIETE, June 2010, 2009)

Hence the characteristic equation of matrix  $A$  is given by

$$|A - \lambda I| = 0 \Rightarrow (3-\lambda)(2-\lambda)(5-\lambda) = 0$$

$$\therefore \lambda = 2, 3, 5.$$

Thus the eigen values of matrix  $A$  are 2, 3, 5.

The eigen vectors of the matrix  $A$  corresponding to the eigen value  $\lambda$  is given by the non-zero solution of the equation  $(A - \lambda I)X = 0$

or 
$$\begin{bmatrix} 3-\lambda & 1 & 4 \\ 0 & 2-\lambda & 6 \\ 0 & 0 & 5-\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \dots (1)$$

When  $\lambda = 2$ , the corresponding eigen vector is given by

$$\begin{aligned} & \begin{bmatrix} 3-2 & 1 & 4 \\ 0 & 2-2 & 6 \\ 0 & 0 & 5-2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\ \Rightarrow & \begin{bmatrix} 1 & 1 & 4 \\ 0 & 0 & 6 \\ 0 & 0 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\ & x_1 + x_2 + 4x_3 = 0 \\ \Rightarrow & 0x_1 + 0x_2 + 6x_3 = 0 \\ & \frac{x_1}{6-0} = \frac{x_2}{0-6} = \frac{x_3}{0-0} = k \Rightarrow \frac{x_1}{1} = \frac{x_2}{-1} = \frac{x_3}{0} = k \Rightarrow x_1 = k, x_2 = -k, x_3 = 0 \end{aligned}$$

Hence  $X_1 = \begin{bmatrix} k \\ -k \\ 0 \end{bmatrix} = k \begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix}$  can be taken as an eigen vector of  $A$  corresponding to the eigen value  $\lambda = 2$

When  $\lambda = 3$ , substituting in (1), the corresponding eigen vector is given by

$$\begin{bmatrix} 3-3 & 1 & 4 \\ 0 & 2-3 & 6 \\ 0 & 0 & 5-3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 0 & 1 & 4 \\ 0 & -1 & 6 \\ 0 & 0 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{aligned} & 0x_1 + x_2 + 4x_3 = 0 \\ & 0x_1 - x_2 + 6x_3 = 0 \end{aligned}$$

$$\begin{aligned} & \frac{x_1}{6+4} = \frac{x_2}{0-0} = \frac{x_3}{0-0} \Rightarrow \frac{x_1}{10} = \frac{x_2}{0} = \frac{x_3}{0} = \frac{k}{10} \\ & x_1 = k, x_2 = 0, x_3 = 0 \end{aligned}$$

Hence,  $X_2 = \begin{bmatrix} k \\ 0 \\ 0 \end{bmatrix} = k \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$  can be taken as an eigen vector of A corresponding to the eigen value  $\lambda = 3$ .

**When  $\lambda = 5$ .**

Again, when  $\lambda = 5$ , substituting in (1), the corresponding eigen vector is given by

$$\begin{bmatrix} 3-5 & 1 & 4 \\ 0 & 2-5 & 6 \\ 0 & 0 & 5-5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} -2 & 1 & 4 \\ 0 & -3 & 6 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$-2x_1 + x_2 + 4x_3 = 0$$

$$-3x_2 + 6x_3 = 0$$

By cross-multiplication method, we have

$$\frac{x_1}{6+12} = \frac{x_2}{0+12} = \frac{x_3}{6-0} \Rightarrow \frac{x_1}{18} = \frac{x_2}{12} = \frac{x_3}{6} \Rightarrow \frac{x_1}{3} = \frac{x_2}{2} = \frac{x_3}{1} = k$$

$$x_1 = 3k, \quad x_2 = 2k, \quad x_3 = k$$

Hence,  $X_3 = \begin{bmatrix} 3k \\ 2k \\ k \end{bmatrix} = k \begin{bmatrix} 3 \\ 2 \\ 1 \end{bmatrix}$  can be taken as an eigen vector of A corresponding to the eigen value  $\lambda = 5$ .

**Ans.**

### EXERCISE 21.3

Non-symmetric matrix with different eigen values:

Find the eigen values and the corresponding eigen vectors for the following matrices:

1.  $\begin{bmatrix} 4 & 2 & -2 \\ -5 & 3 & 2 \\ -2 & 4 & 1 \end{bmatrix}$

**Ans.** 1, 2, 5;  $\begin{bmatrix} 2 \\ 1 \\ 4 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$

2.  $\begin{bmatrix} 2 & -2 & 3 \\ 1 & 1 & 1 \\ 1 & 3 & -1 \end{bmatrix}$

**Ans.** -2, 1, 3;  $\begin{bmatrix} 11 \\ 1 \\ 14 \end{bmatrix}, \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$

3.  $\begin{bmatrix} -9 & 2 & 6 \\ 5 & 0 & -3 \\ -16 & 4 & 11 \end{bmatrix}$

**Ans.** -1, 1, 2;  $\begin{bmatrix} 2 \\ -1 \\ 3 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix}, \begin{bmatrix} 2 \\ -1 \\ 4 \end{bmatrix}$

4.  $\begin{bmatrix} 4 & 6 & 6 \\ 1 & 3 & 2 \\ -1 & -4 & -3 \end{bmatrix}$

**Ans.** -1, 1, 4;  $\begin{bmatrix} -6 \\ -2 \\ 7 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ -1 \end{bmatrix}, \begin{bmatrix} 3 \\ 1 \\ -1 \end{bmatrix}$

### 21.9 NON-SYMMETRIC MATRIX WITH REPEATED EIGEN VALUES

**Example 25.** Find the eigen values and eigen vectors of the matrix:

$$\begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 1 \end{bmatrix}$$

(R.G.P.V. Bhopal, June 2004)

**Solution.** We have,  $A = \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 1 \end{bmatrix}$ .

Characteristic equation of  $A$  is  $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} 2-\lambda & 1 & 1 \\ 1 & 2-\lambda & 1 \\ 0 & 0 & 1-\lambda \end{vmatrix} = 0$$

On expanding the determinant by the third row, we get

$$\Rightarrow (1-\lambda)\{(2-\lambda)(2-\lambda)-1\} = 0 \Rightarrow (1-\lambda)\{(2-\lambda)^2 - 1\} = 0$$

$$\Rightarrow (1-\lambda)(2-\lambda+1)(2-\lambda-1) = 0 \Rightarrow (1-\lambda)(3-\lambda)(1-\lambda) = 0$$

$$\Rightarrow \lambda = 1, 1, 3$$

**when  $\lambda = 1$**

$$\begin{bmatrix} 2-1 & 1 & 1 \\ 1 & 2-1 & 1 \\ 0 & 0 & 1-1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} R_2 \rightarrow R_2 - R_1 \Rightarrow x + y + z = 0$$

Let  $x = k_1$  and  $y = k_2$

$$k_1 + k_2 + z = 0 \Rightarrow z = -(k_1 + k_2)$$

$$X_1 = \begin{bmatrix} k_1 \\ k_2 \\ -(k_1 + k_2) \end{bmatrix} = k \begin{bmatrix} 1 \\ 1 \\ -2 \end{bmatrix} \quad [\text{If } k_1 = k_2 = k]$$

$$\text{Again } \lambda = 1, X_2 = \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix} \quad [\text{Again if } k_1 = 1, k_2 = 0, -(k_1 + k_2) = -1]$$

**when  $\lambda = 3$**

$$\begin{bmatrix} 2-3 & 1 & 1 \\ 1 & 2-3 & 1 \\ 0 & 0 & 1-3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 0 & 0 & -2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 1 & 1 \\ 0 & 0 & 2 \\ 0 & 0 & -2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} R_2 \rightarrow R_2 + R_1$$

$$-x + y + z = 0$$

$$2z = 0 \Rightarrow z = 0$$

$$-x + y + 0 = 0 \Rightarrow x = y = k \text{ (say)}$$

$$X_3 = \begin{bmatrix} k \\ k \\ 0 \end{bmatrix} = k \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

**Ans.**

**Example 26.** Find all the Eigen values and Eigen vectors of the matrix

$$A = \begin{bmatrix} -2 & 2 & -3 \\ 2 & 1 & -6 \\ -1 & -2 & 0 \end{bmatrix}$$

(AMIETE, Dec. 2009)

**Solution.** Characteristic equation of  $A$  is

$$\begin{vmatrix} -2-\lambda & 2 & -3 \\ 2 & 1-\lambda & -6 \\ -1 & -2 & 0-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (-2-\lambda)(-\lambda+\lambda^2-12) - 2(-2\lambda-6) - 3(-4+1-\lambda) = 0$$

$$\lambda^3 + \lambda^2 - 21\lambda - 45 = 0 \quad \dots (1)$$

By trial: If  $\lambda = -3$ , then  $-27 + 9 + 63 - 45 = 0$ , so  $(\lambda + 3)$  is one factor of (1).

The remaining factors are obtained on dividing (1) by  $\lambda + 3$ .

$$\begin{array}{c|cccc} -3 & 1 & 1 & -21 & -45 \\ & & -3 & 6 & 45 \\ \hline & 1 & -2 & -15 & 0 \\ & & \lambda^2 - 2\lambda - 15 = 0 & & \\ \Rightarrow & (\lambda + 3)(\lambda - 5) & = 0 & \Rightarrow & (\lambda - 5)(\lambda + 3) = 0 \end{array}$$

$$\Rightarrow (\lambda + 3)(\lambda - 5) = 0 \Rightarrow \lambda = 5, -3, -3$$

To find the eigen vectors for corresponding eigen values, we will consider the matrix equation

$$(A - \lambda I)X = 0 \quad i.e., \quad \begin{bmatrix} -2-\lambda & 2 & -3 \\ 2 & 1-\lambda & -6 \\ -1 & -2 & 0-\lambda \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \dots (2)$$

$$\text{On putting } \lambda = 5 \text{ in eq. (2), it becomes } \begin{bmatrix} -7 & 2 & -3 \\ 2 & -4 & -6 \\ -1 & -2 & -5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\text{We have } \begin{aligned} -7x + 2y - 3z &= 0, \\ 2x - 4y - 6z &= 0 \end{aligned}$$

$$\frac{x}{-12-12} = \frac{y}{-6-42} = \frac{z}{28-4} \quad \text{or} \quad \frac{x}{-24} = \frac{y}{-48} = \frac{z}{24} \quad \text{or} \quad \frac{x}{1} = \frac{y}{2} = \frac{z}{-1} = k$$

$$x = k, \quad y = 2k, \quad z = -k$$

$$\text{Hence, the eigen vector } X_1 = \begin{bmatrix} k \\ 2k \\ -k \end{bmatrix} = k \begin{bmatrix} 1 \\ 2 \\ -1 \end{bmatrix}$$

$$\text{Put } \lambda = -3 \text{ in eq. (2), it becomes } \begin{bmatrix} 1 & 2 & -3 \\ 2 & 4 & -6 \\ -1 & -2 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\text{We have } \begin{aligned} x + 2y - 3z &= 0, \\ 2x + 4y - 6z &= 0, \\ -x - 2y + 3z &= 0 \end{aligned}$$

Here first, second and third equations are the same.

$$\text{Let } x = k_1, y = k_2 \text{ then } z = \frac{1}{3}(k_1 + 2k_2)$$

$$\text{Hence, the eigen vector is } \begin{bmatrix} k_1 \\ k_2 \\ \frac{1}{3}(k_1 + 2k_2) \end{bmatrix}$$

$$\text{Let } k_1 = 0, k_2 = 3, \text{ Hence } X_2 = \begin{bmatrix} 0 \\ 3 \\ 2 \end{bmatrix}$$

Since the matrix is non-symmetric, the corresponding eigen vectors  $X_2$  and  $X_3$  must be linearly independent. This can be done by choosing

$$k_1 = 3, \quad k_2 = 0, \quad \text{and Hence } X_3 = \begin{bmatrix} 3 \\ 0 \\ 1 \end{bmatrix}$$

$$\text{Hence, } X_1 = \begin{bmatrix} 1 \\ 2 \\ -1 \end{bmatrix}, \quad X_2 = \begin{bmatrix} 0 \\ 3 \\ 2 \end{bmatrix}, \quad X_3 = \begin{bmatrix} 3 \\ 0 \\ 1 \end{bmatrix}.$$

Ans.

### EXERCISE 21.4

**Non-symmetric matrices with repeated eigen values**

Find the eigen values and eigen vectors of the following matrices:

$$1. \begin{bmatrix} 2 & -2 & 2 \\ 1 & 1 & 1 \\ 1 & 3 & -1 \end{bmatrix} \quad \text{Ans. } -2, 2, 2; \begin{bmatrix} -4 \\ -1 \\ 7 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \quad 2. \begin{bmatrix} 2 & 2 & 1 \\ 1 & 3 & 1 \\ 1 & 2 & 2 \end{bmatrix} \quad \text{Ans. } 1, 1, 5; \begin{bmatrix} 1 \\ 2 \\ -5 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

$$3. \begin{bmatrix} 2 & 1 & 1 \\ 2 & 3 & 2 \\ 3 & 3 & 4 \end{bmatrix} \quad \text{Ans. } 1, 1, 7; \begin{bmatrix} 0 \\ 1 \\ -1 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} \quad 4. \begin{bmatrix} -9 & 4 & 4 \\ -8 & 3 & 4 \\ -16 & 8 & 7 \end{bmatrix} \quad \text{Ans. } -1, -1, 3; \begin{bmatrix} 0 \\ 1 \\ -1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix}$$

$$5. \begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad (\text{AMIETE, Dec. 2010}) \quad \text{Ans. } 1, 1, 1, \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$$

### 21.10 SYMMETRIC MATRICES WITH NON REPEATED EIGEN VALUES

**Example 27.** Find the eigen values and the corresponding eigen vectors of the matrix

$$\begin{bmatrix} -2 & 5 & 4 \\ 5 & 7 & 5 \\ 4 & 5 & -2 \end{bmatrix}$$

**Solution.**  $|A - \lambda I| = 0$

$$\begin{vmatrix} -2-\lambda & 5 & 4 \\ 5 & 7-\lambda & 5 \\ 4 & 5 & -2-\lambda \end{vmatrix} = 0 \quad \Rightarrow \quad \lambda^3 - 3\lambda^2 - 90\lambda - 216 = 0$$

**By trial:** Take  $\lambda = -3$ , then  $-27 - 27 + 270 - 216 = 0$

By synthetic division

$$\begin{array}{c|cccc} -3 & 1 & -3 & -90 & -216 \\ & -3 & 18 & 216 \\ \hline & 1 & -6 & -72 & 0 \end{array}$$

$$\lambda^2 - 6\lambda - 72 = 0 \Rightarrow (\lambda - 12)(\lambda + 6) = 0 \Rightarrow \lambda = -3, -6, 12$$

Matrix equation for eigen vectors  $[A - \lambda I]X = 0$

$$\begin{bmatrix} -2-\lambda & 5 & 4 \\ 5 & 7-\lambda & 5 \\ 4 & 5 & -2-\lambda \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \dots(1)$$

**Eigen Vector**

On putting  $\lambda = -3$  in (1), it will become

$$\begin{bmatrix} 1 & 5 & 4 \\ 5 & 10 & 5 \\ 4 & 5 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{cases} x + 5y + 4z = 0 \\ 5x + 10y + 5z = 0 \end{cases}$$

$$\frac{x}{25-40} = \frac{y}{20-5} = \frac{z}{10-25} \quad \text{or} \quad \frac{x}{1} = \frac{y}{-1} = \frac{z}{1}$$

Eigen vector  $X_1 = \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$ .

Eigen vector corresponding to eigen value  $\lambda = -6$ .

Equation (1) becomes

$$\begin{bmatrix} 4 & 5 & 4 \\ 5 & 13 & 5 \\ 4 & 5 & 4 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{or} \quad \begin{cases} 4x + 5y + 4z = 0 \\ 5x + 13y + 5z = 0 \end{cases}$$

$$\frac{x}{25-52} = \frac{y}{20-20} = \frac{z}{52-25} \quad \text{or} \quad \frac{x}{-1} = \frac{y}{0} = \frac{z}{1}$$

eigen vector  $X_2 = \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$

Eigen vector corresponding to eigen value  $\lambda = 12$ .

Equation (1) becomes

$$\begin{bmatrix} -14 & 5 & 4 \\ 5 & -5 & 5 \\ 4 & 5 & -14 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{or} \quad \begin{cases} -14x + 5y + 4z = 0 \\ 5x - 5y + 5z = 0 \end{cases}$$

$$\frac{x}{25+20} = \frac{y}{20+70} = \frac{z}{70-25} \quad \text{or} \quad \frac{x}{1} = \frac{y}{2} = \frac{z}{1}$$

Eigen vector  $X_3 = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$

**Ans.**

**Example 28.** Find the eigen values, eigen vectors the modal matrix given below.

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & -1 \\ 0 & -1 & 3 \end{bmatrix} \quad (R.G.P.V. Bhopal, I Sem., 2003)$$

**Solution.** The characteristic equation of the given matrix is

$$\begin{vmatrix} 1-\lambda & 0 & 0 \\ 0 & 3-\lambda & -1 \\ 0 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (1-\lambda)\{(3-\lambda)^2 - 1\} = 0 \quad \Rightarrow \quad (1-\lambda)(3-\lambda+1)(3-\lambda-1) = 0$$

$$\Rightarrow (1-\lambda)(4-\lambda)(2-\lambda) = 0 \quad \Rightarrow \quad \lambda = 1, 2, 4$$

Eigen vectors

**When  $\lambda = 1$ ,**

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 2 & -1 \\ 0 & -1 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \sim \begin{bmatrix} 0 & 0 & 0 \\ 0 & 2 & -1 \\ 0 & 0 & \frac{3}{2} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} R_3 \rightarrow R_3 + \frac{1}{2}R_2$$

$$\Rightarrow 2x_2 - x_3 = 0 \quad \dots (1)$$

$$\frac{3}{2}x_3 = 0 \Rightarrow x_3 = 0 \quad \dots (2)$$

Putting  $x_3 = 0$  from (2) in (1), we get  $2x_2 - 0 = 0 \Rightarrow x_2 = 0$

$$\text{Eigen Vector} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

**When  $\lambda = 2$ ,**

$$\begin{bmatrix} -1 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} R_1 \rightarrow -R_1$$

$$R_3 \rightarrow R_3 + R_2$$

$$x_1 = 0$$

$$x_2 - x_3 = 0 \Rightarrow x_2 = x_3$$

$$\text{Eigen vector} = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

**When  $\lambda = 4$ ,**

$$\begin{bmatrix} -3 & 0 & 0 \\ 0 & -1 & -1 \\ 0 & -1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$-3x_1 = 0$$

$$-x_2 - x_3 = 0$$

$$x_2 = -x_3$$

$$\text{Eigen Vector} = \begin{bmatrix} 0 \\ 1 \\ -1 \end{bmatrix}$$

$$\text{Modal matrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 1 & -1 \end{bmatrix}$$

**Ans.**

### EXERCISE 21.5

**Symmetric matrices with non-repeated eigen values**

**Find the eigen values and eigen vectors of the following matrices:**

1.  $\begin{bmatrix} 5 & 0 & 1 \\ 0 & -2 & 0 \\ 1 & 0 & 5 \end{bmatrix}$  Ans.  $-2, 4, 6; \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}$  2.  $\begin{bmatrix} 3 & -1 & 1 \\ -1 & 5 & -1 \\ 1 & -1 & 3 \end{bmatrix}$  Ans.  $2, 3, 6; \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix}$

3.  $\begin{bmatrix} 8 & -6 & 2 \\ -6 & 7 & -4 \\ 2 & -4 & 3 \end{bmatrix}$  (U.P., I Semester, Jan 2011) Ans.  $0, 3, 15; \begin{bmatrix} 1 \\ 2 \\ 2 \end{bmatrix}, \begin{bmatrix} 2 \\ 1 \\ -2 \end{bmatrix}, \begin{bmatrix} 2 \\ -2 \\ 1 \end{bmatrix}$

4.  $\begin{bmatrix} 2 & 4 & -6 \\ 4 & 2 & -6 \\ -6 & -6 & -15 \end{bmatrix}$  Ans.  $-2, 9, -18; \begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix}, \begin{bmatrix} 2 \\ 2 \\ -1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 4 \end{bmatrix}$  5.  $\begin{bmatrix} 1 & 1 & 3 \\ 1 & 5 & 1 \\ 3 & 1 & 1 \end{bmatrix}$  Ans.  $-2, 3, 6; \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$

(AMIETE, June 2009)

### 21.11 SYMMETRIC MATRICES WITH REPEATED EIGEN VALUES

**Example 29.** Find all the eigen values and eigen vectors of the matrix

$$\begin{bmatrix} 2 & -1 & 1 \\ -1 & 2 & -1 \\ 1 & -1 & 2 \end{bmatrix}$$

**Solution.** The characteristic equation is 
$$\begin{vmatrix} 2-\lambda & -1 & 1 \\ -1 & 2-\lambda & -1 \\ 1 & -1 & 2-\lambda \end{vmatrix} = 0$$

$$\begin{aligned} \Rightarrow & (2-\lambda)[(2-\lambda)^2 - 1] + 1[-2+\lambda+1] + 1[1-2+\lambda] = 0 \\ \Rightarrow & (2-\lambda)(4-4\lambda+\lambda^2-1) + (\lambda-1) + \lambda - 1 = 0 \\ \Rightarrow & 8-8\lambda+2\lambda^2-2-4\lambda+4\lambda^2-\lambda^3+\lambda+2\lambda-2 = 0 \\ \Rightarrow & -\lambda^3+6\lambda^2-9\lambda+4 = 0 \\ \Rightarrow & \lambda^3-6\lambda^2+9\lambda-4 = 0 \end{aligned} \quad \dots (1)$$

On putting  $\lambda = 1$  in (1), the equation (1) is satisfied. So  $\lambda - 1$  is one factor of the equation (1).

The other factor  $(\lambda^2 - 5\lambda + 4)$  is got on dividing (1) by  $\lambda - 1$ .

$$\Rightarrow (\lambda-1)(\lambda^2 - 5\lambda + 4) = 0 \text{ or } (\lambda-1)(\lambda-1)(\lambda-4) = 0 \Rightarrow \lambda = 1, 1, 4$$

The eigen values are 1, 1, 4.

When  $\lambda = 4$  
$$\begin{pmatrix} 2-4 & -1 & 1 \\ -1 & 2-4 & -1 \\ 1 & -1 & 2-4 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \Rightarrow \begin{pmatrix} -2 & -1 & 1 \\ -1 & -2 & -1 \\ 1 & -1 & -2 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\begin{aligned} -2x_1 - x_2 + x_3 &= 0 \\ x_1 - x_2 - 2x_3 &= 0 \end{aligned}$$

$$\Rightarrow \frac{x_1}{2+1} = \frac{x_2}{1-4} = \frac{x_3}{2+1} \Rightarrow \frac{x_1}{1} = \frac{x_2}{-1} = \frac{x_3}{1} = k$$

$$x_1 = k, \quad x_2 = -k, \quad x_3 = k$$

$$X_1 = \begin{bmatrix} k \\ -k \\ k \end{bmatrix} = k \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} \quad \text{or} \quad X_1 = \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

When  $\lambda = 1$

$$\begin{pmatrix} 2-1 & -1 & 1 \\ -1 & 2-1 & -1 \\ 1 & -1 & 2-1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = 0$$

$$\Rightarrow \begin{pmatrix} 1 & -1 & 1 \\ -1 & 1 & -1 \\ 1 & -1 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = 0 \Rightarrow \begin{pmatrix} 1 & -1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = 0, R_2 \rightarrow R_2 + R_1 \\ R_3 \rightarrow R_3 - R_1$$

$$x_1 - x_2 + x_3 = 0$$

Let  $x_1 = k_1$  and  $x_2 = k_2$

$$k_1 - k_2 + x_3 = 0 \quad \text{or}$$

$$X_2 = \begin{bmatrix} k_1 \\ k_2 \\ k_2 - k_1 \end{bmatrix} \Rightarrow X_2 = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} \quad \begin{bmatrix} k_1 = 1 \\ k_2 = 1 \end{bmatrix}$$

$$\text{Let } X_3 = \begin{bmatrix} l \\ m \\ n \end{bmatrix}$$

As  $X_3$  is orthogonal to  $X_1$  since the given matrix is symmetric

$$[1, -1, 1] \begin{bmatrix} l \\ m \\ n \end{bmatrix} = 0 \quad \text{or} \quad l - m + n = 0 \quad \dots (2)$$

As  $X_3$  is orthogonal to  $X_2$  since the given matrix is symmetric

$$[1, 1, 0] \begin{bmatrix} l \\ m \\ n \end{bmatrix} = 0 \quad \text{or} \quad l + m + 0 = 0 \quad \dots (3)$$

Solving (2) and (3), we get  $\frac{l}{0-1} = \frac{m}{1-0} = \frac{n}{1+1} \Rightarrow \frac{l}{-1} = \frac{m}{1} = \frac{n}{2}$

$$X_3 = \begin{bmatrix} -1 \\ 1 \\ 2 \end{bmatrix} \quad \text{Ans.}$$

### EXERCISE 21.6

Symmetric matrices with repeated eigen values

Find the eigen values and the corresponding eigen vectors of the following matrices:

1.  $\begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & 6 \\ 3 & 6 & 9 \end{bmatrix}$  Ans. 0, 0, 14;  $\begin{bmatrix} -2 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 3 \\ 6 \\ -5 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$  2.  $\begin{bmatrix} 2 & 0 & 1 \\ 0 & 3 & 0 \\ 1 & 0 & 2 \end{bmatrix}$  Ans. 1, 3, 3;  $\begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix}$

3.  $\begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$  Ans. 8, 2, 2;  $\begin{bmatrix} 2 \\ -1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ -2 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix}$

4.  $\begin{bmatrix} 6 & -3 & 3 \\ -3 & 6 & -3 \\ 3 & -3 & 6 \end{bmatrix}$  Ans. 3, 3, 12

**21.12 MATRIX HAVING ONLY ONE LINEARLY INDEPENDENT EIGEN VECTOR**

**Example 30.** Find the eigen values and eigen vectors of

$$A = \begin{bmatrix} -3 & -7 & -5 \\ 2 & 4 & 3 \\ 1 & 2 & 2 \end{bmatrix}$$

has less than three linearly independent eigen vectors. It is possible to obtain a similarity transformation that will diagonalise this matrix.

**Solution.** The characteristic equation of the given matrix is

$$\begin{aligned} |A - \lambda I| &= 0 \\ \Rightarrow \begin{vmatrix} -3-\lambda & -7 & -5 \\ 2 & 4-\lambda & 3 \\ 1 & 2 & 2-\lambda \end{vmatrix} &= 0 \\ \Rightarrow (-3-\lambda)[(4-\lambda)(2-\lambda)-6] + 7[2(2-\lambda)-3] - 5[4-(4-\lambda)] &= 0 \\ \Rightarrow \lambda^3 - 3\lambda^2 + 3\lambda - 1 &= 0 \Rightarrow (\lambda-1)^3 = 1 \Rightarrow \lambda = 1, 1, 1 \\ \text{Eigen values of the given matrix } A \text{ are } 1, 1, 1. \text{ Eigen vector when } \lambda = 1 \\ \begin{bmatrix} -3-1 & -7 & -5 \\ 2 & 4-1 & 3 \\ 1 & 2 & 2-1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} &= \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} -4 & -7 & -5 \\ 2 & 3 & 3 \\ 1 & 2 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \dots (1) \\ \Rightarrow -4x_1 - 7x_2 - 5x_3 &= 0 \dots (1) \\ 2x_1 + 3x_2 + 3x_3 &= 0 \dots (2) \end{aligned}$$

$$\begin{aligned} \frac{x_1}{-21+15} &= \frac{x_2}{-10+12} = \frac{x_3}{-12+14} \\ \Rightarrow \frac{x_1}{-6} &= \frac{x_2}{2} = \frac{x_3}{2} = k \quad (\text{say}) \end{aligned}$$

Thus,  $x_1 = -6k$ ,  $x_2 = 2k$  and  $x_3 = 2k$

$$X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -6k \\ 2k \\ 2k \end{bmatrix} = 2k \begin{bmatrix} -3 \\ 1 \\ 1 \end{bmatrix}$$

All the eigen vectors are same and hence linearly independent.

**Ans.**

**21.13 MATRIX HAVING ONLY TWO EIGEN VECTORS**

**Example 31.** Find the eigen values and eigen vectors of  $A = \begin{bmatrix} 3 & 10 & 5 \\ -2 & -3 & -4 \\ 3 & 5 & 7 \end{bmatrix}$

has less than three linearly independent eigen vectors. Is it possible to obtain a similarity transformation that will diagonalise this matrix?

**Solution.** The characteristic equation of the given matrix  $A$  is

$$\begin{aligned} |A - \lambda I| &= 0 \\ \Rightarrow \begin{vmatrix} 3-\lambda & 10 & 5 \\ -2 & -3-\lambda & -4 \\ 3 & 5 & 7-\lambda \end{vmatrix} &= 0 \\ \Rightarrow (3-\lambda)[(-3-\lambda)(7-\lambda)+20] - 10[-2(7-\lambda)+12] + 5[-10-3(-3-\lambda)] &= 0 \\ \Rightarrow (3-\lambda)[-21+3\lambda-7\lambda+\lambda^2+20]-10[-14+2\lambda+12]+5[-10+9+3\lambda] &= 0 \end{aligned}$$

$$\Rightarrow (3-\lambda)(\lambda^2 - 4\lambda - 1) - 10(2\lambda - 2) + 5(3\lambda - 1) = 0$$

$$\Rightarrow \lambda^3 - 7\lambda^2 + 16\lambda - 12 = 0 \Rightarrow (\lambda - 3)(\lambda - 2)^2 = 0 \Rightarrow \lambda = 3, 2, 2$$

Eigen values of the given matrix  $A$  are 3, 2, 2.

Eigen vector, when  $\lambda = 3$

$$\begin{bmatrix} 3-3 & 10 & 5 \\ -2 & -3-3 & -4 \\ 3 & 5 & 7-3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 0 & 10 & 5 \\ -2 & -6 & -4 \\ 3 & 5 & 4 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$-2x_1 - 6x_2 - 4x_3 = 0 \quad \dots (1)$$

$$3x_1 + 5x_2 + 4x_3 = 0 \quad \dots (2)$$

Solving (1) and (2) by cross multiplication method, we have

$$\frac{x_1}{-24+20} = \frac{x_2}{-12+8} = \frac{x_3}{-10+18}$$

$$\Rightarrow \frac{x_1}{-4} = \frac{x_2}{-4} = \frac{x_3}{8} = k \text{ (say)}$$

Thus,  $x_1 = -4k$ ,  $x_2 = -4k$  and  $x_3 = 8k$

$$X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -4k \\ -4k \\ 8k \end{bmatrix} = 4k \begin{bmatrix} -1 \\ -1 \\ 2 \end{bmatrix}$$

Eigen vector when  $\lambda = 2$

$$\begin{bmatrix} 3-2 & 10 & 5 \\ -2 & -3-2 & -4 \\ 3 & 5 & 7-2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 1 & 10 & 5 \\ -2 & -5 & -4 \\ 3 & 5 & 5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\Rightarrow x_1 + 10x_2 + 5x_3 = 0 \quad \dots (3)$$

$$-2x_1 - 5x_2 - 4x_3 = 0 \quad \dots (4)$$

Solving (3) and (4) by cross multiplication method, we have

$$\frac{x_1}{-40+25} = \frac{x_2}{-10+4} = \frac{x_3}{-5+20} \Rightarrow \frac{x_1}{-15} = \frac{x_2}{-6} = \frac{x_3}{15} = k \text{ (say)}$$

$$\Rightarrow x_1 = -15k, \quad x_2 = -6k, \quad x_3 = 15k$$

$$X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -15k \\ -6k \\ 15k \end{bmatrix} = 3k \begin{bmatrix} -5 \\ -2 \\ 5 \end{bmatrix}$$

We get one eigen vector corresponding to repeated root  $\lambda_2 = \lambda_3 = 2$ .

Eigen vectors corresponding to  $\lambda_2 = \lambda_3 = 2$  are not linearly independent. Similarity transformation is not possible.

**Ans.**

## 21.14 COMPLEX EIGEN VALUES

**Example 32.** Show that if  $0 < \theta < \pi$ , then  $A = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix}$  has no real eigen values and consequently no eigen vector. (Gujarat, II Semester, June 2009)

**Solution.** The characteristic equation of  $A$  is  $\begin{vmatrix} \cos \theta - \lambda & -\sin \theta \\ \sin \theta & \cos \theta - \lambda \end{vmatrix} = 0$

$$\begin{aligned}
 \Rightarrow & (\cos \theta - \lambda)^2 + \sin^2 \theta = 0 \\
 \Rightarrow & \cos^2 \theta - 2\lambda \cos \theta + \lambda^2 + \sin^2 \theta = 0 \\
 \Rightarrow & \lambda^2 - 2\lambda \cos \theta + 1 = 0 \\
 \Rightarrow & \lambda = \frac{2\cos \theta \pm \sqrt{4\cos^2 \theta - 4}}{2} = \frac{2\cos \theta \pm 2i\sqrt{1-\cos^2 \theta}}{2} = \cos \theta \pm i \sin \theta
 \end{aligned}$$

Hence, the given matrix A has no real eigen values and consequently no eigen vector. **Proved.**

**Example 33.** If a matrix A is non-singular. Then  $\lambda = 0$  is not its eigen value.

**Solution.** Since matrix A is non-singular then  $|A| \neq 0$

$$\Rightarrow |A - 0I| \neq 0$$

Hence  $\lambda = 0$  is not its eigen value.

**Proved.**

### 21.15 ALGEBRAIC MULTIPLICITY

Algebraic multiplicity of an eigen value is the number of times of repetition of an eigen value.

It is denoted by  $\text{mult}_a(\lambda)$ .

For example, the eigen values of a matrix  $\begin{bmatrix} -2 & 2 & -3 \\ 2 & 1 & -6 \\ -1 & -2 & 0 \end{bmatrix}$  are  $-3, -3, 5$ .

The  $\text{mult}_a(-3) = 2$  and  $\text{mult}_a(5) = 1$

### 21.16 GEOMETRIC MULTIPLICITY

Geometric multiplicity of an eigen value is the number of linearly independent eigen vectors corresponding to  $\lambda$ .

It is denoted by  $\text{Mult}_g(\lambda)$

In example 30, two linearly independent eigen vectors corresponding to

$$\lambda = -3 \text{ are } \begin{bmatrix} 0 \\ 3 \\ 2 \end{bmatrix} \text{ and } \begin{bmatrix} 3 \\ 0 \\ 1 \end{bmatrix}.$$

so the  $\text{mult}_g(-3) = 2$

And the eigen vector corresponding to  $\lambda = 5$  is  $\begin{bmatrix} 1 \\ 2 \\ -1 \end{bmatrix}$  so the  $\text{mult}_g(5) = 1$ .

### 21.17 REGULAR EIGEN VALUE

If the algebraic multiplicity and geometric multiplicity of an eigen value are equal, then the eigen value is called *regular*.

**Example 34.** Find the algebraic multiplicity and geometric multiplicity of an eigen value of

the matrix  $A = \begin{bmatrix} 3 & 10 & 5 \\ -2 & -3 & -4 \\ 3 & 5 & 7 \end{bmatrix}$  and show geometric multiplicity cannot be greater than

algebraic multiplicity.

**Solution.** The characteristic equation of the given matrix is

$$\begin{vmatrix} 3-\lambda & 10 & 5 \\ -2 & -3-\lambda & -4 \\ 3 & 5 & 7-\lambda \end{vmatrix} = 0$$

$$\begin{aligned}\Rightarrow \lambda^3 - 7\lambda^2 + 16\lambda - 12 &= 0 \\ \Rightarrow (\lambda - 2)(\lambda - 2)(\lambda - 3) &= 0 \\ \Rightarrow \lambda &= 2, 2, 3\end{aligned}$$

Therefore 2 is a multiple eigen value repeating 2 times. So Algebraic Multiplicity of 2 is 2.

$$\text{Mult}_a(2) = 2. \quad \dots(A)$$

We shall find the eigen vector corresponding to the eigen value 2.

$$\begin{aligned}X = \begin{bmatrix} 3-2 & 10 & 5 \\ -2 & -3-2 & -4 \\ 3 & 5 & 7-2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\ \Rightarrow \begin{bmatrix} 1 & 10 & 5 \\ -2 & -5 & -4 \\ 3 & 5 & 5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\ x_1 + 10x_2 + 5x_3 = 0 \quad \dots(1) \\ -2x_1 - 5x_2 - 4x_3 = 0 \quad \dots(2)\end{aligned}$$

Solving (1) and (2) by cross multiplication method, we have

$$\begin{aligned}\frac{x_1}{-40+25} = \frac{x_2}{-10+4} = \frac{x_3}{-5+20} \\ \Rightarrow \frac{x_1}{-15} = \frac{x_2}{-6} = \frac{x_3}{15} = k \text{ (say)} \\ \text{Thus } x_1 = -15k, \quad x_2 = -6k, \quad x_3 = 15k \\ X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -15k \\ -6k \\ 15k \end{bmatrix} = 3k \begin{bmatrix} -5 \\ -2 \\ 5 \end{bmatrix}\end{aligned}$$

Here the linearly independent eigen vector is 1.

So the geometric multiplicity of eigen value 2 is 1

$$\text{Mult}_g(2) = 1 \quad \dots(B)$$

Hence from (A) and (B)

**Ans.**

Geometric multiplicity < Algebraic multiplicity

- Notes:** (1) If the values of  $x_1, x_2, x_3$  are in terms of  $k$  (one independent value), then there is only one linearly independent eigen vector. So the geometric multiplicity is 1.  
 (2) If the values of  $x_1, x_2, x_3$  are in terms of  $k_1, k_2$  (two independent values), then there are two linearly independent eigen vectors. So the geometric multiplicity is 2.

### EXERCISE 21.7

From the following matrices; find eigen value, Algebraic multiplicity, Geometric multiplicity.

$$1. \begin{bmatrix} -2 & -1 \\ 5 & 4 \end{bmatrix} \quad \text{Ans. } \lambda = -1, \text{ Mult}_a(-1) = 1, \text{ Mult}_g(-1) = 1 \\ \lambda = 3, \text{ Mult}_a(3) = 1, \text{ Mult}_g(3) = 1$$

$$2. \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} \quad \text{Ans. } \lambda = 1, \text{ Mult}_a(1) = 3, \text{ Mult}_g(1) = 1$$

$$3. \begin{bmatrix} 0 & 0 & 1 \\ 1 & 0 & -3 \\ 0 & 1 & 3 \end{bmatrix} \quad \text{Ans. } \lambda = 1, \text{ Mult}_a(1) = 3, \text{ Mult}_g(1) = 1$$

4.  $\begin{bmatrix} 1 & 2 & 3 \\ 0 & 2 & 3 \\ 0 & 0 & 2 \end{bmatrix}$  **Ans.**  $\lambda = 2$ ,  $\text{Mult}_a(2) = 2$ ,  $\text{Mult}_g(2) = 1$
5.  $\begin{bmatrix} 2 & 2 & 1 \\ 1 & 3 & 1 \\ 1 & 2 & 2 \\ 1 & 2 & 2 \end{bmatrix}$  **Ans.**  $\lambda = 5$ ,  $\text{Mult}_a(5) = 1$ ,  $\text{Mult}_g(5) = 1$
6.  $\begin{bmatrix} 0 & 2 & 1 \\ -1 & 2 & 2 \end{bmatrix}$  **Ans.**  $\lambda = 1$ ,  $\text{Mult}_a(1) = 1$ ,  $\text{Mult}_g(1) = 1$   
 $\lambda = 2$ ,  $\text{Mult}_a(2) = 2$ ,  $\text{Mult}_g(2) = 1$
7.  $\begin{bmatrix} 5 & 4 & -4 \\ 4 & 5 & -4 \\ -1 & -1 & 2 \end{bmatrix}$  **Ans.**  $\lambda = 1$ ,  $\text{Mult}_a(1) = 2$ ,  $\text{Mult}_g(1) = 2$   
 $\lambda = 10$ ,  $\text{Mult}_a(10) = 1$ ,  $\text{Mult}_g(10) = 1$
8.  $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix}$  **Ans.**  $\lambda = 1$ ,  $\text{Mult}_a(1) = 4$ ,  $\text{Mult}_g(1) = 3$

## 21.18 SIMILARITY TRANSFORMATION

Let  $A$  and  $B$  be two square matrices of order  $n$ . Then  $B$  is said to be similar to  $A$  if there exists a non-singular matrix  $P$  such that

$$B = P^{-1}AP \quad \dots(1)$$

Equation (1) is called a similar transformation.

## 21.19 DIAGONALISATION OF A MATRIX

Diagonalisation of a matrix  $A$  is the process of reduction of  $A$  to a diagonal form ' $D$ '. If  $A$  is related to  $D$  by a similarity transformation such that  $D = P^{-1}AP$  then  $A$  is reduced to the diagonal matrix  $D$  through *modal matrix*  $P$ .  $D$  is also called *spectral matrix* of  $A$ .

## 21.20 ORTHOGONAL TRANSFORMATION OF A SYMMETRIC MATRIX TO DIAGONAL FORM

Let  $A$  be a symmetric matrix, then

$$A \cdot A' = I \quad \dots(1)$$

and  $A \cdot A^{-1} = I \quad \dots(2)$

From (1) and (2), we have  $A^{-1} = A'$

We know that, diagonalisation transformation of a symmetric matrix is

$$P^{-1}AP = D$$

If we normalize each eigen vector and use them to form the normalized modal matirx  $N$  then  $N$  is an orthogonal matrix.

Then,  $N^T AN = D$

Transforming  $A$  into  $D$  by means of the transformation  $N^T AN = D$  is called as orthogonal transformation.

**Note.** To normalize eigen vector divide each element of the vector by the square root of the sum of the squares of all the elements of the vector.

## 21.21 THEOREM ON DIAGONALIZATION OF A MATRIX

**Theorem.** *If a square matrix  $A$  of order  $n$  has  $n$  linearly independent eigen vectors, then a matrix  $P$  can be found such that  $P^{-1}AP$  is a diagonal matrix.*

**Proof.** We shall prove the theorem for a matrix of order 3. The proof can be easily extended to matrices of higher order.

Let

$$A = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix}$$

and let  $\lambda_1, \lambda_2, \lambda_3$  be its eigen values and  $X_1, X_2, X_3$  the corresponding eigen vectors, where

$$X_1 = \begin{bmatrix} x_1 \\ y_1 \\ z_1 \end{bmatrix}, \quad X_2 = \begin{bmatrix} x_2 \\ y_2 \\ z_2 \end{bmatrix}, \quad X_3 = \begin{bmatrix} x_3 \\ y_3 \\ z_3 \end{bmatrix}$$

For the eigen value  $\lambda_1$ , the eigen vector is given by

$$\left. \begin{array}{l} (a_1 - \lambda_1)x_1 + b_1y_1 + c_1z_1 = 0 \\ a_2x_1 + (b_2 - \lambda_1)y_1 + c_2z_1 = 0 \\ a_3x_1 + b_3y_1 + (c_3 - \lambda_1)z_1 = 0 \end{array} \right\} \dots(1)$$

$\therefore$  We have

$$\left. \begin{array}{l} a_1x_1 + b_1y_1 + c_1z_1 = \lambda_1x_1 \\ a_2x_1 + b_2y_1 + c_2z_1 = \lambda_1y_1 \\ a_3x_1 + b_3y_1 + c_3z_1 = \lambda_1z_1 \end{array} \right\} \dots(2)$$

Similarly, for  $\lambda_2$  and  $\lambda_3$ , we have

$$\left. \begin{array}{l} a_1x_2 + b_1y_2 + c_1z_2 = \lambda_2x_2 \\ a_2x_2 + b_2y_2 + c_2z_2 = \lambda_2y_2 \\ a_3x_2 + b_3y_2 + c_3z_2 = \lambda_2z_2 \end{array} \right\} \dots(3)$$

and

$$\left. \begin{array}{l} a_1x_3 + b_1y_3 + c_1z_3 = \lambda_3x_3 \\ a_2x_3 + b_2y_3 + c_2z_3 = \lambda_3y_3 \\ a_3x_3 + b_3y_3 + c_3z_3 = \lambda_3z_3 \end{array} \right\} \dots(4)$$

We consider the matrix  $P = \begin{bmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ z_1 & z_2 & z_3 \end{bmatrix}$

whose columns are the eigen vectors of  $A$ .

Then  $AP = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ z_1 & z_2 & z_3 \end{bmatrix}$

$$= \begin{pmatrix} a_1x_1 + b_1y_1 + c_1z_1 & a_1x_2 + b_1y_2 + c_1z_2 & a_1x_3 + b_1y_3 + c_1z_3 \\ a_2x_1 + b_2y_1 + c_2z_1 & a_2x_2 + b_2y_2 + c_2z_2 & a_2x_3 + b_2y_3 + c_2z_3 \\ a_3x_1 + b_3y_1 + c_3z_1 & a_3x_2 + b_3y_2 + c_3z_2 & a_3x_3 + b_3y_3 + c_3z_3 \end{pmatrix}$$

$$= \begin{pmatrix} \lambda_1x_1 & \lambda_2x_2 & \lambda_3x_3 \\ \lambda_1y_1 & \lambda_2y_2 & \lambda_3y_3 \\ \lambda_1z_1 & \lambda_2z_2 & \lambda_3z_3 \end{pmatrix} \quad [\text{Using results (2), (3) and (4)}]$$

$$= \begin{pmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \\ z_1 & z_2 & z_3 \end{pmatrix} \begin{pmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_2 & 0 \\ 0 & 0 & \lambda_3 \end{pmatrix} = PD$$

where  $D$  is the Diagonal matrix  $\begin{pmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_2 & 0 \\ 0 & 0 & \lambda_3 \end{pmatrix}$ .

$$\therefore AP = PD \\ \Rightarrow P^{-1}AP = P^{-1}PD = D$$

- Notes 1.** The square matrix  $P$ , which diagonalises  $A$ , is found by grouping the eigen vectors of  $A$  into square-matrix and the resulting diagonal matrix has the eigen values of  $A$  as its diagonal elements.
2. The transformation of a matrix  $A$  to  $P^{-1}AP$  is known as a *similarity transformation*.
  3. The reduction of  $A$  to a diagonal matrix is, obviously, a particular case of similarity transformation.
  4. The matrix  $P$  which diagonalises  $A$  is called the *modal matrix* of  $A$  and the resulting diagonal matrix  $D$  is known as the *spectra matrix* of  $A$ .

**Example 35.** Find a matrix  $P$  which diagonalizes the matrix

$$A = \begin{bmatrix} 4 & 1 \\ 2 & 3 \end{bmatrix}, \text{ verify } P^{-1}AP = D \text{ where } D \text{ is the diagonal matrix. (U.P., I Semester, Dec. 2008)}$$

**Solution.** The characteristic equation of matrix  $A$  is

$$\begin{vmatrix} 4-\lambda & 1 \\ 2 & 3-\lambda \end{vmatrix} = 0 \Rightarrow (4-\lambda)(3-\lambda) - 2 = 0 \\ \Rightarrow \lambda^2 - 7\lambda + 12 - 2 = 0 \Rightarrow \lambda^2 - 7\lambda + 10 = 0 \\ \Rightarrow (\lambda - 2)(\lambda - 5) = 0 \Rightarrow \lambda = 2, \lambda = 5$$

Eigen values are 2 and 5.

(i) When  $\lambda = 2$ , eigen vectors are given by the matrix equation

$$\begin{bmatrix} 4-2 & 1 \\ 2 & 3-2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 2 & 1 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \\ \Rightarrow 2x_1 + x_2 = 0 \Rightarrow x_2 = -2x_1 \\ \text{Let } x_1 = k, x_2 = -2k \\ \text{Hence, the eigen vector } X_1 = \begin{bmatrix} k \\ -2k \end{bmatrix} \text{ or } \begin{bmatrix} 1 \\ -2 \end{bmatrix}$$

(ii) When  $\lambda = 5$ , eigen vectors are given by the matrix equation

$$\begin{bmatrix} 4-5 & 1 \\ 2 & 3-5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} -1 & 1 \\ 2 & -2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \\ \Rightarrow -x_1 + x_2 = 0 \Rightarrow x_1 = x_2 \\ \text{Let } x_1 = k, \text{ then } x_2 = k \\ \text{Hence, the eigen vector } X_2 = \begin{bmatrix} k \\ k \end{bmatrix} \text{ or } \begin{bmatrix} 1 \\ 1 \end{bmatrix} \\ \text{Modal matrix } P = \begin{bmatrix} 1 & 1 \\ -2 & 1 \end{bmatrix} \Rightarrow P^{-1} = \frac{1}{3} \begin{bmatrix} 1 & -1 \\ 2 & 1 \end{bmatrix}$$

For diagonalization

$$D = P^{-1}AP = \frac{1}{3} \begin{bmatrix} 1 & -1 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 4 & 1 \\ 2 & 3 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ -2 & 1 \end{bmatrix} \\ = \frac{1}{3} \begin{bmatrix} 1 & -1 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 2 & 5 \\ -4 & 5 \end{bmatrix} = \frac{1}{3} \begin{bmatrix} 6 & 0 \\ 0 & 15 \end{bmatrix} = \begin{bmatrix} 2 & 0 \\ 0 & 5 \end{bmatrix} \quad \text{Verified.}$$

**Example 36.** Let  $A = \begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$  Find matrix  $P$  such that  $P^{-1}AP$  is diagonal matrix.

**Solution.** The characteristic equation of the matrix  $A$  is

$$\begin{vmatrix} 6-\lambda & -2 & 2 \\ -2 & 3-\lambda & -1 \\ 2 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$\begin{aligned} \Rightarrow & (6-\lambda)[9+\lambda^2-6\lambda-1] + 2[-6+2\lambda+2] + 2[2-6+2\lambda] = 0 \\ \Rightarrow & (6-\lambda)(\lambda^2-6\lambda+8) - 8 + 4\lambda - 8 + 4\lambda = 0 \\ \Rightarrow & 6\lambda^2 - 36\lambda + 48 - \lambda^3 + 6\lambda^2 - 8\lambda - 16 + 8\lambda = 0 \\ \Rightarrow & -\lambda^3 + 12\lambda^2 - 36\lambda + 32 = 0 \quad \Rightarrow \quad \lambda^3 - 12\lambda^2 + 36\lambda - 32 = 0 \\ \Rightarrow & (\lambda-2)^2(\lambda-8) = 0 \quad \Rightarrow \quad \lambda = 2, 2, 8 \end{aligned}$$

Eigen vector for  $\lambda = 2$

$$\begin{bmatrix} 4 & -2 & 2 \\ -2 & 1 & -1 \\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \text{ or } \begin{bmatrix} 2 & -1 & 1 \\ -2 & 1 & -1 \\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$R_2 \rightarrow R_1 + R_2$   
 $R_3 \rightarrow R_2 + R_3$

$$\begin{bmatrix} 2 & -1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \text{ or } 2x_1 - x_2 + x_3 = 0$$

This equation is satisfied by  $x_1 = 0, x_2 = 1, x_3 = 1$

$$X_1 = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

and again

$$x_1 = 1, x_2 = 3, x_3 = 1.$$

$$X_2 = \begin{bmatrix} 1 \\ 3 \\ 1 \end{bmatrix}$$

Eigen vector for  $\lambda = 8$

$$\begin{bmatrix} -2 & -2 & 2 \\ -2 & -5 & -1 \\ 2 & -1 & -5 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$-2x_1 - 2x_2 + 2x_3 = 0$$

$$-2x_1 - 5x_2 - x_3 = 0$$

$$\frac{x_1}{2+10} = \frac{x_2}{-4-2} = \frac{x_3}{10-4} \Rightarrow \frac{x_1}{12} = \frac{x_2}{-6} = \frac{x_3}{6} \Rightarrow \frac{x_1}{2} = \frac{x_2}{-1} = \frac{x_3}{1}$$

$$X_3 = \begin{bmatrix} 2 \\ -1 \\ 1 \end{bmatrix}$$

$$\therefore P = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 3 & -1 \\ 1 & 1 & 1 \end{bmatrix}, \quad P^{-1} = -\frac{1}{6} \begin{bmatrix} 4 & 1 & -7 \\ -2 & -2 & 2 \\ -2 & 1 & -1 \end{bmatrix}$$

$$\text{Now } P^{-1}AP = -\frac{1}{6} \begin{bmatrix} 4 & 1 & -7 \\ -2 & -2 & 2 \\ -2 & 1 & -1 \end{bmatrix} \begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix} \begin{bmatrix} 0 & 1 & 2 \\ 1 & 3 & -1 \\ 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 8 \end{bmatrix} \quad \text{Ans.}$$

**Example 37.** The matrix  $A = \begin{bmatrix} a & h \\ h & b \end{bmatrix}$  is transformed to the diagonal form  $D = T^{-1}AT$ , where

$$T = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix}. \text{ Find the value of } \theta \text{ which gives this diagonal transformation.}$$

**Solution.**  $T = \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \therefore T^{-1} = \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix}$

$$\begin{aligned} \text{Now } T^{-1}AT &= \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix} \begin{bmatrix} a & h \\ h & b \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \\ &= \begin{bmatrix} a\cos\theta - h\sin\theta & h\cos\theta - b\sin\theta \\ a\sin\theta + h\cos\theta & h\sin\theta + b\cos\theta \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{bmatrix} \\ &= \begin{bmatrix} a\cos^2\theta - 2h\sin\theta\cos\theta + b\sin^2\theta & (a-b)\sin\theta\cos\theta - h\sin^2\theta + h\cos^2\theta \\ (a-b)\sin\theta\cos\theta + h\cos^2\theta - h\sin^2\theta & a\sin^2\theta + 2h\sin\theta\cos\theta + b\cos^2\theta \end{bmatrix} \\ &= \begin{bmatrix} a\cos^2\theta - h\sin 2\theta + b\sin^2\theta & (a-b)\sin\theta\cos\theta + h\cos 2\theta \\ (a-b)\sin\theta\cos\theta + h\cos 2\theta & a\sin^2\theta + h\sin 2\theta + b\cos^2\theta \end{bmatrix} \\ &= \begin{bmatrix} d_1 & 0 \\ 0 & d_2 \end{bmatrix} \text{ being diagonal matrix} \end{aligned}$$

$$\therefore (a-b)\sin\theta\cos\theta + h\cos 2\theta = 0$$

$$\Rightarrow \frac{a-b}{2}\sin 2\theta + h\cos 2\theta = 0 \quad \Rightarrow \frac{a-b}{2}\sin 2\theta = -h\cos 2\theta$$

$$\Rightarrow \tan 2\theta = \frac{2h}{b-a} \quad \Rightarrow \quad \theta = \frac{1}{2}\tan^{-1}\frac{2h}{b-a} \quad \text{Ans.}$$

### EXERCISE 21.8

1. Find the matrix  $B$  which transforms the matrix

$$A = \begin{bmatrix} 8 & -8 & -2 \\ 4 & -3 & -2 \\ 3 & -4 & 1 \end{bmatrix} \text{ to a diagonal matrix.}$$

**Ans.**  $B = \begin{bmatrix} 4 & 3 & 2 \\ 3 & 2 & 1 \\ 2 & 1 & 1 \end{bmatrix}$

2. For the matrix  $A = \begin{bmatrix} 4 & 1 & 0 \\ 1 & 4 & 1 \\ 0 & 1 & 4 \end{bmatrix}$ , determine a matrix  $P$  such that  $P^{-1}AP$  is diagonal matrix.

**Ans.**  $P = \begin{bmatrix} -1 & 1 & 1 \\ 0 & -\sqrt{2} & \sqrt{2} \\ 1 & 1 & 1 \end{bmatrix}$

3. Determine the eigen values and the corresponding eigen vectors of the matrix  $A = \begin{bmatrix} 5 & 7 & -5 \\ 0 & 4 & -1 \\ 2 & 8 & -3 \end{bmatrix}$

Hence find the matrix  $P$  such that  $P^{-1}AP$  is diagonal matrix.

$$\text{Ans. } P = \begin{bmatrix} 2 & 1 & -1 \\ 1 & 1 & 1 \\ 3 & 2 & 1 \end{bmatrix}$$

4. Reduce the following matrix  $A$  into a diagonal matrix

$$A = \begin{bmatrix} 8 & -6 & 2 \\ -6 & 7 & -4 \\ 2 & -4 & 3 \end{bmatrix}$$

$$\text{Ans. } \begin{bmatrix} 0 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 15 \end{bmatrix}$$

## 21.22 POWERS OF A MATRIX (By diagonalisation)

We can obtain powers of a matrix by using diagonalisation.

We know that

$$D = P^{-1}AP$$

Where  $A$  is the square matrix and  $P$  is a non-singular matrix.

$$D^2 = (P^{-1}AP)(P^{-1}AP) = P^{-1}A(PP^{-1})AP = P^{-1}A^2P$$

$$\text{Similarly } D^3 = P^{-1}A^3P$$

$$\text{In general } D^n = P^{-1}A^nP \quad \dots(1)$$

Pre-multiply (1) by  $P$  and post-multiply by  $P^{-1}$

$$\begin{aligned} P D^n P^{-1} &= P(P^{-1}A^nP)P^{-1} \\ &= (P P^{-1})A^n(P P^{-1}) \\ &= A^n \end{aligned}$$

**Procedure:** (1) Find eigen values for a square matrix  $A$ .

(2) Find eigen vectors to get the modal matrix  $P$ .

(3) Find the diagonal matrix  $D$ , by the formula  $D = P^{-1}AP$

(4) Obtain  $A^n$  by the formula  $A^n = P D^n P^{-1}$ .

**Example 38.** Find a matrix  $P$  which transform the matrix  $A = \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$  to diagonal form. Hence  $A^4$ .

**Solution.** Characteristic equation of the matrix  $A$  is

$$\begin{vmatrix} 1-\lambda & 0 & -1 \\ 1 & 2-\lambda & 1 \\ 2 & 2 & 3-\lambda \end{vmatrix} = 0 \quad \begin{array}{l} \text{or } \lambda^3 - 6\lambda^2 + 11\lambda - 6 = 0 \\ \text{or } (\lambda-1)(\lambda-2)(\lambda-3) = 0 \\ \Rightarrow \lambda = 1, 2, 3 \end{array}$$

For  $\lambda = 1$ , eigen vector is given by

$$\begin{bmatrix} 1-1 & 0 & -1 \\ 1 & 2-1 & 1 \\ 2 & 2 & 3-1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \begin{bmatrix} 0 & 0 & -1 \\ 1 & 1 & 1 \\ 2 & 2 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0x_1 + 0x_2 - x_3 = 0 \\ x_1 + x_2 + x_3 = 0 \end{bmatrix} \Rightarrow \frac{x_1}{0+1} = \frac{x_2}{-1+0} = \frac{x_3}{0} \text{ or } x_1 = 1, x_2 = -1, x_3 = 0$$

Eigen vector is  $[1, -1, 0]$ .

For  $\lambda = 2$ , eigen vector is given by

$$\begin{aligned}
 & \left[ \begin{array}{ccc} 1-2 & 0 & -1 \\ 1 & 2-2 & 1 \\ 2 & 2 & 3-2 \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \left[ \begin{array}{ccc} -1 & 0 & -1 \\ 1 & 0 & 1 \\ 2 & 2 & 1 \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\
 \Rightarrow & \left[ \begin{array}{ccc} 0 & 0 & 0 \\ 1 & 0 & 1 \\ 2 & 2 & 1 \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} R_1 \rightarrow R_1 + R_2 \\
 & \begin{bmatrix} x_1 + 0x_2 + x_3 = 0 \\ 2x_1 + 2x_2 + x_3 = 0 \end{bmatrix} \\
 \Rightarrow & \frac{x_1}{0-2} = \frac{x_2}{2-1} = \frac{x_3}{2-0} \Rightarrow x_1 = -2, x_2 = 1, x_3 = 2
 \end{aligned}$$

Eigen vector is  $[-2, 1, 2]$ .

For  $\lambda = 3$ , eigen vector is given by

$$\begin{aligned}
 & \left[ \begin{array}{ccc} 1-3 & 0 & -1 \\ 1 & 2-3 & 1 \\ 2 & 2 & 3-3 \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \Rightarrow \left[ \begin{array}{ccc} -2 & 0 & -1 \\ 1 & -1 & 1 \\ 2 & 2 & 0 \end{array} \right] \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\
 & \begin{bmatrix} -2x_1 + 0x_2 - x_3 = 0 \\ x_1 - x_2 + x_3 = 0 \end{bmatrix} \\
 \Rightarrow & \frac{x_1}{0-1} = \frac{x_2}{-1+2} = \frac{x_3}{2-0} \Rightarrow x_1 = -1, x_2 = 1, x_3 = 2
 \end{aligned}$$

Eigen vector is  $[-1, 1, 2]$ .

$$\text{Modal matrix } P = \begin{bmatrix} 1 & -2 & -1 \\ -1 & 1 & 1 \\ 0 & 2 & 2 \end{bmatrix} \text{ and } P^{-1} = -\frac{1}{2} \begin{bmatrix} 0 & 2 & -1 \\ 2 & 2 & 0 \\ -2 & -2 & -1 \end{bmatrix}$$

$$\text{Now } P^{-1}AP = \begin{bmatrix} 0 & -1 & \frac{1}{2} \\ -1 & -1 & 0 \\ 1 & 1 & \frac{1}{2} \end{bmatrix} \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix} \begin{bmatrix} 1 & -2 & -1 \\ -1 & 1 & 1 \\ 0 & 2 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 3 \end{bmatrix} = D$$

$$A^4 = PD^4P^{-1} = \begin{bmatrix} 1 & -2 & -1 \\ -1 & 1 & 1 \\ 0 & 2 & 2 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 16 & 0 \\ 0 & 0 & 81 \end{bmatrix} \begin{bmatrix} 0 & -1 & \frac{1}{2} \\ -1 & -1 & 0 \\ 1 & 1 & \frac{1}{2} \end{bmatrix} = \begin{bmatrix} -49 & -50 & -40 \\ 65 & 66 & 40 \\ 130 & 130 & 81 \end{bmatrix} \quad \text{Ans.}$$

### EXERCISE 21.9

Find a matrix  $P$  which transforms the following matrices to diagonal form. Hence calculate the power matrix.

$$1. \text{ If } A = \begin{bmatrix} 1 & 1 & 3 \\ 1 & 5 & 1 \\ 3 & 1 & 1 \end{bmatrix}, \text{ calculate } A^4.$$

$$\text{Ans. } \begin{bmatrix} 251 & 405 & 235 \\ 405 & 891 & 405 \\ 235 & 405 & 251 \end{bmatrix}$$

$$2. \text{ If } A = \begin{bmatrix} 3 & -1 & 1 \\ -1 & 5 & -1 \\ 1 & -1 & 3 \end{bmatrix}, \text{ calculate } A^4.$$

$$\text{Ans. } \begin{bmatrix} 251 & -405 & 235 \\ -405 & 891 & -405 \\ 235 & -405 & 251 \end{bmatrix}$$

3. If  $A = \begin{bmatrix} 2 & -1 & 1 \\ -1 & 2 & -1 \\ 1 & -1 & 2 \end{bmatrix}$ , calculate  $A^6$ .

$$\text{Ans. } \begin{bmatrix} 1366 & -1365 & 1365 \\ -1365 & 1366 & -1365 \\ 1365 & -1365 & 1366 \end{bmatrix}$$

4. If  $A = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 2 & 1 \\ -4 & 4 & 3 \end{bmatrix}$ , calculate  $A^8$ .

$$\text{Ans. } \begin{bmatrix} -12099 & 12355 & 6305 \\ -12100 & 12356 & 6305 \\ -13120 & 13120 & 6561 \end{bmatrix}$$

5. Show that the matrix  $A$  is diagonalisable  $A = \begin{bmatrix} 3 & 1 & -1 \\ -2 & 1 & 2 \\ 0 & 1 & 2 \end{bmatrix}$ . If so obtain the matrix  $P$  such that  $P^{-1}AP$  is a diagonal matrix.

(AMIETE, June 2010)

### 21.23 SYLVESTER THEOREM

Let  $P(A) = C_0 A^n + C_1 A^{n-1} + C_2 A^{n-2} + \dots + C_{n-1} A + C_n I$

and  $|\lambda I - A| = f(\lambda)$  and Adjoint matrix of  $[\lambda I - A] = [f(\lambda)]$

$$z(\lambda) = \frac{[f(\lambda)]}{f'(\lambda)} = \frac{\text{Adjoint matrix of } [\lambda I - A]}{f'(\lambda)}$$

Then according to Sylvester's theorem

$$P(A) = P(\lambda_1). Z(\lambda_1) + P(\lambda_2). Z(\lambda_2) + P(\lambda_3). Z(\lambda_3) + \dots$$

$$= \sum_{r=1}^n P(\lambda_r). Z(\lambda_r)$$

**Example 39.** If  $A = \begin{bmatrix} 2 & 0 \\ 0 & 1 \end{bmatrix}$ , find  $A^{100}$ .

$$\text{Solution. } f(\lambda) = |\lambda I - A| = \begin{vmatrix} \lambda & 0 \\ 0 & \lambda \end{vmatrix} - \begin{vmatrix} 2 & 0 \\ 0 & 1 \end{vmatrix} = \begin{vmatrix} \lambda - 2 & 0 \\ 0 & \lambda - 1 \end{vmatrix} = 0$$

$$\Rightarrow f(\lambda) = (\lambda - 2)(\lambda - 1) = 0 \text{ or } \lambda_1 = 1, \lambda_2 = 2$$

$$f(\lambda) = \lambda^2 - 3\lambda + 2, \quad f'(\lambda) = 2\lambda - 3$$

$$f'(2) = 4 - 3 = 1, \quad f'(1) = 2 - 3 = -1$$

$$[f(\lambda)] = \text{Adjoint matrix of the matrix } [\lambda I - A] = \begin{bmatrix} \lambda - 1 & 0 \\ 0 & \lambda - 2 \end{bmatrix}$$

$$Z(\lambda_1) = Z(1) = \frac{[f(1)]}{f'(1)} = \frac{1}{-1} \begin{bmatrix} 0 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$$

$$Z(\lambda_2) = Z(2) = \frac{[f(2)]}{f'(2)} = \frac{1}{1} \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$$

By Sylvester theorem  $P(A) = P(\lambda_1). Z(\lambda_1) + P(\lambda_2). Z(\lambda_2)$

$$A^{100} = P(\lambda_1) Z(\lambda_1) + P(\lambda_2) Z(\lambda_2)$$

$$= \lambda_1^{100} \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} + \lambda_2^{100} \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} = 1^{100} \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} + 2^{100} \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 2^{100} & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 2^{100} & 0 \\ 0 & 1 \end{bmatrix}$$

**Ans.**

**Example 40.** If  $A = \begin{bmatrix} 1 & 0 \\ 0 & 3 \end{bmatrix}$ , find  $A^{50}$ .

$$\text{Solution. } f(\lambda) = |\lambda I - A| = \begin{vmatrix} \lambda & 0 \\ 0 & \lambda \end{vmatrix} - \begin{vmatrix} 1 & 0 \\ 0 & 3 \end{vmatrix} = \begin{vmatrix} \lambda - 1 & 0 \\ 0 & \lambda - 3 \end{vmatrix} = 0$$

$$\Rightarrow f(\lambda) = (\lambda - 1)(\lambda - 3) = 0 \text{ or } \lambda_1 = 1, \lambda_2 = 3$$

$$f(\lambda) = \lambda^2 - 4\lambda + 3, \quad f'(\lambda) = 2\lambda - 4$$

$$f'(1) = 2 - 4 = -2, \quad f'(3) = 6 - 4 = 2$$

$$[f(\lambda)] = \text{Adjoint matrix of the matrix } [\lambda I - A] = \begin{bmatrix} \lambda - 3 & 0 \\ 0 & \lambda - 1 \end{bmatrix}$$

$$Z(\lambda_1) = Z(1) = \frac{[f(1)]}{f'(1)} = \frac{1}{-2} \begin{bmatrix} -2 & 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$$

$$Z(\lambda_2) = Z(3) = \frac{[f(3)]}{f'(3)} = \frac{1}{2} \begin{bmatrix} 0 & 0 \\ 0 & 2 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$$

By Sylvester theorem  $P(A) = P_1(\lambda_1).Z(\lambda_1) + P(\lambda_2).Z(\lambda_2)$

$$A^{50} = P(\lambda_1)Z(\lambda_1) + P(\lambda_2)Z(\lambda_2) = \lambda_1^{50} \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} + \lambda_2^{50} \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$$

$$= 1^{50} \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} + 3^{50} \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & 3^{50} \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 3^{50} \end{bmatrix}$$

**Ans.**

### EXERCISE 21.10

1. Verify Sylvester's theorem for  $A^3$ , where  $A = \begin{bmatrix} 1 & 4 \\ 3 & 2 \end{bmatrix}$

Use Sylvester's theorem in solving the following:

2. Given  $A = \begin{bmatrix} 1 & 0 \\ 0 & 3 \end{bmatrix}$ , find  $A^{256}$ .

$$\text{Ans. } \begin{bmatrix} 1 & 0 \\ 0 & 3^{256} \end{bmatrix}$$

3. Given  $A = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix}$ , show that  $e^A = \begin{bmatrix} e^{\lambda_1} & 0 \\ 0 & e^{\lambda_2} \end{bmatrix}$ .

4. Given  $A = \begin{bmatrix} -1 & 3 \\ 1 & 1 \end{bmatrix}$ , show that  $2 \sin A = |\sin 2| A$ .

5. Prove that  $3 \tan A = A \tan(3)$  where  $A = \begin{bmatrix} -1 & 4 \\ 2 & 1 \end{bmatrix}$

6. Prove that  $\sin^2 A + \cos^2 A = 1$ , where  $A = \begin{bmatrix} 1 & 2 \\ -1 & 4 \end{bmatrix}$

7. Given  $A = \begin{bmatrix} 1 & -2 & -3 \\ 0 & 2 & 0 \\ 0 & 0 & 3 \end{bmatrix}$ , find  $A^{-1}$ .

$$\text{Ans. } \begin{bmatrix} 1 & -1 & 1 \\ 0 & -\frac{1}{2} & 0 \\ 0 & 0 & \frac{1}{3} \end{bmatrix}$$

8. Given  $A = \begin{bmatrix} 1 & 20 & 0 \\ -1 & 7 & 1 \\ 3 & 0 & -2 \end{bmatrix}$ , find  $\tan A$ .

$$\text{Ans. } \frac{\tan 1}{2} \begin{bmatrix} -18 & 60 & 20 \\ 0 & 0 & 0 \end{bmatrix} + \frac{\tan 2}{-1} \begin{bmatrix} -20 & 80 & 20 \\ -1 & 4 & 1 \end{bmatrix} + \frac{\tan 3}{2} \begin{bmatrix} -20 & 100 & 20 \\ -2 & 10 & 2 \end{bmatrix} - 12 \begin{bmatrix} -18 & 60 & 20 \\ -15 & 60 & 15 \end{bmatrix}$$

## 21.24 COMPLEX MATRICES

### Conjugate of a Complex Number

$z = x + iy$  is called a complex number where  $\sqrt{-1} = i$ ,  $x, y$  are real numbers.  $\bar{z} = x - iy$  is called the conjugate of the complex number  $z$ , e.g.,

Complex number	Conjugate number
$2 + 3i$	$2 - 3i$
$-4 - 5i$	$-4 + 5i$
$6i$	$-6i$
$2$	$2$

**Conjugate of a matrix.** The matrix formed by replacing the elements of a matrix by their respective conjugate numbers is called the conjugate of  $A$  and is denoted by  $\bar{A}$ .

$$A = (a_{ij})_{m \times n}, \text{ then } \bar{A} = (\bar{a}_{ij})_{m \times n}$$

Example

$$\text{If } A = \begin{bmatrix} 3+4i & 2-i & 4 \\ i & 2 & -3i \end{bmatrix} \text{ then } \bar{A} = \begin{bmatrix} 3-4i & 2+i & 4 \\ -i & 2 & 3i \end{bmatrix}$$

## 21.25 THEOREM

If  $A$  and  $B$  be two matrices and their conjugate matrices are  $\bar{A}$  and  $\bar{B}$  respectively, then

$$(i) \quad \bar{\bar{A}} = A \quad (ii) \quad \bar{(A+B)} = \bar{A} + \bar{B} \quad (iii) \quad (k\bar{A}) = \bar{k}\bar{A} \quad (iv) \quad \bar{(AB)} = \bar{A}\bar{B}$$

**Proof.** Let  $A = [a_{ij}]_{m \times n}$ , then

$$\bar{A} = [\bar{a}_{ij}]_{m \times n} \text{ where } \bar{a}_{ij} \text{ is the conjugate complex of } a_{ij}.$$

The  $(i, j)$  th element of  $\bar{\bar{A}}$  = the conjugate complex of the  $(i, j)$  th element of  $\bar{A}$

$$\begin{aligned} &= \text{the conjugate complex of } \bar{a}_{ij} \\ &= a_{ij} = \text{the } (i, j) \text{ th element of } A. \end{aligned}$$

Hence  $\bar{\bar{A}} = A$ .

**Proved.**

(ii) Let  $A = [a_{ij}]_{m \times n}$  and  $B = [b_{ij}]_{m \times n}$   
 $\bar{A} = [\bar{a}_{ij}]_{m \times n}$  and  $\bar{B} = [\bar{b}_{ij}]_{m \times n}$

$$\begin{aligned} \text{The } (i, j) \text{ th element of } \bar{(A+B)} &= \text{conjugate complex of } (i, j) \text{ th element of } (A+B) \\ &= \text{conjugate complex of } (a_{ij} + b_{ij}) \\ &= \overline{(a_{ij} + b_{ij})} = \bar{a}_{ij} + \bar{b}_{ij} \\ &= (i, j) \text{ th element of } \bar{A} + (i, j) \text{ th element of } \bar{B} \\ &= (i, j) \text{ th element of } (\bar{A} + \bar{B}) \end{aligned}$$

Hence,  $\bar{(A+B)} = \bar{A} + \bar{B}$

**Proved.**

(iii) Let  $A = [a_{ij}]_{m \times n}$ , let  $k$  be any complex number.

$$\begin{aligned} \text{The } (i, j) \text{ th element of } \bar{(kA)} &= \text{conjugate complex of the } (i, j) \text{ th element of } kA \\ &= \text{conjugate complex of } ka_{ij} \\ &= \overline{ka_{ij}} = \bar{k} \cdot \bar{a}_{ij} \\ &= \bar{k} \cdot (i, j) \text{ th element of } \bar{A} = (i, j) \text{ th element of } \bar{k} \cdot \bar{A} \end{aligned}$$

Hence,  $\bar{(kA)} = \bar{k} \cdot \bar{A}$

**Proved.**

(iv) Let  $A = [a_{ij}]_{m \times n}$ ,  $B = [b_{ij}]_{n \times p}$   
 Then  $\bar{A} = [\bar{a}_{ij}]_{m \times n}$ ,  $\bar{B} = [\bar{b}_{ij}]_{n \times p}$

The  $(i, j)$ th element of  $(\bar{AB})$  = conjugate complex of  $(i, j)$ th element of  $AB$

$$\begin{aligned}&= \text{conjugate complex of } \sum_{j=1}^n a_{ij} b_{jk} = \left( \sum_{j=1}^n \bar{a}_{ij} \bar{b}_{jk} \right) = \sum_{j=1}^n \bar{a}_{ij} \cdot \bar{b}_{jk} \\&= (i, j)\text{th element of } \bar{A} \cdot \bar{B}\end{aligned}$$

Hence,  $(\bar{AB}) = \bar{A} \cdot \bar{B}$

Proved.

## 21.26 TRANSPOSE OF CONJUGATE OF A MATRIX

The transpose of a conjugate of a matrix  $A$  is denoted by  $A^\theta$  or  $A^*$ .  
 $(\bar{A})' = A^\theta$

The  $(i, j)$ th element of  $A^\theta = (j, i)$ th element of  $\bar{A}$   
 $= \text{conjugate complex of } (j, i)\text{th element of } A$ .

**Example 41.** If  $A = \begin{bmatrix} 2+3i & 1-2i & 2+4i \\ 3-4i & 4+3i & 2-6i \\ 5 & 5+6i & 3 \end{bmatrix}$ , find  $A^\theta$

$$\begin{aligned}\text{Solution. We have, } A &= \begin{bmatrix} 2+3i & 1-2i & 2+4i \\ 3-4i & 4+3i & 2-6i \\ 5 & 5+6i & 3 \end{bmatrix} \Rightarrow \bar{A} = \begin{bmatrix} 2-3i & 1+2i & 2-4i \\ 3+4i & 4-3i & 2+6i \\ 5 & 5-6i & 3 \end{bmatrix} \\ A^\theta &= (\bar{A})' = \begin{bmatrix} 2-3i & 3+4i & 5 \\ 1+2i & 4-3i & 5-6i \\ 2-4i & 2+6i & 3 \end{bmatrix}\end{aligned}$$

Ans.

## EXERCISE 21.11

1. If the matrix  $A = \begin{bmatrix} 1+i & 3-5i \\ 2i & 5 \end{bmatrix}$ , find (i)  $\bar{A}$  (ii)  $(\bar{A})'$  (iii)  $A^\theta$  (iv)  $(A^\theta)^\theta$

$$\text{Ans. (i) } \bar{A} = \begin{bmatrix} 1-i & 3+5i \\ -2i & 5 \end{bmatrix} \quad \text{(ii) } (\bar{A})' = \begin{bmatrix} 1-i & -2i \\ 3+5i & 5 \end{bmatrix}$$

$$\text{(iii) } A^\theta = \begin{bmatrix} 1-i & -2i \\ 3+5i & 5 \end{bmatrix} \quad \text{(iv) } (A^\theta)^\theta = \begin{bmatrix} 1+i & 3-5i \\ 2i & 5 \end{bmatrix}$$

## 21.27 HERMITIAN MATRIX

**Definition.** A square matrix  $A = [a_{ij}]$  is said to be Hermitian if the  $(i, j)$ th element of  $A$ , i.e.,  
 $a_{ij} = \bar{a}_{ji}$  for all  $i$  and  $j$ .

For example,  $\begin{bmatrix} 2 & 3+4i \\ 3-4i & 1 \end{bmatrix}$ ,  $\begin{bmatrix} a & b-id \\ b+id & c \end{bmatrix}$

Hence all the elements of the principal diagonal are real.

A necessary and sufficient condition for a matrix  $A$  to be Hermitian is that  $A = A^\theta$ .

**Example 42.** Prove that the following

$$(i) (A^\theta)^\theta = A \quad (ii) (A+B)^\theta = A^\theta + B^\theta \quad (iii) (kA)^\theta = \bar{k} A^\theta \quad (iv) (AB)^\theta = B^\theta \cdot A^\theta$$

where  $A^\theta$  and  $B^\theta$  be the transposed conjugates of  $A$  and  $B$  respectively,  $A$  and  $B$  being conformable to multiplication.

**Solution.**

$$(i) \quad (A^\theta)^\theta = [\overline{(\overline{A})'}] = \overline{\overline{A}} = A \quad \text{as } \{(\overline{A})'\}' = \overline{A}$$

$$(ii) \quad (A+B)^\theta = (\overline{A+B})' = (\overline{A}+\overline{B})' \\ = (\overline{A})' + (\overline{B})' = A^\theta + B^\theta$$

$$(iii) \quad (kA)^\theta = (\overline{kA})' = (\overline{k}\overline{A})' = \overline{k}(\overline{A})' = \overline{k}A^\theta$$

$$(iv) \quad (AB)^\theta = (\overline{AB})' = (\overline{A}\cdot\overline{B})' = (\overline{B})'\cdot(\overline{A})' = B^\theta \cdot A^\theta$$

**Proved.**

**Example 43.** Prove that matrix  $A = \begin{bmatrix} 1 & 1-i & 2 \\ 1+i & 3 & i \\ 2 & -i & 0 \end{bmatrix}$  is Hermitian.

$$\text{Solution.} \quad \overline{A} = \begin{bmatrix} 1 & 1+i & 2 \\ 1-i & 3 & -i \\ 2 & i & 0 \end{bmatrix} \Rightarrow (\overline{A})' = \begin{bmatrix} 1 & 1-i & 2 \\ 1+i & 3 & i \\ 2 & -i & 0 \end{bmatrix}$$

$$\Rightarrow A^\theta = A \quad \Rightarrow A \text{ is Hermitian matrix.}$$

**Proved.**

**Example 44.** Show that  $A = \begin{bmatrix} -i & 3+2i & -2-i \\ -3+2i & 0 & 3-4i \\ 2-i & -3-4i & -2i \end{bmatrix}$  is Skew-Hermitian matrix.

$$\text{Solution.} \quad \overline{A} = \begin{bmatrix} i & 3-2i & -2+i \\ -3-2i & 0 & 3+4i \\ 2+i & -3+4i & 2i \end{bmatrix}$$

$$(\overline{A})' = \begin{bmatrix} i & -3-2i & 2+i \\ 3-2i & 0 & -3+4i \\ -2+i & 3+4i & 2i \end{bmatrix}$$

$$\Rightarrow A^\theta = \begin{bmatrix} i & -3-2i & 2+i \\ 3-2i & 0 & -3+4i \\ -2+i & 3+4i & 2i \end{bmatrix} \quad [\because A^\theta = (\overline{A})']$$

$$= - \begin{bmatrix} -i & 3+2i & -2-i \\ -3+2i & 0 & 3-4i \\ 2-i & -3-4i & -2i \end{bmatrix} = -A$$

$$A^\theta = -A \Rightarrow A \text{ is Skew-Hermitian matrix.}$$

**Proved.**

**Example 45.** Show that the matrix  $B^\theta AB$  is Hermitian or Skew-Hermitian according as  $A$  is Hermitian or Skew-Hermitian.

**Solution.** (i) Let  $A$  be Hermitian  $\Rightarrow A^\theta = A$

$$\text{Now} \quad (B^\theta AB)^\theta = (AB)^\theta (B^\theta)^\theta \\ = B^\theta \cdot A^\theta \cdot B \\ = B^\theta \cdot A \cdot B \quad (A^\theta = A)$$

Hence,  $A^\theta AB$  is Hermitian.

(ii) Let  $A$  be Skew-Hermitian  $\Rightarrow A^\theta = -A$

Now,

$$\begin{aligned}(B^\theta AB)^\theta &= (AB)^\theta \cdot (B^\theta)^\theta \\ &= B^\theta \cdot A^\theta \cdot B \\ &= -B^\theta A \cdot B \quad (A^\theta = -A)\end{aligned}$$

Hence,  $B^\theta AB$  is Skew-Hermitian.

**Proved.**

## 21.28 THE CHARACTERISTIC ROOTS OF A HERMITIAN MATRIX ARE ALL REAL

**Solution.**

We know that matrix  $A$  is Hermitian if

$$A^\theta = A \text{ i.e., where } A^\theta = (\bar{A}') \text{ or } (\bar{A})'$$

Also  $(\lambda A)^\theta = \bar{\lambda} A^\theta$  and  $(AB)^\theta = B^\theta A^\theta$ .

If  $\lambda$  is a characteristic root of matrix  $A$  then  $AX = \lambda X$ . ... (1)

$\therefore (AX)^\theta = (\lambda X)^\theta \quad \text{or} \quad X^\theta A^\theta = \bar{\lambda} X^\theta$ .  
But  $A$  is Hermitian.  $\therefore A^\theta = \bar{A}$ .

$$\therefore X^\theta A = \bar{\lambda} X^\theta \quad \therefore X^\theta AX = \bar{\lambda} X^\theta X \quad \dots(2)$$

$$\text{Again from (1)} \quad X^\theta AX = X^\theta \lambda X = \lambda X^\theta X \quad \dots(3)$$

Hence from (2) and (3) we conclude that  $\bar{\lambda} = \lambda$  showing that  $\lambda$  is real.

**Deduction 1.** From above we conclude that characteristic roots of real symmetric matrix are all real, as in this case, real symmetric matrix will be Hermitian.

For symmetric, we know that  $A' = A$ .  $(\bar{A}') = \bar{A}$

or  $A^\theta = A \quad \therefore \bar{A} = A$  as  $A$  is real. Rest as above.

## 21.29 SKEW-HERMITIAN MATRIX

**Definition.** A square matrix  $A = (a_{ij})$  is said to be Skew-Hermitian matrix if the  $(i, j)$ th element of  $A$  is equal to the negative of the conjugate complex of the  $(j, i)$ th element of  $A$ , i.e.,  $a_{ij} = -\bar{a}_{ji}$  for all  $i$  and  $j$ .

If  $A$  is a Skew-Hermitian matrix, then

$$\begin{aligned}a_{ii} &= -\bar{a}_{ii} \\ a_{ii} + \bar{a}_{ii} &= 0\end{aligned}$$

Obviously,  $a_{ii}$  is either a pure imaginary number or must be zero.

For example,  $\begin{bmatrix} 0 & -3+4i \\ 3+4i & 0 \end{bmatrix}$  and  $\begin{bmatrix} 0 & a-ib \\ -a-ib & 0 \end{bmatrix}$  are Skew-Hermitian matrixes.

A necessary and sufficient condition for a matrix  $A$  to be Skew-Hermitian is that  $A^\theta = -A$ .

**Deduction 2.** Characteristic roots of a skew Hermitian matrix is either zero or a pure imaginary numbers.

If  $A$  is skew Hermitian, then  $iA$  is Hermitian.

Also  $\lambda$  be a characteristic root of  $A$  then  $AX = \lambda X$ .

$$\therefore (i \cdot A) X = (i\lambda) X.$$

Above shows that  $i\lambda$  is characteristic root of matrix  $iA$ , which is Hermitian and hence  $i\lambda$  should be real, which will be possible if  $\lambda$  is either pure imaginary or zero.

**Example 46.** Show that every square matrix can be expressed as  $R + iS$  uniquely where  $R$  and  $S$  are Hermitian matrices.

**Solution.** Let  $A$  be any square matrix. It can be rewritten as

$$A = \left\{ \frac{1}{2} (A + A^\theta) \right\} + i \left\{ \frac{1}{2i} (A - A^\theta) \right\} = R + iS$$

$$\text{where } R = \frac{1}{2}(A + A^\theta), \quad S = \frac{1}{2i}(A - A^\theta)$$

Now we have to show that  $R$  and  $S$  are Hermitian matrices.

$$R^\theta = \frac{1}{2}(A + A^\theta)^\theta = \frac{1}{2}[A^\theta + (A^\theta)^\theta] = \frac{1}{2}(A^\theta + A) = \frac{1}{2}(A + A^\theta) = R$$

Thus  $R$  is Hermitian matrix.

$$\begin{aligned} \text{Now, } S^\theta &= \left[ \frac{1}{2i}(A - A^\theta) \right]^\theta = -\frac{1}{2i}(A - A^\theta)^\theta \\ &= -\frac{1}{2i}[A^\theta - (A^\theta)^\theta] = \frac{-1}{2i}(A^\theta - A) = \frac{1}{2i}(A - A^\theta) = S \end{aligned}$$

Thus  $S$  is a Hermitian matrix.

Hence  $A = R + iS$ , where  $R$  and  $S$  are Hermitian matrices.

Now, we have to show its **uniqueness**.

Let  $A = P + iQ$  be another expression, where  $P$  and  $Q$  are Hermitian matrices, i.e.,

$$P^\theta = P, \quad Q^\theta = Q$$

$$\text{Then } A^\theta = (P + iQ)^\theta = P^\theta + (iQ)^\theta = P^\theta - iQ^\theta = P - iQ$$

$$A = P + iQ \text{ and } A^\theta = P - iQ$$

$$\Rightarrow P = \frac{1}{2}(A + A^\theta) = R \text{ and } Q = \frac{1}{2i}(A - A^\theta) = S$$

Hence  $A = R + iS$  is the unique expression, where  $R$  and  $S$  are Hermitian matrices. **Proved.**

**Example 47.** Express the matrix  $A = \begin{bmatrix} i & 2-3i & 4+5i \\ 6+i & 0 & 4-5i \\ -i & 2-i & 2+i \end{bmatrix}$  as a sum of Hermitian and Skew Hermitian matrix. (U.P.I Sem Dec, 2009)

**Solution.** Here, we have

$$A = \begin{bmatrix} i & 2-3i & 4+5i \\ 6+i & 0 & 4-5i \\ -i & 2-i & 2+i \end{bmatrix} \quad \dots (1)$$

$$\bar{A} = \begin{bmatrix} 6-i & 0 & 4+5i \\ i & 2+i & 2-i \\ -i & 6-i & i \end{bmatrix} \quad \dots (1)$$

$$(\bar{A})' = \begin{bmatrix} 2+3i & 0 & 2+i \\ 4-5i & 4+5i & 2-i \\ -i & 6-i & i \end{bmatrix} \quad \dots (2)$$

$$A^\theta = \begin{bmatrix} 2+3i & 0 & 2+i \\ 4-5i & 4+5i & 2-i \end{bmatrix} \quad \dots (2)$$

On adding (1) & (2), we get

$$A + A^\theta = \begin{bmatrix} 0 & 8-4i & 4+6i \\ 8+4i & 0 & 6-4i \\ 4-6i & 6+4i & 4 \end{bmatrix}$$

Let

$$R = \frac{1}{2}[A + A^0] = \begin{bmatrix} 0 & 4-2i & 2+3i \\ 4+2i & 0 & 3-2i \\ 2-3i & 3+2i & 2 \end{bmatrix} \quad \dots (3)$$

On subtracting (2) from (1), we get

$$\begin{aligned} A - A^0 &= \begin{bmatrix} 2i & -4-2i & 4+4i \\ 4-2i & 0 & 2-6i \\ -4+4i & -2-6i & 2i \end{bmatrix} \\ \frac{1}{2}(A - A^0) &= \begin{bmatrix} i & -2-i & 2+2i \\ 2-i & 0 & 1-3i \\ -2+2i & -1-3i & i \end{bmatrix} \end{aligned} \quad \dots (4)$$

From (3) and (4), we have

$$A = \begin{bmatrix} 0 & 4-2i & 2+3i \\ 4+2i & 0 & 3-2i \\ 2-3i & 3+2i & 2 \end{bmatrix} + \begin{bmatrix} i & -2-i & 2+2i \\ 2-i & 0 & 1-3i \\ -2+2i & -1-3i & i \end{bmatrix}$$

Hermitian matrix      Skew-Hermitian matrix

**Example 48.** Express the matrix  $A = \begin{bmatrix} 1+i & 2 & 5-5i \\ 2i & 2+i & 4+2i \\ -1+i & -4 & 7 \end{bmatrix}$  as the sum of Hermitian matrix and Skew-Hermitian matrix.

**Solution.**  $A = \begin{bmatrix} 1+i & 2 & 5-5i \\ 2i & 2+i & 4+2i \\ -1+i & -4 & 7 \end{bmatrix} \Rightarrow \bar{A} = \begin{bmatrix} 1-i & 2 & 5+5i \\ -2i & 2-i & 4-2i \\ -1-i & -4 & 7 \end{bmatrix} \dots (1)$

$$(\bar{A})' = \begin{bmatrix} 1-i & -2i & -1-i \\ 2 & 2-i & -4 \\ 5+5i & 4-2i & 7 \end{bmatrix} \Rightarrow A^0 = \begin{bmatrix} 1-i & -2i & -1-i \\ 2 & 2-i & -4 \\ 5+5i & 4-2i & 7 \end{bmatrix} \dots (2)$$

On adding (1) and (2), we get

$$A + A^0 = \begin{bmatrix} 2 & 2-2i & 4-6i \\ 2+2i & 4 & 2i \\ 4+6i & -2i & 14 \end{bmatrix}$$

Let  $R = \frac{1}{2}(A + A^0) = \begin{bmatrix} 1 & 1-i & 2-3i \\ 1+i & 2 & i \\ 2+3i & -i & 7 \end{bmatrix} \dots (3)$

On subtracting (2) from (1), we get

$$A - A^0 = \begin{bmatrix} 2i & 2+2i & 6-4i \\ -2+2i & 2i & 8+2i \\ -6-4i & -8+2i & 0 \end{bmatrix}$$

Let  $S = \frac{1}{2}(A - A^0) = \begin{bmatrix} i & 1+i & 3-2i \\ -1+i & i & 4+i \\ -3-2i & -4+i & 0 \end{bmatrix} \dots (4)$

From (3) and (4), we have

$$\Rightarrow (\lambda^2 - \lambda) X = 0 \quad \Rightarrow \quad \lambda^2 - \lambda = 0$$

$$\Rightarrow \lambda(\lambda - 1) = 0 \quad \Rightarrow \quad \lambda = 0, 1 \quad [\because X \neq 0]$$

Hence, the eigen values of an idempotent matrix are either zero or unity. Proved.

**Example 50.** Determine all the idempotent diagonal matrices of order  $n$ .

**Solution.** Let  $A = \text{diag. } [d_1, d_2, d_3, \dots, d_n]$  be an idempotent matrix of order  $n$ .

Here, for the matrix ' $A$ ' to be idempotent  $A^2 = A$

$$\begin{aligned} & \left[ \begin{array}{cccc|ccc} d_1 & 0 & 0 & \dots & 0 \\ 0 & d_2 & 0 & \dots & 0 \\ 0 & 0 & d_3 & \dots & 0 \\ \hline 0 & 0 & 0 & \dots & d_n \end{array} \right] \left[ \begin{array}{cccc|ccc} d_1 & 0 & 0 & \dots & 0 \\ 0 & d_2 & 0 & \dots & 0 \\ 0 & 0 & d_3 & \dots & 0 \\ \hline 0 & 0 & 0 & \dots & d_n \end{array} \right] = \left[ \begin{array}{cccc|ccc} d_1 & 0 & 0 & \dots & 0 \\ 0 & d_2 & 0 & \dots & 0 \\ 0 & 0 & d_3 & \dots & 0 \\ \hline 0 & 0 & 0 & \dots & d_n \end{array} \right] \\ \Rightarrow & \left[ \begin{array}{cccc|ccc} d_1^2 & 0 & 0 & \dots & 0 \\ 0 & d_2^2 & 0 & \dots & 0 \\ 0 & 0 & d_3^2 & \dots & 0 \\ \hline 0 & 0 & 0 & \dots & d_n^2 \end{array} \right] = \left[ \begin{array}{cccc|ccc} d_1 & 0 & 0 & \dots & 0 \\ 0 & d_2 & 0 & \dots & 0 \\ 0 & 0 & d_3 & \dots & 0 \\ \hline 0 & 0 & 0 & \dots & d_n \end{array} \right] \end{aligned}$$

$$\therefore d_1^2 = d_1; d_2^2 = d_2; \dots; d_n^2 = d_n$$

i.e.,  $d_1 = 0, 1; d_2 = 0, 1; d_3 = 0, 1; \dots; d_n = 0, 1$ .

Hence  $\text{diag. } [d_1, d_2, d_3, \dots, d_n]$ , is the required idempotent matrix where

$$d_1 = d_2 = d_3 = \dots = d_n = 0 \text{ or } 1.$$

**Ans.**

### EXERCISE 21.12

1. Which of the following matrices are Hermitian:

$(a) \begin{bmatrix} 1 & 2+i & 3-i \\ 2+i & 2 & 4-i \\ 3+i & 4+i & 3 \end{bmatrix}$	$(b) \begin{bmatrix} 2i & 3 & 1 \\ 4 & -1 & 6 \\ 3 & 7 & 2i \end{bmatrix}$
$(c) \begin{bmatrix} 4 & 2-i & 5+2i \\ 2+i & 1 & 2-5i \\ 5-2i & 2+5i & 2 \end{bmatrix}$	$(d) \begin{bmatrix} 0 & i & 3 \\ -7 & 0 & 5i \\ 3i & 1 & 0 \end{bmatrix}$

**Ans. (c)**

2. Which of the following matrices are Skew-Hermitian:

$(a) \begin{bmatrix} 2i & -3 & 4 \\ 3 & 3i & -5 \\ -4 & 5 & 4i \end{bmatrix}$	$(b) \begin{bmatrix} 3i & -1 & 2 \\ 1 & 2i & -6 \\ 4 & 6 & -3i \end{bmatrix}$
$(c) \begin{bmatrix} 0 & 1-i & 2+3i \\ -1-i & 0 & 6i \\ -2+3i & 6i & 4i \end{bmatrix}$	$(d) \begin{bmatrix} 1 & 3 & 7+i \\ 3i & -i & 6 \\ 7-i & 8 & 0 \end{bmatrix}$

**Ans. (a), (c)**

3. Give an example of a matrix which is Skew-symmetric but not Skew-Hermitian.

$$\text{Ans. } \begin{bmatrix} 0 & 2+3i \\ -2-3i & 0 \end{bmatrix}$$

4. If  $A$  be a Hermitian matrix, show that  $iA$  is Skew-Hermitian. Also show that if  $B$  be a Skew-Hermitian matrix, then  $iB$  must be Hermitian.

5. If  $A$  and  $B$  are Hermitian matrices, then show that  $AB + BA$  is Hermitian and  $AB - BA$  is Skew-Hermitian.

6. If  $A$  is any square matrix, show that  $A + A^\theta$  is Hermitian.

7. If  $H = \begin{bmatrix} 3 & 5+2i & -3 \\ 5-2i & 7 & 4i \\ -3 & -4i & 5 \end{bmatrix}$ , show that  $H$  is a Hermitian matrix.

Verify that  $iH$  is a Skew-Hermitian matrix.

8. Show that for any complex square matrix  $A$ ,

(i)  $(A + A^*)$  is a Hermitian matrix, where  $A^* = \bar{A}^T$

(ii)  $(A - A^*)$  is Skew-Hermitian matrix.

(iii)  $AA^*$  and  $A^*A$  are Hermitian matrices.

9. Show that any complex square matrix can be uniquely expressed as the sum of a Hermitian matrix and a Skew-Hermitian matrix.

10. Express  $A = \begin{bmatrix} i & 2-3i & 4+5i \\ 6+i & 0 & 4-5i \\ -i & 2-i & 2+i \end{bmatrix}$  as the sum of Hermitian and Skew-Hermitian matrices.

11. Prove that the latent roots of a Hermitian matrix are all real.

12. If  $A = \begin{bmatrix} 2+i & 3 & -1+3i \\ -5 & i & 4-2i \end{bmatrix}$  show that  $AA^*$  is a Hermitian matrix; where  $A^*$  is the conjugate transpose of  $A$ .

(AMIETE, June 2010)

### 21.34 UNITARY MATRIX

A square matrix  $A$  is said to be unitary matrix if

$$A \cdot A^\theta = A^\theta A = I$$

**Example 51.** If  $A$  is a unitary matrix, show that  $A^T$  is also unitary.

**Solution.**  $A \cdot A^\theta = A^\theta A = I$ , since  $A$  is a unitary matrix.

$$(AA^\theta)^\theta = (A^\theta A)^\theta = I^\theta \quad (I^\theta = I)$$

$$(AA^\theta)^\theta = (A^\theta A)^\theta = I$$

$$(A^\theta)^\theta A^\theta = A^\theta (A^\theta)^\theta = I$$

$$AA^\theta = A^\theta A = I \quad [\text{since } (A^\theta)^\theta = A]$$

$$(AA^\theta)^T = (A^\theta A)^T = (I)^T$$

$$(A^\theta)^T A^T = A^T (A^\theta)^T = I$$

$$(A^T)^\theta \cdot A^T = A^T (A^T)^\theta = I$$

Hence,  $A^T$  is a unitary matrix.

**Proved.**

**Example 52.** If  $A$  is a unitary matrix, show that  $A^{-1}$  is also unitary.

**Solution.**  $AA^\theta = A^\theta A = I$ , since  $A$  is a unitary matrix.

$$(AA^\theta)^{-1} = (A^\theta \cdot A)^{-1} = (I)^{-1} \quad \text{taking inverse}$$

$$(A^\theta)^{-1} \cdot A^{-1} = A^{-1} (A^\theta)^{-1} = I$$

$$(A^{-1})^\theta \cdot A^{-1} = A^{-1} (A^{-1})^\theta = I$$

Hence,  $A^{-1}$  is a unitary matrix.

**Proved.**

**Example 53.** If  $A$  and  $B$  are two unitary matrices, show that  $AB$  is a unitary matrix.

**Solution.**  $A \cdot A^\theta = A^\theta A = I$  since  $A$  is a unitary matrix.

... (1)

Similarly,

$$B \cdot B^\theta = B^\theta B = I \quad \dots(2)$$

Now,

$$\begin{aligned} (AB)(AB)^\theta &= (AB)(B^\theta \cdot A^\theta) \\ &= A(BB^\theta) \cdot A^\theta \\ &= AA^\theta \quad [\text{From (2)}] \\ &= AA^\theta = I \quad [\text{From (1)}] \end{aligned}$$

Again,

$$\begin{aligned} (AB)^\theta \cdot (AB) &= (B^\theta \cdot A^\theta)(AB) \\ &= B^\theta (A^\theta A) B \quad [\text{From (1)}] \\ &= B^\theta I B \\ &= B^\theta B \\ &= I \quad [\text{From (2)}] \end{aligned}$$

Hence,  $AB$  is a unitary matrix.

**Proved.**

**Example 54.** Prove that the matrix  $\frac{1}{\sqrt{3}} \begin{bmatrix} 1 & 1+i \\ 1-i & -1 \end{bmatrix}$  is unitary.

**Solution.** Let  $A = \frac{1}{\sqrt{3}} \begin{bmatrix} 1 & 1+i \\ 1-i & -1 \end{bmatrix}$

$$A^\theta = \frac{1}{\sqrt{3}} \begin{bmatrix} 1 & 1+i \\ 1-i & -1 \end{bmatrix}$$

$$\begin{aligned} A^\theta \cdot A &= \frac{1}{\sqrt{3}} \begin{bmatrix} 1 & 1+i \\ 1-i & -1 \end{bmatrix} \times \frac{1}{\sqrt{3}} \begin{bmatrix} 1 & 1+i \\ 1-i & -1 \end{bmatrix} \\ &= \frac{1}{3} \begin{bmatrix} 1+(1+1) & (1+i)-(1+i) \\ (1-i)-1(1-i) & (1+1)+1 \end{bmatrix} = \frac{1}{3} \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I \end{aligned}$$

Hence,  $A$  is a unitary matrix.

**Proved.**

**Example 55.** Show that the matrix  $A = \begin{bmatrix} \alpha + i\gamma & -\beta + i\delta \\ \beta + i\delta & \alpha - i\gamma \end{bmatrix}$  is a unitary matrix if

$$\alpha^2 + \beta^2 + \gamma^2 + \delta^2 = 1 \quad (\text{U.P., I Semester, Dec. 2005})$$

**Solution.** We have,

$$A = \begin{bmatrix} \alpha + i\gamma & -\beta + i\delta \\ \beta + i\delta & \alpha - i\gamma \end{bmatrix}$$

$$A^\theta = \begin{bmatrix} \alpha - i\gamma & \beta - i\delta \\ -\beta - i\delta & \alpha + i\gamma \end{bmatrix}$$

We know that, a square matrix  $A$  is said to be unitary if  $A \cdot A^\theta = I$

$$\begin{aligned} \begin{bmatrix} \alpha + i\gamma & -\beta + i\delta \\ \beta + i\delta & \alpha - i\gamma \end{bmatrix} \begin{bmatrix} \alpha - i\gamma & \beta - i\delta \\ -\beta - i\delta & \alpha + i\gamma \end{bmatrix} &= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \\ \begin{bmatrix} \alpha^2 + \gamma^2 + \beta^2 + \delta^2 & \alpha\beta - i\alpha\delta + i\beta\gamma + \gamma\delta - \alpha\beta - i\beta\gamma + i\alpha\delta - \delta\gamma \\ \alpha\beta - i\beta\gamma + i\alpha\delta + \gamma\delta - \alpha\beta - i\alpha\delta + i\beta\gamma - \delta\gamma & \beta^2 + \delta^2 + \alpha^2 + \gamma^2 \end{bmatrix} &= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \\ \Rightarrow \begin{bmatrix} \alpha^2 + \beta^2 + \gamma^2 + \delta^2 & 0 \\ 0 & \alpha^2 + \beta^2 + \gamma^2 + \delta^2 \end{bmatrix} &= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \\ \Rightarrow \alpha^2 + \beta^2 + \gamma^2 + \delta^2 &= 1 \end{aligned}$$

**Proved.**

**Example 56.** Define a unitary matrix. If  $N = \begin{bmatrix} 0 & 1+2i \\ -1+2i & 0 \end{bmatrix}$  is a matrix, then show that  $(I - N)(I + N)^{-1}$  is a unitary matrix, where  $I$  is an identity matrix.

(U.P., I Semester, Winter 2000)

**Solution. Unitary matrix:** A square matrix ' $A$ ' is said to be unitary if  $A^\theta A = I$ , where

$$A^\theta = (\bar{A})^T \text{ and } I \text{ is an identity matrix.}$$

we have  $N = \begin{bmatrix} 0 & 1+2i \\ -1+2i & 0 \end{bmatrix}$

$$I - N = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} - \begin{bmatrix} 0 & 1+2i \\ -1+2i & 0 \end{bmatrix} = \begin{bmatrix} 1 & -1+2i \\ 1-2i & 1 \end{bmatrix} \quad \dots(1)$$

Now we have to find  $(I + N)^{-1}$

$$I + N = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & 1+2i \\ -1+2i & 0 \end{bmatrix} = \begin{bmatrix} 1 & 1+2i \\ -1+2i & 1 \end{bmatrix}$$

$$|I + N| = 1 - (-1 - 4) = 6$$

$$\text{Adj. } (I + N) = \begin{bmatrix} 1 & -1-2i \\ 1-2i & 1 \end{bmatrix}$$

$$(I + N)^{-1} = \frac{\text{Adj}(I + N)}{|I + N|} = \frac{1}{6} \begin{bmatrix} 1 & -1-2i \\ 1-2i & 1 \end{bmatrix} \quad \dots(2)$$

For unitary matrix,  $A^\theta A = I$

From (1) and (2), we get

$$\therefore (I - N)(I + N)^{-1} = \frac{1}{6} \begin{bmatrix} 1 & -1-2i \\ 1-2i & 1 \end{bmatrix} \begin{bmatrix} 1 & -1-2i \\ 1-2i & 1 \end{bmatrix} = \frac{1}{6} \begin{bmatrix} -4 & -2-4i \\ 2-4i & -4 \end{bmatrix} = B \text{ (say)}$$

Now  $(\bar{B})^T = \frac{1}{6} \begin{bmatrix} -4 & 2+4i \\ -2+4i & -4 \end{bmatrix}$

$$\therefore (\bar{B})^T B = \frac{1}{36} \begin{bmatrix} -4 & 2+4i \\ -2+4i & -4 \end{bmatrix} \begin{bmatrix} -4 & -2-4i \\ 2-4i & -4 \end{bmatrix} = \frac{1}{36} \begin{bmatrix} 36 & 0 \\ 0 & 36 \end{bmatrix} = I.$$

Hence the result.

Proved.

### 21.35. THE MODULUS OF EACH CHARACTERISTIC ROOT OF A UNITARY MATRIX IS UNITY.

(U.P., I Semester, Compartment 2002)

**Solution.** Suppose  $A$  is a unitary matrix. Then

$$A^\theta A = I.$$

Let  $\lambda$  be a characteristic root of  $A$ . Then

$$AX = \lambda X \quad \dots(1)$$

Taking conjugate transpose of both sides of (1), we get

$$(AX)^\theta = \bar{\lambda} X^\theta \quad \dots(2)$$

$$\Rightarrow X^\theta A^\theta = \bar{\lambda} X^\theta$$

From (1) and (2), we have

$$(X^\theta A^\theta)(AX) = \bar{\lambda} \lambda X^\theta X$$

$$\Rightarrow X^\theta (A^\theta A) X = \bar{\lambda} \lambda X^\theta X$$

$$\begin{aligned}
 \Rightarrow & X^{\theta} IX = \bar{\lambda} \lambda X^{\theta} X && (\because A^{\theta} A = I) \\
 \Rightarrow & X^{\theta} X = \bar{\lambda} \lambda X^{\theta} X \\
 \Rightarrow & X^{\theta} X (\bar{\lambda} \lambda - 1) = 0 && \dots(3)
 \end{aligned}$$

Since,  $X^{\theta} X \neq 0$  therefore (3) gives

$$\lambda \bar{\lambda} - 1 = 0 \text{ or } \lambda \bar{\lambda} = 1 \text{ or } |\lambda|^2 = 1 \Rightarrow |\lambda| = 1 \quad \text{Proved.}$$

### EXERCISE 21.13

1. Show that the matrix  $A = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & i \\ -i & -1 \end{bmatrix}$  is unitary.

2. Prove that a real matrix is unitary if it is orthogonal.

3. Prove that the following matrix is unitary:

$$\begin{bmatrix} \frac{1}{2}(1+i) & \frac{1}{2}(-1+i) \\ \frac{1}{2}(1+i) & \frac{1}{2}(1-i) \end{bmatrix}$$

4. Show that  $U = \frac{1}{\sqrt{3}} \begin{bmatrix} 1 & 1 & 1 \\ 1 & \omega & \omega^2 \\ 1 & \omega^2 & \omega \end{bmatrix}$  is a unitary matrix, where  $\omega$  is the complex cube root of unity.

5. Prove that the latent roots of a unitary matrix have unit modulus.

6. Verify that the matrix

$$A = \frac{1}{2} \begin{bmatrix} 1+i & 1-i \\ 1-i & 1+i \end{bmatrix}$$

has eigen values with unit modulus.

**Tick (✓) the correct answer:**

7. If  $\lambda$  is an eigen value of the matrix ' $M$ ' then for the matrix  $(M - \lambda I)$ , which of the following statement

(s) is/are correct?

- (i) Skew symmetric      (ii) Non singular      (iii) Singular      (iv) None of these **Ans. (iii)**  
*(U.P., I Sem. Dec. 2009)*

8. A square matrix  $A$  is idempotent if :

- (i)  $A' = A$       (ii)  $A' = -A$       (iii)  $A^2 = A$       (iv)  $A^2 = I$       **Ans. (iii)**  
*(R.G.P.V. Bhopal, I Semester June, 2007)*

9. If a square matrix  $U$  such that  $\overline{U}' = U^{-1}$  then  $U$  is

- (i) Orthogonal      (ii) Unitary      (iii) Symmetric      (iv) Hermitian      **Ans. (ii)**  
*(R.G.P.V. Bhopal, I Semester June, 2007)*

10. If  $\lambda$  is an eigen value of a non-singular matrix  $A$  then the eigen value of  $A^{-1}$  is

- (i)  $1/\lambda$       (ii)  $\lambda$       (iii)  $-\lambda$       (iv)  $-1/\lambda$   
*(AMIETE, June 2010) Ans. (i)*

## REVIEW OF VECTOR ALGEBRA

---

### 22.1 VECTORS

A vector is a quantity having both magnitude and direction such as force, velocity, acceleration, displacement etc.

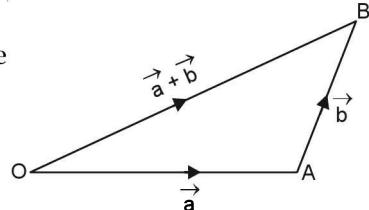

### 22.2 ADDITION OF VECTORS

Let  $\vec{a}$  and  $\vec{b}$  be two given vectors

$\vec{OA} = \vec{a}$  and  $\vec{AB} = \vec{b}$  then vector  $\vec{OB}$  is called the sum of  $\vec{a}$  and  $\vec{b}$ .

Symbolically

$$\begin{aligned}\vec{OA} + \vec{AB} &= \vec{OB} \\ \vec{a} + \vec{b} &= \vec{OB}\end{aligned}$$

### 22.3 RECTANGULAR RESOLUTION OF A VECTOR

Let  $OX, OY, OZ$  be the three rectangular axes. Let  $\hat{i}, \hat{j}, \hat{k}$  be three unit vectors and parallel to three axes.

If  $\vec{OP} = \vec{n}$  and the co-ordinates of  $P$  be  $(x, y, z)$

$$\vec{OA} = x\hat{i}, \quad \vec{OB} = y\hat{j} \quad \text{and} \quad \vec{OC} = z\hat{k}$$

$$\vec{OP} = \vec{OF} + \vec{FP}$$

$$\Rightarrow \vec{OP} = (\vec{OA} + \vec{AF}) + \vec{FP}$$

$$\Rightarrow \vec{OP} = \vec{OA} + \vec{OB} + \vec{OC}$$

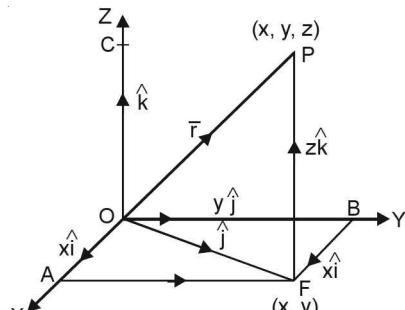

$$\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$$

$$\Rightarrow OP^2 = OF^2 + FP^2$$

$$= (OA^2 + AF^2) + FP^2 = OA^2 + OB^2 + OC^2 = x^2 + y^2 + z^2$$

$$OP = \sqrt{x^2 + y^2 + z^2}$$

$$|\vec{r}| = \sqrt{x^2 + y^2 + z^2}$$

### 22.4 UNIT VECTOR

Let a vector be  $x\hat{i} + y\hat{j} + z\hat{k}$ .

$$\text{Unit vector} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}}$$

**Example 1.** If  $\vec{a}$  and  $\vec{b}$  be two unit vectors and  $\alpha$  be the angle between them, then find the value of  $\alpha$  such that  $\vec{a} + \vec{b}$  is a unit vector. (Nagpur, University, Winter 2001)

**Solution.** Let  $\vec{OA} = \vec{a}$  be a unit vector and  $\vec{AB} = \vec{b}$  is another unit vector and  $\alpha$  be the angle between  $\vec{a}$  and  $\vec{b}$ .

If  $\vec{OB} = \vec{c} = \vec{a} + \vec{b}$  is also a unit vector then, we have

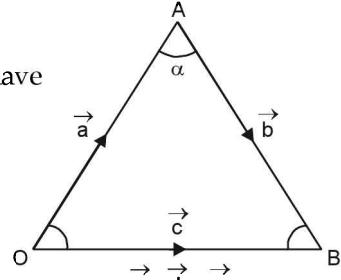

$$|\vec{OA}| = 1$$

$$|\vec{OB}| = 1$$

$$|\vec{OB}| = 1$$

$OAB$  is an equilateral triangle.

Hence each angle of  $\Delta OAB$  is  $\frac{\pi}{3}$

Ans.

## 22.5 POSITION VECTOR OF A POINT

The position vector of a point  $A$  with respect to origin  $O$  is the vector  $\vec{OA}$  which is used to specify the position of  $A$  w.r.t.  $O$ .

**To find  $\vec{AB}$  if the position vectors of the point  $A$  and point  $B$  are given.**

If the position vectors of  $A$  and  $B$  are  $\vec{a}$  and  $\vec{b}$ . Let the origin be  $O$ .

$$\text{Then } \vec{OA} = \vec{a}, \quad \vec{OB} = \vec{b}$$

$$\vec{OA} + \vec{AB} = \vec{OB}$$

$$\vec{AB} = \vec{OB} - \vec{OA}$$

$$\Rightarrow \vec{AB} = \vec{b} - \vec{a}$$

$\vec{AB}$  = Position vector of  $B$  – Position vector of  $A$

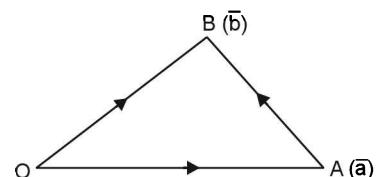

**Example 2.** If  $A$  and  $B$  are  $(3, 4, 5)$  and  $(6, 8, 9)$ , find  $\vec{AB}$ .

**Solution.**  $\vec{AB}$  = Position vector of  $B$  – Position vector of  $A$

$$= (6\hat{i} + 8\hat{j} + 9\hat{k}) - (3\hat{i} + 4\hat{j} + 5\hat{k})$$

$$= 3\hat{i} + 4\hat{j} + 4\hat{k}$$

Ans.

## 22.6 RATIO FORMULA

To find the position vector of the point which divides the line joining two given points.

Let  $A$  and  $B$  be two points and a point  $C$  divides  $AB$  in the ratio of  $m : n$ .

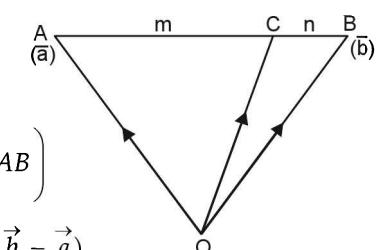

Let  $O$  be the origin, then

$$\vec{OA} = \vec{a}, \quad \text{and} \quad \vec{OB} = \vec{b}, \quad \vec{OC} = ?$$

$$\vec{OC} = \vec{OA} + \vec{AC}$$

$$= \vec{OA} + \frac{m}{m+n} \vec{AB} \quad \left( \because AC = \frac{m}{m+n} AB \right)$$

$$= \vec{a} + \frac{m}{m+n} \cdot (\vec{b} - \vec{a}) \quad (\because \vec{AB} = \vec{b} - \vec{a})$$

$$\vec{OC} = \frac{m\vec{b} + n\vec{a}}{m+n}$$

**Cor.** If  $m = n = 1$ , then  $C$  will be the mid-point, and

$$\vec{OC} = \frac{\vec{a} + \vec{b}}{2}$$

### 22.7 PRODUCT OF TWO VECTORS

The product of two vectors results in two different ways, the one is a number and the other is vector. So, there are two types of product of two vectors, namely scalar product and vector product. They are written as  $\vec{a} \cdot \vec{b}$  and  $\vec{a} \times \vec{b}$ .

### 22.8 SCALAR, OR DOT PRODUCT

The scalar, or dot product of two vectors  $\vec{a}$  and  $\vec{b}$  is defined to be  $|\vec{a}| |\vec{b}| \cos \theta$  i.e.,

scalar where  $\theta$  is the angle between  $\vec{a}$  and  $\vec{b}$ .

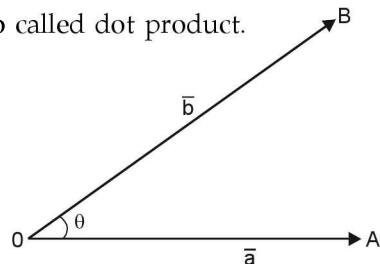

$$\text{Symbolically, } \vec{a} \cdot \vec{b} = |\vec{a}| |\vec{b}| \cos \theta$$

Due to a dot between  $\vec{a}$  and  $\vec{b}$  this product is also called dot product.

The scalar product is commutative

$$\text{To Prove. } \vec{a} \cdot \vec{b} = \vec{b} \cdot \vec{a}$$

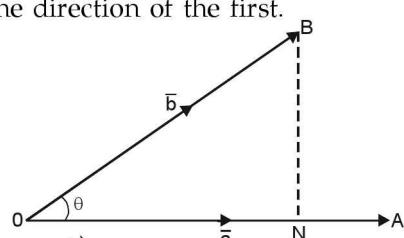

$$\begin{aligned} \text{Proof. } \vec{b} \cdot \vec{a} &= |\vec{b}| |\vec{a}| \cos(-\theta) \\ &= |\vec{a}| |\vec{b}| \cos \theta \\ &= \vec{a} \cdot \vec{b} \quad \text{Proved.} \end{aligned}$$

**Geometrical interpretation.** The scalar product of two vectors is the product of one vector and the length of the projection of the other in the direction of the first.

$$\text{Let } \vec{OA} = \vec{a} \text{ and } \vec{OB} = \vec{b}$$

$$\begin{aligned} \text{then } \vec{a} \cdot \vec{b} &= (OA) \cdot (OB) \cos \theta \\ &= OA \cdot OB \cdot \frac{ON}{OB} \\ &= OA \cdot ON \\ &= (\text{Length of } \vec{a}) (\text{projection of } \vec{b} \text{ along } \vec{a}) \end{aligned}$$

### 22.9 USEFUL RESULTS

$$\hat{i} \cdot \hat{i} = (1)(1) \cos 0^\circ = 1 \quad \text{Similarly, } \hat{j} \cdot \hat{j} = 1, \quad \hat{k} \cdot \hat{k} = 1$$

$$\hat{i} \cdot \hat{j} = (1)(1) \cos 90^\circ = 0 \quad \text{Similarly, } \hat{j} \cdot \hat{k} = 0, \quad \hat{k} \cdot \hat{i} = 0$$

**Note.** If the dot product of two vectors is zero then vectors are perpendicular to each other.

### 22.10 WORK DONE AS A SCALAR PRODUCT

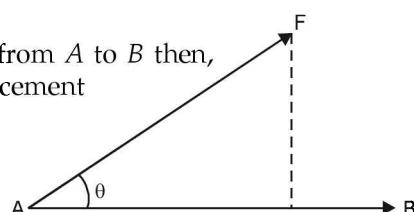

If a constant force  $F$  acting on a particle displaces it from  $A$  to  $B$  then,

Work done = (component of  $F$  along  $AB$ ). Displacement

$$= F \cos \theta \cdot AB$$

$$= \vec{F} \cdot \vec{AB}$$

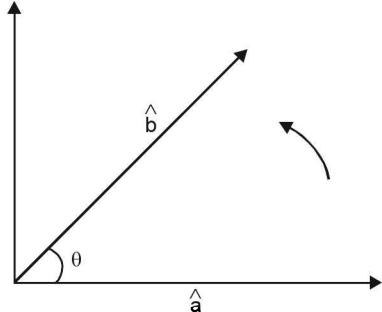

<b>Work done = Force . Displacement</b>
---

## 22.11 VECTOR PRODUCT OR CROSS PRODUCT

1. The vector, or cross product of two vectors  $\vec{a}$  and  $\vec{b}$  is defined to be a vector such that

- (i) Its magnitude is  $|\vec{a}| |\vec{b}| \sin \theta$ , where  $\theta$  is the angle between  $\vec{a}$  and  $\vec{b}$ .
- (ii) Its direction is perpendicular to both vectors  $\vec{a}$  and  $\vec{b}$ .
- (iii) It forms with a right handed system.

Let  $\hat{n}$  be a unit vector perpendicular to both the vectors  $\vec{a}$  and  $\vec{b}$ .

$$\vec{a} \times \vec{b} = |\vec{a}| |\vec{b}| \sin \theta \cdot \hat{n}$$

## 2. Useful results

Since  $\hat{i}, \hat{j}, \hat{k}$  are three mutually perpendicular unit vectors, then

$$\hat{i} \times \hat{i} = \hat{j} \times \hat{j} = \hat{k} \times \hat{k} = 0$$

$$\hat{i} \times \hat{j} = -\hat{j} \times \hat{i} = \hat{k}$$

$$\hat{j} \times \hat{i} = -\hat{i} \times \hat{j}$$

$$\hat{j} \times \hat{k} = -\hat{k} \times \hat{j} = \hat{i}$$

$$\hat{k} \times \hat{j} = -\hat{j} \times \hat{k}$$

$$\hat{k} \times \hat{i} = -\hat{i} \times \hat{k} = \hat{j}$$

$$\hat{i} \times \hat{k} = -\hat{k} \times \hat{i} = \hat{j}$$

## 22.12 VECTOR PRODUCT EXPRESSED AS A DETERMINANT

$$\text{If } \vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}$$

$$\vec{b} = b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}$$

$$\begin{aligned} \vec{a} \times \vec{b} &= (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times (b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}) \\ &= a_1 b_1 (\hat{i} \times \hat{i}) + a_1 b_2 (\hat{i} \times \hat{j}) + a_1 b_3 (\hat{i} \times \hat{k}) + a_2 b_1 (\hat{j} \times \hat{i}) + a_2 b_2 (\hat{j} \times \hat{j}) \\ &\quad + a_2 b_3 (\hat{j} \times \hat{k}) + a_3 b_1 (\hat{k} \times \hat{i}) + a_3 b_2 (\hat{k} \times \hat{j}) + a_3 b_3 (\hat{k} \times \hat{k}) \\ &= a_1 b_2 \hat{k} - a_1 b_3 \hat{j} - a_2 b_1 \hat{k} + a_2 b_3 \hat{i} + a_3 b_1 \hat{j} - a_3 b_2 \hat{i} \\ &= (a_2 b_3 - a_3 b_2) \hat{i} - (a_1 b_3 - a_3 b_1) \hat{j} + (a_1 b_2 - a_2 b_1) \hat{k} \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} \end{aligned}$$

## 22.13 AREA OF PARALLELOGRAM

**Example 3.** Find the area of a parallelogram whose adjacent sides are  $i - 2j + 3k$  and  $2i + j - 4k$ .

**Solution.** Vector area of || gm =  $\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -2 & 3 \\ 2 & 1 & -4 \end{vmatrix}$

$$= (8 - 3)\hat{i} - (-4 - 6)\hat{j} + (1 + 4)\hat{k} = 5\hat{i} + 10\hat{j} + 5\hat{k}$$

$$\text{Area of parallelogram} = \sqrt{(5)^2 + (10)^2 + (5)^2} = 5\sqrt{6}$$

Ans.

### 22.14 MOMENT OF A FORCE

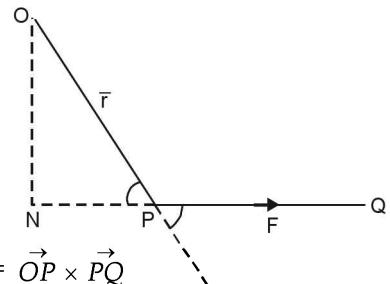

Let a force  $F (\vec{PQ})$  act at a point  $P$ .

Moment of  $\vec{F}$  about  $O$

= Product of force  $F$  and perpendicular distance (ON.  $\hat{\eta}$ )

$$= (PQ) (ON)(\hat{\eta}) = (PQ) (OP) \sin \theta (\hat{\eta}) = \vec{OP} \times \vec{PQ}$$

$$\Rightarrow \vec{M} = \vec{r} \times \vec{F}$$

### 22.15 ANGULAR VELOCITY

Let a rigid body be rotating about the axis  $OA$  with the angular velocity  $\omega$  which is a vector and its magnitude is  $\omega$  radians per second and its direction is parallel to the axis of rotation  $OA$ .

Let  $P$  be any point on the body such that  $\vec{OP} = \vec{r}$  and  $\angle AOP = \theta$  and  $AP \perp OA$ . Let the velocity of  $P$  be  $V$ .

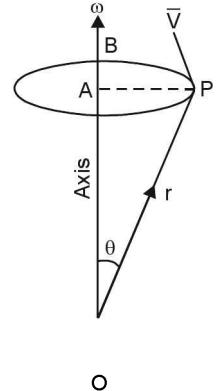

Let  $\hat{\eta}$  be a unit vector perpendicular to  $\vec{\omega}$  and  $\vec{r}$ .

$$\vec{\omega} \times \vec{r} = (\omega r \sin \theta) \hat{\eta} = (\omega AP) \hat{\eta} = (\text{Speed of } P) \hat{\eta}$$

= Velocity of  $P \perp$  to  $\vec{\omega}$  and  $\vec{r}$

Hence

$$\boxed{\vec{V} = \vec{\omega} \times \vec{r}}$$

### 22.16 SCALAR TRIPLE PRODUCT

Let  $\vec{a}, \vec{b}, \vec{c}$  be three vectors then their dot product is written as  $\vec{a} \cdot (\vec{b} \times \vec{c})$  or  $[\vec{a} \vec{b} \vec{c}]$ .

If  $\vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}$ ,  $\vec{b} = b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}$ , and  $\vec{c} = c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k}$

$$\vec{a} \cdot (\vec{b} \times \vec{c}) = (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \cdot [(b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}) \times (c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k})]$$

$$= (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \cdot [(b_2 c_3 - b_3 c_2) \hat{i} + (b_3 c_1 - b_1 c_3) \hat{j} + (b_1 c_2 - b_2 c_1) \hat{k}]$$

$$= a_1 (b_2 c_3 - b_3 c_2) + a_2 (b_3 c_1 - b_1 c_3) + a_3 (b_1 c_2 - b_2 c_1)$$

$$= \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Similarly,  $\vec{b} \cdot (\vec{c} \times \vec{a})$  and  $\vec{c} \cdot (\vec{a} \times \vec{b})$  have the same value.

$$\therefore \vec{a} \cdot (\vec{b} \times \vec{c}) = \vec{b} \cdot (\vec{c} \times \vec{a}) = \vec{c} \cdot (\vec{a} \times \vec{b})$$

The value of the product depends upon the cyclic order of the vector, but is independent of the position of the dot and cross. These may be interchanged.

The value of the product changes if the order is non-cyclic.

**Note.**  $\vec{a} \times (\vec{b} \cdot \vec{c})$  and  $(\vec{a} \cdot \vec{b}) \times \vec{c}$  are meaningless.

### 22.17 GEOMETRICAL INTERPRETATION

The scalar triple product  $\vec{a} \cdot (\vec{b} \times \vec{c})$  represents the volume of the parallelopiped having  $\vec{a}$ ,  $\vec{b}$ ,  $\vec{c}$  as its co-terminous edges.

$$\vec{a} \cdot (\vec{b} \times \vec{c}) = \vec{a} \cdot \text{Area of } \parallel \text{gm } OBDC \hat{n}$$

= Area of  $\parallel \text{gm } OBDC \times$  perpendicular distance between the parallel faces  $OBDC$  and  $AEFG$ .

= Volume of the parallelopiped

**Note.** (1) If  $\vec{a} \cdot (\vec{b} \times \vec{c}) = 0$ , then  $\vec{a}$ ,  $\vec{b}$ ,  $\vec{c}$  are coplanar.

(2) Volume of tetrahedron  $\frac{1}{6}(\vec{a} \cdot \vec{b} \cdot \vec{c})$ .

**Example 4.** Find the volume of parallelopiped if

$\vec{a} = -3\hat{i} + 7\hat{j} + 5\hat{k}$ ,  $\vec{b} = -3\hat{i} + 7\hat{j} - 3\hat{k}$ , and  $\vec{c} = 7\hat{i} - 5\hat{j} - 3\hat{k}$  are the three co-terminous edges of the parallelopiped.

**Solution.**

$$\begin{aligned} \text{Volume} &= \vec{a} \cdot (\vec{b} \times \vec{c}) \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ -3 & 7 & 5 \\ -3 & 7 & -3 \\ 7 & -5 & -3 \end{vmatrix} = -3(-21 - 15) - 7(9 + 21) + 5(15 - 49) \\ &= 108 - 210 - 170 = -272 \end{aligned}$$

Volume = 272 cube units.

**Ans.**

**Example 5.** Show that the volume of the tetrahedron having  $\vec{A} + \vec{B}$ ,  $\vec{B} + \vec{C}$ ,  $\vec{C} + \vec{A}$  as concurrent edges is twice the volume of the tetrahedron having  $\vec{A}$ ,  $\vec{B}$ ,  $\vec{C}$  as concurrent edges.

**Solution.** Volume of tetrahedron =  $\frac{1}{6}(\vec{A} + \vec{B}) \cdot [(\vec{B} + \vec{C}) \times (\vec{C} + \vec{A})]$

$$\begin{aligned} &= \frac{1}{6}(\vec{A} + \vec{B}) \cdot [\vec{B} \times \vec{C} + \vec{B} \times \vec{A} + \vec{C} \times \vec{C} + \vec{C} \times \vec{A}] \quad [\vec{C} \times \vec{C} = 0] \\ &= \frac{1}{6}(\vec{A} + \vec{B}) \cdot (\vec{B} \times \vec{C} + \vec{B} \times \vec{A} + \vec{C} \times \vec{A}) \\ &= \frac{1}{6}[\vec{A} \cdot (\vec{B} \times \vec{C}) + \vec{A} \cdot (\vec{B} \times \vec{A}) + \vec{A} \cdot (\vec{C} \times \vec{A}) + \vec{B} \cdot (\vec{B} \times \vec{C}) + \vec{B} \cdot (\vec{B} \times \vec{A}) + \vec{B} \cdot (\vec{C} \times \vec{A})] \\ &= \frac{1}{6}[\vec{A} \cdot (\vec{B} \times \vec{C}) + \vec{B} \cdot (\vec{C} \times \vec{A})] = \frac{1}{3}\vec{A} \cdot (\vec{B} \times \vec{C}) \\ &= 2 \times \frac{1}{6}[\vec{A} \cdot \vec{B} \cdot \vec{C}] \end{aligned}$$

= 2 Volume of tetrahedron having  $\vec{A}$ ,  $\vec{B}$ ,  $\vec{C}$ , as concurrent edges. **Proved.**

**Example 6.** Using vectors, establish Cramer's rule for solving these following linear equations

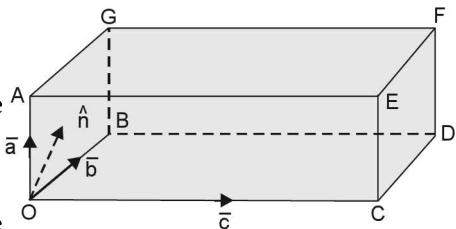

$$a_1x + b_1y + c_1z = d_1, \quad a_2x + b_2y + c_2z = d_2, \quad a_3x + b_3y + c_3z = d_3 \quad \dots(1)$$

**Solution.** Here, we have,  $a_1x + b_1y + c_1z = d_1 \quad \dots(1)$

$$a_2x + b_2y + c_2z = d_2 \quad \dots(2)$$

$$a_3x + b_3y + c_3z = d_3 \quad \dots(3)$$

Multiplying equations (1), (2) and (3) by  $\hat{i}$ ,  $\hat{j}$  and  $\hat{k}$  respectively, we get

$$(a_1 x + b_1 y + c_1 z) \hat{i} = d_1 \hat{i} \quad \dots(4)$$

$$(a_2 x + b_2 y + c_2 z) \hat{j} = d_2 \hat{j} \quad \dots(5)$$

$$(a_3 x + b_3 y + c_3 z) \hat{k} = d_3 \hat{k} \quad \dots(6)$$

Adding (4), (5) and (6), we have

$$(a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) x + (b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}) y + (c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k}) z = d_1 \hat{i} + d_2 \hat{j} + d_3 \hat{k}$$

$$(\vec{a} x + \vec{b} y + \vec{c} z) = \vec{d} \quad \dots(7)$$

$$[\vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}, \vec{b} = b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}, \text{ and } \vec{c} = c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k}]$$

Take scalar product of (7) with  $(\vec{b} \times \vec{c})$

$$\vec{a} \cdot (\vec{b} \times \vec{c}) x + \vec{b} \cdot (\vec{b} \times \vec{c}) y + \vec{c} \cdot (\vec{b} \times \vec{c}) z = \vec{d} \cdot (\vec{b} \times \vec{c})$$

$$\Rightarrow (\vec{a} \vec{b} \vec{c}) x = (\vec{d} \vec{b} \vec{c}) \Rightarrow x = \frac{(\vec{d} \vec{b} \vec{c})}{(\vec{a} \vec{b} \vec{c})}$$

$$\text{Similarly, } (\vec{b} \vec{c} \vec{a}) y = (\vec{d} \vec{c} \vec{a}) \Rightarrow y = \frac{(\vec{d} \vec{c} \vec{a})}{(\vec{b} \vec{c} \vec{a})}$$

$$(\vec{c} \vec{a} \vec{b}) z = (\vec{d} \vec{a} \vec{b}) \Rightarrow z = \frac{(\vec{d} \vec{a} \vec{b})}{(\vec{c} \vec{a} \vec{b})}$$

$$\text{Thus } x = \frac{(\vec{d} \vec{b} \vec{c})}{(\vec{a} \vec{b} \vec{c})}, \quad y = \frac{(\vec{d} \vec{c} \vec{a})}{(\vec{b} \vec{c} \vec{a})}, \quad z = \frac{(\vec{d} \vec{a} \vec{b})}{(\vec{c} \vec{a} \vec{b})} \quad \text{Proved.}$$

### EXERCISE 22.1

1. Find the volume of the parallelopiped with adjacent sides.

$$\overrightarrow{OA} = 3\hat{i} - \hat{j}, \quad \overrightarrow{OB} = \hat{j} + 2\hat{k}, \quad \text{and} \quad \overrightarrow{OC} = \hat{i} + 5\hat{j} + 4\hat{k}$$

extending from the origin of co-ordinates  $O$ . Ans. 20

2. Find the volume of the tetrahedron whose vertices are the points  $A (2, -1, -3)$ ,  $B (4, 1, 3)$ ,

$$C (3, 2, -1) \text{ and } D (1, 4, 2). \quad \text{Ans. } 7 \frac{1}{3}$$

3. Choose  $y$  in order that the vectors  $\vec{a} = 7\hat{i} + y\hat{j} + \hat{k}$ ,  $\vec{b} = 3\hat{i} + 2\hat{j} + \hat{k}$ ,

$$\vec{c} = 5\hat{i} + 3\hat{j} + \hat{k} \text{ are linearly dependent.} \quad \text{Ans. } y = 4$$

4. Prove that

$$[\vec{a} + \vec{b}, \vec{b} + \vec{c}, \vec{c} + \vec{a}] = 2 [\vec{a} \vec{b} \vec{c}]$$

### 22.18 COPLANARITY QUESTIONS

**Example 7.** Find the volume of tetrahedron having vertices

$$(-\hat{j} - \hat{k}), (4\hat{i} + 5\hat{j} + q\hat{k}), (3\hat{i} + 9\hat{j} + 4\hat{k}) \text{ and } 4(-\hat{i} + \hat{j} + \hat{k}).$$

Also find the value of  $q$  for which these four points are coplanar.

(Nagpur University, Summer 2004, 2003, 2002)

**Solution.** Let  $\vec{A} = -\hat{j} - \hat{k}$ ,  $\vec{B} = 4\hat{i} + 5\hat{j} + q\hat{k}$ ,  $\vec{C} = 3\hat{i} + 9\hat{j} + 4\hat{k}$ ,  $\vec{D} = 4(-\hat{i} + \hat{j} + \hat{k})$

$$\overrightarrow{AB} = \vec{B} - \vec{A} = 4\hat{i} + 5\hat{j} + q\hat{k} - (-\hat{j} - \hat{k}) = 4\hat{i} + 6\hat{j} + (q+1)\hat{k}$$

$$\overrightarrow{AC} = \vec{C} - \vec{A} = (3\hat{i} + 9\hat{j} + 4\hat{k}) - (-\hat{j} - \hat{k}) = 3\hat{i} + 10\hat{j} + 5\hat{k}$$

$$\overrightarrow{AD} = \vec{D} - \vec{A} = 4(-\hat{i} + \hat{j} + \hat{k}) - (-\hat{j} - \hat{k}) = -4\hat{i} + 5\hat{j} + 5\hat{k}$$

$$\text{Volume of the tetrahedron} = \frac{1}{6} [\overrightarrow{AB} \overrightarrow{AC} \overrightarrow{AD}]$$

$$\begin{aligned} &= \frac{1}{6} \begin{vmatrix} 4 & 6 & q+1 \\ 3 & 10 & 5 \\ -4 & 5 & 5 \end{vmatrix} = \frac{1}{6} \{4(50-25) - 6(15+20) + (q+1)(15+40)\} \\ &= \frac{1}{6} \{100 - 210 + 55(q+1)\} = \frac{1}{6} (-110 + 55 + 55q) \\ &= \frac{1}{6} (-55 + 55q) = \frac{55}{6} (q-1) \end{aligned}$$

If four points  $A, B, C$  and  $D$  are coplanar, then  $(\overrightarrow{AB} \overrightarrow{AC} \overrightarrow{AD}) = 0$   
i.e., Volume of the tetrahedron = 0

$$\Rightarrow \frac{55}{6}(q-1) = 0 \Rightarrow q = 1 \quad \text{Ans.}$$

**Example 8.** Find  $m$  so that the vectors

$$2\hat{i} - 4\hat{j} + 5\hat{k}; \hat{i} - m\hat{j} + \hat{k}, \text{ and } 3\hat{i} + 2\hat{j} - 5\hat{k} \text{ are coplanar.}$$

(Nagpur University, Winter 2003)

**Solution.** Let

$$\vec{a} = 2\hat{i} - 4\hat{j} + 5\hat{k}$$

$$\vec{b} = \hat{i} - m\hat{j} + \hat{k}$$

$$\vec{c} = 3\hat{i} + 2\hat{j} - 5\hat{k}$$

$\vec{a}, \vec{b}$  and  $\vec{c}$  are coplanar if  $\vec{a} \cdot (\vec{b} \times \vec{c}) = 0$

$$\vec{a} \cdot (\vec{b} \times \vec{c}) = \begin{vmatrix} 2 & -4 & 5 \\ 1 & -m & 1 \\ 3 & 2 & -5 \end{vmatrix} = 0$$

$$0 = 2(5m-2) + 4(-5-3) + 5(2+3m)$$

$$0 = 10m - 4 - 32 + 10 + 15m$$

$$0 = 25m - 26$$

$$25m = 26$$

$$\therefore m = \frac{26}{25}. \quad \text{Ans.}$$

**Example 9.** Show that the vectors

$$(5\bar{a} + 6\bar{b} + 7\bar{c}), (7\bar{a} - 8\bar{b} + 9\bar{c}) \text{ and } (3\bar{a} + 20\bar{b} + 5\bar{c})$$

are coplanar,  $\bar{a}, \bar{b}, \bar{c}$  being three non-collinear vectors.

(Nagpur University, Summer 2003)

**Solution.** Let

$$\vec{\alpha} = 5\bar{a} + 6\bar{b} + 7\bar{c}$$

$$\vec{\beta} = 7\bar{a} - 8\bar{b} + 9\bar{c}$$

$$\vec{\gamma} = 3\bar{a} + 20\bar{b} + 5\bar{c}$$

$$\begin{aligned} \vec{\alpha} \cdot (\vec{\beta} \times \vec{\gamma}) &= \begin{vmatrix} 5 & 6 & 7 \\ 7 & -8 & 9 \\ 3 & 20 & 5 \end{vmatrix} \\ &= 5(-40 - 180) - 6(35 - 27) + 7(140 + 24) \end{aligned}$$

$$\begin{aligned} &= -5 \times 220 - 6 \times 8 + 7 \times 164 \\ &= -1100 - 48 + 1148 = 0 \end{aligned}$$

Hence  $\vec{\alpha}$ ,  $\vec{\beta}$  and  $\vec{\gamma}$  are coplanar. Proved.

**Example 10.** If four points whose position vectors are  $\vec{a}, \vec{b}, \vec{c}, \vec{d}$  are coplanar, show that

$$[\vec{a} \vec{b} \vec{c}] = [\vec{a} \vec{d} \vec{b}] + [\vec{a} \vec{d} \vec{c}] + [\vec{d} \vec{b} \vec{c}] \quad (\text{Nagpur University, Summer 2005})$$

**Solution.** Let  $A, B, C, D$  be four points whose position vectors are  $\vec{a}, \vec{b}, \vec{c}, \vec{d}$ .

$$\vec{AD} = \vec{d} - \vec{a}, \quad \vec{BD} = \vec{d} - \vec{b} \quad \text{and} \quad \vec{CD} = \vec{d} - \vec{c}$$

If  $\vec{AD}, \vec{BD}, \vec{CD}$  are coplanar, then

$$\begin{aligned} \vec{AD} \cdot (\vec{BD} \times \vec{CD}) &= 0 \\ \Rightarrow (\vec{d} - \vec{a}) \cdot [(\vec{d} - \vec{b}) \times (\vec{d} - \vec{c})] &= 0 \\ \Rightarrow (\vec{d} - \vec{a}) \cdot [\vec{d} \times \vec{d} - \vec{d} \times \vec{c} - \vec{b} \times \vec{d} + \vec{b} \times \vec{c}] &= 0 \\ \Rightarrow (\vec{d} - \vec{a}) \cdot [-\vec{d} \times \vec{c} - \vec{b} \times \vec{d} + \vec{b} \times \vec{c}] &= 0 \\ \Rightarrow -\vec{d} \cdot (\vec{d} \times \vec{c}) - \vec{d} \cdot (\vec{b} \times \vec{d}) + \vec{d} \cdot (\vec{b} \times \vec{c}) + \vec{a} \cdot (\vec{d} \times \vec{c}) + \vec{a} \cdot (\vec{b} \times \vec{a}) - \vec{a} \cdot (\vec{b} \times \vec{c}) &= 0 \\ \Rightarrow -0 + 0 + [\vec{d} \vec{b} \vec{c}] + [\vec{d} \vec{d} \vec{c}] + [\vec{d} \vec{b} \vec{d}] - [\vec{a} \vec{b} \vec{c}] &= 0 \\ \Rightarrow [\vec{a} \vec{b} \vec{c}] &= [\vec{a} \vec{b} \vec{d}] + [\vec{a} \vec{d} \vec{c}] + [\vec{d} \vec{b} \vec{c}] \quad \text{Proved.} \end{aligned}$$

**Example 11.** Assuming that  $\vec{a} \cdot (\vec{b} \times \vec{c}) \neq 0$  and  $\vec{d} = x\vec{a} + y\vec{b} + z\vec{c}$ .

Find the values of  $x, y$  and  $z$ . (Nagpur University, Winter 2002)

**Solution.** We have,  $\vec{d} = x\vec{a} + y\vec{b} + z\vec{c}$  ...(1)

Taking dot product of (1) with  $\vec{b} \times \vec{c}$ , we get

$$\begin{aligned} [\vec{d} \vec{b} \vec{c}] &= \vec{d} \cdot (\vec{b} \times \vec{c}) = (x\vec{a} + y\vec{b} + z\vec{c}) \cdot (\vec{b} \times \vec{c}) \\ &= x \{ \vec{a} \cdot (\vec{b} \times \vec{c}) \} + y \{ \vec{b} \cdot (\vec{b} \times \vec{c}) \} + z \{ \vec{c} \cdot (\vec{b} \times \vec{c}) \} = x [\vec{a} \vec{b} \vec{c}] + 0 + 0 \\ \therefore x &= \frac{[\vec{d} \vec{b} \vec{c}]}{[\vec{a} \vec{b} \vec{c}]} \end{aligned}$$

Similarly taking dot product of (1) with  $(\vec{c} \times \vec{a})$  and  $(\vec{a} \times \vec{b})$

Separately, we get

$$y = \frac{[\vec{d} \vec{c} \vec{a}]}{[\vec{a} \vec{b} \vec{c}]} \text{ and } z = \frac{[\vec{d} \vec{a} \vec{b}]}{[\vec{a} \vec{b} \vec{c}]} \quad \text{Ans.}$$

### EXERCISE 22.2

1. Determine  $\lambda$  such that

$$\bar{a} = \hat{i} + \hat{j} + \hat{k}, \bar{b} = 2\hat{i} - 4\hat{k}, \text{ and } \bar{c} = \hat{i} + \lambda \hat{j} + 3\hat{k} \text{ are coplanar.} \quad \text{Ans. } \lambda = 5/3$$

2. Show that the four points

$$-6\hat{i} + 3\hat{j} + 2\hat{k}, 3\hat{i} - 2\hat{j} + 4\hat{k}, 5\hat{i} + 7\hat{j} + 3\hat{k} \text{ and } -13\hat{i} + 17\hat{j} - \hat{k} \text{ are coplanar.}$$

3. Find the constant  $a$  such that the vectors

$$2\hat{i} - \hat{j} + \hat{k}, \hat{i} + 2\hat{j} - 3\hat{k}, \text{ and } 3\hat{i} + a\hat{j} + 5\hat{k} \text{ are coplanar.} \quad \text{Ans. } -4$$

4. Prove that four points

$$4\hat{i} + 5\hat{j} + \hat{k}, -(\hat{j} + \hat{k}), 3\hat{i} + 9\hat{j} + 4\hat{k}, 4(-\hat{i} + \hat{j} + \hat{k}) \text{ are coplanar.}$$

5. If the vectors  $\vec{a}$ ,  $\vec{b}$  and  $\vec{c}$  are coplanar, show that

$$\begin{vmatrix} \vec{a} & \vec{b} & \vec{c} \\ \vec{a} \cdot \vec{a} & \vec{a} \cdot \vec{b} & \vec{a} \cdot \vec{c} \\ \vec{b} \cdot \vec{a} & \vec{b} \cdot \vec{b} & \vec{b} \cdot \vec{c} \end{vmatrix} = 0$$

### 22.19 VECTOR PRODUCT OF THREE VECTORS

(A.M.I.E.T.E., Summer, 2004, 2000)

Let  $\vec{a}$ ,  $\vec{b}$  and  $\vec{c}$  be three vectors then their vector product is written as  $\vec{a} \times (\vec{b} \times \vec{c})$ .

$$\text{Let } \vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k},$$

$$\vec{b} = b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k},$$

$$\vec{c} = c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k}$$

$$\begin{aligned} \vec{a} \times (\vec{b} \times \vec{c}) &= (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times (b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}) \times (c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k}) \\ &= (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times [(b_2 c_3 - b_3 c_2) \hat{i} + (b_3 c_1 - b_1 c_3) \hat{j} + (b_1 c_2 - b_2 c_1) \hat{k}] \\ &= [a_2(b_1 c_2 - b_2 c_1) - a_3(b_3 c_1 - b_1 c_3)] \hat{i} + [a_3(b_2 c_3 - b_3 c_2) - a_1(b_1 c_2 - b_2 c_1)] \hat{j} \\ &\quad + [a_1(b_3 c_1 - b_1 c_3) - a_2(b_2 c_3 - b_3 c_2)] \hat{k} \\ &= (a_1 c_1 + a_2 c_2 + a_3 c_3)(b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}) - (a_1 b_1 + a_2 b_2 + a_3 b_3)(c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k}) \\ &= \vec{a} \cdot \vec{b} \cdot \vec{c} - (\vec{a} \cdot \vec{b}) \cdot \vec{c}. \end{aligned}$$

**Ans.**

**Example 12.** Let  $\vec{a} = \hat{i} + \hat{j} - \hat{k}$ ,  $\vec{b} = \hat{i} - \hat{j} + \hat{k}$ ,  $\vec{c} = \hat{i} - \hat{j} - \hat{k}$ .

Find the vector  $\vec{a} \times (\vec{b} \times \vec{c})$ .

$$\begin{aligned} \text{Solution. } \vec{a} \times (\vec{b} \times \vec{c}) &= (\vec{a} \cdot \vec{c}) \vec{b} - (\vec{a} \cdot \vec{b}) \vec{c} \\ &= [(\hat{i} + \hat{j} - \hat{k}) \cdot (\hat{i} - \hat{j} - \hat{k})] (\hat{i} - \hat{j} + \hat{k}) - [(\hat{i} + \hat{j} - \hat{k}) \cdot (\hat{i} - \hat{j} + \hat{k})] (\hat{i} - \hat{j} - \hat{k}) \\ &= (1 - 1 + 1) (\hat{i} - \hat{j} + \hat{k}) - [(1 - 1 - 1) (\hat{i} - \hat{j} - \hat{k})] \\ &= (\hat{i} - \hat{j} + \hat{k}) + (\hat{i} - \hat{j} - \hat{k}) = 2\hat{i} - 2\hat{j} \end{aligned}$$

**Ans.**

**Example 13.** Prove that :

$$\vec{a} \times (\vec{b} \times \vec{c}) + \vec{b} \times (\vec{c} \times \vec{a}) + \vec{c} \times (\vec{a} \times \vec{b}) = 0 \quad (\text{Nagpur University, Winter 2008})$$

**Solution.** Here, we have

$$\begin{aligned} \vec{a} \times (\vec{b} \times \vec{c}) + \vec{b} \times (\vec{c} \times \vec{a}) + \vec{c} \times (\vec{a} \times \vec{b}) &= [(\vec{a} \cdot \vec{c}) \vec{b} - (\vec{a} \cdot \vec{b}) \vec{c}] + [(\vec{b} \cdot \vec{a}) \vec{c} - (\vec{b} \cdot \vec{c}) \vec{a}] + [(\vec{c} \cdot \vec{b}) \vec{a} - (\vec{c} \cdot \vec{a}) \vec{b}] \\ &= [(\vec{b} \cdot \vec{a}) \vec{c} - (\vec{a} \cdot \vec{b}) \vec{c}] + [(\vec{c} \cdot \vec{b}) \vec{a} - (\vec{b} \cdot \vec{c}) \vec{a}] + [(\vec{a} \cdot \vec{c}) \vec{b} - (\vec{c} \cdot \vec{a}) \vec{b}] \\ &= [(\vec{a} \cdot \vec{b}) \vec{c} - (\vec{a} \cdot \vec{b}) \vec{c}] + [(\vec{b} \cdot \vec{c}) \vec{a} - (\vec{b} \cdot \vec{c}) \vec{a}] + [(\vec{c} \cdot \vec{a}) \vec{b} - (\vec{c} \cdot \vec{a}) \vec{b}] \\ &= 0 + 0 + 0 = 0 \end{aligned}$$

**Proved.**

**Example 14.** Prove that :

$$\hat{i} \times (\vec{a} \times \hat{i}) + \hat{j} \times (\vec{a} \times \hat{j}) + \hat{k} \times (\vec{a} \times \hat{k}) = 2\vec{a} \quad (\text{Nagpur University, Winter 2003})$$

**Solution.** Let  $\vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}$

$$\text{Now, L.H.S.} = \hat{i} \times (\vec{a} \times \hat{i}) + \hat{j} \times (\vec{a} \times \hat{j}) + \hat{k} \times (\vec{a} \times \hat{k})$$

$$\begin{aligned}
&= \hat{i} \times \left[ (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times \hat{i} \right] + \hat{j} \times \left[ (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times \hat{j} \right] + \\
&\quad \hat{k} \times \left[ (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times \hat{k} \right] \\
&= \hat{i} \times \left[ a_1(\hat{i} \times \hat{i}) + a_2(\hat{j} \times \hat{i}) + a_3(\hat{k} \times \hat{i}) \right] + \hat{j} \times \left[ a_1(\hat{i} \times \hat{j}) + a_2(\hat{j} \times \hat{j}) + a_3(\hat{k} \times \hat{j}) \right] \\
&\quad + \hat{k} \times \left[ a_1(\hat{i} \times \hat{k}) + a_2(\hat{j} \times \hat{k}) + a_3(\hat{k} \times \hat{k}) \right] \\
&= \hat{i} \times \left[ 0 - a_2 \hat{k} + a_3 \hat{j} \right] + \hat{j} \times \left[ a_1 \hat{k} + 0 - a_3 \hat{i} \right] + \hat{k} \times \left[ -a_1 \hat{j} + a_2 \hat{i} + 0 \right] \\
&= -a_2(\hat{i} \times \hat{k}) + a_3(\hat{i} \times \hat{j}) + a_1(\hat{j} \times \hat{k}) - a_3(\hat{j} \times \hat{i}) - a_1(\hat{k} \times \hat{j}) + a_2(\hat{k} \times \hat{i}) \\
&= a_2 \hat{j} + a_3 \hat{k} + a_1 \hat{i} + a_3 \hat{k} + a_1 \hat{i} + a_2 \hat{j} = 2a_1 \hat{i} + 2a_2 \hat{j} + 2a_3 \hat{k} \\
&= 2(a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) = 2 \vec{a}
\end{aligned}$$

Proved.

**Example 15.** Show that for any scalar  $\lambda$ , the vectors  $\vec{x}, \vec{y}$  given by

$$\vec{x} = \lambda \vec{a} + \frac{q(\vec{a} \times \vec{b})}{a^2}, \quad \vec{y} = \frac{(1-p)\lambda}{q} \vec{a} - \frac{p(\vec{a} \times \vec{b})}{a^2}$$

$$p\vec{x} + q\vec{y} = \vec{a} \text{ and } \vec{x} \times \vec{y} = \vec{b}. \quad (\text{Nagpur University, Winter 2004})$$

**Solution.** The given equations are

$$p\vec{x} + q\vec{y} = \vec{a} \quad \dots(1)$$

$$\vec{x} \times \vec{y} = \vec{b} \quad \dots(2)$$

Multiplying equation (1) vectorially by  $\vec{x}$ , we get

$$\begin{aligned}
\vec{x} \times (p\vec{x} + q\vec{y}) &= \vec{x} \times \vec{a} \\
p(\vec{x} \times \vec{x}) + q(\vec{x} \times \vec{y}) &= \vec{x} \times \vec{a} \\
q \times (\vec{x} \times \vec{y}) &= \vec{x} \times \vec{a}, \quad \text{as } \vec{x} \times \vec{x} = 0 \\
\vec{x} \times \vec{a} &= \vec{q}\vec{b},
\end{aligned}$$

[From (2)  $\vec{x} \times \vec{y} = \vec{b}$ ] ... (3)

Multiplying (3) vectorially by  $\vec{a}$ , we have

$$\begin{aligned}
\vec{a} \times (\vec{x} \times \vec{a}) &= \vec{a} \times q \vec{b} \\
(\vec{a} \cdot \vec{a}) \vec{x} - (\vec{a} \cdot \vec{x}) \vec{a} &= q(\vec{a} \times \vec{b}) \\
a^2 \vec{x} - (\vec{a} \cdot \vec{x}) \vec{a} &= q(\vec{a} \times \vec{b}) \Rightarrow a^2 \vec{x} = (\vec{a} \cdot \vec{x}) \vec{a} + q(\vec{a} \times \vec{b}) \\
\vec{x} &= \frac{(\vec{a} \cdot \vec{x}) \vec{a}}{a^2} + \frac{q(\vec{a} \times \vec{b})}{a^2} \\
\vec{x} &= \lambda \vec{a} + \frac{q(\vec{a} \times \vec{b})}{a^2} \quad \text{where } \lambda = \frac{\vec{a} \cdot \vec{x}}{a^2}
\end{aligned}$$

Substituting the value of  $\vec{x}$  in (1), we get  $p \left\{ \lambda \vec{a} + \frac{q(\vec{a} \times \vec{b})}{a^2} \right\} + q \vec{y} = \vec{a}$

$$q \vec{y} = \vec{a} - p \left\{ \lambda \vec{a} + \frac{q(\vec{a} \times \vec{b})}{a^2} \right\}$$

$$\vec{y} = \frac{(1 - p\lambda)\vec{a}}{q} - \frac{p(\vec{a} \times \vec{b})}{a^2}$$

Ans.

**EXERCISE 22.3**1. Show that  $\vec{a} \times (\vec{b} \times \vec{a}) = (\vec{a} \times \vec{b}) \times \vec{a}$ 

2. Write the correct answer

(a)  $(\vec{A} \times \vec{B}) \times \vec{C}$  lies in the plane of(i)  $\vec{A}$  and  $\vec{B}$       (ii)  $\vec{B}$  and  $\vec{C}$       (iii)  $\vec{C}$  and  $\vec{A}$ 

Ans. (ii)

(b) The value of  $\vec{a} \cdot (\vec{b} + \vec{c}) \times (\vec{a} + \vec{b} + \vec{c})$  is(i) Zero      (ii)  $[\vec{a}, \vec{b}, \vec{c}] + [\vec{b}, \vec{c}, \vec{a}]$       (iii)  $[\vec{a}, \vec{b}, \vec{c}]$       (iv) None of these

Ans. (ii)

**22.20 SCALAR PRODUCT OF FOUR VECTORS**

Prove the identity

$$(\vec{a} \times \vec{b}) \cdot (\vec{c} \times \vec{d}) = (\vec{a} \cdot \vec{c})(\vec{b} \cdot \vec{d}) - (\vec{a} \cdot \vec{d})(\vec{b} \cdot \vec{c})$$

**Proof.**  $(\vec{a} \times \vec{b}) \cdot (\vec{c} \times \vec{d}) = (\vec{a} \times \vec{b}) \cdot \vec{r}$ 
 $= \vec{a} \cdot (\vec{b} \times \vec{r})$  dot and cross can be interchanged. Put  $\vec{c} \times \vec{d} = \vec{r}$ 

$= \vec{a} \cdot [\vec{b} \times (\vec{c} \times \vec{d})] = \vec{a} \cdot [(\vec{b} \cdot \vec{d}) \vec{c} - (\vec{b} \cdot \vec{c}) \vec{d}]$

$= (\vec{a} \cdot \vec{c})(\vec{b} \cdot \vec{d}) - (\vec{a} \cdot \vec{d})(\vec{b} \cdot \vec{c})$

$= \begin{vmatrix} \vec{a} \cdot \vec{c} & \vec{a} \cdot \vec{d} \\ \vec{b} \cdot \vec{c} & \vec{b} \cdot \vec{d} \end{vmatrix}$

Proved.

**EXERCISE 22.4**1. If  $\vec{a} = 2i + 3j - k$ ,  $\vec{b} = -i + 2j - 4k$ ,  $\vec{c} = i + j + k$ , find  $(\vec{a} \times \vec{b}) \cdot (\vec{a} \times \vec{c})$ .

Ans. -74

2. Prove that  $(\vec{a} \times \vec{b}) \cdot (\vec{a} \times \vec{c}) = a^2(\vec{b} \cdot \vec{c}) - (\vec{a} \cdot \vec{b})(\vec{a} \cdot \vec{c})$ .**22.21 VECTOR PRODUCT OF FOUR VECTORS**Let  $\vec{a}$ ,  $\vec{b}$ ,  $\vec{c}$  and  $\vec{d}$  be four vectors then their vector product is written as

$$(\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d})$$

Now,  $(\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d}) = \vec{r} \times (\vec{c} \times \vec{d})$  [Put  $\vec{a} \times \vec{b} = \vec{r}$ ]

$= (\vec{r} \cdot \vec{d}) \vec{c} - (\vec{r} \cdot \vec{c}) \vec{d}$

$= [(\vec{a} \times \vec{b}) \cdot \vec{d}] \vec{c} - [(\vec{a} \times \vec{b}) \cdot \vec{c}] \vec{d}$

$= [\vec{a} \vec{b} \vec{d}] \vec{c} - [\vec{a} \vec{b} \vec{c}] \vec{d}$

 $\therefore (\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d})$  lies in the plane of  $\vec{c}$  and  $\vec{d}$ . ... (1)Again,  $(\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d}) = (\vec{a} \times \vec{b}) \times \vec{s}$  [Put  $\vec{c} \times \vec{d} = \vec{s}$ ]

$= -\vec{s} \times (\vec{a} \times \vec{b}) = -(\vec{s} \cdot \vec{b}) \vec{a} + (\vec{s} \cdot \vec{a}) \vec{b}$

$= -[(\vec{c} \times \vec{d}) \cdot \vec{b}] \vec{a} + [(\vec{c} \times \vec{d}) \cdot \vec{a}] \vec{b} = -[(\vec{b} \vec{c} \vec{d}) \vec{a} + (\vec{a} \vec{c} \vec{d}) \vec{b}]$

$\therefore (\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d})$  lies in the plane of  $\vec{a}$  and  $\vec{b}$ . ... (2)

**Geometrical interpretation :** From (1) and (2) we conclude that  $(\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d})$  is a vector parallel to the line of intersection of the plane containing  $\vec{a}$ ,  $\vec{b}$  and plane containing  $\vec{c}$ ,  $\vec{d}$ .

**Example 16.** Show that

$$(\vec{B} \times \vec{C}) \times (\vec{A} \times \vec{D}) + (\vec{C} \times \vec{A}) \times (\vec{B} \times \vec{D}) + (\vec{A} \times \vec{B}) \times (\vec{C} \times \vec{D}) = -2(\vec{A} \vec{B} \vec{C} \vec{D})$$

$$\begin{aligned} \text{Solution. L.H.S.} &= (\vec{B} \times \vec{C}) \times (\vec{A} \times \vec{D}) + (\vec{C} \times \vec{A}) \times (\vec{B} \times \vec{D}) + (\vec{A} \times \vec{B}) \times (\vec{C} \times \vec{D}) \\ &= [(\vec{B} \vec{C} \vec{D}) \vec{A} - (\vec{B} \vec{C} \vec{A}) \vec{D}] + [(\vec{C} \vec{A} \vec{D}) \vec{B} - (\vec{C} \vec{A} \vec{B}) \vec{D}] + [(-\vec{B} \vec{C} \vec{D}) \vec{A} + (\vec{A} \vec{C} \vec{D}) \vec{B}] \\ &= (\vec{B} \vec{C} \vec{D}) \vec{A} - (\vec{B} \vec{C} \vec{D}) \vec{A} + (\vec{C} \vec{A} \vec{D}) \vec{B} + (\vec{A} \vec{C} \vec{D}) \vec{B} - (\vec{B} \vec{C} \vec{A}) \vec{D} - (\vec{C} \vec{A} \vec{B}) \vec{D} \\ &= -(\vec{A} \vec{C} \vec{D}) \vec{B} + (\vec{A} \vec{C} \vec{D}) \vec{B} - (\vec{A} \vec{B} \vec{C}) \vec{D} - (\vec{A} \vec{B} \vec{C}) \vec{D} \\ &= -2(\vec{A} \vec{B} \vec{C} \vec{D}) = \text{R.H.S.} \end{aligned}$$

Proved.

**Example 17.** Prove that

$$(\vec{a} \times \vec{b}) \cdot \left\{ (\vec{b} \times \vec{c}) \times (\vec{c} \times \vec{a}) \right\} = [\vec{a} \cdot (\vec{b} \times \vec{c})]^2 \quad (\text{Nagpur University, Summer 2003})$$

$$\text{Solution. L.H.S.} = (\vec{a} \times \vec{b}) \cdot \left\{ (\vec{b} \times \vec{c}) \times (\vec{c} \times \vec{a}) \right\} \quad \dots(1)$$

By applying the formula of vector triple product on  $(\vec{b} \times \vec{c}) \times (\vec{c} \times \vec{a})$  in (1), we get

$$\begin{aligned} \text{L.H.S.} &= (\vec{a} \times \vec{b}) \cdot \left[ \left\{ (\vec{b} \vec{c} \vec{a}) \vec{c} - (\vec{b} \vec{c} \vec{c}) \vec{a} \right\} \right] \\ &= (\vec{a} \times \vec{b}) \cdot [(\vec{a} \vec{b} \vec{c}) \vec{c} - 0 \vec{a}] = (\vec{a} \vec{b} \vec{c}) (\vec{a} \times \vec{b}) \cdot \vec{c} \\ &= [\vec{a} (\vec{b} \times \vec{c})] [\vec{a} \cdot (\vec{b} \times \vec{c})] = [\vec{a} \cdot (\vec{b} \times \vec{c})]^2 = \text{R.H.S.} \quad \text{Proved.} \end{aligned}$$

### EXERCISE 22.5

Show that:

1.  $(\vec{b} \times \vec{c}) \times (\vec{c} \times \vec{a}) = \vec{c} (\vec{a} \vec{b} \vec{c})$  when  $(\vec{a} \vec{b} \vec{c})$  stands for scalar triple product.
2.  $[\vec{b} \times \vec{c}, \vec{c} \times \vec{a}, \vec{a} \times \vec{b}] = [\vec{a} \vec{b} \vec{c}]^2$
3.  $\vec{d} [\vec{a} \times \{\vec{b} \times (\vec{c} \times \vec{d})\}] = [(\vec{b} \cdot \vec{d}) [\vec{a} \cdot (\vec{c} \times \vec{d})]]$
4.  $\vec{a} [\vec{a} \times [\vec{a} \times (\vec{a} \times \vec{b})]] = a^2 (\vec{b} \times \vec{a})$
5.  $[(\vec{a} \times \vec{b}) \times (\vec{a} \times \vec{c})] \cdot \vec{d} = (\vec{a} \cdot \vec{d}) [\vec{a} \vec{b} \vec{c}]$
6.  $2a^2 = \left| \vec{a} \times \hat{i} \right|^2 + \left| \vec{a} \times \hat{j} \right|^2 + \left| \vec{a} \times \hat{k} \right|^2$
7.  $\vec{a} \times \vec{b} = [(\hat{i} \times \vec{a}) \cdot \bar{b}] \hat{i} + [(\hat{j} \times \vec{a}) \cdot \bar{b}] \hat{j} + [(\hat{k} \times \vec{a}) \cdot \bar{b}] \hat{k}$
8.  $\vec{p} \times [(\vec{a} \times \vec{q}) \times (\vec{b} \times \vec{r})] + \vec{q} \times [(\vec{a} \times \vec{r}) \times (\vec{b} \times \vec{p})] + \vec{r} \times [(\vec{a} \times \vec{p}) \times (\vec{b} \times \vec{q})] = 0$

# CHAPTER

## DIFFERENTIATION OF VECTORS

**(POINT FUNCTION, GRADIENT, DIVERGENCE AND CURL OF A VECTOR AND THEIR PHYSICAL INTERPRETATIONS)**

---

---

### 23.1 VECTOR FUNCTION

If vector  $\vec{r}$  is a function of a scalar variable  $t$ , then we write

$$\vec{r} = \vec{r}(t)$$

If a particle is moving along a curved path then the position vector  $\vec{r}$  of the particle is a function of  $t$ . If the component of  $\vec{r}(t)$  along  $x$ -axis,  $y$ -axis,  $z$ -axis are  $f_1(t), f_2(t), f_3(t)$  respectively. Then,

$$\vec{r}(t) = f_1(t)\hat{i} + f_2(t)\hat{j} + f_3(t)\hat{k}$$

### 23.2 DIFFERENTIATION OF VECTORS

Let  $O$  be the origin and  $P$  be the position of a moving particle at time  $t$ .

Let  $\vec{OP} = \vec{r}$

Let  $Q$  be the position of the particle at the time  $t + \delta t$  and the position vector of  $Q$  is  $\vec{OQ} = \vec{r} + \delta \vec{r}$

$$\begin{aligned}\vec{PQ} &= \vec{OQ} - \vec{OP} \\ &= (\vec{r} + \delta \vec{r}) - \vec{r} = \delta \vec{r}\end{aligned}$$

$\frac{\delta \vec{r}}{\delta t}$  is a vector. As  $\delta t \rightarrow 0$ ,  $Q$  tends to  $P$  and the chord becomes the tangent at  $P$ .

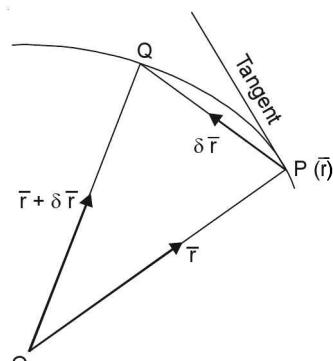

We define  $\frac{d \vec{r}}{dt} = \lim_{\delta t \rightarrow 0} \frac{\delta \vec{r}}{\delta t}$ , then

$\frac{d \vec{r}}{dt}$  is a vector in the direction of the tangent at  $P$ .

$\frac{d \vec{r}}{dt}$  is also called the differential coefficient of  $\vec{r}$  with respect to ' $t$ '.

Similarly,  $\frac{d^2 \vec{r}}{dt^2}$  is the second order derivative of  $\vec{r}$ .

$\frac{d \vec{r}}{dt}$  gives the velocity of the particle at  $P$ , which is along the tangent to its path. Also  $\frac{d^2 \vec{r}}{dt^2}$  gives the acceleration of the particle at  $P$ .

### 23.3 FORMULAE OF DIFFERENTIATION

$$(i) \frac{d}{dt}(\vec{F} + \vec{G}) = \frac{d\vec{F}}{dt} + \frac{d\vec{G}}{dt} \quad (ii) \frac{d}{dt}(\vec{F}\phi) = \frac{d\vec{F}}{dt}\phi + \vec{F}\frac{d\phi}{dt} \quad (\text{U.P. I semester, Dec. 2005})$$

$$(iii) \frac{d}{dt}(\vec{F} \cdot \vec{G}) = \vec{F} \cdot \frac{d\vec{G}}{dt} + \frac{d\vec{F}}{dt} \cdot \vec{G} \quad (iv) \frac{d}{dt}(\vec{F} \times \vec{G}) = \vec{F} \times \frac{d\vec{G}}{dt} + \frac{d\vec{F}}{dt} \times \vec{G}$$

$$(v) \frac{d}{dt}[\vec{a} \cdot \vec{b} \cdot \vec{c}] = \left[ \frac{d\vec{a}}{dt} \cdot \vec{b} \cdot \vec{c} \right] + \left[ \vec{a} \cdot \frac{d\vec{b}}{dt} \cdot \vec{c} \right] + \left[ \vec{a} \cdot \vec{b} \cdot \frac{d\vec{c}}{dt} \right]$$

$$(vi) \frac{d}{dt}[\vec{a} \times (\vec{b} \times \vec{c})] = \frac{d\vec{a}}{dt} \times (\vec{b} \times \vec{c}) + \vec{a} \times \left( \frac{d\vec{b}}{dt} \times \vec{c} \right) + \vec{a} \times \left( \vec{b} \times \frac{d\vec{c}}{dt} \right)$$

The order of the functions  $\vec{F}, \vec{G}$  is not to be changed.

**Example 1.** A particle moves along the curve  $\vec{r} = (t^3 - 4t)\hat{i} + (t^2 + 4t)\hat{j} + (8t^2 - 3t^3)\hat{k}$ , where

t is the time. Find the magnitude of the tangential components of its acceleration at  $t = 2$ .

(Nagpur University, Summer 2005)

**Solution.** We have,  $\vec{r} = (t^3 - 4t)\hat{i} + (t^2 + 4t)\hat{j} + (8t^2 - 3t^3)\hat{k}$

$$\text{Velocity} = \frac{d\vec{r}}{dt} = (3t^2 - 4)\hat{i} + (2t + 4)\hat{j} + (16t - 9t^2)\hat{k}$$

At

$$t = 2, \quad \text{Velocity} = 8\hat{i} + 8\hat{j} - 4\hat{k}$$

$$\text{Acceleration} = \vec{a} = \frac{d^2\vec{r}}{dt^2} = 6t\hat{i} + 2\hat{j} + (16 - 18t)\hat{k}$$

At

$$t = 2 \quad \vec{a} = 12\hat{i} + 2\hat{j} - 20\hat{k}$$

The direction of velocity is along tangent.

So the tangent vector is velocity.

$$\text{Unit tangent vector}, \quad \hat{T} = \frac{\vec{v}}{|v|} = \frac{8\hat{i} + 8\hat{j} - 4\hat{k}}{\sqrt{64 + 64 + 16}} = \frac{8\hat{i} + 8\hat{j} - 4\hat{k}}{12} = \frac{2\hat{i} + 2\hat{j} - \hat{k}}{3}$$

Tangential component of acceleration,  $a_t = \vec{a} \cdot \hat{T}$

$$= (12\hat{i} + 2\hat{j} - 20\hat{k}) \cdot \frac{2\hat{i} + 2\hat{j} - \hat{k}}{3} = \frac{24 + 4 + 20}{3} = \frac{48}{3} = 16 \text{ Ans.}$$

**Example 2.** At any point of the curve  $x = 3 \cos t$ ,  $y = 3 \sin t$ ,  $z = 4t$ , find

(i) Tangent vector    (ii) Unit tangent vector    (R.G.P.V., Bhopal, II Semester June 2007)

**Solution.** We have,  $x = 3 \cos t$ ,  $y = 3 \sin t$ ,  $z = 4t$

$$\vec{r} = x\hat{i} + y\hat{j} + z\hat{k} \Rightarrow \vec{r} = (3 \cos t)\hat{i} + (3 \sin t)\hat{j} + (4t)\hat{k}$$

$$(i) \quad \frac{d\vec{r}}{dt} = (-3 \sin t)\hat{i} + (3 \cos t)\hat{j} + 4\hat{k}$$

which is the required tangent vector.

$$\text{Magnitude of tangent vector} = \sqrt{(-3 \sin t)^2 + (3 \cos t)^2 + (4)^2} = 5.$$

$$(ii) \quad \text{Unit tangent vector} = \frac{1}{5}(-3 \sin t\hat{i} + 3 \cos t\hat{j} + 4\hat{k})$$

**Ans.**

**Example 3.** Show that  $\frac{d}{dt} \left[ \vec{u} \frac{d\vec{u}}{dt} \frac{d^2\vec{u}}{dt^2} \right] = \left[ \vec{u} \frac{d\vec{u}}{dt} \frac{d^3\vec{u}}{dt^3} \right]$

**Solution.** We know that  $\frac{d}{dt}(x y z) = \frac{dx}{dt}yz + x\frac{dy}{dt}z + xy\frac{dz}{dt}$

$$\begin{aligned} \frac{d}{dt} \left[ \vec{u} \frac{d\vec{u}}{dt} \frac{d^2\vec{u}}{dt^2} \right] &= \left[ \frac{d\vec{u}}{dt} \frac{d\vec{u}}{dt} \frac{d^2\vec{u}}{dt} \right] + \left[ \vec{u} \frac{d^2\vec{u}}{dt^2} \frac{d^2\vec{u}}{dt^2} \right] + \left[ \vec{u} \frac{d\vec{u}}{dt} \frac{d^3\vec{u}}{dt^3} \right] \\ &= 0 + 0 + \left[ \vec{u} \frac{d\vec{u}}{dt} \frac{d^3\vec{u}}{dt^3} \right] = \left[ \vec{u} \frac{d\vec{u}}{dt} \frac{d^3\vec{u}}{dt^3} \right] \quad \text{Proved.} \end{aligned}$$

**Example 4.** If  $\frac{d\vec{a}}{dt} = \vec{u} \times \vec{a}$  and  $\frac{d\vec{b}}{dt} = \vec{u} \times \vec{b}$  then prove that  $\frac{d}{dt}[\vec{a} \times \vec{b}] = \vec{u} \times (\vec{a} \times \vec{b})$

(M.U. 2009)

**Solution.** We have,

$$\begin{aligned} \frac{d}{dt}[\vec{a} \times \vec{b}] &= \vec{a} \times \frac{d\vec{b}}{dt} + \frac{d\vec{a}}{dt} \times \vec{b} = \vec{a} \times (\vec{u} \times \vec{b}) + (\vec{u} \times \vec{a}) \times \vec{b} \\ &= \vec{a} \times (\vec{u} \times \vec{b}) - \vec{b} \times (\vec{u} \times \vec{a}) \\ &= (\vec{a} \cdot \vec{b}) \vec{u} - (\vec{a} \cdot \vec{u}) \vec{b} - [(\vec{b} \cdot \vec{a}) \vec{u} - (\vec{b} \cdot \vec{u}) \vec{a}] \\ &\quad \text{(Vector triple product)} \\ &= (\vec{a} \cdot \vec{b}) \vec{u} - (\vec{u} \cdot \vec{a}) \vec{b} - (\vec{a} \cdot \vec{b}) \vec{u} + (\vec{u} \cdot \vec{b}) \vec{a} \\ &= (\vec{u} \cdot \vec{b}) \vec{a} - (\vec{u} \cdot \vec{a}) \vec{b} \\ &= \vec{u} \times (\vec{a} \times \vec{b}) \quad \text{Proved.} \end{aligned}$$

**Example 5.** Find the angle between the surface  $x^2 + y^2 + z^2 = 9$  and  $z = x^2 + y^2 - 3$  at  $(2, -1, 2)$ .  
(M.D.U. Dec. 2009)

**Solution.** Here, we have

$$x^2 + y^2 + z^2 = 9 \quad \dots(1)$$

$$z = x^2 + y^2 - 3 \quad \dots(2)$$

Normal to (1)  $\eta_1 = \nabla(x^2 + y^2 + z^2 - 9)$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 9) = 2x\hat{i} + 2y\hat{j} + 2z\hat{k} \quad \dots(3)$$

Normal to (1) at  $(2, -1, 2)$ ,  $\eta_1 = 4\hat{i} - 2\hat{j} + 4\hat{k}$

Normal to (2),  $\eta_2 = \nabla(z - x^2 - y^2 + 3)$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (z - x^2 - y^2 + 3) = -2x\hat{i} - 2y\hat{j} + \hat{k}$$

Normal to (2) at  $(2, -1, 2)$ ,  $\eta_2 = -4\hat{i} + 2\hat{j} + \hat{k}$

... (4)

$$\eta_1 \cdot \eta_2 = |\eta_1| |\eta_2| \cos \theta$$

$$\begin{aligned} \cos \theta &= \frac{\eta_1 \cdot \eta_2}{|\eta_1| |\eta_2|} = \frac{(4\hat{i} - 2\hat{j} + 4\hat{k}) \cdot (-4\hat{i} + 2\hat{j} + \hat{k})}{|4\hat{i} - 2\hat{j} + 4\hat{k}| |-4\hat{i} + 2\hat{j} + \hat{k}|} = \frac{-16 - 4 + 4}{\sqrt{16 + 4 + 16} \sqrt{16 + 4 + 1}} \\ &= \frac{-16}{6\sqrt{21}} = \frac{-8}{3\sqrt{21}} \end{aligned}$$

$$\theta = \cos^{-1} \left( \frac{-8}{3\sqrt{21}} \right)$$

Hence the angle between (1) and (2)  $\cos^{-1} \left( \frac{-8}{3\sqrt{21}} \right)$  Ans

### EXERCISE 23.1

1. The coordinates of a moving particle are given by  $x = 4t - \frac{t^2}{2}$  and  $y = 3 + 6t - \frac{t^3}{6}$ . Find the velocity and acceleration of the particle when  $t = 2$  secs. Ans. 4.47, 2.24

2. A particle moves along the curve

$x = 2t^2$ ,  $y = t^2 - 4t$  and  $z = 3t - 5$   
where  $t$  is the time. Find the components of its velocity and acceleration at time  $t = 1$ , in the direction  $\hat{i} - 3\hat{j} + 2\hat{k}$ . (Nagpur, Summer 2001) Ans.  $\frac{8\sqrt{14}}{7}, -\frac{\sqrt{14}}{7}$

3. Find the unit tangent and unit normal vector at  $t = 2$  on the curve  $x = t^2 - 1$ ,  $y = 4t - 3$ ,  $z = 2t^2 - 6t$  where  $t$  is any variable. Ans.  $\frac{1}{3}(2\hat{i} + 2\hat{j} + \hat{k})$ ,  $\frac{1}{3\sqrt{5}}(2\hat{i} + 2\hat{k})$

4. Prove that  $\frac{d}{dt}(\vec{F} \times \vec{G}) = \vec{F} \times \frac{d\vec{G}}{dt} + \frac{d\vec{F}}{dt} \times \vec{G}$

5. Find the angle between the tangents to the curve  $\vec{r} = t^2\hat{i} + 2t\hat{j} - t^3\hat{k}$ , at the points  $t = \pm 1$ .

$$\text{Ans. } \cos^{-1} \left( \frac{9}{17} \right)$$

6. If the surface  $5x^2 - 2byz = 9x$  be orthogonal to the surface  $4x^2y + z^3 = 4$  at the point  $(1, -1, 2)$  then  $b$  is equal to

- (a) 0      (b) 1      (c) 2      (d) 3      (AMIETE, Dec. 2009) Ans. (b)

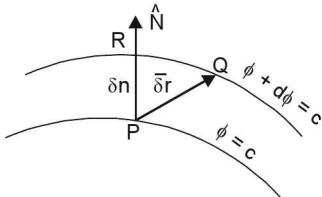

### 23.4 SCALAR AND VECTOR POINT FUNCTIONS

**Point function.** A variable quantity whose value at any point in a region of space depends upon the position of the point, is called a *point function*. There are two types of point functions.

(i) **Scalar point function.** If to each point  $P(x, y, z)$  of a region  $R$  in space there corresponds a unique scalar  $f(P)$ , then  $f$  is called a scalar point function. *For example*, the temperature distribution in a heated body, density of a body and potential due to gravity are the examples of a scalar point function.

(ii) **Vector point function.** If to each point  $P(x, y, z)$  of a region  $R$  in space there corresponds a unique vector  $f(P)$ , then  $f$  is called a *vector point function*. The velocity of a moving fluid, gravitational force are the examples of vector point function.

*(U.P., I Semester, Winter 2000)*

#### Vector Differential Operator Del i.e. $\nabla$

The vector differential operator Del is denoted by  $\nabla$ . It is defined as

$$\nabla = \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z}$$

### 23.5 GRADIENT OF A SCALAR FUNCTION

If  $\phi(x, y, z)$  be a scalar function then  $\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z}$  is called the gradient of the scalar function  $\phi$ .

And is denoted by  $\text{grad } \phi$ .

$$\text{Thus, } \text{grad } \phi = \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z}$$

$$\begin{aligned}\text{grad } \phi &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi(x, y, z) \\ \text{grad } \phi &= \nabla \phi \quad (\nabla \text{ is read del or nebla})\end{aligned}$$

### 23.6 GEOMETRICAL MEANING OF GRADIENT, NORMAL

(U.P. Ist Semester, Dec 2006)

If a surface  $\phi(x, y, z) = c$  passes through a point  $P$ . The value of the function at each point on the surface is the same as at  $P$ . Then such a surface is called a *level surface* through  $P$ . For example, If  $\phi(x, y, z)$  represents potential at the point  $P$ , then *equipotential surface*  $\phi(x, y, z) = c$  is a *level surface*.

Two level surfaces can not intersect.

Let the level surface pass through the point  $P$  at which the value of the function is  $\phi$ . Consider another level surface passing through  $Q$ , where the value of the function is  $\phi + d\phi$ .

Let  $\vec{r}$  and  $\vec{r} + \delta\vec{r}$  be the position vector of  $P$  and  $Q$  then  $\vec{PQ} = \delta\vec{r}$

$$\begin{aligned}\nabla\phi \cdot d\vec{r} &= \left( \hat{i} \frac{\partial\phi}{\partial x} + \hat{j} \frac{\partial\phi}{\partial y} + \hat{k} \frac{\partial\phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= \frac{\partial\phi}{\partial x} dx + \frac{\partial\phi}{\partial y} dy + \frac{\partial\phi}{\partial z} dz = d\phi\end{aligned} \quad \dots(1)$$

If  $Q$  lies on the level surface of  $P$ , then  $d\phi = 0$

Equation (1) becomes  $\nabla\phi \cdot dr = 0$ . Then  $\nabla\phi$  is  $\perp$  to  $dr$  (tangent).

Hence,  $\nabla\phi$  is **normal** to the surface  $\phi(x, y, z) = c$

Let  $\nabla\phi = |\nabla\phi| \hat{N}$ , where  $\hat{N}$  is a unit normal vector. Let  $\delta n$  be the perpendicular distance between two level surfaces through  $P$  and  $R$ . Then the rate of change of  $\phi$  in the direction of the

normal to the surface through  $P$  is  $\frac{\partial\phi}{\partial n}$ .

$$\begin{aligned}\frac{d\phi}{dn} &= \lim_{\delta n \rightarrow 0} \frac{\delta\phi}{\delta n} = \lim_{\delta n \rightarrow 0} \frac{\nabla\phi \cdot d\vec{r}}{\delta n} \\ &= \lim_{\delta n \rightarrow 0} \frac{|\nabla\phi| \hat{N} \cdot d\vec{r}}{\delta n} \\ &= \lim_{\delta n \rightarrow 0} \frac{|\nabla\phi| \delta n}{\delta n} = |\nabla\phi| \\ \therefore \quad |\nabla\phi| &= \frac{\partial\phi}{\partial n}\end{aligned}$$

$$\left. \begin{aligned} \hat{N} \cdot \vec{dr} &= |\hat{N}| |\vec{dr}| \cos \theta \\ &= |\vec{dr}| \cos \theta = \delta n \end{aligned} \right\}$$

Hence, gradient  $\phi$  is a vector normal to the surface  $\phi = c$  and has a magnitude equal to the rate of change of  $\phi$  along this normal.

### 23.7 NORMAL AND DIRECTIONAL DERIVATIVE

(i) **Normal.** If  $\phi(x, y, z) = c$  represents a family of surfaces for different values of the constant  $c$ . On differentiating  $\phi$ , we get  $d\phi = 0$

But  $d\phi = \nabla\phi \cdot d\vec{r}$  so  $\nabla\phi \cdot d\vec{r} = 0$

The scalar product of two vectors  $\nabla\phi$  and  $d\vec{r}$  being zero,  $\nabla\phi$  and  $d\vec{r}$  are perpendicular to each other.  $d\vec{r}$  is in the direction of tangent to the given surface.

Thus  $\nabla\phi$  is a vector *normal* to the surface  $\phi(x, y, z) = c$ .

(ii) **Directional derivative.** The component of  $\nabla\phi$  in the direction of a vector  $\vec{d}$  is equal to  $\nabla\phi \cdot \hat{d}$  and is called the directional derivative of  $\phi$  in the direction of  $\vec{d}$ .

$$\frac{\partial\phi}{\partial r} = \lim_{\delta r \rightarrow 0} \frac{\delta\phi}{\delta r} \quad \text{where, } \delta r = PQ$$

$\frac{\partial\phi}{\partial r}$  is called the *directional derivative* of  $\phi$  at  $P$  in the direction of  $PQ$ .

Let a unit vector along  $PQ$  be  $\hat{N}'$ .

$$\frac{\delta n}{\delta r} = \cos \theta \Rightarrow \delta r = \frac{\delta n}{\cos \theta} = \frac{\delta n}{\hat{N} \cdot \hat{N}'} \quad \dots(1)$$

$$\begin{aligned} \text{Now } \frac{\partial\phi}{\partial r} &= \lim_{\delta r \rightarrow 0} \left[ \frac{\frac{\delta\phi}{\delta n}}{\frac{\delta n}{\hat{N} \cdot \hat{N}'}} \right] = \hat{N} \cdot \hat{N}' \frac{\partial\phi}{\partial n} && \left[ \text{From (1), } \delta r = \frac{\delta n}{\hat{N} \cdot \hat{N}'} \right] \\ &= \hat{N}' \cdot \hat{N} |\nabla\phi| = \hat{N}' \cdot \nabla\phi && (\because \hat{N} |\nabla\phi| = \nabla\phi) \end{aligned}$$

Hence,  $\frac{\partial\phi}{\partial r}$ , directional derivative is the component of  $\nabla\phi$  in the direction  $\hat{N}'$ .

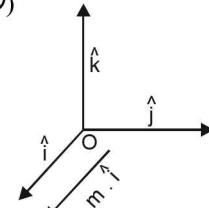

$$\frac{\partial\phi}{\partial r} = \hat{N}' \cdot \nabla\phi = |\nabla\phi| \cos \theta \leq |\nabla\phi|$$

Hence,  $\nabla\phi$  is the maximum rate of change of  $\phi$ .

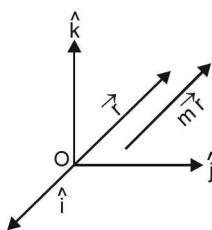

**Example 6.** For the vector field (i)  $\vec{A} = m\hat{i}$  and (ii)  $\vec{A} = m\vec{r}$ . Find  $\nabla \cdot \vec{A}$  and  $\nabla \times \vec{A}$ .

Draw the sketch in each case. (Gujarat, I Semester, Jan. 2009)

**Solution.** (i) Vector  $\vec{A} = m\hat{i}$  is represented in the figure.

(ii)  $\vec{A} = m\vec{r}$  is represented in the figure.

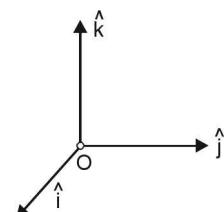

$$(iii) \nabla \cdot \vec{A} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x\hat{i} + y\hat{j} + z\hat{k}) = 1 + 1 + 1 = 3$$

Number line  
0 1 2 3

$\nabla \cdot \vec{A} = 3$  is represented on the number line at 3.

$$(iv) \nabla \times \vec{A} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (x\hat{i} + y\hat{j} + z\hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x & y & z \end{vmatrix} = 0$$

are represented in the adjoining figure.

**Example 7.** If  $\phi = 3x^2y - y^3z^2$ ; find grad  $\phi$  at the point  $(1, -2, -1)$ .

(AMIETE, June 2009, U.P., I Semester, Dec. 2006)

**Solution.**  $\text{grad } \phi = \nabla\phi$

$$\begin{aligned} &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (3x^2y - y^3z^2) \\ &= \hat{i} \frac{\partial}{\partial x} (3x^2y - y^3z^2) + \hat{j} \frac{\partial}{\partial y} (3x^2y - y^3z^2) + \hat{k} \frac{\partial}{\partial z} (3x^2y - y^3z^2) \\ &= \hat{i} (6xy) + \hat{j} (3x^2 - 3y^2z^2) + \hat{k} (-2y^3z) \end{aligned}$$

$$\begin{aligned} \text{grad } \phi \text{ at } (1, -2, -1) &= \hat{i} (6)(1)(-2) + \hat{j} [(3)(1) - 3(4)(1)] + \hat{k} (-2)(-8)(-1) \\ &= -12\hat{i} - 9\hat{j} - 16\hat{k} \end{aligned}$$

**Ans.**

**Example 8.** If  $u = x + y + z$ ,  $v = x^2 + y^2 + z^2$ ,  $w = yz + zx + xy$  prove that grad  $u$ , grad  $v$  and grad  $w$  are coplanar vectors. [U.P., I Semester, 2001]

**Solution.** We have,

$$\begin{aligned} \text{grad } u &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x + y + z) = \hat{i} + \hat{j} + \hat{k} \\ \text{grad } v &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2) = 2x\hat{i} + 2y\hat{j} + 2z\hat{k} \\ \text{grad } w &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (yz + zx + xy) = \hat{i}(z + y) + \hat{j}(z + x) + \hat{k}(y + x) \end{aligned}$$

[For vectors to be coplanar, their scalar triple product is 0]

$$\begin{aligned} \text{Now, grad } u \cdot (\text{grad } v \times \text{grad } w) &= \begin{vmatrix} 1 & 1 & 1 \\ 2x & 2y & 2z \\ z+y & z+x & y+x \end{vmatrix} = 2 \begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ z+y & z+x & y+x \end{vmatrix} \\ &= 2 \begin{vmatrix} 1 & 1 & 1 \\ x+y+z & x+y+z & x+y+z \\ z+y & z+x & y+x \end{vmatrix} \quad [\text{Applying } R_2 \rightarrow R_2 + R_3] \\ &= 2(x+y+z) \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ y+z & z+x & x+y \end{vmatrix} = 0 \end{aligned}$$

Since the scalar product of grad  $u$ , grad  $v$  and grad  $w$  are zero, hence these vectors are coplanar vectors. **Proved.**

**Example 9.** Find the directional derivative of  $x^2y^2z^2$  at the point  $(1, 1, -1)$  in the direction of the tangent to the curve  $x = e^t$ ,  $y = \sin 2t + 1$ ,  $z = 1 - \cos t$  at  $t = 0$ .

(Nagpur University, Summer 2005)

**Solution.** Let  $\phi = x^2 y^2 z^2$

Directional Derivative of  $\phi$

$$= \nabla\phi = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 y^2 z^2)$$

$$\nabla\phi = 2xy^2z^2\hat{i} + 2yx^2z^2\hat{j} + 2zx^2y^2\hat{k}$$

Directional Derivative of  $\phi$  at  $(1, 1, -1)$

$$= 2(1)(1)^2(-1)^2\hat{i} + 2(1)(1)^2(-1)^2\hat{j} + 2(-1)(1)^2(1)^2\hat{k}$$

$$\begin{aligned}
 &= 2\hat{i} + 2\hat{j} - 2\hat{k} \\
 \vec{r} &= x\hat{i} + y\hat{j} + z\hat{k} = e^t\hat{i} + (\sin 2t + 1)\hat{j} + (1 - \cos t)\hat{k} \\
 \text{Tangent vector, } \vec{T} &= \frac{d\vec{r}}{dt} = e^t\hat{i} + 2\cos 2t\hat{j} + \sin t\hat{k}
 \end{aligned} \tag{1}$$

$$\text{Tangent(at } t = 0) = e^0\hat{i} + 2(\cos 0)\hat{j} + (\sin 0)\hat{k} = \hat{i} + 2\hat{j} \tag{2}$$

$$\begin{aligned}
 \text{Required directional derivative along tangent} &= (2\hat{i} + 2\hat{j} - 2\hat{k}) \frac{(\hat{i} + 2\hat{j})}{\sqrt{1+4}} \\
 &\quad [\text{From (1), (2)}]
 \end{aligned}$$

$$= \frac{2+4+0}{\sqrt{5}} = \frac{6}{\sqrt{5}} \tag{Ans.}$$

**Example 10.** Find the unit normal to the surface  $xy^3z^2 = 4$  at  $(-1, -1, 2)$ . (M.U. 2008)

**Solution.** Let  $\phi(x, y, z) = xy^3z^2 - 4$

We know that  $\nabla\phi$  is the vector normal to the surface  $\phi(x, y, z) = c$ .

$$\begin{aligned}
 \text{Normal vector} &= \nabla\phi = \hat{i}\frac{\partial\phi}{\partial x} + \hat{j}\frac{\partial\phi}{\partial y} + \hat{k}\frac{\partial\phi}{\partial z} \\
 \text{Now} &= \hat{i}\frac{\partial}{\partial x}(xy^3z^2) + \hat{j}\frac{\partial}{\partial y}(xy^3z^2) + \hat{k}\frac{\partial}{\partial z}(xy^3z^2)
 \end{aligned}$$

$$\Rightarrow \text{Normal vector} = y^3z^2\hat{i} + 3xy^2z^2\hat{j} + 2xy^3z\hat{k}$$

$$\text{Normal vector at } (-1, -1, 2) = -4\hat{i} - 12\hat{j} + 4\hat{k}$$

Unit vector normal to the surface at  $(-1, -1, 2)$ .

$$= \frac{\nabla\phi}{|\nabla\phi|} = \frac{-4\hat{i} - 12\hat{j} + 4\hat{k}}{\sqrt{16+144+16}} = -\frac{1}{\sqrt{11}}(\hat{i} + 3\hat{j} - \hat{k}) \tag{Ans.}$$

**Example 11.** Find the rate of change of  $\phi = xyz$  in the direction normal to the surface  $x^2y + y^2x + yz^2 = 3$  at the point  $(1, 1, 1)$ . (Nagpur University, Summer 2001)

**Solution.** Rate of change of  $\phi = \Delta\phi$

$$= \left( \hat{i}\frac{\partial}{\partial x} + \hat{j}\frac{\partial}{\partial y} + \hat{k}\frac{\partial}{\partial z} \right)(xyz) = \hat{i}yz + \hat{j}xz + \hat{k}xy$$

$$\text{Rate of change of } \phi \text{ at } (1, 1, 1) = (\hat{i} + \hat{j} + \hat{k})$$

Normal to the surface  $\Psi = x^2y + y^2x + yz^2 - 3$  is given as -

$$\begin{aligned}
 \nabla\Psi &= \left( \hat{i}\frac{\partial}{\partial x} + \hat{j}\frac{\partial}{\partial y} + \hat{k}\frac{\partial}{\partial z} \right)(x^2y + y^2x + yz^2 - 3) \\
 &= \hat{i}(2xy + y^2) + \hat{j}(x^2 + 2xy + z^2) + \hat{k}2yz \\
 (\nabla\Psi)_{(1, 1, 1)} &= 3\hat{i} + 4\hat{j} + 2\hat{k} \\
 \text{Unit normal} &= \frac{3\hat{i} + 4\hat{j} + 2\hat{k}}{\sqrt{9+16+4}}
 \end{aligned}$$

$$\text{Required rate of change of } \phi = (\hat{i} + \hat{j} + \hat{k}) \cdot \frac{(3\hat{i} + 4\hat{j} + 2\hat{k})}{\sqrt{9+16+4}} = \frac{3+4+2}{\sqrt{29}} = \frac{9}{\sqrt{29}} \tag{Ans.}$$

**Example 12.** Find the constants  $m$  and  $n$  such that the surface  $mx^2 - 2nyz = (m + 4)x$  will be orthogonal to the surface  $4x^2y + z^3 = 4$  at the point  $(1, -1, 2)$ .

(M.D.U. Dec. 2009, Nagpur University, Summer 2002)

**Solution.** The point  $P(1, -1, 2)$  lies on both surfaces. As this point lies in

$$mx^2 - 2nyz = (m + 4)x, \text{ so we have}$$

$$m - 2n(-2) = (m + 4)$$

$$\Rightarrow m + 4n = m + 4 \Rightarrow n = 1$$

$$\therefore \text{Let } \phi_1 = mx^2 - 2yz - (m + 4)x \text{ and } \phi_2 = 4x^2y + z^3 - 4$$

$$\text{Normal to } \phi_1 = \nabla \phi_1$$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) [mx^2 - 2yz - (m + 4)x]$$

$$= \hat{i}(2mx - m - 4) - 2z\hat{j} - 2y\hat{k}$$

$$\text{Normal to } \phi_1 \text{ at } (1, -1, 2) = \hat{i}(2m - m - 4) - 4\hat{j} + 2\hat{k} = (m - 4)\hat{i} - 4\hat{j} + 2\hat{k}$$

$$\text{Normal to } \phi_2 = \nabla \phi_2$$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (4x^2y + z^3 - 4) = \hat{i}8xy + 4x^2\hat{j} + 3z^2\hat{k}$$

$$\text{Normal to } \phi_2 \text{ at } (1, -1, 2) = -8\hat{i} + 4\hat{j} + 12\hat{k}$$

Since  $\phi_1$  and  $\phi_2$  are orthogonal, then normals are perpendicular to each other.

$$\nabla \phi_1 \cdot \nabla \phi_2 = 0$$

$$\Rightarrow [(m - 4)\hat{i} - 4\hat{j} + 2\hat{k}] \cdot [-8\hat{i} + 4\hat{j} + 12\hat{k}] = 0$$

$$\Rightarrow -8(m - 4) - 16 + 24 = 0$$

$$\Rightarrow m - 4 = -2 + 3 \Rightarrow m = 5$$

Hence  $m = 5, n = 1$

Ans.

**Example 13.** Find the values of constants  $\lambda$  and  $\mu$  so that the surfaces  $\lambda x^2 - \mu yz = (\lambda + 2)x$ ,  $4x^2y + z^3 = 4$  intersect orthogonally at the point  $(1, -1, 2)$ .

(AMIETE, II Sem., Dec. 2010, June 2009)

**Solution.** Here, we have

$$\lambda x^2 - \mu yz = (\lambda + 2)x \quad \dots(1)$$

$$4x^2y + z^3 = 4 \quad \dots(2)$$

$$\text{Normal to the surface (1), } = \nabla [\lambda x^2 - \mu yz - (\lambda + 2)x]$$

$$= \left[ \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right] [\lambda x^2 - \mu yz - (\lambda + 2)x]$$

$$= \hat{i}(2\lambda x - \lambda - 2) + \hat{j}(-\mu z) + \hat{k}(-\mu y)$$

$$\text{Normal at } (1, -1, 2) = \hat{i}(2\lambda - \lambda - 2) - \hat{j}(-2\mu) + \hat{k}\mu \quad \dots(3)$$

$$= \hat{i}(\lambda - 2) + \hat{j}(2\mu) + \hat{k}\mu$$

Normal at the surface (2)

$$= \left[ \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right] (4x^2y + z^3 - 4)$$

$$= \hat{i}(8xy) + \hat{j}(4x^2) + \hat{k}(3z^2)$$

$$\text{Normal at the point } (1, -1, 2) = -8\hat{i} + 4\hat{j} + 12\hat{k} \quad \dots(4)$$

Since (3) and (4) are orthogonal so

$$\begin{aligned} & [\hat{i}(\lambda - 2) + \hat{j}(2\mu) + \hat{k}\mu] \cdot [-8\hat{i} + 4\hat{j} + 12\hat{k}] = 0 \\ & -8(\lambda - 2) + 4(2\mu) + 12\mu = 0 \Rightarrow -8\lambda + 16 + 8\mu + 12\mu = 0 \\ & -8\lambda + 20\mu + 16 = 0 \Rightarrow 4(-2\lambda + 5\mu + 4) = 0 \\ & -2\lambda + 5\mu + 4 = 0 \Rightarrow 2\lambda - 5\mu = 4 \end{aligned} \quad \dots(5)$$

Point (1, -1, 2) will satisfy (1)

$$\therefore \lambda(1)^2 - \mu(-1)(2) = (\lambda + 2)(1) \Rightarrow \lambda + 2\mu = \lambda + 2 \Rightarrow \mu = 1$$

Putting  $\mu = 1$  in (5), we get

$$2\lambda - 5 = 4 \Rightarrow \lambda = \frac{9}{2}$$

Hence  $\lambda = \frac{9}{2}$  and  $\mu = 1$

**Ans.**

**Example 14.** Find the angle between the surfaces  $x^2 + y^2 + z^2 = 9$  and  $z = x^2 + y^2 - 3$  at the point (2, -1, 2). (Nagpur University, Summer 2002)

**Solution.** Normal on the surface ( $x^2 + y^2 + z^2 - 9 = 0$ )

$$\nabla\phi = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 9) = (2x\hat{i} + 2y\hat{j} + 2z\hat{k})$$

Normal at the point (2, -1, 2) =  $4\hat{i} - 2\hat{j} + 4\hat{k}$  ... (1)

$$\begin{aligned} \text{Normal on the surface } (z = x^2 + y^2 - 3) &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 - z - 3) \\ &= 2x\hat{i} + 2y\hat{j} - \hat{k} \end{aligned}$$

Normal at the point (2, -1, 2) =  $4\hat{i} - 2\hat{j} - \hat{k}$  ... (2)

Let  $\theta$  be the angle between normals (1) and (2).

$$\begin{aligned} (4\hat{i} - 2\hat{j} + 4\hat{k}) \cdot (4\hat{i} - 2\hat{j} - \hat{k}) &= \sqrt{16+4+16} \sqrt{16+4+1} \cos \theta \\ 16 + 4 - 4 &= 6\sqrt{21} \cos \theta \Rightarrow 16 = 6\sqrt{21} \cos \theta \end{aligned}$$

$$\Rightarrow \cos \theta = \frac{8}{3\sqrt{21}} \Rightarrow \theta = \cos^{-1} \frac{8}{3\sqrt{21}} \quad \text{Ans.}$$

**Example 15.** Find the directional derivative of  $\frac{1}{r}$  in the direction  $\bar{r}$  where  $\bar{r} = x\hat{i} + y\hat{j} + z\hat{k}$ . (Nagpur University, Summer 2004, U.P., I Semester, Winter 2005, 2002)

**Solution.** Here,  $\phi(x, y, z) = \frac{1}{r} = \frac{1}{\sqrt{x^2 + y^2 + z^2}} = (x^2 + y^2 + z^2)^{-\frac{1}{2}}$

$$\begin{aligned} \text{Now } \nabla\left(\frac{1}{r}\right) &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2)^{-\frac{1}{2}} \\ &= \frac{\partial}{\partial x} (x^2 + y^2 + z^2)^{-\frac{1}{2}} \hat{i} + \frac{\partial}{\partial y} (x^2 + y^2 + z^2)^{-\frac{1}{2}} \hat{j} + \frac{\partial}{\partial z} (x^2 + y^2 + z^2)^{-\frac{1}{2}} \hat{k} \\ &= \left\{ -\frac{1}{2} (x^2 + y^2 + z^2)^{-\frac{3}{2}} 2x \right\} \hat{i} + \left\{ -\frac{1}{2} (x^2 + y^2 + z^2)^{-\frac{3}{2}} 2y \right\} \hat{j} + \left\{ -\frac{1}{2} (x^2 + y^2 + z^2)^{-\frac{3}{2}} 2z \right\} \hat{k} \end{aligned}$$

$$= \frac{-(x\hat{i} + y\hat{j} + z\hat{k})}{(x^2 + y^2 + z^2)^{3/2}} \quad \dots(1)$$

and  $\hat{r}$  = unit vector in the direction of  $x\hat{i} + y\hat{j} + z\hat{k}$

$$= \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}} \quad \dots(2)$$

So, the required directional derivative

$$\begin{aligned} &= \nabla\phi \cdot \hat{r} = -\frac{x\hat{i} + y\hat{j} + z\hat{k}}{(x^2 + y^2 + z^2)^{3/2}} \cdot \frac{x\hat{i} + y\hat{j} + z\hat{k}}{(x^2 + y^2 + z^2)^{1/2}} = \frac{x^2 + y^2 + z^2}{(x^2 + y^2 + z^2)^2} \quad [\text{From (1), (2)}] \\ &= \frac{1}{x^2 + y^2 + z^2} = \frac{1}{r^2} \end{aligned}$$

**Ans.**

**Example 16.** Find the direction in which the directional derivative of  $\phi(x, y) = \frac{x^2 + y^2}{xy}$  at

(1, 1) is zero and hence find out component of velocity of the vector  $\bar{r} = (t^3 + 1)\hat{i} + t^2\hat{j}$  in the same direction at  $t = 1$ . *(Nagpur University, Winter 2000)*

$$\begin{aligned} \text{Solution. } \text{Directional derivative} &= \nabla\phi = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \left( \frac{x^2 + y^2}{xy} \right) \\ &= \hat{i} \left[ \frac{xy \cdot 2x - (x^2 + y^2)y}{x^2 y^2} \right] + \hat{j} \left[ \frac{xy \cdot 2y - x(y^2 + x^2)}{x^2 y^2} \right] \\ &= \hat{i} \left[ \frac{x^2 y - y^3}{x^2 y^2} \right] + \hat{j} \left[ \frac{xy^2 - x^3}{x^2 y^2} \right] \end{aligned}$$

Directional Derivative at (1, 1) =  $\hat{i} 0 + \hat{j} 0 = 0$

Since  $(\nabla\phi)_{(1, 1)} = 0$ , the directional derivative of  $\phi$  at (1, 1) is zero in any direction.

Again  $\bar{r} = (t^3 + 1)\hat{i} + t^2\hat{j}$

Velocity,  $\bar{v} = \frac{d\bar{r}}{dt} = 3t^2\hat{i} + 2t\hat{j}$

Velocity at  $t = 1$  is  $= 3\hat{i} + 2\hat{j}$

The component of velocity in the same direction of velocity

$$= (3\hat{i} + 2\hat{j}) \cdot \left( \frac{3\hat{i} + 2\hat{j}}{\sqrt{9+4}} \right) = \frac{9+4}{\sqrt{13}} = \sqrt{13}$$

**Ans.**

**Example 17.** Find the directional derivative of  $\phi(x, y, z) = x^2yz + 4xz^2$  at (1, -2, 1) in the direction of  $2\hat{i} - \hat{j} - 2\hat{k}$ . Find the greatest rate of increase of  $\phi$ .

*(Uttarakhand, I Semester, Dec. 2006)*

**Solution.** Here,  $\phi(x, y, z) = x^2yz + 4xz^2$

$$\text{Now, } \nabla\phi = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2yz + 4xz^2)$$

$$= (2xyz + 4z^2)\hat{i} + (x^2z)\hat{j} + (x^2y + 8xz)\hat{k}$$

$$\begin{aligned}\nabla\phi \text{ at } (1, -2, 1) &= \{2(1)(-2)(1) + 4(1)^2\} \hat{i} + (1 \times 1) \hat{j} + \{1(-2) + 8(1)(1)\} \hat{k} \\ &= (-4 + 4) \hat{i} + \hat{j} + (-2 + 8) \hat{k} = \hat{j} + 6 \hat{k}\end{aligned}$$

Let  $\hat{a} = \text{unit vector} = \frac{2\hat{i} - \hat{j} - 2\hat{k}}{\sqrt{4+1+4}} = \frac{1}{3}(2\hat{i} - \hat{j} - 2\hat{k})$

So, the required directional derivative at  $(1, -2, 1)$

$$= \nabla\phi \cdot \hat{a} = (\hat{j} + 6\hat{k}) \cdot \frac{1}{3}(2\hat{i} - \hat{j} - 2\hat{k}) = \frac{1}{3}(-1 - 12) = \frac{-13}{3}$$

$$\begin{aligned}\text{Greatest rate of increase of } \phi &= |\hat{j} + 6\hat{k}| = \sqrt{1+36} \\ &= \sqrt{37}\end{aligned}$$

**Ans.**

**Example 18.** Find the directional derivative of the function  $\phi = x^2 - y^2 + 2z^2$  at the point  $P(1, 2, 3)$  in the direction of the line  $PQ$  where  $Q$  is the point  $(5, 0, 4)$ .

(AMIETE, Dec. 2010, Nagpur University, Summer 2008, U.P., I Sem., Winter 2000)

**Solution.** Directional derivative =  $\bar{\nabla}\phi$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 - y^2 + 2z^2) = 2x \hat{i} - 2y \hat{j} + 4z \hat{k}$$

$$\text{Directional Derivative at the point } P(1, 2, 3) = 2\hat{i} - 4\hat{j} + 12\hat{k} \quad \dots(1)$$

$$\overline{PQ} = \overline{Q} - \overline{P} = (5, 0, 4) - (1, 2, 3) = (4, -2, 1) \quad \dots(2)$$

$$\text{Directional Derivative along } PQ = (2\hat{i} - 4\hat{j} + 12\hat{k}) \cdot \frac{(4\hat{i} - 2\hat{j} + \hat{k})}{\sqrt{16+4+1}} \quad [\text{From (1) and (2)}]$$

$$= \frac{8+8+12}{\sqrt{21}} = \frac{28}{\sqrt{21}} \quad \text{Ans.}$$

**Example 19.** Find the directional derivative of  $\phi = 4e^{2x-y+z}$  at the point  $(1, 1, -1)$  in the direction towards the point  $(-3, 5, 6)$ . (Nagpur University, Winter 2003, Summer 2000)

**Solution.** Directional derivative =  $\nabla\phi$

$$\begin{aligned}&= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) 4e^{2x-y+z} \\ &= 4[\hat{i} 2e^{2x-y+z} - \hat{j} e^{2x-y+z} + \hat{k} e^{2x-y+z}] = 4[2\hat{i} - \hat{j} + \hat{k}]e^{2x-y+z}\end{aligned}$$

Directional Derivative at  $(1, 1, -1)$

$$= 4[2\hat{i} - \hat{j} + \hat{k}]e^{2-1-1} = 4[2\hat{i} - \hat{j} + \hat{k}] \quad \dots(1)$$

Direction of Directional Derivative

$$= (-3\hat{i} + 5\hat{j} + 6\hat{k}) - (\hat{i} + \hat{j} - \hat{k}) = -4\hat{i} + 4\hat{j} + 7\hat{k} \quad \dots(2)$$

Directional Derivative in the direction of  $(-4\hat{i} + 4\hat{j} + 7\hat{k})$

$$\begin{aligned}&= \left| (8\hat{i} - 4\hat{j} + 4\hat{k}) \cdot \frac{(-4\hat{i} + 4\hat{j} + 7\hat{k})}{\sqrt{16+16+49}} \right| \quad [\text{From (1) and (2)}] \\ &= \left| \frac{1}{9} [-32 - 16 + 28] \right| = \left| \frac{20}{9} \right| = \frac{20}{9} \quad \text{Ans.}\end{aligned}$$

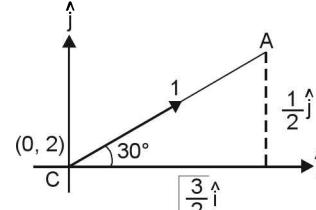

**Example 20.** For the function  $\phi(x, y) = \frac{x}{x^2 + y^2}$ , find the magnitude of the directional derivative along a line making an angle  $30^\circ$  with the positive x-axis at  $(0, 2)$ .  
 (A.M.I.E.T.E., Winter 2002)

**Solution.** Directional derivative =  $\vec{\nabla}\phi$

$$\begin{aligned} &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \frac{x}{x^2 + y^2} = \hat{i} \left( \frac{1}{x^2 + y^2} - \frac{x(2x)}{(x^2 + y^2)^2} \right) - \hat{j} \frac{x(2y)}{(x^2 + y^2)^2} \\ &= \hat{i} \frac{y^2 - x^2}{(x^2 + y^2)^2} - \hat{j} \frac{2xy}{(x^2 + y^2)^2} \end{aligned}$$

Directional derivative at the point  $(0, 2)$

$$= \hat{i} \frac{4-0}{(0+4)^2} - \hat{j} \frac{2(0)(2)}{(0+4)^2} = \frac{\hat{i}}{4}$$

Directional derivative at the point  $(0, 2)$  in the direction  $\vec{CA}$  i.e.  $\left( \frac{\sqrt{3}}{2} \hat{i} + \frac{1}{2} \hat{j} \right)$

$$\begin{aligned} &= \frac{\hat{i}}{4} \cdot \left( \frac{\sqrt{3}}{2} \hat{i} + \frac{1}{2} \hat{j} \right) \quad \left\{ \begin{aligned} \vec{CA} &= \vec{OB} + \vec{BA} = \hat{i} \cos 30^\circ + \hat{j} \sin 30^\circ \\ &= \left( \frac{\sqrt{3}}{2} \hat{i} + \frac{1}{2} \hat{j} \right) \end{aligned} \right\} \\ &= \frac{\sqrt{3}}{8} \end{aligned}$$

Ans.

**Example 21.** Find the directional derivative of  $\vec{V}^2$ , where  $\vec{V} = xy^2 \hat{i} + zy^2 \hat{j} + xz^2 \hat{k}$ , at the point  $(2, 0, 3)$  in the direction of the outward normal to the sphere  $x^2 + y^2 + z^2 = 14$  at the point  $(3, 2, 1)$ .  
 (A.M.I.E.T.E., Dec. 2007)

**Solution.**  $V^2 = \vec{V} \cdot \vec{V}$

$$= (xy^2 \hat{i} + zy^2 \hat{j} + xz^2 \hat{k}) \cdot (xy^2 \hat{i} + zy^2 \hat{j} + xz^2 \hat{k}) = x^2y^4 + z^2y^4 + x^2z^4$$

Directional derivative =  $\vec{\nabla}V^2$

$$\begin{aligned} &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2y^4 + z^2y^4 + x^2z^4) \\ &= (2xy^4 + 2xz^4) \hat{i} + (4x^2y^3 + 4y^3z^2) \hat{j} + (2y^4z + 4x^2z^3) \hat{k} \end{aligned}$$

Directional derivative at  $(2, 0, 3) = (0 + 2 \times 2 \times 81) \hat{i} + (0 + 0) \hat{j} + (0 + 4 \times 4 \times 27) \hat{k}$

$$= 324 \hat{i} + 432 \hat{k} = 108(3 \hat{i} + 4 \hat{k}) \quad \dots(1)$$

Normal to  $x^2 + y^2 + z^2 - 14 = \nabla\phi$

$$\begin{aligned} &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 14) \\ &= (2x \hat{i} + 2y \hat{j} + 2z \hat{k}) \end{aligned}$$

Normal vector at  $(3, 2, 1) = 6 \hat{i} + 4 \hat{j} + 2 \hat{k}$  ... (2)

$$\text{Unit normal vector} = \frac{6 \hat{i} + 4 \hat{j} + 2 \hat{k}}{\sqrt{36 + 16 + 4}} = \frac{2(3 \hat{i} + 2 \hat{j} + \hat{k})}{2\sqrt{14}} = \frac{3 \hat{i} + 2 \hat{j} + \hat{k}}{\sqrt{14}} \quad \text{[From (1), (2)]}$$

$$\begin{aligned}\text{Directional derivative along the normal} &= 108(3\hat{i} + 4\hat{k}) \cdot \frac{3\hat{i} + 2\hat{j} + \hat{k}}{\sqrt{14}} \\ &= \frac{108 \times (9 + 4)}{\sqrt{14}} = \frac{1404}{\sqrt{14}} \quad \text{Ans.}\end{aligned}$$

**Example 22.** Find the directional derivative of  $\nabla(\nabla f)$  at the point  $(1, -2, 1)$  in the direction of the normal to the surface  $xy^2z = 3x + z^2$ , where  $f = 2x^3y^2z^4$ . (U.P., I Semester, Dec 2008)

**Solution.** Here, we have

$$\begin{aligned}f &= 2x^3y^2z^4 \\ \nabla f &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (2x^3y^2z^4) = 6x^2y^2z^4\hat{i} + 4x^3yz^4\hat{j} + 8x^3y^2z^3\hat{k} \\ \nabla(\nabla f) &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (6x^2y^2z^4\hat{i} + 4x^3yz^4\hat{j} + 8x^3y^2z^3\hat{k}) \\ &= 12xy^2z^4 + 4x^3z^4 + 24x^3y^2z^2\end{aligned}$$

Directional derivative of  $\nabla(\nabla f)$

$$\begin{aligned}&= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (12xy^2z^4 + 4x^3z^4 + 24x^3y^2z^2) \\ &= (12y^2z^4 + 12x^2z^4 + 72x^2y^2z^2)\hat{i} + (24xyz^4 + 48x^3yz^2)\hat{j} \\ &\quad + (48xy^2z^3 + 16x^3z^3 + 48x^3y^2z)\hat{k}\end{aligned}$$

$$\begin{aligned}\text{Directional derivative at } (1, -2, 1) &= (48 + 12 + 288)\hat{i} + (-48 - 96)\hat{j} + (192 + 16 + 192)\hat{k} \\ &= 348\hat{i} - 144\hat{j} + 400\hat{k}\end{aligned}$$

$$\begin{aligned}\text{Normal to } (xy^2z - 3x - z^2) &= \nabla(xy^2z - 3x - z^2) \\ &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (xy^2z - 3x - z^2) \\ &= (y^2z - 3)\hat{i} + (2xyz)\hat{j} + (xy^2 - 2z)\hat{k}\end{aligned}$$

$$\text{Normal at } (1, -2, 1) = \hat{i} - 4\hat{j} + 2\hat{k}$$

$$\text{Unit Normal Vector} = \frac{\hat{i} - 4\hat{j} + 2\hat{k}}{\sqrt{1+16+4}} = \frac{1}{\sqrt{21}}(\hat{i} - 4\hat{j} + 2\hat{k})$$

Directional derivative in the direction of normal

$$\begin{aligned}&= (348\hat{i} - 144\hat{j} + 400\hat{k}) \frac{1}{\sqrt{21}}(\hat{i} - 4\hat{j} + 2\hat{k}) \\ &= \frac{1}{\sqrt{21}}(348 + 576 + 800) = \frac{1724}{\sqrt{21}} \quad \text{Ans.}\end{aligned}$$

**Example 23.** If the directional derivative of  $\phi = a x^2 y + b y^2 z + c z^2 x$  at the point  $(1, 1, 1)$  has maximum magnitude 15 in the direction parallel to the line  $\frac{x-1}{2} = \frac{y-3}{-2} = \frac{z}{1}$ , find the values of  $a$ ,  $b$  and  $c$ . (U.P. I semester, Winter 2001)

**Solution.** Given  $\phi = a x^2 y + b y^2 z + c z^2 x$

$$\begin{aligned}\bar{\nabla}\phi &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (a x^2 y + b y^2 z + c z^2 x) \\ &= \hat{i}(2axy + cz^2) + \hat{j}(ay^2 + 2byz) + \hat{k}(bz^2 + 2cxz)\end{aligned}$$

$$\bar{\nabla}\phi \text{ at the point } (1, 1, 1) = \hat{i}(2a+c) + \hat{j}(a+2b) + \hat{k}(b+2c) \quad \dots(1)$$

We know that the maximum value of the directional derivative is in the direction of  $\bar{\nabla}\phi$ .

$$\text{i.e. } |\nabla\phi| = 15 \Rightarrow (2a+c)^2 + (a+2b)^2 + (b+2c)^2 = (15)^2$$

But, the directional derivative is given to be maximum parallel to the line

$$\frac{x-1}{2} = \frac{y-3}{-2} = \frac{z}{1} \text{ i.e., parallel to the vector } 2\hat{i} - 2\hat{j} + \hat{k}. \quad \dots(2)$$

On comparing the coefficients of (1) and (2)

$$\Rightarrow \frac{2a+c}{2} = \frac{2b+a}{-2} = \frac{b+2c}{1} \quad \dots(3)$$

$$\Rightarrow 2a+c = -2b-a \Rightarrow 3a+2b+c=0$$

$$\text{and } 2b+a = -2(2c+b)$$

$$\Rightarrow 2b+a = -4c-2b \Rightarrow a+4b+4c=0 \quad \dots(4)$$

Rewriting (3) and (4), we have

$$\left. \begin{array}{l} 3a+2b+c=0 \\ a+4b+4c=0 \end{array} \right\} \Rightarrow \frac{a}{4} = \frac{b}{-11} = \frac{c}{10} = k \text{ (say)}$$

$$\Rightarrow a = 4k, b = -11k \text{ and } c = 10k.$$

Now, we have

$$(2a+c)^2 + (2b+a)^2 + (2c+b)^2 = (15)^2$$

$$\Rightarrow (8k+10k)^2 + (-22k+4k)^2 + (20k-11k)^2 = (15)^2$$

$$\Rightarrow k = \pm \frac{5}{9}$$

$$\Rightarrow a = \pm \frac{20}{9}, b = \pm \frac{55}{9} \text{ and } c = \pm \frac{50}{9} \quad \text{Ans.}$$

**Example 24.** If  $\bar{r} = x\hat{i} + y\hat{j} + z\hat{k}$ , show that :

$$(i) \text{ grad } r = \frac{\vec{r}}{r} \quad (ii) \text{ grad } \left(\frac{1}{r}\right) = -\frac{\vec{r}}{r^3}. \quad (\text{Nagpur University, Summer 2002})$$

$$\text{Solution. (i)} \bar{r} = x\hat{i} + y\hat{j} + z\hat{k} \Rightarrow r = \sqrt{x^2 + y^2 + z^2} \Rightarrow r^2 = x^2 + y^2 + z^2$$

$$\therefore 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}$$

$$\text{Similarly, } \frac{\partial r}{\partial y} = \frac{y}{r} \text{ and } \frac{\partial r}{\partial z} = \frac{z}{r}$$

$$\text{grad } r = \nabla r = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) r = \hat{i} \frac{\partial r}{\partial x} + \hat{j} \frac{\partial r}{\partial y} + \hat{k} \frac{\partial r}{\partial z}$$

$$= \hat{i} \frac{x}{r} + \hat{j} \frac{y}{r} + \hat{k} \frac{z}{r} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{r} = \frac{\bar{r}}{r} \quad \text{Proved.}$$

$$(ii) \text{ grad } \left(\frac{1}{r}\right) = \nabla \left(\frac{1}{r}\right) = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \left(\frac{1}{r}\right) = \hat{i} \frac{\partial}{\partial x} \left(\frac{1}{r}\right) + \hat{j} \frac{\partial}{\partial y} \left(\frac{1}{r}\right) + \hat{k} \frac{\partial}{\partial z} \left(\frac{1}{r}\right)$$

$$= \hat{i} \left( -\frac{1}{r^2} \frac{\partial r}{\partial x} \right) + \hat{j} \left( -\frac{1}{r^2} \frac{\partial r}{\partial y} \right) + \hat{k} \left( -\frac{1}{r^2} \frac{\partial r}{\partial z} \right)$$

$$= \hat{i} \left( -\frac{1}{r^2} \frac{x}{r} \right) + \hat{j} \left( -\frac{1}{r^2} \frac{y}{r} \right) + \hat{k} \left( -\frac{1}{r^2} \frac{z}{r} \right) = -\frac{x\hat{i} + y\hat{j} + z\hat{k}}{r^3} = -\frac{\bar{r}}{r^3} \quad \text{Proved.}$$

**Example 25.** Prove that  $\nabla^2 f(r) = f''(r) + \frac{2}{r} f'(r)$ . (K. University, Dec. 2008)

**Solution.**

$$\begin{aligned}
 \nabla f(r) &= \left( i \frac{\partial}{\partial x} + j \frac{\partial}{\partial y} + k \frac{\partial}{\partial z} \right) f(r) \\
 &\quad \left[ r^2 = x^2 + y^2 + z^2 \Rightarrow 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}, \quad \frac{\partial r}{\partial y} = \frac{y}{r} \text{ and } \frac{\partial r}{\partial z} = \frac{z}{r} \right] \\
 &= i f'(r) \frac{\partial r}{\partial x} + j f'(r) \frac{\partial r}{\partial y} + k f'(r) \frac{\partial r}{\partial z} = f'(r) \left[ i \frac{x}{r} + j \frac{y}{r} + k \frac{z}{r} \right] \\
 &= f'(r) \frac{xi + yj + zk}{r} \\
 \nabla^2 f(r) &= \nabla [\nabla f(r)] = \left( i \frac{\partial}{\partial x} + j \frac{\partial}{\partial y} + k \frac{\partial}{\partial z} \right) \left[ f'(r) \frac{xi + yj + zk}{r} \right] \\
 &= \frac{\partial}{\partial x} \left[ f'(r) \frac{x}{r} \right] + \frac{\partial}{\partial y} \left[ f'(r) \frac{y}{r} \right] + \frac{\partial}{\partial z} \left[ f'(r) \frac{z}{r} \right] \\
 &= \left( f''(r) \frac{\partial r}{\partial x} \right) \left( \frac{x}{r} \right) + f'(r) \frac{r^2 - x^2}{r^2} \frac{\partial r}{\partial x} + \left( f''(r) \frac{\partial r}{\partial y} \right) \left( \frac{y}{r} \right) + f'(r) \frac{r^2 - y^2}{r^2} \frac{\partial r}{\partial y} + \\
 &\quad \left( f''(r) \frac{\partial r}{\partial z} \right) \left( \frac{z}{r} \right) + f'(r) \frac{r^2 - z^2}{r^2} \frac{\partial r}{\partial z} \\
 &= \left( f''(r) \frac{x}{r} \right) \left( \frac{x}{r} \right) + f'(r) \frac{r^2 - x^2}{r^2} + \left( f''(r) \frac{y}{r} \right) \left( \frac{y}{r} \right) + f'(r) \frac{r^2 - y^2}{r^2} + \left( f''(r) \frac{z}{r} \right) \left( \frac{z}{r} \right) + f'(r) \frac{r^2 - z^2}{r^2} \\
 &= \left( f''(r) \frac{x^2}{r^2} \right) + f'(r) \frac{r^2 - x^2}{r^2} + \left( f''(r) \frac{y^2}{r^2} \right) + f'(r) \frac{r^2 - y^2}{r^2} + \left( f''(r) \frac{z^2}{r^2} \right) + f'(r) \frac{r^2 - z^2}{r^2} \\
 &= f''(r) \frac{x^2}{r^2} + f'(r) \frac{y^2 + z^2}{r^2} + f''(r) \frac{y^2}{r^2} + f'(r) \frac{x^2 + z^2}{r^2} + f''(r) \frac{z^2}{r^2} + f'(r) \frac{x^2 + y^2}{r^2} \\
 &= f''(r) \left[ \frac{x^2}{r^2} + \frac{y^2}{r^2} + \frac{z^2}{r^2} \right] + f'(r) \left[ \frac{y^2 + z^2}{r^2} + \frac{z^2 + x^2}{r^2} + \frac{x^2 + y^2}{r^2} \right] \\
 &= f''(r) \frac{x^2 + y^2 + z^2}{r^2} + f'(r) \frac{2(x^2 + y^2 + z^2)}{r^2} = f''(r) \frac{r^2}{r^2} + f'(r) \frac{2r^2}{r^2} \\
 &= f''(r) + f'(r) \frac{2}{r}
 \end{aligned}$$

**Ans.**

- EXERCISE 23.1**
- Evaluate  $\text{grad } \phi$  if  $\phi = \log(x^2 + y^2 + z^2)$  **Ans.**  $\frac{2(x\hat{i} + y\hat{j} + z\hat{k})}{x^2 + y^2 + z^2}$
  - Find a unit normal vector to the surface  $x^2 + y^2 + z^2 = 5$  at the point  $(0, 1, 2)$ . **Ans.**  $\frac{1}{\sqrt{5}}(\hat{j} + 2\hat{k})$    
*(AMIE, June 2010)*
  - Calculate the directional derivative of the function  $\phi(x, y, z) = xy^2 + yz^3$  at the point  $(1, -1, 1)$  in the direction of  $(3, 1, -1)$  *(A.M.I.E.T.E. Winter 2009, 2000)* **Ans.**  $\frac{5}{\sqrt{11}}$

4. Find the direction in which the directional derivative of  $f(x, y) = (x^2 - y^2)/xy$  at  $(1, 1)$  is zero.

$$(Nagpur Winter 2000) \quad \text{Ans. } \frac{\hat{i} + \hat{j}}{\sqrt{2}}$$

5. Find the directional derivative of the scalar function of  $(x, y, z) = xyz$  in the direction of the outer normal to the surface  $z = xy$  at the point  $(3, 1, 3)$ .  $\text{Ans. } \frac{27}{\sqrt{11}}$

6. The temperature of the points in space is given by  $T(x, y, z) = x^2 + y^2 - z$ . A mosquito located at  $(1, 1, 2)$  desires to fly in such a direction that it will get warm as soon as possible. In what direction should it move?  $\text{Ans. } \frac{1}{3}(2\hat{i} + 2\hat{j} - \hat{k})$

7. If  $\phi(x, y, z) = 3xz^2y - y^3z^2$ , find  $\text{grad } \phi$  at the point  $(1, -2, -1)$   $\text{Ans. } -(16\hat{i} + 9\hat{j} + 4\hat{k})$

8. Find a unit vector normal to the surface  $x^2y + 2xz = 4$  at the point  $(2, -2, 3)$ .

$$\text{Ans. } \frac{1}{3}(-\hat{i} + 2\hat{j} + 2\hat{k})$$

9. What is the greatest rate of increase of the function  $u = xyz^2$  at the point  $(1, 0, 3)$ ?  $\text{Ans. } 9$

10. If  $\theta$  is the acute angle between the surfaces  $xyz^2 = 3x + z^2$  and  $3x^2 - y^2 + 2z = 1$  at the point  $(1, -2, 1)$  show that  $\cos \theta = 3/7\sqrt{6}$ .

11. Find the values of constants  $a, b, c$  so that the maximum value of the directional directive of  $\phi = axy^2 + byz + cz^2x^3$  at  $(1, 2, -1)$  has a maximum magnitude 64 in the direction parallel to the axis of  $z$ .  $\text{Ans. } a = b, b = 24, c = -8$

12. The position vector of a particle at time  $t$  is  $R = \cos(t-1)\hat{i} + \sinh(t-1)\hat{j} + at^2\hat{k}$ . If at  $t = 1$ , the acceleration of the particle be perpendicular to its position vector, then  $a$  is equal to

- (a) 0      (b) 1      (c)  $\frac{1}{2}$       (d)  $\frac{1}{\sqrt{2}}$       (AMIETE, Dec. 2009)  $\text{Ans. (d)}$

### 23.8 DIVERGENCE OF A VECTOR FUNCTION

The divergence of a vector point function  $\vec{F}$  is denoted by  $\text{div } F$  and is defined as below.

Let  $\vec{F} = F_1\hat{i} + F_2\hat{j} + F_3\hat{k}$

$$\text{div } \vec{F} = \vec{\nabla} \cdot \vec{F} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (\hat{i} F_1 + \hat{j} F_2 + \hat{k} F_3) = \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z}$$

It is evident that  $\text{div } F$  is scalar function.

### 23.9 PHYSICAL INTERPRETATION OF DIVERGENCE

Let us consider the case of a fluid flow. Consider a small rectangular parallelopiped of dimensions  $dx, dy, dz$  parallel to  $x, y$  and  $z$  axes respectively.

Let  $\vec{V} = V_x\hat{i} + V_y\hat{j} + V_z\hat{k}$  be the velocity of the

fluid at  $P(x, y, z)$ .

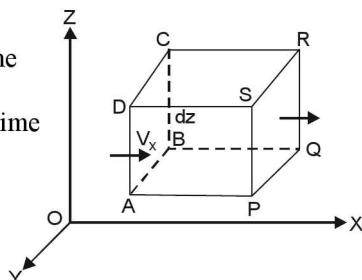

- $\therefore$  Mass of fluid flowing in through the face  $ABCD$  in unit time  
 $=$  Velocity  $\times$  Area of the face  $= V_x(dy dz)$

Mass of fluid flowing out across the face  $PQRS$  per unit time

$$= V_x(x + dx)(dy dz)$$

$$= \left( V_x + \frac{\partial V_x}{\partial x} dx \right) (dy dz)$$

Net decrease in mass of fluid in the parallelopiped

corresponding to the flow along  $x$ -axis per unit time

$$\begin{aligned} &= V_x dy dz - \left( V_x + \frac{\partial V_x}{\partial x} dx \right) dy dz \\ &= - \frac{\partial V_x}{\partial x} dx dy dz \end{aligned} \quad (\text{Minus sign shows decrease})$$

Similarly, the decrease in mass of fluid to the flow along  $y$ -axis =  $\frac{\partial V_y}{\partial y} dx dy dz$

and the decrease in mass of fluid to the flow along  $z$ -axis =  $\frac{\partial V_z}{\partial z} dx dy dz$

Total decrease of the amount of fluid per unit time =  $\left( \frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z} \right) dx dy dz$

Thus the rate of loss of fluid per unit volume =  $\frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z}$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (\hat{i} V_x + \hat{j} V_y + \hat{k} V_z) = \nabla \cdot \vec{V} = \operatorname{div} \vec{V}$$

If the fluid is compressible, there can be no gain or loss in the volume element. Hence

$$\operatorname{div} \vec{V} = 0 \quad \dots(1)$$

and  $V$  is called a *Solenoidal vector function*.

Equation (1) is also called the *equation of continuity or conservation of mass*.

**Example 26.** If  $\vec{v} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{\sqrt{x^2 + y^2 + z^2}}$ , find the value of  $\operatorname{div} \vec{v}$ .

(U.P., I Semester, Winter 2000)

**Solution.** We have,  $\vec{v} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{\sqrt{x^2 + y^2 + z^2}}$

$$\operatorname{div} \vec{v} = \nabla \cdot \vec{v} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot \left( \frac{x \hat{i} + y \hat{j} + z \hat{k}}{(x^2 + y^2 + z^2)^{1/2}} \right)$$

$$= \frac{\partial}{\partial x} \frac{x}{(x^2 + y^2 + z^2)^{1/2}} + \frac{\partial}{\partial y} \frac{y}{(x^2 + y^2 + z^2)^{1/2}} + \frac{\partial}{\partial z} \frac{z}{(x^2 + y^2 + z^2)^{1/2}}$$

$$= \frac{\left[ (x^2 + y^2 + z^2)^{1/2} - x \cdot \frac{1}{2} (x^2 + y^2 + z^2)^{-1/2} \cdot 2x \right]}{(x^2 + y^2 + z^2)}$$

$$+ \frac{\left[ (x^2 + y^2 + z^2)^{1/2} - y \cdot \frac{1}{2} (x^2 + y^2 + z^2)^{-1/2} \cdot 2y \right]}{(x^2 + y^2 + z^2)} + \frac{\left[ (x^2 + y^2 + z^2)^{1/2} - z \cdot \frac{1}{2} (x^2 + y^2 + z^2)^{-1/2} \cdot 2z \right]}{(x^2 + y^2 + z^2)}$$

$$= \frac{(x^2 + y^2 + z^2) - x^2}{(x^2 + y^2 + z^2)^{3/2}} + \frac{(x^2 + y^2 + z^2) - y^2}{(x^2 + y^2 + z^2)^{3/2}} + \frac{(x^2 + y^2 + z^2) - z^2}{(x^2 + y^2 + z^2)^{3/2}}$$

$$= \frac{y^2 + z^2 + x^2 + z^2 + x^2 + y^2}{(x^2 + y^2 + z^2)^{3/2}} = \frac{2(x^2 + y^2 + z^2)}{(x^2 + y^2 + z^2)^{3/2}} = \frac{2}{\sqrt{(x^2 + y^2 + z^2)}} \quad \text{Ans.}$$

**Example 27.** If  $u = x^2 + y^2 + z^2$ , and  $\bar{r} = \hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k}$ , then find  $\operatorname{div}(u\bar{r})$  in terms of  $u$ .  
(A.M.I.E.T.E., Summer 2004)

**Solution.**

$$\begin{aligned}\operatorname{div}(u\bar{r}) &= \left(\hat{i}\frac{\partial}{\partial x} + \hat{j}\frac{\partial}{\partial y} + \hat{k}\frac{\partial}{\partial z}\right) \cdot [(x^2 + y^2 + z^2)(\hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k})] \\ &= \left(\hat{i}\frac{\partial}{\partial x} + \hat{j}\frac{\partial}{\partial y} + \hat{k}\frac{\partial}{\partial z}\right) \cdot [(x^2 + y^2 + z^2)x\hat{i} + (x^2 + y^2 + z^2)y\hat{j} + (x^2 + y^2 + z^2)z\hat{k}] \\ &= \frac{\partial}{\partial x}(x^3 + xy^2 + xz^2) + \frac{\partial}{\partial y}(x^2y + y^3 + yz^2) + \frac{\partial}{\partial z}(x^2z + y^2z + z^3) \\ &= (3x^2 + y^2 + z^2) + (x^2 + 3y^2 + z^2) + (x^2 + y^2 + 3z^2) = 5(x^2 + y^2 + z^2) = 5u \quad \text{Ans.}\end{aligned}$$

**Example 28.** Find the value of  $n$  for which the vector  $r^n\bar{r}$  is solenoidal, where  $\bar{r} = \hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k}$ .

**Solution.** Divergence  $\vec{F} = \vec{\nabla} \cdot \vec{F} = \vec{\nabla} \cdot r^n \bar{r} = \nabla \cdot (x^2 + y^2 + z^2)^{n/2} (\hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k})$

$$\begin{aligned}&= \left[\hat{i}\frac{\partial}{\partial x} + \hat{j}\frac{\partial}{\partial y} + \hat{k}\frac{\partial}{\partial z}\right] \cdot [(x^2 + y^2 + z^2)^{n/2} x\hat{i} + (x^2 + y^2 + z^2)^{n/2} y\hat{j} + (x^2 + y^2 + z^2)^{n/2} z\hat{k}] \\ &= \frac{n}{2}(x^2 + y^2 + z^2)^{n/2-1} (2x^2) + (x^2 + y^2 + z^2)^{n/2} + \frac{n}{2}(x^2 + y^2 + z^2)^{n/2-1} (2y^2) \\ &\quad + (x^2 + y^2 + z^2)^{n/2} + \frac{n}{2}(x^2 + y^2 + z^2)^{n/2-1} (2z^2) + (x^2 + y^2 + z^2)^{n/2} \\ &= n(x^2 + y^2 + z^2)^{n/2-1} (x^2 + y^2 + z^2) + 3(x^2 + y^2 + z^2)^{n/2} \\ &= n(x^2 + y^2 + z^2)^{n/2} + 3(x^2 + y^2 + z^2)^{n/2} = (n+3)(x^2 + y^2 + z^2)^{n/2}\end{aligned}$$

If  $r^n\bar{r}$  is solenoidal, then  $(n+3)(x^2 + y^2 + z^2)^{n/2} = 0$  or  $n+3 = 0$  or  $n = -3$ . **Ans.**

**Example 29.** Show that  $\nabla \left[ \frac{(\vec{a} \cdot \vec{r})}{r^n} \right] = \frac{\vec{a}}{r^n} - \frac{n(\vec{a} \cdot \vec{r})\vec{r}}{r^{n+2}}$ . **(M.U. 2005)**

**Solution.** We have,  $\frac{\vec{a} \cdot \vec{r}}{r^n} = \frac{(a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \cdot (\hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k})}{r^n} = \frac{a_1x + a_2y + a_3z}{r^n}$

Let  $\phi = \frac{\vec{a} \cdot \vec{r}}{r^n} = \frac{a_1x + a_2y + a_3z}{r^n}$

$$\therefore \frac{\partial \phi}{\partial x} = \frac{r^n a_1 - (a_1x + a_2y + a_3z) n r^{n-1} (\partial r / \partial x)}{r^{2n}}$$

But  $r^2 = x^2 + y^2 + z^2 \Rightarrow 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}$

$$\therefore \frac{\partial \phi}{\partial x} = \frac{a_1 r^n - (a_1x + a_2y + a_3z) n r^{n-2} x}{r^{2n}} = \frac{a_1}{r^n} - \frac{n(a_1x + a_2y + a_3z)x}{r^{n+2}}$$

$$\therefore \nabla \phi = \frac{\partial \phi}{\partial x} \hat{i} + \frac{\partial \phi}{\partial y} \hat{j} + \frac{\partial \phi}{\partial z} \hat{k}$$

$$= \frac{1}{r^n} (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) - \frac{n}{r^{n+2}} [(a_1x + a_2y + a_3z)(\hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k})]$$

$$= \frac{\vec{a}}{r^n} - \frac{n}{r^{n+2}} (\vec{a} \cdot \vec{r}) \vec{r}$$

**Example 30.** Let  $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$ ,  $r = |\vec{r}|$  and  $\vec{a}$  is a constant vector. Find the value of

$$\operatorname{div} \left( \frac{\vec{a} \times \vec{r}}{r^n} \right)$$

**Solution.** Let  $\vec{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$

$$\begin{aligned}\vec{a} \times \vec{r} &= (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \times (x\hat{i} + y\hat{j} + z\hat{k}) \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ x & y & z \end{vmatrix} = (a_2z - a_3y)\hat{i} - (a_1z - a_3x)\hat{j} + (a_1y - a_2x)\hat{k} \\ \frac{\vec{a} \times \vec{r}}{|\vec{r}|^n} &= \frac{(a_2z - a_3y)\hat{i} - (a_1z - a_3x)\hat{j} + (a_1y - a_2x)\hat{k}}{(x^2 + y^2 + z^2)^{n/2}} \\ \operatorname{div} \left( \frac{\vec{a} \times \vec{r}}{|\vec{r}|^n} \right) &= \vec{\nabla} \cdot \frac{\vec{a} \times \vec{r}}{|\vec{r}|^n} \\ &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot \frac{(a_2z - a_3y)\hat{i} - (a_1z - a_3x)\hat{j} + (a_1y - a_2x)\hat{k}}{(x^2 + y^2 + z^2)^{n/2}} \\ &= \frac{\partial}{\partial x} \frac{a_2z - a_3y}{(x^2 + y^2 + z^2)^{n/2}} - \frac{\partial}{\partial y} \frac{a_1z - a_3x}{(x^2 + y^2 + z^2)^{n/2}} + \frac{\partial}{\partial z} \frac{(a_1y - a_2x)}{(x^2 + y^2 + z^2)^{n/2}} \\ &= -\frac{n}{2} \frac{(a_2z - a_3y)2x}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} + \frac{n}{2} \frac{(a_1z - a_3x)2y}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} - \frac{n}{2} \frac{(a_1y - a_2x)2z}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} \\ &= -\frac{n}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} [(a_2z - a_3y)x - (a_1z - a_3x)y + (a_1y - a_2x)z] \\ &= -\frac{n}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} [a_2zx - a_3xy - a_1yz + a_3xy + a_1yz - a_2zx] = 0 \quad \text{Ans.}\end{aligned}$$

**Example 31.** Find the directional derivative of  $\operatorname{div}(\vec{u})$  at the point  $(1, 2, 2)$  in the direction of the outer normal of the sphere  $x^2 + y^2 + z^2 = 9$  for  $\vec{u} = x^4\hat{i} + y^4\hat{j} + z^4\hat{k}$ .

**Solution.**  $\operatorname{div}(\vec{u}) = \vec{\nabla} \cdot \vec{u}$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^4\hat{i} + y^4\hat{j} + z^4\hat{k}) = 4x^3 + 4y^3 + 4z^3$$

Outer normal of the sphere =  $\vec{\nabla}(x^2 + y^2 + z^2 - 9)$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 9) = 2x\hat{i} + 2y\hat{j} + 2z\hat{k}$$

Outer normal of the sphere at  $(1, 2, 2) = 2\hat{i} + 4\hat{j} + 4\hat{k}$  ... (1)

Directional derivative =  $\vec{\nabla} \cdot (4x^3 + 4y^3 + 4z^3)$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (4x^3 + 4y^3 + 4z^3) = 12x^2\hat{i} + 12y^2\hat{j} + 12z^2\hat{k}$$

Directional derivative at  $(1, 2, 2) = 12\hat{i} + 48\hat{j} + 48\hat{k}$  ... (2)

$$\begin{aligned}
 \text{Directional derivative along the outer normal} &= (12\hat{i} + 48\hat{j} + 48\hat{k}) \cdot \frac{2\hat{i} + 4\hat{j} + 4\hat{k}}{\sqrt{4+16+16}} \\
 &= \frac{24 + 192 + 192}{6} = 68 \quad \text{[From (1), (2)]} \\
 &\quad \text{Ans.}
 \end{aligned}$$

**Example 32.** Show that  $\operatorname{div}(\operatorname{grad} r^n) = n(n+1)r^{n-2}$ , where

$$r = \sqrt{x^2 + y^2 + z^2}$$

Hence, show that  $\nabla^2\left(\frac{1}{r}\right) = 0$ . (AMIETE, 2010, U.P. I Semester, Dec. 2004, Winter 2002)

**Solution.**  $\operatorname{grad}(r^n) = \hat{i}\frac{\partial}{\partial x}r^n + \hat{j}\frac{\partial}{\partial y}r^n + \hat{k}\frac{\partial}{\partial z}r^n$  by definition

$$\begin{aligned}
 &= \hat{i}n r^{n-1}\frac{\partial r}{\partial x} + \hat{j}n r^{n-1}\frac{\partial r}{\partial y} + \hat{k}n r^{n-1}\frac{\partial r}{\partial z} = n r^{n-1} \left[ \hat{i}\frac{\partial r}{\partial x} + \hat{j}\frac{\partial r}{\partial y} + \hat{k}\frac{\partial r}{\partial z} \right] \\
 &= n r^{n-1} \left[ \hat{i}\left(\frac{x}{r}\right) + \hat{j}\left(\frac{y}{r}\right) + \hat{k}\left(\frac{z}{r}\right) \right] = n r^{n-2} (x\hat{i} + y\hat{j} + z\hat{k}) = n r^{n-2} \vec{r}. \\
 &\quad \left[ \because r^2 = x^2 + y^2 + z^2 \Rightarrow 2r\frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r} \text{ etc.} \right]
 \end{aligned}$$

$$\text{Thus, } \operatorname{grad}(r^n) = n r^{n-2} x\hat{i} + n r^{n-2} y\hat{j} + n r^{n-2} z\hat{k} \quad \dots(1)$$

$$\begin{aligned}
 \therefore \operatorname{div} \operatorname{grad} r^n &= \operatorname{div}[n r^{n-2} x\hat{i} + n r^{n-2} y\hat{j} + n r^{n-2} z\hat{k}] \\
 &= \left( \hat{i}\frac{\partial}{\partial x} + \hat{j}\frac{\partial}{\partial y} + \hat{k}\frac{\partial}{\partial z} \right) \cdot (n r^{n-2} x\hat{i} + n r^{n-2} y\hat{j} + n r^{n-2} z\hat{k}) \quad \text{[From (1)]} \\
 &= \frac{\partial}{\partial x}(n r^{n-2} x) + \frac{\partial}{\partial y}(n r^{n-2} y) + \frac{\partial}{\partial z}(n r^{n-2} z) \quad (\text{By definition}) \\
 &= \left( n r^{n-2} + n x(n-2) r^{n-3} \frac{\partial r}{\partial x} \right) + \left( n r^{n-2} + n y(n-2) r^{n-3} \frac{\partial r}{\partial y} \right) \\
 &\quad + \left( n r^{n-2} + n z(n-2) r^{n-3} \frac{\partial r}{\partial z} \right) \\
 &= 3n r^{n-2} + n(n-2) r^{n-3} \left[ x\frac{\partial r}{\partial x} + y\frac{\partial r}{\partial y} + z\frac{\partial r}{\partial z} \right] \\
 &= 3n r^{n-2} + n(n-2) r^{n-3} \left[ x\left(\frac{x}{r}\right) + y\left(\frac{y}{r}\right) + z\left(\frac{z}{r}\right) \right] \\
 &\quad \left[ \because r^2 = x^2 + y^2 + z^2 \Rightarrow 2r\frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r} \text{ etc.} \right] \\
 &= 3nr^{n-2} + n(n-2)r^{n-4} [x^2 + y^2 + z^2] \\
 &= 3nr^{n-2} + n(n-2)r^{n-4} r^2 \quad (\because r^2 = x^2 + y^2 + z^2) \\
 &= r^{n-2} [3n + n^2 - 2n] = r^{n-2} (n^2 + n) = n(n+1) r^{n-2}
 \end{aligned}$$

If we put  $n = -1$

$$\operatorname{div} \operatorname{grad}(r^{-1}) = -1(-1+1)r^{-1-2}$$

$$\Rightarrow \nabla^2\left(\frac{1}{r}\right) = 0$$

**Ques.** If  $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$ , and  $r = |\vec{r}|$  find  $\operatorname{div} \left( \frac{\vec{r}}{r^2} \right)$ . (U.P. I Sem., Dec. 2006) **Ans.**  $\frac{1}{r^2}$

**EXERCISE 23.3**

1. If  $\mathbf{r} = \hat{x}\mathbf{i} + \hat{y}\mathbf{j} + \hat{z}\mathbf{k}$  and  $\mathbf{r} = |\vec{\mathbf{r}}|$ , show that (i)  $\operatorname{div} \left( \frac{\vec{\mathbf{r}}}{|\vec{\mathbf{r}}|^3} \right) = 0$ ,  
(ii)  $\operatorname{div}(\mathbf{r} \phi) = 3\phi + \mathbf{r} \operatorname{grad} \phi$ .
2. Show that the vector  $\mathbf{V} = (\mathbf{x} + 3\mathbf{y})\hat{\mathbf{i}} + (\mathbf{y} - 3\mathbf{z})\hat{\mathbf{j}} + (\mathbf{x} - 2\mathbf{z})\hat{\mathbf{k}}$  is solenoidal.  
(R.G.P.V., Bhopal, Dec. 2003)
3. Show that  $\nabla \cdot (\phi \mathbf{A}) = \nabla \phi \cdot \mathbf{A} + \phi (\nabla \cdot \mathbf{A})$
4. If  $\rho, \phi, z$  are cylindrical coordinates, show that  $\operatorname{grad}(\log \rho)$  and  $\operatorname{grad} \phi$  are solenoidal vectors.
5. Obtain the expression for  $\nabla^2 f$  in spherical coordinates from their corresponding expression in orthogonal curvilinear coordinates.

**Prove the following:**

6. (a)  $\nabla \cdot (\nabla \phi) = \nabla^2 \phi$
7.  $\vec{\nabla} \times \frac{(\vec{A} \times \vec{R})}{r^n} = \frac{(2-n)\vec{A}}{r^n} + \frac{n(\vec{A} \cdot \vec{R})\vec{R}}{r^{n+2}}, r = |\vec{R}|$
8.  $\operatorname{div}(f \nabla g) - \operatorname{div}(g \nabla f) = f \nabla^2 g - g \nabla^2 f$

**23.10 CURL**

(U.P., I semester, Dec. 2006)

The curl of a vector point function  $F$  is defined as below

$$\begin{aligned} \operatorname{curl} \vec{F} &= \vec{\nabla} \times \vec{F} \\ &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (F_1 \hat{\mathbf{i}} + F_2 \hat{\mathbf{j}} + F_3 \hat{\mathbf{k}}) \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ F_1 & F_2 & F_3 \end{vmatrix} = \hat{i} \left( \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} \right) - \hat{j} \left( \frac{\partial F_3}{\partial x} - \frac{\partial F_1}{\partial z} \right) + \hat{k} \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) \end{aligned} \quad (\vec{F} = F_1 \hat{\mathbf{i}} + F_2 \hat{\mathbf{j}} + F_3 \hat{\mathbf{k}})$$

Curl  $\vec{F}$  is a vector quantity.

**23.11 PHYSICAL MEANING OF CURL**

(M.D.U., Dec. 2009, U.P. I Semester, Winter 2009, 2000)

We know that  $\vec{V} = \vec{\omega} \times \vec{r}$ , where  $\omega$  is the angular velocity,  $\vec{V}$  is the linear velocity and  $\vec{r}$  is the position vector of a point on the rotating body.

$$\begin{aligned} \operatorname{Curl} \vec{V} &= \vec{\nabla} \times \vec{V} \\ &= \vec{\nabla} \times (\vec{\omega} \times \vec{r}) = \vec{\nabla} \times [(\omega_1 \hat{\mathbf{i}} + \omega_2 \hat{\mathbf{j}} + \omega_3 \hat{\mathbf{k}}) \times (x \hat{\mathbf{i}} + y \hat{\mathbf{j}} + z \hat{\mathbf{k}})] \\ &= \vec{\nabla} \times \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \omega_1 & \omega_2 & \omega_3 \\ x & y & z \end{vmatrix} = \vec{\nabla} \times [(\omega_2 z - \omega_3 y) \hat{\mathbf{i}} - (\omega_1 z - \omega_3 x) \hat{\mathbf{j}} + (\omega_1 y - \omega_2 x) \hat{\mathbf{k}}] \\ &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(\omega_2 z - \omega_3 y) \hat{\mathbf{i}} - (\omega_1 z - \omega_3 x) \hat{\mathbf{j}} + (\omega_1 y - \omega_2 x) \hat{\mathbf{k}}] \end{aligned} \quad \left[ \begin{array}{l} \vec{\omega} = \omega_1 \hat{\mathbf{i}} + \omega_2 \hat{\mathbf{j}} + \omega_3 \hat{\mathbf{k}} \\ \vec{r} = x \hat{\mathbf{i}} + y \hat{\mathbf{j}} + z \hat{\mathbf{k}} \end{array} \right]$$

$$\begin{aligned}
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \omega_2 z - \omega_3 y & \omega_3 x - \omega_1 z & \omega_1 y - \omega_2 x \end{vmatrix} \\
 &= (\omega_1 + \omega_1) \hat{i} - (-\omega_2 - \omega_2) \hat{j} + (\omega_3 + \omega_3) \hat{k} = 2(\omega_1 \hat{i} + \omega_2 \hat{j} + \omega_3 \hat{k}) = 2\omega
 \end{aligned}$$

Curl  $\vec{V} = 2\omega$  which shows that curl of a vector field is connected with rotational properties of the vector field and justifies the name *rotation* used for curl.

If Curl  $\vec{F} = 0$ , the field  $F$  is termed as *irrotational*.

**Example 33.** Find the divergence and curl of  $\vec{v} = (xyz)\hat{i} + (3x^2y)\hat{j} + (xz^2 - y^2z)\hat{k}$  at  $(2, -1, 1)$  (Nagpur University, Summer 2003)

**Solution.** Here, we have

$$\begin{aligned}
 \vec{v} &= (xyz)\hat{i} + (3x^2y)\hat{j} + (xz^2 - y^2z)\hat{k} \\
 \text{Div. } \vec{v} &= \nabla \cdot \vec{v} \\
 \text{Div. } \vec{v} &= \frac{\partial}{\partial x}(xyz) + \frac{\partial}{\partial y}(3x^2y) + \frac{\partial}{\partial z}(xz^2 - y^2z) \\
 &= yz + 3x^2 + 2xz - y^2 = -1 + 12 + 4 - 1 = 14 \text{ at } (2, -1, 1) \\
 \text{Curl } \vec{v} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ xyz & 3x^2y & xz^2 - y^2z \end{vmatrix} = -2yz \hat{i} - (z^2 - xy) \hat{j} + (6xy - xz) \hat{k} \\
 &= -2yz \hat{i} + (xy - z^2) \hat{j} + (6xy - xz) \hat{k}
 \end{aligned}$$

Curl at  $(2, -1, 1)$

$$\begin{aligned}
 &= -2(-1)(1) \hat{i} + \{(2)(-1) - 1\} \hat{j} + \{6(2)(-1) - 2(1)\} \hat{k} \\
 &= 2 \hat{i} - 3 \hat{j} - 14 \hat{k}
 \end{aligned}$$

**Ans.**

**Example 34.** If  $\vec{V} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}}$ , find the value of curl  $\vec{V}$ .

(U.P., I Semester, Winter 2000)

**Solution.**

$$\begin{aligned}
 \text{Curl } \vec{V} &= \vec{\nabla} \times \vec{V} \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times \left( \frac{x\hat{i} + y\hat{j} + z\hat{k}}{(x^2 + y^2 + z^2)^{1/2}} \right) \\
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{x}{(x^2 + y^2 + z^2)^{1/2}} & \frac{y}{(x^2 + y^2 + z^2)^{1/2}} & \frac{z}{(x^2 + y^2 + z^2)^{1/2}} \end{vmatrix}
 \end{aligned}$$

$$\begin{aligned}
&= \hat{i} \left[ \frac{\partial}{\partial y} \left( \frac{z}{(x^2 + y^2 + z^2)^{1/2}} \right) - \frac{\partial}{\partial z} \left( \frac{y}{(x^2 + y^2 + z^2)^{1/2}} \right) \right] - \hat{j} \left[ \frac{\partial}{\partial x} \left( \frac{z}{(x^2 + y^2 + z^2)^{1/2}} \right) - \frac{\partial}{\partial z} \left( \frac{x}{(x^2 + y^2 + z^2)^{1/2}} \right) \right] \\
&\quad - \frac{\partial}{\partial z} \left( \frac{x}{(x^2 + y^2 + z^2)^{1/2}} \right) + \hat{k} \left[ \frac{\partial}{\partial x} \left( \frac{y}{(x^2 + y^2 + z^2)^{1/2}} \right) - \frac{\partial}{\partial y} \left( \frac{x}{(x^2 + y^2 + z^2)^{1/2}} \right) \right] \\
&= \hat{i} \left[ \frac{-yz}{(x^2 + y^2 + z^2)^{3/2}} + \frac{y.z}{(x^2 + y^2 + z^2)^{3/2}} \right] - \hat{j} \left[ \frac{-zx}{(x^2 + y^2 + z^2)^{3/2}} + \frac{zx}{(x^2 + y^2 + z^2)^{3/2}} \right] \\
&\quad + \hat{k} \left[ \frac{-xy}{(x^2 + y^2 + z^2)^{3/2}} + \frac{xy}{(x^2 + y^2 + z^2)^{3/2}} \right] = 0 \quad \text{Ans.}
\end{aligned}$$

**Example 35.** Prove that  $(y^2 - z^2 + 3yz - 2x)\hat{i} + (3xz + 2xy)\hat{j} + (3xy - 2xz + 2z)\hat{k}$  is both solenoidal and irrotational. (U.P., I Sem, Dec. 2008)

**Solution.** Let  $\vec{F} = (y^2 - z^2 + 3yz - 2x)\hat{i} + (3xz + 2xy)\hat{j} + (3xy - 2xz + 2z)\hat{k}$

For solenoidal, we have to prove  $\vec{\nabla} \cdot \vec{F} = 0$ .

$$\begin{aligned}
\text{Now, } \vec{\nabla} \cdot \vec{F} &= \left[ \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right] \cdot \left[ (y^2 - z^2 + 3yz - 2x)\hat{i} + (3xz + 2xy)\hat{j} + (3xy - 2xz + 2z)\hat{k} \right] \\
&= -2 + 2x - 2x + 2 = 0
\end{aligned}$$

Thus,  $\vec{F}$  is solenoidal. For irrotational, we have to prove  $\text{Curl } \vec{F} = 0$ .

$$\begin{aligned}
\text{Now, } \text{Curl } \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 - z^2 + 3yz - 2x & 3xz + 2xy & 3xy - 2xz + 2z \end{vmatrix} \\
&= (3x - 3x)\hat{i} - (-2z + 3y - 3y + 2z)\hat{j} + (3z + 2y - 2y - 3z)\hat{k} \\
&= 0\hat{i} + 0\hat{j} + 0\hat{k} = 0
\end{aligned}$$

Thus,  $\vec{F}$  is irrotational.

Hence,  $\vec{F}$  is both solenoidal and irrotational. Proved.

**Example 36.** Determine the constants  $a$  and  $b$  such that the curl of vector

$$\vec{A} = (2xy + 3yz)\hat{i} + (x^2 + axz - 4z^2)\hat{j} - (3xy + byz)\hat{k} \text{ is zero.} \quad (\text{U.P. I Semester, Dec 2008})$$

**Solution.**  $\text{Curl } A = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(2xy + 3yz)\hat{i} + (x^2 + axz - 4z^2)\hat{j} - (3xy + byz)\hat{k}]$

$$\begin{aligned}
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2xy + 3yz & x^2 + axz - 4z^2 & -3xy - byz \end{vmatrix} - (3xy + byz)\hat{k} \\
&= 0\hat{i} + 0\hat{j} + 0\hat{k} = 0
\end{aligned}$$

$$\begin{aligned}
 &= [-3x - bz - ax + 8z] \hat{i} - [-3y - 3y] \hat{j} + [2x + az - 2x - 3z] \hat{k} \\
 &= [-x(3+a) + z(8-b)] \hat{i} + 6y \hat{j} + z(-3+a) \hat{k} \\
 &= 0 \quad (\text{given}) \\
 \text{i.e., } 3+a &= 0 \quad \text{and } 8-b = 0, \quad -3+a = 0 \quad \Rightarrow \quad a = 3 \\
 a &= -3, \quad b = 8 \quad \text{Ans.}
 \end{aligned}$$

**Example 37.** If a vector field is given by

$$\vec{F} = (x^2 - y^2 + x) \hat{i} - (2xy + y) \hat{j}. \text{ Is this field irrotational? If so, find its scalar potential.}$$

(U.P. I Semester, Dec 2009)

**Solution.** Here, we have

$$\vec{F} = (x^2 - y^2 + x) \hat{i} - (2xy + y) \hat{j}$$

$$\begin{aligned}
 \text{Curl } F &= \nabla \times \vec{F} \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (x^2 - y^2 + x) \hat{i} - (2xy + y) \hat{j} \\
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 - y^2 + x & -2xy - y & 0 \end{vmatrix} = \hat{i}(0-0) - \hat{j}(0-0) + \hat{k}(-2y+2y) = 0
 \end{aligned}$$

Hence, vector field  $\vec{F}$  is irrotational.

To find the scalar potential function  $\phi$

$$\begin{aligned}
 \vec{F} &= \nabla \phi \\
 d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz = \left| \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right| \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi \cdot (\vec{d} \cdot \vec{r}) = \nabla \phi \cdot \vec{d} \cdot \vec{r} = \vec{F} \cdot \vec{d} \cdot \vec{r} \\
 &= [(x^2 - y^2 + x)\hat{i} - (2xy + y)\hat{j}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= (x^2 - y^2 + x)dx - (2xy + y)dy. \\
 \phi &= \int [(x^2 - y^2 + x)dx - (2xy + y)dy] + c \\
 &= \int \left[ x^2 dx + x dy - y^2 dx - 2xy dy \right] + c = \frac{x^3}{3} + \frac{x^2}{2} - \frac{y^2}{2} - xy^2 + c
 \end{aligned}$$

Hence, the scalar potential is  $\frac{x^3}{3} + \frac{x^2}{2} - \frac{y^2}{2} - xy^2 + c$  **Ans.**

**Example 38.** Find the scalar potential function  $f$  for  $\vec{A} = y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k}$ .  
(Gujarat, I Semester, Jan. 2009)

**Solution.** We have,  $\vec{A} = y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k}$

$$\text{Curl } \vec{A} = \nabla \times \vec{A} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 & 2xy & -z^2 \end{vmatrix} = \hat{i}(0) - \hat{j}(0) + \hat{k}(2y - 2y) = 0$$

Hence,  $\vec{A}$  is irrotational. To find the scalar potential function  $f$ .

$$\begin{aligned} \vec{A} &= \nabla f \\ df &= \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz = \left( \hat{i} \frac{\partial f}{\partial x} + \hat{j} \frac{\partial f}{\partial y} + \hat{k} \frac{\partial f}{\partial z} \right) (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) f \cdot dr = \nabla f \cdot d\vec{r} \\ &= \vec{A} \cdot dr \\ &= (y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k}) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= y^2 dx + 2xy dy - z^2 dz = d(xy^2) - z^2 dz \\ f &= \int d(xy^2) - \int z^2 dz = xy^2 - \frac{z^3}{3} + C \quad \text{Ans.} \end{aligned}$$

**Example 39.** A vector field is given by  $\vec{A} = (x^2 + xy^2) \hat{i} + (y^2 + x^2y) \hat{j}$ . Show that the field is irrotational and find the scalar potential. (Nagpur University, Summer 2003, Winter 2002)

**Solution.**  $\vec{A}$  is irrotational if  $\operatorname{curl} \vec{A} = 0$

$$\operatorname{Curl} \vec{A} = \nabla \times \vec{A} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 + xy^2 & y^2 + x^2y & 0 \end{vmatrix} = \hat{i}(0 - 0) - \hat{j}(0 - 0) + \hat{k}(2xy - 2xy) = 0$$

Hence,  $\vec{A}$  is irrotational. If  $\phi$  is the scalar potential, then

$$\vec{A} = \operatorname{grad} \phi$$

$$\begin{aligned} d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \quad [\text{Total differential coefficient}] \\ &= \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \operatorname{grad} \phi \cdot dr \\ &= \vec{A} \cdot dr = [(x^2 + xy^2) \hat{i} + (y^2 + x^2y) \hat{j}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= (x^2 + xy^2) dx + (y^2 + x^2y) dy = x^2 dx + y^2 dy + (x dx)y^2 + (x^2)(y dy) \\ \phi &= \int x^2 dx + \int y^2 dy + \int [(x dx)y^2 + (x^2)(y dy)] = \frac{x^3}{3} + \frac{y^3}{3} + \frac{x^2 y^2}{2} + c \quad \text{Ans.} \end{aligned}$$

**Example 40.** Show that  $\vec{V}(x, y, z) = 2x y z \hat{i} + (x^2 z + 2y) \hat{j} + x^2 y \hat{k}$  is irrotational and find a scalar function  $u(x, y, z)$  such that  $\vec{V} = \operatorname{grad} (u)$ .

$$\text{Solution. } \vec{V}(x, y, z) = 2x y z \hat{i} + (x^2 z + 2y) \hat{j} + x^2 y \hat{k}$$

$$\begin{aligned}
 \text{Curl } \vec{V} &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [2xyz\hat{i} + (x^2z + 2y)\hat{j} + x^2y\hat{k}] \\
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2xyz & x^2z + 2y & x^2y \end{vmatrix} \\
 &= (x^2 - x^2)\hat{i} - (2xy - 2xy)\hat{j} + (2xz - 2xz)\hat{k} = 0
 \end{aligned}$$

Hence,  $\vec{V}(x, y, z)$  is irrotational.

To find corresponding scalar function  $u$ , consider the following relations given

$$\begin{aligned}
 \vec{V} &= \text{grad } (u) \\
 \text{or} \quad \vec{V} &= \vec{\nabla}(u) \quad \dots(1) \\
 du &= \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz \quad (\text{Total differential coefficient}) \\
 &= \left( \hat{i} \frac{\partial u}{\partial x} + \hat{j} \frac{\partial u}{\partial y} + \hat{k} \frac{\partial u}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= \vec{\nabla}u \cdot d\vec{r} = \vec{V} \cdot d\vec{r} \quad [\text{From (1)}] \\
 &= [2xyz\hat{i} + (x^2z + 2y)\hat{j} + x^2y\hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= 2xyz dx + (x^2z + 2y) dy + x^2y dz \\
 &= y(2xz dx + x^2 dz) + (x^2z) dy + 2y dy \\
 &= [yd(x^2z) + (x^2z) dy] + 2y dy = d(x^2yz) + 2y dy
 \end{aligned}$$

Integrating, we get  $u = x^2yz + y^2$  Ans.

**Example 41.** A fluid motion is given by  $\vec{v} = (y+z)\hat{i} + (z+x)\hat{j} + (x+y)\hat{k}$ . Show that the motion is irrotational and hence find the velocity potential.

(AMIEETE, Dec. 2007, Uttarakhand, I Semester 2006; U.P., I Semester, Winter 2003)

$$\begin{aligned}
 \text{Solution.} \quad \text{Curl } \vec{v} &= \nabla \times \vec{v} \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(y+z)\hat{i} + (z+x)\hat{j} + (x+y)\hat{k}] \\
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y+z & z+x & x+y \end{vmatrix} = (1-1)\hat{i} - (1-1)\hat{j} + (1-1)\hat{k} = 0
 \end{aligned}$$

Hence,  $\vec{v}$  is irrotational.

To find the corresponding velocity potential  $\phi$ , consider the following relation.

$$\begin{aligned}
 \vec{v} &= \nabla\phi \\
 d\phi &= \frac{\partial\phi}{\partial x} dx + \frac{\partial\phi}{\partial y} dy + \frac{\partial\phi}{\partial z} dz \quad [\text{Total Differential coefficient}]
 \end{aligned}$$

$$\begin{aligned}
&= \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi \cdot d\vec{r} = \nabla \phi \cdot d\vec{r} = \vec{v} \cdot d\vec{r} \\
&= [(y+z)\hat{i} + (z+x)\hat{j} + (x+y)\hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= (y+z)dx + (z+x)dy + (x+y)dz \\
&= ydx + zdx + zd़y + xdy + xdz + ydz \\
\phi &= \int (ydx + xdy) + \int (zd़y + ydz) + \int (xd़x + xdz) \\
&\quad \phi = xy + yz + zx + c
\end{aligned}$$

Velocity potential =  $xy + yz + zx + c$  Ans.

**Example 42.** A fluid motion is given by  $\vec{v} = (y \sin z - \sin x)\hat{i} + (x \sin z + 2yz)\hat{j} + (xy \cos z + y^2)\hat{k}$  is the motion irrotational? If so, find the velocity potential.

**Solution.**  $\text{Curl } \vec{v} = \vec{\nabla} \times \vec{v}$

$$\begin{aligned}
&= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (y \sin z - \sin x)\hat{i} + (x \sin z + 2yz)\hat{j} + (xy \cos z + y^2)\hat{k} \\
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y \sin z - \sin x & x \sin z + 2yz & xy \cos z + y^2 \end{vmatrix}
\end{aligned}$$

$$= (x \cos z + 2y - x \cos z - 2y)\hat{i} - [y \cos z - y \cos z]\hat{j} + (\sin z - \sin z)\hat{k} = 0$$

Hence, the motion is irrotational.

So,  $\vec{v} = \vec{\nabla} \phi$  where  $\phi$  is called velocity potential.

$$\begin{aligned}
d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \quad [\text{Total differential coefficient}] \\
&= \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \vec{\nabla} \phi \cdot d\vec{r} = \vec{v} \cdot d\vec{r}
\end{aligned}$$

$$\begin{aligned}
&= [(y \sin z - \sin x)\hat{i} + (x \sin z + 2yz)\hat{j} + (xy \cos z + y^2)\hat{k}] \cdot [\hat{i} dx + \hat{j} dy + \hat{k} dz] \\
&= (y \sin z - \sin x)dx + (x \sin z + 2yz)dy + (xy \cos z + y^2)dz \\
&= (y \sin z dx + x dy \sin z + x y \cos z dz) - \sin x dx + (2yz dy + y^2 dz) \\
&= d(xy \sin z) + d(\cos x) + d(y^2 z)
\end{aligned}$$

$$\phi = \int d(xy \sin z) + \int d(\cos x) + \int d(y^2 z)$$

$$\phi = xy \sin z + \cos x + y^2 z + c$$

Hence, Velocity potential =  $xy \sin z + \cos x + y^2 z + c$ . Ans.

**Example 43.** Prove that  $\vec{F} = r^2 \vec{r}$  is conservative and find the scalar potential  $\phi$  such that

$$\vec{F} = \vec{\nabla} \phi. \quad (\text{Nagpur University, Summer 2004})$$

**Solution.** Given  $\vec{F} = r^2 \vec{r} = r^2(x\hat{i} + y\hat{j} + z\hat{k}) = r^2 x\hat{i} + r^2 y\hat{j} + r^2 z\hat{k}$

$$\text{Consider } \vec{\nabla} \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ r^2 x & r^2 y & r^2 z \end{vmatrix}$$

$$\begin{aligned}
&= \hat{i} \left[ \frac{\partial}{\partial y} r^2 z - \frac{\partial}{\partial z} r^2 y \right] - \hat{j} \left[ \frac{\partial}{\partial x} r^2 z - \frac{\partial}{\partial z} r^2 x \right] + \hat{k} \left[ \frac{\partial}{\partial x} r^2 y - \frac{\partial}{\partial y} r^2 x \right] \\
&= \hat{i} \left[ 2rz \frac{\partial r}{\partial y} - 2ry \frac{\partial r}{\partial z} \right] - \hat{j} \left[ 2rz \frac{\partial r}{\partial x} - 2rx \frac{\partial r}{\partial z} \right] + \hat{k} \left[ 2ry \frac{\partial r}{\partial x} - 2rx \frac{\partial r}{\partial y} \right] \\
&\quad \left[ \text{But } r^2 = x^2 + y^2 + z^2, \frac{\partial r}{\partial x} = \frac{x}{r}, \frac{\partial r}{\partial y} = \frac{y}{r}, \frac{\partial r}{\partial z} = \frac{z}{r} \right] \\
&= \hat{i} \left[ 2rz \frac{y}{r} - 2ry \frac{z}{r} \right] - \hat{j} \left[ 2rz \frac{x}{r} - 2rx \frac{z}{r} \right] + \hat{k} \left[ 2ry \frac{x}{r} - 2rx \frac{y}{r} \right] \\
&= \hat{i}(2yz - 2yz) - \hat{j}(2zx - 2zx) + \hat{k}(2xy - 2xy) = 0 \hat{i} - 0 \hat{j} + 0 \hat{k} = 0
\end{aligned}$$

$\therefore \nabla \times \vec{F} = 0$

$\therefore \vec{F}$  is irrotational       $\therefore F$  is conservative.

Consider scalar potential  $\phi$  such that  $\vec{F} = \nabla\phi$ .

$$\begin{aligned}
d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz && [\text{Total differential coefficient}] \\
&= \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \nabla\phi (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= \vec{F} (\hat{i} dx + \hat{j} dy + \hat{k} dz) && (\nabla\phi = \vec{F}) \\
&= (x^2 + y^2 + z^2) (\hat{i} x + \hat{j} y + \hat{k} z) (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= (x^2 + y^2 + z^2) (x dx + y dy + z dz) \\
&= x^3 dx + y^3 dy + z^3 dz + (x dx) y^2 + (x^2) (y dy) \\
&\quad + (x dx) z^2 + z^2 (y dy) + x^2 (z dz) + y^2 (z dz) \\
\phi &= \int x^3 dx + \int y^3 dy + \int z^3 dz + \int [(x dx)y^2 + (y dy)x^2] \\
&\quad + \int [(x dx)z^2 + (z dz)x^2] + \int [(y dy)z^2 + (z dz)y^2] \\
&= \frac{x^4}{4} + \frac{y^4}{4} + \frac{z^4}{4} + \frac{1}{2} x^2 y^2 + \frac{1}{2} x^2 z^2 + \frac{1}{2} y^2 z^2 + c \\
&= \frac{1}{4} (x^4 + y^4 + z^4 + 2x^2 y^2 + 2x^2 z^2 + 2y^2 z^2) + c && \text{Ans.}
\end{aligned}$$

**Example 44.** Show that the vector field  $\vec{F} = \frac{\vec{r}}{|\vec{r}|^3}$  is irrotational as well as solenoidal. Find the scalar potential.

(Nagpur University, Summer 2008, 2001, U.P. I Semester Dec. 2005, 2001)

**Solution.**  $F = \frac{\vec{r}}{|\vec{r}|^3} = \frac{\hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k}}{(x^2 + y^2 + z^2)^{3/2}}$

$$\text{Curl } \vec{F} = \vec{\nabla} \times \vec{F} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times \left( \frac{\hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k}}{(x^2 + y^2 + z^2)^{3/2}} \right)$$

$$\begin{aligned}
&= \left| \begin{array}{ccc} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{x}{(x^2 + y^2 + z^2)^{3/2}} & \frac{y}{(x^2 + y^2 + z^2)^{3/2}} & \frac{z}{(x^2 + y^2 + z^2)^{3/2}} \end{array} \right| \\
&= \hat{i} \left[ \frac{-3}{2} \frac{2yz}{(x^2 + y^2 + z^2)^{5/2}} + \frac{3}{2} \frac{2yz}{(x^2 + y^2 + z^2)^{5/2}} \right] \\
&\quad - \hat{j} \left[ \frac{-3}{2} \frac{2xz}{(x^2 + y^2 + z^2)^{5/2}} - \left( -\frac{3}{2} \right) \frac{2xz}{(x^2 + y^2 + z^2)^{5/2}} \right] \\
&\quad + \hat{k} \left[ -\frac{3}{2} \frac{2xy}{(x^2 + y^2 + z^2)^{5/2}} - \left( -\frac{3}{2} \right) \frac{2xy}{(x^2 + y^2 + z^2)^{5/2}} \right] \\
&= 0
\end{aligned}$$

Hence,  $\vec{F}$  is irrotational.

$$\begin{aligned}
\Rightarrow \vec{F} &= \vec{\nabla}\phi, \text{ where } \phi \text{ is called scalar potential} \\
d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \quad [\text{Total differential coefficient}] \\
&= \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \vec{\nabla}\phi \cdot d\vec{r} = \vec{F} \cdot d\vec{r} \\
&= \frac{x \hat{i} + y \hat{j} + z \hat{k}}{(x^2 + y^2 + z^2)^{3/2}} (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \frac{x dx + y dy + z dz}{(x^2 + y^2 + z^2)^{3/2}} \\
\phi &= \frac{1}{2} \int \frac{2x dx + 2y dy + 2z dz}{(x^2 + y^2 + z^2)^{3/2}} \\
&= \frac{1}{2} \left( -\frac{2}{1} \right) (x^2 + y^2 + z^2)^{-\frac{1}{2}} = -\frac{1}{(x^2 + y^2 + z^2)^{\frac{1}{2}}} = -\frac{1}{|\vec{r}|} \quad \text{Ans.}
\end{aligned}$$

$$\text{Now, } \text{Div } \vec{F} = \vec{\nabla} \cdot \vec{F}$$

$$\begin{aligned}
&= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot \frac{x \hat{i} + y \hat{j} + z \hat{k}}{(x^2 + y^2 + z^2)^{3/2}} \\
&= \frac{\partial}{\partial x} \frac{x}{(x^2 + y^2 + z^2)^{3/2}} + \frac{\partial}{\partial y} \frac{y}{(x^2 + y^2 + z^2)^{3/2}} + \frac{\partial}{\partial z} \frac{z}{(x^2 + y^2 + z^2)^{3/2}} \\
&= \frac{(x^2 + y^2 + z^2)^{3/2} (1) - x \left( \frac{3}{2} \right) (x^2 + y^2 + z^2)^{1/2} (2x)}{(x^2 + y^2 + z^2)^3} \\
&\quad + \frac{(x^2 + y^2 + z^2)^{3/2} (1) - y \left( \frac{3}{2} \right) (x^2 + y^2 + z^2)^{1/2} (2y)}{(x^2 + y^2 + z^2)^3} \\
&\quad + \frac{(x^2 + y^2 + z^2)^{3/2} (1) - z \left( \frac{3}{2} \right) (x^2 + y^2 + z^2)^{1/2} (2z)}{(x^2 + y^2 + z^2)^3}
\end{aligned}$$

$$\begin{aligned}
 &= \frac{(x^2 + y^2 + z^2)^{1/2}}{(x^2 + y^2 + z^2)^3} [x^2 + y^2 + z^2 - 3x^2 + x^2 + y^2 + z^2 - 3y^2 + x^2 + y^2 + z^2 - 3z^2] \\
 &= 0
 \end{aligned}$$

Hence,  $\vec{F}$  is solenoidal.

**Proved.**

**Example 45.** Given the vector field  $\vec{V} = (x^2 - y^2 + 2xz) \hat{i} + (xz - xy + yz) \hat{j} + (z^2 + x^2) \hat{k}$  find  $\text{curl } V$ . Show that the vectors given by  $\text{curl } V$  at  $P_0(1, 2, -3)$  and  $P_1(2, 3, 12)$  are orthogonal.

**Solution.**

$$\begin{aligned}
 \overline{\text{Curl}} \vec{V} &= \vec{\nabla} \times \vec{V} \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(x^2 - y^2 + 2xz) \hat{i} + (xz - xy + yz) \hat{j} + (z^2 + x^2) \hat{k}]
 \end{aligned}$$

$$\begin{aligned}
 \text{curl } \vec{V} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 - y^2 + 2xz & xz - xy + yz & z^2 + x^2 \end{vmatrix} \\
 &= -(x + y) \hat{i} - (2x - 2y) \hat{j} + (z - y + 2y) \hat{k} = -(x + y) \hat{i} + (y + z) \hat{k}
 \end{aligned}$$

$$\text{curl } \vec{V} \text{ at } P_0(1, 2, -3) = -(1+2) \hat{i} + (2-3) \hat{k} = -3 \hat{i} - \hat{k}$$

$$\text{curl } \vec{V} \text{ at } P_1(2, 3, 12) = -(2+3) \hat{i} + (3+12) \hat{k} = -5 \hat{i} + 15 \hat{k}$$

The  $\text{curl } \vec{V}$  at  $(1, 2, -3)$  and  $(2, 3, 12)$  are perpendicular since

$$(-3 \hat{i} - \hat{k}) \cdot (-5 \hat{i} + 15 \hat{k}) = 15 - 15 = 0$$

**Proved.**

**Example 46.** Find the constants  $a, b, c$ , so that

$$\vec{F} = (x+2y+az) \hat{i} + (bx-3y-z) \hat{j} + (4x+cy+2z) \hat{k} \quad \dots(1)$$

is irrotational and hence find function  $\phi$  such that  $\vec{F} = \nabla\phi$ .

(Nagpur University, Summer 2005, Winter 2000; R.G.P.V., Bhopal 2009)

**Solution.** We have,

$$\begin{aligned}
 \nabla \times \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ (x+2y+az) & (bx-3y-z) & (4x+cy+2z) \end{vmatrix} \\
 &= (c+1) \hat{i} - (4-a) \hat{j} + (b-2) \hat{k}
 \end{aligned}$$

As  $\vec{F}$  is irrotational,  $\nabla \times \vec{F} = \vec{0}$

$$\text{i.e., } (c+1) \hat{i} - (4-a) \hat{j} + (b-2) \hat{k} = 0 \hat{i} + 0 \hat{j} + 0 \hat{k}$$

$$\therefore c+1 = 0, \quad 4-a = 0 \quad \text{and} \quad b-2 = 0$$

$$\text{i.e., } a = 4, \quad b = 2, \quad c = -1$$

Putting the values of  $a, b, c$  in (1), we get

$$\vec{F} = (x+2y+4z) \hat{i} + (2x-3y-z) \hat{j} + (4x+y+2z) \hat{k}$$

Now we have to find  $\phi$  such that  $\vec{F} = \nabla\phi$

We know that

$$\begin{aligned}
 d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \\
 &= \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \nabla \phi \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= \bar{F} \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= [(x+2y+4z)\hat{i} + (2x-3y-z)\hat{j} + (4x-y+2z)\hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= (x+2y+4z) dx + (2x-3y-z) dy + (4x-y+2z) dz \\
 &= x dx - 3y dy + 2z dz + (2y dx + 2x dy) + (4z dx + 4x dz) + (-z dy - y dz) \\
 \phi &= \int x dx - 3 \int y dy + 2 \int z dz + \int (2y dx + 2x dy) + \int (4z dx + 4x dz) - \int (z dy - y dz) \\
 &= \frac{x^2}{2} - \frac{3y^2}{2} + z^2 + 2xy + 4zx - yz + c
 \end{aligned}
 \tag{Ans.}$$

**Example 47.** Let  $\vec{V}(x, y, z)$  be a differentiable vector function and  $\phi(x, y, z)$  be a scalar function. Derive an expression for  $\operatorname{div}(\phi \vec{V})$  in terms of  $\phi \cdot \vec{V}$ ,  $\operatorname{div} \vec{V}$  and  $\nabla \phi$ .

(U.P. I Semester, Winter 2003)

**Solution.** Let  $\vec{V} = V_1 \hat{i} + V_2 \hat{j} + V_3 \hat{k}$

$$\begin{aligned}
 \operatorname{div}(\phi \vec{V}) &= \vec{\nabla} \cdot (\phi \vec{V}) \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) [\phi V_1 \hat{i} + \phi V_2 \hat{j} + \phi V_3 \hat{k}] = \frac{\partial}{\partial x}(\phi V_1) + \frac{\partial}{\partial y}(\phi V_2) + \frac{\partial}{\partial z}(\phi V_3) \\
 &= \left( \phi \frac{\partial V_1}{\partial x} + \frac{\partial \phi}{\partial x} V_1 \right) + \left( \phi \frac{\partial V_2}{\partial y} + \frac{\partial \phi}{\partial y} V_2 \right) + \left( \phi \frac{\partial V_3}{\partial z} + \frac{\partial \phi}{\partial z} V_3 \right) \\
 &= \phi \left( \frac{\partial V_1}{\partial x} + \frac{\partial V_2}{\partial y} + \frac{\partial V_3}{\partial z} \right) + \left( \frac{\partial \phi}{\partial x} V_1 + \frac{\partial \phi}{\partial y} V_2 + \frac{\partial \phi}{\partial z} V_3 \right) \\
 &= \phi \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (V_1 \hat{i} + V_2 \hat{j} + V_3 \hat{k}) + \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (V_1 \hat{i} + V_2 \hat{j} + V_3 \hat{k}) \\
 &= \phi (\vec{\nabla} \cdot \vec{V}) + (\vec{\nabla} \phi) \cdot \vec{V} = \phi (\operatorname{div} \vec{V}) + (\operatorname{grad} \phi) \cdot \vec{V}
 \end{aligned}
 \tag{Ans.}$$

**Example 48.** If  $\vec{A}$  is a constant vector and  $\vec{R} = x \hat{i} + y \hat{j} + z \hat{k}$ , then prove that

$$\operatorname{Curl} \left[ \left( \vec{A} \cdot \vec{R} \right) \vec{A} \right] = \vec{A} \times \vec{R} \tag{K. University, Dec. 2009}$$

**Solution.** Let  $\vec{A} = A_1 \hat{i} + A_2 \hat{j} + A_3 \hat{k}$ ,

$$\vec{R} = x \hat{i} + y \hat{j} + z \hat{k}$$

$$\vec{A} \cdot \vec{R} = (A_1 \hat{i} + A_2 \hat{j} + A_3 \hat{k}) \cdot (x \hat{i} + y \hat{j} + z \hat{k}) = A_1 x + A_2 y + A_3 z$$

$$[\vec{A} \cdot \vec{R}] \vec{R} = (A_1 x + A_2 y + A_3 z) (x \hat{i} + y \hat{j} + z \hat{k})$$

$$= (A_1 x^2 + A_2 xy + A_3 zx) \hat{i} + (A_1 xy + A_2 y^2 + A_3 yz) \hat{j} + (A_1 xz + A_2 yz + A_3 z^2) \hat{k}$$

$$\operatorname{Curl} \left[ (\vec{A} \cdot \vec{R}) \vec{R} \right] = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ A_1 x^2 + A_2 xy + A_3 zx & A_2 xy + A_2 y^2 + A_3 yz & A_1 xz + A_2 yz + A_3 z^2 \end{vmatrix}$$

$$\begin{aligned}
 &= (A_2 z - A_3 y) \hat{i} - (A_1 z - A_3 x) \hat{j} + [A_1 y - A_2 x] \hat{k} \quad \dots (1) \\
 \text{L.H.S.} &= \vec{A} \times \vec{R} \\
 &= (A_1 \hat{i} + A_2 \hat{j} + A_3 \hat{k}) \times (x \hat{i} + y \hat{j} + z \hat{k}) \\
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ A_1 & A_2 & A_3 \\ x & y & z \end{vmatrix} \\
 &= (A_2 z - A_3 y) \hat{i} - (A_1 z - A_3 x) \hat{j} + (A_1 y - A_2 x) \hat{k} \\
 &= \text{R.H.S.} \quad [\text{From (1)}]
 \end{aligned}$$

**Example 49.** Suppose that  $\vec{U}, \vec{V}$  and  $f$  are continuously differentiable fields then

Prove that,  $\text{div } (\vec{U} \times \vec{V}) = \vec{V} \cdot \text{curl } \vec{U} - \vec{U} \cdot \text{curl } \vec{V}$ . (GBTU, 2012, M.U. 2003, 2005)

**Solution.** Let

$$\begin{aligned}
 \vec{U} &= u_1 \hat{i} + u_2 \hat{j} + u_3 \hat{k}, \quad \vec{V} = v_1 \hat{i} + v_2 \hat{j} + v_3 \hat{k} \\
 \vec{U} \times \vec{V} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix} \\
 &= (u_2 v_3 - u_3 v_2) \hat{i} - (u_1 v_3 - u_3 v_1) \hat{j} + (u_1 v_2 - u_2 v_1) \hat{k} \\
 \text{div } (\vec{U} \times \vec{V}) &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot [(u_2 v_3 - u_3 v_2) \hat{i} - (u_1 v_3 - u_3 v_1) \hat{j} + (u_1 v_2 - u_2 v_1) \hat{k}] \\
 &= \frac{\partial}{\partial x} (u_2 v_3 - u_3 v_2) + \frac{\partial}{\partial y} (-u_1 v_3 + u_3 v_1) + \frac{\partial}{\partial z} (u_1 v_2 - u_2 v_1) \\
 &= \left[ u_2 \frac{\partial v_3}{\partial x} + v_3 \frac{\partial u_2}{\partial x} - u_3 \frac{\partial v_2}{\partial x} - v_2 \frac{\partial u_3}{\partial x} \right] + \left[ -u_1 \frac{\partial v_3}{\partial y} - v_3 \frac{\partial u_1}{\partial y} + u_3 \frac{\partial v_1}{\partial y} + v_1 \frac{\partial u_3}{\partial y} \right] \\
 &\quad + \left[ u_1 \frac{\partial v_2}{\partial z} + v_2 \frac{\partial u_1}{\partial z} - u_2 \frac{\partial v_1}{\partial z} - v_1 \frac{\partial u_2}{\partial z} \right] \\
 &= v_1 \left( \frac{\partial u_3}{\partial y} - \frac{\partial u_2}{\partial z} \right) + v_2 \left( -\frac{\partial u_3}{\partial x} + \frac{\partial u_1}{\partial z} \right) + v_3 \left( \frac{\partial u_2}{\partial x} - \frac{\partial u_1}{\partial y} \right) \\
 &\quad + u_1 \left( -\frac{\partial v_3}{\partial y} + \frac{\partial v_2}{\partial z} \right) + u_2 \left( \frac{\partial v_3}{\partial x} - \frac{\partial v_1}{\partial z} \right) + u_3 \left( \frac{\partial v_1}{\partial y} - \frac{\partial v_2}{\partial x} \right) \\
 &= (v_1 \hat{i} + v_2 \hat{j} + v_3 \hat{k}) \cdot \left[ \hat{i} \left( \frac{\partial u_3}{\partial y} - \frac{\partial u_2}{\partial z} \right) + \hat{j} \left( -\frac{\partial u_3}{\partial x} + \frac{\partial u_1}{\partial z} \right) + \hat{k} \left( \frac{\partial u_2}{\partial x} - \frac{\partial u_1}{\partial y} \right) \right] \\
 &\quad - (u_1 \hat{i} + u_2 \hat{j} + u_3 \hat{k}) \cdot \left[ \hat{i} \left( -\frac{\partial v_3}{\partial y} + \frac{\partial v_2}{\partial z} \right) + \hat{j} \left( \frac{\partial v_3}{\partial x} - \frac{\partial v_1}{\partial z} \right) + \hat{k} \left( \frac{\partial v_1}{\partial y} - \frac{\partial v_2}{\partial x} \right) \right] \\
 &= \vec{V} \cdot (\vec{U} \times \vec{V}) - \vec{U} \cdot (\vec{V} \times \vec{V}) = \vec{V} \cdot \text{curl } \vec{U} - \vec{U} \cdot \text{curl } \vec{V} \quad \text{Proved.}
 \end{aligned}$$

**Example 50.** Prove that

$$\vec{\nabla} \times (\vec{F} \times \vec{G}) = \vec{F}(\vec{\nabla} \cdot \vec{G}) - \vec{G}(\vec{\nabla} \cdot \vec{F}) + (\vec{G} \cdot \vec{\nabla}) \vec{F} - (\vec{F} \cdot \vec{\nabla}) \vec{G} \quad (\text{M.U. 2004, 2005})$$

**Solution.**

$$\begin{aligned}
 \vec{\nabla} \times (\vec{F} \times \vec{G}) &= \Sigma \hat{i} \times \frac{\partial}{\partial x} (\vec{F} \times \vec{G}) \\
 &= \Sigma \hat{i} \times \left( \frac{\partial F}{\partial x} \times \vec{G} + \vec{F} \times \frac{\partial G}{\partial x} \right) = \Sigma \hat{i} \times \left( \frac{\partial F}{\partial x} \times \vec{G} \right) + \Sigma \hat{i} \times \left( \vec{F} \times \frac{\partial G}{\partial x} \right)
 \end{aligned}$$

$$\begin{aligned}
&= \Sigma \left[ (\hat{i} \cdot \vec{G}) \frac{\partial F}{\partial x} - \left( \hat{i} \frac{\partial F}{\partial x} \right) \vec{G} \right] + \Sigma \left[ \left( \hat{i} \frac{\partial G}{\partial x} \right) \vec{F} - (\hat{i} \cdot \vec{F}) \frac{\partial G}{\partial x} \right] \\
&= \Sigma (\vec{G} \cdot \hat{i}) \frac{\partial F}{\partial x} - \vec{G} \Sigma \left( \hat{i} \frac{\partial F}{\partial x} \right) + \vec{F} \Sigma \left( \hat{i} \frac{\partial G}{\partial x} \right) - \Sigma (\vec{F} \cdot \hat{i}) \frac{\partial G}{\partial x} \\
&= \vec{F} \left( \Sigma \hat{i} \frac{\partial G}{\partial x} \right) - \vec{G} \Sigma \left( \hat{i} \frac{\partial F}{\partial x} \right) + \Sigma (\vec{G} \cdot \hat{i}) \frac{\partial F}{\partial x} - \Sigma (\vec{F} \cdot \hat{i}) \frac{\partial G}{\partial x} \\
&= \vec{F} (\vec{\nabla} \vec{G}) - \vec{G} (\vec{\nabla} \cdot \vec{F}) + (\vec{G} \cdot \vec{\nabla}) \vec{F} - (\vec{F} \cdot \vec{\nabla}) \vec{G}
\end{aligned}$$

**Proved.**

**Example 51.** Prove that, for every field  $\vec{V}$ ;  $\operatorname{div} \operatorname{curl} \vec{V} = 0$ .

(Nagpur University, Summer 2004; AMIETE, Sem II, June 2010)

**Solution.** Let

$$\begin{aligned}
V &= V_1 \hat{i} + V_2 \hat{j} + V_3 \hat{k} \\
\operatorname{div} (\overline{\operatorname{curl}} \vec{V}) &= \vec{\nabla} \cdot (\vec{\nabla} \times \vec{V}) \\
&= \vec{\nabla} \cdot \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ V_1 & V_2 & V_3 \end{vmatrix} \\
&= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot \left[ \hat{i} \left( \frac{\partial V_3}{\partial y} - \frac{\partial V_2}{\partial z} \right) - \hat{j} \left( \frac{\partial V_3}{\partial x} - \frac{\partial V_1}{\partial z} \right) + \hat{k} \left( \frac{\partial V_2}{\partial x} - \frac{\partial V_1}{\partial y} \right) \right] \\
&= \frac{\partial}{\partial x} \left( \frac{\partial V_3}{\partial y} - \frac{\partial V_2}{\partial z} \right) - \frac{\partial}{\partial y} \left( \frac{\partial V_3}{\partial x} - \frac{\partial V_1}{\partial z} \right) + \frac{\partial}{\partial z} \left( \frac{\partial V_2}{\partial x} - \frac{\partial V_1}{\partial y} \right) \\
&= \frac{\partial^2 V_3}{\partial x \partial y} - \frac{\partial^2 V_2}{\partial x \partial z} - \frac{\partial^2 V_3}{\partial y \partial x} + \frac{\partial^2 V_1}{\partial y \partial z} + \frac{\partial^2 V_2}{\partial z \partial x} - \frac{\partial^2 V_1}{\partial z \partial y} \\
&= \left( \frac{\partial^2 V_1}{\partial y \partial z} - \frac{\partial^2 V_1}{\partial z \partial y} \right) + \left( \frac{\partial^2 V_2}{\partial z \partial x} - \frac{\partial^2 V_2}{\partial x \partial z} \right) + \left( \frac{\partial^2 V_3}{\partial x \partial y} - \frac{\partial^2 V_3}{\partial y \partial x} \right) \\
&= 0
\end{aligned}$$

**Ans.**

**Example 52.** If  $\vec{a}$  is a constant vector, show that

$$\vec{a} \times (\vec{\nabla} \times \vec{r}) = \vec{\nabla}(\vec{a} \cdot \vec{r}) - (\vec{a} \cdot \vec{\nabla}) \vec{r}. \quad (\text{U.P., Ist Semester, Dec. 2007})$$

**Solution.**

$$\begin{aligned}
\vec{a} &= a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}, \quad \vec{r} = r_1 \hat{i} + r_2 \hat{j} + r_3 \hat{k} \\
\vec{\nabla} \times \vec{r} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ r_1 & r_2 & r_3 \end{vmatrix} = \left( \frac{\partial r_3}{\partial y} - \frac{\partial r_2}{\partial z} \right) \hat{i} - \left( \frac{\partial r_3}{\partial x} - \frac{\partial r_1}{\partial z} \right) \hat{j} + \left( \frac{\partial r_2}{\partial x} - \frac{\partial r_1}{\partial y} \right) \hat{k} \\
\vec{a} \times (\vec{\nabla} \times \vec{r}) &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ \frac{\partial r_3}{\partial y} - \frac{\partial r_2}{\partial z} & -\frac{\partial r_3}{\partial x} + \frac{\partial r_1}{\partial z} & \frac{\partial r_2}{\partial x} - \frac{\partial r_1}{\partial y} \end{vmatrix}
\end{aligned}$$

$$\begin{aligned}
&= \left[ \left( a_2 \frac{\partial r_2}{\partial x} - a_2 \frac{\partial r_1}{\partial y} \right) - \left( -a_3 \frac{\partial r_3}{\partial x} + a_3 \frac{\partial r_1}{\partial z} \right) \right] \hat{i} - \left[ a_1 \frac{\partial r_2}{\partial x} - a_1 \frac{\partial r_1}{\partial y} - a_3 \frac{\partial r_3}{\partial y} + a_3 \frac{\partial r_2}{\partial z} \right] \hat{j} \\
&\quad + \left[ -a_1 \frac{\partial r_3}{\partial x} + a_1 \frac{\partial r_1}{\partial z} - a_2 \frac{\partial r_3}{\partial y} + a_2 \frac{\partial r_2}{\partial z} \right] \hat{k} \\
&= \left[ \left( a_1 \hat{i} \frac{\partial r_1}{\partial x} + a_2 \hat{i} \frac{\partial r_2}{\partial x} + a_3 \hat{i} \frac{\partial r_3}{\partial x} \right) + \left( a_1 \hat{j} \frac{\partial r_1}{\partial y} + a_2 \hat{j} \frac{\partial r_2}{\partial y} + a_3 \hat{j} \frac{\partial r_3}{\partial y} \right) \right. \\
&\quad \left. + \left( a_1 \hat{k} \frac{\partial r_1}{\partial z} + a_2 \hat{k} \frac{\partial r_2}{\partial z} + a_3 \hat{k} \frac{\partial r_3}{\partial z} \right) \right] - \left[ \left( a_1 \hat{i} \frac{\partial r_1}{\partial x} + a_1 \hat{j} \frac{\partial r_2}{\partial x} + a_1 \hat{k} \frac{\partial r_3}{\partial x} \right) \right. \\
&\quad \left. + \left( a_2 \hat{i} \frac{\partial r_1}{\partial y} + a_2 \hat{j} \frac{\partial r_2}{\partial y} + a_2 \hat{k} \frac{\partial r_3}{\partial y} \right) + \left( a_3 \hat{i} \frac{\partial r_1}{\partial z} + a_3 \hat{j} \frac{\partial r_2}{\partial z} + a_3 \hat{k} \frac{\partial r_3}{\partial z} \right) \right] \\
&= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (a_1 r_1 + a_2 r_2 + a_3 r_3) - \left[ a_1 \frac{\partial}{\partial x} + a_2 \frac{\partial}{\partial y} + a_3 \frac{\partial}{\partial z} \right] (\hat{r}_1 \hat{i} + \hat{r}_2 \hat{j} + \hat{r}_3 \hat{k}) \\
&= \vec{\nabla}(a \cdot \vec{r}) - (a \cdot \vec{\nabla}) \vec{r}
\end{aligned}$$

**Proved.**

**Example 53.** If  $r$  is the distance of a point  $(x, y, z)$  from the origin, prove that  $\text{Curl} \left( k \times \text{grad} \frac{1}{r} \right) + \text{grad} \left( k \cdot \text{grad} \frac{1}{r} \right) = 0$ , where  $k$  is the unit vector in the direction OZ. (U.P., I Semester, Winter 2000)

**Solution.**

$$\begin{aligned}
r^2 &= (x - 0)^2 + (y - 0)^2 + (z - 0)^2 = x^2 + y^2 + z^2 \\
\Rightarrow \frac{1}{r} &= (x^2 + y^2 + z^2)^{-1/2} \\
\text{grad} \frac{1}{r} &= \vec{\nabla} \frac{1}{r} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2)^{-1/2} \\
&= -\frac{1}{2} (x^2 + y^2 + z^2)^{-3/2} (2x \hat{i} + 2y \hat{j} + 2z \hat{k}) \\
&= -(x^2 + y^2 + z^2)^{-3/2} (x \hat{i} + y \hat{j} + z \hat{k}) \\
k \times \text{grad} \frac{1}{r} &= k \times [-(x^2 + y^2 + z^2)^{-3/2} (x \hat{i} + y \hat{j} + z \hat{k})] \\
&= -(x^2 + y^2 + z^2)^{-3/2} (x \hat{j} - y \hat{i}) \\
\text{curl} \left( k \times \text{grad} \frac{1}{r} \right) &= \vec{\nabla} \times \left( k \times \text{grad} \frac{1}{r} \right) \\
&= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [-(x^2 + y^2 + z^2)^{-3/2} (x \hat{j} - y \hat{i})] \\
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{y}{(x^2 + y^2 + z^2)^{3/2}} & \frac{-x}{(x^2 + y^2 + z^2)^{3/2}} & 0 \end{vmatrix} \\
&= -\left( -\frac{3}{2} \right) \frac{(-x)(2z)}{(x^2 + y^2 + z^2)^{5/2}} \hat{i} + \frac{3}{2} \frac{y(2z)}{(x^2 + y^2 + z^2)^{5/2}} \hat{j} + \left[ -\frac{3}{2} \frac{(-x)(2x)}{(x^2 + y^2 + z^2)^{5/2}} \right. \\
&\quad \left. - \frac{1}{(x^2 + y^2 + z^2)^{3/2}} - \frac{(-3/2)(y)(2y)}{(x^2 + y^2 + z^2)^{5/2}} - \frac{1}{(x^2 + y^2 + z^2)^{3/2}} \right] \hat{k}
\end{aligned}$$

$$\begin{aligned}
&= \frac{-3xz}{(x^2+y^2+z^2)^{5/2}} \hat{i} - \frac{3yz}{(x^2+y^2+z^2)^{5/2}} \hat{j} + \frac{(3x^2-x^2-y^2-z^2+3y^2-x^2-y^2-z^2) \hat{k}}{(x^2+y^2+z^2)^{5/2}} \\
&= \frac{-3xz \hat{i} - 3yz \hat{j} + (x^2+y^2-2z^2) \hat{k}}{(x^2+y^2+z^2)^{5/2}}
\end{aligned} \quad \dots(1)$$

$$k \cdot \text{grad} \frac{1}{r} = k \cdot [-(x^2+y^2+z^2)^{-3/2} (x \hat{i} + y \hat{j} + z \hat{k})] = \frac{-z}{(x^2+y^2+z^2)^{3/2}}$$

$$\begin{aligned}
\text{grad} \left( k \cdot \text{grad} \frac{1}{r} \right) &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \frac{-z}{(x^2+y^2+z^2)^{3/2}} \\
&= -\frac{3}{2} \frac{\hat{i}(-z)(2x)}{(x^2+y^2+z^2)^{5/2}} + -\frac{3}{2} \frac{\hat{j}(-z)(2y)}{(x^2+y^2+z^2)^{5/2}} \\
&\quad + \left[ -\frac{3}{2} \frac{(-z)(2z)}{(x^2+y^2+z^2)^{5/2}} - \frac{1}{(x^2+y^2+z^2)^{3/2}} \right] \hat{k}
\end{aligned}$$

$$= \frac{3xz \hat{i} + 3yz \hat{j} + (3z^2-x^2-y^2-z^2) \hat{k}}{(x^2+y^2+z^2)^{5/2}} = \frac{3xz \hat{i} + 3yz \hat{j} - (x^2+y^2-2z^2) \hat{k}}{(x^2+y^2+z^2)^{5/2}} \quad \dots(2)$$

Adding (1) and (2), we get

$$\text{Curl} \left( k \times \text{grad} \frac{1}{r} \right) + \text{grad} \left( k \cdot \text{grad} \frac{1}{r} \right) = 0 \quad \text{Proved.}$$

$$\begin{aligned}
\text{Example 54. Prove that } \nabla \times \left( \frac{\vec{a} \times \vec{r}}{r^n} \right) &= \frac{(2-n)\vec{a}}{r^n} + \frac{n(\vec{a} \cdot \vec{r})\vec{r}}{r^{n+2}}. \\
&\quad (\text{M.U. 2009, 2005, 2003, 2002; AMIETE, II Sem. June 2010})
\end{aligned}$$

**Solution.** We have,

$$\begin{aligned}
\frac{\vec{a} \times \vec{r}}{r^n} &= \frac{1}{r^n} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ x & y & z \end{vmatrix} \\
&= \frac{1}{r^n} (a_2 z - a_3 y) \hat{i} + \frac{1}{r^n} (a_3 x - a_1 z) \hat{j} + \frac{1}{r^n} (a_1 y - a_2 x) \hat{k} \\
\nabla \times \frac{(\vec{a} \times \vec{r})}{r^n} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{a_2 z - a_3 y}{r^n} & \frac{a_3 x - a_1 z}{r^n} & \frac{a_1 y - a_2 x}{r^n} \end{vmatrix} \\
&= \hat{i} \left[ \frac{\partial}{\partial y} \left( \frac{a_1 y - a_2 x}{r^n} \right) - \frac{\partial}{\partial z} \left( \frac{a_3 x - a_1 z}{r^n} \right) \right] - \hat{j} \left[ \frac{\partial}{\partial x} \left( \frac{a_1 y - a_2 x}{r^n} \right) - \frac{\partial}{\partial z} \left( \frac{a_2 z - a_3 y}{r^n} \right) \right] \\
&\quad + \hat{k} \left[ \frac{\partial}{\partial x} \left( \frac{a_3 x - a_1 z}{r^n} \right) - \frac{\partial}{\partial y} \left( \frac{a_2 z - a_3 y}{r^n} \right) \right]
\end{aligned}$$

$$\text{Now, } r^2 = x^2 + y^2 + z^2 \Rightarrow 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}$$

$$\text{Similarly, } \frac{\partial r}{\partial y} = \frac{y}{r}, \quad \frac{\partial r}{\partial z} = \frac{z}{r}$$

$$\begin{aligned}
\therefore \nabla \times \left( \frac{\vec{a} \times \vec{r}}{r^n} \right) &= \hat{i} \left[ \left\{ -nr^{-n-1} \left( \frac{y}{r} \right) (a_1 y - a_2 x) + \frac{1}{r^n} a_1 \right\} \right. \\
&\quad \left. - \left\{ -nr^{-n-1} \left( \frac{z}{r} \right) (a_3 x - a_1 z) + \frac{1}{r^n} (-a_1) \right\} \right] + \text{two similar terms} \\
&= \hat{i} \left[ -\frac{n}{r^{n+2}} (a_1 y^2 - a_2 xy) + \frac{a_1}{r^n} + \frac{n}{r^{n+2}} (a_3 xz - a_1 z^2) + \frac{a_1}{r^n} \right] \\
&\quad + \text{two similar terms} \\
&= \hat{i} \left[ \frac{2a_1}{r^n} - \frac{n}{r^{n+2}} a_1 (y^2 + z^2) + \frac{n}{r^{n+2}} (a_2 xy + a_3 xz) \right] + \text{two similar terms}
\end{aligned}$$

Adding and subtracting  $\frac{n}{r^{n+2}} a_1 x^2$  to third and from second term, we get

$$\begin{aligned}
\vec{\nabla} \times \left( \frac{\vec{a} \times \vec{r}}{r^n} \right) &= \hat{i} \left[ \frac{2a_1}{r^n} - \frac{na_1}{r^{n+2}} (x^2 + y^2 + z^2) + \frac{n}{r^{n+2}} (a_1 x^2 + a_2 xy + a_3 xz) \right] \\
&\quad + \text{two similar terms} \\
&= \hat{i} \left[ \frac{2a_1}{r^n} - \frac{na_1}{r^{n+2}} r^2 + \frac{n}{r^{n+2}} x(a_1 x + a_2 y + a_3 z) \right] + \text{two similar terms} \\
&= \hat{i} \left[ \frac{2a_1}{r^n} - \frac{na_1}{r^n} + \frac{n}{r^{n+2}} x(a_1 x + a_2 y + a_3 z) \right] + \hat{j} \left[ \frac{2a_2}{r^n} - \frac{na_2}{r^n} + \frac{n}{r^{n+2}} y(a_2 y + a_3 z + a_1 x) \right] \\
&\quad + \hat{k} \left[ \frac{2a_3}{r^n} - \frac{na_3}{r^n} + \frac{n}{r^{n+2}} z(a_3 z + a_1 x + a_2 y) \right] \\
&= \frac{2}{r^n} (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) - \frac{n}{r^n} (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) + \frac{n}{r^{n+2}} (a_1 x + a_2 y + a_3 z) (\hat{x} i + \hat{y} j + \hat{z} k) \\
&= \frac{2-n}{r^n} (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) + \frac{n}{r^{n+2}} (a_1 x + a_2 y + a_3 z) (\hat{x} i + \hat{y} j + \hat{z} k) \\
&= \frac{2-n}{r^n} \vec{a} + \frac{n}{r^{n+2}} (\vec{a} \cdot \vec{r}) \vec{r}
\end{aligned}$$

**Proved.**

**Example 55.** If  $f$  and  $g$  are two scalar point functions, prove that

$$\operatorname{div}(f \nabla g) = f \nabla^2 g + \nabla f \nabla g. \quad (\text{U.P., I Semester, compartment, Winter 2001})$$

**Solution.** We have,  $\nabla g = \frac{\partial g}{\partial x} \hat{i} + \frac{\partial g}{\partial y} \hat{j} + \frac{\partial g}{\partial z} \hat{k}$

$$\begin{aligned}
\Rightarrow f \nabla g &= f \frac{\partial g}{\partial x} \hat{i} + f \frac{\partial g}{\partial y} \hat{j} + f \frac{\partial g}{\partial z} \hat{k} \\
\Rightarrow \operatorname{div}(f \nabla g) &= \frac{\partial}{\partial x} \left( f \frac{\partial g}{\partial x} \right) + \frac{\partial}{\partial y} \left( f \frac{\partial g}{\partial y} \right) + \frac{\partial}{\partial z} \left( f \frac{\partial g}{\partial z} \right) \\
&= f \left( \frac{\partial^2 g}{\partial x^2} + \frac{\partial^2 g}{\partial y^2} + \frac{\partial^2 g}{\partial z^2} \right) + \left( \frac{\partial f}{\partial x} \frac{\partial g}{\partial x} + \frac{\partial f}{\partial y} \frac{\partial g}{\partial y} + \frac{\partial f}{\partial z} \frac{\partial g}{\partial z} \right) \\
&= f \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2} \right) g + \left( \frac{\partial f}{\partial x} \hat{i} + \frac{\partial f}{\partial y} \hat{j} + \frac{\partial f}{\partial z} \hat{k} \right) \cdot \left( \frac{\partial g}{\partial x} \hat{i} + \frac{\partial g}{\partial y} \hat{j} + \frac{\partial g}{\partial z} \hat{k} \right) \\
&= f \nabla^2 g + \nabla f \nabla g
\end{aligned}$$

**Proved.**

**Example 56.** Establish the relation  $\operatorname{curl} \operatorname{curl} \vec{f} = \vec{\nabla} \operatorname{div} \vec{f} - \nabla^2 \vec{f}$ .

(U.P., I Semester, Compartment 2002)

**Solution.** Let  $\vec{f} = f_1 \hat{i} + f_2 \hat{j} + f_3 \hat{k}$ , then by definition,

$$\begin{aligned}
 \text{Curl } \vec{f} &= \left| \begin{array}{ccc} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ f_1 & f_2 & f_3 \end{array} \right| = \left( \frac{\partial f_3}{\partial y} - \frac{\partial f_2}{\partial z} \right) \hat{i} + \left( \frac{\partial f_1}{\partial z} - \frac{\partial f_3}{\partial x} \right) \hat{j} + \left( \frac{\partial f_2}{\partial x} - \frac{\partial f_1}{\partial y} \right) \hat{k} \\
 \therefore \text{Curl curl } \vec{f} &= \left| \begin{array}{ccc} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{\partial f_3}{\partial y} - \frac{\partial f_2}{\partial z} & \frac{\partial f_1}{\partial z} - \frac{\partial f_3}{\partial x} & \frac{\partial f_2}{\partial x} - \frac{\partial f_1}{\partial y} \end{array} \right| = \left[ \frac{\partial}{\partial y} \left( \frac{\partial f_2}{\partial x} - \frac{\partial f_1}{\partial y} \right) - \frac{\partial}{\partial z} \left( \frac{\partial f_1}{\partial z} - \frac{\partial f_3}{\partial x} \right) \right] \hat{i} \\
 &\quad - \left[ \frac{\partial}{\partial x} \left( \frac{\partial f_2}{\partial x} - \frac{\partial f_1}{\partial y} \right) - \frac{\partial}{\partial z} \left( \frac{\partial f_3}{\partial y} - \frac{\partial f_2}{\partial z} \right) \right] \hat{j} + \left[ \frac{\partial}{\partial x} \left( \frac{\partial f_1}{\partial z} - \frac{\partial f_3}{\partial x} \right) - \frac{\partial}{\partial y} \left( \frac{\partial f_3}{\partial y} - \frac{\partial f_2}{\partial z} \right) \right] \hat{k} \\
 &= \left[ \frac{\partial^2 f_2}{\partial y \partial x} - \frac{\partial^2 f_1}{\partial y^2} - \frac{\partial^2 f_1}{\partial z^2} + \frac{\partial^2 f_3}{\partial z \partial x} \right] \hat{i} \\
 &\quad - \left[ \frac{\partial^2 f_2}{\partial x^2} - \frac{\partial^2 f_1}{\partial x \partial y} - \frac{\partial^2 f_3}{\partial z \partial y} + \frac{\partial^2 f_2}{\partial z^2} \right] \hat{j} + \left[ \frac{\partial^2 f_1}{\partial x \partial z} - \frac{\partial^2 f_3}{\partial x^2} - \frac{\partial^2 f_3}{\partial y^2} + \frac{\partial^2 f_2}{\partial y \partial z} \right] \hat{k} \\
 &= \left[ \frac{\partial^2 f_1}{\partial x^2} + \frac{\partial^2 f_2}{\partial y \partial x} + \frac{\partial^2 f_3}{\partial z \partial x} - \left( \frac{\partial^2 f_1}{\partial x^2} + \frac{\partial^2 f_1}{\partial y^2} + \frac{\partial^2 f_1}{\partial z^2} \right) \right] \hat{i} \\
 &\quad - \left[ \frac{\partial^2 f_1}{\partial x \partial z} + \frac{\partial^2 f_2}{\partial y^2} + \frac{\partial^2 f_3}{\partial x \partial y} - \left( \frac{\partial^2 f_2}{\partial x^2} + \frac{\partial^2 f_2}{\partial y^2} + \frac{\partial^2 f_2}{\partial z^2} \right) \right] \hat{j} \\
 &\quad + \left[ \frac{\partial^2 f_1}{\partial x \partial z} - \frac{\partial^2 f_1}{\partial y^2} + \frac{\partial^2 f_2}{\partial y \partial z} - \left( \frac{\partial^2 f_3}{\partial x^2} + \frac{\partial^2 f_3}{\partial y^2} + \frac{\partial^2 f_3}{\partial z^2} \right) \right] \hat{k} \\
 &= \left[ \frac{\partial}{\partial x} \left( \frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) - \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2} \right) f_1 \right] \hat{i} \\
 &\quad + \left[ \frac{\partial}{\partial y} \left( \frac{\partial f_2}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_2}{\partial z} \right) - \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2} \right) f_2 \right] \hat{j} \\
 &\quad + \left[ \frac{\partial}{\partial z} \left( \frac{\partial f_3}{\partial x} + \frac{\partial f_3}{\partial y} + \frac{\partial f_3}{\partial z} \right) - \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2} \right) f_3 \right] \hat{k} \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (\nabla f_1 + \nabla f_2 + \nabla f_3) \\
 &= \frac{\partial}{\partial x} (\operatorname{div} \vec{f} - \nabla^2 f_1) \hat{i} + \frac{\partial}{\partial y} (\operatorname{div} \vec{f} - \nabla^2 f_2) \hat{j} + \frac{\partial}{\partial z} (\operatorname{div} \vec{f} - \nabla^2 f_3) \hat{k} \\
 &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \operatorname{div} \vec{f} - \nabla^2 [f_1 \hat{i} + f_2 \hat{j} + f_3 \hat{k}] = \nabla (\nabla \cdot \vec{f}) - \nabla^2 \vec{f} \\
 &= \operatorname{grad} \operatorname{div} \vec{f} - \nabla^2 \vec{f}
 \end{aligned}$$

**Proved.**

**Example 57.** For a solenoidal vector  $\vec{F}$ , show that  $\operatorname{curl} \operatorname{curl} \operatorname{curl} \operatorname{curl} \vec{F} = \nabla^4 \vec{F}$ .

(M.D.U., Dec. 2009)

**Solution.** Since vector  $\vec{F}$  is solenoidal, so  $\operatorname{div} \vec{F} = 0$  ... (1)

We know that  $\operatorname{curl} \operatorname{curl} \vec{F} = \operatorname{grad} \operatorname{div} (\vec{F} - \nabla^2 \vec{F})$  ... (2)

Using (1) in (2),  $\operatorname{grad} \operatorname{div} \vec{F} = \operatorname{grad}(0) = 0$  ... (3)

On putting the value of  $\operatorname{grad} \operatorname{div} \vec{F}$  in (2), we get

$\operatorname{curl} \operatorname{curl} \vec{F} = -\nabla^2 \vec{F}$  ... (4)

Now,  $\operatorname{curl} \operatorname{curl} \operatorname{curl} \operatorname{curl} \vec{F} = \operatorname{curl} \operatorname{curl} (-\nabla^2 \vec{F})$  [Using (4)]

$= -\operatorname{curl} \operatorname{curl} (\nabla^2 \vec{F}) = -[\operatorname{grad} \operatorname{div} (\nabla^2 \vec{F}) - \nabla^2 (\nabla^2 \vec{F})]$  [Using (2)]

$= -\operatorname{grad} (\nabla \cdot \nabla^2 \vec{F}) + \nabla^2 (\nabla^2 \vec{F}) = -\operatorname{grad} (\nabla^2 \nabla \cdot \vec{F}) + \nabla^4 \vec{F}$  [ $\nabla \cdot \vec{F} = 0$ ]

$= 0 + \nabla^4 \vec{F} = \nabla^4 \vec{F}$  [Using (1)] **Proved.**

### EXERCISE 23.4

1. Find the divergence and curl of the vector field  $V = (x^2 - y^2) \hat{i} + 2xy \hat{j} + (y^2 - xy) \hat{k}$ .

**Ans.** Divergence =  $4x$ , Curl =  $(2y - x) \hat{i} + y \hat{j} + 4y \hat{k}$

2. If  $a$  is constant vector and  $r$  is the radius vector, prove that

$$(i) \quad \nabla(\vec{a} \cdot \vec{r}) = \vec{a} \quad (ii) \quad \operatorname{div}(\vec{r} \times \vec{a}) = 0 \quad (iii) \quad \operatorname{curl}(\vec{r} \times \vec{a}) = -2\vec{a}$$

where  $\vec{r} = x \hat{i} + y \hat{j} + z \hat{k}$  and  $\vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}$ .

3. Prove that:

$$\nabla(A \cdot B) = (A \cdot \nabla)B + (B \cdot \nabla)A + A \times (\nabla \times B) + B \times (\nabla \times A) \quad (R.G.P.V. Bhopal, June 2004)$$

4. If  $F = (x + y + 1) \hat{i} + \hat{j} - (x + y) \hat{k}$ , show that  $F \cdot \operatorname{curl} F = 0$ .

(R.G.P.V. Bhopal, Feb. 2006, June 2004)

**Prove that**

5.  $\vec{\nabla} \times (\phi \vec{F}) = (\vec{\nabla} \phi) \times \vec{F} + \phi (\vec{\nabla} \times \vec{F})$

6.  $\nabla \cdot (\vec{F} \times \vec{G}) = \vec{G} \cdot (\nabla \times \vec{F}) - \vec{F} \cdot (\nabla \times \vec{G})$

7. Prove that  $\operatorname{curl}(\vec{a} \times \vec{r}) = 2\vec{a}$

8. Evaluate curl grad, rm, where  $\vec{r} = |\vec{r}| = |x \hat{i} + y \hat{j} + z \hat{k}|$  **Ans.** 0

9. Find div  $\vec{F}$  and curl  $F$  where  $F = \operatorname{grad} (x^3 + y^3 + z^3 - 3xyz)$ . (R.G.P.V. Bhopal Dec. 2003)

**Ans.**  $\operatorname{div} \vec{F} = 6(x + y + z)$ ,  $\operatorname{curl} \vec{F} = 0$

10. Find out values of  $a$ ,  $b$ ,  $c$  for which  $\vec{v} = (x + y + az) \hat{i} + (bx + 3y - z) \hat{j} + (3x + cy + z) \hat{k}$  is irrotational.

**Ans.**  $a = 3$ ,  $b = 1$ ,  $c = -1$

11. Determine the constants  $a$ ,  $b$ ,  $c$ , so that  $\vec{F} = (x + 2y + az) \hat{i} + (bx - 3y - z) \hat{j} + (4x + cy + 2z) \hat{k}$  is irrotational. Hence find the scalar potential  $\phi$  such that  $\vec{F} = \operatorname{grad} \phi$ . (R.G.P.V. Bhopal, Feb. 2005) **Ans.**  $a = 4$ ,  $b = 2$ ,  $c = 1$

Potential  $\phi = \left( \frac{x^2}{2} - \frac{3y^2}{2} + z^2 + 2xy - yz + 4zx \right)$

**Choose the correct alternative:**

12. The magnitude of the vector drawn in a direction perpendicular to the surface  $x^2 + 2y^2 + z^2 = 7$  at the point (1, -1, 2) is

(i)  $\frac{2}{3}$       (ii)  $\frac{3}{2}$       (iii) 3      (iv) 6      (A.M.I.E.T.E., Summer 2000) **Ans. (iv)**

13. If  $u = x^2 - y^2 + z^2$  and  $\bar{V} = \hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k}$  then  $\nabla \cdot (u\bar{V})$  is equal to

(i)  $5u$       (ii)  $5|\bar{V}|$       (iii)  $5(u - |\bar{V}|)$       (iv)  $5(u + |\bar{V}|)$  (A.M.I.E.T.E., June 2007) **Ans. (i)**

14. A unit normal to  $x^2 + y^2 + z^2 = 5$  at (0, 1, 2) is equal to

(i)  $\frac{1}{\sqrt{5}}(\hat{i} + \hat{j} + \hat{k})$       (ii)  $\frac{1}{\sqrt{5}}(\hat{i} + \hat{j} - \hat{k})$       (iii)  $\frac{1}{\sqrt{5}}(\hat{j} + 2\hat{k})$       (iv)  $\frac{1}{\sqrt{5}}(\hat{i} - \hat{j} + \hat{k})$  (A.M.I.E.T.E., Dec. 2008) **Ans. (iii)**

15. The directional derivative of  $\phi = xy\bar{z}$  at the point (1, 1, 1) in the direction  $\hat{i}$  is:

(i) -1      (ii)  $-\frac{1}{3}$       (iii) 1      (iv)  $\frac{1}{3}$       (R.G.P.V. Bhopal, II Sem., June 2007) **Ans. (iii)**

16. If  $\vec{r} = \hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k}$  and  $r = |\vec{r}|$  then  $\nabla\phi(r)$  is:

(i)  $\phi'(r)\hat{r}$       (ii)  $\frac{\phi(r)\vec{r}}{r}$       (iii)  $\frac{\phi'(r)\vec{r}}{r}$       (iv) None of these (R.G.P.V. Bhopal, II Semester, Feb. 2006)

17. If  $\vec{r} = \hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k}$  is position vector, then value of  $\nabla(\log r)$  is (U.P., I Sem, Dec 2008)

(i)  $\frac{\vec{r}}{r}$       (ii)  $\frac{\vec{r}}{r^2}$       (iii)  $-\frac{\vec{r}}{r^3}$       (iv) none of the above. **Ans. (ii)**

18. If  $\vec{r} = \hat{x}\hat{i} + \hat{y}\hat{j} + \hat{z}\hat{k}$  and  $|\vec{r}| = r$ , then  $\operatorname{div} \vec{r}$  is:

(i) 2      (ii) 3      (iii) -3      (iv) -2 (R.G.P.V. Bhopal, II Semester, Feb. 2006) **Ans. (ii)**

19. If  $\vec{V} = xy^2\hat{i} + 2yx^2\hat{z}\hat{j} - 3yz^2\hat{k}$  then  $\operatorname{curl} \vec{V}$  at point (1, -1, 1) is

(i)  $-(\hat{j} + 2\hat{k})$       (ii)  $(\hat{i} + 3\hat{k})$       (iii)  $-(\hat{i} + 2\hat{k})$       (iv)  $(\hat{i} + 2\hat{j} + \hat{k})$  (R.G.P.V. Bhopal, II Semester, Feb 2006) **Ans. (iii)**

20. If  $\vec{A}$  is such that  $\nabla \times \vec{A} = 0$  then  $\vec{A}$  is called

(i) Irrotational      (ii) Solenoidal      (iii) Rotational      (iv) None of these (A.M.I.E.T.E., Dec. 2008) **Ans. (i)**

21. If  $\vec{F}$  is a conservative force field, then the value of  $\operatorname{curl} \vec{F}$  is

(i) 0      (ii) 1      (iii)  $\bar{\nabla}F$       (iv) -1 (A.M.I.E.T.E., June 2007) **Ans. (i)**

22. If  $\nabla^2 [(1-x)(1-2x)]$  is equal to  
(i) 2      (ii) 3      (iii) 4      (iv) 6 (A.M.I.E.T.E., Dec. 2009) **Ans. (iii)**

23. If  $\vec{R} = xi + yj + zk$  and  $\vec{A}$  is a constant vector,  $\operatorname{curl} (\vec{A} \times \vec{R})$  is equal to

(i)  $\vec{R}$       (ii)  $2\vec{R}$       (iii)  $\vec{A}$       (iv)  $2\vec{A}$  (A.M.I.E.T.E., Dec. 2009) **Ans. (iv)**

24. If  $r$  is the distance of a point (x, y, z) from the origin, the value of the expression  $\hat{j} \times \operatorname{grad} \frac{1}{2}$  equals

(i)  $(x^2 + y^2 + z^2)^{-\frac{3}{2}} (\hat{j}z - \hat{k}x)$       (ii)  $(x^2 + y^2 + z^2)^{-\frac{3}{2}} (\hat{j}z - \hat{i}z)$   
 (iii) zero      (iv)  $(x^2 + y^2 + z^2)^{-\frac{3}{2}} (\hat{j}y - \hat{k}x)$  (AMIETE, Dec. 2010) **Ans. (ii)**

## VECTOR INTEGRATION

---

---

### 24.1 LINE INTEGRAL

Let  $\vec{F}(x, y, z)$  be a vector function and a curve  $AB$ .

Line integral of a vector function  $\vec{F}$  along the curve  $AB$  is defined as integral of the component of  $\vec{F}$  along the tangent to the curve  $AB$ .

Component of  $\vec{F}$  along a tangent  $PT$  at  $P$

$$= \text{Dot product of } \vec{F} \text{ and unit vector along PT}$$

$$= \vec{F} \cdot \frac{\vec{dr}}{ds} \left( \frac{\vec{dr}}{ds} \text{ is a unit vector along tangent PT} \right)$$

Line integral  $= \sum \vec{F} \cdot \frac{\vec{dr}}{ds}$  from A to B along the curve

$$\therefore \text{Line integral} = \int_c \left( \vec{F} \cdot \frac{\vec{dr}}{ds} \right) ds = \int_c \vec{F} \cdot \vec{dr}$$

**Note (1) Work.** If  $\vec{F}$  represents the variable force acting on a particle along arc AB, then the total work done  $= \int_A^B \vec{F} \cdot \vec{dr}$

**(2) Circulation.** If  $\vec{V}$  represents the velocity of a liquid then  $\oint_c \vec{V} \cdot \vec{dr}$  is called the circulation of  $V$  round the closed curve  $c$ .

If the circulation of  $V$  round every closed curve is zero then  $V$  is said to be irrotational there.

**(3)** When the path of integration is a closed curve then notation of integration is  $\oint$  in place of  $\int$ .

**Example 1.** If a force  $\vec{F} = 2x^2 y \hat{i} + 3xy \hat{j}$  displaces a particle in the  $xy$ -plane from  $(0, 0)$  to  $(1, 4)$  along a curve  $y = 4x^2$ . Find the work done.

**Solution.** Work done  $= \int_c \vec{F} \cdot \vec{dr}$

$$= \int_c (2x^2 y \hat{i} + 3xy \hat{j}) \cdot (dx \hat{i} + dy \hat{j})$$

$$= \int_c (2x^2 y dx + 3xy dy)$$

$$\left[ \begin{array}{l} \vec{r} = x\hat{i} + y\hat{j} \\ \vec{dr} = dx\hat{i} + dy\hat{j} \end{array} \right]$$

Putting the values of  $y$  and  $dy$ , we get

$$\begin{cases} y = 4x^2 \\ dy = 8x \, dx \end{cases}$$

$$\begin{aligned} &= \int_0^1 [2x^2(4x^2) \, dx + 3x(4x^2)8x \, dx] \\ &= 104 \int_0^1 x^4 \, dx = 104 \left( \frac{x^5}{5} \right)_0^1 = \frac{104}{5} \end{aligned}$$

**Ans.**

**Example 2.** Evaluate  $\int_C \vec{F} \cdot d\vec{r}$  where  $\vec{F} = x^2\hat{i} + xy\hat{j}$  and  $C$  is the boundary of the square in the plane  $z = 0$  and bounded by the lines  $x = 0, y = 0, x = a$  and  $y = a$ .

(Nagpur University, Summer 2001)

**Solution.**  $\int_C \vec{F} \cdot d\vec{r} = \int_{OA} \vec{F} \cdot d\vec{r} + \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CO} \vec{F} \cdot d\vec{r}$

Here  $\vec{r} = xi\hat{i} + yj\hat{j}, \quad d\vec{r} = dx\hat{i} + dy\hat{j}, \quad \vec{F} = x^2\hat{i} + xy\hat{j}$

$$\vec{F} \cdot d\vec{r} = x^2dx + xydy \quad \dots(1)$$

On  $OA, y = 0$

$$\therefore \vec{F} \cdot d\vec{r} = x^2dx$$

$$\int_{OA} \vec{F} \cdot d\vec{r} = \int_0^a x^2dx = \left[ \frac{x^3}{3} \right]_0^a = \frac{a^3}{3} \quad \dots(2)$$

On  $AB, x = a$   
(1) becomes

$$\therefore dx = 0$$

$$\therefore \vec{F} \cdot d\vec{r} = aydy$$

$$\int_{AB} \vec{F} \cdot d\vec{r} = \int_0^a aydy = a \left[ \frac{y^2}{2} \right]_0^a = \frac{a^3}{2} \quad \dots(3)$$

On  $BC, y = a$

$$\therefore dy = 0$$

$\Rightarrow$  (1) becomes

$$\vec{F} \cdot d\vec{r} = x^2dx$$

$$\int_{BC} \vec{F} \cdot d\vec{r} = \int_a^0 x^2dx = \left[ \frac{x^3}{3} \right]_a^0 = -\frac{a^3}{3} \quad \dots(4)$$

On  $CO, x = 0$ ,

(1) becomes

$$\int_{CO} \vec{F} \cdot d\vec{r} = 0 \quad \dots(5)$$

On adding (2), (3), (4) and (5), we get  $\int_C \vec{F} \cdot d\vec{r} = \frac{a^3}{3} + \frac{a^3}{2} - \frac{a^3}{3} + 0 = \frac{a^3}{2}$

**Ans.**

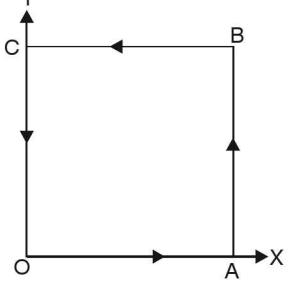

**Example 3.** A vector field is given by

$$\vec{F} = (2y+3)\hat{i} + xz\hat{j} + (yz-x)\hat{k}. \text{ Evaluate } \int_C \vec{F} \cdot d\vec{r} \text{ along the path } C \text{ is } x = 2t,$$

$y = t, z = t^3$  from  $t = 0$  to  $t = 1$ . (Nagpur University, Winter 2003)

**Solution.**  $\int_C \vec{F} \cdot d\vec{r} = \int_C (2y+3) \, dx + (xz) \, dy + (yz-x) \, dz$

$$\begin{bmatrix} \text{Since } x = 2t & y = t & z = t^3 \\ \therefore \frac{dx}{dt} = 2 & \frac{dy}{dt} = 1 & \frac{dz}{dt} = 3t^2 \end{bmatrix}$$

$$\begin{aligned}
&= \int_0^1 (2t+3)(2dt) + (2t)(t^3)dt + (t^4 - 2t)(3t^2)dt = \int_0^1 (4t+6+2t^4+3t^6-6t^3)dt \\
&= \left[ 4\frac{t^2}{2} + 6t + \frac{2}{5}t^5 + \frac{3}{7}t^7 - \frac{6}{4}t^4 \right]_0^1 = \left[ 2t^2 + 6t + \frac{2}{5}t^5 + \frac{3}{7}t^7 - \frac{3}{2}t^4 \right]_0^1 \\
&= 2+6+\frac{2}{5}+\frac{3}{7}-\frac{3}{2} = 7.32857. \quad \text{Ans.}
\end{aligned}$$

**Example 4.** If  $\vec{F} = 2y\hat{i} - z\hat{j} + x\hat{k}$ , evaluate  $\int_C \vec{F} \times d\vec{r}$  along the curve

$$x = \cos t, y = \sin t, z = 2 \cos t \text{ from } t = 0 \text{ to } t = \frac{\pi}{2}. \quad (\text{Nagpur University, winter 2002})$$

**Solution.** We have,  $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$

$$\begin{aligned}
d\vec{r} &= dx\hat{i} + dy\hat{j} + dz\hat{k} \\
\vec{F} \times d\vec{r} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2y & -z & x \\ dx & dy & dz \end{vmatrix} \\
&= (-zdz - xdy)\hat{i} - (2ydz - xdx)\hat{j} + (2ydy + zdx)\hat{k} \\
&= [-2\cos t(-2\sin t)dt - \cos t(\cos t)dt]\hat{i} \\
&\quad - [2\sin t(-2\sin t)dt - \cos t(-\sin t)dt]\hat{j} \\
&\quad + [2\sin t(\cos t)dt + 2\cos t(-\sin t)dt]\hat{k} \\
&= [(4\cos t \sin t - \cos^2 t)\hat{i} + (4\sin^2 t - \cos t \sin t)\hat{j}]dt
\end{aligned}$$

$$\begin{aligned}
\therefore \int_C \vec{F} \times d\vec{r} &= \int_0^{\frac{\pi}{2}} [(4\cos t \sin t - \cos^2 t)\hat{i} + (4\sin^2 t - \cos t \sin t)\hat{j}]dt \\
&= \int_0^{\frac{\pi}{2}} \left[ \left\{ 2\sin 2t - \frac{\cos 2t + 1}{2} \right\} \hat{i} \right] dt + \int_0^{\frac{\pi}{2}} \left[ \left\{ 2(1 - \cos 2t) - \frac{1}{2}\sin 2t \right\} \hat{j} \right] dt \\
&= \left[ -\cos 2t - \frac{1}{4}\sin 2t - \frac{1}{2}t \right]_0^{\frac{\pi}{2}} \hat{i} + \left[ 2t - \sin 2t + \frac{1}{4}\cos 2t \right]_0^{\frac{\pi}{2}} \hat{j} \\
&= \left[ -\cos \pi - \frac{1}{4}\sin \pi - \frac{1}{2}\left(\frac{\pi}{2}\right) + \cos 0 + \frac{1}{4}\sin 0 + \frac{1}{2}(0) \right] \hat{i} + \\
&\quad \left[ \pi - \sin \pi + \frac{1}{4}\cos \pi - 0 + \sin 0 - \frac{1}{4}\cos 0 \right] \hat{j} \\
&= \left[ 1 - 0 - \frac{\pi}{4} + 1 + 0 \right] \hat{i} + \left[ \pi - 0 - \frac{1}{4} + 0 - \frac{1}{4} \right] \hat{j} = \left( 2 - \frac{\pi}{4} \right) \hat{i} + \left( \pi - \frac{1}{2} \right) \hat{j} \quad \text{Ans.}
\end{aligned}$$

**Example 5.** The acceleration of a particle at time  $t$  is given by

$$\vec{a} = 18\cos 3t\hat{i} - 8\sin 2t\hat{j} + 6t\hat{k}.$$

If the velocity  $\vec{v}$  and displacement  $\vec{r}$  be zero at  $t = 0$ , find  $\vec{v}$  and  $\vec{r}$  at any point  $t$ .

**Solution.** Here,  $\vec{a} = \frac{d^2\vec{r}}{dt^2} = 18\cos 3t\hat{i} - 8\sin 2t\hat{j} + 6t\hat{k}$ .

On integrating, we have

$$\begin{aligned}\vec{v} &= \frac{d\vec{r}}{dt} = \hat{i} \int 18 \cos 3t \, dt + \hat{j} \int -8 \sin 2t \, dt + \hat{k} \int 6t \, dt \\ \Rightarrow \vec{v} &= 6 \sin 3t \hat{i} + 4 \cos 2t \hat{j} + 3t^2 \hat{k} + \vec{c} \quad \dots(1)\end{aligned}$$

At  $t = 0$ ,  $\vec{v} = \vec{0}$

Putting  $t = 0$  and  $\vec{v} = 0$  in (1), we get

$$\begin{aligned}\vec{0} &= 4\hat{j} + \vec{c} \Rightarrow \vec{c} = -4\hat{j} \\ \therefore \vec{v} &= \frac{d\vec{r}}{dt} = 6 \sin 3t \hat{i} + 4(\cos 2t - 1) \hat{j} + 3t^2 \hat{k}\end{aligned}$$

Again integrating, we have

$$\begin{aligned}\vec{r} &= \hat{i} \int 6 \sin 3t \, dt + \hat{j} \int 4(\cos 2t - 1) \, dt + \hat{k} \int 3t^2 \, dt \\ \Rightarrow \vec{r} &= -2 \cos 3t \hat{i} + (2 \sin 2t - 4t) \hat{j} + t^3 \hat{k} + \vec{C}_1 \quad \dots(2)\end{aligned}$$

At,  $t = 0$ ,  $\vec{r} = 0$

Putting  $t = 0$  and  $\vec{r} = 0$  in (2), we get

$$\therefore \vec{0} = -2\hat{i} + \vec{C}_1 \Rightarrow \vec{C}_1 = 2\hat{i}$$

$$\text{Hence, } \vec{r} = 2(1 - \cos 3t) \hat{i} + 2(\sin 2t - 2t) \hat{j} + t^3 \hat{k} \quad \text{Ans.}$$

**Example 6.** If  $\vec{A} = (3x^2 + 6y) \hat{i} - 14yz \hat{j} + 20xz^2 \hat{k}$ , evaluate the line integral  $\oint_C \vec{A} \cdot d\vec{r}$  from  $(0, 0, 0)$  to  $(1, 1, 1)$  along the curve  $C$ .

$$x = t, y = t^2, z = t^3.$$

(Uttarakhand, I Semester, Dec. 2006)

**Solution.** We have,

$$\begin{aligned}\int_C \vec{A} \cdot d\vec{r} &= \int_C [(3x^2 + 6y) \hat{i} - 14yz \hat{j} + 20xz^2 \hat{k}] \cdot [\hat{i} dx + \hat{j} dy + \hat{k} dz] \\ &= \int_C [(3x^2 + 6y) dx - 14yz dy + 20xz^2 dz]\end{aligned}$$

If  $x = t$ ,  $y = t^2$ ,  $z = t^3$ , then points  $(0, 0, 0)$  and  $(1, 1, 1)$  correspond to  $t = 0$  and  $t = 1$  respectively.

$$\begin{aligned}\text{Now, } \int_C \vec{A} \cdot d\vec{r} &= \int_{t=0}^{t=1} [(3t^2 + 6t^2) d(t) - 14t^2 t^3 d(t^2) + 20t(t^3)^2 d(t^3)] \\ &= \int_{t=0}^{t=1} [9t^2 dt - 14t^5 \cdot 2t dt + 20t^7 \cdot 3t^2 dt] = \int_0^1 (9t^2 - 28t^6 + 60t^9) dt \\ &= \left[ 9\left(\frac{t^3}{3}\right) - 28\left(\frac{t^7}{7}\right) + 60\left(\frac{t^{10}}{10}\right) \right]_0^1 = 3 - 4 + 6 = 5 \quad \text{Ans.}\end{aligned}$$

**Example 7.** Compute  $\int_c \vec{F} \cdot d\vec{r}$ , where  $\vec{F} = \frac{\hat{i}y - \hat{j}x}{x^2 + y^2}$  and  $c$  is the circle  $x^2 + y^2 = 1$  traversed counter clockwise.

**Solution.**  $\vec{r} = \hat{i}x + \hat{j}y + \hat{k}z$ ,  $d\vec{r} = \hat{i}dx + \hat{j}dy + \hat{k}dz$

$$\begin{aligned}\int_c \vec{F} \cdot d\vec{r} &= \int_c \frac{\hat{i}y - \hat{j}x}{x^2 + y^2} \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\ &= \int_c \frac{ydx - xdy}{x^2 + y^2} = \int_c (ydx - xdy) \quad \dots(1) \quad [\because x^2 + y^2 = 1]\end{aligned}$$

Parametric equation of the circle are  $x = \cos \theta$ ,  $y = \sin \theta$ .

Putting  $x = \cos \theta$ ,  $y = \sin \theta$ ,  $dx = -\sin \theta d\theta$ ,  $dy = \cos \theta d\theta$  in (1), we get

$$\begin{aligned}\int_C \vec{F} \cdot d\vec{r} &= \int_0^{2\pi} \sin \theta (-\sin \theta d\theta) - \cos \theta (\cos \theta d\theta) \\ &= - \int_0^{2\pi} (\sin^2 \theta + \cos^2 \theta) d\theta = - \int_0^{2\pi} d\theta = -(\theta)_0^{2\pi} = -2\pi \quad \text{Ans.}\end{aligned}$$

**Example 8.** Show that the vector field  $\vec{F} = 2x(y^2 + z^3)\hat{i} + 2x^2y\hat{j} + 3x^2z^2\hat{k}$  is conservative. Find its scalar potential and the work done in moving a particle from  $(-1, 2, 1)$  to  $(2, 3, 4)$ .

(A.M.I.E.T.E. June 2010, 2009)

**Solution.** Here, we have

$$\begin{aligned}\vec{F} &= 2x(y^2 + z^3)\hat{i} + 2x^2y\hat{j} + 3x^2z^2\hat{k} \\ \text{Curl } \vec{F} &= \nabla \times \vec{F} \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2x(y^2 + z^3) & 2x^2y & 3x^2z^2 \end{vmatrix} = (0-0)\hat{i} - (6xz^2 - 6xz^2)\hat{j} + (4xy - 4xy)\hat{k} = 0\end{aligned}$$

Hence, vector field  $\vec{F}$  is irrotational.

To find the scalar potential function  $\phi$

$$\begin{aligned}\vec{F} &= \nabla \phi \\ d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz = \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\ &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi \cdot \left( d\vec{r} \right) = \nabla \phi \cdot d\vec{r} = \vec{F} \cdot d\vec{r} \\ &= [2x(y^2 + z^3)\hat{i} + 2x^2y\hat{j} + 3x^2z^2\hat{k}] (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\ &= 2x(y^2 + z^3)dx + 2x^2ydy + 3x^2z^2dz \\ \phi &= \int [2x(y^2 + z^3)dx + 2x^2ydy + 3x^2z^2dz] + C\end{aligned}$$

$$\int (2xy^2 dx + 2x^2y dy) + (2xz^3 dx + 3x^2z^2 dz) + C = x^2y^2 + x^2z^3 + C$$

Hence, the scalar potential is  $x^2y^2 + x^2z^3 + C$

Now, for conservative field

$$\begin{aligned}\text{Work done} &= \int_{(-1, 2, 1)}^{(2, 3, 4)} \vec{F} \cdot d\vec{r} = \int_{(-1, 2, 1)}^{(2, 3, 4)} d\phi = [\phi]_{(-1, 2, 1)}^{(2, 3, 4)} = [x^2y^2 + x^2z^3 + c]_{(-1, 2, 1)}^{(2, 3, 4)} \\ &= (36 + 256) - (2 - 1) = 291 \quad \text{Ans.}\end{aligned}$$

**Example 9.** A vector field is given by  $\vec{F} = (\sin y)\hat{i} + x(1 + \cos y)\hat{j}$ . Evaluate the line integral over a circular path  $x^2 + y^2 = a^2$ ,  $z = 0$ .

(Nagpur University, Winter 2001)

**Solution.** We have,

$$\text{Work done} = \int_C \vec{F} \cdot d\vec{r}$$

$$\begin{aligned}
 &= \int_C [(\sin y) \hat{i} + x(1 + \cos y) \hat{j}] \cdot [dx\hat{i} + dy\hat{j}] \quad (\because z = 0 \text{ hence } dz = 0) \\
 \Rightarrow \int_C \vec{F} \cdot d\vec{r} &= \int_C \sin y \, dx + x(1 + \cos y) \, dy = \int_C (\sin y \, dx + x \cos y \, dy + x \, dy) \\
 &= \int_C d(x \sin y) + \int_C x \, dy
 \end{aligned}$$

(where  $d$  is differential operator).

The parametric equations of given path

$$x^2 + y^2 = a^2 \text{ are } x = a \cos \theta, y = a \sin \theta,$$

Where  $\theta$  varies from 0 to  $2\pi$

$$\begin{aligned}
 \therefore \int_C \vec{F} \cdot d\vec{r} &= \int_0^{2\pi} d[a \cos \theta \sin(a \sin \theta)] + \int_0^{2\pi} a \cos \theta \cdot a \cos \theta \, d\theta \\
 &= \int_0^{2\pi} d[a \cos \theta \sin(a \sin \theta)] + \int_0^{2\pi} a^2 \cos^2 \theta \cdot d\theta \\
 &= [a \cos \theta \sin(a \sin \theta)]_0^{2\pi} + \int_0^{2\pi} a^2 \cos^2 \theta \, d\theta \\
 &= 0 + a^2 \int_0^{2\pi} \left( \frac{1 + \cos 2\theta}{2} \right) d\theta = \frac{a^2}{2} \left[ \theta + \frac{\sin 2\theta}{2} \right]_0^{2\pi} \\
 &= \frac{a^2}{2} \cdot 2\pi = \pi a^2
 \end{aligned}
 \tag{Ans.}$$

**Example 10.** Determine whether the line integral

$\int (2xyz^2) \, dx + (x^2z^2 + z \cos yz) \, dy + (2x^2yz + y \cos yz) \, dz$  is independent of the path of

integration? If so, then evaluate it from  $(1, 0, 1)$  to  $\left(0, \frac{\pi}{2}, 1\right)$ .

**Solution.**  $\int_C (2xyz^2) \, dx + (x^2z^2 + z \cos yz) \, dy + (2x^2yz + y \cos yz) \, dz$

$$\begin{aligned}
 &= \int_C [(2xyz^2\hat{i}) + (x^2z^2 + z \cos yz)\hat{j} + (2x^2yz + y \cos yz)\hat{k}] \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\
 &= \int_C \vec{F} \cdot d\vec{r}
 \end{aligned}$$

This integral is independent of path of integration if

$$\begin{aligned}
 \vec{F} &= \nabla \phi \Rightarrow \nabla \times \vec{F} = 0 \\
 \nabla \times \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2xyz^2 & x^2z^2 + z \cos yz & 2x^2yz + y \cos yz \end{vmatrix} \\
 &= (2x^2z + \cos yz - yz \sin yz - 2x^2z - \cos yz + yz \sin yz) \hat{i} - (4xyz - 4x \cos yz) \hat{j} + (2xz^2 - 2xz^2) \hat{k} \\
 &= 0
 \end{aligned}$$

Hence, the line integral is independent of path.

$$\begin{aligned}
 d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \quad (\text{Total differentiation}) \\
 &= \left( \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) = \nabla \phi \cdot d\vec{r} = \vec{F} \cdot d\vec{r} \\
 &= [(2xyz^2)\hat{i} + (x^2z^2 + z \cos yz)\hat{j} + (2x^2yz + y \cos yz)\hat{k}] \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\
 &= 2xyz^2 \, dx + (x^2z^2 + z \cos yz) \, dy + (2x^2yz + y \cos yz) \, dz \\
 &= [(2x \, dx)yz^2 + x^2(dy)z^2 + x^2y(2z \, dz)] + [(\cos yz \, dy)z + (\cos yz \, dz)y]
 \end{aligned}$$

$$\begin{aligned}
 &= d(x^2yz^2) + d(\sin yz) \\
 \phi &= \int d(x^2yz^2) + \int d(\sin yz) = x^2yz^2 + \sin yz \\
 [\phi]_A^B &= \phi(B) - \phi(A) \\
 &= [x^2yz^2 + \sin yz]_{(0, \frac{\pi}{2}, 1)} - [x^2yz^2 + \sin yz]_{(1, 0, 1)} = \left[ 0 + \sin\left(\frac{\pi}{2} \times 1\right) \right] - [0 + 0] \\
 &= 1 \quad \text{Ans.}
 \end{aligned}$$

**EXERCISE 24.1**

1. Find the work done by a force  $y\hat{i} + x\hat{j}$  which displaces a particle from origin to a point  $(\hat{i} + \hat{j})$ . **Ans.** 1
2. Find the work done when a force  $\vec{F} = (x^2 - y^2 + x)\hat{i} - (2xy + y)\hat{j}$  moves a particle from origin to  $(1, 1)$  along a parabola  $y^2 = x$ . **Ans.**  $\frac{2}{3}$
3. Show that  $\vec{V} = (2xy + z^3)\hat{i} + x^2\hat{j} + 3xz^2\hat{k}$  is a conservative field. Find its scalar potential  $\phi$  such that  $\vec{V} = \text{grad } \phi$ . Find the work done by the force  $\vec{V}$  in moving a particle from  $(1, -2, 1)$  to  $(3, 1, 4)$ . **Ans.**  $x^2y + xz^3$ , 202
4. Show that the line integral  $\int_C (2xy + 3)dx + (x^2 - 4z)dy - 4ydz$  where  $c$  is any path joining  $(0, 0, 0)$  to  $(1, -1, 3)$  does not depend on the path  $c$  and evaluate the line integral. **Ans.** 14
5. Find the work done in moving a particle once round the ellipse  $\frac{x^2}{25} + \frac{y^2}{16} = 1$ ,  $z = 0$ , under the field of force given by  $F = (2x - y + z)\hat{i} + (x + y - z^2)\hat{j} + (3x - 2y + 4z)\hat{k}$ . Is the field of force conservative? (AMIE.TE, Winter 2000) **Ans.**  $40\pi$
6. If  $\nabla\phi = (y^2 - 2xyz^3)\hat{i} + (3 + 2xy - x^2z^3)\hat{j} + (z^3 - 3x^2yz^2)\hat{k}$ , find  $\phi$ . **Ans.**  $3y + \frac{z^4}{4} + xy^2 - x^2yz^3$
7.  $\int_C \vec{R} \cdot d\vec{R}$  is independent of the path joining any two points if it is. (AMIE.TE, June 2010) **Ans.** (i)  
(i) irrotational field (ii) solenoidal field (iii) rotational field (iv) vector field.

**24.2 SURFACE INTEGRAL**

A surface  $r = f(u, v)$  is called smooth if  $f(u, v)$  possesses continuous first order partial derivatives.

Let  $\vec{F}$  be a vector function and  $S$  be the given surface.

Surface integral of a vector function  $\vec{F}$  over the surface  $S$  is defined

as the integral of the components of  $\vec{F}$  along the normal to the surface.

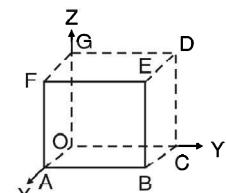

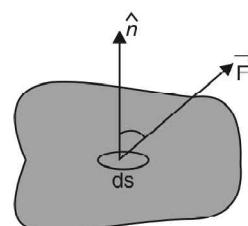

Component of  $\vec{F}$  along the normal

$= \vec{F} \cdot \hat{n}$ , where  $n$  is the unit normal vector to an element  $ds$  and

$$\hat{n} = \frac{\text{grad } f}{|\text{grad } f|} \quad ds = \frac{dx dy}{(\hat{n} \cdot \hat{k})}$$

Surface integral of  $F$  over  $S$

$$= \sum \vec{F} \cdot \hat{n} \quad = \iint_S (\vec{F} \cdot \hat{n}) ds$$

**Note.** (1) Flux  $= \iint_S (\vec{F} \cdot \hat{n}) ds$  where,  $\vec{F}$  represents the velocity of a liquid.

If  $\iint_S (\vec{F} \cdot \hat{n}) ds = 0$ , then  $\vec{F}$  is said to be a *solenoidal* vector point function.

**Example 11.** Evaluate  $\iint_S \vec{A} \cdot \hat{n} ds$  where  $\vec{A} = (x + y^2) \hat{i} - 2x\hat{j} + 2yz\hat{k}$  and  $S$  is the surface of the plane  $2x + y + 2z = 6$  in the first octant. (Nagpur University, Summer 2000)

**Solution.** A vector normal to the surface "S" is given by

$$\nabla(2x + y + 2z) = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right)(2x + y + 2z) = 2\hat{i} + \hat{j} + 2\hat{k}$$

And  $\hat{n}$  = a unit vector normal to surface  $S$

$$= \frac{2\hat{i} + \hat{j} + 2\hat{k}}{\sqrt{4+1+4}} = \frac{2}{3}\hat{i} + \frac{1}{3}\hat{j} + \frac{2}{3}\hat{k}$$

$$\hat{k} \cdot \hat{n} = \hat{k} \cdot \left( \frac{2}{3}\hat{i} + \frac{1}{3}\hat{j} + \frac{2}{3}\hat{k} \right) = \frac{2}{3}$$

$$\therefore \iint_S \vec{A} \cdot \hat{n} ds = \iint_R \vec{A} \cdot \hat{n} \frac{dx dy}{|\hat{k} \cdot \hat{n}|}$$

Where  $R$  is the projection of  $S$ .

$$\text{Now, } \vec{A} \cdot \hat{n} = [(x + y^2) \hat{i} - 2x\hat{j} + 2yz\hat{k}] \cdot \left( \frac{2}{3}\hat{i} + \frac{1}{3}\hat{j} + \frac{2}{3}\hat{k} \right)$$

$$= \frac{2}{3}(x + y^2) - \frac{2}{3}x + \frac{4}{3}yz = \frac{2}{3}y^2 + \frac{4}{3}yz \quad \dots(1)$$

Putting the value of  $z$  in (1), we get

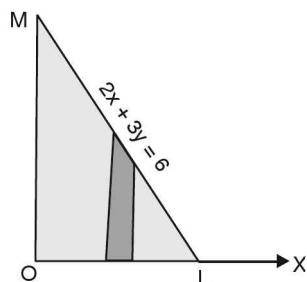

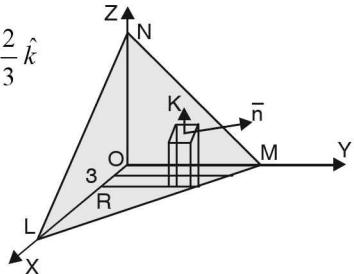

$$\vec{A} \cdot \hat{n} = \frac{2}{3}y^2 + \frac{4}{3}y \left( \frac{6-2x-y}{2} \right) \left( \because \text{on the plane } 2x + y + 2z = 6, z = \frac{(6-2x-y)}{2} \right)$$

$$\vec{A} \cdot \hat{n} = \frac{2}{3}y(y + 6 - 2x - y) = \frac{4}{3}y(3-x) \quad \dots(2)$$

Hence,  $\iint_S \vec{A} \cdot \hat{n} ds = \iint_R \vec{A} \cdot \bar{n} \frac{dx dy}{|\hat{k} \cdot \bar{n}|}$  ... (3)

Putting the value of  $\vec{A} \cdot \hat{n}$  from (2) in (3), we get

$$\begin{aligned} \iint_S \vec{A} \cdot \hat{n} ds &= \iint_R \frac{4}{3}y(3-x) \cdot \frac{3}{2} dx dy = \int_0^3 \int_0^{6-2x} 2y(3-x) dy dx \\ &= \int_0^3 2(3-x) \left[ \frac{y^2}{2} \right]_0^{6-2x} dx \\ &= \int_0^3 (3-x)(6-2x)^2 dx = 4 \int_0^3 (3-x)^3 dx \\ &= 4 \left[ \frac{(3-x)^4}{4(-1)} \right]_0^3 = -(0-81) = 81 \end{aligned}$$

**Example 12.** Evaluate  $\iint_S \vec{A} \cdot \hat{n} dS$ , where  $\vec{A} = 18z\hat{i} - 12\hat{j} + 3y\hat{k}$  and  $S$  is the part of the plane  $2x + 3y + 6z = 12$  included in the first octant. (Uttarakhand, I semester, Dec. 2006)

**Solution.** Here,  $\vec{A} = 18z\hat{i} - 12\hat{j} + 3y\hat{k}$   
Given surface  $f(x, y, z) = 2x + 3y + 6z - 12$

$$\text{Normal vector} = \nabla f = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right)(2x + 3y + 6z - 12) = 2\hat{i} + 3\hat{j} + 6\hat{k}$$

$\hat{n}$  = unit normal vector at any point  $(x, y, z)$  of  $2x + 3y + 6z = 12$

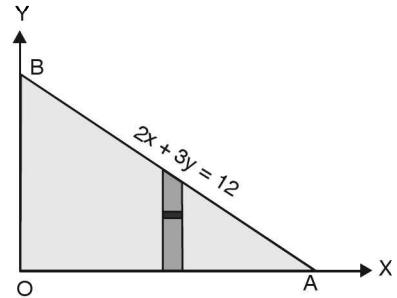

$$= \frac{2\hat{i} + 3\hat{j} + 6\hat{k}}{\sqrt{4+9+36}} = \frac{1}{7}(2\hat{i} + 3\hat{j} + 6\hat{k})$$

$$dS = \frac{dx dy}{\hat{n} \cdot \hat{k}} = \frac{dx dy}{\frac{1}{7}(2\hat{i} + 3\hat{j} + 6\hat{k}) \cdot \hat{k}} = \frac{dx dy}{\frac{6}{7}} = \frac{7}{6} dx dy$$

$$\text{Now, } \iint_S \vec{A} \cdot \hat{n} dS = \iint_S (18z\hat{i} - 12\hat{j} + 3y\hat{k}) \cdot \frac{1}{7}(2\hat{i} + 3\hat{j} + 6\hat{k}) \frac{7}{6} dx dy \\ = \iint_S (36z - 36 + 18y) \frac{dx dy}{6} = \iint_S (6z - 6 + 3y) dx dy$$

Putting the value of  $6z = 12 - 2x - 3y$ , we get

$$\begin{aligned} &= \int_0^6 \int_0^{\frac{1}{3}(12-2x)} (12 - 2x - 3y - 6 + 3y) dx dy \\ &= \int_0^6 \int_0^{\frac{1}{3}(12-2x)} (6 - 2x) dx dy \\ &= \int_0^6 (6 - 2x) dx \int_0^{\frac{1}{3}(12-2x)} dy \\ &= \int_0^6 (6 - 2x) dx (y) \Big|_0^{\frac{1}{3}(12-2x)} \\ &= \int_0^6 (6 - 2x) \frac{1}{3} (12 - 2x) dx = \frac{1}{3} \int_0^6 (4x^2 - 36x + 72) dx \\ &= \frac{1}{3} \left[ \frac{4x^3}{3} - 18x^2 + 72x \right]_0^6 = \frac{1}{3} [4 \times 36 \times 2 - 18 \times 36 + 72 \times 6] = \frac{72}{3} [4 - 9 + 6] = 24 \text{ Ans.} \end{aligned}$$

**Example 13.** Evaluate  $\iint_S (yz\hat{i} + zx\hat{j} + xy\hat{k}) \cdot d\vec{s}$  where  $S$  is the surface of the sphere

$x^2 + y^2 + z^2 = a^2$  in the first octant. (U.P., I Semester, Dec. 2004)

**Solution.** Here,  $\phi = x^2 + y^2 + z^2 - a^2$

$$\begin{aligned} \text{Vector normal to the surface} &= \nabla \phi = \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \\ &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - a^2) = 2x\hat{i} + 2y\hat{j} + 2z\hat{k} \\ \hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{2x\hat{i} + 2y\hat{j} + 2z\hat{k}}{\sqrt{4x^2 + 4y^2 + 4z^2}} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}} \\ &= \frac{x\hat{i} + y\hat{j} + z\hat{k}}{a} \quad [\because x^2 + y^2 + z^2 = a^2] \end{aligned}$$

Here,

$$\vec{F} = yz\hat{i} + zx\hat{j} + xy\hat{k}$$

$$\vec{F} \cdot \hat{n} = (yz\hat{i} + zx\hat{j} + xy\hat{k}) \cdot \left( \frac{x\hat{i} + y\hat{j} + z\hat{k}}{a} \right) = \frac{3xyz}{a}$$

$$\text{Now, } \iint_S \vec{F} \cdot \hat{n} ds = \iint_S (\vec{F} \cdot \hat{n}) \frac{dx dy}{|\hat{k} \cdot \hat{n}|} = \int_0^a \int_0^{\sqrt{a^2 - x^2}} \frac{3xyz}{a \left( \frac{z}{a} \right)} dx dy$$

$$\begin{aligned}
 &= 3 \int_0^a \int_0^{\sqrt{a^2 - x^2}} xy \, dy \, dx = 3 \int_0^a x \left( \frac{y^2}{2} \right)_{0}^{\sqrt{a^2 - x^2}} \, dx \\
 &= \frac{3}{2} \int_0^a x (a^2 - x^2) \, dx = \frac{3}{2} \left( \frac{a^2 x^2}{2} - \frac{x^4}{4} \right)_{0}^a = \frac{3}{2} \left( \frac{a^4}{2} - \frac{a^4}{4} \right) = \frac{3a^4}{8}. \quad \text{Ans.}
 \end{aligned}$$

**Example 14.** Show that  $\iint_S \vec{F} \cdot \hat{n} \, ds = \frac{3}{2}$ , where  $\vec{F} = 4xz\hat{i} - y^2\hat{j} + yz\hat{k}$

and  $S$  is the surface of the cube bounded by the planes,

$$x=0, x=1, y=0, y=1, z=0, z=1.$$

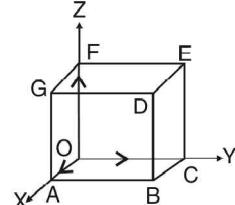

**Solution.**  $\iint_S \vec{F} \cdot \hat{n} \, ds = \iint_{OABC} \vec{F} \cdot \hat{n} \, ds$

$$\begin{aligned}
 &+ \iint_{DEFG} \vec{F} \cdot \hat{n} \, ds + \iint_{OAGF} \vec{F} \cdot \hat{n} \, ds \\
 &+ \iint_{BCED} \vec{F} \cdot \hat{n} \, ds + \iint_{ABDG} \vec{F} \cdot \hat{n} \, ds \\
 &+ \iint_{OCEF} \vec{F} \cdot \hat{n} \, ds \quad \dots(1)
 \end{aligned}$$

S.No.	Surface	Outward normal	$ds$	
1	OABC	$-k$	$dx \, dy$	$z=0$
2	DEFG	$k$	$dx \, dy$	$z=1$
3	OAGF	$-j$	$dx \, dz$	$y=0$
4	BCED	$j$	$dx \, dz$	$y=1$
5	ABDG	$i$	$dy \, dz$	$x=1$
6	OCEF	$-i$	$dy \, dz$	$x=0$

$$\text{Now, } \iint_{OABC} \vec{F} \cdot n \, ds = \iint_{OABC} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot (-k) \, dx \, dy = \int_0^1 \int_0^1 -yz \, dx \, dy = 0 \text{ (as } z=0)$$

$$\begin{aligned}
 &\iint_{DEFG} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot k \, dx \, dy \\
 &= \iint_{DEFG} yz \, dx \, dy = \int_0^1 \int_0^1 y (1) \, dx \, dy \text{ (as } z=1) \\
 &= \int_0^1 dx \left[ \frac{y^2}{2} \right]_0^1 = [x]_0^1 \frac{1}{2} = \frac{1}{2}
 \end{aligned}$$

$$\iint_{OAGF} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot (-j) \, dx \, dz = \iint_{OAGF} y^2 \, dx \, dz = 0 \quad (\text{as } y=0)$$

$$\begin{aligned}
 &\iint_{BCED} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot j \, dx \, dz = \iint_{BCED} (-y^2) \, dx \, dz \\
 &= - \int_0^1 dx \int_0^1 -y^2 \, dz = -(x)_0^1 (z)_0^1 = -1 \quad (\text{as } y=1)
 \end{aligned}$$

$$\begin{aligned}
 &\iint_{ABDG} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot i \, dy \, dz = \iint 4xz \, dy \, dz = \int_0^1 \int_0^1 4 (1) z \, dy \, dz \text{ (as } x=1) \\
 &= 4 (y)_0^1 \left( \frac{z^2}{2} \right)_0^1 = 4 (1) \left( \frac{1}{2} \right) = 2
 \end{aligned}$$

$$\iint_{OCEF} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot (-i) \, dy \, dz = \int_0^1 \int_0^1 -4xz \, dy \, dz = 0 \quad (\text{as } x=0)$$

On putting these values in (1), we get

$$\iint_S \vec{F} \cdot \hat{n} \, ds = 0 + \frac{1}{2} + 0 - 1 + 2 + 0 = \frac{3}{2} \quad \text{Proved.}$$

**EXERCISE 24.2**

1. Evaluate  $\iint_S \vec{A} \cdot \hat{n} ds$ , where  $\vec{A} = z\hat{i} + x\hat{j} - 3y^2z\hat{k}$  and  $S$  is the surface of the cylinder  $x^2 + y^2 = 16$  included in the first octant between  $z = 0$  and  $z = 5$ . **Ans.** 90
2. If  $\vec{r} = t\hat{i} - t^2\hat{j} + (t-1)\hat{k}$  and  $\vec{S} = 2t^2\hat{i} + 6t\hat{k}$ , evaluate  $\int_0^2 \vec{r} \cdot \vec{S} dt$ . **Ans.** 12
3. Evaluate  $\iint_S \vec{F} \cdot \hat{n} ds$ , where,  $F = 2yx\hat{i} - yz\hat{j} + x^2\hat{k}$  over the surface  $S$  of the cube bounded by the coordinate planes and planes  $x = a$ ,  $y = a$  and  $z = a$ . **Ans.**  $\frac{1}{2}a^4$
4. If  $\vec{F} = 2y\hat{i} - 3\hat{j} + x^2\hat{k}$  and  $S$  is the surface of the parabolic cylinder  $y^2 = 8x$  in the first octant bounded by the planes  $y = 4$ , and  $z = 6$ , then evaluate  $\iint_S \vec{F} \cdot \hat{n} dS$ . **Ans.** 132

**24.3 VOLUME INTEGRAL**

Let  $\vec{F}$  be a vector point function and volume  $V$  enclosed by a closed surface.

The volume integral =  $\iiint_V \vec{F} dv$

**Example 15.** If  $\vec{F} = 2z\hat{i} - x\hat{j} + y\hat{k}$ , evaluate  $\iiint_V \vec{F} dv$  where,  $V$  is the region bounded by the surfaces

$$x = 0, y = 0, x = 2, y = 4, z = x^2, z = 2.$$

**Solution.**  $\iiint_V \vec{F} dv = \iiint (2z\hat{i} - x\hat{j} + y\hat{k}) dx dy dz$

$$\begin{aligned} &= \int_0^2 dx \int_0^4 dy \int_{x^2}^2 (2z\hat{i} - x\hat{j} + y\hat{k}) dz = \int_0^2 dx \int_0^4 dy [z^2\hat{i} - xz\hat{j} + yz\hat{k}]_{x^2}^2 \\ &= \int_0^2 dx \int_0^4 dy [4\hat{i} - 2x\hat{j} + 2y\hat{k} - x^4\hat{i} + x^3\hat{j} - x^2y\hat{k}] \\ &= \int_0^2 dx \left[ 4y\hat{i} - 2xy\hat{j} + y^2\hat{k} - x^4y\hat{i} + x^3y\hat{j} - \frac{x^2y^2}{2}\hat{k} \right]_0^4 \\ &= \int_0^2 (16\hat{i} - 8x\hat{j} + 16\hat{k} - 4x^4\hat{i} + 4x^3\hat{j} - 8x^2\hat{k}) dx \\ &= \left[ 16x\hat{i} - 4x^2\hat{j} + 16x\hat{k} - \frac{4x^5}{5}\hat{i} + x^4\hat{j} - \frac{8x^3}{3}\hat{k} \right]_0^2 \\ &= 32\hat{i} - 16\hat{j} + 32\hat{k} - \frac{128}{5}\hat{i} + 16\hat{j} - \frac{64}{3}\hat{k} = \frac{32}{5}\hat{i} + \frac{32}{3}\hat{k} = \frac{32}{15}(3\hat{i} + 5\hat{k}) \end{aligned} \quad \text{Ans.}$$

**EXERCISE 24.3**

1. If  $\vec{F} = (2x^2 - 3z)\hat{i} - 2xy\hat{j} - 4x\hat{k}$ , then evaluate  $\iiint_V \nabla \cdot \vec{F} dV$ , where  $V$  is bounded by the plane  $x = 0, y = 0, z = 0$  and  $2x + 2y + z = 4$ . **Ans.**  $\frac{8}{3}$
2. Evaluate  $\iiint_V \phi dV$ , where  $\phi = 45x^2y$  and  $V$  is the closed region bounded by the planes  $4x + 2y + z = 8, x = 0, y = 0, z = 0$  **Ans.** 128

3. If  $\vec{F} = (2x^2 - 3z)\hat{i} - 2xy\hat{j} - 4x\hat{k}$ , then evaluate  $\iiint_V \nabla \times \vec{F} dV$ , where  $V$  is the closed region bounded by the planes  $x = 0, y = 0, z = 0$  and  $2x + 2y + z = 4$ . **Ans.**  $\frac{8}{3}(\hat{j} - \hat{k})$
4. Evaluate  $\iiint_V (2x + y) dV$ , where  $V$  is closed region bounded by the cylinder  $z = 4 - x^2$  and the planes  $x = 0, y = 0, y = 2$  and  $z = 0$ . **Ans.**  $\frac{80}{3}$
5. If  $\vec{F} = 2xz\hat{i} - x\hat{j} + y^2\hat{k}$ , evaluate  $\iiint_V \vec{F} dV$  over the region bounded by the surfaces  $x = 0, y = 0, y = 6$  and  $z = x^2, z = 4$ . **Ans.**  $(16\hat{i} - 3\hat{j} + 48\hat{k})$

#### 24.4 GREEN'S THEOREM (For a plane)

**Statement.** If  $\phi(x, y), \psi(x, y)$ ,  $\frac{\partial\phi}{\partial y}$  and  $\frac{\partial\psi}{\partial x}$  be continuous functions over a region  $R$  bounded by simple closed curve  $C$  in  $x-y$  plane, then **(MTU, Dec. 2012)**

$$\oint_C (\phi dx + \psi dy) = \iint_R \left( \frac{\partial\psi}{\partial x} - \frac{\partial\phi}{\partial y} \right) dx dy \quad (\text{AMIETE, June 2010, U.P., I Semester, Dec. 2007})$$

**Proof.** Let the curve  $C$  be divided into two curves  $C_1$  ( $ABC$ ) and  $C_2$  ( $CDA$ ).

Let the equation of the curve  $C_1$  ( $ABC$ ) be  $y = y_1(x)$  and equation of the curve  $C_2$  ( $CDA$ ) be  $y = y_2(x)$ .

Let us see the value of

$$\begin{aligned} \iint_R \frac{\partial\phi}{\partial y} dx dy &= \int_{x=a}^{x=c} \left[ \int_{y=y_1(x)}^{y=y_2(x)} \frac{\partial\phi}{\partial y} dy \right] dx = \int_a^c [\phi(x, y)]_{y=y_1(x)}^{y=y_2(x)} dx \\ &= \int_a^c [\phi(x, y_2) - \phi(x, y_1)] dx = - \int_c^a \phi(x, y_2) dx - \int_a^c \phi(x, y_1) dx \\ &= - \left[ \int_c^a \phi(x, y_2) dx + \int_a^c \phi(x, y_1) dx \right] \\ &= - \left[ \int_{C_2} \phi(x, y) dx + \int_{C_1} \phi(x, y) dx \right] = - \oint_C \phi(x, y) dx \end{aligned}$$

$$\text{Thus, } \oint_C \phi dx = - \iint_R \frac{\partial\phi}{\partial y} dx dy \quad \dots(1)$$

Similarly, it can be shown that

$$\oint_C \psi dy = \iint_R \frac{\partial\psi}{\partial x} dx dy \quad \dots(2)$$

On adding (1) and (2), we get

$$\oint_C (\phi dx + \psi dy) = \iint_R \left( \frac{\partial\psi}{\partial x} - \frac{\partial\phi}{\partial y} \right) dx dy \quad \text{Proved.}$$

**Note.** Green's Theorem in vector form

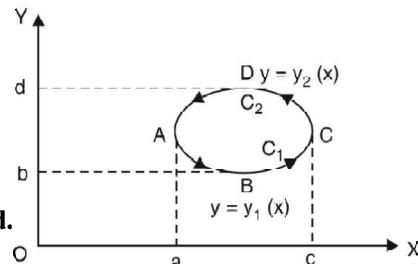

$$\int_C \vec{F} \cdot d\vec{r} = \iint_R (\nabla \times \vec{F}) \cdot \hat{k} dR$$

where,  $\vec{F} = \phi \hat{i} + \psi \hat{j}, \vec{r} = x\hat{i} + y\hat{j}, \hat{k}$  is a unit vector along  $z$ -axis and  $dR = dx dy$ .

**Example 16.** A vector field  $\vec{F}$  is given by  $\vec{F} = \sin y\hat{i} + x(1 + \cos y)\hat{j}$ .

Evaluate the line integral  $\int_C \vec{F} \cdot d\vec{r}$  where  $C$  is the circular path given by  $x^2 + y^2 = a^2$ .

**Solution.**  $\vec{F} = \sin y\hat{i} + x(1 + \cos y)\hat{j}$

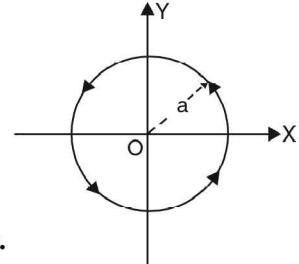

$$\int_C \vec{F} \cdot d\vec{r} = \int_C [\sin y \hat{i} + x(1 + \cos y) \hat{j}] \cdot (\hat{i} dx + \hat{j} dy) = \int_C \sin y \, dx + x(1 + \cos y) \, dy$$

On applying Green's Theorem, we have

$$\begin{aligned}\oint_c (\phi \, dx + \psi \, dy) &= \iint_S \left( \frac{\partial \psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx \, dy \\ &= \iint_S [(1 + \cos y) - \cos y] dx \, dy\end{aligned}$$

where  $S$  is the circular plane surface of radius  $a$ .

$$= \iint_S dx \, dy = \text{Area of circle} = \pi a^2. \quad \text{Ans.}$$

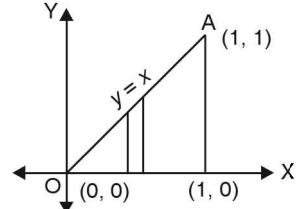

**Example 17.** Using Green's Theorem, evaluate  $\int_C (x^2 y \, dx + x^2 \, dy)$ , where  $C$  is the boundary described counter clockwise of the triangle with vertices  $(0, 0), (1, 0), (1, 1)$ .

(U.P., I Semester, Winter 2003)

**Solution.** By Green's Theorem, we have

$$\begin{aligned}\int_C (\phi \, dx + \psi \, dy) &= \iint_R \left( \frac{\partial \psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx \, dy \\ \int_C (x^2 y \, dx + x^2 \, dy) &= \iint_R (2x - x^2) dx \, dy \\ &= \int_0^1 (2x - x^2) dx \int_0^x dy = \int_0^1 (2x - x^2) dx [y]_0^x \\ &= \int_0^1 (2x - x^2)(x) dx = \int_0^1 (2x^2 - x^3) dx = \left( \frac{2x^3}{3} - \frac{x^4}{4} \right)_0^1 \\ &= \left( \frac{2}{3} - \frac{1}{4} \right) = \frac{5}{12} \quad \text{Ans.}\end{aligned}$$

**Example 18.** State and verify Green's Theorem in the plane for  $\oint_C (3x^2 - 8y^2) \, dx + (4y - 6xy) \, dy$  where  $C$  is the boundary of the region bounded by  $x \geq 0, y \leq 0$  and  $2x - 3y = 6$ .

(Uttarakhand, I Semester, Dec. 2006)

**Solution. Statement:** See Article 24.4 on page 576.

Here the closed curve  $C$  consists of straight lines  $OB, BA$  and  $AO$ , where coordinates of  $A$  and  $B$  are  $(3, 0)$  and  $(0, -2)$  respectively. Let  $R$  be the region bounded by  $C$ .

Then by Green's Theorem in plane, we have

$$\begin{aligned}\oint_C [(3x^2 - 8y^2) \, dx + (4y - 6xy) \, dy] &= \iint_R \left[ \frac{\partial}{\partial x} (4y - 6xy) - \frac{\partial}{\partial y} (3x^2 - 8y^2) \right] dx \, dy \quad \dots(1) \\ &= \iint_R (-6y + 16y) dx \, dy = \iint_R 10y dx \, dy \\ &= 10 \int_0^3 dx \int_{\frac{1}{3}(2x-6)}^0 y dy = 10 \int_0^3 dx \left[ \frac{y^2}{2} \right]_{\frac{1}{3}(2x-6)}^0 = -\frac{5}{9} \int_0^3 dx (2x - 6)^2 \\ &= -\frac{5}{9} \left[ \frac{(2x - 6)^3}{3 \times 2} \right]_0^3 = -\frac{5}{54} (0 + 6)^3 = -\frac{5}{54} (216) = -20 \quad \dots(2)\end{aligned}$$

Now we evaluate L.H.S. of (1) along  $OB, BA$  and  $AO$ .

Along  $OB$ ,  $x = 0$ ,  $dx = 0$  and  $y$  varies from 0 to  $-2$ .

Along  $BA$ ,  $x = \frac{1}{2}(6 + 3y)$ ,  $dx = \frac{3}{2} dy$  and  $y$  varies from  $-2$  to  $0$ .

and along  $AO$ ,  $y = 0$ ,  $dy = 0$  and  $x$  varies from  $3$  to  $0$ .

$$\begin{aligned}
 \text{L.H.S. of (1)} &= \oint_C [(3x^2 - 8y^2) dx + (4y - 6xy) dy] \\
 &= \int_{OB} [(3x^2 - 8y^2) dx + (4y - 6xy) dy] + \int_{BA} [(3x^2 - 8y^2) dx + (4y - 6xy) dy] \\
 &\quad + \int_{AO} [(3x^2 - 8y^2) dx + (4y - 6xy) dy] \\
 &= \int_0^{-2} 4y dy + \int_{-2}^0 \left[ \frac{3}{4}(6+3y)^2 - 8y^2 \right] \left( \frac{3}{2} dy \right) + [4y - 3(6+3y)y] dy + \int_3^0 3x^2 dx \\
 &= [2y^2]_{-2}^0 + \int_{-2}^0 \left[ \frac{9}{8}(6+3y)^2 - 12y^2 + 4y - 18y - 9y^2 \right] dy + (x^3)_3^0 \\
 &= 2[4] + \int_{-2}^0 \left[ \frac{9}{8}(6+3y)^2 - 21y^2 - 14y \right] dy + (0 - 27) \\
 &= 8 + \left[ \frac{9}{8} \frac{(6+3y)^3}{3 \times 3} - 7y^3 - 7y^2 \right]_{-2}^0 - 27 = -19 + \left[ \frac{216}{8} + 7(-2)^3 + 7(-2)^2 \right] \\
 &= -19 + 27 - 56 + 28 = -20 \tag{3}
 \end{aligned}$$

With the help of (2) and (3), we find that (1) is true and so Green's Theorem is verified.

**Example 19.** Verify Green's Theorem in the plane for

$$\oint_C (3x^2 - 8y^2) dx + (4y - 6xy) dy$$

Where  $C$  is the boundary of the region defined by

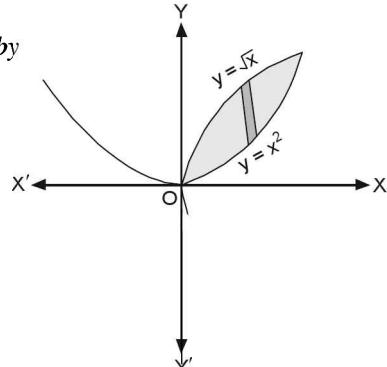

$y = \sqrt{x}$ , and  $y = x^2$  (K.Uiversity, Dec. 2008)

**Solution.** Here we have,

$$\oint_C (3x^2 - 8y^2) dx + (4y - 6xy) dy$$

By Green's Theorem, we have

$$\begin{aligned}
 \oint_C (\phi dx + \psi dy) &= \iint_S \left( \frac{\partial \psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx dy \\
 &= \int_0^1 \int_{x^2}^{\sqrt{x}} \left[ \frac{\partial}{\partial x} (4y - 6xy) - \frac{\partial}{\partial y} (3x^2 - 8y^2) \right] dx dy \\
 &= \int_0^1 \int_{x^2}^{\sqrt{x}} (-6y + 16y) dx dy = 10 \int_0^1 \int_{x^2}^{\sqrt{x}} y dx dy = 10 \int_0^1 dx \left( \frac{y^2}{2} \right)_{x^2}^{\sqrt{x}} = \frac{10}{2} \int_0^1 dx (x - x^4) \\
 &= 5 \left( \frac{x^2}{2} - \frac{x^5}{5} \right)_0^1 = 5 \left( \frac{1}{2} - \frac{1}{5} \right) = 5 \left( \frac{3}{10} \right) = \frac{3}{2} \tag{Ans.}
 \end{aligned}$$

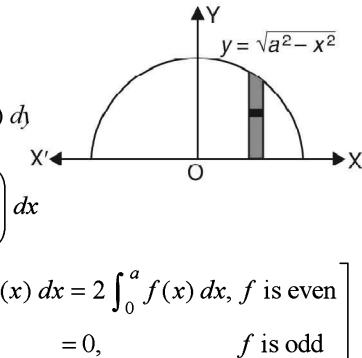

**Example 20.** Apply Green's Theorem to evaluate  $\int_C [(2x^2 - y^2) dx + (x^2 + y^2) dy]$ , where  $C$  is the boundary of the area enclosed by the  $x$ -axis and the upper half of circle  $x^2 + y^2 = a^2$ . (M.D.U. Dec. 2009, U.P., I Sem., Dec. 2004)

**Solution.**  $\int_C [(2x^2 - y^2) dx + (x^2 + y^2) dy]$

By Green's Theorem, we've  $\int_C (\phi dx + \psi dy) = \iint_S \left( \frac{\partial \Psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx dy$

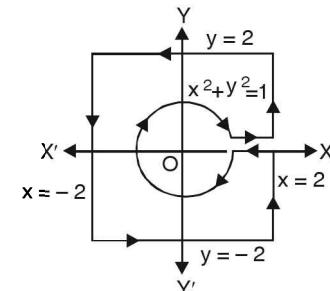

$$\begin{aligned} &= \int_{-a}^a \int_0^{\sqrt{a^2 - x^2}} \left[ \frac{\partial}{\partial x} (x^2 + y^2) - \frac{\partial}{\partial y} (2x^2 - y^2) \right] dx dy \\ &= \int_{-a}^a \int_0^{\sqrt{a^2 - x^2}} (2x + 2y) dx dy = 2 \int_{-a}^a dx \int_0^{\sqrt{a^2 - x^2}} (x + y) dy \\ &= 2 \int_{-a}^a dx \left( xy + \frac{y^2}{2} \right) \Big|_0^{\sqrt{a^2 - x^2}} = 2 \int_{-a}^a \left( x\sqrt{a^2 - x^2} + \frac{a^2 - x^2}{2} \right) dx \\ &= 2 \int_{-a}^a x\sqrt{a^2 - x^2} dx + \int_{-a}^a (a^2 - x^2) dx \quad \left[ \begin{array}{l} \int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx, f \text{ is even} \\ = 0, \quad f \text{ is odd} \end{array} \right] \\ &= 0 + 2 \int_0^a (a^2 - x^2) dx = 2 \left( a^2 x - \frac{x^3}{3} \right) \Big|_0^a = 2 \left( a^3 - \frac{a^3}{3} \right) = \frac{4a^3}{3} \quad \text{Ans.} \end{aligned}$$

**Example 21.** Evaluate  $\oint_C -\frac{y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy$ , where  $C = C_1 \cup C_2$  with  $C_1 : x^2 + y^2 = 1$  and  $C_2 : x = \pm 2, y = \pm 2$ . (Gujarat, I Semester, Jan 2009)

**Solution.**  $\oint_C -\frac{y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy$

$$\begin{aligned} &= \iint \left( \frac{\partial}{\partial x} \frac{x}{x^2 + y^2} + \frac{\partial}{\partial y} \frac{y}{x^2 + y^2} \right) dx dy \\ &= \iint \left[ \frac{(x^2 + y^2)1 - 2x(x)}{(x^2 + y^2)^2} + \frac{(x^2 + y^2)1 - 2y(y)}{(x^2 + y^2)^2} \right] dx dy \\ &= \iint \left[ \frac{x^2 + y^2 - 2x^2}{(x^2 + y^2)^2} + \frac{x^2 + y^2 - 2y^2}{(x^2 + y^2)^2} \right] dx dy \\ &= \iint \left[ \frac{y^2 - x^2}{(x^2 + y^2)^2} + \frac{x^2 - y^2}{(x^2 + y^2)^2} \right] dx dy = \iint \frac{0}{(x^2 + y^2)^2} dx dy = 0 \quad \text{Ans.} \end{aligned}$$

## 24.5 AREA OF THE PLANE REGION BY GREEN'S THEOREM

**Proof.** We know that

$$\int_C M dx + N dy = \iint_A \left( \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} \right) dx dy \quad \dots(1)$$

On putting  $N = x \left( \frac{\partial N}{\partial x} = 1 \right)$  and  $M = -y \left( \frac{\partial M}{\partial y} = 1 \right)$  in (1), we get

$$\int_C -y dx + x dy = \iint_A [1 - (-1)] dx dy = 2 \iint_A dx dy = 2 A$$

$$\text{Area} = \frac{1}{2} \int_C (x dy - y dx)$$

**Example 22.** Using Green's theorem, find the area of the region in the first quadrant bounded by the curves

$$y = x, y = \frac{1}{x}, y = \frac{x}{4}$$

(U.P. I, Semester, Dec. 2008)

**Solution.** By Green's Theorem Area A of the region bounded by a closed curve  $C$  is given by

$$A = \frac{1}{2} \oint_C (xdy - ydx)$$

Here,  $C$  consists of the curves  $C_1 : y = \frac{x}{4}$ ,  $C_2 : y = \frac{1}{x}$  and  $C_3 : y = x$  So

$$\left[ A = \frac{1}{2} \oint_C = \frac{1}{2} \left[ \int_{C_1} + \int_{C_2} + \int_{C_3} \right] = \frac{1}{2} (I_1 + I_2 + I_3) \right]$$

Along  $C_1 : y = \frac{x}{4}, dy = \frac{1}{4} dx, x : 0$  to 2

$$I_1 = \int_{C_1} (xdy - ydx) = \int_{C_1} \left( x \frac{1}{4} dx - \frac{x}{4} dx \right) = 0$$

Along  $C_2 : y = \frac{1}{x}, dy = -\frac{1}{x^2} dx, x : 2$  to 1

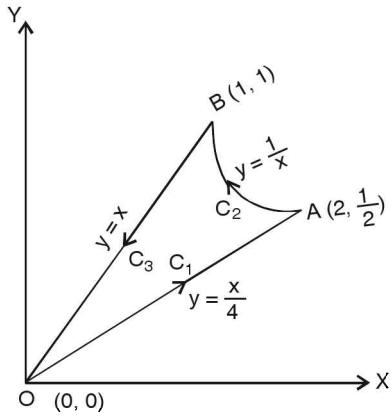

$$I_2 = \int_{C_2} (xdy - ydx) = \int_2^1 \left[ x \left( -\frac{1}{x^2} \right) dx - \frac{1}{2} dx \right] = [-2 \log x]_2^1 = 2 \log 2$$

Along  $C_3 : y = x, dy = dx ; x : 1$  to 0 ;

$$I_3 = \int_{C_3} (xdy - ydx) = \int (xdx - xdx) = 0$$

$$A = \frac{1}{2} (I_1 + I_2 + I_3) = \frac{1}{2} (0 + 2 \log 2 + 0) = \log 2$$

**Ans.**

#### EXERCISE 24.4

- Evaluate  $\int_c [(3x^2 - 6yz) dx + (2y + 3xz) dy + (1 - 4xyz^2) dz]$  from  $(0, 0, 0)$  to  $(1, 1, 1)$  along the path  $c$  given by the straight line from  $(0, 0, 0)$  to  $(0, 0, 1)$  then to  $(0, 1, 1)$  and then to  $(1, 1, 1)$ .
- Verify Green's Theorem in plane for  $\int_C (x^2 + 2xy) dx + (y^2 + x^3y) dy$ , where  $c$  is a square with the vertices  $P(0, 0)$ ,  $Q(1, 0)$ ,  $R(1, 1)$  and  $S(0, 1)$ . **Ans.**  $-\frac{1}{2}$
- Verify Green's Theorem for  $\int_c (x^2 - 2xy) dx + (x^2y + 3) dy$  around the boundary  $c$  of the region  $y^2 = 8x$  and  $x = 2$ .
- Use Green's Theorem in a plane to evaluate the integral  $\int_c [(2x^2 - y^2) dx + (x^2 + y^2) dy]$ , where  $c$  is the boundary in the  $xy$ -plane of the area enclosed by the  $x$ -axis and the semi-circle  $x^2 + y^2 = 1$  in the upper half  $xy$ -plane. **Ans.**  $\frac{4}{3}$
- Apply Green's Theorem to evaluate  $\int_c [(y - \sin x) dy + \cos x dx]$ , where  $c$  is the plane triangle enclosed by the lines  $y = 0$ ,  $x = \frac{\pi}{2}$  and  $y = \frac{2x}{\pi}$ . **Ans.**  $-\frac{\pi^2 + 8}{4\pi}$
- Either directly or by Green's Theorem, evaluate the line integral  $\int_c e^{-x} (\cos y dx - \sin y dy)$ , where  $c$  is the rectangle with vertices  $(0, 0)$ ,  $(\pi, 0)$ ,  $\left(\pi, \frac{\pi}{2}\right)$  and  $\left(0, \frac{\pi}{2}\right)$ . **Ans.**  $2(1 - e^{-\pi})$   
*(AMIETE II Sem June 2010)*
- Verify the Green's Theorem to evaluate the line integral  $\int_c (2y^2 dx + 3x dy)$ , where  $c$  is the boundary of the closed region bounded by  $y = x$  and  $y = x^2$ .

8. Evaluate  $\iint_S \vec{F} \cdot \hat{n} ds$ , where  $\vec{F} = xy\hat{i} - x^2\hat{j} + (x+z)\hat{k}$  and  $s$  is the region of the plane  $2x + 2y + z = 6$  in the first octant. (A.M.I.E.T.E., Summer 2004, Winter 2001) Ans.  $\frac{27}{4}$

9. Verify Green's Theorem for  $\int_C [(xy + y^2) dx + x^2 dy]$  where  $C$  is the boundary by  $y = x$  and  $y = x^2$ . (AMIETE, June 2010) Ans.  $-\frac{1}{20}$

## 24.6 STOKE'S THEOREM (Relation between Line Integral and Surface Integral)

(Uttarakhand, I Sem. 2008, U.P., Ist Semester, Dec. 2006)

**Statement.** Surface integral of the component of  $\operatorname{curl} \vec{F}$  along the normal to the surface  $S$ , taken over the surface  $S$  bounded by curve  $C$  is equal to the line integral of the vector point function

$\vec{F}$  taken along the closed curve  $C$ .

Mathematically

$$\oint_C \vec{F} \cdot d\vec{r} = \iint_S \operatorname{curl} \vec{F} \cdot \hat{n} ds$$

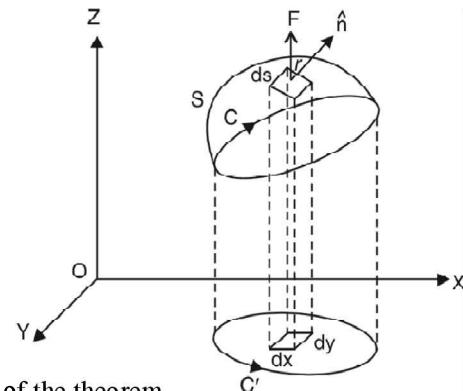

where  $\hat{n} = \cos \alpha \hat{i} + \cos \beta \hat{j} + \cos \gamma \hat{k}$  is a unit external normal to any surface  $ds$ ,

**Proof.** Let

$$\vec{r} = xi\hat{i} + yj\hat{j} + zk\hat{k}$$

$$d\vec{r} = \hat{i} dx + \hat{j} dy + \hat{k} dz$$

$$\vec{F} = F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}$$

On putting the values of  $\vec{F}$ ,  $d\vec{r}$  in the statement of the theorem

$$\begin{aligned} & \oint_C (F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= \iint_S \left( i \frac{\partial}{\partial x} + j \frac{\partial}{\partial y} + k \frac{\partial}{\partial z} \right) \times (F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}) \cdot (\cos \alpha \hat{i} + \cos \beta \hat{j} + \cos \gamma \hat{k}) ds \\ & \oint_C (F_1 dx + F_2 dy + F_3 dz) = \iint_S \left[ \left( \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} \right) \hat{i} + \left( \frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x} \right) \hat{j} + \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) \hat{k} \right] \cdot (\hat{i} \cos \alpha + \hat{j} \cos \beta + \hat{k} \cos \gamma) ds \\ &= \iint_S \left[ \left( \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} \right) \cos \alpha + \left( \frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x} \right) \cos \beta + \left( \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) \cos \gamma \right] ds \quad \dots(1) \end{aligned}$$

Let us first prove

$$\oint_C F_1 dx = \iint_S \left[ \left( \frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma \right) \right] ds \quad \dots(2)$$

Let the equation of the surface  $S$  be  $z = g(x, y)$ . The projection of the surface on  $x-y$  plane is region  $R$ .

$$\begin{aligned} \oint_C F_1 (x, y, z) dx &= \oint_C F_1 [x, y, g(x, y)] dx \\ &= - \iint_R \frac{\partial}{\partial y} F_1 (x, y, g) dx dy \quad [\text{By Green's Theorem}] \\ &= - \iint_R \left( \frac{\partial F_1}{\partial y} + \frac{\partial F_1}{\partial z} \frac{\partial g}{\partial y} \right) dx dy \quad \dots(3) \end{aligned}$$

The direction cosines of the normal to the surface  $z = g(x, y)$  are given by

$$\frac{\cos \alpha}{\frac{-\partial g}{\partial x}} = \frac{\cos \beta}{\frac{-\partial g}{\partial y}} = \frac{\cos \gamma}{1}$$

And  $dx dy = \text{projection of } ds \text{ on the } xy\text{-plane} = ds \cos \gamma$

Putting the values of  $ds$  in R.H.S. of (2)

$$\begin{aligned} \iint_S \left( \frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma \right) ds &= \iint_R \left( \frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma \right) \frac{dx dy}{\cos \gamma} \\ &= \iint_R \left( \frac{\partial F_1}{\partial z} \frac{\cos \beta}{\cos \gamma} - \frac{\partial F_1}{\partial y} \right) dx dy = \iint_R \left( \frac{\partial F_1}{\partial z} \left( -\frac{\partial g}{\partial y} \right) - \frac{\partial F_1}{\partial y} \right) dx dy \\ &= - \iint_R \left( \frac{\partial F_1}{\partial y} + \frac{\partial F_1}{\partial z} \frac{\partial g}{\partial y} \right) dx dy \end{aligned} \quad \dots(4)$$

From (3) and (4), we get

$$\oint_c F_1 dx = \iint_S \left( \frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma \right) ds \quad \dots(5)$$

$$\text{Similarly, } \oint_c F_2 dy = \iint_S \left( \frac{\partial F_2}{\partial x} \cos \gamma - \frac{\partial F_2}{\partial z} \cos \alpha \right) ds \quad \dots(6)$$

$$\text{and } \oint_c F_3 dz = \iint_S \left( \frac{\partial F_3}{\partial y} \cos \alpha - \frac{\partial F_3}{\partial x} \cos \beta \right) ds \quad \dots(7)$$

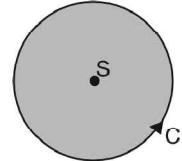

On adding (5), (6) and (7), we get

$$\begin{aligned} \oint_c (F_1 dx + F_2 dy + F_3 dz) &= \iint_S \left( \frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma + \frac{\partial F_2}{\partial x} \cos \gamma - \frac{\partial F_2}{\partial z} \cos \alpha \right. \\ &\quad \left. + \frac{\partial F_3}{\partial y} \cos \alpha - \frac{\partial F_3}{\partial x} \cos \beta \right) ds \quad \text{Proved.} \end{aligned}$$

## 24.7 ANOTHER METHOD OF PROVING STOKE'S THEOREM

The circulation of vector  $F$  around a closed curve  $C$  is equal to the flux of the curve of the vector through the surface  $S$  bounded by the curve  $C$ .

$$\oint_c \bar{F} \cdot d\bar{r} = \iint_S \text{curl } \bar{F} \cdot \hat{n} d\vec{s} = \iint_S \text{curl } \bar{F} \cdot d\vec{S}$$

**Proof :** The projection of any curved surface over  $xy$ -plane can be treated as kernel of the surface integral over actual surface

$$\begin{aligned} \text{Now, } \iint_S (\nabla \times \bar{F}) \cdot \hat{k} d\vec{S} &= \iint_S (\nabla \times \bar{F}) \cdot (\hat{i} \times \hat{j}) dx dy \quad [\hat{k} = \hat{i} \times \hat{j}] \\ &= \iint_S [(\nabla \cdot \hat{i})(\bar{F} \cdot \hat{j}) - (\nabla \cdot \hat{j})(\bar{F} \cdot \hat{i})] dx dy = \iint_S \left[ \frac{\partial}{\partial x} (F_y) - \frac{\partial}{\partial y} (F_x) \right] dx dy \\ &= \iint_S [F_x dx + F_y dy] \quad [\text{By Green's theorem}] \\ &= \iint_S [\hat{i} F_x + \hat{j} F_y] \cdot (\hat{i} dx + \hat{j} dy) = \oint_c \bar{F} \cdot d\bar{r} \\ \iint_S \text{curl } \bar{F} \cdot \hat{n} dS &= \oint_c \bar{F} \cdot d\bar{r}. \end{aligned}$$

where,  $\bar{F} = F_x \hat{i} + F_y \hat{j} + F_z \hat{k}$  and  $d\bar{r} = dx \hat{i} + dy \hat{j} + dz \hat{k}$

**Example 23.** Evaluate by Stokes theorem  $\oint_C (yz dx + zx dy + xy dz)$  where  $C$  is the curve  $x^2 + y^2 = 1, z = y^2$ . (M.D.U., Dec 2009)

**Solution.** Here we have  $\oint_C yz dx + zx dy + xy dz$

$$= \int (yzi + zxj + xyk) \cdot (idx + jdy + kdz)$$

$$\begin{aligned}
 &= \oint_C F \cdot d\vec{r} \\
 &= \int_C \operatorname{curl} \vec{F} \cdot \hat{n} \, ds \\
 &\quad \text{Curl } \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ yz & zx & xy \end{vmatrix} \\
 &= (x - x) \hat{i} + (y - y) \hat{j} + (z - z) \hat{k} \\
 &= 0 \quad = 0 \quad \text{Ans.}
 \end{aligned}$$

**Example 24.** Using Stoke's theorem or otherwise, evaluate

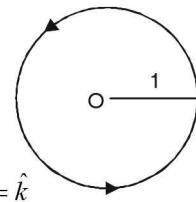

$$\int_C [(2x - y) dx - yz^2 dy - y^2 z dz]$$

where  $C$  is the circle  $x^2 + y^2 = 1$ , corresponding to the surface of sphere of unit radius.  
(U.P., I Semester, Winter 2001)

**Solution.**  $\int_C [(2x - y) dx - yz^2 dy - y^2 z dz]$

$$= \int_C [(2x - y) \hat{i} - yz^2 \hat{j} - y^2 z \hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz)$$

By Stoke's theorem  $\oint_C \vec{F} \cdot d\vec{r} = \iint_S \operatorname{curl} \vec{F} \cdot \hat{n} \, ds$  ... (1)

$$\begin{aligned}
 \operatorname{curl} \vec{F} &= \nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2x - y & -yz^2 & -y^2 z \end{vmatrix} \\
 &= (-2yz + 2yz) \hat{i} - (0 - 0) \hat{j} + (0 + 1) \hat{k} = \hat{k}
 \end{aligned}$$

Putting the value of  $\operatorname{curl} \vec{F}$  in (1), we get

$$\oint_C \vec{F} \cdot d\vec{r} = \iint_S \hat{k} \cdot \hat{n} \, ds = \iint_S \hat{k} \cdot \hat{n} \frac{dx \, dy}{\hat{n} \cdot \hat{k}} = \iint_S dx \, dy = \text{Area of the circle} = \pi \left[ \because ds = \frac{dx \, dy}{(\hat{n} \cdot \hat{k})} \right]$$

**Example 25.** Evaluate  $\int_C \vec{F} \cdot d\vec{r}$ , where  $F(x, y, z) = -y^2 \hat{i} + x \hat{j} + z^2 \hat{k}$  and  $C$  is the curve of intersection of the plane  $y + z = 2$  and the cylinder  $x^2 + y^2 = 1$ . (Gujarat, I sem. Jan. 2009)

**Solution.**  $\oint_C \vec{F} \cdot d\vec{r} = \iint_S \operatorname{curl} \vec{F} \cdot \hat{n} \, ds = \iint_S \operatorname{curl} (-y^2 \hat{i} + x \hat{j} + z^2 \hat{k}) \cdot \hat{n} \, ds$  ... (1)

$$\begin{aligned}
 F(x, y, z) &= -y^2 \hat{i} + x \hat{j} + z^2 \hat{k} \quad (\text{By Stoke's Theorem}) \\
 \operatorname{curl} \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ -y^2 & x & z^2 \end{vmatrix} \\
 &= \hat{i} (0 - 0) - \hat{j} (0 - 0) + \hat{k} (1 + 2y) = (1 + 2y) \hat{k}
 \end{aligned}$$

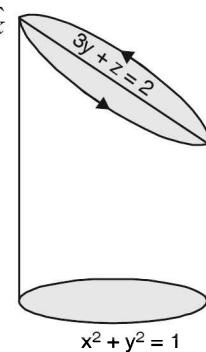

Normal vector  $= \nabla F$

$$= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (y + z - 2) = \hat{j} + \hat{k}$$

Unit normal vector  $\hat{n}$

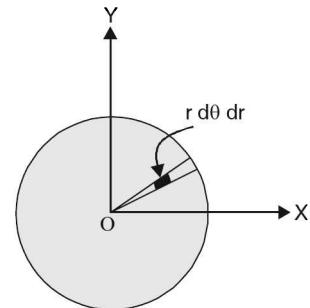

$$= \frac{\hat{j} + \hat{k}}{\sqrt{2}}$$

$$ds = \frac{dx \, dy}{\hat{n} \cdot \hat{k}}$$

On putting the values of  $\text{curl } \vec{F}$ ,  $\hat{n}$  and  $ds$  in (1), we get

$$\begin{aligned}
 \int_C \vec{F} \cdot d\vec{r} &= \iint_S (1+2y) \hat{k} \cdot \frac{\hat{j} + \hat{k}}{\sqrt{2}} \frac{dx dy}{\left(\frac{\hat{j} + \hat{k}}{\sqrt{2}}\right) \cdot \hat{k}} \\
 &= \iint_S \frac{1+2y}{\sqrt{2}} \frac{dx dy}{\frac{1}{\sqrt{2}}} = \iint_S (1+2y) dx dy = \int_0^{2\pi} \int_0^1 (1+2r \sin \theta) r d\theta dr \\
 &= \int_0^{2\pi} \int_0^1 (r + 2r^2 \sin \theta) d\theta dr \\
 &= \int_0^{2\pi} d\theta \left[ \frac{r^2}{2} + \frac{2r^3}{3} \sin \theta \right]_0^1 = \int_0^{2\pi} \left[ \frac{1}{2} + \frac{2}{3} \sin \theta \right] d\theta \\
 &= \left[ \frac{\theta}{2} - \frac{2}{3} \cos \theta \right]_0^{2\pi} = \left( \pi - \frac{2}{3} - 0 + \frac{2}{3} \right) = \pi \quad \text{Ans.}
 \end{aligned}$$

**Example 26.** Apply Stoke's Theorem to find the value of

$$\int_C (y dx + z dy + x dz)$$

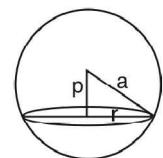

where  $C$  is the curve of intersection of  $x^2 + y^2 + z^2 = a^2$  and  $x + z = a$ . (Nagpur, Summer 2001)

**Solution.**  $\int_C (y dx + z dy + x dz)$

$$\begin{aligned}
 &= \int_C (y\hat{i} + z\hat{j} + x\hat{k}) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \int_C (y\hat{i} + z\hat{j} + x\hat{k}) \cdot d\vec{r} \\
 &= \iint_S \text{curl} (y\hat{i} + z\hat{j} + x\hat{k}) \cdot \hat{n} ds \quad (\text{By Stoke's Theorem}) \\
 &= \iint_S \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (y\hat{i} + z\hat{j} + x\hat{k}) \cdot \hat{n} ds = \iint_S -(\hat{i} + \hat{j} + \hat{k}) \cdot \hat{n} ds \quad \dots(1)
 \end{aligned}$$

where  $S$  is the circle formed by the intersection of  $x^2 + y^2 + z^2 = a^2$  and  $x + z = a$ .

$$\begin{aligned}
 \hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{\left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x+z-a)}{|\nabla \phi|} = \frac{\hat{i} + \hat{k}}{\sqrt{1+1}} \\
 \therefore \hat{n} &= \frac{\hat{i}}{\sqrt{2}} + \frac{\hat{k}}{\sqrt{2}}
 \end{aligned}$$

Putting the value of  $\hat{n}$  in (1), we have

$$\begin{aligned}
 &= \iint_S -(\hat{i} + \hat{j} + \hat{k}) \cdot \left( \frac{\hat{i}}{\sqrt{2}} + \frac{\hat{k}}{\sqrt{2}} \right) ds \\
 &= \iint_S -\left( \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} \right) ds \quad \left[ \text{Use } r^2 = R^2 - p^2 = a^2 - \frac{a^2}{2} = \frac{a^2}{2} \right] \\
 &= \frac{-2}{\sqrt{2}} \iint_S ds = \frac{-2}{\sqrt{2}} \pi \left( \frac{a}{\sqrt{2}} \right)^2 = -\frac{\pi a^2}{\sqrt{2}} \quad \text{Ans.}
 \end{aligned}$$

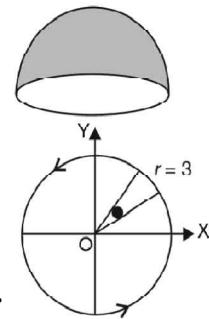

**Example 27.** Use Stoke's Theorem to evaluate  $\int_C \vec{v} \cdot d\vec{r}$ , where  $\vec{v} = y^2\hat{i} + xy\hat{j} + xz\hat{k}$ , and  $C$  is the bounding curve of the hemisphere  $x^2 + y^2 + z^2 = 9$ ,  $z > 0$ , oriented in the positive direction.

**Solution.** By Stoke's theorem

$$\begin{aligned}\int_C \vec{v} \cdot d\vec{r} &= \iint_S (\operatorname{curl} \vec{v}) \cdot \hat{n} \, ds = \iint_S (\nabla \times \vec{v}) \cdot \hat{n} \, ds \\ \nabla \times \vec{v} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 & xy & xz \end{vmatrix} = (0 - 0)\hat{i} - (z - 0)\hat{j} + (y - 2y)\hat{k} \\ &= -z\hat{j} - y\hat{k} \\ \hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{\left( i \frac{\partial}{\partial x} + j \frac{\partial}{\partial y} + k \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 9)}{|\nabla \phi|} \\ &= \frac{2xi + 2yj + 2zk}{\sqrt{4x^2 + 4y^2 + 4z^2}} = \frac{xi + yj + zk}{\sqrt{x^2 + y^2 + z^2}} = \frac{xi + yj + zk}{3} \\ (\nabla \times \vec{v}) \cdot \hat{n} &= (-z\hat{j} - y\hat{k}) \cdot \frac{xi + yj + zk}{3} = \frac{-yz - yz}{3} = \frac{-2yz}{3} \\ \hat{n} \cdot \hat{k} \, ds &= dx \, dy \Rightarrow \frac{xi + yj + zk}{3} \cdot \hat{k} \, dx = dx \, dy \Rightarrow \frac{z}{3} \, ds = dx \, dy\end{aligned}$$

∴

$$\begin{aligned}ds &= \frac{3}{z} \, dx \, dy \\ \iint_S (\nabla \times \vec{v}) \cdot \hat{n} \, ds &= \iint \left( \frac{-2yz}{3} \right) \left( \frac{3}{z} \, dx \, dy \right) = - \iint 2y \, dx \, dy \\ &= - \iint 2r \sin \theta \, r \, d\theta \, dr = - 2 \int_0^{2\pi} \sin \theta \, d\theta \int_0^3 r^2 \, dr \\ &= - 2(-\cos \theta)_0^{2\pi} \cdot \left[ \frac{r^3}{3} \right]_0^3 = - 2(-1 + 1)9 = 0 \quad \text{Ans.}\end{aligned}$$

**Example 28.** Evaluate the surface integral  $\iint_S \operatorname{curl} \vec{F} \cdot \hat{n} \, dS$  by transforming it into a line integral,  $S$  being that part of the surface of the paraboloid  $z = 1 - x^2 - y^2$  for which

$$z \geq 0 \text{ and } \vec{F} = y\hat{i} + z\hat{j} + x\hat{k}.$$

(K. University, Dec. 2008)

**Solution.**

$$\nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y & z & x \end{vmatrix} = -\hat{i} - \hat{j} - \hat{k}$$

Obviously

$$\hat{n} = \hat{k}.$$

Therefore

$$(\nabla \times \vec{F}) \cdot \hat{n} = (-\hat{i} - \hat{j} - \hat{k}) \cdot \hat{k} = -1$$

Hence  $\iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds = \iint_S (-1) dx dy = - \iint_S dx dy$   
 $= -\pi (1)^2 = -\pi.$  (Area of circle =  $\pi r^2$ ) Ans.

**Example 29.** Evaluate  $\oint_C \vec{F} \cdot d\vec{r}$  by Stoke's Theorem, where  $\vec{F} = y^2 \hat{i} + x^2 \hat{j} - (x+z) \hat{k}$  and  $C$  is the boundary of triangle with vertices at  $(0, 0, 0)$ ,  $(1, 0, 0)$  and  $(1, 1, 0)$ .

(U.P., I Semester, Winter 2000)

**Solution.** We have,  $\text{curl } \vec{F} = \nabla \times \vec{F}$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 & x^2 & -(x+z) \end{vmatrix} = 0 \cdot \hat{i} + \hat{j} 2(x-y) \hat{k}.$$

We observe that  $z$  co-ordinate of each vertex of the triangle is zero.

Therefore, the triangle lies in the  $xy$ -plane.

$$\therefore \hat{n} = \hat{k}$$

$$\therefore \text{curl } \vec{F} \cdot \hat{n} = [\hat{j} + 2(x-y)\hat{k}] \cdot \hat{k} = 2(x-y).$$

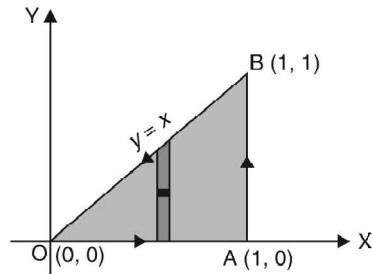

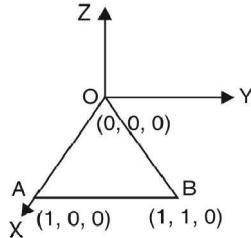

In the figure, only  $xy$ -plane is considered.

The equation of the line  $OB$  is  $y = x$

By Stoke's theorem, we have

$$\begin{aligned} \oint_C \vec{F} \cdot d\vec{r} &= \iint_S (\text{curl } \vec{F} \cdot \hat{n}) ds \\ &= \int_{x=0}^1 \int_{y=0}^x 2(x-y) dx dy = 2 \int_0^1 \left[ xy - \frac{y^2}{2} \right]_0^x dx \\ &= 2 \int_0^1 \left[ x^2 - \frac{x^2}{2} \right] dx = 2 \int_0^1 \frac{x^2}{2} dx = \int_0^1 x^2 dx = \left[ \frac{x^3}{3} \right]_0^1 = \frac{1}{3}. \end{aligned}$$

Ans.

**Example 30.** Use the Stoke's Theorem to evaluate

$$\oint_C [(x+2y) dx + (x-z) dy + (y-z) dz]$$

where  $c$  is the boundary of the triangle with vertices  $(2, 0, 0)$ ,  $(0, 3, 0)$  and  $(0, 0, 6)$  oriented in the anti-clockwise direction.

**Solution.**

$$\begin{aligned} \oint_C \vec{F} \cdot d\vec{r} &= \iint_S [(x+2y) dx + (x-z) dy + (y-z) dz] \\ &= \iint_S [(x+2y) \hat{i} + (x-z) \hat{j} + (y-z) \hat{k}] \cdot [\hat{i} dx + \hat{j} dy + \hat{k} dz] \end{aligned}$$

$$\therefore \vec{F} = (x+2y)\hat{i} + (x-z)\hat{j} + (y-z)\hat{k}$$

$$\nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x+2y & x-z & y-z \end{vmatrix}$$

$$= (1+1)\hat{i} - (0-0)\hat{j} + (1-2)\hat{k} = 2\hat{i} - \hat{k}$$

$S$  is the surface of the plane  $\frac{x}{2} + \frac{y}{3} + \frac{z}{6} = 1$ ,

$\hat{n}$  is the normal to the plane ABC.

$$\text{Normal Vector} = \nabla \phi = \left[ \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right] \left[ \frac{x}{2} + \frac{y}{3} + \frac{z}{6} - 1 \right]$$

$$= \frac{\hat{i}}{2} + \frac{\hat{j}}{3} + \frac{\hat{k}}{6} = \frac{1}{6}(3\hat{i} + 2\hat{j} + \hat{k})$$

$$\hat{n} = \frac{\frac{1}{6}(3\hat{i} + 2\hat{j} + \hat{k})}{\sqrt{\frac{1}{4} + \frac{4}{9} + 1}} = \frac{1}{\sqrt{14}}(3\hat{i} + 2\hat{j} + \hat{k})$$

$$(\nabla \times \vec{F}) \cdot \hat{n} = (2\hat{i} - \hat{k}) \cdot \frac{1}{\sqrt{14}}(3\hat{i} + 2\hat{j} + \hat{k}) = \frac{1}{\sqrt{14}}(6 - 1) = \frac{5}{\sqrt{14}}$$

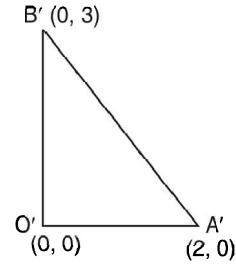

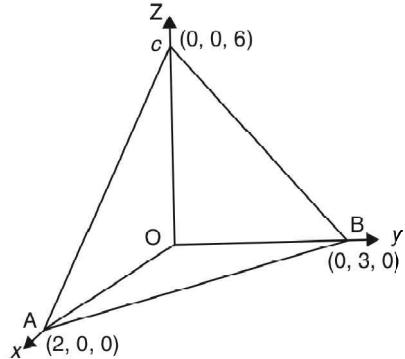

$$\int_C \vec{F} \cdot d\vec{r} = \iint_S (\text{curl } \vec{F}) \cdot \hat{n} \, ds$$

$$= \iint_S \frac{5}{\sqrt{14}} \, ds = \frac{5}{\sqrt{14}} \iint_R \frac{dx \, dy}{\hat{k} \cdot \frac{1}{\sqrt{14}}(3\hat{i} + 2\hat{j} + \hat{k})} = 5 \iint_R dx \, dy$$

where  $R$  is the projection of  $S$  on the  $x-y$  plane i.e. triangle  $OAB$ .

$$= 5 \cdot \text{Area of triangle } OAB = \frac{5}{2}(2 \times 3) = 15$$

**Ans.**

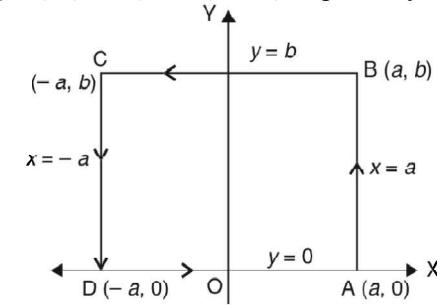

**Example 31.** Evaluate  $\oint_C \vec{F} \cdot d\vec{r}$  by Stoke's Theorem, where  $\vec{F} = (x^2 + y^2)\hat{i} - 2xy\hat{j}$  and  $C$

is the boundary of the rectangle  $x = \pm a$ ,  $y = 0$  and  $y = b$ . (U.P., I Semester, Winter 2002)

**Solution.** Since the  $z$  co-ordinate of each vertex of the given rectangle is zero, hence the given rectangle must lie in the  $xy$ -plane.

Here, the co-ordinates of  $A$ ,  $B$ ,  $C$  and  $D$  are  $(a, 0)$ ,  $(a, b)$ ,  $(-a, b)$  and  $(-a, 0)$  respectively.

$$\therefore \text{Curl } \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 + y^2 & -2xy & 0 \end{vmatrix} = -4y\hat{k}$$

Here,  $\hat{n} = \hat{k}$ , so by Stoke's theorem, we've

$$\oint_C \vec{F} \cdot d\vec{r} = \iint_S \text{curl } \vec{F} \cdot \hat{n} \, ds$$

$$= \iint_S (-4y\hat{k}) \cdot (\hat{k}) \, dx \, dy = -4 \int_{x=-a}^a \int_{y=0}^b y \, dx \, dy$$

$$= -4 \int_{-a}^a \left[ \frac{y^2}{2} \right]_0^b dx = -2 b^2 \int_{-a}^a dx = -4 a b^2 \quad \text{Ans.}$$

**Example 32.** Apply Stoke's Theorem to calculate  $\int_c 4y \, dx + 2z \, dy + 6y \, dz$  where  $c$  is the curve of intersection of  $x^2 + y^2 + z^2 = 6z$  and  $z = x + 3$ .

**Solution.**  $\int_c \vec{F} \cdot d\vec{r} = \int_c 4y \, dx + 2z \, dy + 6y \, dz$

$$\begin{aligned} \vec{F} &= 4y\hat{i} + 2z\hat{j} + 6y\hat{k} \\ \nabla \times \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 4y & 2z & 6y \end{vmatrix} = (6-2)\hat{i} - (0-0)\hat{j} + (0-4)\hat{k} \\ &= 4\hat{i} - 4\hat{k} \end{aligned}$$

$S$  is the surface of the circle  $x^2 + y^2 + z^2 = 6z$ ,  $z = x + 3$ ,  $\hat{n}$  is normal to the plane  $x - z + 3 = 0$

$$\begin{aligned} \hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{\left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x - z + 3)}{|\nabla \phi|} = \frac{\hat{i} - \hat{k}}{\sqrt{1+1}} = \frac{\hat{i} - \hat{k}}{\sqrt{2}} \\ (\nabla \times F) \cdot \hat{n} &= (4\hat{i} - 4\hat{k}) \cdot \frac{\hat{i} - \hat{k}}{\sqrt{2}} = \frac{4+4}{\sqrt{2}} = 4\sqrt{2} \end{aligned}$$

$$\int_c \vec{F} \cdot d\vec{r} = \iint_S (\nabla \times F) \cdot \hat{n} \, ds = \iint_S 4\sqrt{2} \, (dx \, dz) = 4\sqrt{2} \text{ (area of circle)}$$

Centre of the sphere  $x^2 + y^2 + (z-3)^2 = 9$ ,  $(0, 0, 3)$  lies on the plane  $z = x + 3$ . It means that the given circle is a great circle of sphere, where radius of the circle is equal to the radius of the sphere.

$$\text{Radius of circle} = 3, \text{ Area} = \pi (3)^2 = 9\pi$$

$$\iint_S (\nabla \times F) \cdot \hat{n} \, ds = 4\sqrt{2}(9\pi) = 36\sqrt{2}\pi \quad \text{Ans.}$$

**Example 33.** Verify Stoke's Theorem for the function  $\vec{F} = z\hat{i} + x\hat{j} + y\hat{k}$ , where  $C$  is the unit

circle in  $xy$ -plane bounding the hemisphere  $z = \sqrt{1-x^2-y^2}$ . (U.P., I Semester Comp. 2002)

**Solution.** Here  $\vec{F} = z\hat{i} + x\hat{j} + y\hat{k}$ . ... (1)

Also,  $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k} \Rightarrow d\vec{r} = dx\hat{i} + dy\hat{j} + dz\hat{k}$ .

$\therefore \vec{F} \cdot d\vec{r} = z \, dx + x \, dy + y \, dz$ .

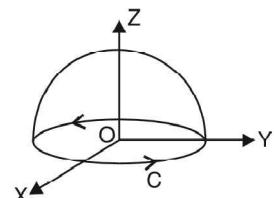

$\therefore \oint_C \vec{F} \cdot d\vec{r} = \oint_C (z \, dx + x \, dy + y \, dz)$ . ... (2)

On the circle  $C$ ,  $x^2 + y^2 = 1$ ,  $z = 0$  on the  $xy$ -plane. Hence on  $C$ , we have  $z = 0$  so that  $dz = 0$ . Hence (2) reduces to

$$\oint_C \vec{F} \cdot d\vec{r} = \oint_C x \, dy. \quad \text{... (3)}$$

Now the parametric equations of  $C$ , i.e.,  $x^2 + y^2 = 1$  are

$$x = \cos \phi, y = \sin \phi. \quad \text{... (4)}$$

$$\text{Using (4), (3) reduces to } \oint_C \vec{F} \cdot d\vec{r} = \int_{\phi=0}^{2\pi} \cos \phi \cos \phi d\phi = \int_0^{2\pi} \frac{1 + \cos 2\phi}{2} d\phi \\ = \frac{1}{2} \left[ \phi + \frac{\sin 2\phi}{2} \right]_0^{2\pi} = \pi \quad \dots(5)$$

Let  $P(x, y, z)$  be any point on the surface of the hemisphere  $x^2 + y^2 + z^2 = 1$ , O origin is the centre of the sphere.

$$\text{Radius} = OP = x\hat{i} + y\hat{j} + z\hat{k}$$

$$\text{Normal} = x\hat{i} + y\hat{j} + z\hat{k}$$

$$\hat{n} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}} = x\hat{i} + y\hat{j} + z\hat{k} \quad (\text{Radius is } \perp \text{ to tangent i.e. Radius is normal})$$

$$x = \sin \theta \cos \phi, \quad y = \sin \theta \sin \phi, \quad z = \cos \theta \quad \dots(6)$$

$$\text{Also, } \hat{n} = \sin \theta \cos \phi \hat{i} + \sin \theta \sin \phi \hat{j} + \cos \theta \hat{k}$$

$$\text{Curl } \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \partial/\partial x & \partial/\partial y & \partial/\partial z \\ z & x & y \end{vmatrix} = \hat{i} + \hat{j} + \hat{k} \quad \dots(7)$$

$$\text{Curl } \vec{F} \cdot \hat{n} = (\hat{i} + \hat{j} + \hat{k}) \cdot (\sin \theta \cos \phi \hat{i} + \sin \theta \sin \phi \hat{j} + \cos \theta \hat{k}) \\ = \sin \theta \cos \phi + \sin \theta \sin \phi + \cos \theta$$

$$\therefore \iint_S \text{Curl } \vec{F} \cdot \hat{n} dS = \int_{\theta=0}^{\pi/2} \int_{\phi=0}^{2\pi} (\hat{i} + \hat{j} + \hat{k}) \cdot (\sin \theta \cos \phi \hat{i} + \sin \theta \sin \phi \hat{j} + \cos \theta \hat{k}) \sin \theta d\theta d\phi \\ = \int_{\theta=0}^{\pi/2} \sin \theta d\theta \int_{\phi=0}^{2\pi} (\sin \theta \cos \phi + \sin \theta \sin \phi + \cos \theta) d\phi \\ [ \because dS = \text{Elementary area on hemisphere} = \sin \theta d\theta d\phi ] \\ = \int_0^{\pi/2} \sin \theta d\theta [\sin \theta \sin \phi + \sin \theta (-\cos \phi) + \phi \cos \theta]_0^{2\pi} = \int_0^{\pi/2} \sin \theta d\theta \\ = \int_0^{\pi/2} (0 + 0 + 2\pi \sin \theta \cos \theta) d\theta = \pi \int_0^{\pi/2} \sin 2\theta d\theta = \pi \left[ -\frac{\cos 2\theta}{2} \right]_0^{\pi/2} \\ = -(\pi/2)[-1 - 1] = \pi$$

From (5) and (8),  $\oint_C \vec{F} \cdot d\vec{r} = \iint_S \text{curl } \vec{F} \cdot \hat{n} dS$ , which verifies Stokes's theorem.

**Example 34.** Verify Stoke's theorem for the vector field  $\vec{F} = (2x - y)\hat{i} - yz^2\hat{j} - y^2z\hat{k}$  over the upper half of the surface  $x^2 + y^2 + z^2 = 1$  bounded by its projection on xy-plane.

(Nagpur University, Summer 2001)

**Solution.** Let  $S$  be the upper half surface of the sphere  $x^2 + y^2 + z^2 = 1$ . The boundary  $C$  or  $S$  is a circle in the  $xy$  plane of radius unity and centre  $O$ . The equation of  $C$  are  $x^2 + y^2 = 1$ ,

$z = 0$  whose parametric form is

$$x = \cos t, \quad y = \sin t, \quad z = 0, \quad 0 < t < 2\pi$$

$$\int_C \vec{F} \cdot d\vec{r} = \int_C [(2x - y)\hat{i} - yz^2\hat{j} - y^2z\hat{k}] \cdot [\hat{i} dx + \hat{j} dy + \hat{k} dz] \\ = \int_C [(2x - y)dx - yz^2dy - y^2zdz] \\ = \int_C (2x - y)dx, \quad \text{since on } C, z = 0 \text{ and } 2z = 0 \\ = \int_0^{2\pi} (2\cos t - \sin t) \frac{dx}{dt} dt = \int_0^{2\pi} (2\cos t - \sin t)(-\sin t) dt$$

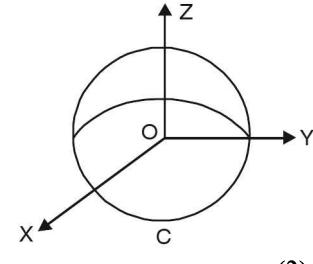

$$\begin{aligned}
 &= \int_0^{2\pi} (-\sin 2t + \sin^2 t) dt = \int_0^{2\pi} \left( -\sin 2t + \frac{1 - \cos 2t}{2} \right) dt \\
 &= \left[ \frac{\cos 2t}{2} + \frac{t}{2} - \frac{\sin 2t}{4} \right]_0^{2\pi} = \frac{1}{2} + \pi - \frac{1}{2} = \pi \quad \dots(1) \\
 \text{Curl } \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2x - y & -yz^2 & -y^2z \end{vmatrix} = (-2yz + 2yz)\hat{i} + (0 - 0)\hat{j} + (0 + 1)\hat{k} = \hat{k}
 \end{aligned}$$

$$\text{Curl } \vec{F} \cdot \hat{n} = \hat{k} \cdot \hat{n} = \hat{n} \cdot \hat{k}$$

$$\iint_S \text{Curl } \vec{F} \cdot \hat{n} ds = \iint_S \hat{n} \cdot \hat{k} ds = \iint_R \hat{n} \cdot \hat{k} \cdot \frac{dx}{\hat{n}} \cdot \frac{dy}{\hat{k}}$$

Where  $R$  is the projection of  $S$  on  $xy$ -plane.

$$\begin{aligned}
 &= \int_{-1}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} dx dy \\
 &= \int_{-1}^1 2\sqrt{1-x^2} dx = 4 \int_0^1 \sqrt{1-x^2} dx \\
 &= 4 \left[ \frac{x}{2} \sqrt{1-x^2} + \frac{1}{2} \sin^{-1} x \right]_0^1 = 4 \left[ \frac{1}{2} \cdot \frac{\pi}{2} \right] = \pi \quad \dots(2)
 \end{aligned}$$

From (1) and (2), we have

$$\therefore \int_C \vec{F} \cdot d\vec{r} = \iint_S \text{Curl } \vec{F} \cdot \hat{n} ds \text{ which is the Stoke's theorem.} \quad \text{Ans.}$$

**Example 35.** Verify Stoke's Theorem for

$$\vec{F} = (x^2 + y - 4)\hat{i} + 3xy\hat{j} + (2xz + z^2)\hat{k}$$

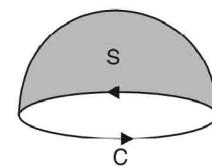

over the surface of hemisphere  $x^2 + y^2 + z^2 = 16$  above the  $xy$ -plane.

**Solution.**  $\int_c \vec{F} \cdot d\vec{r}$ , where  $c$  is the boundary of the circle  $x^2 + y^2 = 16$

(bounding the hemispherical surface)

$$= \int_c [(x^2 + y - 4)\hat{i} + 3xy\hat{j} + (2xz + z^2)\hat{k}] \cdot (\hat{i}dx + \hat{j}dy)$$

$$= \int_c [(x^2 + y - 4) dx + 3xy dy]$$

Putting  $x = 4 \cos \theta, y = 4 \sin \theta, dx = -4 \sin \theta d\theta, dy = 4 \cos \theta d\theta$

$$= \int_0^{2\pi} [(16 \cos^2 \theta + 4 \sin \theta - 4)(-4 \sin \theta d\theta) + (192 \sin \theta \cos^2 \theta d\theta)]$$

$$= 16 \int_0^{2\pi} [-4 \cos^2 \theta \sin \theta - \sin^2 \theta + \sin \theta + 12 \sin \theta \cos^2 \theta] d\theta$$

$$= 16 \int_0^{2\pi} (8 \sin \theta \cos^2 \theta - \sin^2 \theta + \sin \theta) d\theta$$

$$\left\{ \begin{array}{l} \int_0^{2\pi} \sin^n \theta \cos \theta d\theta = 0 \\ \int_0^{2\pi} \cos^n \theta \sin \theta d\theta = 0 \end{array} \right.$$

$$= -16 \int_0^{2\pi} \sin^2 \theta d\theta = -16 \times 4 \int_0^{\pi/2} \sin^2 \theta d\theta = -64 \left( \frac{1}{2} \cdot \frac{\pi}{2} \right) = -16\pi.$$

$$\text{To evaluate surface integral } \nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 + y - 4 & 3xy & 2xz + z^2 \end{vmatrix}$$

$$\begin{aligned}
&= (0 - 0) \hat{i} - (2z - 0) \hat{j} + (3y - 1) \hat{k} = -2z \hat{j} + (3y - 1) \hat{k} \\
\hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{\left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 16)}{|\nabla \phi|} \\
&= \frac{2x \hat{i} + 2y \hat{j} + 2z \hat{k}}{\sqrt{4x^2 + 4y^2 + 4z^2}} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{\sqrt{x^2 + y^2 + z^2}} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{4} \\
(\nabla \times \vec{F}) \cdot \hat{n} &= [-2z \hat{j} + (3y - 1) \hat{k}] \cdot \frac{x \hat{i} + y \hat{j} + z \hat{k}}{4} = \frac{-2yz + (3y - 1)z}{4} \\
\hat{k} \cdot \hat{n} \cdot ds &= dx dy \Rightarrow \frac{x \hat{i} + y \hat{j} + z \hat{k}}{4} \cdot k ds = dx dy \Rightarrow \frac{z}{4} ds = dx dy \\
\therefore ds &= \frac{4}{z} dx dy \\
\iint (\nabla \times F) \cdot \hat{n} ds &= \iint \frac{-2yz + (3y - 1)z}{4} \left( \frac{4}{z} dx dy \right) \\
&= \iint [-2y + (3y - 1)] dx dy = \iint (y - 1) dx dy
\end{aligned}$$

On putting  $x = r \cos \theta$ ,  $y = r \sin \theta$ ,  $dx dy = r d\theta dr$ , we get

$$\begin{aligned}
&= \iint (r \sin \theta - 1) r d\theta dr = \int d\theta \int (r^2 \sin \theta - r) dr \\
&= \int_0^{2\pi} d\theta \left( \frac{r^3}{3} \sin \theta - \frac{r^2}{2} \right)_0^{2\pi} = \int_0^{2\pi} d\theta \left( \frac{64}{3} \sin \theta - 8 \right) \\
&= \left( -\frac{64}{3} \cos \theta - 8\theta \right)_0^{2\pi} = \frac{-64}{3} - 16\pi + \frac{64}{3} = -16\pi
\end{aligned}$$

The line integral is equal to the surface integral, hence Stoke's Theorem is verified. **Proved.**

**Example 36.** Verify Stoke's theorem for a vector field defined by  $\vec{F} = (x^2 - y^2) \hat{i} + 2xy \hat{j}$  in the rectangular in xy-plane bounded by lines  $x = 0$ ,  $x = a$ ,  $y = 0$ ,  $y = b$ .

(Nagpur University, Summer 2000)

**Solution.** Here we have to verify Stoke's theorem  $\int_C \vec{F} \cdot d\vec{r} = \iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds$

Where 'C' be the boundary of rectangle (ABCD) and S be the surface enclosed by curve C.

$$\begin{aligned}
\vec{F} &= (x^2 - y^2) \hat{i} + (2xy) \hat{j} \\
\vec{F} \cdot d\vec{r} &= [(x^2 - y^2) \hat{i} + 2xy \hat{j}] \cdot [\hat{i} dx + \hat{j} dy] \\
\Rightarrow \vec{F} \cdot d\vec{r} &= (x^2 + y^2) dx + 2xy dy \quad \dots(1)
\end{aligned}$$

$$\text{Now, } \int_C \vec{F} \cdot d\vec{r} = \int_{OA} \vec{F} \cdot d\vec{r} + \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CO} \vec{F} \cdot d\vec{r} \quad \dots(2)$$

Along OA, put  $y = 0$  so that  $k dy = 0$  in (1) and  $\vec{F} \cdot d\vec{r} = x^2 dx$ ,  
Where x is from 0 to a.

$$\therefore \int_{OA} \vec{F} \cdot d\vec{r} = \int_0^a x^2 dx = \left[ \frac{x^3}{3} \right]_0^a = \frac{a^3}{3} \quad \dots(3)$$

Along AB, put  $x = a$  so that  $dx = 0$  in (1), we get  $\vec{F} \cdot d\vec{r} = 2ay dy$   
Where y is from 0 to b.

$$\therefore \int_{AB} \vec{F} \cdot d\vec{r} = \int_0^b 2ay dy = [ay^2]_0^b = ab^2 \quad \dots(4)$$

Along  $BC$ , put  $y = b$  and  $dy = 0$  in (1) we get  $\vec{F} \cdot d\vec{r} = (x^2 - b^2) dx$ , where  $x$  is from  $a$  to  $0$ .

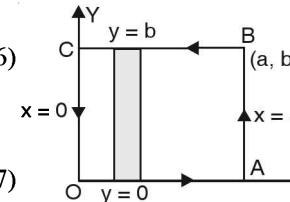

$$\therefore \int_{BC} \vec{F} \cdot d\vec{r} = \int_a^0 (x^2 - b^2) dx = \left[ \frac{x^3}{3} - b^2 x \right]_a^0 = \frac{-a^3}{3} + b^2 a \quad \dots(5)$$

Along  $CO$ , put  $x = 0$  and  $dx = 0$  in (1), we get  $\vec{F} \cdot d\vec{r} = 0$

$$\therefore \int_{CO} \vec{F} \cdot d\vec{r} = 0 \quad \dots(6)$$

Putting the values of integrals (3), (4), (5) and (6) in (2), we get

$$\int_C \vec{F} \cdot d\vec{r} = \frac{a^3}{3} + ab^2 - \frac{a^3}{3} + ab^2 + 0 = 2ab^2 \quad \dots(7)$$

Now we have to evaluate R.H.S. of Stoke's Theorem i.e.  $\iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds$

We have,

$$\nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 - y^2 & 2xy & 0 \end{vmatrix} = (2y + 2y) \hat{k} = 4y \hat{k}$$

Also the unit vector normal to the surface  $S$  in outward direction is  $\hat{n} = \hat{k}$

( $\because z$ -axis is normal to surface  $S$ )

Also in  $xy$ -plane  $ds = dx dy$

$$\therefore \iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds = \iint_R 4y \hat{k} \cdot \hat{k} dx dy = \iint_R 4y dx dy.$$

Where  $R$  be the region of the surface  $S$ .

Consider a strip parallel to  $y$ -axis. This strip starts on line  $y = 0$  (i.e.  $x$ -axis) and end on the line  $y = b$ . We move this strip from  $x = 0$  ( $y$ -axis) to  $x = a$  to cover complete region  $R$ .

$$\begin{aligned} \therefore \iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds &= \int_0^a \left[ \int_0^b 4y dy \right] dx = \int_0^a [2y^2]_0^b dx \\ &= \int_0^a 2b^2 dx = 2b^2 [x]_0^a = 2ab^2 \end{aligned} \quad \dots(8)$$

$\therefore$  From (7) and (8), we get

$$\int_C \vec{F} \cdot d\vec{r} = \iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds \text{ and hence the Stoke's theorem is verified.}$$

**Example 37.** Verify Stoke's Theorem for the function

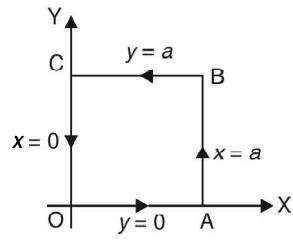

$$\vec{F} = x^2 \hat{i} - xy \hat{j}$$

integrated round the square in the plane  $z = 0$  and bounded by the lines  $x = 0, y = 0, x = a, y = a$ .

**Solution.** We have,  $\vec{F} = x^2 \hat{i} - xy \hat{j}$

$$\begin{aligned} \nabla \times \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 & -xy & 0 \end{vmatrix} \\ &= (0 - 0) \hat{i} - (0 - 0) \hat{j} + (-y - 0) \hat{k} = -y \hat{k} \end{aligned}$$

$(\hat{n} \perp \text{to } xy \text{ plane i.e. } \hat{k})$

$$\begin{aligned} \iint_S (\nabla \times \vec{F}) \cdot \hat{n} \, ds &= \iint_S (-yk) \cdot k \, dx \, dy \\ &= \int_0^a dx \int_0^a -y \, dy = \int_0^a dx \left[ -\frac{y^2}{2} \right]_0^a = -\frac{a^2}{2} (x)_0^a = -\frac{a^3}{2} \end{aligned} \quad \dots(1)$$

To obtain line integral

$$\int_C \vec{F} \cdot \vec{dr} = \int_C (x^2 \hat{i} - xy \hat{j}) \cdot (\hat{i} \, dx + \hat{j} \, dy) = \int_C (x^2 \, dx - xy \, dy)$$

where  $c$  is the path  $OABC$  as shown in the figure.

$$\text{Also, } \int_C \vec{F} \cdot \vec{dr} = \int_{OABC} \vec{F} \cdot \vec{dr} = \int_{OA} \vec{F} \cdot \vec{dr} + \int_{AB} \vec{F} \cdot \vec{dr} + \int_{BC} \vec{F} \cdot \vec{dr} + \int_{CO} \vec{F} \cdot \vec{dr} \quad \dots(2)$$

Along  $OA$ ,  $y = 0$ ,  $dy = 0$

$$\begin{aligned} \int_{OA} \vec{F} \cdot \vec{dr} &= \int_{OA} (x^2 \, dx - xy \, dy) \\ &= \int_0^a x^2 \, dx = \left[ \frac{x^3}{3} \right]_0^a = \frac{a^3}{3} \end{aligned}$$

Along  $AB$ ,  $x = a$ ,  $dx = 0$

$$\begin{aligned} \int_{AB} \vec{F} \cdot \vec{dr} &= \int_{AB} (x^2 \, dx - xy \, dy) \\ &= \int_0^a -ay \, dy = -a \left[ \frac{y^2}{2} \right]_0^a = -\frac{a^3}{2} \end{aligned}$$

Along  $BC$ ,  $y = a$ ,  $dy = 0$

$$\int_{BC} \vec{F} \cdot \vec{dr} = \int_{BC} (x^2 \, dx - xy \, dy) = \int_a^0 x^2 \, dx = \left[ \frac{x^3}{3} \right]_a^0 = -\frac{a^3}{3}$$

Along  $CO$ ,  $x = 0$ ,  $dx = 0$

$$\int_{CO} \vec{F} \cdot \vec{dr} = \int_{CO} (x^2 \, dx - xy \, dy) = 0$$

Putting the values of these integrals in (2), we have

$$\int_C \vec{F} \cdot \vec{dr} = \frac{a^3}{3} - \frac{a^3}{2} - \frac{a^3}{3} + 0 = -\frac{a^3}{2} \quad \dots(3)$$

$$\text{From (1) and (3), } \iint_S (\nabla \times \vec{F}) \cdot \hat{n} \, ds = \int_C \vec{F} \cdot \vec{dr}$$

Hence, Stoke's Theorem is verified.

**Ans.**

**Example 38.** Verify Stoke's Theorem for  $\vec{F} = (x+y) \hat{i} + (2x-z) \hat{j} + (y+z) \hat{k}$  for the surface of a triangular lamina with vertices  $(2, 0, 0)$ ,  $(0, 3, 0)$  and  $(0, 0, 6)$ .

(Nagpur University 2004, K. U. Dec. 2009, 2008, A.M.I.E.T.E., Summer 2000)

**Solution.** Here the path of integration  $c$  consists of the straight lines  $AB$ ,  $BC$ ,  $CA$  where the co-ordinates of  $A$ ,  $B$ ,  $C$  and  $(2, 0, 0)$ ,  $(0, 3, 0)$  and  $(0, 0, 6)$  respectively. Let  $S$  be the plane surface of triangle  $ABC$  bounded by  $C$ . Let  $\hat{n}$  be unit normal vector to surface  $S$ . Then by Stoke's Theorem, we must have

$$\oint_c \vec{F} \cdot \vec{dr} = \iint_S \text{curl } \vec{F} \cdot \hat{n} \, ds \quad \dots(1)$$

$$\text{L.H.S. of (1)} = \int_{ABC}^c \vec{F} \cdot d\vec{r} = \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CA} \vec{F} \cdot d\vec{r}$$

Along line  $AB$ ,  $z = 0$ , equation of  $AB$  is  $\frac{x}{2} + \frac{y}{3} = 1$

$$\Rightarrow y = \frac{3}{2}(2-x), dy = -\frac{3}{2}dx$$

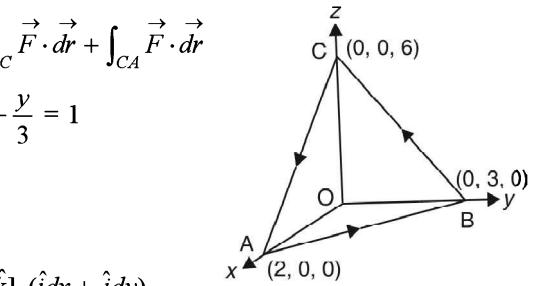

At  $A$ ,  $x = 2$ , At  $B$ ,  $x = 0$ ,  $\vec{r} = x\hat{i} + y\hat{j}$

$$\begin{aligned} \int_{AB} \vec{F} \cdot d\vec{r} &= \int_{AB} [(x+y)\hat{i} + 2x\hat{j} + y\hat{k}] \cdot (\hat{i}dx + \hat{j}dy) \\ &= \int_{AB} (x+y) dx + 2xdy \\ &= \int_{AB} \left( x + 3 - \frac{3x}{2} \right) dx + 2x \left( -\frac{3}{2} dx \right) \\ &= \int_2^0 \left( -\frac{7x}{2} + 3 \right) dx = \left( -\frac{7x^2}{4} + 3x \right)_2^0 \\ &= (7-6) = +1 \end{aligned}$$

Along line  $BC$ ,  $x = 0$ , Equation of  $BC$  is

$$\frac{y}{3} + \frac{z}{6} = 1 \text{ or } z = 6 - 2y, dz = -2dy$$

At  $B$ ,  $y = 3$ , At  $C$ ,  $y = 0$ ,  $\vec{r} = y\hat{j} + z\hat{k}$

line	Eq. of line		Lower limit	Upper limit
$AB$	$\frac{x}{2} + \frac{y}{3} = 1$ $z = 0$	$dy = -\frac{3}{2}dx$	At $A$ $x = 2$	At $B$ $x = 0$
$BC$	$\frac{y}{3} + \frac{z}{6} = 1$ $x = 0$	$dz = -2dy$	At $B$ $y = 3$	At $C$ $y = 0$
$CA$	$\frac{x}{2} + \frac{z}{6} = 1$ $y = 0$	$dz = -3dx$	At $C$ $x = 0$	At $A$ $x = 2$

$$\begin{aligned} \int_{BC} \vec{F} \cdot d\vec{r} &= \int_{BC} [yi + zj + (y+z)k] \cdot (jdy + kdz) = \int_{BC} -zdy + (y+z)dz \\ &= \int_3^0 (-6+2y) dy + (y+6-2y)(-2dy) \\ &= \int_3^0 (4y-18) dy = (2y^2 - 18y)_3^0 = 36 \end{aligned}$$

Along line  $CA$ ,  $y = 0$ , Eq. of  $CA$ ,  $\frac{x}{2} + \frac{z}{6} = 1$  or  $z = 6 - 3x$ ,  $dz = -3dx$

At  $C$ ,  $x = 0$ , at  $A$ ,  $x = 2$ ,  $\vec{r} = x\hat{i} + z\hat{k}$

$$\begin{aligned} \int_{CA} \vec{F} \cdot d\vec{r} &= \int_{CA} [x\hat{i} + (2x-z)\hat{j} + z\hat{k}] \cdot (dx\hat{i} + dz\hat{k}) = \int_{CA} (xdx + zdz) \\ &= \int_0^2 xdx + (6-3x)(-3dx) = \int_0^2 (10x-18) dx = [5x^2 - 18x]_0^2 = -16 \end{aligned}$$

$$\text{L.H.S. of (1)} = \int_{ABC} \vec{F} \cdot d\vec{r} = \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CA} \vec{F} \cdot d\vec{r} = 1 + 36 - 16 = 21 \quad \dots(2)$$

$$\text{Curl } \vec{F} = \nabla \times \vec{F} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(x+y)\hat{i} + (2x-z)\hat{j} + (y+z)\hat{k}]$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x+y & 2x-z & y+z \end{vmatrix} = (1+1)\hat{i} - (0-0)\hat{j} + (2-1)\hat{k} = 2\hat{i} + \hat{k}$$

Equation of the plane of  $ABC$  is  $\frac{x}{2} + \frac{y}{3} + \frac{z}{6} = 1$

Normal to the plane  $ABC$  is

$$\begin{aligned}
 \nabla\phi &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \left( \frac{x}{2} + \frac{y}{3} + \frac{z}{6} - 1 \right) = \frac{\hat{i}}{2} + \frac{\hat{j}}{3} + \frac{\hat{k}}{6} \\
 \text{Unit Normal Vector} &= \frac{\frac{\hat{i}}{2} + \frac{\hat{j}}{3} + \frac{\hat{k}}{6}}{\sqrt{\frac{1}{4} + \frac{1}{9} + \frac{1}{36}}} \\
 \hat{n} &= \frac{1}{\sqrt{14}} (3\hat{i} + 2\hat{j} + \hat{k}) \\
 \text{R.H.S. of (1)} &= \iint_s \operatorname{curl} \vec{F} \cdot \hat{n} \, ds = \iint_s (2\hat{i} + \hat{k}) \cdot \frac{1}{\sqrt{4}} (3\hat{i} + 2\hat{j} + \hat{k}) \frac{dx \, dy}{\frac{1}{\sqrt{14}} (3\hat{i} + 2\hat{j} + \hat{k}) \cdot \hat{k}} \\
 &= \iint_s \frac{(6+1)}{\sqrt{14}} \frac{dx \, dy}{\frac{1}{\sqrt{14}}} = 7 \iint dx \, dy = 7 \text{ Area of } \Delta \text{ OAB} \\
 &= 7 \left( \frac{1}{2} \times 2 \times 3 \right) = 21 \quad \dots(3)
 \end{aligned}$$

with the help of (2) and (3) we find (1) is true and so Stoke's Theorem is verified.

**Example 39.** Verify Stoke's Theorem for

$\vec{F} = (y - z + 2) \hat{i} + (yz + 4) \hat{j} - (xz) \hat{k}$   
over the surface of a cube  $x = 0, y = 0, z = 0, x = 2, y = 2, z = 2$  above the  $XOY$  plane (open the bottom).

**Solution.** Consider the surface of the cube as shown in the figure. Bounding path is  $OABC$  shown by arrows.

$$\begin{aligned}
 \int_c \vec{F} \cdot \vec{dr} &= \int [(y - z + 2) \hat{i} + (yz + 4) \hat{j} - (xz) \hat{k}] \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\
 &= \int_c (y - z + 2) \, dx + (yz + 4) \, dy - xz \, dz
 \end{aligned}$$

$$\int_{OA} \vec{F} \cdot \vec{dr} = \int_{OA} \vec{F} \cdot \vec{dr} + \int_{AB} \vec{F} \cdot \vec{dr} + \int_{BC} \vec{F} \cdot \vec{dr} + \int_{CO} \vec{F} \cdot \vec{dr} \quad \dots(1)$$

(1) Along  $OA, y = 0, dy = 0, z = 0, dz = 0$

$$\int_{OA} \vec{F} \cdot \vec{dr} = \int_0^2 2 \, dx = [2x]_0^2 = 4$$

(2) Along  $AB, x = 2, dx = 0, z = 0, dz = 0$

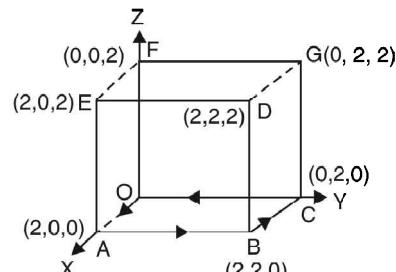

$$\int_{AB} \vec{F} \cdot \vec{dr} = \int_0^2 4 \, dy = 4(y)_0^2 = 8$$

(3) Along  $BC, y = 2, dy = 0, z = 0, dz = 0$

$$\int_{BC} \vec{F} \cdot \vec{dr} = \int_0^2 (2 - 0 + 2) \, dx = (4x)_0^2 = -8$$

(4) Along  $CO, x = 0, dx = 0, z = 0, dz = 0$

$$\int_{CO} \vec{F} \cdot \vec{dr} = \int_{CO} (y - 0 + 2) \times 0 + (0 + 4) \, dy = 0$$

	Line	Equ. of line		Lower limit	Upper limit	$\vec{F} \cdot \vec{dr}$
1	$OA$	$y = 0$ $z = 0$	$dy = 0$ $dz = 0$	$x = 0$	$x = 2$	$2 \, dx$
2	$AB$	$x = 2$ $z = 0$	$dx = 0$ $dz = 0$	$y = 0$	$y = 2$	$4 \, dy$
3	$BC$	$y = 2$ $z = 0$	$dy = 0$ $dz = 0$	$x = 2$	$x = 0$	$4 \, dx$
4	$CO$	$x = 0$ $z = 0$	$dx = 0$ $dz = 0$	$y = 2$	$y = 0$	$4 \, dy$

$$= 4 \int dy = 4(y)_2^0 = -8$$

On putting the values of these integrals in (1), we get

$$\int_C \vec{F} \cdot d\vec{r} = 4 + 8 - 8 - 8 = -4$$

To obtain surface integral

$$\nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y - z + 2 & yz + 4 & -xz \end{vmatrix}$$

$$= (0 - y) \hat{i} - (-z + 1) \hat{j} + (0 - 1) \hat{k} = -y \hat{i} + (z - 1) \hat{j} - \hat{k}$$

Here we have to integrate over the five surfaces,  $ABDE$ ,  $OCGF$ ,  $BCGD$ ,  $OAEF$ ,  $DEFG$ .

Over the surface  $ABDE$  ( $x = 2$ ),  $\hat{n} = i$ ,  $ds = dy dz$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-yi + (z-1)j - k] \cdot i dx dz = \iint -y dy dz \\ &= \iint_R [F_3(x, y, z)]_{z=f_1(x, y)}^{z=f_2(x, y)} dx dy \\ &= - \int_0^2 y dy \int_0^2 dz = - \left[ \frac{y^2}{2} \right]_0^2 [z]_0^2 = -4 \end{aligned}$$

Over the surface  $OCGF$  ( $x = 0$ ),  $\hat{n} = -i$ ,  $ds = dy dz$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-yi + (z-1)j - k] \cdot (-i) dy dz \\ &= \iint y dy dz = \int_0^2 y dy \int_0^2 dz = 2 \left[ \frac{y^2}{2} \right]_0^2 = 4 \end{aligned}$$

(3) Over the surface  $BCGD$ , ( $y = 2$ ),  $\hat{n} = j$ ,  $ds = dx dz$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-yi + (z-1)j - k] \cdot j dx dz \\ &= - \iint (z-1) dx dz = \int_0^2 dx \int_0^2 (z-1) dz = -(x)_0^2 \left( \frac{z^2}{2} - z \right)_0^2 = 0 \end{aligned}$$

(4) Over the surface  $OAEF$ , ( $y = 0$ ),  $\hat{n} = -\hat{j}$ ,  $ds = dx dz$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-yi + (z-1)j - k] \cdot (-j) dx dz \\ &= - \iint (z-1) dx dz = - \int_0^2 dx \int_0^2 (z-1) dz = -(x)_0^2 \left( \frac{z^2}{2} - z \right)_0^2 = 0 \end{aligned}$$

(5) Over the surface  $DEFG$ , ( $z = 2$ ),  $\hat{n} = k$ ,  $ds = dx dy$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-yi + (z-1)j - k] \cdot k dx dy = - \iint dx dy \\ &= - \int_0^2 dx \int_0^2 dy = -[x]_0^2 [y]_0^2 = -4 \end{aligned}$$

Total surface integral =  $-4 + 4 + 0 + 0 - 4 = -4$

$$\text{Thus } \iint_S \text{curl } \vec{F} \cdot \hat{n} ds = \int_C \vec{F} \cdot d\vec{r} = -4$$

which verifies Stoke's Theorem.

**Ans.**

### EXERCISE 24.5

1. Use the Stoke's Theorem to evaluate  $\int_C y^2 dx + xy dy + xz dz$ , where  $C$  is the bounding curve of the hemisphere  $x^2 + y^2 + z^2 = 1, z \geq 0$ , oriented in the positive direction. **Ans.** 0
2. Evaluate the integral for  $\int_C y^2 dx + z^2 dy + x^2 dz$ , where  $C$  is the triangular closed path joining the points  $(0, 0, 0), (0, a, 0)$  and  $(0, 0, a)$  by transforming the integral to surface integral using Stoke's Theorem.

**Ans.**  $\frac{a^3}{3}$ .

3. Verify Stoke's Theorem for  $\vec{A} = 3y\hat{i} - xz\hat{j} + yz^2\hat{k}$ , where  $S$  is the surface of the paraboloid  $2z = x^2 + y^2$  bounded by  $z = 2$  and  $C$  is its boundary traversed in the clockwise direction. **Ans.**  $-20\pi$
4. Evaluate  $\int_C \vec{F} \cdot dR$  where  $\vec{F} = y\hat{i} + xz^3\hat{j} - zy^3\hat{k}$ ,  $C$  is the circle  $x^2 + y^2 = 4, z = 1.5$ . **Ans.**  $\frac{19}{2}\pi$
5. Verify Stoke's Theorem for the vector field

$$\vec{F} = (2y + z)\hat{i} + (x - z)\hat{j} + (y - x)\hat{k}$$

over the portion of the plane  $x + y + z = 1$  cut off by the co-ordinate planes.

6. Evaluate  $\int_C \vec{F} \cdot dr$  by Stoke's Theorem for  $\vec{F} = yz\hat{i} + zx\hat{j} + xy\hat{k}$  and  $C$  is the curve of intersection of  $x^2 + y^2 = 1$  and  $y = z^2$ . **Ans.** 0
7. If  $\vec{F} = (x - z)\hat{i} + (x^3 + yz)\hat{j} + 3xy^2\hat{k}$  and  $S$  is the surface of the cone  $z = a - \sqrt{x^2 + y^2}$  above the  $xy$ -plane, show that  $\iint_S \operatorname{curl} \vec{F} \cdot dS = 3\pi a^4 / 4$ .
8. If  $\vec{F} = 3y\hat{i} - xy\hat{j} + yz2\hat{k}$  and  $S$  is the surface of the paraboloid  $2z = x^2 + y^2$  bounded by  $z = 2$ , show by using Stoke's Theorem that  $\iint_S (\nabla \times \vec{F}) \cdot dS = 20\pi$ .
9. If  $\vec{F} = (y^2 + z^2 - x^2)\hat{i} + (z^2 + x^2 - y^2)\hat{j} + (x^2 + y^2 - z^2)\hat{k}$ , evaluate  $\int \operatorname{curl} \vec{F} \cdot \hat{n} ds$  integrated over the portion of the surface  $x^2 + y^2 - 2ax + az = 0$  above the plane  $z = 0$  and verify Stoke's Theorem; where  $\hat{n}$  is unit vector normal to the surface. **(A.M.I.E.T.E., Winter 20002) Ans.**  $2\pi a^3$
10. Evaluate by using Stoke's Theorem  $\int_C [\sin z dx - \cos x dy + \sin y dz]$  where  $C$  is the boundary of rectangle  $0 \leq x \leq \pi, 0 \leq y \leq 1, z = 3$ . **(AMIETE, June 2010) Ans.** 2

### 24.8 GAUSS'S THEOREM OF DIVERGENCE

(Relation between surface integral and volume integral)

*(GBTU, Dec. 2012, U.P., Ist Semester, Jan., 2011, Dec, 2006)*

**Statement.** The surface integral of the normal component of a vector function  $F$  taken around a closed surface  $S$  is equal to the integral of the divergence of  $F$  taken over the volume  $V$  enclosed by the surface  $S$ .

Mathematically

$$\iint_S \vec{F} \cdot \hat{n} ds = \iiint_V \operatorname{div} \vec{F} dw$$

**Proof.** Let  $\vec{F} = F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}$ .

Putting the values of  $\vec{F}, \hat{n}$  in the statement of the divergence theorem, we have

$$\begin{aligned}\iint_S F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k} \cdot \hat{n} \, ds &= \iiint_V \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}) \, dx \, dy \, dz \\ &= \iiint_V \left( \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z} \right) \, dx \, dy \, dz\end{aligned}\dots(1)$$

We require to prove (1).

Let us first evaluate  $\iiint_V \frac{\partial F_3}{\partial z} \, dx \, dy \, dz$ .

$$\begin{aligned}\iiint_V \frac{\partial F_3}{\partial z} \, dx \, dy \, dz &= \iint_R \left[ \int_{z=f_1(x,y)}^{z=f_2(x,y)} \frac{\partial F_3}{\partial z} \, dz \right] \, dx \, dy \\ &= \iint_R [F_3(x, y, f_2) - F_3(x, y, f_1)] \, dx \, dy\end{aligned}\dots(2)$$

For the upper part of the surface i.e.  $S_2$ , we have

$$dx \, dy = ds_2 \cos r_2 = \hat{n}_2 \cdot \hat{k} \, ds_2$$

Again for the lower part of the surface i.e.  $S_1$ , we have,

$$dx \, dy = -\cos r_1, \, ds_1 = \hat{n}_1 \cdot \hat{k} \, ds_1$$

$$\iint_R F_3(x, y, f_2) \, dx \, dy = \iint_{S_2} F_3 \hat{n}_2 \cdot \hat{k} \, ds_2$$

$$\text{and } \iint_R F_3(x, y, f_1) \, dx \, dy = -\iint_{S_1} F_3 \hat{n}_1 \cdot \hat{k} \, ds_1$$

Putting these values in (2), we have

$$\iiint_V \frac{\partial F_3}{\partial z} \, dv = \iint_{S_2} F_3 \hat{n}_2 \cdot \hat{k} \, ds_2 + \iint_{S_1} F_3 \hat{n}_1 \cdot \hat{k} \, ds_1 = \iint_S F_3 \hat{n} \cdot \hat{k} \, ds \dots(3)$$

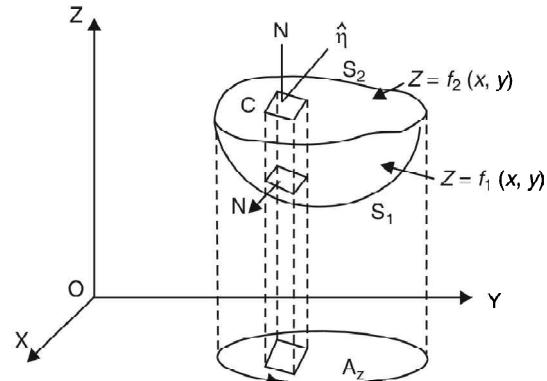

Similarly, it can be shown that

$$\iiint_V \frac{\partial F_2}{\partial y} \, dv = \iint_S F_2 \hat{n} \cdot \hat{j} \, ds \dots(4)$$

$$\iiint_V \frac{\partial F_1}{\partial x} \, dv = \iint_S F_1 \hat{n} \cdot \hat{i} \, ds \dots(5)$$

Adding (3), (4) & (5), we have

$$\begin{aligned}\iiint_V \left( \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z} \right) \, dv \\ &= \iint_S (F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}) \cdot \hat{n} \, ds \\ \Rightarrow \iiint_V (\nabla \cdot \vec{F}) \, dv &= \iint_S \vec{F} \cdot \hat{n} \, ds \quad \text{Proved.}\end{aligned}$$

**Example 40.** State Gauss's Divergence theorem  $\iint_S \vec{F} \cdot \hat{n} \, ds = \iiint_V \operatorname{Div} \vec{F} \, dv$  where  $S$  is the surface of the sphere  $x^2 + y^2 + z^2 = 16$  and  $\vec{F} = 3x \hat{i} + 4y \hat{j} + 5z \hat{k}$ .

(Nagpur University, Winter 2004)

**Solution.** Statement of Gauss's Divergence theorem is given in Art 24.8 on page 597.  
Thus by Gauss's divergence theorem,

$$\iint_S \vec{F} \cdot \hat{n} \, ds = \iint_V \nabla \cdot \vec{F} \, dv \quad \text{Here } \vec{F} = 3x \hat{i} + 4y \hat{j} + 5z \hat{k}$$

$$\nabla \cdot \vec{F} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (3x\hat{i} + 4y\hat{j} + 5z\hat{k})$$

$$\nabla \cdot \vec{F} = 3 + 4 + 5 = 14$$

Putting the value of  $\nabla \cdot F$ , we get

$$\begin{aligned} \iint_S \vec{F} \cdot \hat{n} ds &= \iint_v \int 14 \cdot dv && \text{where } v \text{ is volume of a sphere} \\ &= 14v \\ &= 14 \frac{4}{3}\pi (4)^3 = \frac{3584\pi}{3} && \text{Ans.} \end{aligned}$$

**Example 41.** Evaluate  $\iint_S \vec{F} \cdot \hat{n} ds$  where  $\vec{F} = 4xz\hat{i} - y^2\hat{j} + yz\hat{k}$  and  $S$  is the surface of the cube bounded by  $x = 0, x = 1, y = 0, y = 1, z = 0, z = 1$ .  
(U.P., Ist Semester, 2009, Nagpur University, Winter 2003)

**Solution.** By Divergence theorem,

$$\begin{aligned} \iint_S \vec{F} \cdot \hat{n} ds &= \iint_v \int (\nabla \cdot \vec{F}) dv \\ &= \iiint_v \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) dv \\ &= \iint_v \int \left[ \frac{\partial}{\partial x} (4xz) + \frac{\partial}{\partial y} (-y^2) + \frac{\partial}{\partial z} (yz) \right] dx dy dz \\ &= \iint_v \int (4z - 2y + y) dx dy dz \\ &= \iint_v \int (4z - y) dx dy dz = \int_0^1 \int_0^1 \left( \frac{4z^2}{2} - yz \right)_0^1 dx dy \\ &= \int_0^1 \int_0^1 (2z^2 - yz)_0^1 dx dy = \int_0^1 \int_0^1 (2 - y) dx dy \\ &= \int_0^1 \left( 2y - \frac{y^2}{2} \right)_0^1 dx = \frac{3}{2} \int_0^1 dx = \frac{3}{2} [x]_0^1 = \frac{3}{2} (1) = \frac{3}{2} \text{ Ans.} \end{aligned}$$

**Note:** This question is directly solved as on example 14 on Page 574.

**Example 42.** Find  $\iint_S \vec{F} \cdot \hat{n} \cdot ds$ , where  $\vec{F} = (2x + 3z)\hat{i} - (xz + y)\hat{j} + (y^2 + 2z)\hat{k}$  and  $S$  is the surface of the sphere having centre  $(3, -1, 2)$  and radius 3.  
(AMIETE, Dec. 2010, U.P., I Semester, Winter 2005, 2000)

**Solution.** Let  $V$  be the volume enclosed by the surface  $S$ .  
By Divergence theorem, we've

$$\iint_S \vec{F} \cdot \hat{n} \cdot ds = \iiint_V \operatorname{div} \vec{F} dv.$$

$$\text{Now, } \operatorname{div} \vec{F} = \frac{\partial}{\partial x} (2x + 3z) + \frac{\partial}{\partial y} [-(xz + y)] + \frac{\partial}{\partial z} (y^2 + 2z) = 2 - 1 + 2 = 3$$

$$\therefore \iint_S \vec{F} \cdot \hat{n} \cdot ds = \iiint_V 3 dv = 3 \iiint_V dv = 3V.$$

Again  $V$  is the volume of a sphere of radius 3. Therefore

$$V = \frac{4}{3}\pi r^3 = \frac{4}{3}\pi (3)^3 = 36\pi.$$

$$\therefore \iint_S \vec{F} \cdot \hat{n} \cdot ds = 3V = 3 \times 36\pi = 108\pi \quad \text{Ans.}$$

**Example 43.** Use Divergence Theorem to evaluate  $\iint_S \vec{A} \cdot d\vec{s}$ ,

where  $\vec{A} = x^3\hat{i} + y^3\hat{j} + z^3\hat{k}$  and  $S$  is the surface of the sphere  $x^2 + y^2 + z^2 = a^2$ .

(AMIETE, Dec. 2009)

$$\text{Solution. } \iint_S \vec{A} \cdot d\vec{s} = \iiint_V \operatorname{div} \vec{A} dV$$

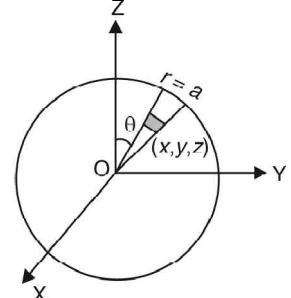

$$= \iiint_V \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^3 \hat{i} + y^3 \hat{j} + z^3 \hat{k}) dV$$

$$= \iiint_V (3x^2 + 3y^2 + 3z^2) dV = 3 \iiint_V (x^2 + y^2 + z^2) dV$$

On putting  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$ , we get

$$= 3 \iiint_V r^2 (r^2 \sin \theta dr d\theta d\phi) = 3 \times 8 \int_0^{\frac{\pi}{2}} d\phi \int_0^{\frac{\pi}{2}} \sin \theta d\theta \int_0^a r^4 dr$$

$$= 24 (\phi)_0^{\frac{\pi}{2}} (-\cos \theta)_0^{\frac{\pi}{2}} \left( \frac{r^5}{5} \right)_0^a = 24 \left( \frac{\pi}{2} \right) (-0+1) \left( \frac{a^5}{5} \right) = \frac{12\pi a^5}{5}$$

Ans.

**Example 44.** Use divergence Theorem to show that

$$\iint_S \nabla (x^2 + y^2 + z^2) \cdot d\vec{s} = 6 V$$

where  $S$  is any closed surface enclosing volume  $V$ . (U.P., I Semester, Winter 2002)

$$\text{Solution. Here } \nabla (x^2 + y^2 + z^2) = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^2 + y^2 + z^2)$$

$$= 2x \hat{i} + 2y \hat{j} + 2z \hat{k} = 2(x \hat{i} + y \hat{j} + z \hat{k})$$

$$\therefore \iint_S \nabla (x^2 + y^2 + z^2) \cdot d\vec{s} = \iint_S \nabla (x^2 + y^2 + z^2) \cdot \hat{n} dS$$

$\hat{n}$  being outward drawn unit normal vector to  $S$

$$= \iint_S 2(x \hat{i} + y \hat{j} + z \hat{k}) \cdot \hat{n} dS$$

$$= 2 \iiint_V \operatorname{div} (x \hat{i} + y \hat{j} + z \hat{k}) dV \quad \dots(1)$$

(By Divergence Theorem)  
( $V$  being volume enclosed by  $S$ )

$$\text{Now, } \operatorname{div} (x \hat{i} + y \hat{j} + z \hat{k}) = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x \hat{i} + y \hat{j} + z \hat{k})$$

$$= \frac{\partial x}{\partial x} + \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} = 3 \quad \dots(2)$$

From (1) & (2), we have

$$\iint_S \nabla (x^2 + y^2 + z^2) \cdot d\vec{s} = 2 \iiint_V 3 dV = 6 \iiint_V dV = 6 V \quad \text{Proved.}$$

**Example 45.** Evaluate  $\iint_S (y^2 z^2 \hat{i} + z^2 x^2 \hat{j} + z^2 y^2 \hat{k}) \cdot \hat{n} dS$ , where  $S$  is the part of the sphere  $x^2 + y^2 + z^2 = 1$  above the  $xy$ -plane and bounded by this plane.

**Solution.** Let  $V$  be the volume enclosed by the surface  $S$ . Then by divergence Theorem, we have

$$\iint_S (y^2 z^2 \hat{i} + z^2 x^2 \hat{j} + z^2 y^2 \hat{k}) \cdot \hat{n} dS = \iiint_V \operatorname{div} (y^2 z^2 \hat{i} + z^2 x^2 \hat{j} + z^2 y^2 \hat{k}) dV$$

$$= \iiint_V \left[ \frac{\partial}{\partial x} (y^2 z^2) + \frac{\partial}{\partial y} (z^2 x^2) + \frac{\partial}{\partial z} (z^2 y^2) \right] dV = \iint_V 2z y^2 dV = 2 \iint_V z y^2 dV$$

Changing to spherical polar coordinates by putting

$$x = r \sin \theta \cos \phi, \quad y = r \sin \theta \sin \phi, \quad z = r \cos \theta, \quad dV = r^2 \sin \theta \, dr \, d\theta \, d\phi$$

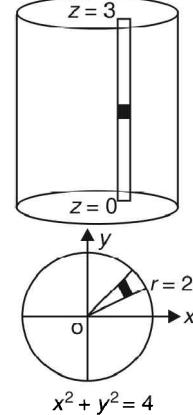

To cover  $V$ , the limits of  $r$  will be 0 to 1, those of  $\theta$  will be 0 to  $\frac{\pi}{2}$  and those of  $\phi$  will be 0 to  $2\pi$ .

$$\begin{aligned} \therefore 2 \iiint_V zy^2 \, dV &= 2 \int_0^{2\pi} \int_0^{\pi/2} \int_0^1 (r \cos \theta) (r^2 \sin^2 \theta \sin^2 \phi) r^2 \sin \theta \, dr \, d\theta \, d\phi \\ &= 2 \int_0^{2\pi} \int_0^{\pi/2} \int_0^1 r^5 \sin^3 \theta \cos \theta \sin^2 \phi \, dr \, d\theta \, d\phi \\ &= 2 \int_0^{2\pi} \int_0^{\pi/2} \left[ \frac{r^6}{6} \right]_0^1 \sin^3 \theta \cos \theta \sin^2 \phi \, d\theta \, d\phi \\ &= \frac{2}{6} \int_0^{2\pi} \sin^2 \phi \cdot \frac{2}{4.2} \, d\phi = \frac{1}{12} \int_0^{2\pi} \sin^2 \phi \, d\phi = \frac{\pi}{12} \quad \text{Ans.} \end{aligned}$$

**Example 46.** Use Divergence Theorem to evaluate  $\iint_S \vec{F} \cdot d\vec{S}$  where  $\vec{F} = 4x\hat{i} - 2y^2\hat{j} + z^2\hat{k}$  and  $S$  is the surface bounding the region  $x^2 + y^2 = 4$ ,  $z = 0$  and  $z = 3$ .  
(A.M.I.E.T.E., Summer 2003, 2001)

**Solution.** By Divergence Theorem,

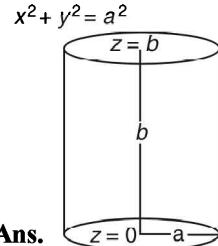

$$\begin{aligned} \iint_S \vec{F} \cdot d\vec{S} &= \iiint_V \operatorname{div} \vec{F} \, dV \\ &= \iiint_V \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (4x\hat{i} - 2y^2\hat{j} + z^2\hat{k}) \, dV \\ &= \iiint_V (4 - 4y + 2z) \, dx \, dy \, dz \\ &= \iint dx \, dy \int_0^3 (4 - 4y + 2z) \, dz = \iint dx \, dy [4z - 4yz + z^2]_0^3 \\ &= \iint (12 - 12y + 9) \, dx \, dy = \iint (21 - 12y) \, dx \, dy \\ \text{Let us put } x = r \cos \theta, y = r \sin \theta & \\ &= \iint (21 - 12r \sin \theta) r \, d\theta \, dr = \int_0^{2\pi} d\theta \int_0^2 (21r - 12r^2 \sin \theta) \, dr \\ &= \int_0^{2\pi} d\theta \left[ \frac{21r^2}{2} - 4r^3 \sin \theta \right]_0^2 = \int_0^{2\pi} d\theta (42 - 32 \sin \theta) = (42\theta + 32 \cos \theta) \Big|_0^{2\pi} \\ &= 84\pi + 32 - 32 = 84\pi \quad \text{Ans.} \end{aligned}$$

**Example 47.** Apply the Divergence Theorem to compute  $\iint \vec{u} \cdot \hat{n} \, ds$ , where  $s$  is the surface of the cylinder  $x^2 + y^2 = a^2$  bounded by the planes  $z = 0$ ,  $z = b$  and where  $\vec{u} = \hat{i}x - \hat{j}y + \hat{k}z$ .

**Solution.** By Gauss's Divergence Theorem

$$\begin{aligned} \iint \vec{u} \cdot \hat{n} \, ds &= \iiint_V (\nabla \cdot \vec{u}) \, dv \\ &= \iiint_V \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (\hat{i}x - \hat{j}y + \hat{k}z) \, dv \\ &= \iiint_V \left( \frac{\partial x}{\partial x} - \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} \right) \, dv = \iiint_V (1 - 1 + 1) \, dv \\ &= \iiint_V \, dv = \iiint_V \, dx \, dy \, dz = \text{Volume of the cylinder} = \pi a^2 b \quad \text{Ans.} \end{aligned}$$

**Example 48.** Apply Divergence Theorem to evaluate  $\iiint_V \vec{F} \cdot \hat{n} ds$ , where

$\vec{F} = 4x^3\hat{i} - x^2y\hat{j} + x^2z\hat{k}$  and  $S$  is the surface of the cylinder  $x^2 + y^2 = a^2$  bounded by the planes  $z = 0$  and  $z = b$ .  
(U.P. Ist Semester, Dec. 2006)

**Solution.** We have,

$$\begin{aligned}\vec{F} &= 4x^3\hat{i} - x^2y\hat{j} + x^2z\hat{k} \\ \therefore \operatorname{div} \vec{F} &= \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (4x^3\hat{i} - x^2y\hat{j} + x^2z\hat{k}) \\ &= \frac{\partial}{\partial x}(4x^3) + \frac{\partial}{\partial y}(-x^2y) + \frac{\partial}{\partial z}(x^2z) = 12x^2 - x^2 + x^2 = 12x^2\end{aligned}$$

$$\begin{aligned}\text{Now, } \iiint_V \operatorname{div} \vec{F} dV &= 12 \int_{x=-a}^a \int_{y=-\sqrt{a^2-x^2}}^{\sqrt{a^2-x^2}} \int_{z=0}^b x^2 dz dy dx \\ &= 12 \int_{x=-a}^a \int_{y=-\sqrt{a^2-x^2}}^{\sqrt{a^2-x^2}} x^2 (z)_0^b dy dx = 12b \int_{-a}^a x^2 (y) \Big|_{-\sqrt{a^2-x^2}}^{\sqrt{a^2-x^2}} dx \\ &= 12b \int_{-a}^a x^2 \cdot 2\sqrt{a^2-x^2} dx &= 24b \int_{-a}^a x^2 \sqrt{a^2-x^2} dx \\ &= 48b \int_0^a x^2 \sqrt{a^2-x^2} dx &[\text{Put } x = a \sin \theta, dx = a \cos \theta d\theta] \\ &= 48b \int_0^{\pi/2} a^2 \sin^2 \theta a \cos \theta a \cos \theta d\theta \\ &= 48ba^4 \int_0^{\pi/2} \sin^2 \theta \cdot \cos^2 \theta d\theta = 48ba^4 \frac{3}{2} \frac{1}{2} \frac{1}{2} \frac{1}{2} \\ &= 48ba^4 \frac{1}{2} \frac{1}{2} \frac{1}{2} \frac{1}{2} = 3b a^4 \pi\end{aligned}$$

**Ans.**

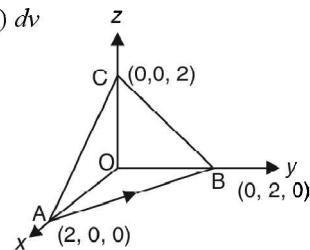

**Example 49.** Evaluate surface integral  $\iint_S \vec{F} \cdot \hat{n} ds$ , where  $\vec{F} = (x^2 + y^2 + z^2)(\hat{i} + \hat{j} + \hat{k})$ ,  $S$  is the surface of the tetrahedron  $x = 0, y = 0, z = 0, x + y + z = 2$  and  $n$  is the unit normal in the outward direction to the closed surface  $S$ .

**Solution.** By Divergence theorem

$$\iint_S \vec{F} \cdot \hat{n} ds = \iiint_V \operatorname{div} \vec{F} dv$$

where  $S$  is the surface of tetrahedron  $x = 0, y = 0, z = 0, x + y + z = 2$

$$\begin{aligned}&= \iiint_V \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^2 + y^2 + z^2)(\hat{i} + \hat{j} + \hat{k}) dv \\ &= \iiint_V (2x + 2y + 2z) dv \\ &= 2 \iiint_V (x + y + z) dx dy dz \\ &= 2 \int_0^2 dx \int_0^{2-x} dy \int_0^{2-x-y} (x + y + z) dz \\ &= 2 \int_0^2 dx \int_0^{2-x} dy \left( xz + yz + \frac{z^2}{2} \right) \Big|_0^{2-x-y}\end{aligned}$$

$$\begin{aligned}
&= 2 \int_0^2 dx \int_0^{2-x} dy \left( 2x - x^2 - xy + 2y - xy - y^2 + \frac{(2-x-y)^2}{2} \right) \\
&= 2 \int_0^2 dx \left[ 2xy - x^2y - xy^2 + y^2 - \frac{y^3}{3} - \frac{(2-x-y)^3}{6} \right]_0^{2-x} \\
&= 2 \int_0^2 dx \left[ 2x(2-x) - x^2(2-x) - x(2-x)^2 + (2-x)^2 - \frac{(2-x)^3}{3} + \frac{(2-x)^3}{6} \right] \\
&= 2 \int_0^2 \left( 4x - 2x^2 - 2x^2 + x^3 - 4x + 4x^2 - x^3 + (2-x)^2 - \frac{(2-x)^3}{3} + \frac{(2-x)^3}{6} \right) \\
&= 2 \left[ 2x^2 - \frac{4x^3}{3} + \frac{x^4}{4} - 2x^2 + \frac{4x^3}{3} - \frac{x^4}{4} - \frac{(2-x)^3}{3} + \frac{(2-x)^4}{12} - \frac{(2-x)^4}{24} \right]_0^2 \\
&= 2 \left[ -\frac{(2-x)^3}{3} + \frac{(2-x)^4}{12} - \frac{(2-x)^4}{24} \right]_0^2 = 2 \left[ \frac{8}{3} - \frac{16}{12} + \frac{16}{24} \right] = 4 \quad \text{Ans.}
\end{aligned}$$

**Example 50.** Use the Divergence Theorem to evaluate

$$\iint_S (x \, dy \, dz + y \, dz \, dx + z \, dx \, dy)$$

where  $S$  is the portion of the plane  $x + 2y + 3z = 6$  which lies in the first Octant.  
(U.P., I Semester, Winter 2003)

**Solution.**  $\iint_S (f_1 \, dy \, dz + f_2 \, dx \, dz + f_3 \, dx \, dy)$

$$= \iiint_V \left( \frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) dx \, dy \, dz$$

where  $S$  is a closed surface bounding a volume  $V$ .

$$\therefore \iint_S (x \, dy \, dz + y \, dz \, dx + z \, dx \, dy)$$

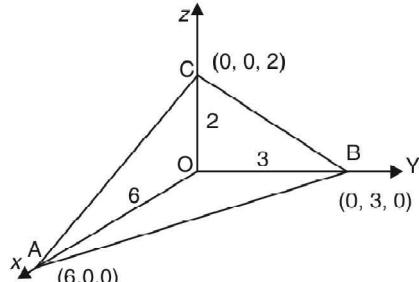

$$= \iiint_V \left[ \frac{\partial x}{\partial x} + \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} \right] dx \, dy \, dz$$

$$= \iiint_V (1+1+1) dx \, dy \, dz = 3 \iiint_V dx \, dy \, dz$$

$$= 3 \text{ (Volume of tetrahedron } OABC)$$

$$= 3 \left[ \frac{1}{3} \text{ Area of the base } \Delta OAB \times \text{height } OC \right]$$

$$= 3 \left[ \frac{1}{3} \left( \frac{1}{2} \times 6 \times 3 \right) \times 2 \right] = 18 \quad \text{Ans.}$$

**Example 51.** Use Divergence Theorem to evaluate :  $\iint (x \, dy \, dz + y \, dz \, dx + z \, dx \, dy)$

over the surface of a sphere radius  $a$ . (K. University, Dec. 2009)

**Solution.** Here, we have

$$\iint_S [x \, dy \, dz + y \, dx \, dz + z \, dx \, dy]$$

$$= \iiint_V \left( \frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) dx \, dy \, dz = \iiint_V \left( \frac{\partial x}{\partial x} + \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} \right) dx \, dy \, dz$$

$$= \iiint_V (1+1+1) dx \, dy \, dz = 3 \text{ (volume of the sphere)}$$

$$= 3 \left( \frac{4}{3} \pi a^3 \right) = 4 \pi a^3 \quad \text{Ans.}$$

**Example 52.** Using the divergence theorem, evaluate the surface integral  $\iint_S (yz dy dz + zx dz dx + xy dy dx)$  where  $S: x^2 + y^2 + z^2 = 4$ .

(AMIETE, Dec. 2010, UP, I Sem., Dec 2008)

**Solution.**  $\iint_S (f_1 dy dz + f_2 dz dx + f_3 dx dy)$

$$= \iiint_V \left( \frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) dx dy dz$$

where  $S$  is closed surface bounding a volume  $V$ .

$$\therefore \iint_S (yz dy dz + zx dz dx + xy dy dx)$$

$$= \iiint_V \left( \frac{\partial (yz)}{\partial x} + \frac{\partial (zx)}{\partial y} + \frac{\partial (xy)}{\partial z} \right) dx dy dz = \iiint_V (0 + 0 + 0) dx dy dz \\ = 0$$

**Ans.**

**Example 53.** Evaluate  $\iint_S xz^2 dy dz + (x^2 y - z^3) dz dx + (2xy + y^2 z) dx dy$

where  $S$  is the surface of hemispherical region bounded by

$$z = \sqrt{a^2 - x^2 - y^2} \text{ and } z = 0.$$

**Solution.**  $\iint_S (f_1 dy dz + f_2 dz dx + f_3 dx dy) = \iiint_V \left( \frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) dx dy dz$

where  $S$  is a closed surface bounding a volume  $V$ .

$$\therefore \iint_S xz^2 dy dz + (x^2 y - z^3) dz dx + (2xy + y^2 z) dx dy$$

$$= \iiint_V \left[ \frac{\partial (xz^2)}{\partial x} + \frac{\partial (x^2 y - z^3)}{\partial y} + \frac{\partial (2xy + y^2 z)}{\partial z} \right] dx dy dz$$

(Here  $V$  is the volume of hemisphere)

$$= \iiint_V (z^2 + x^2 + y^2) dx dy dz$$

Let  $x = r \sin \theta \cos \phi$ ,  $y = r \sin \theta \sin \phi$ ,  $z = r \cos \theta$

$$= \iiint r^2 (r^2 \sin \theta dr d\theta d\phi) = \int_0^{2\pi} d\phi \int_0^{\frac{\pi}{2}} \sin \theta d\theta \int_0^a r^4 dr$$

$$= (\phi)_0^{2\pi} (-\cos \theta)_0^{\frac{\pi}{2}} \left( \frac{r^5}{5} \right)_0^a = 2\pi (-0+1) \frac{a^5}{5} = \frac{2\pi a^5}{5}$$

**Ans.**

**Example 54.** Evaluate  $\iint_S \vec{F} \cdot \hat{n} ds$  over the entire surface of the region above the  $xy$ -plane

bounded by the cone  $z^2 = x^2 + y^2$  and the plane  $z = 4$ , if  $F = 4xz \hat{i} + xyz^2 \hat{j} + 3z \hat{k}$ .

**Solution.** If  $V$  is the volume enclosed by  $S$ , then  $V$  is bounded by the surfaces  $z = 0$ ,  $z = 4$ ,  $z^2 = x^2 + y^2$ .

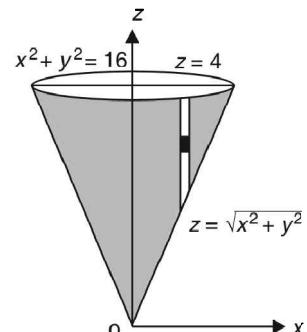

By divergence theorem, we have

$$\iint_S \vec{F} \cdot \hat{n} ds = \iiint_V \operatorname{div} \vec{F} dx dy dz$$

$$= \iiint_V \left[ \frac{\partial}{\partial x} (4xz) + \frac{\partial}{\partial y} (xyz^2) + \frac{\partial}{\partial z} (3z) \right] dx dy dz$$

$$= \iiint_V (4z + xz^2 + 3) dx dy dz$$

Limits of  $z$  are  $\sqrt{x^2 + y^2}$  and 4.

$$\begin{aligned}
\iiint_{\sqrt{x^2+y^2}}^4 (4z + xz^2 + 3) \, dz \, dy \, dx &= \iint \left[ 2z^2 + \frac{xz^3}{3} + 3z \right]_{\sqrt{x^2+y^2}}^4 \, dy \, dx \\
&= \iint \left[ \left( 32 + \frac{64x}{3} + 12 \right) - \{2(x^2 + y^2) + x(x^2 + y^2)^{3/2} + 3\sqrt{x^2 + y^2}\} \right] \, dy \, dx \\
&= \iint \left( 44 + \frac{64x}{3} - 2(x^2 + y^2) - x(x^2 + y^2)^{3/2} - 3\sqrt{x^2 + y^2} \right) \, dy \, dx
\end{aligned}$$

Putting  $x = r \cos \theta$  and  $y = r \sin \theta$ , we have

$$= \iint \left( 44 + \frac{64r \cos \theta}{3} - 2r^2 - r \cos \theta r^3 - 3r \right) r \, d\theta \, dr$$

Limits of  $r$  are 0 to 4.

and limits of  $\theta$  are 0 to  $2\pi$ .

$$\begin{aligned}
&= \int_0^{2\pi} \int_0^4 \left( 44r + \frac{64r^2 \cos \theta}{3} - 2r^3 - r^5 \cos \theta - 3r^2 \right) d\theta \, dr \\
&= \int_0^{2\pi} \left[ 22r^2 + \frac{64 \times r^3 \cos \theta}{9} - \frac{r^4}{2} - \frac{r^6}{6} \cos \theta - r^3 \right]_0^4 d\theta \\
&= \int_0^{2\pi} \left[ 22(4)^2 + \frac{64 \times (4)^3 \cos \theta}{9} - \frac{(4)^4}{2} - \frac{(4)^6}{6} \cos \theta - (4)^3 \right] d\theta \\
&= \int_0^{2\pi} \left[ 352 + \frac{64 \times 64}{9} \cos \theta - 128 - \frac{(4)^6}{6} \cos \theta - 64 \right] d\theta \\
&= \int_0^{2\pi} \left[ 160 + \left( \frac{64 \times 64}{9} - \frac{(4)^6}{6} \right) \cos \theta \right] d\theta \\
&= \left[ 160\theta + \left( \frac{64 \times 64}{9} - \frac{(4)^6}{6} \right) \sin \theta \right]_0^{2\pi} = 160(2\pi) + \left( \frac{64 \times 64}{9} - \frac{(4)^6}{6} \right) \sin 2\pi \\
&= 320\pi
\end{aligned}$$

**Ans.**

**Example 55.** The vector field  $\vec{F} = x^2\hat{i} + z\hat{j} + yz\hat{k}$  is defined over the volume of the cuboid given by  $0 \leq x \leq a$ ,  $0 \leq y \leq b$ ,  $0 \leq z \leq c$ , enclosing the surface  $S$ . Evaluate the surface integral

$$\iint_S \vec{F} \cdot \vec{ds} \quad (\text{U.P., I Semester, Winter 2001})$$

**Solution.** By Divergence Theorem, we have

$$\iint_S (x^2 \hat{i} + z \hat{j} + yz \hat{k}) \cdot ds = \iiint_V \operatorname{div} (x^2 \hat{i} + z \hat{j} + yz \hat{k}) \, dv,$$

where  $V$  is the volume of the cuboid enclosing the surface  $S$ .

$$\begin{aligned}
&= \iiint_V \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^2 \hat{i} + z \hat{j} + yz \hat{k}) \, dv \\
&= \iiint_V \left\{ \frac{\partial}{\partial x} (x^2) + \frac{\partial}{\partial y} (z) + \frac{\partial}{\partial z} (yz) \right\} \, dx \, dy \, dz \\
&= \int_{x=0}^a \int_{y=0}^b \int_{z=0}^c (2x + y) \, dx \, dy \, dz = \int_0^a dx \int_0^b dy \int_0^c (2x + y) \, dz \\
&= \int_0^a dx \int_0^b [2xz + yz]_0^c \, dy = \int_0^a dx \int_0^b (2xc + yc) \, dy
\end{aligned}$$

$$\begin{aligned}
 &= c \int_0^a dx \int_0^b (2x + y) dy = c \int_0^a \left[ 2xy + \frac{y^2}{2} \right]_0^b dx = c \int_0^a \left( 2bx + \frac{b^2}{2} \right) dx \\
 &= c \left[ \frac{2bx^2}{2} + \frac{b^2 x}{2} \right]_0^a = c \left[ a^2 b + \frac{ab^2}{2} \right] = abc \left( a + \frac{b}{2} \right)
 \end{aligned}
 \quad \text{Ans.}$$

**Example 56.** Verify the divergence Theorem for the function  $\vec{F} = 2x^2yi - y^2j + 4xz^2k$  taken over the region in the first octant bounded by  $y^2 + z^2 = 9$  and  $x = 2$ .

$$\begin{aligned}
 \text{Solution. } \iiint_V \nabla \cdot \vec{F} dV &= \iiint \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (2x^2y\hat{i} - y^2\hat{j} + 4xz^2\hat{k}) dV \\
 &= \iiint (4xy - 2y + 8xz) dx dy dz = \int_0^2 dx \int_0^3 dy \int_0^{\sqrt{9-y^2}} (4xy - 2y + 8xz) dz \\
 &= \int_0^2 dx \int_0^3 dy (4xyz - 2yz + 4xz^2) \Big|_0^{\sqrt{9-y^2}} \\
 &= \int_0^2 dx \int_0^3 [4xy\sqrt{9-y^2} - 2y\sqrt{9-y^2} + 4x(9-y^2)] dy \\
 &= \int_0^2 dx \left[ -\frac{4x}{2} \frac{2}{3} (9-y^2)^{3/2} + \frac{2}{3} (9-y^2)^{3/2} + 36xy - \frac{4xy^3}{3} \right]_0^3 \\
 &= \int_0^2 (0 + 0 + 108x - 36x + 36x - 18) dx = \int_0^2 (108x - 18) dx = \left[ 108 \frac{x^2}{2} - 18x \right]_0^2 \\
 &= 216 - 36 = 180
 \end{aligned} \tag{1}$$

Here  $\iint_S \vec{F} \cdot \hat{n} ds = \iint_{OABC} \vec{F} \cdot \hat{n} ds + \iint_{OCE} \vec{F} \cdot \hat{n} ds + \iint_{ODE} \vec{F} \cdot \hat{n} ds + \iint_{ABD} \vec{F} \cdot \hat{n} ds + \iint_{BDEC} \vec{F} \cdot \hat{n} ds$

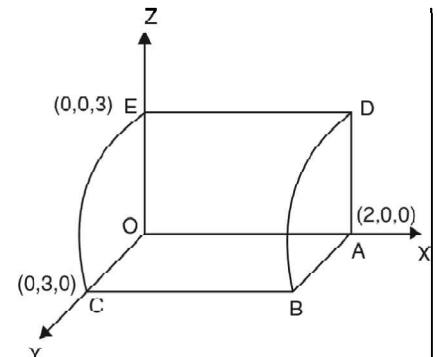

$\iint_{BDEC} \vec{F} \cdot \hat{n} ds = \iint_{BDEC} (2x^2y\hat{i} - y^2\hat{j} + 4xz^2\hat{k}) \cdot \hat{n} ds$

Normal vector

$$\begin{aligned}
 &= \nabla \phi = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (y^2 + z^2 - 9) \\
 &= 2y\hat{j} + 2z\hat{k}
 \end{aligned}$$

$$\begin{aligned}
 \text{Unit normal vector } \hat{n} &= \frac{2y\hat{j} + 2z\hat{k}}{\sqrt{4y^2 + 4z^2}} = \frac{y\hat{j} + z\hat{k}}{\sqrt{y^2 + z^2}} \\
 &= \frac{y\hat{j} + z\hat{k}}{\sqrt{9}} = \frac{y\hat{j} + z\hat{k}}{3}
 \end{aligned}$$

$$\begin{aligned}
 \iint_{BDEC} (2x^2y\hat{i} - y^2\hat{j} + 4xz^2\hat{k}) \cdot \frac{y\hat{j} + z\hat{k}}{3} ds &= \frac{1}{3} \iint_{BDEC} (-y^3 + 4xz^3) ds \\
 &\quad \left[ \begin{aligned} dx dy = ds (\hat{n} \cdot k) &= ds \left( \frac{y\hat{j} + z\hat{k}}{3} \cdot \hat{k} \right) = ds \frac{z}{3} \text{ or } ds = \frac{dx dy}{\frac{z}{3}} \\ &= \frac{1}{3} \iint_{BDEC} (-y^3 + 4xz^3) \frac{dx dy}{\frac{z}{3}} = \int_0^2 dx \int_0^3 \left( -\frac{y^3}{z} + 4xz^2 \right) dy \quad \begin{cases} y = 3 \sin \theta, \\ z = 3 \cos \theta \end{cases} \end{aligned} \right] \\
 &= \int_0^2 dx \int_0^{\frac{\pi}{2}} \left[ \frac{-27 \sin^3 \theta}{3 \cos \theta} + 4x(9 \cos^2 \theta) \right]
 \end{aligned}$$

$$\begin{aligned}
&= \int_0^2 dx \left( -27 \times \frac{2}{3} + 108 x \times \frac{2}{3} \right) = \int_0^2 (-18 + 72x) dx \\
&= \left[ -18x + 36x^2 \right]_0^2 = 108
\end{aligned} \quad \dots(2)$$

$$\begin{aligned}
\iint_{OABC} \vec{F} \cdot \hat{n} ds &= \iint_{OABC} (2x^2 y \hat{i} - y^2 \hat{j} + 4xz^2 \hat{k}) \cdot (-\hat{k}) ds \\
&= \iint_{OABC} 4xz^2 ds = 0 \quad \dots(3) \text{ because in } OABC \text{ } xy\text{-plane, } z = 0
\end{aligned}$$

$$\iint_{OADE} \vec{F} \cdot \hat{n} ds = \iint_{OADE} (2x^2 y \hat{i} - y^2 \hat{j} + 4xz^2 \hat{k}) \cdot (-\hat{j}) ds = \iint_{OADE} y^2 ds = 0 \quad \dots(4) \text{ because in } OADE \text{ } xz\text{-plane, } y = 0$$

$$\iint_{OCE} \vec{F} \cdot \hat{n} ds = \iint_{OCE} (2x^2 y \hat{i} - y^2 \hat{j} + 4xz^2 \hat{k}) \cdot (-\hat{i}) ds = \iint_{OCE} -2x^2 y ds = 0 \quad \dots(5) \text{ because in } OCE \text{ } yz\text{-plane, } x = 0$$

$$\begin{aligned}
\iint_{ABD} \vec{F} \cdot \hat{n} ds &= \iint_{ABD} (2x^2 y \hat{i} - y^2 \hat{j} + 4xz^2 \hat{k}) \cdot (\hat{i}) ds = \iint_{ABD} 2x^2 y ds \\
&= \iint 2x^2 y dy dz = \int_0^3 dz \int_0^{\sqrt{9-z^2}} 2(2)^2 y dy \quad \text{because in } ABD \text{ plane, } x = 2 \\
&= 8 \int_0^3 dz \left[ \frac{y^3}{3} \right]_0^{\sqrt{9-z^2}} = 4 \int_0^3 dz (9-z^2) = 4 \left[ 9z - \frac{z^3}{3} \right]_0^3 = 4 [27-9] = 72 \quad \dots(6)
\end{aligned}$$

On adding (2), (3), (4), (5) and (6), we get

$$\iint_S \vec{F} \cdot \hat{n} ds = 108 + 0 + 0 + 0 + 72 = 180 \quad \dots(7)$$

From (1) and (7), we have  $\iiint_V \nabla \cdot \vec{F} dV = \iint_S \vec{F} \cdot \hat{n} ds$

Hence the theorem is verified.

**Example 57.** Verify the Gauss divergence Theorem for

$\vec{F} = (x^2 - yz) \hat{i} + (y^2 - zx) \hat{j} + (z^2 - xy) \hat{k}$  taken over the rectangular parallelopiped  $0 \leq x \leq a, 0 \leq y \leq b, 0 \leq z \leq c$ . (U.P., I Semester, Compartment 2002)

**Solution.** We have

$$\begin{aligned}
\operatorname{div} \vec{F} &= \nabla \cdot \vec{F} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot [(x^2 - yz) \hat{i} + (y^2 - zx) \hat{j} + (z^2 - xy) \hat{k}] \\
&= \frac{\partial}{\partial x} (x^2 - yz) + \frac{\partial}{\partial y} (y^2 - zx) + \frac{\partial}{\partial z} (z^2 - xy) = 2x + 2y + 2z
\end{aligned}$$

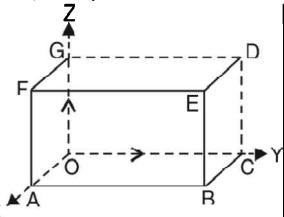

$$\begin{aligned}
\therefore \text{Volume integral} &= \iiint_V \nabla \cdot \vec{F} dV = \iiint_V 2(x + y + z) dV \\
&= 2 \int_{x=0}^a \int_{y=0}^b \int_{z=0}^c (x + y + z) dx dy dz = 2 \int_0^a dx \int_0^b dy \int_0^c (x + y + z) dz \\
&= 2 \int_0^a dx \int_0^b dy \left( xz + yz + \frac{z^2}{2} \right)_0^c = 2 \int_0^a dx \int_0^b dy \left( cx + cy + \frac{c^2}{2} \right) \\
&= 2 \int_0^a dx \left( cx^2 + c \frac{y^2}{2} + \frac{c^2 y}{2} \right)_0^b = 2 \int_0^a dx \left( bcx + \frac{b^2 c}{2} + \frac{bc^2}{2} \right)
\end{aligned}$$

$$= 2 \left[ \frac{bcx^2}{2} + \frac{b^2 cx}{2} + \frac{bc^2 x}{2} \right]_0^a = [a^2 bc + ab^2 c + abc^2] \\ = abc(a + b + c) \quad \dots(A)$$

To evaluate  $\iint_S \vec{F} \cdot \hat{n} ds$ , where  $S$  consists of six plane surfaces.

$$\iint_S \vec{F} \cdot \hat{n} ds = \iint_{OABC} \vec{F} \cdot \hat{n} ds + \iint_{DEFG} \vec{F} \cdot \hat{n} ds + \iint_{OAFG} \vec{F} \cdot \hat{n} ds \\ + \iint_{BCDE} \vec{F} \cdot \hat{n} ds + \iint_{ABEF} \vec{F} \cdot \hat{n} ds + \iint_{OCDG} \vec{F} \cdot \hat{n} ds$$

$$\iint_{OABC} \vec{F} \cdot \hat{n} ds = \iint_{OABC} \{(x^2 - yz)\hat{i} + (y^2 - xz)\hat{j} + (z^2 - xy)\hat{k}\}(-\hat{k}) dx dy \\ = - \iint_{00}^{ab} (z^2 - xy) dx dy \\ = - \iint_{00}^{ab} (0 - xy) dx dy = \frac{a^2 b^2}{4} \quad \dots(1)$$

$$\iint_{DEFG} \vec{F} \cdot \hat{n} ds = \iint_{DEFG} \{(x^2 - yz)\hat{i} + (y^2 - xz)\hat{j} + (z^2 - xy)\hat{k}\}(\hat{k}) dx dy$$

$$= \iint_{00}^{ab} (z^2 - xy) dx dy = \iint_{00}^{ab} (c^2 - xy) dx dy \\ = \int_0^a \left[ c^2 y - \frac{xy^2}{2} \right]_0^b dx = \int_0^a \left( c^2 b - \frac{x b^2}{2} \right) dx \\ = \left[ c^2 b x - \frac{x^2 b^2}{4} \right]_0^a = abc^2 - \frac{a^2 b^2}{4} \quad \dots(2)$$

S.No.	Surface	Outward normal	$ds$	
1	OABC	$-\hat{k}$	$dx dy$	$z = 0$
2	DEFG	$\hat{k}$	$dx dy$	$z = c$
3	OAFG	$-\hat{j}$	$dx dz$	$y = 0$
4	BCDE	$\hat{j}$	$dx dz$	$y = b$
5	ABEF	$\hat{i}$	$dy dz$	$x = a$
6	OCDG	$-\hat{i}$	$dy dz$	$x = 0$

$$\iint_{OAFG} \vec{F} \cdot \hat{n} ds = \iint_{OAFG} \{(x^2 - yz)\hat{i} + (y^2 - zx)\hat{j} + (z^2 - xy)\hat{k}\}(-\hat{j}) dx dz$$

$$= - \iint_{OAFG} (y^2 - zx) dx dz \\ = - \int_0^a dx \int_0^c (0 - zx) dz = \int_0^a dx \left( \frac{x z^2}{2} \right)_0^c = \int_0^a \frac{x c^2}{2} dx = \left[ \frac{x^2 c^2}{4} \right]_0^a = \frac{a^2 c^2}{4} \quad \dots(3)$$

$$\iint_{BCDE} \vec{F} \cdot \hat{n} ds = \iint \{(x^2 - yz)\hat{i} + (y^2 - zx)\hat{j} + (z^2 - xy)\hat{k}\} \cdot \hat{j} dx dz = \iint_{BCDE} (y^2 - zx) dx dz$$

$$= - \int_0^a dx \int_0^c (b^2 - xz) dz = \int_0^a dx \left( b^2 z - \frac{xz^2}{2} \right)_0^c = \int_0^a \left( b^2 c - \frac{xc^2}{2} \right) dx \\ = \left[ b^2 c x - \frac{x^2 c^2}{4} \right]_0^a = ab^2 c - \frac{a^2 c^2}{4} \quad \dots(4)$$

$$\iint_{ABEF} \vec{F} \cdot \hat{n} ds = \iint_{ABEF} \{(x^2 - yz)\hat{i} + (y^2 - zx)\hat{j} + (z^2 - xy)\hat{k}\} \cdot \hat{i} dy dz$$

$$= \iint_{ABEF} (x^2 - yz) dy dz = \int_0^b dy \int_0^c (a^2 - yz) dz = \int_0^b dy \left( a^2 z - \frac{yz^2}{2} \right)_0^c$$

$$= \int_0^b \left( a^2 c - \frac{y c^2}{2} \right) dy = \left[ a^2 c y - \frac{y^2 c^2}{4} \right]_0^b = a^2 b c - \frac{b^2 c^2}{4} \quad \dots(5)$$

$$\begin{aligned} \iint_{OCDG} \vec{F} \cdot \hat{n} ds &= \iint_{OCDG} \{(x^2 - yz)\hat{i} + (y^2 - zx)\hat{j} + (z^2 - xy)\hat{k}\} \cdot (-\hat{i}) dy dz \\ &= \int_0^b \int_0^c (x^2 - yz) dy dz = - \int_0^b dy \int_0^c (-yz) dz = - \int_0^b dy \left[ \frac{-yz^2}{2} \right]_0^c \\ &= \int_0^b \frac{yc^2}{2} dy = \left[ \frac{y^2 c^2}{4} \right]_0^b = \frac{b^2 c^2}{4} \end{aligned} \quad \dots(6)$$

Adding (1), (2), (3), (4), (5) and (6), we get

$$\begin{aligned} \iint \vec{F} \cdot \hat{n} ds &= \left( \frac{a^2 b^2}{4} \right) + \left( abc^2 - \frac{a^2 b^2}{4} \right) + \left( \frac{a^2 c^2}{4} \right) + \left( ab^2 c - \frac{a^2 c^2}{4} \right) \\ &\quad + \left( \frac{b^2 c^2}{4} \right) + \left( a^2 b c - \frac{b^2 c^2}{4} \right) \\ &= abc^2 + ab^2 c + a^2 bc \\ &= abc(a + b + c) \end{aligned} \quad \dots(B)$$

From (A) and (B), Gauss divergence Theorem is verified.

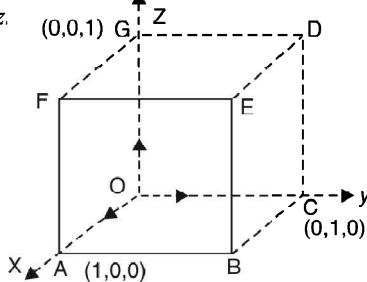

**Verified.**

**Example 58.** Verify Divergence Theorem, given that  $\vec{F} = 4xzi - y^2\hat{j} + yz\hat{k}$  and  $S$  is the surface of the cube bounded by the planes  $x = 0, x = 1, y = 0, y = 1, z = 0, z = 1$ .

**Solution.**  $\nabla \cdot \vec{F} = \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (4xzi - y^2\hat{j} + yz\hat{k})$

$$\begin{aligned} &= 4z - 2y + y \\ &= 4z - y \end{aligned}$$

$$\begin{aligned} \text{Volume Integral} &= \iiint \nabla \cdot \vec{F} dv \\ &= \iiint (4z - y) dx dy dz \\ &= \int_0^1 dx \int_0^1 dy \int_0^1 (4z - y) dz \\ &= \int_0^1 dx \int_0^1 dy (2z^2 - yz)_0^1 = \int_0^1 dx \int_0^1 dy (2 - y) \\ &= \int_0^1 dx \left( 2y - \frac{y^2}{2} \right)_0^1 = \int_0^1 dx \left( 2 - \frac{1}{2} \right) = \frac{3}{2} \int_0^1 dx = \frac{3}{2} (x)_0^1 = \frac{3}{2} \end{aligned} \quad \dots(1)$$

To evaluate  $\iint_S \vec{F} \cdot \hat{n} ds$ , where  $S$  consists of six plane surfaces.

Over the face  $OABC, z = 0, dz = 0, \hat{n} = -\hat{k}, ds = dx dy$

$$\iint \vec{F} \cdot \hat{n} ds = \int_0^1 \int_0^1 (-y^2\hat{j}) \cdot (-\hat{k}) dx dy = 0$$

Over the face  $BCDE, y = 1, dy = 0$

$$\iint \vec{F} \cdot \hat{n} ds = \int_0^1 \int_0^1 (4xzi - \hat{j} + zk\hat{k}) \cdot (\hat{j}) dx dz$$

$$\hat{n} = \hat{j}, ds = dx dz = \int_0^1 \int_0^1 -dx dz$$

S.No.				$\hat{n}$	$ds$
1	$OABC$	$z = 0$	$dz = 0$	$-\hat{k}$	$dx dy$
2	$BCDE$	$y = 1$	$dy = 0$	$\hat{j}$	$dx dz$
3	$DEFG$	$z = 1$	$dz = 0$	$\hat{k}$	$dx dy$
4	$OCDG$	$x = 0$	$dx = 0$	$-\hat{i}$	$dy dz$
5	$AOGF$	$x = 0$	$dy = 0$	$-\hat{j}$	$dx dz$
6	$ABEF$	$x = 1$	$dx = 0$	$\hat{i}$	$dy dz$

$$= - \int_0^1 dx \int_0^1 dz = -(x)_0^1 (z)_0^1 = -(1)(1) = -1$$

Over the face  $DEFG, z = 1, dz = 0, \hat{n} = \hat{k}, ds = dx dy$

$$\begin{aligned} \iint \vec{F} \cdot \hat{n} \, ds &= \int_0^1 \int_0^1 [4x(1) - y^2 \hat{j} + y(1) \hat{k}] \cdot (\hat{k}) \, dx \, dy \\ &= \int_0^1 \int_0^1 y \, dx \, dy = \int_0^1 dx \int_0^1 y \, dy = (x)_0^1 \left( \frac{y^2}{2} \right)_0^1 = \frac{1}{2} \end{aligned}$$

Over the face  $OCDG, x = 0, dx = 0, \hat{n} = -\hat{i}, ds = dy dz$

$$\iint \vec{F} \cdot \hat{n} \, ds = \int_0^1 \int_0^1 (0\hat{i} - y^2 \hat{j} + yz\hat{k}) \cdot (-\hat{i}) \, dy \, dz = 0$$

Over the face  $AOGF, y = 0, dy = 0, \hat{n} = -\hat{j}, ds = dx dz$

$$\iint \vec{F} \cdot \hat{n} \, ds = \int_0^1 \int_0^1 (4xz\hat{i}) \cdot (-\hat{j}) \, dx \, dz = 0$$

Over the face  $ABEF, x = 1, dx = 0, \hat{n} = \hat{i}, ds = dy dz$

$$\begin{aligned} \iint \vec{F} \cdot \hat{n} \, ds &= \int_0^1 \int_0^1 [(4z\hat{i} - y^2 \hat{j} + yz\hat{k}) \cdot (\hat{i})] \, dy \, dz = \int_0^1 \int_0^1 4z \, dy \, dz \\ &= \int_0^1 dy \int_0^1 4z \, dz = \int_0^1 dy (2z^2)_0^1 = 2 \int_0^1 dy = 2(y)_0^1 = 2 \end{aligned}$$

On adding we see that over the whole surface  $\iint \vec{F} \cdot \hat{n} \, ds = \left( 0 - 1 + \frac{1}{2} + 0 + 0 + 2 \right) = \frac{3}{2}$  ... (2)

From (1) and (2), we have  $\iiint_V \nabla \cdot \vec{F} \, dv = \iint_S \vec{F} \cdot \hat{n} \, ds$

**Verified.**

### EXERCISE 24.6

1. Use Divergence Theorem to evaluate  $\iint_S (y^2 z^2 \hat{i} + z^2 x^2 \hat{j} + x^2 y^2 \hat{k}) \cdot \vec{ds}$ ,

where  $S$  is the upper part of the sphere  $x^2 + y^2 + z^2 = 9$  above  $xy$ -plane. **Ans.**  $\frac{243\pi}{8}$

2. Evaluate  $\iint_S (\nabla \times \vec{F}) \cdot \vec{ds}$ , where  $S$  is the surface of the paraboloid  $x^2 + y^2 + z = 4$  above the  $xy$ -plane and  $\vec{F} = (x^2 + y - 4) \hat{i} + 3xy\hat{j} + (2xz + z^2) \hat{k}$ . **Ans.**  $-4\pi$

3. Evaluate  $\iint_S [xz^2 \, dy \, dz + (x^2 y - z^3) \, dz \, dx + (2xy + y^2 z) \, dx \, dy]$ , where  $S$  is the surface enclosing a region bounded by hemisphere  $x^2 + y^2 + z^2 = 4$  above  $XY$ -plane. **Ans.**  $\frac{64\pi}{5}$

4. Verify Divergence Theorem for  $\vec{F} = x^2 \hat{i} + z\hat{j} + yz\hat{k}$ , taken over the cube bounded by  $x = 0, x = 1, y = 0, y = 1, z = 0, z = 1$ . **Ans.**  $\frac{3}{2}$

5. Evaluate  $\iint_S (2xy\hat{i} + yz^2\hat{j} + xz\hat{k}) \cdot \vec{ds}$  over the surface of the region bounded by  $x = 0, y = 0, y = 3, z = 0$  and  $x + 2z = 6$ . **Ans.**  $\frac{351}{2}$

6. Verify Divergence Theorem for  $\vec{F} = (x + y^2) \hat{i} - 2xy\hat{j} + yz\hat{k}$  and the volume of a tetrahedron bounded by co-ordinate planes and the plane  $2x + y + 2z = 6$ .  
*(Nagpur, Winter 2000, A.M.I.E.T.E., Winter 2000)*

7. Verify Divergence Theorem for the function  $\vec{F} = y\hat{i} + x\hat{j} + z^2\hat{k}$  over the region bounded by  $x^2 + y^2 = 9, z = 0$  and  $z = 2$ .

8. Use the Divergence Theorem to evaluate  $\iint_S x^3 \, dy \, dz + x^2 y \, dz \, dx + x^2 z \, dx \, dy$ , where  $S$  is the surface of the region bounded by the closed cylinder

$x^2 + y^2 = a^2, (0 \leq z \leq b)$  and  $z = 0, z = b$ . **Ans.**  $\frac{5\pi a^4 b}{4}$

9. Evaluate the integral  $\iint_S (z^2 - x) dy dz - xy dx dz + 3z dx dy$ , where S is the surface of closed region bounded by  $z = 4 - y^2$  and planes  $x = 0$ ,  $x = 3$ ,  $z = 0$  by transforming it with the help of Divergence Theorem to a triple integral. **Ans. 16**

10. Evaluate  $\iint_S \frac{ds}{\sqrt{a^2x^2 + b^2y^2 + c^2z^2}}$  over the closed surface of the ellipsoid  $ax^2 + by^2 + cz^2 = 1$  by applying Divergence Theorem. *(MTU, Dec. 2012)* **Ans.**  $\frac{4\pi}{\sqrt{(a b c)}}$

11. Apply Divergence Theorem to evaluate  $\iint(l x^2 + m y^2 + n z^2) ds$  taken over the sphere  $(x - a)^2 + (y - b)^2 + (z - c)^2 = r^2$ , l, m, n being the direction cosines of the external normal to the sphere. *(AMIETE June 2010, 2009)* **Ans.**  $\frac{8\pi}{3}(a + b + c)r^3$

12. Show that  $\iiint_V (u \nabla \cdot \vec{V} + \nabla u \cdot \vec{V}) dv = \iint_S u \vec{V} \cdot d\vec{s}$ .
13. If  $E = \text{grad } \phi$  and  $\nabla^2 \phi = 4\pi\rho$ , prove that  $\iint_S \vec{E} \cdot \vec{n} ds = -4\pi \iiint_V \rho dv$  where  $\vec{n}$  is the outward unit normal vector, while  $dS$  and  $dV$  are respectively surface and volume elements.

**Pick up the correct option from the following:**

14. If  $\vec{F}$  is the velocity of a fluid particle then  $\int_C \vec{F} \cdot d\vec{r}$  represents.  
 (a) Work done      (b) Circulation      (c) Flux      (d) Conservative field. *(U.P. Ist Semester, Dec 2009)* **Ans. (b)**

15. If  $\vec{f} = ax \vec{i} + by \vec{j} + cz \vec{k}$ , a, b, c, constants, then  $\iint f \cdot dS$  where S is the surface of a unit sphere is  
 (a)  $\frac{\pi}{3}(a+b+c)$       (b)  $\frac{4}{3}\pi(a+b+c)$       (c)  $2\pi(a+b+c)$       (d)  $\pi(a+b+c)$  *(U.P., Ist Semester, 2009)* **Ans. (b)**

16. A force field  $\vec{F}$  is said to be conservative if  
 (a)  $\text{Curl } \vec{F} = 0$       (b)  $\text{grad } \vec{F} = 0$       (c)  $\text{Div } \vec{F} = 0$       (d)  $\text{Curl}(\text{grad } \vec{F}) = 0$  *(AMIETE, Dec. 2006)* **Ans. (a)**

17. The line integral  $\int_C x^2 dx + y^2 dy$ , where C is the boundary of the region  $x^2 + y^2 < a^2$  equals  
 (a) 0,      (b) a      (c)  $\pi a^2$       (d)  $\frac{1}{2}\pi a^2$  *(AMIETE, Dec. 2006)* **Ans. (b)**

## CHAPTER

# 25

## COMPLEX NUMBERS

### 25.1 INTRODUCTION

We have learnt the complex numbers in the previous class. Here we will review the complex number. In this chapter we will learn how to add, subtract, multiply and divide complex numbers.

### 25.2 COMPLEX NUMBERS

A number of the form  $a + ib$  is called a complex number when  $a$  and  $b$  are real numbers and  $i = \sqrt{-1}$ . We call ‘ $a$ ’ the real part and ‘ $b$ ’ the imaginary part of the complex number  $a + ib$ . If  $a = 0$  the number  $ib$  is said to be purely imaginary, if  $b = 0$  the number  $a$  is real.

A complex number  $x + iy$  is denoted by  $z$ .

### 25.3 GEOMETRICAL REPRESENTATION OF IMAGINARY NUMBERS

Let  $OA$  be positive numbers which is represented by  $x$  and  $OA'$  by  $-x$ .

And  $-x = (i)^2 x = i(ix)$  is on  $OX'$ .

It means that the multiplication of the real number  $x$  by  $i$  twice amounts to the rotation of  $OA$  through two right angles to reach  $OA'$ .

Thus, it means that multiplication of  $x$  by  $i$  is equivalent to the rotation of  $x$  through one right angle to reach  $OA''$ .

Hence,  $y$ -axis is known as imaginary axis.

Multiplication by  $i$  rotates its direction through a right angle.

### 25.4 ARGAND DIAGRAM

Mathematician Argand represented a complex number in a diagram known as Argand diagram. A complex number  $x + iy$  can be represented by a point  $P$  whose co-ordinate are  $(x, y)$ . The axis of  $x$  is called the real axis and the axis of  $y$  the imaginary axis. The distance  $OP$  is the modulus and the angle,  $OP$  makes with the  $x$ -axis, is the argument of  $x + iy$ .

### 25.5 EQUAL COMPLEX NUMBERS

If two complex numbers  $a + ib$  and  $c + id$  are equal, prove that

$$a = c \quad \text{and} \quad b = d$$

**Solution.** We have,

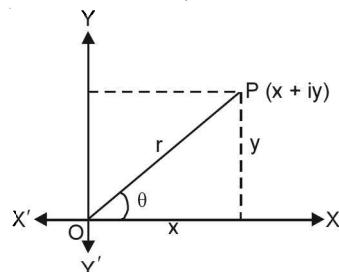

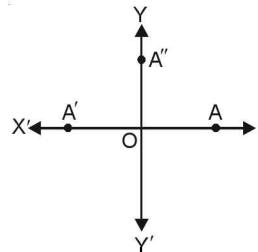

$$a + ib = c + id \Rightarrow a - c = i(d - b)$$

$$(a - c)^2 = -(d - b)^2 \Rightarrow (a - c)^2 + (d - b)^2 = 0$$

Here sum of two positive numbers is zero. This is only possible if each number is zero.

$$\text{i.e., } (a - c)^2 = 0 \Rightarrow a = c \quad \text{and} \quad (d - b)^2 = 0 \Rightarrow b = d$$

**Ans.**

### 25.6 ADDITION OF COMPLEX NUMBERS

Let  $a + ib$  and  $c + id$  be two complex numbers, then

$$(a + ib) + (c + id) = (a + c) + i(b + d)$$

**Procedure.** In addition of complex numbers we add real parts with real parts and imaginary parts with imaginary parts.

**Example 1.** Add the following complex numbers:

$$z_1 = 2 + \frac{3}{2}i, \quad z_2 = -5 + \frac{7}{4}i, \quad z_3 = \frac{5}{4} - \frac{8}{3}i, \quad z_4 = \frac{-11}{2} - i$$

$$\begin{aligned}\text{Solution. } z_1 + z_2 + z_3 + z_4 &= \left(2 + \frac{3}{2}i\right) + \left(-5 + \frac{7}{4}i\right) + \left(\frac{5}{4} - \frac{8}{3}i\right) + \left(\frac{-11}{2} - i\right) \\ &= \left(2 - 5 + \frac{5}{4} - \frac{11}{2}\right) + \left(\frac{3}{2} + \frac{7}{4} - \frac{8}{3} - 1\right)i \\ &= \left(\frac{8 - 20 + 5 - 22}{4}\right) + \left(\frac{18 + 21 - 32 - 12}{12}\right)i \\ &= -\frac{29}{4} - \frac{5}{12}i\end{aligned}$$

Ans.

### 25.7 ADDITION OF COMPLEX NUMBERS BY GEOMETRY

Let  $z_1 = x_1 + iy_1$  and  $z_2 = x_2 + iy_2$  be two complex numbers represented by the points  $P$  and  $Q$  on the Argand diagram.

Complete the parallelogram  $OPRQ$ .

Draw  $PK, RM, QL$ , perpendiculars on  $OX$ .

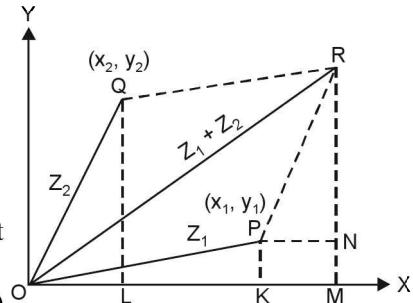

Also draw  $PN \perp$  to  $RM$ .

$$OM = OK + KM = OK + OL = x_1 + x_2$$

$$\text{and } RM = MN + NR = KP + LQ = y_1 + y_2$$

∴ The co-ordinates of  $R$  are  $(x_1 + x_2, y_1 + y_2)$  and it represents the complex number.

$$(x_1 + x_2) + i(y_1 + y_2) = (x_1 + iy_1) + (x_2 + iy_2)$$

Thus the sum of two complex numbers is represented by the extremity of the diagonal of the parallelogram formed by  $OP$  ( $z_1$ ) and  $OQ$  ( $z_2$ ) as adjacent sides.

$$|z_1 + z_2| = OR \quad \text{and} \quad \text{amp}(z_1 + z_2) = \angle ROM.$$

### 25.8 SUBTRACTION

$$(a + ib) - (c + id) = (a - c) + i(b - d)$$

**Procedure.** In subtraction of complex numbers we subtract real parts from real parts and imaginary parts from imaginary parts.

**Example 2.** Subtract  $z_1 = \frac{3}{4} - \frac{7}{3}i$  from  $z_2 = \frac{-5}{3} + \frac{11}{5}i$ .

$$\begin{aligned}\text{Solution. } z_2 - z_1 &= \left(\frac{-5}{3} + \frac{11}{5}i\right) - \left(\frac{3}{4} - \frac{7}{3}i\right) = \left(\frac{-5}{3} - \frac{3}{4}\right) + \left(\frac{11}{5} + \frac{7}{3}\right)i \\ &= \left(\frac{-20 - 9}{12}\right) + \left(\frac{33 + 35}{15}\right)i = \frac{-29}{12} + \frac{68}{15}i\end{aligned}$$

Ans.

**SUBTRACTION OF COMPLEX NUMBERS BY GEOMETRY.**

Let  $P$  and  $Q$  represent two complex numbers

$$z_1 = x_1 + iy_1 \text{ and } z_2 = x_2 + iy_2.$$

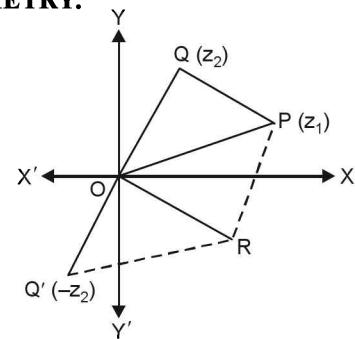

Then

$$z_1 - z_2 = z_1 + (-z_2)$$

$z_1 - z_2$  means the addition of  $z_1$  and  $-z_2$ .

$-z_2$  is represented by  $OQ'$  formed by producing  $OQ$  to  $OQ'$  such that  $OQ = OQ'$ .

Complete the parallelogram  $OPRQ'$ , then the sum of  $z_1$  and  $-z_2$  represented by  $OR$ .

**25.9 POWERS OF  $i$** 

Some time we need various powers of  $i$ .

We know that  $i = \sqrt{-1}$ .

On squaring both sides, we get

$$i^2 = -1$$

Multiplying by  $i$  both sides, we get

$$i^3 = -i$$

Again,

$$i^4 = (i^3)(i) = (-i)(i) = -(i^2) = -(-1) = 1$$

$$i^5 = (i^4)(i) = (1)(i) = i$$

$$i^6 = (i^4)(i^2) = (1)(-1) = -1$$

$$i^7 = (i^4)(i^3) = 1(-i) = -i$$

$$i^8 = (i^4)(i^4) = (1)(1) = 1.$$

**Example 3.** Simplify the following: (a)  $i^{49}$ , (b)  $i^{103}$ .

**Solution.** (a) We divide 49 by 4 and we get

$$49 = 4 \times 12 + 1$$

$$i^{49} = i^{4 \times 12 + 1} = (i^4)^{12}(i^1) = (1)^{12}(i) = i$$

(b) we divide 103 by 4, we get

$$103 = 4 \times 25 + 3$$

$$i^{103} = i^{4 \times 25 + 3} = (i^4)^{25}(i^3) = (1)^{25}(-i) = -i$$

**Ans.**

**25.10 MULTIPLICATION**

$$(a + ib) \times (c + id) = ac - bd + i(ad + bc)$$

$$\begin{aligned} \text{Proof. } (a + ib) \times (c + id) &= ac + iad + ibc + i^2bd \\ &= ac + i(ad + bc) + (-1)bd \\ &= (ac - bd) + (ad + bc)i \end{aligned}$$

[ $\because i^2 = -1$ ]

**Example 4.** Multiply  $3 + 4i$  by  $7 - 3i$ .

**Solution.** Let  $z_1 = 3 + 4i$  and  $z_2 = 7 - 3i$

$$\begin{aligned} z_1 \cdot z_2 &= (3 + 4i)(7 - 3i) \\ &= 21 - 9i + 28i - 12i^2 \\ &= 21 - 9i + 28i - 12(-1) \\ &= 21 - 9i + 28i + 12 \\ &= 33 + 19i \end{aligned}$$

**Ans.**

**Multiplication of complex numbers (Polar form) :**

Let  $z_1 = r_1(\cos \theta_1 + i \sin \theta_1)$  and  $z_2 = r_2(\cos \theta_2 + i \sin \theta_2)$

$$x_1 = r_1 \cos \theta_1, \quad y_1 = r_1 \sin \theta_1$$

$$x_2 = r_2 \cos \theta_2, \quad y_2 = r_2 \sin \theta_2$$

$$z_1 = x_1 + iy_1 = r_1(\cos \theta_1 + i \sin \theta_1)$$

$$|z_1| = r_1$$

$$z_2 = x_2 + iy_2 = r_2(\cos \theta_2 + i \sin \theta_2)$$

$$|z_2| = r_2$$

$$z_1 \cdot z_2 = r_1 r_2 (\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2)$$

$$= r_1 r_2 [\cos \theta_1 \cos \theta_2 - \sin \theta_1 \sin \theta_2 + i(\sin \theta_1 \cos \theta_2 + \cos \theta_1 \sin \theta_2)]$$

$$= r_1 r_2 [\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)],$$

$$|z_1 z_2| = r_1 r_2$$

**The modulus of the product of two complex numbers is the product of their moduli and the argument of the product is the sum of their arguments.**

**Graphical method**

Let  $P, Q$  represent the complex numbers.

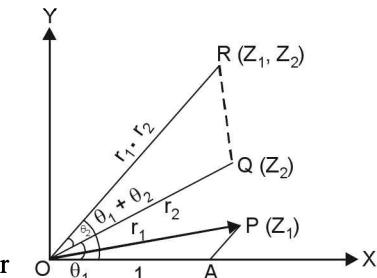

$$z_1 = x_1 + iy_1$$

$$= r_1(\cos \theta_1 + i \sin \theta_1)$$

$$z_2 = x_2 + iy_2$$

$$= r_2(\cos \theta_2 + i \sin \theta_2)$$

Cut off  $OA = 1$  along  $x$ -axis. Construct  $\Delta ORQ$  on  $OQ$  similar to  $\Delta OAP$ .

So that

$$\frac{OR}{OP} = \frac{OQ}{OA} \Rightarrow \frac{OR}{OP} = \frac{OQ}{1} \Rightarrow OR = OP \cdot OQ = r_1 r_2$$

$$\angle XOR = \angle AOP + \angle QOR = \theta_1 + \theta_2$$

Hence the product of two complex numbers  $z_1, z_2$  is represented by the point  $R$ , such that

$$(i) |z_1 \cdot z_2| = |z_1| \cdot |z_2| \quad (ii) \operatorname{Arg}(z_1 \cdot z_2) = \operatorname{Arg}(z_1) + \operatorname{Arg}(z_2)$$

**25.11  $i$  (IOTA) AS AN OPERATOR**

Multiplication of a complex number by  $i$ .

Let

$$z = x + iy = r(\cos \theta + i \sin \theta)$$

$$i = 0 + i \cdot 1 = \left[ \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \right]$$

$$i \cdot z = r(\cos \theta + i \sin \theta) \cdot \left[ \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \right]$$

$$= r \left[ \cos \left( \theta + \frac{\pi}{2} \right) + i \sin \left( \theta + \frac{\pi}{2} \right) \right]$$

Hence a complex number multiplied by  $i$  results :

The rotation of the complex number by  $\frac{\pi}{2}$  in anticlockwise direction without change in magnitude.

**25.12 CONJUGATE OF A COMPLEX NUMBER**

Two complex numbers which differ only in the sign of imaginary parts are called conjugate of each other.

A pair of complex number  $a + ib$  and  $a - ib$  are said to be conjugate of each other.

**Theorem.** Show that the sum and product of a complex number and its conjugate complex are both real.

**Proof.** Let  $x + iy$  be a complex number and  $x - iy$  its conjugate complex.

$$\text{Sum} = (x + iy) + (x - iy) = 2x \quad (\text{Real})$$

$$\text{Product} = (x + iy)(x - iy) = x^2 + y^2. \quad (\text{Real}) \quad \text{Proved.}$$

**Note.** Let a complex number be  $z$ . Then the conjugate complex number is denoted by  $\bar{z}$ .

**Example 5.** Find out the conjugate of a complex number  $7 + 6i$ .

**Solution.** Let  $z = 7 + 6i$

To find conjugate complex number of  $7 + 6i$  we change the sign of imaginary number.

Conjugate of  $z = \bar{z} = 7 - 6i$

**Ans.**

### 25.13 DIVISION

To divide a complex number  $a + ib$  by  $c + id$ , we write it as  $\frac{a + ib}{c + id}$ .

To simplify further, we multiply the numerator and denominator by the conjugate of the denominator.

$$\begin{aligned} \frac{a + ib}{c + id} &= \frac{(a + ib)}{(c + id)} \times \frac{(c - id)}{(c - id)} = \frac{ac - iad + ibc - i^2 bd}{(c)^2 - (id)^2} \\ &= \frac{ac - i(ad - bc) + bd}{c^2 - d^2 i^2} \quad [\because i^2 = -1] \\ &= \frac{ac + bd}{c^2 + d^2} + \frac{bc - ad}{c^2 + d^2} i \end{aligned}$$

**Example 6.** Divide  $1 + i$  by  $3 + 4i$ .

$$\begin{aligned} \text{Solution.} \quad \frac{1 + i}{3 + 4i} &= \frac{1 + i}{3 + 4i} \times \frac{3 - 4i}{3 - 4i} \\ &= \frac{3 - 4i + 3i - 4i^2}{9 - 16i^2} \\ &= \frac{3 - i + 4}{9 + 16} = \frac{7}{25} - \frac{1}{25} i \quad \text{Ans.} \end{aligned}$$

### DIVISION (By Algebra)

Let  $z_1 = r_1(\cos \theta_1 + i \sin \theta_1)$  and  $z_2 = r_2(\cos \theta_2 + i \sin \theta_2)$

$$\begin{aligned} \frac{z_1}{z_2} &= \frac{r_1(\cos \theta_1 + i \sin \theta_1)}{r_2(\cos \theta_2 + i \sin \theta_2)} = \frac{r_1(\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 - i \sin \theta_2)}{r_2(\cos \theta_2 + i \sin \theta_2)(\cos \theta_2 - i \sin \theta_2)} \\ &= \frac{r_1[(\cos \theta_1 \cos \theta_2 + \sin \theta_1 \sin \theta_2) + i(\sin \theta_1 \cos \theta_2 - \sin \theta_2 \cos \theta_1)]}{r_2(\cos^2 \theta_2 + \sin^2 \theta_2)} \\ &= \frac{r_1}{r_2}[\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)] \end{aligned}$$

The modulus of the quotient of two complex numbers is the quotient of their moduli, and the argument of the quotient is the difference of their arguments.

### 25.14 DIVISION OF COMPLEX NUMBERS BY GEOMETRY

Let  $P$  and  $Q$  represent the complex numbers.

$$\begin{aligned} z_1 &= x_1 + i y_1 = r_1(\cos \theta_1 + i \sin \theta_1) \\ z_2 &= x_2 + i y_2 = r_2(\cos \theta_2 + i \sin \theta_2) \end{aligned}$$

Cut off  $OA = 1$ , construct  $\Delta OAR$  on  $OA$  similar to  $\Delta OQP$ .

$$\text{So that } \frac{OR}{OA} = \frac{OP}{OQ} \Rightarrow \frac{OR}{1} = \frac{OP}{OQ}$$

$$OR = \frac{OP}{OQ} = \frac{r_1}{r_2}$$

$$\angle AOR = \angle QOP = \angle AOP - \angle AOQ = \theta_1 - \theta_2$$

$\therefore R$  represents the number  $\frac{r_1}{r_2}[\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)]$

Hence the complex number  $\frac{z_1}{z_2}$  is represented by the point  $R$ .

$$(i) \left| \frac{z_1}{z_2} \right| = \frac{|z_1|}{|z_2|} \quad (ii) \operatorname{Arg}\left(\frac{z_1}{z_2}\right) = \operatorname{Arg.}(z_1) - \operatorname{Arg.}(z_2).$$

**Example 7.** Express  $\frac{(6+i)(2-i)}{(4+3i)(1-2i)}$  in the form of  $a + ib$ .

$$\begin{aligned} \text{Solution. } \frac{(6+i)(2-i)}{(4+3i)(1-2i)} &= \frac{12+1+i(2-6)}{4+6+i(3-8)} = \frac{13-4i}{10-5i} \\ &= \frac{(13-4i)(10+5i)}{(10-5i)(10+5i)} = \frac{150+25i}{100+25} = \frac{6+i}{5} = \frac{6}{5} + \frac{1}{5}i. \quad \text{Ans.} \end{aligned}$$

**Example 8.** If  $a = \cos \theta + i \sin \theta$ , prove that  $1 + a + a^2 = (1 + 2 \cos \theta)(\cos \theta + i \sin \theta)$ .

**Solution.** Here we have  $a = \cos \theta + i \sin \theta$

$$\begin{aligned} 1 + a + a^2 &= 1 + (\cos \theta + i \sin \theta) + (\cos \theta + i \sin \theta)^2 \\ &= 1 + \cos \theta + i \sin \theta + \cos^2 \theta + 2i \sin \theta \cos \theta - \sin^2 \theta \\ &= (\cos \theta + i \sin \theta) + (1 - \sin^2 \theta) + \cos^2 \theta + 2i \sin \theta \cos \theta \\ &= (\cos \theta + i \sin \theta) + \cos^2 \theta + \cos^2 \theta + 2i \sin \theta \cos \theta \\ &= (\cos \theta + i \sin \theta) + 2 \cos^2 \theta + 2i \sin \theta \cos \theta \\ &= (\cos \theta + i \sin \theta) + 2 \cos \theta (\cos \theta + i \sin \theta) \\ &= (\cos \theta + i \sin \theta) (1 + 2 \cos \theta) \end{aligned} \quad \text{Proved.}$$

**Example 9.** Solve for  $\theta$  such that the expression  $\frac{3+2i \sin \theta}{1-2i \sin \theta}$  is imaginary.

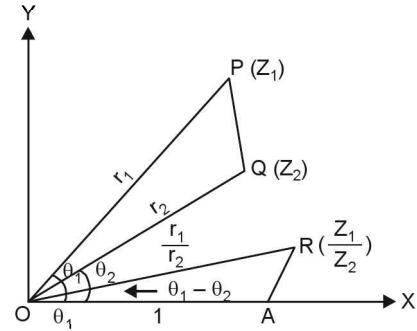

$$\text{Solution. } \frac{3+2i \sin \theta}{1-2i \sin \theta} = \frac{(3+2i \sin \theta)(1+2i \sin \theta)}{(1-2i \sin \theta)(1+2i \sin \theta)} = \frac{3-4 \sin^2 \theta + 8i \sin \theta}{1+4 \sin^2 \theta}$$

If  $3 - 4 \sin^2 \theta = 0$  then  $\frac{3-4 \sin^2 \theta + 8i \sin \theta}{1+4 \sin^2 \theta}$  = purely imaginary.

$$\sin^2 \theta = \frac{3}{4} \quad \text{or} \quad \sin \theta = \frac{\sqrt{3}}{2} \quad \text{or} \quad \theta = \frac{\pi}{3} \quad \text{Ans.}$$

**Example 10.** If  $a^2 + b^2 + c^2 = 1$  and  $b + ic = (1 + a)z$ , prove that  $\frac{a+ib}{1+c} = \frac{1+iz}{1-iz}$ .

**Solution.** Here, we have  $b + ic = (1 + a)z \Rightarrow z = \frac{b+ic}{1+a}$

$$\begin{aligned}
 \frac{1+iz}{1-iz} &= \frac{1+i}{1-i} \frac{b+ic}{\overline{b+ic}} = \frac{1+a+ib-c}{1+a-ib+c} \\
 &= \frac{[(1+a+ib)-c]}{(1+a+c-ib)} \times \frac{(1+a+ib+c)}{(1+a+c+ib)} = \frac{(1+a+ib)^2 - c^2}{(1+a+c)^2 + b^2} \\
 &= \frac{1+a^2 - b^2 + 2a + 2ib + 2iab - c^2}{1+a^2 + c^2 + 2a + 2c + 2ac + b^2} = \frac{1+a^2 - b^2 - c^2 + 2a + 2ib + 2iab}{1+(a^2+b^2+c^2)+2a+2c+2ac}
 \end{aligned}$$

Putting the value of  $a^2 + b^2 + c^2 = 1$  in the above, we get

$$= \frac{1+a^2 - (1-a^2) + 2a + 2ib + 2iab}{1+1+2a+2c+2ac} = \frac{2(a^2 + a + ib + iab)}{2(1+a+c+ac)} = \frac{2(1+a)(a+ib)}{2(1+a)(1+c)} = \frac{a+ib}{1+c}$$

**Proved.**

**Example 11.** If  $z = \cos \theta + i \sin \theta$ , prove that

$$(a) \frac{2}{1+z} = 1 - i \tan \frac{\theta}{2} \quad (b) \frac{1+z}{1-z} = i \cot \frac{\theta}{2}$$

**Solution.** Here, we have  $z = \cos \theta + i \sin \theta$

$$\begin{aligned}
 (a) \frac{2}{1+z} &= \frac{2}{1+(\cos \theta + i \sin \theta)} = \frac{2}{(1+\cos \theta) + i \sin \theta} \times \frac{(1+\cos \theta) - i \sin \theta}{(1+\cos \theta) - i \sin \theta} \\
 &= \frac{2[(1+\cos \theta) - i \sin \theta]}{(1+\cos \theta)^2 + \sin^2 \theta} \\
 &= \frac{2[(1+\cos \theta) - i \sin \theta]}{2(1+\cos \theta)} = 1 - \frac{i \sin \theta}{1+\cos \theta} \left| \begin{array}{l} (1+\cos \theta)^2 + \sin^2 \theta \\ = 1 + \cos^2 \theta + 2 \cos \theta + \sin^2 \theta \\ = 1 + (\sin^2 \theta + \cos^2 \theta) + 2 \cos \theta \\ = 1 + 1 + 2 \cos \theta \end{array} \right. \\
 &= 1 - i \frac{2 \sin \left(\frac{\theta}{2}\right) \cos \left(\frac{\theta}{2}\right)}{2 \cos^2 \left(\frac{\theta}{2}\right)} = 1 - i \tan \left(\frac{\theta}{2}\right) \left| \begin{array}{l} = 2 + 2 \cos \theta \\ = 2(1 + \cos \theta) \end{array} \right. \quad \text{Proved.}
 \end{aligned}$$

$$\begin{aligned}
 (b) \frac{1+z}{1-z} &= \frac{(1+\cos \theta) + i \sin \theta}{(1-\cos \theta) - i \sin \theta} = \frac{2 \cos^2 \frac{\theta}{2} + 2i \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{2 \sin^2 \frac{\theta}{2} - 2i \sin \frac{\theta}{2} \cos \frac{\theta}{2}} \\
 &= \frac{\cos \frac{\theta}{2}}{\sin \frac{\theta}{2}} \cdot \left( \frac{\cos \frac{\theta}{2} + i \sin \frac{\theta}{2}}{\sin \frac{\theta}{2} - i \cos \frac{\theta}{2}} \right) = \cot \frac{\theta}{2} \left( \frac{\cos \frac{\theta}{2} + i \sin \frac{\theta}{2}}{\sin \frac{\theta}{2} - i \cos \frac{\theta}{2}} \right)
 \end{aligned}$$

$$\begin{aligned}
 \text{Now, } \frac{\cos \frac{\theta}{2} + i \sin \frac{\theta}{2}}{\sin \frac{\theta}{2} - i \cos \frac{\theta}{2}} &= \left( \frac{\cos \frac{\theta}{2} + i \sin \frac{\theta}{2}}{\sin \frac{\theta}{2} - i \cos \frac{\theta}{2}} \right) \left( \frac{\sin \frac{\theta}{2} + i \cos \frac{\theta}{2}}{\sin \frac{\theta}{2} + i \cos \frac{\theta}{2}} \right) \\
 &= \frac{\cos \frac{\theta}{2} \sin \frac{\theta}{2} + i \cos^2 \frac{\theta}{2} + i \sin^2 \frac{\theta}{2} - \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{\sin^2 \frac{\theta}{2} + \cos^2 \frac{\theta}{2}} = \frac{i \left( \cos^2 \frac{\theta}{2} + \sin^2 \frac{\theta}{2} \right)}{\left( \cos^2 \frac{\theta}{2} + \sin^2 \frac{\theta}{2} \right)} = i
 \end{aligned}$$

Thus,

$$\frac{1+z}{1-z} = i \cot \frac{\theta}{2}$$

**Proved.**

**Example 12.** If  $x = \cos \theta + i \sin \theta$ ,  $y = \cos \phi + i \sin \phi$ , prove that

$$\frac{x - y}{x + y} = i \tan\left(\frac{\theta - \phi}{2}\right) \quad (M.U. 2008)$$

**Solution.** We have,

$$\begin{aligned} \frac{x - y}{x + y} &= \frac{(\cos \theta + i \sin \theta) - (\cos \phi + i \sin \phi)}{(\cos \theta + i \sin \theta) + (\cos \phi + i \sin \phi)} \\ &= \frac{(\cos \theta - \cos \phi) + i(\sin \theta - \sin \phi)}{(\cos \theta + \cos \phi) + i(\sin \theta + \sin \phi)} \\ &= \frac{\left[ -2 \sin\left(\frac{\theta + \phi}{2}\right) \sin\left(\frac{\theta - \phi}{2}\right) + 2i \cos\left(\frac{\theta + \phi}{2}\right) \sin\left(\frac{\theta - \phi}{2}\right) \right]}{\left[ 2 \cos\left(\frac{\theta + \phi}{2}\right) \cos\left(\frac{\theta - \phi}{2}\right) + 2i \sin\left(\frac{\theta + \phi}{2}\right) \cos\left(\frac{\theta - \phi}{2}\right) \right]} \\ &= \frac{2i \sin\left(\frac{\theta - \phi}{2}\right) \left[ \cos\left(\frac{\theta + \phi}{2}\right) + i \sin\left(\frac{\theta + \phi}{2}\right) \right]}{2 \cos\left(\frac{\theta - \phi}{2}\right) \left[ \cos\left(\frac{\theta + \phi}{2}\right) + i \sin\left(\frac{\theta + \phi}{2}\right) \right]} = i \tan\left(\frac{\theta - \phi}{2}\right) \text{ Proved.} \end{aligned}$$

### EXERCISE 25.1

1. If  $z = 1 + i$ , find (i)  $z^2$  (ii)  $\frac{1}{z}$  and plot them on the Argand diagram. **Ans.** (i)  $2i$ , (ii)  $\frac{1}{2} - \frac{i}{2}$

Express the following in the form  $a + ib$ , where  $a$  and  $b$  are real (2 – 4):

2.  $\frac{2-3i}{4-i}$

**Ans.**  $\frac{11}{17} - \frac{10}{17}i$

3.  $\frac{(3+4i)(2+i)}{1+i}$

**Ans.**  $\frac{13}{2} + \frac{9}{2}i$

4.  $\frac{(1+2i)^3}{(1+i)(2-i)}$

**Ans.**  $-\frac{7}{2} + \frac{1}{2}i$

5. The points  $A, B, C$  represent the complex numbers  $z_1, z_2, z_3$  respectively, and  $G$  is the centroid of the triangle  $ABC$ , if  $4z_1 + z_2 + z_3 = 0$ , show that the origin is the mid-point of  $AG$ .

6.  $ABCD$  is a parallelogram on the Argand plane. The affixes of  $A, B, C$  are  $8 + 5i, -7 - 5i, -5 + 5i$ , respectively. Find the affix of  $D$ . **Ans.**  $10 + 15i$

7. If  $z_1, z_2, z_3$  are three complex numbers and

$$a_1 = z_1 + z_2 + z_3$$

$$b_1 = z_1 + \omega z_2 + \omega^2 z_3$$

$$c_1 = z_1 + \omega^2 z_2 + \omega z_3$$

show that  $|a_1|^2 + |b_1|^2 + |c_1|^2 = 3\{|z_1|^2 + |z_2|^2 + |z_3|^2\}$   
where  $\omega, \omega^2$  are cube roots of unity.

8. Find the complex conjugate of  $\frac{2+3i}{1-i}$ .

**Ans.**  $-\frac{1}{2} - \frac{5}{2}i$

9. If  $x + iy = \frac{1}{a+ib}$ , prove that  $(x^2 + y^2)(a^2 + b^2) = 1$

10. Find the value of  $x^2 - 6x + 13$ , when  $x = 3 + 2i$ . **Ans.** 0

11. If  $\alpha - i\beta = \frac{1}{a-ib}$ , prove that  $(\alpha^2 + \beta^2)(a^2 + b^2) = 1$ . **(M.U. 2008)**

12. If  $\frac{1}{\alpha + i\beta} + \frac{1}{a + ib} = 1$ , where  $\alpha, \beta, a, b$  are real, express  $b$  in terms of  $\alpha, \beta$ .

**Ans.**  $\frac{-\beta}{\alpha^2 + \beta^2 - 2\alpha + 1}$

13. If  $(x + iy)^{1/3} = a + ib$ , then show that  $4(a^2 - b^2) = \frac{x}{a} + \frac{y}{b}$ .
14. If  $(x + iy)^3 = u + iv$ , then show that  $\frac{u}{x} + \frac{v}{y} = 4(x^2 - y^2)$ .
15. Find the values of  $x$  and  $y$ , if  $\frac{(1+i)x - 2i}{3+i} + \frac{(2-3i)y + i}{3-i} = i$ . **Ans.**  $x = 3$  and  $y = -1$
16. If  $a + ib = \frac{(x + i)^2}{2x^2 + 1}$ , prove that  $a^2 + b^2 = \frac{(x^2 + 1)^2}{(2x^2 + 1)^2}$ .

### 25.15 MODULUS AND ARGUMENT

Let  $x + iy$  be a complex number.

Putting  $x = r \cos \theta$  and  $y = r \sin \theta$  so that  $r = \sqrt{x^2 + y^2}$

$$\cos \theta = \frac{x}{\sqrt{x^2 + y^2}} \quad \text{and} \quad \sin \theta = \frac{y}{\sqrt{x^2 + y^2}}$$

the positive value of the root being taken.

Then  $r$  called the *modulus* or absolute value of the complex number  $x + iy$  and is denoted by  $|x + iy|$ .

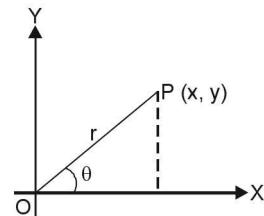

The angle  $\theta$  is called the *argument* or *amplitude* of the complex number  $x + iy$  and is denoted by  $\arg.(x + iy)$ .

It is clear that  $\theta$  will have infinite number of values differing by multiples of  $2\pi$ . The values of  $\theta$  lying in the range  $-\pi < \theta \leq \pi$  [ $(0 < \theta < \pi)$  or  $(-\pi < \theta < 0)$ ] is called the *principal value* of the argument.

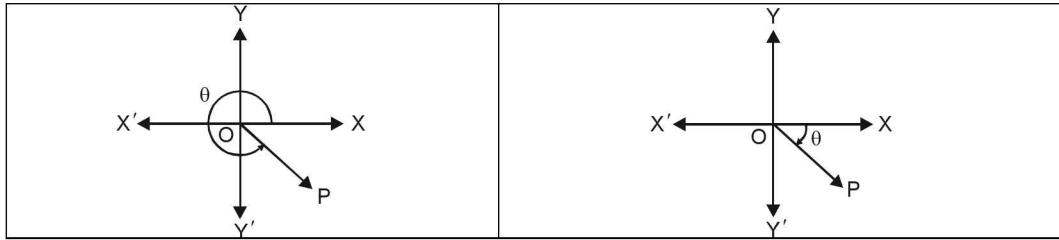

The principal value of  $\theta$  is written either between  $0$  and  $\pi$  or between  $0$  and  $-\pi$ .

A complex number  $x + iy$  is denoted by a single letter  $z$ . The number  $x - iy$  (conjugate) is denoted by  $\bar{z}$ . The complex number in polar form is  $r(\cos \theta + i \sin \theta)$ .

Modulus of  $z$  is denoted by  $|z|$  and  $|z|^2 = x^2 + y^2$ .

Angle $\theta$	Principal value of $\theta$

For example (i) the principal value of  $240^\circ$  is  $-120^\circ$ .

(ii) the principal value of  $330^\circ$  is  $-30^\circ$ .

**Example 13.** Find the modulus and principal argument of the complex number

$$\text{Solution. } \frac{1+2i}{1-(1-i)^2} = \frac{1+2i}{1-(1-1-2i)} = \frac{1+2i}{1+2i} = 1 = 1 + 0i$$

$$\therefore \left| \frac{1+2i}{1-(1-i)^2} \right| = |1+0i| = \sqrt{1^2} = 1 \quad \text{Ans.}$$

$$\begin{aligned} \text{Principal argument of } \frac{1+2i}{1-(1-i)^2} &= \text{Principal argument of } 1+0i \\ &= \tan^{-1} \frac{0}{1} = \tan^{-1} 0 = 0^\circ. \end{aligned}$$

Hence modulus = 1 and principal argument =  $0^\circ$ . Ans.

**Example 14.** Find the modulus and principal argument of the complex number :

$$1 + \cos \alpha + i \sin \alpha. \quad \left( 0 < \alpha < \frac{\pi}{2} \right)$$

**Solution.** Let  $(1 + \cos \alpha) + i \sin \alpha = r(\cos \theta + i \sin \theta)$

Equating real and imaginary parts, we get

$$1 + \cos \alpha = r \cos \theta \quad \dots(1)$$

$$\text{And} \quad \sin \alpha = r \sin \theta \quad \dots(2)$$

Squaring and adding (1) and (2), we get

$$\begin{aligned} r^2(\cos^2 \theta + \sin^2 \theta) &= (1 + \cos \alpha)^2 + (\sin \alpha)^2 \\ \Rightarrow r^2 &= 1 + \cos^2 \alpha + 2 \cos \alpha + \sin^2 \alpha = 1 + 2 \cos \alpha + 1 \\ &= 2(1 + \cos \alpha) = 2 \left( 1 + 2 \cos^2 \frac{\alpha}{2} - 1 \right) = 4 \cos^2 \frac{\alpha}{2} \end{aligned}$$

$$\Rightarrow r = 2 \cos \frac{\alpha}{2}$$

$$\text{From (1), we have, } \cos \theta = \frac{1 + \cos \alpha}{r} = \frac{1 + 2 \cos^2 \frac{\alpha}{2} - 1}{2 \cos \frac{\alpha}{2}} = \cos \frac{\alpha}{2} \quad \dots(3)$$

$$\text{From (2), we have, } \sin \theta = \frac{\sin \alpha}{r} = \frac{\sin \alpha}{2 \cos \frac{\alpha}{2}} = \frac{2 \sin \frac{\alpha}{2} \cos \frac{\alpha}{2}}{2 \cos \frac{\alpha}{2}} = \sin \frac{\alpha}{2} \quad \dots(4)$$

$$\text{Argument} = \tan^{-1} \frac{\sin \alpha}{1 + \cos \alpha} = \tan^{-1} \frac{2 \sin \frac{\alpha}{2} \cos \frac{\alpha}{2}}{1 + 2 \cos^2 \frac{\alpha}{2} - 1} = \tan^{-1} \tan \frac{\alpha}{2} = \frac{\alpha}{2}$$

General value of argument =  $2\pi k + \frac{\alpha}{2}$

$\theta = \frac{\alpha}{2}$  satisfied both equations, (1) and (2),

$\text{Arg}(1 + \cos \alpha + i \sin \alpha) = \frac{\alpha}{2}$  and modulus of  $(1 + \cos \alpha + i \sin \alpha) = r = 2 \cos \frac{\alpha}{2}$  Ans.

### EXERCISE 25.2

Find the modulus and principal argument of the following complex numbers:

1.  $-\sqrt{3} - i$  Ans.  $2, -\frac{5\pi}{6}$  2.  $\frac{(1+i)^2}{1-i}$  Ans.  $\sqrt{2}, \frac{3\pi}{4}$

3.  $\sqrt{\left(\frac{1+i}{1-i}\right)}$  Ans.  $1, \frac{\pi}{4}$  4.  $\tan \alpha - i$  Ans.  $\sec \alpha, -\left(\frac{\pi}{2} - \alpha\right)$

5.  $1 - \cos \alpha + i \sin \alpha$  Ans.  $2 \sin \frac{\alpha}{2}, \frac{\pi - \alpha}{2}$

6.  $(4+2i)(-3+\sqrt{2}i)$  Ans.  $2\sqrt{55}, \tan^{-1}\left(\frac{3-2\sqrt{2}}{6+\sqrt{2}}\right)$

Find the modulus of the following complex numbers :

7.  $\overline{(7+i^2)} + (6-i) - (4-3i^3)$  Ans.  $4\sqrt{5}$

8.  $\overline{(5-6i)} - (5+6i) + (8-i)$  Ans.  $\sqrt{185}$

9.  $\overline{(8-i^3)} - (7i^2 + 5) + \overline{(9-i)}$  Ans.  $\sqrt{365}$

10.  $(5+6i^{11}) + (8i^3 + i^5) + (i^2 - i^4)$  Ans.  $\sqrt{178}$

11. If  $\arg(z+2i) = \frac{\pi}{4}$  and  $\arg(z-2i) = \frac{3\pi}{4}$ , find  $z$ . Ans.  $z = 2$

**Example 15.** If  $z_1 = \cos \alpha + i \sin \alpha$ ,  $z_2 = \cos \beta + i \sin \beta$  show that

$$\frac{1}{2i} \left( \frac{z_1}{z_2} - \frac{z_2}{z_1} \right) = \sin(\alpha - \beta)$$

**Solution.** We have

$$\begin{aligned} \frac{z_1}{z_2} &= \frac{\cos \alpha + i \sin \alpha}{\cos \beta + i \sin \beta} = \frac{\cos \alpha + i \sin \alpha}{\cos \beta + i \sin \beta} \times \frac{\cos \beta - i \sin \beta}{\cos \beta - i \sin \beta} \\ &= \frac{(\cos \alpha \cos \beta + \sin \alpha \sin \beta) + i(\sin \alpha \cos \beta - \cos \alpha \sin \beta)}{\cos^2 \beta + \sin^2 \beta} \\ &= \cos(\alpha - \beta) + i \sin(\alpha - \beta) \end{aligned} \quad \dots(1)$$

$$\begin{aligned} \frac{z_2}{z_1} &= \frac{1}{\cos(\alpha - \beta) + i \sin(\alpha - \beta)} \times \frac{\cos(\alpha - \beta) - i \sin(\alpha - \beta)}{\cos(\alpha - \beta) - i \sin(\alpha - \beta)} \\ &= \frac{\cos(\alpha - \beta) - i \sin(\alpha - \beta)}{\cos^2(\alpha - \beta) + \sin^2(\alpha - \beta)} = \cos(\alpha - \beta) - i \sin(\alpha - \beta) \end{aligned} \quad \dots(2)$$

Subtracting (2) from (1), we get

$$\frac{z_1}{z_2} - \frac{z_2}{z_1} = 2i \sin(\alpha - \beta) \quad \text{Proved.}$$

**Example 16.** If  $z_1$  and  $z_2$  are any two complex numbers, prove that

$$|z_1 + z_2|^2 + |z_1 - z_2|^2 = 2[|z_1|^2 + |z_2|^2]$$

**Solution.** Let

$$z_1 = x_1 + iy_1$$

$$z_2 = x_2 + iy_2$$

$$|z_1 + z_2|^2 = |(x_1 + iy_1) + (x_2 + iy_2)|^2$$

$$\begin{aligned} &= |(x_1 + x_2) + i(y_1 + y_2)|^2 \\ &= (x_1 + x_2)^2 + (y_1 + y_2)^2 \end{aligned} \quad \dots(1)$$

Similarly  $|z_1 - z_2|^2 = (x_1 - x_2)^2 + (y_1 - y_2)^2 \quad \dots(2)$

and  $|z_1|^2 = x_1^2 + y_1^2 \quad \dots(3)$

$$|z_2|^2 = x_2^2 + y_2^2 \quad \dots(4)$$

$$\text{L.H.S.} = |z_1 + z_2|^2 + |z_1 - z_2|^2 = (x_1 + x_2)^2 + (y_1 + y_2)^2 + (x_1 - x_2)^2 + (y_1 - y_2)^2$$

[Using (1) and (2)]

$$\begin{aligned} &= x_1^2 + 2x_1x_2 + x_2^2 + y_1^2 + 2y_1y_2 + y_2^2 \\ &\quad + x_1^2 - 2x_1x_2 + x_2^2 + y_1^2 - 2y_1y_2 + y_2^2 \\ &= 2[x_1^2 + x_2^2 + y_1^2 + y_2^2] = 2[(x_1^2 + y_1^2) + (x_2^2 + y_2^2)] \end{aligned} \quad \dots(5)$$

$$= 2(|z_1|^2 + |z_2|^2) = \text{R.H.S.}$$

**Proved.**

**Example 17.** If  $z_1$  and  $z_2$  are two complex numbers such that

$$|z_1 + z_2| = |z_1 - z_2|, \text{ prove that}$$

$$\arg z_1 - \arg z_2 = \frac{\pi}{2} \quad (\text{M.U. 2002, 2007})$$

**Solution.** Let

$$z_1 = x_1 + iy_1$$

$$z_2 = x_2 + iy_2$$

Given that

$$|z_1 + z_2| = |z_1 - z_2|$$

$$\Rightarrow |(x_1 + iy_1) + (x_2 + iy_2)| = |(x_1 + iy_1) - (x_2 + iy_2)|$$

$$\Rightarrow |(x_1 + x_2) + i(y_1 + y_2)| = |(x_1 - x_2) + i(y_1 - y_2)|$$

$$\Rightarrow (x_1 + x_2)^2 + (y_1 + y_2)^2 = (x_1 - x_2)^2 + (y_1 - y_2)^2$$

$$\Rightarrow x_1^2 + x_2^2 + 2x_1x_2 + y_1^2 + y_2^2 + 2y_1y_2 = x_1^2 + x_2^2 - 2x_1x_2 + y_1^2 + y_2^2 - 2y_1y_2$$

$$\Rightarrow 2x_1x_2 + 2y_1y_2 = -2x_1x_2 - 2y_1y_2$$

$$\Rightarrow 4x_1x_2 + 4y_1y_2 = 0$$

$$\Rightarrow x_1x_2 + y_1y_2 = 0 \quad \dots(1)$$

Now,  $\arg z_1 - \arg z_2 = \tan^{-1}\left(\frac{y_1}{x_1}\right) - \tan^{-1}\left(\frac{y_2}{x_2}\right)$

$$= \tan^{-1}\left[\frac{\frac{y_1}{x_1} - \frac{y_2}{x_2}}{1 + \left(\frac{y_1}{x_1}\right)\left(\frac{y_2}{x_2}\right)}\right] = \tan^{-1}\left(\frac{x_2y_1 - x_1y_2}{x_1x_2 + y_1y_2}\right)$$

$$= \tan^{-1}\left(\frac{x_2y_1 - x_1y_2}{0}\right) = \tan^{-1}\infty = \frac{\pi}{2} \quad [\text{Using (1)}]$$

$$\arg z_1 - \arg z_2 = \frac{\pi}{2} \quad \text{Proved.}$$

**Example 18.** Find the complex number  $z$  if  $\arg(z + 1) = \frac{\pi}{6}$  and  $\arg(z - 1) = \frac{2\pi}{3}$ .  
 (M.U. 2009, 2000, 01, 02, 03)

**Solution.** Let  $z = x + iy \quad \dots(1)$

$$\therefore z + 1 = (x + 1) + iy$$

We also given that

$$\arg(z + 1) = \tan^{-1}\left(\frac{y}{x+1}\right) = \frac{\pi}{6}$$

$$\therefore \frac{y}{x+1} = \tan 30^\circ = \frac{1}{\sqrt{3}}$$

$$\therefore \sqrt{3}y = x+1 \quad \dots(2)$$

Now  $\frac{z-1}{x-1} = (x-1) + iy$  [From (1)]

and  $\tan^{-1}\left(\frac{y}{x-1}\right) = \frac{2\pi}{3} \Rightarrow \frac{y}{x-1} = \tan 120^\circ$

$$\Rightarrow \frac{y}{x-1} = -\cot 30^\circ = -\sqrt{3}$$

$$\therefore -y = \sqrt{3}x - \sqrt{3}$$

$$\Rightarrow -\sqrt{3}y = 3x - 3 \quad \dots(3)$$

Adding (2) and (3), we get

$$0 = 4x - 2 \Rightarrow 4x = 2 \Rightarrow x = \frac{1}{2}$$

Putting  $x = \frac{1}{2}$  in (2), we get

$$\sqrt{3}y = \frac{1}{2} + 1 \Rightarrow \sqrt{3}y = \frac{3}{2} \Rightarrow y = \frac{\sqrt{3}}{2}$$

Putting the values of  $x$  and  $y$  in (1), we get

$$z = \frac{1}{2} + \frac{\sqrt{3}}{2}i \quad \text{Ans.}$$

**Example 19.** Prove that

$$(i) |z_1 + z_2| \leq |z_1| + |z_2| \quad (ii) |z_1 - z_2| \geq |z_1| - |z_2|$$

**Solution.** (a) (By Geometry) Let  $z_1 = x_1 + iy_1$  and  $z_2 = x_2 + iy_2$  be the two complex numbers shown in the figure

$$|z_1| = OP, |z_2| = OQ$$

(i) Since in a triangle any side is less than the sum of the other two.

In  $\Delta OPR$ ,  $OR < OP + PR$ ,  $OR < OP + OQ$

$$\Rightarrow |z_1 + z_2| < |z_1| + |z_2|$$

$OR = OP + PR$  if  $O, P, R$  are collinear.

$$\text{or } |z_1 + z_2| = |z_1| + |z_2|$$

(ii) Again, any side of a triangle is greater than the difference between the other two, we have

In  $\Delta OPR$

$$OR > OP - PR, \Rightarrow OR > OP - OQ$$

$$|z_1 - z_2| > |z_1| - |z_2|$$

**Proved.**

(b) By Algebra.

$$z_1 + z_2 = x_1 + iy_1 + x_2 + iy_2 = (x_1 + x_2) + i(y_1 + y_2)$$

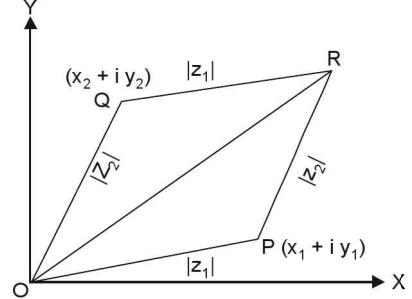

$$(i) |z_1 + z_2|^2 = (x_1 + x_2)^2 + (y_1 + y_2)^2$$

$$= x_1^2 + x_2^2 + 2x_1x_2 + y_1^2 + y_2^2 + 2y_1y_2 = (x_1^2 + y_1^2) + (x_2^2 + y_2^2) + 2(x_1x_2 + y_1y_2)$$

$$= (x_1^2 + y_1^2) + (x_2^2 + y_2^2) + 2\sqrt{(x_1x_2 + y_1y_2)^2}$$

$$= |z_1|^2 + |z_2|^2 + 2\sqrt{x_1^2x_2^2 + y_1^2y_2^2 + 2x_1x_2y_1y_2}$$

$$[\because (x_1y_2 - x_2y_1)^2 \geq 0 \text{ or } x_1^2y_2^2 + x_2^2y_1^2 \geq 2x_1x_2y_1y_2]$$

$$\begin{aligned}
 |z_1 + z_2|^2 &\leq |z_1|^2 + |z_2|^2 + 2\sqrt{x_1^2 x_2^2 + y_1^2 y_2^2 + x_1^2 y_2^2 + x_2^2 y_1^2} \\
 &\leq |z_1|^2 + |z_2|^2 + 2\sqrt{(x_1^2 + y_1^2)(x_2^2 + y_2^2)} \\
 &\leq |z_1|^2 + |z_2|^2 + 2|z_1||z_2| \\
 &\leq (|z_1| + |z_2|)^2 \\
 |z_1 + z_2| &\leq |z_1| + |z_2| \\
 (ii) \quad |z_1| &= |(z_1 - z_2) + z_2| \leq |z_1 - z_2| + |z_2| \\
 |z_1| - |z_2| &\leq |z_1 - z_2| \\
 |z_1 - z_2| &\geq |z_1| - |z_2|
 \end{aligned}$$

Proved.

**EXERCISE 25.3**

1. If  $z = x + iy$ , prove that  $\left(\frac{z}{\bar{z}} + \frac{\bar{z}}{z}\right) = 2\left(\frac{x^2 - y^2}{x^2 + y^2}\right)$ .

2. If  $z = a \cos \theta + ia \sin \theta$ , prove that  $\left(\frac{z}{\bar{z}} + \frac{\bar{z}}{z}\right) = 2 \cos 2\theta$ .

3. Prove that  $\left|\frac{z-1}{\bar{z}-1}\right| = 1$ .

4. Let  $z_1 = 2 - i$ ,  $z_2 = -2 + i$ , find

$$(i) \text{ Re}\left[\frac{z_1 z_2}{\bar{z}_1}\right] \quad (ii) \text{ Im}\left[\frac{1}{z_1 \bar{z}_2}\right]$$

**Ans.** (i)  $-\frac{2}{5}$ , (ii) 0

5. If  $|z| = 1$ , prove that  $\frac{z-1}{z+1}$  ( $z \neq 1$ ) is a pure imaginary number, what will you conclude, if

$z = 1$ ?

**Ans.** If  $z = 1$ ,  $\frac{z-1}{z+1} = 0$ , which is purely real.

**25.16 POLAR FORM**

Polar form of a complex number as we have discussed above

$$\begin{aligned}
 x &= r \cos \theta \quad \text{and} \quad y = r \sin \theta \\
 \Rightarrow x + iy &= r(\cos \theta + i \sin \theta) \\
 &= r e^{i\theta} \quad (\text{Exponential form}) \quad (e^{i\theta} = \cos \theta + i \sin \theta)
 \end{aligned}$$

**Procedure.** To convert  $x + iy$  into polar.

We write

$$x = r \cos \theta$$

$$y = r \sin \theta$$

On solving these equations, we get the value of  $\theta$  which satisfy both the equations and

$$r = \sqrt{x^2 + y^2}$$

**25.17 TYPES OF COMPLEX NUMBERS**

1. Cartesian form :  $x + iy$
2. Polar form :  $r(\cos \theta + i \sin \theta)$
3. Exponential form :  $r e^{i\theta}$

**Example 20.** Express in polar form :  $1 - \sqrt{2} + i$

**Solution.** Let  $(1 - \sqrt{2}) + i = r(\cos \theta + i \sin \theta)$

$$\therefore 1 - \sqrt{2} = r \cos \theta \quad \dots(1)$$

$$1 = r \sin \theta \quad \dots(2)$$

Squaring and adding (1) and (2), we get

$$r^2(\cos^2 \theta + \sin^2 \theta) = (1 - \sqrt{2})^2 + 1^2$$

$$\Rightarrow r^2 = 1 - 2\sqrt{2} + 2 + 1$$

$$\Rightarrow r = \sqrt{4 - 2\sqrt{2}}$$

Putting the value of  $r$  in (1) and (2), we get

$$\cos \theta = \frac{1 - \sqrt{2}}{\sqrt{4 - 2\sqrt{2}}} \quad \text{and} \quad \sin \theta = \frac{1}{\sqrt{4 - 2\sqrt{2}}}$$

$$\text{Hence, the polar form is } \sqrt{4 - 2\sqrt{2}} \left\{ \frac{1 - \sqrt{2}}{\sqrt{4 - 2\sqrt{2}}} + i \frac{1}{\sqrt{4 - 2\sqrt{2}}} \right\} \quad \text{Ans.}$$

**Example 21.** Find the smallest positive integer  $n$  for which

$$\left( \frac{1+i}{1-i} \right)^n = 1. \quad (\text{Nagpur University, Winter 2004})$$

**Solution.**  $\left[ \frac{1+i}{1-i} \right]^n = 1$

$$\left[ \frac{1+i}{1-i} \times \frac{1+i}{1+i} \right]^n = 1 \Rightarrow \left( \frac{1-1+2i}{1+1} \right)^n = 1$$

$$(i)^n = 1 = (i)^4 \Rightarrow n = 4 \quad \text{Ans.}$$

**Example 22.** If  $i^\alpha + i^\beta = \alpha + i\beta$ , prove that  $\alpha^2 + \beta^2 = e^{-(4n+1)\pi\beta}$

(Nagpur University, Summer 2003)

**Solution.** We have,  $\alpha + i\beta = i^{(\alpha + i\beta)} = e^{\log i^{\alpha + i\beta}}$

$$\begin{aligned} \alpha + i\beta &= e^{(\alpha + i\beta) \log i} = e^{(\alpha + i\beta)(\log i + 2\pi ni)} \\ &= e^{(\alpha + i\beta)[\log(\cos \pi/2 + i \sin \pi/2) + 2\pi ni]} \end{aligned}$$

$$\Rightarrow \alpha + i\beta = e^{(\alpha + i\beta)[\log e^{i\pi/2} + 2\pi ni]} = e^{(\alpha + i\beta)[i\pi/2 + 2\pi ni]} \\ = e^{i\alpha(\pi/2 + 2\pi n) - \beta(\pi/2 + 2\pi n)} = e^{-\beta\pi(2n + 1/2)} \times e^{\pi\alpha(2n + 1/2)i}$$

$$\Rightarrow \alpha + i\beta = e^{-\beta\pi(4n+1)/2} \left[ \cos \left[ \pi\alpha \frac{(4n+1)}{2} \right] + i \sin \left[ \pi\alpha \frac{(4n+1)}{2} \right] \right]$$

Equating real and imaginary parts, we get

$$\alpha = e^{-\beta\pi(4n+1)/2} \cdot \cos \left\{ \frac{1}{2} \pi\alpha (4n+1) \right\} \quad \dots(1)$$

and  $\beta = e^{-\beta\pi(4n+1)/2} \cdot \sin \left\{ \frac{1}{2} \pi\alpha (4n+1) \right\} \quad \dots(2)$

Squaring and adding (1) and (2), we get

$$\alpha^2 + \beta^2 = e^{-\beta\pi(4n+1)} \cdot \left[ \cos^2 \left\{ \frac{1}{2} \pi\alpha (4n+1) \right\} + \sin^2 \left\{ \frac{1}{2} \pi\alpha (4n+1) \right\} \right]$$

$$\therefore \alpha^2 + \beta^2 = e^{-\beta\pi(4n+1)}$$

Hence the result.

**Proved.**

#### EXERCISE 25.4

Express the following complex numbers into polar form :

$$1. \frac{1+i}{1-i} \quad \text{Ans. } \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \quad 2. \frac{-35+5i}{4\sqrt{2}+3\sqrt{2}i} \quad \text{Ans. } 5 \left( \cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4} \right)$$

$$3. \frac{3(-4-\sqrt{3}+4\sqrt{3}i)-i}{8+2i} \quad \text{Ans. } 3 \left( \cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3} \right) \quad 4. \frac{2+6\sqrt{3}i}{5+\sqrt{3}i} \quad \text{Ans. } 2 \left( \cos \frac{\pi}{3} + i \sin \frac{\pi}{3} \right)$$

5.  $\frac{2+3i}{3-7i}$  Ans.  $r = \sqrt{754}$ ,  $\theta = \tan^{-1}\left(-\frac{23}{15}\right)$  6.  $\left(\frac{4-5i}{2+3i}\right) \cdot \left(\frac{3+2i}{7+i}\right)$  Ans. 0.905,  $\theta = \tan^{-1}(-7.2)$   
 7.  $\frac{(2+5i)(-3+i)}{(1-2i)^2}$  Ans.  $\frac{\sqrt{290}}{5}$ ,  $\tan^{-1}\left(-\frac{1}{17}\right)$  8.  $\frac{1+7i}{(2-i)^2}$  Ans.  $\sqrt{2}\left(\cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4}\right)$   
 9.  $\frac{1+3i}{1-2i}$  Ans.  $\sqrt{2}\left(\cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4}\right)$  10.  $\frac{i-1}{\cos \frac{\pi}{3} + i \sin \frac{\pi}{3}}$  Ans.  $\sqrt{2}\left(\cos \frac{5\pi}{12} + i \sin \frac{5\pi}{12}\right)$

### 25.18 SQUARE ROOT OF A COMPLEX NUMBER

Let  $a + ib$  be a complex number and its square root is  $x + iy$ .

$$\text{i.e., } \sqrt{a+ib} = x+iy \quad \dots(1)$$

where  $x$  and  $y \in R$ .

Squaring both sides of (1), we get

$$\begin{aligned} a+ib &= (x+iy)^2 \\ \Rightarrow a+ib &= x^2 + i^2y^2 + i \cdot 2xy \\ \Rightarrow a+ib &= (x^2 - y^2) + i \cdot 2xy \quad [\because i^2 = -1] \end{aligned} \quad \dots(2)$$

Equating real and imaginary parts of (2), we get

$$x^2 - y^2 = a \quad \dots(3)$$

$$\text{and} \quad 2xy = b \quad \dots(4)$$

Also, we know that

$$\begin{aligned} (x^2 + y^2)^2 &= (x^2 - y^2)^2 + 4x^2y^2 \\ \Rightarrow (x^2 + y^2)^2 &= a^2 + b^2 \quad [\text{Using (3) and (4)}] \\ \Rightarrow x^2 + y^2 &= \sqrt{a^2 + b^2} \quad \dots(5) \end{aligned}$$

Adding (3) and (5), we get

$$2x^2 = a + \sqrt{a^2 + b^2} \Rightarrow x = \sqrt{\frac{a + \sqrt{a^2 + b^2}}{2}}$$

**Example 23.** Find the square root of the complex number  $5 + 12i$ .

$$\text{Solution. Let } \sqrt{5+12i} = x+iy \quad \dots(1)$$

$$\text{Squaring both sides of (1), we get } 5+12i = (x+iy)^2 = (x^2 - y^2) + i \cdot 2xy \quad \dots(2)$$

Equating real and imaginary parts of (2), we get

$$x^2 - y^2 = 5 \quad \dots(3)$$

$$\text{and} \quad 2xy = 12 \quad \dots(4)$$

$$\text{Now, } x^2 + y^2 = \sqrt{(x^2 - y^2)^2 + 4x^2y^2} = \sqrt{(5)^2 + (12)^2}$$

$$= \sqrt{25 + 144} = \sqrt{169} = 13$$

$$\Rightarrow x^2 + y^2 = 13 \quad \dots(5)$$

$$\text{Adding (3) and (5), we get } 2x^2 = 5 + 13 = 18 \Rightarrow x = \sqrt{\frac{18}{2}} = \sqrt{9} = \pm 3$$

$$\text{Subtracting (3) from (5), we get } 2y^2 = 13 - 5 = 8 \Rightarrow y = \sqrt{\frac{8}{2}} = \sqrt{4} = \pm 2$$

Since,  $xy$  is positive, so  $x$  and  $y$  are of same sign. Hence,  $x = \pm 3$ ,  $y = \pm 2$

$$\therefore \sqrt{5+12i} = \pm 3 \pm 2i \quad \text{i.e. } (3+2i) \text{ or } -(3+2i) \quad \text{Ans.}$$

**Example 24.** Find the square root of  $-4 - 3i$ .

$$\text{Solution. Let } \sqrt{-4-3i} = x+iy \quad \dots(1)$$

Squaring both sides of (1), we get

$$-4 - 3i = (x+iy)^2 = (x^2 - y^2) + i \cdot 2xy \quad \dots(2)$$

Equating real and imaginary parts of (2), we get

$$x^2 - y^2 = -4 \quad \dots(3)$$

$$\text{And} \quad 2xy = -3 \quad \dots(4)$$

$$\text{Now, } x^2 + y^2 = \sqrt{(x^2 - y^2)^2 + 4x^2y^2} = \sqrt{16 + 9} = \sqrt{25} = \pm 5$$

$$\Rightarrow x^2 + y^2 = 5 \quad \dots(5) \quad (\because x^2 + y^2 \geq 0)$$

Adding (3) and (5), we get

$$2x^2 = 5 - 4 = 1 \Rightarrow x = \sqrt{\frac{1}{2}} = \pm \frac{1}{\sqrt{2}}$$

Subtracting (3) from (5), we get

$$2y^2 = 5 + 4 = 9 \Rightarrow y = \sqrt{\frac{9}{2}} = \pm \frac{3}{\sqrt{2}}$$

Since,  $xy$  is negative, so  $x$  and  $y$  will be of different signs. Hence,  $x = \pm \frac{1}{\sqrt{2}}$ ,  $y = \mp \frac{3}{\sqrt{2}}$

$$\therefore \sqrt{-4 - 3i} = \pm \left( \frac{1}{\sqrt{2}} - \frac{3}{\sqrt{2}} i \right) \quad \text{Ans.}$$

**Example 25.** Prove that if the sum and product of two complex numbers are real then the two numbers must be either real or conjugate. (M.U. 2008)

**Solution.** Let  $z_1$  and  $z_2$  be the two complex numbers.

We are given that  $z_1 + z_2 = a$  (real)

and  $z_1 \cdot z_2 = b$  (real)

If sum and product of the roots of a quadratic equation are given. Then the equation becomes

$$x^2 - (\text{sum of the roots}) x + \text{product of the roots} = 0$$

$$x^2 - ax + b = 0$$

$$\text{Root} = x = \frac{a \pm \sqrt{a^2 - 4b}}{2}$$

**Case I.** If  $a^2 > 4b$

Then both the roots are real

**Case II.** If  $a^2 < 4b$

$$\begin{aligned} \text{Then} \quad \text{one root} &= \frac{a}{2} + i \frac{\sqrt{4b - a^2}}{2} \\ \text{Second root} &= \frac{a}{2} - i \frac{\sqrt{4b - a^2}}{2} \end{aligned}$$

These roots are conjugate to each other.

**Proved.**

### EXERCISE 25.5

Find the square root of the following :

$$1. 1 + i \quad \text{Ans.} \left\{ \pm \sqrt{\frac{\sqrt{2} + 1}{2}} \pm \sqrt{\frac{\sqrt{2} - 1}{2}} i \right\} \quad 2. 1 - i \quad \text{Ans.} \left\{ \pm \sqrt{\frac{\sqrt{2} + 1}{2}} \mp \sqrt{\frac{\sqrt{2} - 1}{2}} i \right\}$$

$$3. i \quad \text{Ans.} \left\{ \pm \frac{1}{\sqrt{2}} \pm \frac{1}{\sqrt{2}} i \right\} \quad 4. 15 - 8i \quad \text{Ans.} 1 - 4i, -1 + 4i$$

$$5. -2 + 2\sqrt{3}i \quad \text{Ans.} \pm(1 + \sqrt{3}i) \quad 6. 3 + 4\sqrt{7}i \quad \text{Ans.} \pm(\sqrt{7} + 2i)$$

$$7. \frac{2+3i}{5-4i} + \frac{2-3i}{5+4i} \quad \text{Ans.} \pm \frac{2}{\sqrt{41}} i \quad 8. x^2 - 1 + i \cdot 2x \quad \text{Ans.} \pm(x + i)$$

$$9. 3 - 4i \quad \text{Ans.} \pm(2 - i)$$

### 25.19 EXPONENTIAL AND CIRCULAR FUNCTIONS OF COMPLEX VARIABLES

**Proof.**

$$\cos \theta + i \sin \theta = e^{i\theta}$$

$$e^z = 1 + z + \frac{z^2}{2!} + \frac{z^3}{3!} + \frac{z^4}{4!} + \dots \quad \dots(1)$$

$$\sin z = z - \frac{z^3}{3!} + \frac{z^5}{5!} - \frac{z^7}{7!} + \dots \quad \dots(2)$$

$$\cos z = 1 - \frac{z^2}{2!} + \frac{z^4}{4!} - \frac{z^6}{6!} + \dots \quad \dots(3)$$

From (2) and (3), we have

$$\begin{aligned} \cos z + i \sin z &= \left( 1 - \frac{z^2}{2!} + \frac{z^4}{4!} - \frac{z^6}{6!} + \dots \right) + i \left( z - \frac{z^3}{3!} + \frac{z^5}{5!} - \dots \right) \\ &= 1 + \frac{(iz)^1}{1!} + \frac{(iz)^2}{2!} + \frac{(iz)^3}{3!} + \dots = e^{iz} \end{aligned}$$

$$\text{Therefore, } \cos z + i \sin z = e^{iz} \quad \dots(4)$$

$$\text{Similarly, } \cos z - i \sin z = e^{-iz} \quad \dots(5)$$

From (4) and (5), we have

$$\cos z = \frac{e^{iz} + e^{-iz}}{2} \quad \dots(6)$$

$$\sin z = \frac{e^{iz} - e^{-iz}}{2i} \quad \dots(7)$$

### 25.20 DE MOIVRE'S THEOREM (By Exponential Function)

$$(\cos \theta + i \sin \theta)^n = \cos n\theta + i \sin n\theta$$

**Proof.** We know that  $e^{i\theta} = \cos \theta + i \sin \theta$

$$(e^{i\theta})^n = (\cos \theta + i \sin \theta)^n$$

$$e^{in\theta} = (\cos \theta + i \sin \theta)^n$$

$$(\cos n\theta + i \sin n\theta) = (\cos \theta + i \sin \theta)^n$$

**Proved.**

If  $n$  is a fraction, then  $\cos n\theta + i \sin n\theta$  is one of the values of  $(\cos \theta + i \sin \theta)^n$

### 25.21 DE MOIVRE'S THEOREM (BY INDUCTION)

**Statement:** For any rational number  $n$  the value or one of the values of

$$(\cos \theta + i \sin \theta)^n = \cos n\theta + i \sin n\theta$$

**Proof. Case I.** Let  $n$  be a non-negative integer. By actual multiplication,

$$\begin{aligned} (\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2) &= (\cos \theta_1 \cos \theta_2 - \sin \theta_1 \sin \theta_2) \\ &\quad + i(\cos \theta_1 \sin \theta_2 + \sin \theta_1 \cos \theta_2) \\ &= \cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2) \quad \dots(1) \end{aligned}$$

Similarly we can prove that

$$\begin{aligned} (\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2)(\cos \theta_3 + i \sin \theta_3) \\ &= \cos(\theta_1 + \theta_2 + \theta_3) + i \sin(\theta_1 + \theta_2 + \theta_3) \end{aligned}$$

Continuing in this way, we can prove that

$$\begin{aligned} (\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2) \dots (\cos \theta_n + i \sin \theta_n) \\ &= \cos(\theta_1 + \theta_2 + \dots + \theta_n) + i \sin(\theta_1 + \theta_2 + \dots + \theta_n) \end{aligned}$$

Putting  $\theta_1 = \theta_2 = \theta_3 = \dots = \theta_n = \theta$ , we get

$$(\cos \theta + i \sin \theta)^n = (\cos n\theta + i \sin n\theta)$$

**Case II.** Let  $n$  be a negative integer, say  $n = -m$  where  $m$  is a positive integer. Then,

$$(\cos \theta + i \sin \theta)^n = (\cos \theta + i \sin \theta)^{-m}$$

$$= \frac{1}{(\cos \theta + i \sin \theta)^m} = \frac{1}{(\cos m\theta + i \sin m\theta)} \quad [\text{By case I}]$$

$$\begin{aligned}
 &= \frac{1}{(\cos m\theta + i \sin m\theta)} \cdot \frac{(\cos m\theta - i \sin m\theta)}{(\cos m\theta - i \sin m\theta)} = \frac{\cos m\theta - i \sin m\theta}{\cos^2 m\theta + \sin^2 m\theta} \\
 &= \cos m\theta - i \sin m\theta \\
 &= \cos(-m\theta) + i \sin(-m\theta) = \cos n\theta + i \sin n\theta
 \end{aligned}$$

Hence, the theorem is true for negative integers also.

**Case III.** Let  $n$  be a proper fraction  $\frac{p}{q}$  where  $p$  and  $q$  are integers. Without loss of generality we can select  $q$  to be positive integer,  $p$  may be a positive or negative integer.

Since  $q$  is a positive integer

$$\begin{aligned}
 \text{Now, } \left( \cos \frac{\theta}{q} + i \sin \frac{\theta}{q} \right)^q &= \cos q \cdot \frac{\theta}{q} + i \sin q \cdot \frac{\theta}{q} \\
 &= \cos \theta + i \sin \theta
 \end{aligned}
 \quad [\text{By case I}]$$

Taking the  $q$  th root of both sides, we get

$$(\cos \theta + i \sin \theta)^{\frac{1}{q}} = \cos \frac{\theta}{q} + i \sin \frac{\theta}{q}$$

Raising both sides to the power  $p$ ,

$$(\cos \theta + i \sin \theta)^{\frac{p}{q}} = \left( \cos \frac{\theta}{q} + i \sin \frac{\theta}{q} \right)^p = \cos p \cdot \frac{\theta}{q} + i \sin p \cdot \frac{\theta}{q} \quad [\text{By case I and II}]$$

Hence, one of the values of  $(\cos \theta + i \sin \theta)^n$  is  $\cos n\theta + i \sin n\theta$  when  $n$  is a proper fraction.

Thus, the theorem is true for all rational values of  $n$ .

**Example 26.** Express  $\frac{(\cos \theta + i \sin \theta)^8}{(\sin \theta + i \cos \theta)^4}$  in the form  $(x + iy)$ .

$$\begin{aligned}
 \text{Solution. } \frac{(\cos \theta + i \sin \theta)^8}{(\sin \theta + i \cos \theta)^4} &= \frac{(\cos \theta + i \sin \theta)^8}{(i)^4 \left( \cos \theta + \frac{1}{i} \sin \theta \right)^4} \\
 &= \frac{(\cos \theta + i \sin \theta)^8}{(\cos \theta - i \sin \theta)^4} = \frac{(\cos \theta + i \sin \theta)^8}{[\cos(-\theta) + i \sin(-\theta)]^4} \\
 &= \frac{(\cos \theta + i \sin \theta)^8}{[(\cos \theta + i \sin \theta)^{-1}]^4} = \frac{(\cos \theta + i \sin \theta)^8}{(\cos \theta + i \sin \theta)^4} = (\cos \theta + i \sin \theta)^{12} \\
 &= \cos 12\theta + i \sin 12\theta
 \end{aligned}$$

**Ans.**

**Example 27.** Prove that  $(1 + \cos \theta + i \sin \theta)^n + (1 + \cos \theta - i \sin \theta)^n = 2^{n+1} \cos^n \frac{\theta}{2} \cos \frac{n\theta}{2}$

where  $n$  is an integer.

**Solution.** L.H.S. =  $(1 + \cos \theta + i \sin \theta)^n + (1 + \cos \theta - i \sin \theta)^n$

$$\begin{aligned}
 &= \left[ 1 + 2 \cos^2 \frac{\theta}{2} - 1 + 2i \sin \frac{\theta}{2} \cos \frac{\theta}{2} \right]^n + \left[ 1 + 2 \cos^2 \frac{\theta}{2} - 1 - 2i \sin \frac{\theta}{2} \cos \frac{\theta}{2} \right]^n \\
 &= \left[ 2 \cos^2 \frac{\theta}{2} + 2i \sin \frac{\theta}{2} \cos \frac{\theta}{2} \right]^n + \left[ 2 \cos^2 \frac{\theta}{2} - 2i \sin \frac{\theta}{2} \cos \frac{\theta}{2} \right]^n \\
 &= \left( 2 \cos \frac{\theta}{2} \right)^n \left[ \cos \frac{\theta}{2} + i \sin \frac{\theta}{2} \right]^n + \left( 2 \cos \frac{\theta}{2} \right)^n \left[ \cos \frac{\theta}{2} - i \sin \frac{\theta}{2} \right]^n \\
 &= 2^n \cos^n \frac{\theta}{2} \left[ \cos \frac{n\theta}{2} + i \sin \frac{n\theta}{2} \right] + 2^n \cos^n \frac{\theta}{2} \left[ \cos \frac{n\theta}{2} - i \sin \frac{n\theta}{2} \right]
 \end{aligned}$$

$$\begin{aligned}
 &= 2^n \cos^n \frac{\theta}{2} \left[ \cos \frac{n\theta}{2} + i \sin \frac{n\theta}{2} + \cos \frac{n\theta}{2} - i \sin \frac{n\theta}{2} \right] \\
 &= 2^n \cos^n \frac{\theta}{2} \left( 2 \cos \frac{n\theta}{2} \right) = 2^{n+1} \cos^n \frac{\theta}{2} \cos \frac{n\theta}{2} = \text{R.H.S.} \quad \text{Proved.}
 \end{aligned}$$

**Example 28.** Evaluate  $\left( \frac{1 + \sin \alpha + i \cos \alpha}{1 + \sin \alpha - i \cos \alpha} \right)^n$  (*M.U. 2001, 2004, 2005*)

**Solution.** We know that,

$$\begin{aligned}
 1 &= \sin^2 \alpha + \cos^2 \alpha \\
 \Rightarrow 1 &= \sin^2 \alpha - i^2 \cos^2 \alpha \\
 \Rightarrow 1 &= (\sin \alpha + i \cos \alpha) (\sin \alpha - i \cos \alpha) \quad \dots(1)
 \end{aligned}$$

Adding  $\sin \alpha + i \cos \alpha$  both sides of (1), we get

$$\begin{aligned}
 1 + \sin \alpha + i \cos \alpha &= (\sin \alpha + i \cos \alpha) (\sin \alpha - i \cos \alpha) + (\sin \alpha + i \cos \alpha) \\
 &= (\sin \alpha + i \cos \alpha) (\sin \alpha - i \cos \alpha + 1) \\
 \therefore \frac{1 + \sin \alpha + i \cos \alpha}{1 + \sin \alpha - i \cos \alpha} &= \sin \alpha + i \cos \alpha \\
 &= \cos \left( \frac{\pi}{2} - \alpha \right) + i \sin \left( \frac{\pi}{2} - \alpha \right) \quad \dots(2) \\
 \Rightarrow \left( \frac{1 + \sin \alpha + i \cos \alpha}{1 + \sin \alpha - i \cos \alpha} \right)^n &= \left\{ \cos \left( \frac{\pi}{2} - \alpha \right) + i \sin \left( \frac{\pi}{2} - \alpha \right) \right\}^n \\
 &= \cos n \left( \frac{\pi}{2} - \alpha \right) + i \sin n \left( \frac{\pi}{2} - \alpha \right) \quad \text{Ans.}
 \end{aligned}$$

**Example 29.** If  $2 \cos \theta = x + \frac{1}{x}$  and  $2 \cos \phi = y + \frac{1}{y}$ , then prove that

$$x^p \cdot y^q + \frac{1}{x^p \cdot y^q} = 2 \cos(p\theta + q\phi). \quad (\text{Nagpur University, Summer 2000})$$

**Solution.** We have,

$$\begin{aligned}
 x + \frac{1}{x} = 2 \cos \theta &\Rightarrow x^2 - 2x \cos \theta + 1 = 0 \\
 \Rightarrow x = \frac{2 \cos \theta \pm \sqrt{4 \cos^2 \theta - 4}}{2} &= \cos \theta \pm \sqrt{-\sin^2 \theta}
 \end{aligned}$$

Putting  $i^2$  for  $-1$  and considering the positive sign, we get

$$x = \cos \theta + i \sin \theta \text{ and similarly, } y = \cos \phi + i \sin \phi$$

$$\begin{aligned}
 \text{Now, } x^p &= (\cos \theta + i \sin \theta)^p = \cos p\theta + i \sin p\theta \\
 \text{and } y^q &= (\cos \phi + i \sin \phi)^q = \cos q\phi + i \sin q\phi
 \end{aligned}$$

(by De-Moivre's theorem)

$$\begin{aligned}
 \therefore x^p \cdot y^q &= (\cos p\theta + i \sin p\theta) (\cos q\phi + i \sin q\phi) \\
 &= \cos(p\theta + q\phi) + i \sin(p\theta + q\phi) \quad \dots(1)
 \end{aligned}$$

$$\begin{aligned}
 \text{Also } \frac{1}{x^p \cdot y^q} &= [\cos(p\theta + q\phi) + i \sin(p\theta + q\phi)]^{-1} \\
 &= \cos(p\theta + q\phi) - i \sin(p\theta + q\phi) \quad \dots(2)
 \end{aligned}$$

Adding (1) and (2), we get

$$\therefore x^p \cdot y^q + \frac{1}{x^p \cdot y^q} = 2 \cos(p\theta + q\phi) \quad \text{Proved.}$$

**Example 30.** Prove that the general value of  $\theta$  which satisfies the equation

$$(\cos \theta + i \sin \theta) \cdot (\cos 2\theta + i \sin 2\theta) \cdots (\cos n\theta + i \sin n\theta) = 1 \text{ is } \frac{4m\pi}{n(n+1)}, \text{ where } m$$

is any integer.

$$\begin{aligned}\textbf{Solution.} \quad & (\cos \theta + i \sin \theta)(\cos 2\theta + i \sin 2\theta) \dots (\cos n\theta + i \sin n\theta) = 1 \\ & (\cos \theta + i \sin \theta)(\cos \theta + i \sin \theta)^2 \dots (\cos \theta + i \sin \theta)^n = 1 \\ & (\cos \theta + i \sin \theta)^{1+2+\dots+n} = 1\end{aligned}$$

$$\begin{aligned} (\cos \theta + i \sin \theta)^{\frac{n(n+1)}{2}} &= (\cos 2m\pi + i \sin 2m\pi) \\ \cos \frac{n(n+1)}{2}\theta + i \sin \frac{n(n+1)}{2}\theta &= \cos 2m\pi + i \sin 2m\pi \\ \frac{n(n+1)}{2}\theta &= 2m\pi \Rightarrow \theta = \frac{4m\pi}{n(n+1)} \end{aligned}$$

**Proved.**

**Example 31.** If  $(a_1 + ib_1) \cdot (a_2 + ib_2) \dots (a_n + ib_n) = A + iB$ , then prove that

$$(i) \quad \tan^{-1} \frac{b_1}{a_1} + \tan^{-1} \frac{b_2}{a_2} + \dots + \tan^{-1} \frac{b_n}{a_n} = \tan^{-1} \frac{B}{A}$$

$$(ii) \quad (a_1^2 + b_1^2) \ (a_2^2 + b_2^2) \quad \dots \quad (a_n^2 + b_n^2) = A^2 + B^2$$

**Solution.** Let  $a_1 = r_1 \cos \alpha_1$ ,  $b_1 = r_1 \sin \alpha_1$   
 $a_2 = r_2 \cos \alpha_2$ ,  $b_2 = r_2 \sin \alpha_2$

$$a_n = r_n \cos \alpha_n, \quad b_n = r_n \sin \alpha_n$$

$$(a_1 + ib_1)(a_2 + ib_2) \dots (a_n + ib_n) = A + iB \quad (\text{Given})$$

$$r_1 (\cos \alpha_1 + i \sin \alpha_1) r_2 (\cos \alpha_2 + i \sin \alpha_2) \dots r_n (\cos \alpha_n + i \sin \alpha_n) = R (\cos \theta + i \sin \theta)$$

$$r_1 r_2 \dots r_n [\cos(\alpha_1 + \alpha_2 + \dots + \alpha_n) + i \sin(\alpha_1 + \alpha_2 + \dots + \alpha_n)] = R (\cos \theta + i \sin \theta)$$

$$\therefore r_1 r_2 \dots r_n = R$$

$$\Rightarrow (a_1^2 + b_1^2)(a_2^2 + b_2^2) \dots (a_n^2 + b_n^2) = A^2 + B^2$$

And  $\alpha_1 + \alpha_2 + \dots + \alpha_n = \theta$

$$\Rightarrow \tan^{-1} \frac{b_1}{a_1} + \tan^{-1} \frac{b_2}{a_2} + \dots + \tan^{-1} \frac{b_n}{a_n} = \tan^{-1} \frac{B}{A}$$

**Proved.**

**Example 32.** If  $\cos \alpha + \cos \beta + \cos \gamma = 0 = \sin \alpha + \sin \beta + \sin \gamma$ , then prove that

$$(i) \quad \sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma = \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = \frac{3}{2}$$

$$(ii) \cos 2\alpha + \cos 2\beta + \cos 2\gamma = 0$$

$$(iii) \cos(\alpha + \beta) + \cos(\beta + \gamma) + \cos(\gamma + \alpha) = 0$$

$$(iv) \quad \sin(\alpha + \beta) + \sin(\beta + \gamma) + \sin(\gamma + \alpha) = 0$$

(M.U. 2009)

**Solution.** Here, we have

$$(\cos \alpha + \cos \beta + \cos \gamma) + i (\sin \alpha + \sin \beta + \sin \gamma) = 0$$

$$(\cos \alpha + i \sin \alpha) + (\cos \beta + i \sin \beta) + (\cos \gamma + i \sin \gamma) = 0$$

$$\therefore a + b + c = 0 \text{ say}$$

... (1)

where,  $a = \cos \alpha + i \sin \alpha$ ,  $b = \cos \beta + i \sin \beta$  and  $c = \cos \gamma + i \sin \gamma$

Also we can write

$$(\cos \alpha - i \sin \alpha) + (\cos \beta - i \sin \beta) + (\cos \gamma - i \sin \gamma) = 0$$

$$\Rightarrow (\cos \alpha + i \sin \alpha)^{-1} + (\cos \beta + i \sin \beta)^{-1} + (\cos \gamma + i \sin \gamma)^{-1} = 0$$

$$\Rightarrow \frac{1}{a} + \frac{1}{b} + \frac{1}{c} = 0$$

$$\Rightarrow \frac{bc + ca + ab}{abc} = 0 \Rightarrow ab + bc + ca = 0 \quad \dots(2)$$

But  $(a + b + c)^2 = (a^2 + b^2 + c^2) + 2(ab + bc + ca)$

$0 = (a^2 + b^2 + c^2) + 0 \quad \text{[From (1) and (2)]}$

$$\Rightarrow a^2 + b^2 + c^2 = 0$$

$$\Rightarrow (\cos \alpha + i \sin \alpha)^2 + (\cos \beta + i \sin \beta)^2 + (\cos \gamma + i \sin \gamma)^2 = 0$$

$$\Rightarrow (\cos 2\alpha + i \sin 2\alpha) + (\cos 2\beta + i \sin 2\beta) + (\cos 2\gamma + i \sin 2\gamma) = 0$$

$$\Rightarrow (\cos 2\alpha + \cos 2\beta + \cos 2\gamma) + i(\sin 2\alpha + \sin 2\beta + \sin 2\gamma) = 0$$

$$\Rightarrow \cos 2\alpha + \cos 2\beta + \cos 2\gamma = 0.$$

$$\Rightarrow 2 \cos^2 \alpha - 1 + 2 \cos^2 \beta - 1 + 2 \cos^2 \gamma - 1 = 0$$

$$\Rightarrow \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = \frac{3}{2} \quad \dots(3)$$

Further  $1 - \sin^2 \alpha + 1 - \sin^2 \beta + 1 - \sin^2 \gamma = \frac{3}{2}$

$$\Rightarrow \sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma = \frac{3}{2} \quad \dots(5)$$

Again consider  $ab + bc + ca = 0 \quad \text{[From (2)]}$

$$\Rightarrow (\cos \alpha + i \sin \alpha)(\cos \beta + i \sin \beta) + (\cos \beta + i \sin \beta)(\cos \gamma + i \sin \gamma) + (\cos \gamma + i \sin \gamma)(\cos \alpha + i \sin \alpha) = 0$$

$$\Rightarrow [\cos(\alpha + \beta) + i \sin(\alpha + \beta)] + [\cos(\beta + \gamma) + i \sin(\beta + \gamma)] + [\cos(\gamma + \alpha) + i \sin(\gamma + \alpha)] = 0$$

Equating real and imaginary parts, we get

$$\begin{aligned} \cos(\alpha + \beta) + \cos(\beta + \gamma) + \cos(\gamma + \alpha) &= 0 \\ \sin(\alpha + \beta) + \sin(\beta + \gamma) + \sin(\gamma + \alpha) &= 0 \end{aligned}$$

**Proved.**

### EXERCISE 25.6

1. If  $n$  is a positive integer show that  $(a + ib)^n + (a - ib)^n = 2r^n \cos n\theta$  where  $r^2 = a^2 + b^2$  and

$$\theta = \tan^{-1}\left(\frac{b}{a}\right). \text{ Hence deduce that } (1 + i\sqrt{3})^8 + (1 - i\sqrt{3})^8 = -2^8.$$

2. If  $n$  be a positive integer, prove that  $(1 + i)^n + (1 - i)^n = \frac{n+2}{2^{n/2}} \cos \frac{n\pi}{4}$

3. Show that  $(a + ib)^{m/n} + (a - ib)^{m/n} = 2(a^2 + b^2)^{\frac{m}{2n}} \cos\left(\frac{m}{n} \tan^{-1} \frac{b}{a}\right)$ .

4. If  $P = \cos \theta + i \sin \theta$ ,  $q = \cos \phi + i \sin \phi$ , show that

$$(i) \frac{P - q}{P + q} = i \tan \frac{\theta - \phi}{2} \quad (ii) \frac{(P + q)(Pq - 1)}{(P - q)(Pq + 1)} = \frac{\sin \theta + \sin \phi}{\sin \theta - \sin \phi}$$

5. If  $x = \cos \theta + i \sin \theta$ , show that (i)  $x^m + \frac{1}{x^m} = 2 \cos m\theta$  (ii)  $x^m - \frac{1}{x^m} = 2i \sin m\theta$ .

6. Prove that  $\tanh(\log \sqrt{3}) = \frac{1}{2}$

7. Prove that  $[\sin(\alpha + \theta) - e^{i\alpha} \sin \theta]^n = \sin^n \alpha e^{-in\theta}$

8. If  $x + \frac{1}{x} = 2 \cos \theta$ ,  $y + \frac{1}{y} = 2 \cos \phi$ ,  $z + \frac{1}{z} = 2 \cos \psi$ , show that

$$xyz + \frac{1}{xyz} = 2 \cos(\theta + \phi + \psi)$$

## 25.22 ROOTS OF A COMPLEX NUMBER

We know that  $\cos \theta + i \sin \theta = \cos(2m\pi + \theta) + i \sin(2m\pi + \theta)$ ,  $m \in \mathbb{I}$

$$[\cos \theta + i \sin \theta]^{1/n} = [\cos(2m\pi + \theta) + i \sin(2m\pi + \theta)]^{1/n}$$

$$= \cos \frac{(2m\pi + \theta)}{n} + i \sin \frac{(2m\pi + \theta)}{n}$$

Giving  $m$  the values  $0, 1, 2, 3, \dots, n-1$  successively, we get the following  $n$  values of  $(\cos \theta + i \sin \theta)^{1/n}$ .

$$\text{when } m = 0, \quad \cos \frac{\theta}{n} + i \sin \frac{\theta}{n}$$

$$\text{When } m = 1, \quad \cos \left( \frac{2\pi + \theta}{n} \right) + i \sin \left( \frac{2\pi + \theta}{n} \right)$$

$$\text{When } m = 2, \quad \cos \left( \frac{4\pi + \theta}{n} \right) + i \sin \left( \frac{4\pi + \theta}{n} \right)$$

$$\text{When } m = n-1, \quad \cos \left( \frac{2(n-1)\pi + \theta}{n} \right) + i \sin \left( \frac{2(n-1)\pi + \theta}{n} \right)$$

$$\begin{aligned} \text{When } m = n, \quad & \cos \frac{2n\pi + \theta}{n} + i \sin \frac{2n\pi + \theta}{n} = \cos \left( 2\pi + \frac{\theta}{n} \right) + i \sin \left( 2\pi + \frac{\theta}{n} \right) \\ & = \cos \frac{\theta}{n} + i \sin \frac{\theta}{n} \end{aligned}$$

which is the same as the value for  $m = 0$ . Thus, the values of  $(\cos \theta + i \sin \theta)^{1/n}$  for  $m = n, n+1, n+2$  etc., are the mere repetition of the first  $n$  values as obtained above.

**Example 33.** Solve  $x^4 + i = 0$ .

(M.U. 2008)

**Solution.** Here, we have

$$\begin{aligned} x^4 &= -i = \cos \frac{\pi}{2} - i \sin \frac{\pi}{2} \\ x^4 &= \cos \left( 2n\pi + \frac{\pi}{2} \right) - i \sin \left( 2n\pi + \frac{\pi}{2} \right) \\ \Rightarrow x &= \left[ \cos \left( 2n\pi + \frac{\pi}{2} \right) - i \sin \left( 2n\pi + \frac{\pi}{2} \right) \right]^{\frac{1}{4}} \\ &= \cos(4n+1)\frac{\pi}{8} - i \sin(4n+1)\frac{\pi}{8} \end{aligned}$$

Putting  $n = 0, 1, 2, 3$  we get the roots as

$$x_1 = \cos \frac{\pi}{8} - i \sin \frac{\pi}{8}, \quad x_2 = \cos \frac{5\pi}{8} - i \sin \frac{5\pi}{8}$$

$$x_3 = \cos \frac{9\pi}{8} - i \sin \frac{9\pi}{8}, \quad x_4 = \cos \frac{13\pi}{8} - i \sin \frac{13\pi}{8}$$

Ans.

**Example 34.** Solve  $x^5 = 1 + i$  and find the continued product of the roots.

(M.U. 2005, 2004)

**Solution.**

$$\begin{aligned} x^5 &= 1 + i \\ &= \sqrt{2} \left( \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right) \Rightarrow x = 2^{\frac{1}{10}} \left( \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right)^{\frac{1}{5}} \\ \Rightarrow x &= 2^{\frac{1}{10}} \left[ \cos \left( 2k\pi + \frac{\pi}{4} \right) \cdot \frac{1}{5} + i \sin \left( 2k\pi + \frac{\pi}{4} \right) \cdot \frac{1}{5} \right] \end{aligned}$$

$$= 2^{\frac{1}{10}} \left[ \cos(8k+1) \frac{\pi}{20} + i \sin(8k+1) \frac{\pi}{20} \right]$$

The roots are obtained by putting  $k = 0, 1, 2, 3, 4$ ...

$$x_1 = 2^{\frac{1}{10}} \left[ \cos \frac{\pi}{20} + i \sin \frac{\pi}{20} \right], \quad x_2 = 2^{\frac{1}{10}} \left[ \cos \frac{9\pi}{20} + i \sin \frac{9\pi}{20} \right]$$

$$x_3 = 2^{\frac{1}{10}} \left[ \cos \frac{17\pi}{20} + i \sin \frac{17\pi}{20} \right], \quad x_4 = 2^{\frac{1}{10}} \left[ \cos \frac{5\pi}{4} + i \sin \frac{5\pi}{4} \right]$$

$$x_5 = 2^{\frac{1}{10}} \left[ \cos \frac{33\pi}{20} + i \sin \frac{33\pi}{20} \right]$$

$$\begin{aligned} x_1 \cdot x_2 \cdot x_3 \cdot x_4 \cdot x_5 &= \left( 2^{\frac{1}{10}} \right)^5 \left( \cos \frac{\pi}{20} + i \sin \frac{\pi}{20} \right) \left( \cos \frac{9\pi}{20} + i \sin \frac{9\pi}{20} \right) \left( \cos \frac{17\pi}{20} + i \sin \frac{17\pi}{20} \right) \\ &\quad \left( \cos \frac{5\pi}{4} + i \sin \frac{5\pi}{4} \right) \left( \cos \frac{33\pi}{20} + i \sin \frac{33\pi}{20} \right) \\ &= 2^{\frac{1}{2}} \left[ \cos \left( \frac{\pi}{20} + \frac{9\pi}{20} + \frac{17\pi}{20} + \frac{5\pi}{4} + \frac{33\pi}{20} \right) + i \sin \left( \frac{\pi}{20} + \frac{9\pi}{20} + \frac{17\pi}{20} + \frac{5\pi}{4} + \frac{33\pi}{20} \right) \right] \\ &= \sqrt{2} \left[ \cos \frac{17\pi}{4} + i \sin \frac{17\pi}{4} \right] = \sqrt{2} \left[ \cos \left( 4\pi + \frac{\pi}{4} \right) + i \sin \left( 4\pi + \frac{\pi}{4} \right) \right] \\ &= \sqrt{2} \left[ \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right] = \sqrt{2} \left[ \frac{1}{\sqrt{2}} + i \frac{1}{\sqrt{2}} \right] = 1 + i \end{aligned}$$

**Ans.**

**Example 35.** If  $\alpha, \alpha^2, \alpha^3, \alpha^4$  are the roots of  $x^5 - 1 = 0$  find them and show that  $(1 - \alpha)(1 - \alpha^2)(1 - \alpha^3)(1 - \alpha^4) = 5$ . (M.U. 2007)

**Solution.** Here, we have

$$\begin{aligned} x^5 - 1 &= 0 \\ \Rightarrow x^5 &= 1 = \cos 0 + i \sin 0 \\ \Rightarrow x^5 &= \cos(2k\pi) + i \sin(2k\pi) \\ \Rightarrow x &= (\cos 2k\pi + i \sin 2k\pi)^{1/5} = \cos \frac{2k\pi}{5} + i \sin \frac{2k\pi}{5} \end{aligned}$$

Putting  $k = 0, 1, 2, 3, 4$ , we get the five roots as below

$$\begin{aligned} x_0 &= \cos 0 + i \sin 0, \quad x_1 = \cos \frac{2\pi}{5} + i \sin \frac{2\pi}{5} \\ x_2 &= \cos \frac{4\pi}{5} + i \sin \frac{4\pi}{5}, \quad x_3 = \cos \frac{6\pi}{5} + i \sin \frac{6\pi}{5} \\ x_4 &= \cos \frac{8\pi}{5} + i \sin \frac{8\pi}{5} \end{aligned}$$

Putting  $x_1 = \cos \frac{2\pi}{5} + i \sin \frac{2\pi}{5} = \alpha$ , we see that

$$x_2 = \left( \cos \frac{4\pi}{3} + i \sin \frac{4\pi}{3} \right) = \left( \cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3} \right)^2 = \alpha^2$$

Similarly,  $x_3 = \alpha^3$  and  $x_4 = \alpha^4$

$\therefore$  The roots are  $1, \alpha, \alpha^2, \alpha^3, \alpha^4$

Hence

$$x^5 - 1 = (x - 1)(x - \alpha)(x - \alpha^2)(x - \alpha^3)(x - \alpha^4)$$

$$\Rightarrow \frac{x^5 - 1}{x - 1} = (x - \alpha)(x - \alpha^2)(x - \alpha^3)(x - \alpha^4)$$

On dividing  $x^5 - 1$  by  $x - 1$ , we get

$$\begin{aligned}x^4 + x^3 + x^2 + x + 1 &= (x - \alpha)(x - \alpha^2)(x - \alpha^3)(x - \alpha^4) \\ \therefore (x - \alpha)(x - \alpha^2)(x - \alpha^3)(x - \alpha^4) &= x^4 + x^3 + x^2 + x + 1\end{aligned}$$

Putting  $x = 1$ , we get

$$(1 - \alpha)(1 - \alpha^2)(1 - \alpha^3)(1 - \alpha^4) = 1 + 1 + 1 + 1 + 1 = 5.$$

**Proved.**

**Example 36.** If  $\omega$  is a cube root of unity, prove that

$$(1 - \omega)^6 = -27$$

(M.U. 2003)

**Solution.** Let  $x^3 = 1$

$$\begin{aligned}\Rightarrow x &= (1)^{1/3} = (\cos 0 + i \sin 0)^{1/3} = (\cos 2n\pi + i \sin 2n\pi)^{1/3} \\ &= \cos\left(\frac{2n\pi}{3}\right) + i \sin\left(\frac{2n\pi}{3}\right)\end{aligned}$$

Putting  $n = 0, 1, 2$  the roots of unity are

$$\begin{aligned}x_0 &= 1 \\ x_1 &= \cos\frac{2\pi}{3} + i \sin\frac{2\pi}{3} = \omega \text{ (say)} \\ x_2 &= \cos\frac{4\pi}{3} + i \sin\frac{4\pi}{3} = \left[\cos\frac{2\pi}{3} + i \sin\frac{2\pi}{3}\right]^2 = \omega^2\end{aligned}$$

Now,  $1 + \omega + \omega^2 = 1 + \cos\frac{2\pi}{3} + i \sin\frac{2\pi}{3} + \cos\frac{4\pi}{3} + i \sin\frac{4\pi}{3}$

$$\begin{aligned}&= 1 + \cos\left(\pi - \frac{\pi}{3}\right) + i \sin\left(\pi - \frac{\pi}{3}\right) \\ &\quad + \cos\left(\pi + \frac{\pi}{3}\right) + i \sin\left(\pi + \frac{\pi}{3}\right) \\ &= 1 - \cos\frac{\pi}{3} + i \sin\frac{\pi}{3} - \cos\frac{\pi}{3} - i \sin\frac{\pi}{3} \\ &= 1 - 2\cos\frac{\pi}{3} = 1 - 2\left(\frac{1}{2}\right) = 0\end{aligned}$$

$$\Rightarrow 1 + \omega + \omega^2 = 0$$

$$\Rightarrow 1 + \omega^2 = -\omega$$

...(1)

Now,  $(1 - \omega)^6 = [(1 - \omega)^2]^3 = [1 - 2\omega + \omega^2]^3 = [-\omega - 2\omega]^3$

$$= (-3\omega)^3 = -27\omega^3 = -27 \quad [\text{Using (1)}] \text{ Proved.}$$

**Example 37.** Use De Moivre's theorem to solve the equation  $x^4 - x^3 + x^2 - x + 1 = 0$ .

**Solution.**  $x^4 - x^3 + x^2 - x + 1 = 0$

$$(x + 1)(x^3 - x^2 + x - 1) = 0$$

$$x^3 + 1 = 0$$

$$x^5 = -1 = (\cos \pi + i \sin \pi) = \cos(2n\pi + \pi) + i \sin(2n\pi + \pi)$$

$$x = [\cos(2n+1)\pi + i \sin(2n+1)\pi]^{1/5}$$

$$= \cos\frac{(2n+1)\pi}{5} + i \sin\frac{(2n+1)\pi}{5}$$

When  $n = 0, 1, 2, 3, 4$ , the values are

$$\cos\frac{\pi}{5} + i \sin\frac{\pi}{5}, \cos\frac{3\pi}{5} + i \sin\frac{3\pi}{5}, \cos\pi + i \sin\pi, \cos\frac{7\pi}{5} + i \sin\frac{7\pi}{5},$$

$$\cos\frac{9\pi}{5} + i \sin\frac{9\pi}{5}.$$

$\cos \pi + i \sin \pi = -1$ , which is rejected as it is corresponding to  $x + 1 = 0$ .  
Hence, the required roots are

$$\cos \frac{\pi}{5} + i \sin \frac{\pi}{5}, \cos \frac{3\pi}{5} + i \sin \frac{3\pi}{5}, \cos \frac{7\pi}{5} + i \sin \frac{7\pi}{5}, \cos \frac{9\pi}{5} + i \sin \frac{9\pi}{5}. \quad \text{Ans.}$$

### EXERCISE 25.7

Find the values of:

1.  $(1+i)^{1/5}$ . **Ans.**  $2^{1/10} \left[ \cos \frac{1}{5} \left( 2n\pi + \frac{\pi}{4} \right) + i \sin \frac{1}{5} \left( 2n\pi + \frac{\pi}{4} \right) \right]$ , where  $n = 0, 1, 2, 3, 4$

2.  $(1+\sqrt{-3})^{3/4}$  **Ans.**  $(2)^{3/4} \left[ \cos \frac{3}{4} \left( 2n\pi + \frac{\pi}{3} \right) + i \sin \frac{3}{4} \left( 2n\pi + \frac{\pi}{3} \right) \right]$ , where  $n = 0, 1, 2, 3$ .

3.  $(-i)^{1/6}$  **Ans.**  $\cos (4n+1) \frac{\pi}{12} - i \sin (4n+1) \frac{\pi}{12}$ , where  $n = 0, 1, 2, 3, 4, 5$ .

4.  $(1+i)^{2/3}$  **Ans.**  $2^{1/3} \left[ \cos \left( \frac{4n\pi}{3} + \frac{\pi}{6} \right) + i \sin \left( \frac{4n\pi}{3} + \frac{\pi}{6} \right) \right]$ , where  $n = 0, 1, 2$

5. Solve the equation with the help of De Moivre's theorem  $x^7 - 1 = 0$

**Ans.**  $\cos \frac{2n\pi}{7} + i \sin \frac{2n\pi}{7}$  where  $n = 0, 1, 2, 3, 4, 5, 6$ .

6. Find the roots of the equation  $x^3 + 8 = 0$ .

**Ans.**  $2 \left[ \cos \left( \frac{2n\pi + \pi}{3} \right) + i \sin \left( \frac{2n\pi + \pi}{3} \right) \right]$ , where  $n = 0, 1, 2$ .

7. Use De-Moivre's theorem to solve  $x^9 - x^5 + x^4 - 1 = 0$

**Ans.**  $\left[ \cos (2n+1) \frac{\pi}{5} + i \sin (2n+1) \frac{\pi}{5} \right]$ , where  $n = 0, 1, 2, 3, 4$ ,

and  $\left[ \cos \frac{n\pi}{2} + i \sin \frac{n\pi}{2} \right]$ , where  $n = 0, 1, 2, 3$ .

8. Show that the roots of  $(x+1)^6 + (x-1)^6 = 0$  are given by

$$i \cot \frac{(2n+1)\pi}{12}, n = 0, 1, 2, 3, 4, 5. \text{ Deduce } \tan^2 \frac{\pi}{12} + \tan^2 \frac{3\pi}{12} + \tan^2 \frac{5\pi}{12} = 15.$$

9. Show that all the roots of  $(x+1)^7 = (x-1)^7$  are given by  $\pm i \cot \left( \frac{n\pi}{7} \right)$ , where  $n = 1, 2, 3$ . Why  $n \neq 0$ .

### 25.23 CIRCULAR FUNCTIONS OF COMPLEX NUMBERS

We have already discussed circular functions in terms of exponential functions i.e., Euler's exponential form of circular functions:

$$\boxed{\cos \theta = \frac{e^{i\theta} + e^{-i\theta}}{2}}, \quad \boxed{\sin \theta = \frac{e^{i\theta} - e^{-i\theta}}{2i}}$$

If  $\theta = z$ , then  $\boxed{\cos z = \frac{e^{iz} + e^{-iz}}{2}}$  and  $\boxed{\sin z = \frac{e^{iz} - e^{-iz}}{2i}}$

### 25.24 HYPERBOLIC FUNCTIONS

$$(i) \sinh x = \frac{e^x - e^{-x}}{2} \quad (ii) \cosh x = \frac{e^x + e^{-x}}{2} \quad (iii) \tanh x = \frac{e^x - e^{-x}}{e^x + e^{-x}}$$

$$(iv) \coth x = \frac{e^x + e^{-x}}{e^x - e^{-x}} \quad (v) \operatorname{sech} x = \frac{2}{e^x + e^{-x}} \quad (vi) \operatorname{cosech} x = \frac{2}{e^x - e^{-x}}$$

$$(vii) \cosh x + \sinh x = \frac{e^x + e^{-x}}{2} + \frac{e^x - e^{-x}}{2} = e^x$$

$$(viii) \cosh x - \sinh x = \frac{e^x + e^{-x}}{2} - \frac{e^x - e^{-x}}{2} = e^{-x}$$

$$(ix) (\cosh x + \sinh x)^n = \cosh nx + \sinh nx.$$

### 25.25 RELATION BETWEEN CIRCULAR AND HYPERBOLIC FUNCTIONS

$$\sin ix = i \sinh x$$

$$\cos ix = \cosh x$$

$$\tan ix = i \tanh x$$

$$\sinh ix = i \sin x$$

$$\cosh ix = \cos x$$

$$\tanh ix = i \tan x$$

### 25.26 FORMULAE OF HYPERBOLIC FUNCTIONS

$$A. \quad (1) \cosh^2 x - \sinh^2 x = 1, \quad (2) \operatorname{sech}^2 x = 1 - \tanh^2 x,$$

$$(3) \operatorname{cosech}^2 x = \coth^2 x - 1$$

$$B. \quad (1) \sinh(x \pm y) = \sinh x \cosh y \pm \cosh x \sinh y$$

$$(2) \cosh(x \pm y) = \cosh x \cosh y \pm \sinh x \sinh y$$

$$(3) \tanh(x \pm y) = \frac{\tanh x \pm \tanh y}{1 \pm \tanh x \tanh y}$$

$$C. \quad (1) \sinh 2x = 2 \sinh x \cosh x \quad (2) \cosh 2x = \cosh^2 x + \sinh^2 x$$

$$(3) \cosh 2x = 2 \cosh^2 x - 1 \quad (4) \cosh 2x = 1 + 2 \sinh^2 x$$

$$(5) \tanh 2x = \frac{2 \tanh x}{1 + \tanh^2 x}$$

$$D. \quad (1) \sinh x + \sinh y = 2 \sinh \frac{x+y}{2} \cosh \frac{x-y}{2}$$

$$(2) \sinh x - \sinh y = 2 \cosh \frac{x+y}{2} \sinh \frac{x-y}{2}$$

$$(3) \cosh x + \cosh y = 2 \cosh \frac{x+y}{2} \cosh \frac{x-y}{2}$$

$$(4) \cosh x - \cosh y = 2 \sinh \frac{x+y}{2} \sinh \frac{x-y}{2}$$

**Note:** For proof, put  $\sinh x = \frac{e^x - e^{-x}}{2}$  and  $\cosh x = \frac{e^x + e^{-x}}{2}$ .

**Example 38.** Prove that

$$(\cosh x - \sinh x)^n = \cosh nx - \sinh nx. \quad (M.U. 2001, 2002)$$

**Solution.** L.H.S. =  $(\cosh x - \sinh x)^n$

$$= \left[ \frac{e^x + e^{-x}}{2} - \frac{e^x - e^{-x}}{2} \right]^n = \left[ \frac{2e^{-x}}{2} \right]^n = (e^{-x})^n = e^{-nx} \quad \dots(1)$$

$$\begin{aligned} \text{R.H.S.} &= \cosh nx - \sinh nx \\ &= \left( \frac{e^{nx} + e^{-nx}}{2} - \frac{e^{nx} - e^{-nx}}{2} \right) = \frac{2e^{-nx}}{2} = e^{-nx} \end{aligned} \quad \dots(2)$$

From (1) and (2), we have

$$\text{L.H.S.} = \text{R.H.S.}$$

**Proved.**

**Example 39.** If  $x = 2 \sin \alpha \cosh \beta$ ,  $y = 2 \cosh \alpha \sinh \beta$ , show that

$$\operatorname{cosec}(\alpha - i\beta) + \operatorname{cosec}(\alpha + i\beta) = \frac{4x}{x^2 + y^2}$$

**Solution.** We know that  $\operatorname{cosec}(\alpha + i\beta) = \frac{1}{\sin(\alpha + i\beta)} = \frac{1}{\sin \alpha \cos i\beta + \cos \alpha \sin i\beta}$

$$= \frac{1}{\sin \alpha \cosh \beta + i \cos \alpha \sinh \beta} = \frac{1}{\frac{x}{2} + i \frac{y}{2}} = \frac{2}{x + iy} \quad \dots (1) \text{ (Given)}$$

$$\operatorname{cosec}(\alpha - i\beta) = \frac{2}{x - iy} \quad \dots (2)$$

Adding (1) and (2), we get

$$\operatorname{cosec}(\alpha - i\beta) + \operatorname{cosec}(\alpha + i\beta) = \frac{2}{x - iy} + \frac{2}{x + iy} = \frac{4x}{x^2 + y^2} \quad \text{Proved.}$$

**Example 40.** If  $\tan(x + iy) = i$ , where  $x$  and  $y$  are real, prove that  $x$  is indeterminate and  $y$  is infinite.

**Solution.**  $\tan(x + iy) = i \Rightarrow \tan(x - iy) = -i$

$$\begin{aligned} \tan 2x &= \tan(\overline{x+iy} + \overline{x-iy}) = \frac{\tan(x+iy) + \tan(x-iy)}{1 - \tan(x+iy)\tan(x-iy)} \\ &= \frac{i-i}{1-i(-i)} = \frac{i-i}{1-1} = \frac{0}{0}, \text{ which is indeterminate.} \end{aligned}$$

$$\begin{aligned} \text{Also } \tan 2iy &= \tan[(x+iy) - (x-iy)] = \frac{\tan(x+iy) - \tan(x-iy)}{1 + \tan(x+iy)\tan(x-iy)} \\ &= \frac{i - (-i)}{1 + i(-i)} = \frac{2i}{1+1} = i \end{aligned}$$

$$i \tanh 2y = i \Rightarrow \tanh 2y = 1 \Rightarrow 2y = \tanh^{-1}(1) = \frac{1}{2} \log \frac{1+1}{1-1} = \infty$$

$\therefore y$  is infinite. Proved.

**Example 41.** If  $\tan(\theta + i\phi) = \cos \alpha + i \sin \alpha$ , prove that:

$$\theta = \frac{n\pi}{2} + \frac{\pi}{4} \text{ and } \phi = \frac{1}{2} \log \tan\left(\frac{\pi}{4} + \frac{\alpha}{2}\right) \quad (\text{Nagpur University, Summer 2002, Winter 2001})$$

**Solution.** We have,  $\tan(\theta + i\phi) = \cos \alpha + i \sin \alpha$

$$\therefore \tan(\theta - i\phi) = \cos \alpha - i \sin \alpha$$

$$\text{But } \tan 2\theta = \tan[(\theta + i\phi) + (\theta - i\phi)]$$

$$\begin{aligned} &= \frac{\tan(\theta + i\phi) + \tan(\theta - i\phi)}{1 - \tan(\theta + i\phi)\tan(\theta - i\phi)} = \frac{\cos \alpha + i \sin \alpha + \cos \alpha - i \sin \alpha}{1 - (\cos \alpha + i \sin \alpha)(\cos \alpha - i \sin \alpha)} \\ &= \frac{2 \cos \alpha}{1 - (\cos^2 \alpha + \sin^2 \alpha)} = \frac{2 \cos \alpha}{1-1} = \infty = \tan \frac{\pi}{2} \end{aligned}$$

$$\therefore 2\theta = \frac{\pi}{2} \text{ or for general values,}$$

$$2\theta = n\pi + \frac{\pi}{2} \Rightarrow \theta = \frac{n\pi}{2} + \frac{\pi}{4}$$

$$\text{Again, } \tan(2i\phi) = \tan[(\theta + i\phi) - (\theta - i\phi)] = \frac{\tan(\theta + i\phi) - \tan(\theta - i\phi)}{1 + \tan(\theta + i\phi)\tan(\theta - i\phi)}$$

$$= \frac{\cos \alpha + i \sin \alpha - (\cos \alpha - i \sin \alpha)}{1 + (\cos \alpha + i \sin \alpha)(\cos \alpha - i \sin \alpha)}$$

$$= \frac{2i \sin \alpha}{1 + \cos^2 \alpha + \sin^2 \alpha} = \frac{2i \sin \alpha}{1+1} = \frac{2i \sin \alpha}{2} = i \sin \alpha$$

$$\begin{aligned} \Rightarrow \frac{i \tanh 2\phi}{\tanh 2\phi} &= \frac{i \sin \alpha}{\sin \alpha} \quad (\because \tan ix = i \tanh x) \\ \Rightarrow \end{aligned}$$

$$\text{i.e., } \frac{e^{2\phi} - e^{-2\phi}}{e^{2\phi} + e^{-2\phi}} = \frac{\sin \alpha}{1}$$

$$\therefore \frac{e^{2\phi} - e^{-2\phi} + e^{2\phi} + e^{-2\phi}}{(e^{2\phi} + e^{-2\phi}) - (e^{2\phi} - e^{-2\phi})} = \frac{1 + \sin \alpha}{1 - \sin \alpha} \quad (\text{Componendo and dividendo})$$

$$\text{i.e. } \frac{2e^{2\phi}}{2e^{-2\phi}} = \frac{1 - \cos\left(\frac{\pi}{2} + \alpha\right)}{1 + \cos\left(\frac{\pi}{2} + \alpha\right)} \quad \because \cos\left(\frac{\pi}{2} + \theta\right) = -\sin \theta$$

$$\Rightarrow e^{4\phi} = \frac{2 \sin^2\left(\frac{\pi}{4} + \frac{\alpha}{2}\right)}{2 \cos^2\left(\frac{\pi}{4} + \frac{\alpha}{2}\right)}$$

$$\Rightarrow e^{4\phi} = \tan^2\left(\frac{\pi}{4} + \frac{\alpha}{2}\right) \Rightarrow e^{2\phi} = \tan\left(\frac{\pi}{4} + \frac{\alpha}{2}\right)$$

$$\text{Hence, } 2\phi = \log_e \tan\left(\frac{\pi}{4} + \frac{\alpha}{2}\right) \Rightarrow \phi = \frac{1}{2} \log_e \tan\left(\frac{\pi}{4} + \frac{\alpha}{2}\right) \quad \text{Proved.}$$

**Example 42.** If  $u = \log_e \tan\left(\frac{\pi}{4} + \frac{\theta}{2}\right)$ , prove that

$$\tanh \frac{u}{2} = \tan \frac{\theta}{2}$$

**Solution.** Here, we have,

$$\begin{aligned} u &= \log_e \tan\left(\frac{\pi}{4} + \frac{\theta}{2}\right) \Rightarrow e^u = \tan\left(\frac{\pi}{4} + \frac{\theta}{2}\right) \\ \Rightarrow e^u &= \frac{\tan \frac{\pi}{4} + \tan \frac{\theta}{2}}{1 - \tan \frac{\pi}{4} \cdot \tan \frac{\theta}{2}} = \frac{1 + \tan \frac{\theta}{2}}{1 - \tan \frac{\theta}{2}} \end{aligned} \quad \dots(1)$$

$$\Rightarrow e^{-u} = \frac{1 - \tan \frac{\theta}{2}}{1 + \tan \frac{\theta}{2}} \quad \dots(2)$$

By componendo and dividendo on (1), we have

$$\frac{e^u + 1}{e^u - 1} = \frac{2}{2 \tan \frac{\theta}{2}} \quad \therefore \frac{e^u - 1}{e^u + 1} = \tan \frac{\theta}{2} \quad \dots(3)$$

Now,

$$\tanh \frac{u}{2} = \frac{\frac{u}{2} - \frac{-u}{2}}{\frac{u}{2} + \frac{-u}{2}} = \frac{\frac{u}{2} - \frac{-u}{2}}{\frac{u}{2} + \frac{-u}{2}} \cdot \frac{\frac{u}{2}}{\frac{u}{2}}$$

$$\Rightarrow \tanh \frac{u}{2} = \frac{e^u - 1}{e^u + 1}$$

$$\Rightarrow \tanh \frac{u}{2} = \tan \frac{\theta}{2} \quad [\text{Using (3) and (4)}] \quad \text{Proved.}$$

**Example 43.** If  $\cosh x = \sec \theta$ , prove that:

$$(i) \quad \theta = \frac{\pi}{2} - 2 \tan^{-1}(e^{-x})$$

$$(ii) \quad \tanh \frac{\pi}{2} = \tan \frac{\theta}{2} \quad (\text{M.U. 2003, 2005})$$

**Solution.** (i) Let  $\tan^{-1} e^{-x} = \alpha$   
 $\Rightarrow e^{-x} = \tan \alpha$  and  $\alpha = \tan^{-1} (e^{-x})$  ... (1)  
 $\Rightarrow e^x = \cot \alpha$  ... (2)

Now,  $\sec \theta = \cosh x = \frac{e^x + e^{-x}}{2}$  ... (3) (Given)

Putting the values of  $e^{-x}$  and  $e^x$  from (1) and (2) in (3), we get

$$\begin{aligned}\sec \theta &= \frac{\cot \alpha + \tan \alpha}{2} \\ \therefore 2 \sec \theta &= \cot \alpha + \tan \alpha = \frac{\cos \alpha}{\sin \alpha} + \frac{\sin \alpha}{\cos \alpha} = \frac{\cos^2 \alpha + \sin^2 \alpha}{\sin \alpha \cos \alpha} \\ &= \frac{2}{2 \sin \alpha \cos \alpha} \quad [\because \cos^2 \alpha + \sin^2 \alpha = 1] \\ &= \frac{2}{\sin 2\alpha} \\ \therefore \cos \theta &= \sin 2\alpha \\ \Rightarrow \cos \theta &= \cos \left( \frac{\pi}{2} - 2\alpha \right) \\ \therefore \theta &= \frac{\pi}{2} - 2\alpha = \frac{\pi}{2} - 2 \tan^{-1} (e^{-x}) \quad [\text{From (1)] Proved.}\end{aligned}$$

(ii) We have,

$$\begin{aligned}\cosh x &= \sec \theta \quad (\text{Given}) \\ \Rightarrow \frac{e^x + e^{-x}}{2} &= \sec \theta \quad \left[ \because \cosh x = \frac{e^x + e^{-x}}{2} \right] \\ \therefore e^x - 2 \sec \theta + e^{-x} &= 0 \\ \therefore (e^x)^2 - 2 e^x \sec \theta + 1 &= 0\end{aligned}$$

Solving the quadratic equation in  $e^x$ .

$$\begin{aligned}e^x &= \frac{2 \sec \theta \pm \sqrt{4 \sec^2 \theta - 4}}{2} \\ \Rightarrow e^x &= \sec \theta \pm \sqrt{\sec^2 \theta - 1} \\ \Rightarrow e^x &= \sec \theta \pm \tan \theta \quad \dots (4)\end{aligned}$$

$$\begin{aligned}\text{Now, } \tanh \frac{x}{2} &= \frac{\frac{x}{2} - \frac{-x}{2}}{\frac{x}{2} + \frac{-x}{2}} = \frac{e^x - 1}{e^x + 1} \quad \dots (5)\end{aligned}$$

Putting the value of  $e^x$  from (4) in (5), we get

$$\begin{aligned}\tanh \frac{x}{2} &= \frac{\sec \theta + \tan \theta - 1}{\sec \theta + \tan \theta + 1} \quad [\text{Using (1)]} \\ &= \frac{1 + \sin \theta - \cos \theta}{1 + \sin \theta + \cos \theta} = \frac{(1 - \cos \theta) + \sin \theta}{(1 + \cos \theta) + \sin \theta} \\ &= \frac{2 \sin^2 \frac{\theta}{2} + 2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{2 \cos^2 \frac{\theta}{2} + 2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}} = \frac{\sin \frac{\theta}{2}}{\cos \frac{\theta}{2}} = \tan \frac{\theta}{2} \quad \text{Proved.}\end{aligned}$$

## EXERCISE 25.8

1. If  $\tan\left(\frac{\pi}{8} + i\alpha\right) = x + iy$ , prove that  $x^2 + y^2 + 2x = 1$ .

2. If  $\cot\left(\frac{\pi}{8} + i\alpha\right) = x + iy$ , prove that  $x^2 + y^2 - 2x = 1$ .

3. Prove that if  $(1 + i \tan \alpha)^{1+i \tan \beta}$  can have real values, one of them is  $(\sec \alpha)^{\sec^2 \beta}$ .

4. If  $\frac{(1+i)^{x+iy}}{(1-i)^{x-iy}} = \alpha + i\beta$ , prove that the value of  $\tan^{-1} \frac{\beta}{\alpha}$  is  $\frac{\pi x}{2} + y \log 2$ .

5. If  $\tanh x = \frac{1}{2}$ , find the value of  $\sinh 2x$ .

Ans.  $\frac{4}{3}$

6. If  $\sin \alpha \cosh \beta = \frac{x}{2}$ ,  $\cos \alpha \sinh \beta = \frac{y}{2}$ , show that

$$(i) \operatorname{cosec}(\alpha - i\beta) + \operatorname{cosec}(\alpha + i\beta) = \frac{4x}{x^2 + y^2}$$

$$(ii) \operatorname{cosec}(\alpha - i\beta) - \operatorname{cosec}(\alpha + i\beta) = \frac{4iy}{x^2 + y^2}$$

7. Show that  $\tan\left(\frac{u+iv}{2}\right) = \frac{\sin u + i \sinh v}{\cos u + \cosh v}$

8. If  $\cot(\alpha + i\beta) = x + iy$ , prove that

$$(i) x^2 + y^2 - 2x \cot 2\alpha = 1$$

$$(ii) x^2 + y^2 + 2y \coth 2\beta + 1 = 0$$

9. If  $\tan\frac{x}{2} = \tanh\frac{u}{2}$  prove that

$$(i) \sinh u = \tan x$$

$$(ii) \cosh u = \sec x.$$

10. Solve the following equation for real values of  $x$ .

$$17 \cosh x + 18 \sinh x = 1$$

Ans.  $-\log 5$

## 25.27 SEPARATION OF REAL AND IMAGINARY PARTS OF CIRCULAR FUNCTIONS

**Example 44.** Separate the following into real and imaginary parts:

$$(i) \sin(x+iy) \quad (ii) \cos(x+iy) \quad (iii) \tan(x+iy)$$

$$(iv) \cot(x+iy) \quad (v) \sec(x+iy) \quad (vi) \operatorname{cosec}(x+iy).$$

**Solution.** (i)  $\sin(x+iy) = \sin x \cos iy + \cos x \sin(iy) = \sin x \cosh y + i \cos x \sinh y$ .

(ii)  $\cos(x+iy) = \cos x \cos(iy) - \sin x \sin(iy) = \cos x \cosh y - i \sin x \sinh y$ .

$$(iii) \tan(x+iy) = \frac{\sin(x+iy)}{\cos(x+iy)} = \frac{2 \sin(x+iy) \cos(x-iy)}{2 \cos(x+iy) \cos(x-iy)}$$

$$= \frac{\sin 2x + \sin(2iy)}{\cos 2x + \cos 2iy} = \frac{\sin 2x + i \sinh 2y}{\cos 2x + \cosh 2y}$$

$$\left. \begin{aligned} & \because 2 \sin A \cos B = \sin(A+B) + \sin(A-B) \\ & \text{and } 2 \cos A \sin B = \cos(A+B) + \cos(A-B) \end{aligned} \right\}$$

$$(iv) \cot(x+iy) = \frac{\cos(x+iy)}{\sin(x+iy)} = \frac{2 \cos(x+iy) \sin(x-iy)}{2 \sin(x+iy) \sin(x-iy)}$$

$$= \frac{\sin 2x - \sin(2iy)}{\cos(2iy) - \cos 2x} = \frac{\sin 2x - i \sinh 2y}{\cosh 2y - \cos 2x}$$

$$(v) \sec(x+iy) = \frac{1}{\cos(x+iy)} = \frac{2 \cos(x-iy)}{2 \cos(x+iy) \cos(x-iy)}$$

$$= \frac{2[\cos x \cos(iy) + \sin x \sin(iy)]}{\cos 2x + \cos(2iy)} = \frac{2[\cos x \cosh y + i \sin x \sinh y]}{\cos 2x + \cosh 2y}$$

$$\begin{aligned}
 (vi) \cosec(x+iy) &= \frac{1}{\sin(x+iy)} = \frac{2\sin(x-iy)}{2\sin(x+iy)\sin(x-iy)} = \frac{2[\sin x \cos(iy) - \cos x \sin(iy)]}{\cos(2iy) - \cos 2x} \\
 &= \frac{2[\sin x \cosh y - i \cos x \sinh y]}{\cosh 2y - \cos 2x}
 \end{aligned}
 \quad \text{Ans.}$$

**Example 45.** If  $\tan(A + iB) = x + iy$ , prove that

$$\tan 2A = \frac{2x}{1-x^2-y^2} \text{ and } \tanh 2B = \frac{2x}{1+x^2+y^2} \quad (\text{Nagpur University, Summer 2000})$$

**Solution.**  $\tan(A + iB) = x + iy$ ;  $\tan(A - iB) = x - iy$

$$\tan 2A = \tan(A + iB + A - iB)$$

$$\begin{aligned}
 &= \frac{\tan(A+iB)+\tan(A-iB)}{1-\tan(A+iB)\tan(A-iB)} \\
 \tan 2A &= \frac{(x+iy)+(x-iy)}{1-(x+iy)(x-iy)} = \frac{2x}{1-(x^2+y^2)} = \frac{2x}{1-x^2-y^2}
 \end{aligned}$$

Again

$$\tan 2iB = \tan(A + iB - A + iB) = \frac{\tan(A+iB)-\tan(A-iB)}{1+\tan(A+iB)\tan(A-iB)}$$

$$\tan 2iB = \frac{(x+iy)-(x-iy)}{1+(x+iy)(x-iy)} = \frac{(2y)i}{1+x^2+y^2}$$

$$\tanh 2B = \frac{2y}{1+x^2+y^2} \quad \tan ix = i \tanh x \quad \text{Proved.}$$

**Example 46.** If  $\sin(\alpha + i\beta) = x + iy$ , prove that

$$(a) \frac{x^2}{\cosh^2 \beta} + \frac{y^2}{\sinh^2 \beta} = 1 \quad (b) \frac{x^2}{\sin^2 \alpha} - \frac{y^2}{\cos^2 \alpha} = 1$$

**Solution.** (a)  $x + iy = \sin(\alpha + i\beta) = \sin \alpha \cosh \beta + i \cos \alpha \sinh \beta$

Equating real and imaginary parts, we get

$$x = \sin \alpha \cosh \beta, y = \cos \alpha \sinh \beta$$

$$\sin \alpha = \frac{x}{\cosh \beta} \text{ and } \cos \alpha = \frac{y}{\sinh \beta}$$

$$\text{Squaring and adding, } \sin^2 \alpha + \cos^2 \alpha = \frac{x^2}{\cosh^2 \beta} + \frac{y^2}{\sinh^2 \beta}$$

$$\Rightarrow 1 = \frac{x^2}{\cosh^2 \beta} + \frac{y^2}{\sinh^2 \beta} \quad \text{Proved.}$$

$$(b) \text{ Again } \cosh \beta = \frac{x}{\sin \alpha} \text{ and } \sinh \beta = \frac{y}{\cos \alpha}$$

$$\cosh^2 \beta - \sinh^2 \beta = \frac{x^2}{\sin^2 \alpha} - \frac{y^2}{\cos^2 \alpha}$$

$$1 = \frac{x^2}{\sin^2 \alpha} - \frac{y^2}{\cos^2 \alpha} \quad \text{Proved.}$$

## 25.28 SEPARATION OF REAL AND IMAGINARY PARTS OF HYPERBOLIC FUNCTIONS

**Example 47.** Separate the following into real and imaginary parts of hyperbolic functions.

$$(a) \sinh(x+iy) \quad (b) \cosh(x+iy) \quad (c) \tanh(x+iy)$$

$$\begin{aligned}
 \text{Solution.} \quad (a) \sinh(x+iy) &= \sinh x \cosh(iy) + \cosh x \sinh(iy) \\
 &= \sinh x \cos y + i \sin y \cosh x.
 \end{aligned}$$

Ans.

$$(b) \cosh(x+iy) = \cosh x \cosh(iy) - \sinh x \sinh iy = \cosh x \cos y - i \sinh x \sin y.$$

Ans.

$$\begin{aligned} (c) \tanh(x+iy) &= \frac{\sinh(x+iy)}{\cosh(x+iy)} = \frac{-i \sin i(x+iy)}{\cos i(x+iy)} \\ &= \frac{-i \sin(ix-y)}{\cos(ix-y)} = \frac{-i 2 \sin(ix-y) \cos(ix+y)}{2 \cos(ix-y) \cos(ix+y)} \quad (\text{Note this step}) \\ &= -i \frac{\sin 2ix - \sin 2y}{\cos 2ix + \cos 2y} = -i \frac{i \sinh 2x - \sin 2y}{\cosh 2x + \cos 2y} = \frac{\sinh 2x + i \sin 2y}{\cosh 2x + \cos 2y} \\ &= \frac{\sinh 2x}{\cosh 2x + \cos 2y} + i \frac{\sin 2y}{\cosh 2x + \cos 2y} \end{aligned}$$

Ans.

**Example 48.** If  $\tan(x+iy) = \sin(u+iv)$ , prove that

$$\frac{\sin 2x}{\sinh 2y} = \frac{\tan u}{\tanh v}$$

**Solution.** Now  $\tan(x+iy) = \sin(u+iv)$  separating the real and imaginary parts of both sides, we have

$$\frac{\sin 2x}{\cos 2x + \cosh 2y} + \frac{i \sinh 2y}{\cos 2x + \cosh 2y} = \sin u \cosh v + i \cos u \sinh v$$

Equating real and imaginary parts, we get

$$\frac{\sin 2x}{\cos 2x + \cosh 2y} = \sin u \cosh v \quad \dots(1)$$

$$\text{and} \quad \frac{\sinh 2y}{\cos 2x + \cosh 2y} = \cos u \sinh v \quad \dots(2)$$

Dividing (1) by (2), we obtain

$$\begin{aligned} \frac{\sin 2x}{\sinh 2y} &= \frac{\sin u \cosh v}{\cos u \sinh v} \\ \Rightarrow \quad \frac{\sin 2x}{\sinh 2y} &= \frac{\tan u}{\tanh v} \end{aligned} \quad \text{Proved.}$$

**Example 49.** If  $\sin(\theta+i\phi) = \tan \alpha + i \sec \alpha$ , show that  $\cos 2\theta \cosh 2\phi = 3$

$$\sin(\theta+i\phi) = \tan \alpha + i \sec \alpha$$

$$\sin \theta \cosh \phi + i \cos \theta \sinh \phi = \tan \alpha + i \sec \alpha$$

Equating real and imaginary parts, we get

$$\sin \theta \cosh \phi = \tan \alpha \quad \dots(1)$$

$$\cos \theta \sinh \phi = \sec \alpha \quad \dots(2)$$

We know that

$$\begin{aligned} \sec^2 \alpha - \tan^2 \alpha &= 1 \\ \cos^2 \theta \sinh^2 \phi - \sin^2 \theta \cosh^2 \phi &= 1 \end{aligned} \quad [\text{From (1) and (2)}]$$

$$\left( \frac{1 + \cos 2\theta}{2} \right) \left( \frac{\cosh 2\phi - 1}{2} \right) - \left( \frac{1 - \cos 2\theta}{2} \right) \left( \frac{\cosh 2\phi + 1}{2} \right) = 1$$

$$[-1 + \cosh 2\phi - \cos 2\theta + \cos 2\theta \cosh 2\phi] - [\cosh 2\phi + 1 - \cos 2\theta \cosh 2\phi - \cos 2\theta] = 4$$

$$\Rightarrow -2 + 2 \cos 2\theta \cosh 2\phi = 4$$

$$\Rightarrow 2 \cos 2\theta \cosh 2\phi = 6 \Rightarrow \cos 2\theta \cosh 2\phi = 3 \quad \text{Proved.}$$

**Example 50.** If  $\sinh(\theta+i\phi) = \cos \alpha + i \sin \alpha$ , prove that  $\sinh^4 \theta = \cos^2 \alpha = \cos^4 \phi$ .

$$\sinh(\theta+i\phi) = \cos \alpha + i \sin \alpha$$

$$\sinh \theta \cos \phi + i \sin \phi \cosh \theta = \cos \alpha + i \sin \alpha$$

Equating real and imaginary parts, we have

$$\sinh \theta \cos \phi = \cos \alpha \text{ and} \quad \dots(1)$$

$$\sin \phi \cosh \theta = \sin \alpha \quad \dots(2)$$

Let us eliminate  $\phi$  from (1) and (2).

$$\cos \phi = \frac{\cos \alpha}{\sinh \theta} \text{ and } \sin \phi = \frac{\sin \alpha}{\cosh \theta}$$

Squaring and adding, we get

$$1 = \frac{\cos^2 \alpha}{\sinh^2 \theta} + \frac{\sin^2 \alpha}{\cosh^2 \theta} \Rightarrow \frac{\cos^2 \alpha}{\sinh^2 \theta} = 1 - \frac{\sin^2 \alpha}{\cosh^2 \theta}$$

$$\Rightarrow \frac{\cos^2 \alpha}{\sinh^2 \theta} = 1 - \frac{1 - \cos^2 \alpha}{1 + \sinh^2 \theta} = \frac{1 + \sinh^2 \theta - 1 + \cos^2 \alpha}{1 + \sinh^2 \theta}$$

$$\frac{\cos^2 \alpha}{\sinh^2 \theta} = \frac{\sinh^2 \theta + \cos^2 \alpha}{1 + \sinh^2 \theta}$$

$$\sinh^4 \theta + \sinh^2 \theta \cos^2 \alpha = \cos^2 \alpha + \cos^2 \alpha \sinh^2 \theta$$

$$\Rightarrow \sinh^4 \theta = \cos^2 \alpha$$

**Proved.**

For second result, let us eliminate  $\theta$ .

$$\sinh \theta = \frac{\cos \alpha}{\cos \phi} \text{ and } \cosh \theta = \frac{\sin \alpha}{\sin \phi}$$

$$\cosh^2 \theta - \sinh^2 \theta = \frac{\sin^2 \alpha}{\sin^2 \phi} - \frac{\cos^2 \alpha}{\cos^2 \phi} \Rightarrow 1 = \frac{1 - \cos^2 \alpha}{1 - \cos^2 \phi} - \frac{\cos^2 \alpha}{\cos^2 \phi}$$

$$\Rightarrow \frac{\cos^2 \alpha}{\cos^2 \phi} = \frac{1 - \cos^2 \alpha - 1 + \cos^2 \phi}{1 - \cos^2 \phi}$$

$$\frac{\cos^2 \alpha}{\cos^2 \phi} = \frac{\cos^2 \phi - \cos^2 \alpha}{1 - \cos^2 \phi}$$

$$\Rightarrow \cos^4 \phi - \cos^2 \phi \cos^2 \alpha = \cos^2 \alpha - \cos^2 \alpha \cos^2 \phi$$

$$\Rightarrow \cos^4 \phi = \cos^2 \alpha.$$

**Proved.**

**Example 51.** If  $e^z = \sin(u + iv)$  and  $z = x + iy$ , prove that

$$2e^{2x} = \cosh 2v - \cos 2u \quad (M.U. 2006)$$

**Solution.** We have,  $e^z = \sin(u + iv)$

$$\Rightarrow e^{x+iy} = \sin(u + iv)$$

$$\Rightarrow e^x \cdot e^{iy} = \sin u \cos iv + \cos u \sin iv$$

$$\Rightarrow e^x (\cos y + i \sin y) = \sin u \cosh v + i \cos u \sinh v$$

Equating real and imaginary parts, we get

$$e^x \cos y = \sin u \cosh v$$

$$\text{and } e^x \sin y = \cos u \sinh v$$

Squaring and adding, we get

$$e^{2x}(\cos^2 y + \sin^2 y) = \sin^2 u \cosh^2 v + \cos^2 u \sinh^2 v$$

$$\Rightarrow e^{2x} = (1 - \cos^2 u) \cosh^2 v + \cos^2 u (\cosh^2 v - 1)$$

$$\Rightarrow e^{2x} = \cosh^2 v - \cos^2 u$$

$$\Rightarrow e^{2x} = \frac{1}{2} (1 + \cosh 2v) - \frac{1}{2} (1 + \cos 2u)$$

$$\Rightarrow e^{2x} = \frac{1}{2} (\cosh 2v - \cos 2u)$$

$$\Rightarrow 2e^{2x} = \cosh 2v - \cos 2u$$

**Proved.**

**Example 52.** If  $\sin(\theta + i\phi) = \cos \alpha + i \sin \alpha$ , prove that

$$\cos^4 \theta = \sin^2 \alpha = \sinh^4 \phi.$$

(M.U. 2003, 2004)

**Solution.** Here, we have

$$\sin(\theta + i\phi) = \cos \alpha + i \sin \alpha$$

$$\Rightarrow \sin \theta \cosh \phi + i \cos \theta \sinh \phi = \cos \alpha + i \sin \alpha$$

Equating real and imaginary parts, we get

$$\sin \theta \cosh \phi = \cos \alpha \Rightarrow \cosh \phi = \frac{\cos \alpha}{\sin \theta} \quad \dots(1)$$

$$\text{and } \cos \theta \sinh \phi = \sin \alpha \Rightarrow \sinh \phi = \frac{\sin \alpha}{\cos \theta} \quad \dots(2)$$

$$\text{But } \cosh^2 \phi - \sinh^2 \phi = 1$$

$$\Rightarrow \frac{\cos^2 \alpha}{\sin^2 \theta} - \frac{\sin^2 \alpha}{\cos^2 \theta} = 1 \quad [\text{Using (1) and (2)}]$$

$$\Rightarrow \cos^2 \alpha \cdot \cos^2 \theta - \sin^2 \alpha \cdot \sin^2 \theta = \sin^2 \theta \cos^2 \theta$$

$$\Rightarrow (1 - \sin^2 \alpha) \cos^2 \theta - \sin^2 \alpha \cdot \sin^2 \theta = (1 - \cos^2 \theta) \cos^2 \theta$$

$$\Rightarrow \cos^2 \theta - \sin^2 \alpha (\cos^2 \theta + \sin^2 \theta) = \cos^2 \theta - \cos^4 \theta$$

$$\Rightarrow \sin^2 \alpha = \cos^4 \theta \quad \dots(3)$$

$$\text{Again } \sin^2 \theta + \cos^2 \theta = 1$$

$$\therefore \frac{\cos^2 \alpha}{\cosh^2 \phi} + \frac{\sin^2 \alpha}{\sinh^2 \phi} = 1 \quad [\text{Using (1) and (2)}]$$

$$\Rightarrow \cos^2 \alpha \cdot \sinh^2 \phi + \sin^2 \alpha \cosh^2 \phi = \sinh^2 \phi \cosh^2 \phi$$

$$\Rightarrow (1 - \sin^2 \alpha) \sinh^2 \phi + \sin^2 \alpha (1 + \sinh^2 \phi) = \sinh^2 \phi (1 + \sinh^2 \phi)$$

$$\Rightarrow \sinh^2 \phi - \sin^2 \alpha \sinh^2 \phi + \sin^2 \alpha + \sin^2 \alpha \sinh^2 \phi = \sinh^2 \phi + \sinh^4 \phi$$

$$\Rightarrow \sin^2 \alpha = \sinh^4 \phi. \quad \dots(4)$$

From (3) and (4), we have  $\cos^4 \theta = \sin^2 \alpha = \sinh^4 \phi$

**Proved.**

**Example 53.** If  $\operatorname{cosec}\left(\frac{\pi}{4} + ix\right) = u + iv$ , prove that

$$(u^2 + v^2)^2 = 2(u^2 - v^2)$$

(M.U. 2009)

**Solution.** Here, we have

$$\begin{aligned} u + iv &= \operatorname{cosec}\left(\frac{\pi}{4} + ix\right) \\ &= \frac{1}{\sin\left(\frac{\pi}{4} + ix\right)} \Rightarrow = \frac{1}{\sin \frac{\pi}{4} \cos ix + \cos \frac{\pi}{4} \sin ix} \\ &= \frac{1}{\frac{1}{\sqrt{2}} \cosh x + \frac{1}{\sqrt{2}} i \sinh x} = \frac{\sqrt{2}}{\cosh x + i \sinh x} \\ &= \frac{\sqrt{2} (\cosh x - i \sinh x)}{\cosh^2 x + \sinh^2 x} = \frac{\sqrt{2} (\cosh x - i \sinh x)}{\cosh 2x} \end{aligned}$$

Equating real and imaginary parts, we get  $u = \frac{\sqrt{2} \cosh x}{\cosh 2x}$ ,  $v = -\frac{\sqrt{2} \sinh x}{\cosh 2x}$

Squaring and adding, we get

$$u^2 + v^2 = \frac{2(\cosh^2 x + \sinh^2 x)}{\cosh^2 2x} = \frac{2 \cosh 2x}{\cosh^2 2x}$$

$$\Rightarrow (u^2 + v^2)^2 = \left( \frac{2}{\cosh 2x} \right)^2 = \frac{4}{\cosh^2 2x} \quad \dots(1)$$

$$\text{Also, } u^2 - v^2 = \frac{2}{\cosh^2 2x} (\cosh^2 x - \sinh^2 x) = \frac{2}{\cosh^2 2x} \quad \dots(2)$$

From (1) and (2), we have

$$(u^2 + v^2)^2 = 2(u^2 - v^2) \quad \text{Proved.}$$

**Example 54.** Separate into real and imaginary parts  $\sqrt{i}^{\sqrt{i}}$ . (M.U. 2008)

**Solution.** We have,

$$\begin{aligned} \sqrt{i} = i^{\frac{1}{2}} &= \left( \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \right)^{\frac{1}{2}} \\ &= \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \\ &= \frac{1}{\sqrt{2}} + i \frac{1}{\sqrt{2}} \end{aligned}$$

$$\text{Also, } \sqrt{i} = \left( \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \right)^{\frac{1}{2}} = \left( e^{i \frac{\pi}{2}} \right)^{\frac{1}{2}} = e^{i \frac{\pi}{4}}$$

$$\begin{aligned} \therefore (\sqrt{i})^{\sqrt{i}} &= \left( e^{i \frac{\pi}{4}} \right)^{\left( \frac{1}{\sqrt{2}} + i \cdot \frac{1}{\sqrt{2}} \right)} = e^{i \frac{\pi}{4\sqrt{2}} - \frac{\pi}{4\sqrt{2}}} \\ &= e^{-\frac{\pi}{4\sqrt{2}}} \cdot e^{i \frac{\pi}{4\sqrt{2}}} = e^{-\frac{\pi}{4\sqrt{2}}} \left( \cos \frac{\pi}{4\sqrt{2}} + i \sin \frac{\pi}{4\sqrt{2}} \right) \end{aligned}$$

$$\therefore \text{Real part} = e^{-\frac{\pi}{4\sqrt{2}}} \cos \left( \frac{\pi}{4\sqrt{2}} \right)$$

$$\text{Imaginary part} = e^{-\frac{\pi}{4\sqrt{2}}} \sin \left( \frac{\pi}{4\sqrt{2}} \right) \quad \text{Ans.}$$

### EXERCISE 25.9

Separate into real and imaginary parts.

1.  $\operatorname{sech}(x + iy)$

Ans.  $\frac{2 \cosh x \cos y - 2i \sinh x \sin y}{\cosh 2x + \cos 2y}$

2.  $\coth i(x + iy)$

Ans.  $\frac{-\sinh 2y - i \sin 2x}{\cosh 2x - \cos 2y}$

3.  $\coth(x + iy)$

Ans.  $\frac{\sinh 2x - i \sin 2y}{\cosh 2x - \cos 2y}$

4. If  $\sin(\theta + i\phi) = p(\cos \alpha + i \sin \alpha)$ , prove that

$$p^2 = \frac{1}{2} [\cosh 2\phi - \cos 2\theta], \tan \alpha = \tanh \phi \cot \theta$$

5. If  $\sin(\alpha + i\beta) = x + iy$ , prove that  $x^2 \operatorname{sech}^2 \beta + y^2 \operatorname{cosech}^2 \beta = 1$  and  $x^2 \operatorname{cosec}^2 \alpha - y^2 \sec^2 \alpha = 1$

6. If  $\cos(\theta + i\phi) = r(\cos \alpha + i \sin \alpha)$ , prove that  $\theta = \frac{1}{2} \log \left[ \frac{\sin(\theta - \alpha)}{\sin(\theta + \alpha)} \right]$

7. If  $\tan \left( \frac{\pi}{6} + i\alpha \right) = x + iy$ , prove that  $x^2 + y^2 + \frac{2x}{\sqrt{3}} = 1$

8. If  $\tan(A + B) = \alpha + i\beta$ , show that  $\frac{1 - (\alpha^2 + \beta^2)}{1 + (\alpha^2 + \beta^2)} = \frac{\cos 2A}{\cosh 2B}$

9. If  $\frac{x + iy - c}{x + iy + c} = e^{u + iv}$ , prove that

$$x = -\frac{c \sinh u}{\cosh u - \cos v}, \quad y = \frac{c \sinh v}{\cosh u - \cos v}$$

Further, if  $v = (2n + 1)\frac{\pi}{2}$ , prove that  $x^2 + y^2 = c^2$  where  $n$  is an integer.

10. If  $\frac{u-1}{u+1} = \sin(x + iy)$ , where  $u = \alpha + i\beta$  show that the argument of  $u$  is  $\theta + \phi$  where

$$\tan \theta = \frac{\cos x \sinh y}{1 + \sin x \cosh y} \text{ and } \tan \phi = \frac{\cos x \sinh y}{1 - \sin x \sinh y}$$

11. If  $A + iB = C \tan(x + iy)$ , prove that  $\tan 2x = \frac{2CA}{C^2 - A^2 - B^2}$

12. If  $\cosh(\alpha + i\beta) = x + iy$ , prove that

$$(a) \frac{x^2}{\cosh^2 \alpha} + \frac{y^2}{\sinh^2 \alpha} = 1 \quad (b) \frac{x^2}{\cos^2 \beta} - \frac{y^2}{\sin^2 \beta} = 1$$

13. If  $\cos(\theta + i\phi) = R(\cos \alpha + i \sin \alpha)$ , prove that  $\phi = \frac{1}{2} \log_e \left[ \frac{\sin(\theta - \alpha)}{\sin(\theta + \alpha)} \right]$

14. If  $\cos(\alpha + i\beta) \cos(\gamma + i\delta) = 1$ , prove that  $\tanh^2 \delta \cosh^2 \beta = \sin^2 \alpha$

15. If  $\frac{u-1}{u+1} = \sin(x + iy)$ , find  $u$ . Ans.  $\tan^{-1} \frac{2 \cos x \sinh y}{\cos^2 x - \sinh^2 y}$

## 25.29 LOGARITHMIC FUNCTION OF A COMPLEX VARIABLE

**Example 55.** Define logarithm of a complex number.

**Solution.** If  $z$  and  $w$  are two complex numbers and  $z = e^w$  then  $w = \log z$ , and if  $w = \log z$ , then  $z = e^w$

Here  $\log z$  is a many valued function. General value of  $\log z$  is defined by  $\text{Log } z$ , where  $\text{Log } z = \log z + 2n\pi i$ .

**Example 56.** Separate  $\log(x + iy)$  into its real and imaginary parts.

**Solution.** Let  $x = r \cos \theta$  ... (1)

and  $y = r \sin \theta$  ... (2)

Squaring and adding (1) and (2) we have  $x^2 + y^2 = r^2$

$$\therefore r = \sqrt{x^2 + y^2},$$

$$\text{We have, } \tan \theta = \frac{y}{x} \Rightarrow \theta = \tan^{-1} \left( \frac{y}{x} \right) \quad [\text{Dividing (2) by (1)}]$$

$$\therefore \log(x + iy) = \log[r(\cos \theta + i \sin \theta)] \\ = [\log r + \log(\cos \theta + i \sin \theta)]$$

$$\log(x + iy) = \log r + \log[\cos(2n\pi + \theta) + i \sin(2n\pi + \theta)] \\ = \log r + \log e^{i(2n\pi + \theta)} = \log r + i(2n\pi + \theta)$$

$$\text{Log}(x + iy) = \log \sqrt{x^2 + y^2} + i \left( 2n\pi + \tan^{-1} \frac{y}{x} \right)$$

$$\text{and } \log(x + iy) = \log \sqrt{x^2 + y^2} + i \tan^{-1} \frac{y}{x}$$

Ans.

**Example 57.** Find the general value of  $\text{Log}(1 + i) + \text{Log}(1 - i)$ .

$$\text{Solution. } 1 + i = \sqrt{2} \left( \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right) = \sqrt{2} e^{i\frac{\pi}{4}}$$

$$\log(1+i) = \log\sqrt{2} \cdot e^{i\frac{\pi}{4}} = \log\sqrt{2} + i\frac{\pi}{4}$$

$$\operatorname{Log}(1+i) = \log\sqrt{2} + i\frac{\pi}{4} + 2n\pi i = \log\sqrt{2} + \left(2n\pi + \frac{\pi}{4}\right)i$$

$$\operatorname{Log}(1-i) = \log\sqrt{2} + \left(2n\pi - \frac{\pi}{4}\right)i$$

$$\begin{aligned}\text{Hence, } \operatorname{Log}(1+i) + \operatorname{Log}(1-i) &= \left[\log\sqrt{2} + \left(2n\pi + \frac{\pi}{4}\right)i\right] + \left[\log\sqrt{2} + \left(2n\pi - \frac{\pi}{4}\right)i\right] \\ &= 2\log\sqrt{2} + 4n\pi i = \log 2 + 4n\pi i\end{aligned}\quad \text{Ans.}$$

**Example 58.** Show that  $\log \frac{x+iy}{x-iy} = 2i \tan^{-1} \frac{y}{x}$ . (Nagpur University, Winter 2003)

**Solution.** Let  $\log(x+iy) = \log(r \cos \theta + ir \sin \theta) = \log r e^{i\theta}$

$$= \log r + i\theta \quad \begin{bmatrix} x = r \cos \theta \\ y = r \sin \theta \end{bmatrix}$$

Similarly,  $\log(x-iy) = \log r - i\theta$

$$\begin{aligned}\log \frac{x+iy}{x-iy} &= \log(x+iy) - \log(x-iy) = (\log r + i\theta) - (\log r - i\theta) = 2i\theta \\ &= 2i \tan^{-1} \frac{y}{x}.\end{aligned}\quad \text{Proved.}$$

**Example 59.** Show that for real values of  $a$  and  $b$

$$e^{2ai \cot^{-1} b} \left[ \frac{b+i-1}{b+i+1} \right]^a = 1 \quad (M.U. 2008)$$

**Solution.** Consider  $\frac{b+i-1}{b+i+1} = \frac{b+i+i^2}{b+i-i^2} = \frac{b+i}{b-i}$

$$\Rightarrow \left( \frac{b+i-1}{b+i+1} \right)^a = \left( \frac{b+i}{b-i} \right)^{-a}$$

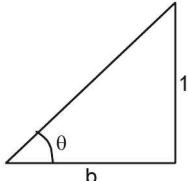

$$\log \left[ \frac{b+i-1}{b+i+1} \right]^a = \log \left( \frac{b+i}{b-i} \right)^{-a} = -a [\log(b+i) - \log(b-i)]$$

$$= -a \left[ \log \sqrt{b^2+1} + i \tan^{-1} \frac{1}{b} - \log \sqrt{b^2+1} + i \tan^{-1} \frac{1}{b} \right]$$

$$= -2ai \tan^{-1} \frac{1}{b}$$

$$\left( \frac{b+i-1}{b+i+1} \right)^a = e^{-2ai \tan^{-1} \left( \frac{1}{b} \right)} \quad \begin{bmatrix} \text{If } \cot \theta = b, \tan \theta = \frac{1}{b} \\ \text{Since } \cot^{-1} b = \tan^{-1} \left( \frac{1}{b} \right) \end{bmatrix}$$

$$e^{2ai \cot^{-1} b} \left( \frac{b+i-1}{b+i+1} \right)^a = \left[ e^{2ai \tan^{-1} \left( \frac{1}{b} \right)} \right] \cdot \left[ e^{-2ai \tan^{-1} \left( \frac{1}{b} \right)} \right] = 1 \quad \text{Proved.}$$

## EXERCISE 25.10

1. Find the general value of  $\log i$ .

$$\text{Ans. } (4n+1) \frac{\pi i}{2}$$

2. Express  $\log(-5)$  in terms of  $a+ib$ .

$$\text{Ans. } \log 5 + i(2n+1)\pi$$

3. Find the value of  $z$  if

$$(a) \cos z = 2.$$

$$\text{Ans. } z = 2n\pi \pm i \log(2+\sqrt{3})$$

$$(b) \cosh z = -1.$$

$$\text{Ans. } z = (2n+1)\pi i$$

4. Find the general and principal values of  $i^i$ 

$$\text{Ans. } e^{-\left(\frac{2n\pi + \frac{\pi}{2}}{2}\right)}, e^{-\frac{\pi}{2}}$$

5. If  $i^{(\alpha+i\beta)} = x+iy$ , prove that  $x^2+y^2 = e^{-(4m+1)\pi\theta}$ .

$$6. \text{Prove that } \log \frac{1}{1-e^{i\theta}} = \log\left(\frac{1}{2}\operatorname{cosec}\theta\right) + i\left(\frac{\pi}{2} - \frac{\theta}{2}\right)$$

$$7. \text{Show that } \log \sin(x+iy) = \frac{1}{2}\log \frac{\cosh 2y - \cos 2x}{2} + i\tan^{-1}(\cot x \tanh y).$$

$$8. \text{Prove that } \tan\left[i\log \frac{a-ib}{a+ib}\right] = \frac{2ab}{a^2-b^2}.$$

$$9. \log \frac{\cos(x-iy)}{\cos(x+iy)} = 2i\tan^{-1}(\tan x \tanh y).$$

$$10. \text{Separate } i^{(1+i)} \text{ into real and imaginary parts.} \quad \text{Ans. } ie^{-\frac{\pi}{2}}$$

## 25.30 INVERSE FUNCTIONS

If  $\sin \theta = \frac{1}{2}$  then  $\theta = \sin^{-1}\left(\frac{1}{2}\right)$ , so here  $\theta$  is called inverse sine of  $\frac{1}{2}$ .

Similarly, we can define inverse hyperbolic function  $\sinh$ ,  $\cosh$ ,  $\tanh$ , etc. If  $\cosh \theta = z$  then  $\theta = \cosh^{-1} z$ .

## 25.31 INVERSE HYPERBOLIC FUNCTIONS

**Example 60.** Prove that  $\sinh^{-1} x = \log(x + \sqrt{x^2 + 1})$

(M.U. 2009)

**Solution.** Let  $\sinh^{-1} x = y \Rightarrow x = \sinh y$

$$x = \frac{e^y - e^{-y}}{2}$$

$$\Rightarrow e^y - e^{-y} = 2x$$

$$\Rightarrow e^{2y} - 2x e^y - 1 = 0$$

This is quadratic in  $e^y$

$$e^y = \frac{2x \pm \sqrt{4x^2 + 4}}{2} = x \pm \sqrt{x^2 + 1}$$

$$y = \log(x + \sqrt{x^2 + 1})$$

(Taking positive sign only)

$$\sinh^{-1} x = \log(x + \sqrt{x^2 + 1})$$

**Proved.**

**Example 61.** Prove that  $\cosh^{-1} x = \log(x + \sqrt{x^2 - 1})$

(M.U. 2009)

**Solution.** Let  $y = \cosh^{-1} x \Rightarrow x = \cosh y$

$$x = \frac{e^y + e^{-y}}{2} \Rightarrow 2x = e^y + e^{-y}$$

$$\begin{aligned}
 \Rightarrow e^{2y} - 2x e^y + 1 &= 0 && \text{(This is quadratic in } e^y) \\
 \Rightarrow e^y &= \frac{2x \pm \sqrt{4x^2 - 4}}{2} = x \pm \sqrt{x^2 - 1} \\
 \Rightarrow y &= \log(x + \sqrt{x^2 - 1}) && \text{(Taking positive sign only)} \\
 \Rightarrow \cosh^{-1} x &= \log(x + \sqrt{x^2 - 1}) && \text{Proved.}
 \end{aligned}$$

**Example 62.** Prove that  $\tanh^{-1} x = \frac{1}{2} \log \frac{1+x}{1-x}$

**Solution.** Let  $\tanh^{-1} x = y \Rightarrow x = \tanh y$

$$x = \frac{e^y - e^{-y}}{e^y + e^{-y}}$$

Applying componendo and dividendo, we obtain

$$\begin{aligned}
 \frac{1+x}{1-x} &= \frac{e^y}{e^{-y}} = e^{2y}, \quad 2y = \log \frac{1+x}{1-x} \\
 \Rightarrow \tanh^{-1} x &= \frac{1}{2} \log \frac{1+x}{1-x}. \\
 \text{Similarly, } \coth^{-1} x &= \frac{1}{2} \log \frac{x+1}{x-1} && \text{Proved.}
 \end{aligned}$$

**Example 63.** Prove that  $\operatorname{sech}^{-1} x = \log \frac{1+\sqrt{1-x^2}}{x}$

$$\begin{aligned}
 \text{Solution. Let } y &= \operatorname{sech}^{-1} x \Rightarrow x = \operatorname{sech} y \\
 x &= \frac{2}{e^y + e^{-y}} \Rightarrow x = \frac{2e^y}{e^{2y} + 1} \\
 \Rightarrow xe^{2y} - 2e^y + x &= 0 \Rightarrow e^y = \frac{2 \pm \sqrt{4 - 4x^2}}{2x} = \frac{1 \pm \sqrt{1 - x^2}}{x}
 \end{aligned}$$

We take only positive sign

$$\begin{aligned}
 e^y &= \frac{1 + \sqrt{1 - x^2}}{x} \Rightarrow y = \log \frac{1 + \sqrt{1 - x^2}}{x} \\
 \operatorname{sech}^{-1} x &= \log \frac{1 + \sqrt{1 - x^2}}{x}
 \end{aligned}$$

$$\text{Similarly, } \operatorname{cosech}^{-1} x = \log \frac{1 + \sqrt{1 + x^2}}{x} && \text{Proved.}$$

**Example 64.** If  $x + iy = \cos(\alpha + i\beta)$  or if  $\cos^{-1}(x + iy) = \alpha + i\beta$  express  $x$  and  $y$  in terms of  $\alpha$  and  $\beta$ . Hence show that  $\cos^2 \alpha$  and  $\cosh^2 \beta$  are the roots of the equation  $\lambda^2 - (x^2 + y^2 + 1)\lambda + x^2 = 0$ . (M.U. 2002, 2004)

**Solution.** Here, we have

$$\begin{aligned}
 \cos(\alpha + i\beta) &= x + iy \\
 \Rightarrow \cos \alpha \cos i\beta - \sin \alpha \sin i\beta &= x + iy \\
 \Rightarrow \cos \alpha \cosh \beta - i \sin \alpha \sinh \beta &= x + iy
 \end{aligned}$$

Equating real and imaginary parts, we get

$$\cos \alpha \cosh \beta = x \text{ and } \sin \alpha \sinh \beta = -y$$

We want to find the equation whose roots are  $\cos^2 \alpha$  and  $\cosh^2 \beta$ .

$$\begin{aligned}
 \text{Now, } x^2 + y^2 + 1 &= \cos^2 \alpha \cos^2 \beta + \sin^2 \alpha \sinh^2 \beta + 1 \\
 &= \cos^2 \alpha \cosh^2 \beta + (1 - \cos^2 \alpha)(\cosh^2 \beta - 1) + 1
 \end{aligned}$$

$$= \cos^2 \alpha \cosh^2 \beta + \cosh^2 \beta - 1 - \cos^2 \alpha \cosh^2 \beta + \cos^2 \alpha + 1$$

$$= \cos^2 \alpha + \cosh^2 \beta$$

$$\text{Sum of the roots} = \cos^2 \alpha + \cosh^2 \beta$$

$$= x^2 + y^2 + 1$$

$$\text{And product of the roots} = \cos^2 \alpha \cosh^2 \beta$$

$$= x^2$$

Hence, the equation whose roots are  $\cos^2 \alpha, \cosh^2 \beta$  is  
 $\lambda^2 - (x^2 + y^2 + 1) \lambda + x^2 = 0$

**Proved.**

**Example 65.** Separate into real and imaginary part  $\cos^{-1} \left( \frac{3i}{4} \right)$  (M.U. 2003)

**Solution.** Let  $\cos^{-1} \left( \frac{3i}{4} \right) = x + iy$

$$\Rightarrow \frac{3i}{4} = \cos(x + iy)$$

$$\Rightarrow \frac{3i}{4} = \cos x \cosh y - i \sin x \sinh y$$

Equating real and imaginary parts, we get

$$\therefore \cos x \cosh y = 0 \Rightarrow \cos x = 0 \Rightarrow x = \frac{\pi}{2}$$

$$\text{and } -\sin x \sinh y = \frac{3}{4}$$

$$-\sin x \sinh y = \frac{3}{4} \quad \sin x = \sin \left( \frac{\pi}{2} \right) = 1$$

$$\therefore \sinh y = -\frac{3}{4}$$

$$\Rightarrow y = \log \left( \frac{-3}{4} + \sqrt{1 + \frac{9}{16}} \right) \Rightarrow y = \log \left( \frac{-3}{4} + \frac{5}{4} \right) = -\log 2 = \log \left( \frac{1}{2} \right)$$

$$\therefore \text{Real part} = \frac{\pi}{2} \text{ and imaginary Part} = -\log 2$$

**Proved.**

### 25.32 SOME OTHER INVERSE FUNCTIONS

**Example 66.** Separate  $\tan^{-1} (\cos \theta + i \sin \theta)$  into real and imaginary parts. (M.U. 2009)

**Solution.** Let  $\tan^{-1} (\cos \theta + i \sin \theta) = x + iy$

$$\Rightarrow \cos \theta + i \sin \theta = \tan(x + iy)$$

$$\text{Similarly, } \cos \theta - i \sin \theta = \tan(x - iy)$$

$$\tan 2x = \tan [(x + iy) + (x - iy)] = \frac{\tan(x + iy) + \tan(x - iy)}{1 - \tan(x + iy) \tan(x - iy)}$$

$$= \frac{(\cos \theta + i \sin \theta) + (\cos \theta - i \sin \theta)}{1 - (\cos \theta + i \sin \theta)(\cos \theta - i \sin \theta)} = \frac{2 \cos \theta}{1 - (\cos^2 \theta + \sin^2 \theta)}$$

$$= \frac{2 \cos \theta}{1 - 1} = \frac{2 \cos \theta}{0} = \infty = \tan \frac{\pi}{2}$$

$$\tan 2x = \tan \left( n\pi + \frac{\pi}{2} \right) \Rightarrow 2x = n\pi + \frac{\pi}{2} \Rightarrow x = \frac{n\pi}{2} + \frac{\pi}{4}$$

$$\text{Now, } \tan 2iy = \tan [(x + iy) - (x - iy)] = \frac{\tan(x + iy) - \tan(x - iy)}{1 + \tan(x + iy) \tan(x - iy)}$$

$$= \frac{(\cos \theta + i \sin \theta) - (\cos \theta - i \sin \theta)}{1 + (\cos \theta + i \sin \theta)(\cos \theta - i \sin \theta)} = \frac{2i \sin \theta}{1 + (\cos^2 \theta + \sin^2 \theta)} = \frac{2i \sin \theta}{1+1} = i \sin \theta$$

$$i \tanh 2y = i \sin \theta \Rightarrow \frac{e^{2y} - e^{-2y}}{e^{2y} + e^{-2y}} = \frac{\sin \theta}{1}$$

By componendo and dividendo, we have

$$\begin{aligned} \frac{2e^{2y}}{2e^{-2y}} = \frac{1 + \sin \theta}{1 - \sin \theta} \Rightarrow e^{4y} &= \frac{1 + \cos\left(\frac{\pi}{2} - \theta\right)}{1 - \cos\left(\frac{\pi}{2} - \theta\right)} = \frac{1 + 2 \cos^2\left(\frac{\pi}{4} - \frac{\theta}{2}\right) - 1}{1 - \left[1 - 2 \sin^2\left(\frac{\pi}{4} - \frac{\theta}{2}\right)\right]} \\ &= \frac{\cos^2\left(\frac{\pi}{4} - \frac{\theta}{2}\right)}{\sin^2\left(\frac{\pi}{4} - \frac{\theta}{2}\right)} = \cot^2\left(\frac{\pi}{4} - \frac{\theta}{2}\right) \Rightarrow e^{2y} = \cot\left(\frac{\pi}{4} - \frac{\theta}{2}\right) \\ \Rightarrow 2y &= \log \cot\left(\frac{\pi}{4} - \frac{\theta}{2}\right) \Rightarrow y = \frac{1}{2} \log \cot\left(\frac{\pi}{4} - \frac{\theta}{2}\right) \end{aligned}$$

$$\text{Imaginary part} = \frac{1}{2} \log \cot\left(\frac{\pi}{4} - \frac{\theta}{2}\right)$$

$$\text{Real part} = \frac{n\pi}{2} + \frac{\pi}{4}$$

$$\tan^{-1}(\cos \theta + i \sin \theta) = \frac{n\pi}{2} + \frac{\pi}{4} + \frac{i}{2} \log \cot\left(\frac{\pi}{4} - \frac{\theta}{2}\right)$$

**Ans.**

**Example 67.** Separate  $\sin^{-1}(\alpha + i\beta)$  into real and imaginary parts.

**Solution.** Let  $\sin^{-1}(\alpha + i\beta) = x + iy$

$$\alpha + i\beta = \sin(x + iy)$$

$$\Rightarrow \alpha + i\beta = \sin x \cos iy + \cos x \sin iy = \sin x \cosh y + i \cos x \sinh y$$

Equating real and imaginary parts, we have

$$\alpha = \sin x \cosh y \quad \dots(1)$$

$$\text{and} \quad \beta = \cos x \sinh y \quad \dots(2)$$

We know that  $\cosh^2 y - \sinh^2 y = 1$

$$\left(\frac{\alpha}{\sin x}\right)^2 - \left(\frac{\beta}{\cos x}\right)^2 = 1$$

$$\begin{cases} \cosh y = \frac{\alpha}{\sin x} \\ \sinh y = \frac{\beta}{\cos x} \end{cases}$$

$$\Rightarrow \alpha^2 \cos^2 x - \beta^2 \sin^2 x = \sin^2 x \cos^2 x$$

$$\Rightarrow \alpha^2 (1 - \sin^2 x) - \beta^2 \sin^2 x = \sin^2 x (1 - \sin^2 x)$$

$$\Rightarrow \sin^4 x - (\alpha^2 + \beta^2 + 1) \sin^2 x + \alpha^2 = 0$$

This is quadratic equation in  $\sin^2 x$ .

$$\sin^2 x = \frac{(\alpha^2 + \beta^2 + 1) \pm \sqrt{(\alpha^2 + \beta^2 + 1)^2 - 4\alpha^2}}{2}$$

$$\Rightarrow \sin x = \sqrt{\frac{1}{2} \left[ (\alpha^2 + \beta^2 + 1) \pm \sqrt{(\alpha^2 + \beta^2 + 1)^2 - 4\alpha^2} \right]}$$

$$\Rightarrow x = \sin^{-1} \sqrt{\frac{1}{2} \left[ (\alpha^2 + \beta^2 + 1) \pm \sqrt{(\alpha^2 + \beta^2 + 1)^2 - 4\alpha^2} \right]}$$

We know that  $\sin^2 x + \cos^2 x = 1$

$$\Rightarrow \left( \frac{\alpha}{\cosh y} \right)^2 + \left( \frac{\beta}{\sinh y} \right)^2 = 1 \quad \left[ \begin{array}{l} \text{From (1) and (2)} \\ \sin x = \frac{\alpha}{\cosh y} \\ \cos x = \frac{\beta}{\sinh y} \end{array} \right]$$

$$\Rightarrow \alpha^2 \sinh^2 y + \beta^2 \cosh^2 y = \sinh^2 y \cosh^2 y$$

$$\Rightarrow \alpha^2 \sinh^2 y + \beta^2 (1 + \sinh^2 y) = \sinh^2 y (1 + \sinh^2 y)$$

$$\Rightarrow \sinh^4 y - (\alpha^2 + \beta^2 - 1) \sinh^2 y - \beta^2 = 0$$

This is quadratic equation in  $\sinh^2 y$ .

$$\sinh^2 y = \frac{(\alpha^2 + \beta^2 - 1) \pm \sqrt{(\alpha^2 + \beta^2 - 1)^2 + 4\beta^2}}{2}$$

$$\Rightarrow \sinh y = \sqrt{\frac{1}{2} \left[ (\alpha^2 + \beta^2 - 1) \pm \sqrt{(\alpha^2 + \beta^2 - 1)^2 + 4\beta^2} \right]}$$

$$\Rightarrow y = \sinh^{-1} \sqrt{\frac{1}{2} \left[ (\alpha^2 + \beta^2 - 1) \pm \sqrt{(\alpha^2 + \beta^2 - 1)^2 + 4\beta^2} \right]}$$

$$\text{Real part} = \sin^{-1} \sqrt{\frac{1}{2} \left[ (\alpha^2 + \beta^2 + 1) \pm \sqrt{(\alpha^2 + \beta^2 + 1)^2 - 4\alpha^2} \right]}$$

$$\text{Imaginary part} = \sinh^{-1} \sqrt{\frac{1}{2} \left[ (\alpha^2 + \beta^2 - 1) \pm \sqrt{(\alpha^2 + \beta^2 - 1)^2 + 4\beta^2} \right]}$$

**Ans.**

**Example 68.** Separate  $\tan^{-1}(a + i b)$  into real and imaginary parts.

(Nagpur University, Summer 2008, 2004)

**Solution.** Let  $\tan^{-1}(a + i b) = x + i y \quad \dots(1)$

$$\therefore \tan(x + i y) = a + i b$$

On both sides for  $i$  write  $-i$  we get,

$$\therefore \tan(x - i y) = a - i b$$

Now,

$$\tan 2x = \tan[(x + i y) + (x - i y)]$$

$$= \frac{\tan(x + i y) + \tan(x - i y)}{1 - \tan(x + i y) \tan(x - i y)} = \frac{a + i b + a - i b}{1 - (a + i b)(a - i b)} = \frac{2a}{1 - a^2 - b^2}$$

$$2x = \tan^{-1} \left[ \frac{2a}{1 - a^2 - b^2} \right] \Rightarrow x = \frac{1}{2} \tan^{-1} \left[ \frac{2a}{1 - a^2 - b^2} \right] \quad \dots(2)$$

and

$$\tan(2y) = \tan[(x + i y) - (x - i y)]$$

$$= \frac{\tan(x + i y) - \tan(x - i y)}{1 + \tan(x + i y) \tan(x - i y)} = \frac{a + bi - a + bi}{1 + (a + bi)(a - bi)}$$

$$i \tanh 2y = \frac{2bi}{1 + a^2 + b^2} \text{ so, } \tanh 2y = \frac{2b}{1 + a^2 + b^2}$$

$$2y = \tanh^{-1} \left[ \frac{2b}{1 + a^2 + b^2} \right]$$

$$\text{so } y = \frac{1}{2} \tanh^{-1} \left[ \frac{2b}{1 + a^2 + b^2} \right] \quad \dots(3)$$

From (1), (2) and (3), we have

$$\tan^{-1}(a+ib) = \frac{1}{2} \tan^{-1} \left[ \frac{2a}{1-a^2-b^2} \right] + \frac{i}{2} \tanh^{-1} \left[ \frac{2b}{1+a^2+b^2} \right] \quad \text{Ans.}$$

**Example 69.** Show that  $\tan^{-1} i \left( \frac{x-a}{x+a} \right) = \frac{i}{2} \log \left( \frac{x}{a} \right)$ . (M.U. 2006, 2002)

**Solution.** Let  $\tan^{-1} i \left( \frac{x-a}{x+a} \right) = u + i v \quad \dots(1)$

$$\begin{aligned} \Rightarrow \quad \tan(u+iv) &= i \left( \frac{x-a}{x+a} \right) \text{ and } \tan(u-iv) = -i \left( \frac{x-a}{x+a} \right) \\ \tan 2u &= \tan [(u+iv) + (u-iv)] = \frac{\tan(u+iv) + \tan(u-iv)}{1 - \tan(u+iv)\tan(u-iv)} \\ &= \frac{ix - ia - ix + ia}{x+a} = 0 \end{aligned}$$

$$\therefore \tan 2u = 0 \Rightarrow 2u = 0 \Rightarrow u = 0$$

Putting the value of  $u$  in (1), we get

$$\therefore \tan^{-1} i \left( \frac{x-a}{x+a} \right) = i v \quad \therefore i \left( \frac{x-a}{x+a} \right) = \tan i v = i \tanh v$$

$$\therefore \frac{x-a}{x+a} = \tanh v = \frac{e^v - e^{-v}}{e^v + e^{-v}}$$

By Componendo and dividendo, we get

$$\begin{aligned} \frac{2x}{2a} &= \frac{2e^v}{2e^{-v}} \quad \Rightarrow \quad \frac{x}{a} = e^{2v} \quad \Rightarrow \quad v = \frac{1}{2} \log \left( \frac{x}{a} \right) \\ \therefore \tan^{-1} i \left( \frac{x-a}{x+a} \right) &= u + iv = 0 + \frac{i}{2} \log \frac{x}{a} = \frac{i}{2} \log \left( \frac{x}{a} \right) \quad \text{Proved.} \end{aligned}$$

**Example 70.** Prove that

$$(i) \quad \cosh^{-1} \sqrt{1+x^2} = \sinh^{-1} x \quad (\text{M.U. 2007})$$

$$(ii) \quad \cosh^{-1} \sqrt{1+x^2} = \tanh^{-1} \left( \frac{x}{\sqrt{1+x^2}} \right) \quad (\text{M.U. 2002})$$

**Solution.** (i) Let  $\cosh^{-1} \sqrt{1+x^2} = y \quad \dots(1)$

$$\Rightarrow \sqrt{1+x^2} = \cosh y \quad \dots(2)$$

On squaring both sides, we get

$$\begin{aligned} 1+x^2 &= \cosh^2 y \\ \therefore x^2 &= \cosh^2 y - 1 \\ \Rightarrow x^2 &= \sinh^2 y \\ \Rightarrow x &= \sinh y \\ \Rightarrow y &= \sinh^{-1} x \end{aligned} \quad \dots(3)$$

$$\Rightarrow \cosh^{-1} \sqrt{1+x^2} = \sinh^{-1} x \quad [\text{Using (1)}] \quad \text{Proved.}$$

(ii) Dividing (3) by (2), we get

$$\frac{\sinh y}{\cosh y} = \frac{x}{\sqrt{1+x^2}}$$

$$\Rightarrow \tanh y = \frac{x}{\sqrt{1+x^2}} \Rightarrow y = \tanh^{-1} \left( \frac{x}{\sqrt{1+x^2}} \right)$$

$$\Rightarrow \cosh^{-1} \sqrt{1+x^2} = \tanh^{-1} \left( \frac{x}{\sqrt{1+x^2}} \right) \quad [\text{Using (1)}]$$

**Proved.**

**EXERCISE 25.11**

1. Prove that  $\sin^{-1} (\operatorname{cosec} \theta) = \frac{\pi}{2} + i \log \cot \frac{\theta}{2}$ .
2. If  $\tan(\alpha + i\beta) = x + iy$ , prove that
  - (a)  $x^2 + y^2 + 2x \cot 2\alpha = 1$
  - (b)  $x^2 + y^2 - 2y \coth 2\beta = -1$ .
3. If  $\tan(\theta + i\phi) = \sin(x + iy)$ , then prove that  $\coth y \sinh 2\phi = \cot x \sin 2\theta$ .
4. If  $\sin^{-1} (\cos \theta + i \sin \theta) = x + iy$ , show that.
  - (a)  $x = \cos^{-1} \sqrt{\sin \theta}$
  - (b)  $y = \log [\sqrt{\sin \theta} + \sqrt{1 + \sin \theta}]$ .
5. Separate into real and imaginary parts  $\sin^{-1}(e^{i\theta})$

$$\text{Ans. } \cos^{-1} \sqrt{\sin \theta} + i \log [\sqrt{\sin \theta} + \sqrt{1 + \sin \theta}]$$

6. Prove that
 
$$\tan^{-1} \left( \frac{\tan 2\theta + \tan 2\phi}{\tan 2\theta - \tan 2\phi} \right) + \tan^{-1} \left( \frac{\tan \theta - \tan \phi}{\tan \theta + \tan \phi} \right) = \tan^{-1} (\cot \theta \coth \phi)$$
7. Prove that  $\tanh^{-1} x = \sinh^{-1} \frac{x}{\sqrt{1-x^2}}$ .
8. Prove that  $\tanh^{-1} (\sin \theta) = \cosh^{-1} (\sec \theta)$
9. Prove that
 
$$\cosh^{-1} \left( \frac{b+a \cos x}{a+b \cos x} \right) = \log \left[ \frac{\sqrt{b+a} + \sqrt{b-a} \tan \frac{x}{2}}{\sqrt{b+a} - \sqrt{b-a} \tan \frac{x}{a}} \right]$$
10. Prove that  $\tan^{-1}(e^{i\theta}) = \frac{n\pi}{2} + \frac{\pi}{4} = \log \tan \left( \frac{\pi}{4} - \frac{\theta}{2} \right)$
11. If  $\cosh^{-1}(x+iy) + \cosh^{-1}(x-iy) = \cosh^{-1} a$ , prove that  
 $2(a-1)x^2 + 2(a+1)y^2 = a^2 - 1$ .
12. Prove that :  $\tanh^{-1} \cos \theta = \cosh^{-1} \operatorname{cosec} \theta$
13. Prove that :  $\sinh^{-1} \tan \theta = \log (\sec \theta + \tan \theta)$
14. Prove that :  $\sinh^{-1} \tan \theta = \log \tan \left( \frac{\theta}{2} + \frac{\pi}{4} \right)$

**Separate into real and imaginary parts**

15.  $\cos^{-1} e^{i\theta}$  or  $\cos^{-1} (\cos \theta + i \sin \theta)$
16. If  $\sinh^{-1}(x+iy) + \sinh^{-1}(x-iy) = \sinh^{-1} a$ , prove that  
 $2(x^2 + y^2) \sqrt{a^2 + 1} = a^2 - 2x^2 - 2y^2$ .

$$\text{Ans. } \sin^{-1} \sqrt{\sin \theta} + i \log (\sqrt{1 + \sin \theta} - \sqrt{\sin \theta})$$

## EXPANSION OF TRIGONOMETRIC FUNCTIONS

---

### 26.1 EXPANSION OF $\sin n\theta$ , $\cos n\theta$ IN POWERS OF $\sin \theta$ , $\cos \theta$

By De-Moivre's theorem, we know that

$$\begin{aligned}
 \cos n\theta + i \sin n\theta &= (\cos \theta + i \sin \theta)^n. && \text{(Binomial Theorem)} \\
 &= {}^nC_0 (\cos \theta)^n + {}^nC_1 (\cos \theta)^{n-1} (i \sin \theta) + {}^nC_2 (\cos \theta)^{n-2} (i \sin \theta)^2 \\
 &\quad + {}^nC_3 (\cos \theta)^{n-3} (i \sin \theta)^3 + {}^nC_4 (\cos \theta)^{n-4} (i \sin \theta)^4 \\
 &\quad + {}^nC_5 (\cos \theta)^{n-5} (i \sin \theta)^5 + {}^nC_6 (\cos \theta)^{n-6} (i \sin \theta)^6 \\
 &\quad + {}^nC_7 (\cos \theta)^{n-7} (i \sin \theta)^7 + \dots + {}^nC_n (\cos \theta)^{n-n} (i \sin \theta)^n \\
 &= \cos^n \theta + i {}^nC_1 \cos^{n-1} \theta \sin \theta - {}^nC_2 \cos^{n-2} \theta \sin^2 \theta \\
 &\quad - i {}^nC_3 \cos^{n-3} \theta \sin^3 \theta + {}^nC_4 \cos^{n-4} \theta \sin^4 \theta + i {}^nC_5 \cos^{n-5} \theta \sin^5 \theta \\
 &\quad - {}^nC_6 \cos^{n-6} \theta \sin^6 \theta - i {}^nC_7 \cos^{n-7} \theta \sin^7 \theta + \dots + (i \sin \theta)^n \\
 &= \cos^n \theta - {}^nC_2 \cos^{n-2} \theta \sin^2 \theta + {}^nC_4 \cos^{n-4} \theta \sin^4 \theta \\
 &\quad - {}^nC_6 \cos^{n-6} \theta \sin^6 \theta + \dots + i [{}^nC_1 \cos^{n-1} \theta \sin \theta \\
 &\quad - {}^nC_3 \cos^{n-3} \theta \sin^3 \theta + {}^nC_5 \cos^{n-5} \theta \sin^5 \theta - {}^nC_7 \cos^{n-7} \theta \sin^7 \theta \dots]
 \end{aligned}$$

Equating real and imaginary parts, we get

$$\cos n\theta = \cos^n \theta - {}^nC_2 \cos^{n-2} \theta \sin^2 \theta + {}^nC_4 \cos^{n-4} \theta \sin^4 \theta + \dots \quad \dots(1)$$

$$\sin n\theta = {}^nC_1 \cos^{n-1} \theta \sin \theta - {}^nC_3 \cos^{n-3} \theta \sin^3 \theta + {}^nC_5 \cos^{n-5} \theta \sin^5 \theta + \dots \quad \dots(2)$$

Replacing every  $\sin^2 \theta$  by  $(1 - \cos^2 \theta)$  in (1) and every  $\cos^2 \theta$  by  $(1 - \sin^2 \theta)$  in (2), we get the expansions of  $\cos n\theta$  in powers of  $\cos \theta$  and  $\sin n\theta$  in powers of  $\sin \theta$ .

Dividing (2) by (1), we get

$$\frac{\sin n\theta}{\cos n\theta} = \frac{{}^nC_1 \cos^{n-1} \theta \sin \theta - {}^nC_3 \cos^{n-3} \theta \sin^3 \theta + {}^nC_5 \cos^{n-5} \theta \sin^5 \theta \dots}{\cos^n \theta - {}^nC_2 \cos^{n-2} \theta \sin^2 \theta + {}^nC_4 \cos^{n-4} \theta \sin^4 \theta \dots}$$

and dividing numerator and denominator by  $\cos^n \theta$ , we get

$$\tan n\theta = \frac{{}^nC_1 \tan \theta - {}^nC_3 \tan^3 \theta + {}^nC_5 \tan^5 \theta \dots}{1 - {}^nC_2 \tan^2 \theta + {}^nC_4 \tan^4 \theta \dots}$$

**Example 1.** Expand  $\cos 6\theta$  and  $\sin 6\theta$  in terms of  $\cos \theta$  and  $\sin \theta$ .

**Solution.**  $\cos 6\theta + i \sin 6\theta = (\cos \theta + i \sin \theta)^6$

Expansion by Binomial theorem

$$\begin{aligned}\cos 6\theta + i \sin 6\theta &= \cos^6\theta + {}^6C_1 \cos^5\theta (i \sin\theta) + {}^6C_2 \cos^4\theta (i \sin\theta)^2 \\ &\quad + {}^6C_3 \cos^3\theta (i \sin\theta)^3 + {}^6C_4 \cos^2\theta (i \sin\theta)^4 + {}^6C_5 \cos\theta (i \sin\theta)^5 + {}^6C_6 (i \sin\theta)^6 \\ &= \cos^6\theta + i 6 \cos^5\theta \sin\theta - 15 \cos^4\theta \sin^2\theta - i 20 \cos^3\theta \sin^3\theta + 15 \cos^2\theta \sin^4\theta \\ &\quad + i 6 \cos\theta \sin^5\theta - \sin^6\theta\end{aligned}$$

Equating real and imaginary parts, we have

$$\begin{aligned}\cos 6\theta &= \cos^6\theta - 15 \cos^4\theta \sin^2\theta + 15 \cos^2\theta \sin^4\theta - \sin^6\theta \\ \sin 6\theta &= 6 \cos^5\theta \sin\theta - 20 \cos^3\theta \sin^3\theta + 6 \cos\theta \sin^5\theta\end{aligned}$$

**Ans.**

**Example 2.** Prove that  $\sin 7\theta = 7 \sin\theta - 56 \sin^3\theta + 112 \sin^5\theta - 64 \sin^7\theta$ .

**Solution.**  $\cos 7\theta + i \sin 7\theta = (\cos\theta + i \sin\theta)^7$

$$\begin{aligned}&= \cos^7\theta + {}^7C_1 \cos^6\theta (i \sin\theta) + {}^7C_2 \cos^5\theta (i \sin\theta)^2 + {}^7C_3 \cos^4\theta (i \sin\theta)^3 + \\ &\quad {}^7C_4 \cos^3\theta (i \sin\theta)^4 + {}^7C_5 \cos^2\theta (i \sin\theta)^5 + {}^7C_6 \cos\theta (i \sin\theta)^6 + {}^7C_7 (i \sin\theta)^7\end{aligned}$$

Equating imaginary parts, we get

$$\begin{aligned}\sin 7\theta &= 7 \cos^6\theta \sin\theta - 35 \cos^4\theta \sin^3\theta + 21 \cos^2\theta \sin^5\theta - \sin^7\theta \\ &= 7(1 - \sin^2\theta)^3 \sin\theta - 35(1 - \sin^2\theta)^2 \sin^3\theta + 21(1 - \sin^2\theta) \sin^5\theta - \sin^7\theta \\ &= 7(1 - 3 \sin^2\theta + 3 \sin^4\theta - \sin^6\theta) \sin\theta - 35(1 - 2 \sin^2\theta + \sin^4\theta) \sin^3\theta \\ &\quad + 21 \sin^5\theta - 21 \sin^7\theta - \sin^7\theta \\ &= 7 \sin\theta - 21 \sin^3\theta + 21 \sin^5\theta - 7 \sin^7\theta - 35 \sin^3\theta \\ &\quad + 70 \sin^5\theta - 35 \sin^7\theta + 21 \sin^5\theta - 22 \sin^7\theta \\ &= 7 \sin\theta - 56 \sin^3\theta + 112 \sin^5\theta - 64 \sin^7\theta.\end{aligned}$$

**Proved.**

**Example 3.** Expand  $\tan 9\theta$  in powers of  $\tan\theta$ .

**Solution.** We know,

$$\begin{aligned}\tan n\theta &= \frac{{}^nC_1 \tan\theta - {}^nC_3 \tan^3\theta + {}^nC_5 \tan^5\theta + \dots}{1 - {}^nC_2 \tan^2\theta + {}^nC_4 \tan^4\theta - {}^nC_6 \tan^6\theta + \dots} \\ \tan 9\theta &= \frac{{}^9C_1 \tan\theta - {}^9C_3 \tan^3\theta + {}^9C_5 \tan^5\theta - {}^9C_7 \tan^7\theta + \tan^9\theta}{1 - {}^9C_2 \tan^2\theta + {}^9C_4 \tan^4\theta - {}^9C_6 \tan^6\theta + {}^9C_8 \tan^8\theta} \\ &= \frac{9 \tan\theta - 84 \tan^3\theta + 126 \tan^5\theta - 36 \tan^7\theta + \tan^9\theta}{1 - 36 \tan^2\theta + 126 \tan^4\theta - 84 \tan^6\theta + 9 \tan^8\theta}\end{aligned}$$

**Ans.**

## EXERCISE 26.1

Prove that

1.  $\cos 4\theta = \cos^4\theta - 6 \cos^2\theta \sin^2\theta + \sin^4\theta$ .
2.  $\sin 4\theta = 4 \cos^3\theta \sin\theta - 4 \cos\theta \sin^3\theta$ .
3.  $\frac{\sin 6\theta}{\cos\theta} = 32 \sin^5\theta - 32 \sin^3\theta + 6 \sin\theta$ .
4.  $\sin 7\theta = 7 \cos^6\theta \sin\theta - 35 \cos^4\theta \sin^3\theta + 21 \cos^2\theta \sin^5\theta - \sin^7\theta$ .
5.  $\frac{\sin 7\theta}{\sin\theta} = 7 - 56 \sin^2\theta + 112 \sin^4\theta - 64 \sin^6\theta$ .
6.  $\cos 8\theta = \cos^8\theta - 28 \cos^6\theta \sin^2\theta + 70 \cos^4\theta \sin^4\theta - 28 \cos^2\theta \sin^6\theta + \sin^8\theta$ .

7.  $\sin 10\theta = 10 \cos^9 \theta \sin \theta - 120 \cos^7 \theta \sin^3 \theta + 210 \cos^5 \theta \sin^5 \theta - 120 \cos^3 \theta \sin^7 \theta + 10 \cos \theta \sin^9 \theta$
8.  $1 + \cos 10\theta = 2(16 \cos^5 \theta - 20 \cos^3 \theta + 5 \cos \theta)^2$ .
9.  $1 - \cos 10\theta = 2(16 \sin^5 \theta - 20 \sin^3 \theta + 5 \sin \theta)^2$
10.  $\tan 5\theta = \frac{5 \tan \theta - 10 \tan^3 \theta + \tan^5 \theta}{1 - 10 \tan^2 \theta + 5 \tan^4 \theta}$

## 26.2 EXPANSION OF $\cos^n \theta \sin^n \theta$ IN TERMS OF SINES AND COSINES OF MULTIPLES OF $\theta$

Method :

Let  $x = \cos \theta + i \sin \theta$ , then  $\frac{1}{x} = \cos \theta - i \sin \theta$

$$x + \frac{1}{x} = 2 \cos \theta \text{ and } x - \frac{1}{x} = 2i \sin \theta$$

Again  $x^n = \cos n\theta + i \sin n\theta$ , and

$$\frac{1}{x^n} = \cos n\theta - i \sin n\theta$$

$$x^n + \frac{1}{x^n} = 2 \cos n\theta \text{ and } x^n - \frac{1}{x^n} = 2i \sin n\theta$$

To expand  $\cos^n \theta$  : Start from  $(2 \cos \theta)^n = \left(x + \frac{1}{x}\right)^n$

Expand R.H.S. and substitute the values of  $\left(x + \frac{1}{x}\right)$ ,  $\left(x^2 + \frac{1}{x^2}\right)$  etc.

To expand  $\sin^n \theta$  : Start from  $(2i \sin \theta)^n = \left(x - \frac{1}{x}\right)^n$

Expand R.H.S. and substitute the values of  $\left(x - \frac{1}{x}\right)$ ,  $\left(x^2 - \frac{1}{x^2}\right)$  etc.

**Example 4.** Express  $\sin^5 \theta$  in terms of sines of multiples of  $\theta$ .

**Solution.**  $(2i \sin \theta)^5 = \left(x - \frac{1}{x}\right)^5$   $\begin{bmatrix} x = \cos \theta + i \sin \theta \\ \frac{1}{x} = \cos \theta - i \sin \theta \end{bmatrix}$

$$\begin{aligned} i 32 \sin^5 \theta &= x^5 + 5x^4 \left(-\frac{1}{x}\right) + 10x^3 \left(-\frac{1}{x}\right)^2 + 10x^2 \left(-\frac{1}{x}\right)^3 + 5x \left(-\frac{1}{x}\right)^4 + \left(-\frac{1}{x}\right)^5 \\ &= \left(x^5 - \frac{1}{x^5}\right) - 5\left(x^3 - \frac{1}{x^3}\right) + 10\left(x - \frac{1}{x}\right) \end{aligned}$$

$$= 2i \sin 5\theta - 5(2i \sin 3\theta) + 10(2i \sin \theta)$$

$$16 \sin^5 \theta = \sin 5\theta - 5 \sin 3\theta + 10 \sin \theta$$

$$\sin^5 \theta = \frac{1}{16} (\sin 5\theta - 5 \sin 3\theta + 10 \sin \theta)$$

**Ans.**

**Example 5.** Prove that

$$\begin{aligned} -2^{12} \cos^6 \theta \sin^7 \theta &= \sin 13\theta - \sin 11\theta - 6 \sin 9\theta + 6 \sin 7\theta \\ &\quad + 15 \sin 5\theta - 15 \sin 3\theta - 20 \sin \theta \end{aligned}$$

**Solution.**  $x^n = (\cos \theta + i \sin \theta)^n = \cos n\theta + i \sin n\theta$

$\begin{bmatrix} x = \cos \theta + i \sin \theta \\ \frac{1}{x} = \cos \theta - i \sin \theta \end{bmatrix}$

$$\frac{1}{x^n} = (\cos \theta + i \sin \theta)^{-n} = \cos n \theta - i \sin n \theta$$

$$x^n + \frac{1}{x^n} = 2 \cos n \theta \text{ and } x^n - \frac{1}{x^n} = 2 i \sin n \theta$$

$$\left[ \begin{array}{l} x + \frac{1}{x} = 2 \cos \theta \\ x - \frac{1}{x} = 2 i \sin \theta \end{array} \right]$$

$$(2 \cos \theta)^6 (2 i \sin \theta)^7 = \left( x + \frac{1}{x} \right)^6 \left( x - \frac{1}{x} \right)^7 = \left( x^2 - \frac{1}{x^2} \right)^6 \left( x - \frac{1}{x} \right)$$

$$= \left[ x^{12} + 6x^{10} \left( -\frac{1}{x^2} \right) + 15x^8 \left( -\frac{1}{x^2} \right)^2 + 20x^6 \left( -\frac{1}{x^2} \right)^3 + \right.$$

$$\quad \quad \quad \left. 15x^4 \left( -\frac{1}{x^2} \right)^4 + 6x^2 \left( -\frac{1}{x^2} \right)^5 + \left( -\frac{1}{x^2} \right)^6 \right] \left( x - \frac{1}{x} \right)$$

$$= \left[ x^{12} - 6x^8 + 15x^4 - 20 + \frac{15}{x^4} - \frac{6}{x^8} + \frac{1}{x^{12}} \right] \left[ x - \frac{1}{x} \right]$$

$$= x^{13} - 6x^9 + 15x^5 - 20x + \frac{15}{x^3} - \frac{6}{x^7} + \frac{1}{x^{11}} - x^{11} + 6x^7 - 15x^3 + \frac{20}{x} - \frac{15}{x^5} + \frac{6}{x^9} - \frac{1}{x^{13}}$$

$$= \left( x^{13} - \frac{1}{x^{13}} \right) - \left( x^{11} - \frac{1}{x^{11}} \right) - 6 \left( x^9 - \frac{1}{x^9} \right) + 6 \left( x^7 - \frac{1}{x^7} \right) +$$

$$\quad \quad \quad 15 \left( x^5 - \frac{1}{x^5} \right) - 15 \left( x^3 - \frac{1}{x^3} \right) - 20 \left( x - \frac{1}{x} \right)$$

$$= 2 i \sin 13 \theta - 2 i \sin 11 \theta - 6 (2 i \sin 9 \theta) + 6 (2 i \sin 7 \theta) +$$

$$\quad \quad \quad 15 (2 i \sin 5 \theta) - 15 (2 i \sin 3 \theta) - 20 (2 i \sin \theta)$$

$$- 2^{12} \cos^6 \theta \sin^7 \theta = \sin 13 \theta - \sin 11 \theta - 6 \sin 9 \theta + 6 \sin 7 \theta + 15 \sin 5 \theta -$$

$$\quad \quad \quad 15 \sin 3 \theta - 20 \sin \theta \quad \text{Proved.}$$

### EXERCISE 26.2

1. Express  $\sin^7 \theta$  as a sum of sines of multiples of  $\theta$ .

$$\text{Ans.} - \frac{1}{64} [\sin 7 \theta - 7 \sin 5 \theta + 12 \sin 3 \theta - 35 \sin \theta]$$

2. Express  $\cos^8 \theta$  as a sum of cosines of multiples of  $\theta$ .

$$\text{Ans.} \frac{1}{128} [\cos 8 \theta + 8 \cos 6 \theta + 28 \cos 4 \theta + 56 \cos 2 \theta + 35]$$

3. Prove that  $2^7 \cos^3 \theta \sin^5 \theta = \sin 8 \theta - 2 \sin 6 \theta - 2 \sin 4 \theta + 6 \sin 2 \theta$ .

4. Prove that  $32 \cos^6 \theta = \cos 6\theta + 6 \cos 4\theta + 15 \cos 2\theta + 10$

5. Prove that  $\sin^8 \theta = 2^{-7} (\cos 8\theta - 8 \cos 6\theta + 28 \cos 4\theta - 56 \cos 2\theta + 35)$

6.  $32 \sin^4 \theta \cos^2 \theta = \cos 6\theta - 2 \cos 4\theta - \cos 2\theta + 2$ .

7.  $\sin^5 \theta \cos^2 \theta = \frac{1}{64} (\sin 7\theta - 3 \sin 5\theta + \sin 3\theta + 5 \sin \theta)$

8. Expand  $\cos^5 \theta \sin^7 \theta$  in a series of sines and of multiples of  $\theta$ .

$$\text{Ans.} -2^{-11} (\sin 12\theta - 2 \sin 10\theta - 4 \sin 8\theta + 10 \sin 6\theta + 5 \sin 4\theta - 20 \sin 2\theta)$$

### 26.3 SUMMATION OF SINES AND COSINES SERIES: 'C + iS' METHOD

Sum of cosines series is denoted by  $C$  and sum of sines series is denoted by  $S$ .

- (i) Suppose we have to find  $C$ , the sum of cosines series. Then write a similar series of sines,  $S$ .
- (ii) Multiply the sines series by  $i$  and add to series of cosines, we will get  $C + iS$  as an exponential series. The sum of exponential series is calculated by using any one of the following series.

$$(a) \text{ Geometric Series : } a + ar + ar^2 + \dots + ar^{n-1} = \frac{a(1-r^n)}{1-r}$$

$$a + ar + ar^2 + \dots \infty = \frac{a}{1-r}$$

$$(b) \text{ Binomial series : } 1 + nx + \frac{n(n-1)}{2!} x^2 + \dots \infty = (1+x)^n$$

$$(c) \text{ Exponential series : } 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \infty = e^x$$

(d)  $\sin, \cos, \sinh$  or  $\cosh$  series :

$$x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \infty = \sin x \quad \text{and}$$

$$1 - \frac{x^2}{2!} + \frac{x^4}{4!} + \dots \infty = \cos x$$

$$x + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots \infty = \sinh x \quad \text{and}$$

$$1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \dots \infty = \cosh x$$

$$(e) \text{ Logarithmic series : } x - \frac{x^2}{2} + \frac{x^3}{3} - \dots \infty = \log(1+x)$$

$$-x - \frac{x^2}{2} - \frac{x^3}{3} - \dots \infty = \log(1-x)$$

$$(f) \text{ Gregory's series : } x - \frac{x^3}{3} + \frac{x^5}{5} - \dots \infty = \tan^{-1} x$$

$$x + \frac{x^3}{3} + \frac{x^5}{5} + \dots \infty = \tanh^{-1} x = \frac{1}{2} \log \frac{1+x}{1-x}$$

**Example 6.** Sum the series

$$\cos \alpha + x \cos(\alpha + \beta) + \frac{x^2}{2!} \cos(\alpha + 2\beta) + \dots \infty \quad (\text{Nagpur University Summer 2005})$$

$$\text{Solution. Let } C = \cos \alpha + x \cos(\alpha + \beta) + \frac{x^2}{2!} \cos(\alpha + 2\beta) + \dots \infty$$

and

$$S = \sin \alpha + x \sin(\alpha + \beta) + \frac{x^2}{2!} \sin(\alpha + 2\beta) + \dots \infty$$

∴

$$C + iS = (\cos \alpha + i \sin \alpha) + x [\cos(\alpha + \beta) + i \sin(\alpha + \beta)]$$

$$+ \frac{x^2}{2!} [\cos(\alpha + 2\beta) + i \sin(\alpha + 2\beta)] + \dots \infty$$

$$= e^{i\alpha} + x e^{i(\alpha + \beta)} + \frac{x^2}{2!} e^{i(\alpha + 2\beta)} + \dots \infty$$

$$= e^{i\alpha} \left[ 1 + x e^{i\beta} + \frac{x^2 e^{i2\beta}}{2!} + \dots \infty \right]$$

This is an exponential series.

$$= e^{i\alpha} \left( e^{x e^{i\beta}} \right) = e^{i\alpha} \cdot e^{x(\cos \beta + i \sin \beta)} = e^{x \cos \beta} \cdot e^{i(\alpha + x \sin \beta)}$$

$$= e^{x \cos \beta} [\cos(\alpha + x \sin \beta) + i \sin(\alpha + x \sin \beta)]$$

Equating real parts, we have

$$C = e^{x \cos \beta} \cdot \cos(\alpha + x \sin \beta)$$

**Ans.**

**Example 7.** Sum the series

$$\sin \alpha + \sin (\alpha + \beta) + \sin (\alpha + 2\beta) + \dots + \sin (\alpha + \overline{n-1} \beta)$$

**Solution.** Let  $S = \sin \alpha + \sin (\alpha + \beta) + \sin (\alpha + 2\beta) + \dots + \sin (\alpha + \overline{n-1} \beta)$

and  $C = \cos \alpha + \cos (\alpha + \beta) + \cos (\alpha + 2\beta) + \dots + \cos (\alpha + \overline{n-1} \beta)$

$$\begin{aligned} \therefore C + iS &= [\cos \alpha + i \sin \alpha] + [\cos (\alpha + \beta) + i \sin (\alpha + \beta)] + [\cos (\alpha + 2\beta) \\ &\quad + i \sin (\alpha + 2\beta)] + \dots + [\cos (\alpha + \overline{n-1} \beta) + i \sin (\alpha + \overline{n-1} \beta)] \\ &= e^{i\alpha} + e^{i(\alpha+\beta)} + e^{i(\alpha+2\beta)} + \dots + e^{i(\alpha+\overline{n-1}\beta)} \\ &= e^{i\alpha} [1 + e^{i\beta} + e^{i2\beta} + \dots + e^{i\overline{n-1}\beta}] \end{aligned}$$

This is a geometric series.

$$\begin{aligned} &= e^{i\alpha} \frac{1 - (e^{i\beta})^n}{1 - e^{i\beta}} = e^{i\alpha} \cdot \frac{1 - e^{in\beta}}{1 - e^{i\beta}} = e^{i\alpha} \frac{1 - \cos n\beta - i \sin n\beta}{1 - \cos \beta - i \sin \beta} \\ &= e^{i\alpha} \frac{2 \sin^2 \frac{n\beta}{2} - 2i \sin \frac{n\beta}{2} \cos \frac{n\beta}{2}}{2 \sin^2 \frac{\beta}{2} - 2i \sin \frac{\beta}{2} \cos \frac{\beta}{2}} \\ &= e^{i\alpha} \frac{\sin \frac{n\beta}{2}}{\sin \frac{\beta}{2}} \times \frac{\sin \frac{n\beta}{2} - i \cos \frac{n\beta}{2}}{\sin \frac{\beta}{2} - i \cos \frac{\beta}{2}} = e^{i\alpha} \frac{\cos \frac{n\beta}{2} + i \sin \frac{n\beta}{2}}{\cos \frac{\beta}{2} + i \sin \frac{\beta}{2}} \times \frac{\sin \frac{n\beta}{2}}{\sin \frac{\beta}{2}} \\ &= \frac{e^{i\alpha} \cdot e^{\frac{i\beta}{2}}}{e^{\frac{i\beta}{2}}} \sin \frac{n\beta}{2} \operatorname{cosec} \frac{\beta}{2} = e^{i\left[\alpha + (n-1)\frac{\beta}{2}\right]} \sin \frac{n\beta}{2} \operatorname{cosec} \frac{\beta}{2} \\ &= \left[ \cos \left\{ \alpha + (n-1) \frac{\beta}{2} \right\} + i \sin \left\{ \alpha + (n-1) \frac{\beta}{2} \right\} \right] \sin \frac{n\beta}{2} \operatorname{cosec} \frac{\beta}{2} \end{aligned}$$

Equating imaginary parts, we get  $S = \sin \left\{ \alpha + (n-1) \frac{\beta}{2} \right\} \sin \frac{n\beta}{2} \operatorname{cosec} \frac{\beta}{2}$

**Ans.**

**Example 8.** Sum the series

$$n \sin \alpha + \frac{n(n+1)}{1.2} \sin 2\alpha + \frac{n(n+1)(n+2)}{1.2.3} \sin 3\alpha + \dots \infty$$

(Nagpur University, Winter 2001)

**Solution.**

$$\text{Let } S = n \sin \alpha + \frac{n(n+1)}{1.2} \sin 2\alpha + \frac{n(n+1)(n+2)}{1.2.3} \sin 3\alpha + \dots \infty$$

$$\text{and } C = n \cos \alpha + \frac{n(n+1)}{1.2} \cos 2\alpha + \frac{n(n+1)(n+2)}{1.2.3} \cos 3\alpha + \dots \infty$$

$$\begin{aligned} \therefore C + iS &= n(\cos \alpha + i \sin \alpha) + \frac{n(n+1)}{1.2} (\cos 2\alpha + i \sin 2\alpha) + \\ &\quad \frac{n(n+1)(n+2)}{1.2.3} (\cos 3\alpha + i \sin 3\alpha) + \dots \infty \\ &= n e^{i\alpha} + \frac{n(n+1)}{1.2} e^{i2\alpha} + \frac{n(n+1)(n+2)}{1.2.3} e^{i3\alpha} + \dots \infty \\ &= -1 + 1 + (-n)(-e^{i\alpha}) + \frac{-n(-n-1)}{1.2} (-e^{i\alpha})^2 + \\ &\quad \frac{-n(-n-1)(-n-2)}{1.2.3} (-e^{i\alpha})^3 + \dots \infty \end{aligned}$$

This is a binomial series.

$$\begin{aligned}
 &= -1 + [1 - e^{i\alpha}]^{-n} = -1 + (1 - \cos \alpha - i \sin \alpha)^{-n} \\
 &= -1 + \left[ 2 \sin^2 \frac{\alpha}{2} - i 2 \sin \frac{\alpha}{2} \cos \frac{\alpha}{2} \right]^{-n} = -1 + \left( 2 \sin \frac{\alpha}{2} \right)^{-n} \left[ \sin \frac{\alpha}{2} - i \cos \frac{\alpha}{2} \right]^{-n} \\
 &= -1 + \left( 2 \sin \frac{\alpha}{2} \right)^{-n} \left[ \cos \left( \frac{\pi}{2} - \frac{\alpha}{2} \right) - i \sin \left( \frac{\pi}{2} - \frac{\alpha}{2} \right) \right]^{-n} \\
 &= -1 + \frac{\operatorname{cosec}^n \frac{\alpha}{2}}{2^n} \left[ \cos n \left( \frac{\pi}{2} - \frac{\alpha}{2} \right) + i \sin n \left( \frac{\pi}{2} - \frac{\alpha}{2} \right) \right]
 \end{aligned}$$

Equating imaginary parts, we get  $S = \frac{\operatorname{cosec}^n \frac{\alpha}{2}}{2^n} \sin \frac{n}{2}(\pi - \alpha)$  Ans.

**Example 9.** Sum the series

$$\frac{\sin \theta}{1!} - \frac{\sin 2\theta}{2!} + \frac{\sin 3\theta}{3!} - \frac{\sin 4\theta}{4!} + \dots \infty \quad (\text{Nagpur University, Summer 2001})$$

**Solution.** Let  $S = \frac{\sin \theta}{1!} - \frac{\sin 2\theta}{2!} + \frac{\sin 3\theta}{3!} - \frac{\sin 4\theta}{4!} + \dots \infty$

and  $C = \frac{\cos \theta}{1!} - \frac{\cos 2\theta}{2!} + \frac{\cos 3\theta}{3!} - \frac{\cos 4\theta}{4!} + \dots \infty$

$$\begin{aligned}
 \therefore C + iS &= \frac{1}{1!}(\cos \theta + i \sin \theta) - \frac{1}{2!}(\cos 2\theta + i \sin 2\theta) + \frac{1}{3!}(\cos 3\theta + i \sin 3\theta) - \dots \infty \\
 &= \frac{1}{1!} e^{i\theta} - \frac{1}{2!} e^{2i\theta} + \frac{1}{3!} e^{3i\theta} - \dots \infty = 1 - \left[ 1 - \frac{e^{i\theta}}{1!} + \frac{e^{2i\theta}}{2!} - \frac{e^{3i\theta}}{3!} + \dots \infty \right] \\
 &= 1 - e^{-e^{i\theta}} \quad \left( \because 1 - \frac{x}{1!} + \frac{x^2}{2!} - \frac{x^3}{3!} + \dots \infty = e^{-x} \right) \\
 &= 1 - e^{-(\cos \theta + i \sin \theta)} = 1 - e^{-\cos \theta} \cdot (e^{-i \sin \theta}) \\
 &= 1 - e^{-\cos \theta} \cdot [\cos(\sin \theta) - i \sin(\sin \theta)] \\
 &= [1 - e^{-\cos \theta}] \cdot \cos(\sin \theta) + i[e^{-\cos \theta} \cdot \sin(\sin \theta)]
 \end{aligned}$$

Equating imaginary parts on both sides, we get

$$S = e^{-\cos \theta} \cdot \sin(\sin \theta) \quad \text{Ans.}$$

**Example 10.** Sum the series

$$1 + \frac{1}{2} \cos 2\theta + \frac{1.3}{2.4} \cos 4\theta + \frac{1.3.5}{2.4.6} \cos 6\theta + \dots \infty \quad (\text{Nagpur University, Winter 2003, 2000})$$

**Solution.** Let  $C = 1 + \frac{1}{2} \cos 2\theta + \frac{1.3}{2.4} \cos 4\theta + \frac{1.3.5}{2.4.6} \cos 6\theta + \dots \infty$

and  $S = \frac{1}{2} \sin 2\theta + \frac{1.3}{2.4} \sin 4\theta + \frac{1.3.5}{2.4.6} \sin 6\theta + \dots \infty$

$$\begin{aligned}
 \therefore C + iS &= 1 + \frac{1}{2}(\cos 2\theta + i \sin 2\theta) + \frac{1.3}{2.4}(\cos 4\theta + i \sin 4\theta) \\
 &\quad + \frac{1.3.5}{2.4.6}(\cos 6\theta + i \sin 6\theta) + \dots \infty \\
 &= 1 + \frac{1}{2} e^{2i\theta} + \frac{1.3}{2.4} e^{4i\theta} + \frac{1.3.5}{2.4.6} e^{6i\theta} + \dots \infty
 \end{aligned}$$

$$\begin{aligned}
&= 1 - \left( -\frac{1}{2} \right) e^{2i\theta} + \frac{-\frac{1}{2} \left( -\frac{1}{2} - 1 \right)}{1.2} (e^{2i\theta})^2 - \frac{-\frac{1}{2} \left( -\frac{1}{2} - 1 \right) \left( -\frac{1}{2} - 2 \right)}{1.2.3} (e^{2i\theta})^3 + \dots \infty \\
&\quad \text{(Binomial Theorem)} \\
&= (1 - e^{2i\theta})^{-1/2} = (1 - \cos 2\theta - i \sin 2\theta)^{-1/2} \\
&= [2 \sin^2 \theta - i \cdot 2 \sin \theta \cos \theta]^{-1/2} = (2 \sin \theta)^{-1/2} (\sin \theta - i \cos \theta)^{-1/2} \\
&= (2 \sin \theta)^{-1/2} \left[ \cos \left( \frac{\pi}{2} - \theta \right) - i \sin \left( \frac{\pi}{2} - \theta \right) \right]^{-1/2} \\
&= (2 \sin \theta)^{-1/2} \left[ \cos \left( \frac{\pi}{4} - \frac{\theta}{2} \right) - i \sin \left( \frac{\pi}{4} - \frac{\theta}{2} \right) \right]
\end{aligned}$$

(De-Moivre's Theorem)

Equating real parts on both sides, we get

$$C = (2 \sin \theta)^{-1/2} \cos \left( \frac{\pi}{4} - \frac{\theta}{2} \right) \quad \text{Ans.}$$

**Example 11.** Sum the series

$$\sin \alpha - \frac{\sin(\alpha + 2\beta)}{2!} + \frac{\sin(\alpha + 4\beta)}{4!} - \dots \infty$$

**Solution.** Let  $S = \sin \alpha - \frac{\sin(\alpha + 2\beta)}{2!} + \frac{\sin(\alpha + 4\beta)}{4!} - \dots \infty$

and  $C = \cos \alpha - \frac{\cos(\alpha + 2\beta)}{2!} + \frac{\cos(\alpha + 4\beta)}{4!} - \dots \infty$

$$\begin{aligned}
\therefore C + iS &= (\cos \alpha + i \sin \alpha) - \frac{1}{2!} [\cos(\alpha + 2\beta) + i \sin(\alpha + 2\beta)] \\
&\quad + \frac{1}{4!} [\cos(\alpha + 4\beta) + i \sin(\alpha + 4\beta)] - \dots \infty \\
&= e^{i\alpha} - \frac{e^{i(\alpha + 2\beta)}}{2!} + \frac{e^{i(\alpha + 4\beta)}}{4!} - \dots \infty = e^{i\alpha} \left[ 1 - \frac{e^{i2\beta}}{2!} + \frac{e^{i4\beta}}{4!} - \dots \infty \right]
\end{aligned}$$

This series of R.H.S. is a cosine series.

$$\begin{aligned}
&= e^{i\alpha} \cos(e^{i\beta}) = (\cos \alpha + i \sin \alpha) \cos(\cos \beta + i \sin \beta) \\
&= (\cos \alpha + i \sin \alpha) [\cos(\cos \beta) \cos(i \sin \beta) - \sin(\cos \beta) \sin(i \sin \beta)] \\
&= (\cos \alpha + i \sin \alpha) [\cos(\cos \beta) \cosh(\sin \beta) - i \sin(\cos \beta) \sinh(\sin \beta)]
\end{aligned}$$

Equating imaginary parts, we get

$$S = \sin \alpha \cos(\cos \beta) \cosh(\sin \beta) - \cos \alpha \sin(\cos \beta) \sinh(\sin \beta) \quad \text{Ans.}$$

**Example 12.** Sum the series

$$x \sin \theta - \frac{1}{2} \cdot x^2 \sin 2\theta + \frac{1}{3} \cdot x^3 \sin 3\theta - \dots \infty$$

(Nagpur University, Winter 2004)

**Solution.** Let  $S = x \sin \theta - \frac{1}{2} \cdot x^2 \sin 2\theta + \frac{1}{3} \cdot x^3 \sin 3\theta - \dots \infty$

and  $C = x \cos \theta - \frac{1}{2} \cdot x^2 \cos 2\theta + \frac{1}{3} \cdot x^3 \cos 3\theta - \dots \infty$

$$\begin{aligned}
\therefore C + iS &= x(\cos \theta + i \sin \theta) - \frac{x^2}{2} (\cos 2\theta + i \sin 2\theta) + \frac{x^3}{3} (\cos 3\theta + i \sin 3\theta) - \dots \infty \\
&= x e^{i\theta} - \frac{x^2}{2} e^{2i\theta} + \frac{x^3}{3} e^{3i\theta} - \dots \infty
\end{aligned}$$

The series of R.H.S. is a logarithmic series.

$$= \log(1 + x e^{i\theta}) = \log(1 + x \cos \theta + i x \sin \theta)$$

Separating real and imaginary parts,

$$= \log \sqrt{(1 + x \cos \theta)^2 + (x \sin \theta)^2} + i \tan^{-1} \frac{x \sin \theta}{1 + x \cos \theta}$$

Equating imaginary parts, we have

$$S = \tan^{-1} \frac{x \sin \theta}{1 + x \cos \theta} \quad [\text{except when } x \cos \theta = -1] \quad \text{Ans.}$$

**Example 13.** Find sum of the series

$$c \sin \alpha + c^2 \sin 2\alpha + c^3 \sin 3\alpha + \dots \quad (\text{Nagpur University Summer 2002})$$

**Solution.** Let  $S = c \sin \alpha + c^2 \sin 2\alpha + c^3 \sin 3\alpha + \dots$

and  $C = c \cos \alpha + c^2 \cos 2\alpha + c^3 \cos 3\alpha + \dots$

$$C + iS = c(\cos \alpha + i \sin \alpha) + c^2(\cos 2\alpha + i \sin 2\alpha) + c^3(\cos 3\alpha + i \sin 3\alpha) + \dots$$

$$C + iS = c e^{i\alpha} + c^2 e^{i2\alpha} + c^3 e^{i3\alpha} + \dots$$

$$= \frac{ce^{i\alpha}}{1 - ce^{i\alpha}} = \frac{ce^{i\alpha}(1 - ce^{-i\alpha})}{(1 - ce^{i\alpha})(1 - ce^{-i\alpha})} \quad (\text{Infinite Geometric series}) \quad \left( S = \frac{a}{1 - r} \right)$$

$$= \frac{ce^{i\alpha} - c^2}{1 - c(e^{i\alpha} + e^{-i\alpha}) + c^2} = \frac{c(\cos \alpha + i \sin \alpha) - c^2}{1 - 2c \cos \alpha + c^2}$$

Equating imaginary part, we get

$$\therefore S = \frac{c \sin \alpha}{1 + c^2 - 2c \cos \alpha} \quad \text{Ans.}$$

**Example 14.** Find the sum of the series

$$c \sin \theta - \frac{1}{2} c^2 \sin 2\theta + \frac{1}{3} c^3 \sin 3\theta - \dots \infty \quad (\text{Nagpur University, Summer 2003})$$

**Solution.** Let  $S = c \sin \theta - \frac{1}{2} c^2 \sin 2\theta + \frac{1}{3} c^3 \sin 3\theta - \dots \infty$

and  $C = c \cos \theta - \frac{1}{2} c^2 \cos 2\theta + \frac{1}{3} c^3 \cos 3\theta - \dots \infty$

$$\therefore C + iS = c(\cos \theta + i \sin \theta) - \frac{1}{2} c^2(\cos 2\theta + i \sin 2\theta) + \frac{1}{3} c^3(\cos 3\theta + i \sin 3\theta) - \dots \infty$$

$$= c e^{i\theta} - \frac{1}{2} c^2 e^{2i\theta} + \frac{1}{3} c^3 e^{3i\theta} - \dots \text{to } \infty$$

$$= c e^{i\theta} - \frac{1}{2} (ce^{i\theta})^2 + \frac{1}{3} (ce^{i\theta})^3 - \dots \text{to } \infty$$

$$= \log_e(1 + ce^{i\theta}) \quad \left[ \log(1 + x) = x - \frac{x^2}{2} + \frac{x^3}{3} + \dots \right]$$

$$= \log_e(1 + c \cos \theta + i c \sin \theta) \quad \dots(1)$$

Now, put  $1 + c \cos \theta + i c \sin \theta = r(\cos \alpha + i \sin \alpha)$

$$\therefore 1 + c \cos \theta = r \cos \theta, \quad c \sin \theta = r \sin \theta$$

$$r^2 = (1 + c \cos \theta)^2 + c^2 \sin^2 \theta = 1 + 2c \cos \theta + c^2 \cos^2 \theta + c^2 \sin^2 \theta$$

$$= 1 + 2c \cos \theta + c^2 (\cos^2 \theta + \sin^2 \theta)$$

$$r^2 = 1 + 2c \cos \theta + c^2$$

$$\therefore r^2 = \sqrt{1 + 2c \cos \theta + c^2} \quad \text{and} \quad \alpha = \tan^{-1} \frac{c \sin \theta}{1 + c \cos \theta}$$

From equation (1), we have

$$\begin{aligned} C + iS &= \log_e \{r (\cos \alpha + i \sin \alpha)\} = \log_e r e^{i\alpha} = \log_e r + \log_e e^{i\alpha} \\ \therefore C + iS &= \log_e r + i\alpha \end{aligned}$$

Putting the values of  $r$  and  $\alpha$ , we get

$$C + iS = \log_e \sqrt{1 + 2c \cos \theta + c^2} + \tan^{-1} \frac{c \sin \theta}{1 + c \cos \theta}$$

Equating imaginary part, we get

$$S = \tan^{-1} \frac{c \sin \theta}{1 + c \cos \theta} \quad \text{Ans.}$$

**Example 15.** Sum the series

$$c \cos \alpha - \frac{c^2}{2} \cos 2\alpha + \frac{c^3}{3} \cos 3\alpha - \dots \infty$$

where,  $0 < c < 1$ .

(Nagpur University, Winter 2000)

[Hint. From example 12

$$c \cos \alpha - \frac{c^2}{2} \cos 2\alpha + \frac{c^3}{3} \cos 3\alpha \dots = \log_e \left[ \sqrt{1 + 2c \cos \alpha + c^2} \right] \quad \text{Ans.}$$

**Example 16.** Sum the series  $\cos \theta + \sin \theta \cos 2\theta + \frac{\sin^2 \theta}{1.2} \cos 3\theta + \dots \infty$

(Nagpur University, Summer 2004)

**Solution.** Let

$$C = \cos \theta + \sin \theta \cdot \cos 2\theta + \frac{\sin^2 \theta}{1.2} \cos 3\theta + \dots \infty$$

and

$$S = \sin \theta + \sin \theta \cdot \sin 2\theta + \frac{\sin^2 \theta}{1.2} \sin 3\theta + \dots \infty$$

$\therefore$

$$\begin{aligned} C + iS &= (\cos \theta + i \sin \theta) + \sin \theta (\cos 2\theta + i \sin 2\theta) \\ &\quad + \frac{\sin^2 \theta}{2!} (\cos 3\theta + i \sin 3\theta) + \dots \infty \\ &= e^{i\theta} + \sin \theta \cdot e^{2i\theta} + \frac{\sin^2 \theta}{2!} e^{3i\theta} + \dots \infty \\ &= e^{i\theta} \left[ 1 + \frac{\sin \theta}{1!} e^{i\theta} + \frac{\sin^2 \theta}{2!} e^{2i\theta} + \dots \infty \right] \\ &= e^{i\theta} \cdot e^{\sin \theta \cdot e^{i\theta}} \quad \left( \because e^x = 1 + x + \frac{x^2}{2!} + \dots \infty \right) \\ &= e^{i\theta} \cdot e^{\sin \theta (\cos \theta + i \sin \theta)} = e^{\sin \theta \cdot \cos \theta} \cdot e^{i(\theta + \sin^2 \theta)} \\ &= e^{\sin \theta \cdot \cos \theta} \cdot [\cos (\theta + \sin^2 \theta) + i \sin (\theta + \sin^2 \theta)] \end{aligned}$$

Equating real parts on both sides, we get

$$C = e^{\sin \theta \cdot \cos \theta} \cdot \cos (\theta + \sin^2 \theta) \quad \text{Ans.}$$

### EXERCISE 26.3

Find the sum of the following series :

$$1. \sin \alpha + x \sin (\alpha + \beta) + \frac{x^2}{2!} \sin (\alpha + 2\beta) + \dots \infty \quad \text{Ans. } e^{x \cos \beta} \sin (\alpha + x\beta)$$

$$2. \cos \alpha + \cos (\alpha + \beta) + \cos (\alpha + 2\beta) + \dots + \cos (\alpha + \overline{n-1}\beta)$$

$$\text{Ans. } \cos \left\{ \alpha + (n-1) \frac{\beta}{2} \right\} \sin \frac{n\beta}{2} \operatorname{cosec} \frac{\beta}{2}$$

3.  $n \cos \alpha + \frac{n(n+1)}{1.2} \cos 2\alpha + \frac{n(n+1)(n+2)}{1.2.3} \cos 3\alpha + \dots \infty$   
**Ans.**  $-1 + \frac{\operatorname{cosec}^n \alpha}{2^n} \cos \frac{n}{2}(\pi - \alpha)$
4.  $e^\alpha \sin \beta - \frac{e^{3\alpha}}{3} \sin 3\beta + \frac{e^{5\alpha}}{5} \sin 5\beta + \dots \infty$   
**Ans.**  $\frac{1}{2} \tanh^{-1}(\operatorname{sech} \alpha \sin \beta)$
5.  $\sin \alpha \cdot \cos \alpha - \frac{1}{2} \sin^2 \alpha \cos 2\alpha + \frac{1}{3} \sin^3 \alpha \cos 3\alpha + \dots \infty$  **Ans.**  $\log(1 + \sin \alpha)$
6.  $-\frac{1}{2} \sin \alpha + \frac{1.3}{2.4} \sin 2\alpha - \frac{1.3.5}{2.4.6} \sin 3\alpha + \dots \infty$   
**Ans.**  $-\frac{\sin \frac{\alpha}{4}}{\sqrt{2 \cos \frac{\alpha}{2}}}$
7.  $1 + \frac{1}{2} \cos 2\alpha - \frac{1.3}{2.4} \cos 4\alpha + \frac{1.3.5}{2.4.6} \cos 6\alpha + \dots \infty$   
**Ans.**  $\sqrt{[\cos \alpha(1 + \cos \alpha)]}$
8.  $\sin \alpha + \frac{1}{3} \sin 3\alpha + \frac{1}{3^2} \sin 5\alpha + \dots \infty$   
**Ans.**  $\frac{6 \sin \alpha}{5 - 3 \cos 2\alpha}$
9.  $1 + x \cos \theta + x^2 \cos 2\theta + x^3 \cos 3\theta + \dots$  **Ans.**  $\frac{1 - x \cos \theta - x^n \cos n\theta + x^{n+1} \cos (n-1)\theta}{1 - 2x \cos \theta + x^2}$
10.  $1 - \frac{1}{2} \cos \theta + \frac{1.3}{2.4} \cos 2\theta - \frac{1.3.5}{2.4.6} \cos 3\theta + \dots$   
**Ans.**  $\left(2 \cos \frac{\theta}{2}\right)^{-1/2} \cos \frac{\theta}{4}$
11.  $\sin \theta - \frac{\sin 2\theta}{2!} + \frac{\sin 3\theta}{3!} - \dots \infty$   
**Ans.**  $e^{-\cos \theta} \sin(\sin \theta)$
12.  $1 + \frac{1}{3} \cos x + \frac{1}{9} \cos 2x + \frac{1}{27} \cos 3x + \dots \infty$   
**Ans.**  $\frac{9 - 3 \cos x}{10 - 6 \cos x}$
13.  $x \cos \theta - \frac{x^2}{2} \cos 2\theta + \frac{x^3}{3} \cos 3\theta - \dots \infty$   
**Ans.**  $\frac{1}{2} \log(1 + 2x \cos \theta + x^2)$

## 26.4 APPROXIMATION

**Example 17.** If  $\frac{\sin x}{x} = \frac{2399}{2400}$ , find an approximate value of  $x$  in radians.

**Solution.**  $\frac{\sin x}{x} = \frac{2399}{2400}$

We know that  $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$  or  $\frac{\sin x}{x} = 1 - \frac{x^2}{6} + \frac{x^4}{120}$

$$\frac{2399}{2400} = 1 - \frac{x^2}{6} \quad (\text{Ignoring } x^4 \text{ and higher powers})$$

$$\frac{x^2}{6} = 1 - \frac{2399}{2400} \Rightarrow \frac{x^2}{6} = \frac{1}{2400}$$

$$x^2 = \frac{1}{400} \quad \text{or} \quad x = \frac{1}{20} \text{ radian.}$$

**Ans.**

**Example 18.** If  $\cos x = \frac{1681}{1682}$ , find  $x$  approximately.

**Solution.**  $\cos x = \frac{1681}{1682}$

$$1 - 2 \sin^2 \frac{x}{2} = \frac{1681}{1682} \quad \text{or} \quad 2 \sin^2 \frac{x}{2} = \frac{1}{1682} \quad \text{or} \quad \sin^2 \frac{x}{2} = \frac{1}{3364}$$

$$\sin \frac{x}{2} = \frac{1}{58}$$

We know that  $\lim_{x \rightarrow 0} \frac{\sin \frac{x}{2}}{\frac{x}{2}} = 1 \Rightarrow \sin \frac{x}{2} = \frac{x}{2} \Rightarrow \frac{x}{2} = \frac{1}{58} \Rightarrow x = \frac{1}{29}$  radian  
 $x = 1^\circ 58.5'.$

**Ans.**

**Example 19.** Solve  $\cos\left(\frac{\pi}{3} + \theta\right) = 0.49.$

**Solution.**  $\cos\left(\frac{\pi}{3} + \theta\right) = 0.49$

$$\cos \frac{\pi}{3} \cos \theta - \sin \frac{\pi}{3} \sin \theta = 0.49$$

$$\frac{1}{2} \cos \theta - \frac{\sqrt{3}}{2} \sin \theta = 0.49$$

$$\frac{1}{2} \left[ 1 - \frac{\theta^2}{2!} + \dots \right] - \frac{\sqrt{3}}{2} \left[ \theta - \frac{\theta^3}{3!} + \dots \right] = 0.49$$

$$\frac{1}{2} - \frac{\theta^2}{4} - \frac{\sqrt{3}}{2} \theta + \frac{\sqrt{3}}{12} \theta^3 + \dots = 0.49$$

$$\frac{1}{2} - \frac{\sqrt{3}}{2} \theta + \dots = 0.49 \quad (\text{Ignoring higher powers of } \theta)$$

$$\Rightarrow \frac{\sqrt{3}}{2} \theta = 0.5 - 0.49 \Rightarrow \theta = \frac{0.02}{\sqrt{3}} = 0.011547$$

**Ans.**

**Example 20.** Evaluate  $\lim_{\theta \rightarrow 0} \frac{\tan \theta - \sin \theta}{\theta^3}$

**Solution.** 
$$\lim_{\theta \rightarrow 0} \frac{\tan \theta - \sin \theta}{\theta^3} = \lim_{\theta \rightarrow 0} \frac{\left[ \theta + \frac{\theta^3}{3} + \frac{2}{15} \theta^5 + \dots \right] - \left[ \theta - \frac{\theta^3}{3!} + \frac{\theta^5}{5!} - \dots \right]}{\theta^3}$$

$$= \lim_{\theta \rightarrow 0} \frac{1 + \frac{\theta^2}{3} + \frac{2}{15} \theta^4 + \dots - 1 + \frac{\theta^2}{6} - \frac{\theta^4}{120} + \dots}{\theta^2} = \lim_{\theta \rightarrow 0} \frac{\frac{\theta^2}{2} + \frac{\theta^4}{8} + \dots}{\theta^2}$$

$$= \lim_{\theta \rightarrow 0} \left( \frac{1}{2} + \frac{\theta^2}{8} \right) = \frac{1}{2}.$$

**Ans.****EXERCISE 26.4**

1. If  $\frac{\sin x}{x} = \frac{559}{600}$ , find an approximate value of  $x$ . **Ans.**  $x = \frac{1}{10}$  radian

2. If  $\frac{\sin x}{x} = \frac{5045}{5046}$ , find an approximate value of  $x$ . **Ans.**  $x = 1^\circ, 58'$

3. Solve  $\sin\left(\frac{x}{6} + x\right) = 0.51$  approximately. **Ans.**  $x = 39.7'$

4. Evaluate  $\lim_{x \rightarrow 0} \frac{\sin x - x \cos x}{x^3}$ . **Ans.**  $\frac{1}{3}$

## FUNCTIONS OF COMPLEX VARIABLE, ANALYTIC FUNCTION

---

---

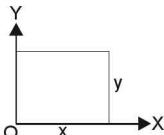

### 27.1 INTRODUCTION

The theory of functions of a complex variable is of utmost importance in solving a large number of problems in the field of engineering and science. Many complicated integrals of real functions are solved with the help of functions of a complex variable.

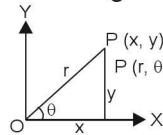

### 27.2 COMPLEX VARIABLE

$x + iy$  is a complex variable and it is denoted by  $z$ .

$$(1) \ z = x + iy. \quad \text{where } i = \sqrt{-1} \quad (\text{Cartesian form})$$

$$(2) \ z = r(\cos \theta + i \sin \theta) \quad (\text{Polar form})$$

$$(3) \ z = re^{i\theta} \quad (\text{Exponential form})$$

### 27.3 FUNCTIONS OF A COMPLEX VARIABLE

$f(z)$  is a function of a complex variable  $z$  and is denoted by  $w$ .

$$w = f(z)$$

$$w = u + iv$$

where  $u$  and  $v$  are the real and imaginary parts of  $f(z)$ .

### 27.4 LIMIT OF A FUNCTION OF A COMPLEX VARIABLE

Let  $f(z)$  be a single valued function defined at all points in some neighbourhood of point  $z_0$ . Then the limit of  $f(z)$  as  $z$  approaches  $z_0$  is  $w_0$ .

$$\lim_{z \rightarrow z_0} f(z) = w_0$$

**Example.** Prove that  $\lim_{z \rightarrow 1-i} \frac{(z^2 + 4z + 3)}{z + 1} = 4 - i$

**Solution.**  $\lim_{z \rightarrow 1-i} \frac{z^2 + 4z + 3}{z + 1} = \lim_{z \rightarrow 1-i} \frac{(z+1)(z+3)}{(z+1)} = \lim_{z \rightarrow 1-i} (z+3) = (1-i) + 3 = 4 - i \quad \text{Proved.}$

### 27.5 CONTINUITY

The function  $f(z)$  of a complex variable  $z$  is said to be continuous at the point  $z_0$  if for any given positive number  $\epsilon$ , we can find a number  $\delta$  such that  $|f(z) - f(z_0)| < \epsilon$

for all points  $z$  of the domain satisfying

$$|z - z_0| < \delta$$

$f(z)$  is said to be continuous at  $z = z_0$  if

$$\lim_{z \rightarrow z_0} f(z) = f(z_0)$$

## 27.6 DIFFERENTIABILITY

Let  $f(z)$  be a single valued function of the variable  $z$ , then

$$f'(z) = \lim_{\delta z \rightarrow 0} \frac{f(z + \delta z) - f(z)}{\delta z}$$

provided that the limit exists and is independent of the path along which  $\delta z \rightarrow 0$ .

Let  $P$  be a fixed point and  $Q$  be a neighbouring point. The point  $Q$  may approach  $P$  along any straight line or curved path.

**Example 1.** Consider the function

$$f(z) = 4x + y + i(-x + 4y)$$

and discuss  $\frac{df}{dz}$ .

$$\begin{aligned} \text{Solution. } \text{Here, } f(z) &= 4x + y + i(-x + 4y) \\ &= u + iv \end{aligned}$$

$$\text{so } u = 4x + y$$

$$\text{and } v = -x + 4y$$

$$f(z + \delta z) = 4(x + \delta x) + (y + \delta y) - i(x + \delta x) + 4i(y + \delta y)$$

$$\begin{aligned} f(z + \delta z) - f(z) &= 4(x + \delta x) + (y + \delta y) - i(x + \delta x) + 4i(y + \delta y) - 4x - y + ix - 4iy \\ &= 4\delta x + \delta y - i\delta x + 4i\delta y \end{aligned}$$

$$\frac{f(z + \delta z) - f(z)}{\delta z} = \frac{4\delta x + \delta y - i\delta x + 4i\delta y}{\delta x + i\delta y}$$

$$\Rightarrow \frac{\delta f}{\delta z} = \frac{4\delta x + \delta y - i\delta x + 4i\delta y}{\delta x + i\delta y} \quad \dots (1)$$

(a) **Along real axis:** If  $Q$  is taken on the horizontal line through  $P(x, y)$  and  $Q$  then approaches  $P$  along this line, we shall have  $\delta y = 0$  and  $\delta z = \delta x$ .

$$\frac{\delta f}{\delta z} = \frac{4\delta x - i\delta x}{\delta x} = 4 - i$$

(b) **Along imaginary axis:** If  $Q$  is taken on the vertical line through  $P$  and then  $Q$  approaches  $P$  along this line, we have

$$z = x + iy = 0 + iy, \delta z = i\delta y, \delta x = 0.$$

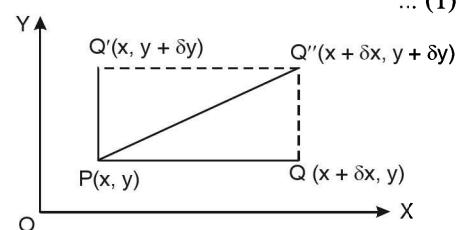

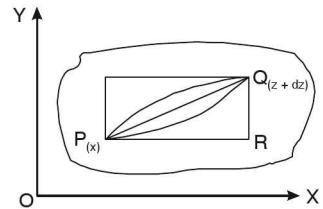

Putting these values in (1), we have

$$\frac{\delta f}{\delta z} = \frac{\delta y + 4i\delta y}{i\delta y} = \frac{1}{i}(1 + 4i) = 4 - i$$

(c) **Along a line  $y = x$ :** If  $Q$  is taken on a line  $y = x$ .

$$z = x + iy = x + ix = (1+i)x$$

$$\delta z = (1+i)\delta x \quad \text{and} \quad \delta y = \delta x$$

On putting these values in (1), we have

$$\frac{\delta f}{\delta z} = \frac{4\delta x + \delta x - i\delta x + 4i\delta x}{\delta x + i\delta x} = \frac{4+1-i+4i}{1+i} = \frac{5+3i}{1+i} = \frac{(5+3i)(1-i)}{(1+i)(1-i)} = 4-i$$

In all the three different paths approaching  $Q$  from  $P$ , we get the same values of  $\frac{\delta f}{\delta z} = 4-i$ .

In such a case, the function is said to be differentiable at the point  $z$  in the given region.

**Example 2.** If  $f(z) = \begin{cases} \frac{x^3y(y-ix)}{x^6+y^2}, & z \neq 0, \\ 0, & z=0 \end{cases}$  then discuss  $\frac{df}{dz}$  at  $z=0$ .

**Solution.** If  $z \rightarrow 0$  along radius vector  $y = mx$

$$\begin{aligned} \lim_{z \rightarrow 0} \frac{f(z) - f(0)}{z} &= \lim_{z \rightarrow 0} \left[ \frac{\frac{x^3y(y-ix)}{x^6+y^2} - 0}{x+iy} \right] = \lim_{z \rightarrow 0} \left[ \frac{-ix^3y(x+iy)}{(x^6+y^2)(x+iy)} \right] \\ &= \lim_{z \rightarrow 0} \left[ \frac{-ix^3y}{x^6+y^2} \right] = \lim_{z \rightarrow 0} \left[ \frac{-ix^3(mx)}{x^6+m^2x^2} \right] \quad [\because y = mx] \\ &= \lim_{x \rightarrow 0} \left[ \frac{-imx^2}{x^4+m^2} \right] = 0 \end{aligned}$$

But along  $y = x^3$

$$\lim_{z \rightarrow 0} \frac{f(z) - f(0)}{z} = \lim_{z \rightarrow 0} \left[ \frac{-ix^3y}{x^6+y^2} \right] = \lim_{x \rightarrow 0} \frac{-ix^3(x^3)}{x^6+(x^3)^2} = -\frac{i}{2}$$

In different paths we get different values of  $\frac{df}{dz}$  i.e. 0 and  $-\frac{i}{2}$ . In such a case, the function is not differentiable at  $z=0$ .

**Theorem:** Continuity is a necessary condition but not sufficient condition for the existence of a finite derivative.

**Proof.** We have,  $f(z_0 + \delta z) - f(z_0) = \delta z \left\{ \frac{f(z_0 + \delta z) - f(z_0)}{\delta z} \right\}$  ... (1)

Taking limit of both sides of (1), as  $\delta z \rightarrow 0$ , we get

$$\begin{aligned} \lim_{\delta z \rightarrow 0} [f(z_0 + \delta z) - f(z_0)] &= 0 \cdot f'(z_0) \Rightarrow \lim_{\delta z \rightarrow 0} [f(z_0 + \delta z) - f(z_0)] = 0 \\ \Rightarrow \lim_{z \rightarrow z_0} [f(z) - f(z_0)] &= 0 \quad \Rightarrow \lim_{z \rightarrow z_0} f(z) = f(z_0) \\ \Rightarrow f(z) \text{ is continuous at } z = z_0. & \end{aligned}$$

**Proved.**

The converse of the above theorem is not true.

This can be shown by the following example.

**Example 3.** Prove that the function  $f(z) = |z|^2$  is continuous everywhere but not differentiable except at the origin.

**Solution.** Here,  $f(z) = |z|^2$ .

$$\therefore \text{But } |z| = \sqrt{(x^2 + y^2)} \Rightarrow |z|^2 = x^2 + y^2$$

Since  $x^2$  and  $y^2$  are polynomial so  $x^2 + y^2$  is continuous everywhere, therefore,  $|z|^2$  is

continuous everywhere.

$$\text{Now, we have } f'(z) = \lim_{\delta z \rightarrow 0} \frac{f(z + \delta z) - f(z)}{\delta z}$$

$$\begin{aligned} f'(z) &= \lim_{\delta z \rightarrow 0} \frac{|z + \delta z|^2 - |z|^2}{\delta z} \quad (z\bar{z} = |z|^2) \\ &= \lim_{\delta z \rightarrow 0} \frac{(z + \delta z)(\bar{z} + \delta \bar{z}) - z\bar{z}}{\delta z} = \lim_{\delta z \rightarrow 0} \frac{z\bar{z} + z\delta\bar{z} + \delta z\bar{z} + \delta z\delta\bar{z} - z\bar{z}}{\delta z} \\ &= \lim_{\delta z \rightarrow 0} \frac{z\delta\bar{z} + \delta z\bar{z} + \delta z\delta\bar{z}}{\delta z} = \lim_{\delta z \rightarrow 0} \left\{ z + \delta\bar{z} + z\frac{\delta\bar{z}}{\delta z} \right\} = \lim_{\delta z \rightarrow 0} \left\{ z + z\frac{\delta\bar{z}}{\delta z} \right\} \dots(1) \end{aligned}$$

[Since,  $\delta z \rightarrow 0$  so  $\delta\bar{z} \rightarrow 0$ ]

Let  $\delta z = r(\cos \theta + i \sin \theta)$  and  $\delta\bar{z} = r(\cos \theta - i \sin \theta)$

$$\begin{aligned} \Rightarrow \frac{\delta\bar{z}}{\delta z} &= \frac{\cos \theta - i \sin \theta}{\cos \theta + i \sin \theta} \Rightarrow \frac{\delta\bar{z}}{\delta z} = (\cos \theta - i \sin \theta)(\cos \theta + i \sin \theta)^{-1} \\ \Rightarrow \frac{\delta\bar{z}}{\delta z} &= (\cos \theta - i \sin \theta)(\cos \theta - i \sin \theta) \Rightarrow \frac{\delta\bar{z}}{\delta z} = (\cos \theta - i \sin \theta)^2 \\ \Rightarrow \frac{\delta\bar{z}}{\delta z} &= \cos 2\theta - i \sin 2\theta \end{aligned}$$

Since  $\frac{\delta\bar{z}}{\delta z}$  depends on  $\theta$ . It means for different values of  $\theta$ ,  $\frac{\delta\bar{z}}{\delta z}$  has different values.

It means  $\frac{\delta\bar{z}}{\delta z}$  has different values for different  $z$ .

Therefore  $\lim_{\delta z \rightarrow 0} \frac{\delta\bar{z}}{\delta z}$  does not tend to a unique limit when  $z \neq 0$ .

Thus, from (1), it follows that  $f'(z)$  is not unique and hence  $f(z)$  is not differentiable when  $z \neq 0$ .

But when  $z = 0$  then  $f'(z) = 0$  i.e.,  $f'(0) = 0$  and is unique.

Hence, the function is differentiable at  $z = 0$ .

**Ans.**

## 27.7 ANALYTIC FUNCTION

A function  $f(z)$  is said to be **analytic** at a point  $z_0$ , if  $f$  is differentiable not only at  $z_0$  but at every point of some neighbourhood of  $z_0$ .

A function  $f(z)$  is analytic in a domain if it is **analytic** at every point of the domain.

The point at which the function is not differentiable is called a **singular point** of the function.

An analytic function is also known as “holomorphic”, “regular”, “monogenic”.

**Entire Function.** A function which is analytic everywhere (for all  $z$  in the complex plane) is known as an entire function.

**For Example 1.** Polynomials rational functions are entire.

2.  $|\bar{z}|^2$  is differentiable only at  $z = 0$ . So it is nowhere analytic.

**Note:** (i) An entire is always analytic, differentiable and continuous function. But converse is not true.

(ii) Analytic function is always differentiable and continuous. But converse is not true.

(iii) A differentiable function is always continuous. But converse is not true

### 27.8 THE NECESSARY CONDITION FOR $f(z)$ TO BE ANALYTIC

**Theorem.** The necessary conditions for a function  $f(z) = u + iv$  to be analytic at all the points in a region  $R$  are

$$(i) \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \quad (ii) \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x} \text{ provided } \frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y} \text{ exist.}$$

**Proof:** Let  $f(z)$  be an analytic function in a region  $R$ ,

$$f(z) = u + iv,$$

where  $u$  and  $v$  are the functions of  $x$  and  $y$ .

Let  $\delta u$  and  $\delta v$  be the increments of  $u$  and  $v$  respectively corresponding to increments  $\delta x$  and  $\delta y$  of  $x$  and  $y$ .

$$\therefore f(z + \delta z) = (u + \delta u) + i(v + \delta v)$$

$$\text{Now } \frac{f(z + \delta z) - f(z)}{\delta z} = \frac{(u + \delta u) + i(v + \delta v) - (u + iv)}{\delta z} = \frac{\delta u + i\delta v}{\delta z} = \frac{\delta u}{\delta z} + i \frac{\delta v}{\delta z}$$

$$\lim_{\delta z \rightarrow 0} \frac{f(z + \delta z) - f(z)}{\delta z} = \lim_{\delta z \rightarrow 0} \left( \frac{\delta u}{\delta z} + i \frac{\delta v}{\delta z} \right) \text{ or } f'(z) = \lim_{\delta z \rightarrow 0} \left( \frac{\delta u}{\delta z} + i \frac{\delta v}{\delta z} \right) \dots (1)$$

since  $\delta z$  can approach zero along any path.

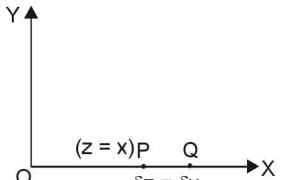

#### (a) Along real axis (x-axis)

$$z = x + iy \quad \text{but on } x\text{-axis, } y = 0$$

$$\therefore z = x, \quad \delta z = \delta x, \quad \delta y = 0$$

Putting these values in (1), we have

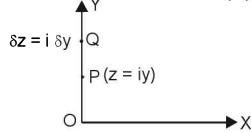

$$f'(z) = \lim_{\delta x \rightarrow 0} \left( \frac{\delta u}{\delta x} + i \frac{\delta v}{\delta x} \right) = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \dots (2)$$

#### (b) Along imaginary axis (y-axis)

$$z = x + iy \quad \text{but on } y\text{-axis, } x = 0$$

$$z = 0 + iy \quad \delta x = 0, \quad \delta z = i\delta y.$$

Putting these values in (1), we get

$$f'(z) = \lim_{\delta y \rightarrow 0} \left( \frac{\delta u}{i\delta y} + \frac{i\delta v}{\delta y} \right) = \lim_{\delta y \rightarrow 0} \left( -i \frac{\delta u}{\delta y} + \frac{\delta v}{\delta y} \right) = -i \frac{\partial u}{\partial y} + \frac{\partial v}{\partial y} \dots (3)$$

If  $f(z)$  is differentiable, then two values of  $f'(z)$  must be the same.

Equating (2) and (3), we get

$$\frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} = -i \frac{\partial u}{\partial y} + \frac{\partial v}{\partial y}$$

Equating real and imaginary parts, we have

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \quad \frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y}$$

$$\boxed{\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}}$$

$$\boxed{\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}}$$

are known as **Cauchy Riemann equations**.

### 27.9 SUFFICIENT CONDITION FOR $f(z)$ TO BE ANALYTIC

**Theorem.** The sufficient condition for a function  $f(z) = u + iv$  to be analytic at all the points in a region  $R$  are

$$(i) \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

(ii)  $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y}$  are continuous functions of  $x$  and  $y$  in region  $R$ .

**Proof.** Let  $f(z)$  be a single-valued function having

$$\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y}$$

at each point in the region  $R$ . Then the  $C - R$  equations are satisfied.

By Taylor's Theorem:

$$\begin{aligned} f(z + \delta z) &= u(x + \delta x, y + \delta y) + iv(x + \delta x, y + \delta y) \\ &= u(x, y) + \left( \frac{\partial u}{\partial x} \delta x + \frac{\partial u}{\partial y} \delta y \right) + \dots + i \left[ v(x, y) + \left( \frac{\partial v}{\partial x} \delta x + \frac{\partial v}{\partial y} \delta y \right) + \dots \right] \\ &= [u(x, y) + iv(x, y)] + \left[ \frac{\partial u}{\partial x} \cdot \delta x + i \frac{\partial v}{\partial x} \cdot \delta x \right] + \left[ \frac{\partial u}{\partial y} \delta y + i \frac{\partial v}{\partial y} \cdot \delta y \right] + \dots \\ &= f(z) + \left( \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right) \delta x + \left( \frac{\partial u}{\partial y} + i \frac{\partial v}{\partial y} \right) \delta y + \dots \end{aligned}$$

(Ignoring the terms of second power and higher powers)

$$\Rightarrow f(z + \delta z) - f(z) = \left( \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right) \delta x + \left( \frac{\partial u}{\partial y} + i \frac{\partial v}{\partial y} \right) \delta y \quad \dots (1)$$

We know  $C - R$  equations i.e.,

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \text{ and } \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

Replacing  $\frac{\partial u}{\partial y}$  and  $\frac{\partial v}{\partial y}$  by  $-\frac{\partial v}{\partial x}$  and  $\frac{\partial u}{\partial x}$  respectively in (1), we get

$$\begin{aligned} f(z + \delta z) - f(z) &= \left( \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right) \delta x + \left( -\frac{\partial v}{\partial x} + i \frac{\partial u}{\partial x} \right) \delta y \quad (\text{taking } i \text{ common}) \\ &= \left( \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right) \delta x + \left( i \frac{\partial v}{\partial x} + \frac{\partial u}{\partial x} \right) i \delta y = \left( \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right) (\delta x + i \delta y) = \left( \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right) \delta z \end{aligned}$$

$$\Rightarrow \frac{f(z + \delta z) - f(z)}{\delta z} = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x}$$

$$\Rightarrow \lim_{\delta z \rightarrow 0} \frac{f(z + \delta z) - f(z)}{\delta z} = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x}$$

$$\Rightarrow \boxed{f'(z) = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x}}$$

$$\Rightarrow \boxed{f'(z) = \frac{\partial v}{\partial y} - i \frac{\partial u}{\partial y}}$$

**Proved.**

**Remember:** 1. If a function is analytic in a domain  $D$ , then  $u, v$  satisfy  $C - R$  conditions at all points in  $D$ .

2.  $C - R$  conditions are necessary but not sufficient for analytic function.

3.  $C - R$  conditions are sufficient if the partial derivative are continuous.

**Example 4.** Determine whether  $\frac{1}{z}$  is analytic or not? (R.G.P.V. Bhopal, III Sem., June 2003)

$$\text{Solution. Let } w = f(z) = u + iv = \frac{1}{z} \Rightarrow u + iv = \frac{1}{x+iy} = \frac{x-iy}{x^2+y^2}$$

Equating real and imaginary parts, we get

$$\begin{aligned} u &= \frac{x}{x^2+y^2}, & v &= \frac{-y}{x^2+y^2} \\ \frac{\partial u}{\partial x} &= \frac{(x^2+y^2).1 - x.2x}{(x^2+y^2)^2} = \frac{y^2-x^2}{(x^2+y^2)^2}, & \frac{\partial u}{\partial y} &= \frac{-2xy}{(x^2+y^2)^2}. \\ \frac{\partial v}{\partial x} &= \frac{2xy}{(x^2+y^2)^2}, & \frac{\partial v}{\partial y} &= \frac{y^2-x^2}{(x^2+y^2)^2} \end{aligned}$$

$$\text{Thus, } \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \text{ and } \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}.$$

Thus C – R equations are satisfied. Also partial derivatives are continuous except at (0, 0).

Therefore  $\frac{1}{z}$  is analytic everywhere except at  $z = 0$ .

$$\text{Also } \frac{dw}{dz} = -\frac{1}{z^2}$$

This again shows that  $\frac{dw}{dz}$  exists everywhere except at  $z = 0$ . Hence  $\frac{1}{z}$  is analytic everywhere except at  $z = 0$ . Ans.

**Example 5.** Show that the function  $e^x(\cos y + i \sin y)$  is an analytic function, find its derivative. (R.G.P.V., Bhopal, III Semester, June 2008)

**Solution.** Let  $e^x(\cos y + i \sin y) = u + iv$

$$\text{So, } e^x \cos y = u \quad \text{and} \quad e^x \sin y = v \quad \text{then} \quad \frac{\partial u}{\partial x} = e^x \cos y, \quad \frac{\partial v}{\partial y} = e^x \cos y$$

$$\frac{\partial u}{\partial y} = -e^x \sin y, \quad \frac{\partial v}{\partial x} = e^x \sin y$$

$$\text{Here we see that } \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

These are C – R equations and are satisfied and the partial derivatives are continuous.

Hence,  $e^x(\cos y + i \sin y)$  is analytic.

$$f(z) = u + iv = e^x(\cos y + i \sin y) \text{ and } \frac{\partial u}{\partial x} = e^x \cos y, \quad \frac{\partial v}{\partial x} = e^x \sin y$$

$$f'(z) = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} = e^x \cos y + ie^x \sin y = e^x(\cos y + i \sin y) = e^x \cdot e^{iy} = e^{x+iy} = e^z.$$

Which is the required derivative. Ans.

**Example 6.** Test the analyticity of the function  $w = \sin z$  and hence derive that:

$$\frac{d}{dz}(\sin z) = \cos z$$

**Solution.**  $w = \sin z = \sin(x+iy) = \sin x \cos iy + \cos x \sin iy$

$$\begin{aligned}
 &= \sin x \cosh y + i \cos x \sinh y \\
 u &= \sin x \cosh y, \quad v = \cos x \sinh y \quad [\cos iy = \cosh y] \\
 \frac{\partial u}{\partial x} &= \cos x \cosh y, \quad \frac{\partial u}{\partial y} = \sin x \sinh y \quad [\sin iy = i \sinh y] \\
 \frac{\partial v}{\partial x} &= -\sin x \sinh y, \quad \frac{\partial v}{\partial y} = \cos x \cosh y
 \end{aligned}$$

Thus  $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$  and  $\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$

So  $C - R$  equations are satisfied and partial derivatives are continuous.

Hence,  $\sin z$  is an analytic function.

$$\begin{aligned}
 \frac{d}{dz}(\sin z) &= \frac{d}{dz}[\sin x \cosh y + i \cos x \sinh y] \\
 &= \frac{\partial}{\partial x}(\sin x \cosh y + i \cos x \sinh y) \\
 &= \cos x \cosh y - i \sin x \sinh y = \cos x \cos iy - \sin x \sin iy \\
 &= \cos(x+iy) = \cos z
 \end{aligned}$$

**Ans.**

**Example 7.** Show that the real and imaginary parts of the function  $w = \log z$  satisfy the Cauchy-Riemann equations when  $z$  is not zero. Find its derivative.

**Solution.** To separate the real and imaginary parts of  $\log z$ , we put  $x = r \cos \theta$ ;  $y = r \sin \theta$

$$w = \log z = \log(x+iy)$$

$$\begin{aligned}
 \Rightarrow u+iv &= \log(r \cos \theta + ir \sin \theta) = \log r (\cos \theta + i \sin \theta) = \log_e r \cdot e^{i\theta} \\
 &= \log_e r + \log_e e^{i\theta} = \log r + i\theta = \log \sqrt{x^2 + y^2} + i \tan^{-1} \frac{y}{x} \quad \left[ \begin{array}{l} r = \sqrt{x^2 + y^2} \\ \theta = \tan^{-1} \frac{y}{x} \end{array} \right]
 \end{aligned}$$

So  $u = \log \sqrt{x^2 + y^2} = \frac{1}{2} \log(x^2 + y^2)$ ,  $v = \tan^{-1} \frac{y}{x}$

On differentiating  $u, v$ , we get

$$\frac{\partial u}{\partial x} = \frac{1}{2} \frac{1}{x^2 + y^2} \cdot (2x) = \frac{x}{x^2 + y^2} \quad \dots (1)$$

$$\frac{\partial v}{\partial y} = \frac{1}{1 + \frac{y^2}{x^2}} \left( \frac{1}{x} \right) = \frac{x}{x^2 + y^2} \quad \dots (2)$$

From (1) and (2),  $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$   $\dots (A)$

Again differentiating  $u, v$ , we have

$$\frac{\partial u}{\partial y} = \frac{1}{2} \frac{1}{x^2 + y^2} (2y) = \frac{y}{x^2 + y^2} \quad \dots (3)$$

$$\frac{\partial v}{\partial x} = \frac{1}{1 + \frac{y^2}{x^2}} \left( -\frac{y}{x^2} \right) = -\frac{y}{x^2 + y^2} \quad \dots (4)$$

$$\cosh x = \frac{e^x + e^{-x}}{2} \quad \dots (1)$$

$$\sinh x = \frac{e^x - e^{-x}}{2} \quad \dots (2)$$

$$\cos x = \frac{e^{ix} + e^{-ix}}{2} \quad \dots (3)$$

$$\sin x = \frac{e^{ix} - e^{-ix}}{2i} \quad \dots (4)$$

$$\text{From (1)} \quad \cosh ix = \frac{e^{ix} + e^{-ix}}{2} = \cos x$$

$$\begin{aligned}
 \text{From (3)} \quad \cos ix &= \frac{e^{i(ix)} + e^{-i(ix)}}{2} \\
 &= \frac{e^x + e^{-x}}{2} = \cosh x
 \end{aligned}$$

$$\begin{aligned}
 \text{From (4)} \quad \sin ix &= \frac{e^{i(ix)} - e^{-i(ix)}}{2i} \\
 &= i \frac{e^x - e^{-x}}{2} = i \sinh x
 \end{aligned}$$

$$\text{From (2)} \quad \sinh ix = \frac{e^{ix} - e^{-ix}}{2} = i \sin x$$

From (3) and (4), we have

$$\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x} \quad \dots \text{(B)}$$

Equations (A) and (B) are  $C - R$  equations and partial derivatives are continuous. Hence,  $w = \log z$  is an analytic function except

$$\text{when } x^2 + y^2 = 0 \Rightarrow x = y = 0 \Rightarrow x + iy = 0 \Rightarrow z = 0$$

$$\text{Now } w = u + iv$$

$$\begin{aligned} \frac{dw}{dz} &= \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} = \frac{x}{x^2 + y^2} - i \frac{y}{x^2 + y^2} = \frac{x - iy}{x^2 + y^2} \\ &= \frac{x - iy}{(x + iy)(x - iy)} = \frac{1}{x + iy} = \frac{1}{z} \end{aligned}$$

Which is the required derivative.

**Ans.**

**Example 8.** Find the values of  $C_1$  and  $C_2$  such that the function

$$f(z) = x^2 + C_1 y^2 - 2xy + i(C_2 x^2 - y^2 + 2xy) \text{ is analytic. Also find } f'(z).$$

**Solution.** Let  $f(z) = u + iv = x^2 + C_1 y^2 - 2xy + i(C_2 x^2 - y^2 + 2xy)$

Equating real and imaginary parts, we get

$$u = x^2 + C_1 y^2 - 2xy \text{ and } v = C_2 x^2 - y^2 + 2xy$$

$$\frac{\partial u}{\partial x} = 2x - 2y \text{ and } \frac{\partial v}{\partial x} = 2C_2 x + 2y$$

$$\frac{\partial u}{\partial y} = 2C_1 y - 2x \text{ and } \frac{\partial v}{\partial y} = -2y + 2x$$

$C - R$  equations are

$$\left. \begin{aligned} \frac{\partial u}{\partial x} &= \frac{\partial v}{\partial y} \\ \frac{\partial u}{\partial y} &= -\frac{\partial v}{\partial x} \end{aligned} \right] \Rightarrow \begin{aligned} 2x - 2y &= -2y + 2x \\ 2C_1 y - 2x &= -2C_2 x - 2y \end{aligned} \quad \dots \text{(1)} \quad \dots \text{(2)}$$

From (2) equating the coefficient of  $x$  and  $y$ .

$$2C_1 = -2 \Rightarrow C_1 = -1$$

$$-2 = -2C_2 \Rightarrow C_2 = 1$$

Hence,  $C_1 = -1$  and  $C_2 = 1$

**Ans.**

On putting the value of  $C_2$ , we get

$$\frac{\partial u}{\partial x} = 2x - 2y, \quad \frac{\partial v}{\partial x} = 2x + 2y$$

$$\begin{aligned} f'(z) &= \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} = (2x - 2y) + i(2x + 2y) = 2[(x + iy) + (-y + iy)] \\ &= 2[(1+i)x + i(1+i)y] = 2(1+i)(x + iy) = 2(1+i)z \end{aligned}$$

This is the required derivative.

**Ans.**

**Example 9.** Discuss the analyticity of the function  $f(z) = z\bar{z}$ .

$$\text{Solution. } f(z) = z\bar{z} = (x+iy)(x-iy) = x^2 - i^2 y^2 = x^2 + y^2$$

$$f(z) = x^2 + y^2 = u + iv.$$

$$u = x^2 + y^2, v = 0$$

At origin,  $\frac{\partial u}{\partial x} = \lim_{h \rightarrow 0} \frac{u(0+h, 0) - u(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{h^2}{h} = 0$

$$\frac{\partial u}{\partial y} = \lim_{k \rightarrow 0} \frac{u(0, 0+k) - u(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{k^2}{k} = 0 \quad [\text{See Art. 27.13 on page 685}]$$

Also,  $\frac{\partial v}{\partial x} = \lim_{h \rightarrow 0} \frac{v(0+h, 0) - v(0, 0)}{h} = 0$

$$\frac{\partial v}{\partial y} = \lim_{k \rightarrow 0} \frac{v(0, 0+k) - v(0, 0)}{k} = 0$$

Thus,  $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$  and  $\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$ .

Hence, C – R equations are satisfied at the origin.

$$f'(0) = \lim_{z \rightarrow 0} \frac{f(z) - f(0)}{z} = \lim_{z \rightarrow 0} \frac{(x^2 + y^2) - 0}{x + iy}$$

Let  $z \rightarrow 0$  along the line  $y = mx$ , then

$$f'(0) = \lim_{x \rightarrow 0} \frac{(x^2 + m^2 x^2)}{(x + imx)} = \lim_{x \rightarrow 0} \frac{(1+m^2)x}{1+im} = 0$$

Therefore,  $f'(0)$  is unique. Hence the function  $f(z)$  is analytic at  $z=0$ .

**Ans.**

**Example 10.** Show that the function  $f(z) = u + iv$ , where

$$f(z) = \frac{x^3(1+i) - y^3(1-i)}{x^2 + y^2}, \quad z \neq 0$$

$$= 0, \quad z = 0$$

satisfies the Cauchy-Riemann equations at  $z = 0$ . Is the function analytic at  $z = 0$  ? Justify your answer.

**Solution.**  $f(z) = \frac{x^3(1+i) - y^3(1-i)}{x^2 + y^2} = u + iv$

$$u = \frac{x^3 - y^3}{x^2 + y^2}, \quad v = \frac{x^3 + y^3}{x^2 + y^2}$$

[By differentiation the value of  $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y}$  at  $(0, 0)$  we get  $\frac{0}{0}$ , so we apply first principle method]

At the origin

$$\frac{\partial u}{\partial x} = \lim_{h \rightarrow 0} \frac{u(0+h, 0) - u(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{\frac{h^3}{h^2}}{\frac{-k^3}{h^3}} = 1 \quad (\text{Along } x\text{- axis})$$

$$\frac{\partial u}{\partial y} = \lim_{k \rightarrow 0} \frac{u(0, 0+k) - u(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{\frac{k^3}{k^2}}{\frac{k^3}{k}} = -1 \quad (\text{Along } y\text{- axis})$$

$$\frac{\partial v}{\partial x} = \lim_{h \rightarrow 0} \frac{v(0+h, 0) - v(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{\frac{h^3}{h^2}}{\frac{k^3}{h^3}} = 1 \quad (\text{Along } x\text{- axis})$$

$$\frac{\partial v}{\partial y} = \lim_{k \rightarrow 0} \frac{v(0, 0+k) - v(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{\frac{k^3}{k^2}}{\frac{k^3}{k}} = 1 \quad (\text{Along } y\text{- axis})$$

Thus we see that

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \quad \text{and} \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

Hence, Cauchy-Riemann equations are satisfied at  $z = 0$ .

$$\begin{aligned} \text{Again } f'(0) &= \lim_{z \rightarrow 0} \frac{f(0+z) - f(0)}{z} = \lim_{z \rightarrow 0} \left[ \frac{\frac{x^3 - y^3 + i(x^3 + y^3)}{x^2 + y^2} - (0)}{x + iy} \right] \\ &= \lim_{z \rightarrow 0} \left[ \frac{x^3 - y^3 + i(x^3 + y^3)}{x^2 + y^2} \cdot \frac{1}{x + iy} \right] \end{aligned}$$

Now let  $z \rightarrow 0$  along  $y = x$ , then

$$\begin{aligned} f'(0) &= \lim_{x \rightarrow 0} \frac{x^3 - x^3 + i(x^3 + x^3)}{x^2 + x^2} \left( \frac{1}{x + ix} \right) \\ &= \frac{2i}{2(1+i)} = \frac{i}{1+i} = \frac{i(1-i)}{(1+i)(1-i)} = \frac{i+1}{1+1} = \frac{1}{2}(1+i) \end{aligned} \quad \dots (1)$$

Again let  $z \rightarrow 0$  along  $y = 0$ , then

$$f'(0) = \lim_{x \rightarrow 0} \frac{x^3 + ix^3}{x^2} \cdot \frac{1}{x} = (1+i) \quad [\text{Increment} = z] \quad \dots (2)$$

From (1) and (2), we see that  $f'(0)$  is not unique. Hence the function  $f(z)$  is not analytic at  $z = 0$ .  
**Ans.**

**Example 11.** Show that the function defined by  $f(z) = \sqrt{|xy|}$

Satisfies Cauchy-Riemann equation at the origin but is not analytic at that point.

**Solution.** Let  $f(z) = u + iv = \sqrt{|xy|}$

Equating real and imaginary parts, we get  $u = \sqrt{|xy|}$ ,  $v = 0$

At origin

$$\frac{\partial u}{\partial x} = \lim_{h \rightarrow 0} \frac{u(0+h, 0) - u(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{0-0}{h} = 0$$

$$\frac{\partial u}{\partial y} = \lim_{k \rightarrow 0} \frac{u(0, 0+k) - u(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{0-0}{k} = 0$$

$$\text{Also } \frac{\partial v}{\partial x} = \lim_{h \rightarrow 0} \frac{v(0+h, 0) - v(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{0-0}{h} = 0$$

$$\frac{\partial v}{\partial y} = \lim_{k \rightarrow 0} \frac{v(0, 0+k) - v(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{0-0}{k} = 0$$

From the above results, it is clear that

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \quad \text{and} \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

Hence, C-R equations are satisfied at the origin

$$f'(0) = \lim_{z \rightarrow 0} \frac{f(z) - f(0)}{z} = \lim_{z \rightarrow 0} \frac{\sqrt{|xy|} - 0}{x + iy}$$

Let  $z \rightarrow 0$  along the line  $y = mx$ , then

$$f'(0) = \lim_{x \rightarrow 0} \frac{\sqrt{|mx^2|} - 0}{x(1+im)} = \lim_{x \rightarrow 0} \frac{\sqrt{|m|}}{1+im}$$

Thus, the limit on R.H.S. depends upon  $m$  and hence will have different values for different values of  $m$ .

Therefore,  $f'(0)$  is not unique.

Hence the function  $f(z)$  is not analytic at  $z = 0$ .

**Ans.**

**Example 12.** Show that the function

$$\begin{aligned} f(z) &= e^{-z^{-4}}, \quad (z \neq 0) \quad \text{and} \\ f(0) &= 0 \end{aligned}$$

is not analytic at  $z = 0$ ,

although, Cauchy-Riemann equations are satisfied at the point. How would you explain this.

**Solution.**  $f(z) = u + iv = e^{-z^{-4}} = e^{-(x+iy)^{-4}} = e^{-\frac{1}{(x+iy)^4}}$

$$\begin{aligned} \Rightarrow u + iv &= e^{-\frac{(x-iy)^4}{(x^2+y^2)^4}} = e^{-\frac{1}{(x^2+y^2)^4}[(x^4+y^4-6x^2y^2)-i4xy(x^2-y^2)]} \\ \Rightarrow u + iv &= e^{-\frac{x^4+y^4-6x^2y^2}{(x^2+y^2)^4}} \cdot e^{-\frac{i4xy(x^2-y^2)}{(x^2+y^2)^4}} \\ \Rightarrow u + iv &= e^{-\frac{x^4+y^4-6x^2y^2}{(x^2+y^2)^4} \left[ \cos \frac{4xy(x^2-y^2)}{(x^2+y^2)^4} - i \sin \frac{4xy(x^2-y^2)}{(x^2+y^2)^4} \right]} \end{aligned}$$

Equating real and imaginary parts, we get

$$u = e^{-\frac{x^4+y^4-6x^2y^2}{(x^2+y^2)^4} \cos \frac{4xy(x^2-y^2)}{(x^2+y^2)^4}}, \quad v = e^{-\frac{x^4+y^4-6x^2y^2}{(x^2+y^2)^4} \sin \frac{4xy(x^2-y^2)}{(x^2+y^2)^4}}$$

$$\text{At } z = 0 \quad \frac{\partial u}{\partial x} = \lim_{h \rightarrow 0} \frac{u(0+h, 0) - u(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{e^{-h^{-4}}}{h} = \lim_{h \rightarrow 0} \frac{1}{he^{-h^4}}$$

$$= \lim_{h \rightarrow 0} \left[ \frac{1}{h \left[ 1 + \frac{1}{h^4} + \frac{1}{2!h^8} + \frac{1}{3!h^{12}} + \dots \right]} \right], \quad \left( e^x = 1 + x + \frac{x^2}{2!} + \dots \right)$$

$$= \lim_{h \rightarrow 0} \left[ \frac{1}{h + \frac{1}{h^3} + \frac{1}{2h^7} + \frac{1}{6h^{11}} + \dots} \right] = \frac{1}{0 + \infty} = \frac{1}{\infty} = 0$$

$$\frac{\partial u}{\partial y} = \lim_{k \rightarrow 0} \frac{u(0, 0+k) - u(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{e^{-k^{-4}}}{k} = \lim_{k \rightarrow 0} \frac{1}{ke^{-k^4}} = 0$$

$$\frac{\partial v}{\partial x} = \lim_{h \rightarrow 0} \frac{v(0+h, 0) - v(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{e^{-h^{-4}}}{h} = \lim_{h \rightarrow 0} \frac{1}{h \cdot e^{-h^4}} = 0$$

$$\frac{\partial v}{\partial y} = \lim_{k \rightarrow 0} \frac{v(0, 0+k) - v(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{e^{-k^4}}{k} = \lim_{k \rightarrow 0} \frac{1}{k \cdot e^{k^4}} = 0$$

Hence  $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$  and  $\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$  (C-R equations are satisfied at  $z=0$ )

But  $f'(0) = \lim_{z \rightarrow 0} \frac{f(z) - f(0)}{z} = \lim_{z \rightarrow 0} \frac{e^{-z^4}}{z}$

Along  $z = re^{i\frac{\pi}{4}}$  
$$f'(0) = \lim_{r \rightarrow 0} \frac{e^{-r^4} \cdot e^{-\left(e^{\frac{i\pi}{4}}\right)^{-4}}}{r e^{\frac{i\pi}{4}}} = \lim_{r \rightarrow 0} \frac{e^{-r^4} \cdot e^{-\left(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4}\right)^{-4}}}{r e^{\frac{i\pi}{4}}}$$
  
 $= \lim_{r \rightarrow 0} \frac{e^{-r^4} e^{-\cos \pi}}{r e^{\frac{i\pi}{4}}} = \lim_{r \rightarrow 0} \frac{e^{-r^4} \cdot e}{r e^{\frac{i\pi}{4}}} = \infty$

Showing that  $f'(z)$  does not exist at  $z=0$ . Hence  $f(z)$  is not analytic at  $z=0$ . **Proved.**

**Example 13.** Examine the nature of the function

$$f(z) = \frac{x^2 y^5 (x+iy)}{x^4 + y^{10}}, z \neq 0$$

$$f(0) = 0$$

in the region including the origin.

**Solution.** Here  $f(z) = u + iv = \frac{x^2 y^5 (x+iy)}{x^4 + y^{10}}, z \neq 0$

Equating real and imaginary parts, we get

$$u = \frac{x^3 y^5}{x^4 + y^{10}}, \quad v = \frac{x^2 y^6}{x^4 + y^{10}}$$

$$\frac{\partial u}{\partial x} = \lim_{h \rightarrow 0} \frac{u(0+h, 0) - u(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{\frac{0}{h^4}}{h} = \lim_{h \rightarrow 0} \frac{0}{h} = 0$$

$$\frac{\partial u}{\partial y} = \lim_{k \rightarrow 0} \frac{u(0, 0+k) - u(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{\frac{0}{k^{10}}}{k} = \lim_{k \rightarrow 0} \frac{0}{k} = 0$$

$$\frac{\partial v}{\partial x} = \lim_{h \rightarrow 0} \frac{v(0+h, 0) - v(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{\frac{0}{h^4}}{h} = \lim_{h \rightarrow 0} \frac{0}{h} = 0$$

$$\frac{\partial v}{\partial y} = \lim_{k \rightarrow 0} \frac{v(0, 0+k) - v(0, 0)}{k} = \lim_{k \rightarrow 0} \frac{\frac{0}{k^{10}}}{k} = \lim_{k \rightarrow 0} \frac{0}{k} = 0$$

From the above results, it is clear that

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \quad \text{and} \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

Hence, C-R equations are satisfied at the origin.

$$\text{But } f'(0) = \lim_{z \rightarrow 0} \frac{f(0+z) - f(0)}{z} = \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \left[ \frac{x^2 y^5 (x+iy)}{x^4 + y^{10}} - 0 \right] \cdot \frac{1}{x+iy} \quad (\text{Increment} = z)$$

$$= \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 y^5}{x^4 + y^{10}}$$

Let  $z \rightarrow 0$  along the radius vector  $y = mx$ , then

$$f'(0) = \lim_{x \rightarrow 0} \frac{m^5 x^7}{x^4 + m^{10} x^{10}} = \lim_{x \rightarrow 0} \frac{m^5 x^3}{1 + m^{10} x^6} = \frac{0}{1} = 0 \quad \dots (1)$$

Again let  $z \rightarrow 0$  along the curve  $y^5 = x^2$

$$f'(0) = \lim_{x \rightarrow 0} \frac{x^4}{x^4 + x^4} = \frac{1}{2} \quad \dots (2)$$

(1) and (2) shows that  $f'(0)$  does not exist. Hence,  $f(z)$  is not analytic at origin although Cauchy-Riemann equations are satisfied there. **Ans.**

## 27.10 C-R EQUATIONS IN POLAR FORM

$$\frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta}$$

$$\frac{\partial u}{\partial \theta} = -r \frac{\partial v}{\partial r} \quad (RGPV., Bhopal, III Sem. Dec. 2007)$$

**Proof.** We know  $x = r \cos \theta$ , and  $u$  is a function of  $x$  and  $y$ .

$$z = x + iy = r(\cos \theta + i \sin \theta) = r e^{i\theta} \quad \dots (1)$$

Differentiating (1) partially w.r.t., "r", we get

$$\frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} = f'(r e^{i\theta}) \cdot e^{i\theta} \quad \dots (2)$$

Differentiating (1) w.r.t. " $\theta$ ", we get

$$\frac{\partial u}{\partial \theta} + i \frac{\partial v}{\partial \theta} = f'(r e^{i\theta}) r e^{i\theta} i \quad \dots (3)$$

Substituting the value of  $f'(r e^{i\theta}) e^{i\theta}$  from (2) in (3), we obtain

$$\frac{\partial u}{\partial \theta} + i \frac{\partial v}{\partial \theta} = r \left( \frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right) i \quad \text{or} \quad \frac{\partial u}{\partial \theta} + i \frac{\partial v}{\partial \theta} = ir \frac{\partial u}{\partial r} - r \frac{\partial v}{\partial r}$$

Equating real and imaginary parts, we get

$\frac{\partial u}{\partial \theta} = -r \frac{\partial v}{\partial r}$	$\Rightarrow$	$\frac{\partial v}{\partial r} = -\frac{1}{r} \frac{\partial u}{\partial \theta}$
---	---------------	---

And

$\frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta}$
--

**Proved.**

### 27.11 DERIVATIVE OF $w$ IN POLAR FORM

We know that  $w = u + iv$ ,  $\frac{\partial w}{\partial x} = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x}$

$$\begin{aligned} \text{But } \frac{dw}{dz} &= \frac{\partial w}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial w}{\partial \theta} \frac{\partial \theta}{\partial x} = \frac{\partial w}{\partial r} \cos \theta - \left( \frac{\partial u}{\partial \theta} + i \frac{\partial v}{\partial \theta} \right) \frac{\sin \theta}{r} \\ &= \frac{\partial w}{\partial r} \cos \theta - \left( -r \frac{\partial v}{\partial r} + i \cdot r \frac{\partial u}{\partial r} \right) \frac{\sin \theta}{r} & \frac{\partial u}{\partial \theta} = -r \frac{\partial v}{\partial r} \\ &= \frac{\partial w}{\partial r} \cos \theta - i \left( \frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right) \sin \theta & \frac{\partial v}{\partial \theta} = r \frac{\partial u}{\partial r} \\ &= \frac{\partial w}{\partial r} \cos \theta - i \frac{\partial}{\partial r} (u + iv) \sin \theta = \frac{\partial w}{\partial r} \cos \theta - i \frac{\partial w}{\partial r} \sin \theta & [\because w = u + iv] \\ &= (\cos \theta - i \sin \theta) \frac{\partial w}{\partial r} & \dots (1) \end{aligned}$$

Second form of  $\frac{dw}{dz}$

$$\begin{aligned} \frac{dw}{dz} &= \frac{\partial w}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial w}{\partial \theta} \frac{\partial \theta}{\partial x} = \frac{\partial(u+iv)}{\partial r} \cos \theta - \frac{\partial w}{\partial \theta} \frac{\sin \theta}{r} & [w = u + iv] \\ &= \left( \frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right) \cos \theta - \frac{\partial w}{\partial \theta} \frac{\sin \theta}{r} \\ &= \left( \frac{1}{r} \frac{\partial v}{\partial \theta} - i \frac{1}{r} \cdot \frac{\partial u}{\partial \theta} \right) \cos \theta - \frac{\partial w}{\partial \theta} \frac{\sin \theta}{r} & \left[ \begin{array}{l} \frac{\partial u}{\partial \theta} = -r \frac{\partial v}{\partial r} \\ \frac{\partial v}{\partial \theta} = r \frac{\partial u}{\partial r} \end{array} \right] \\ &= -\frac{i}{r} \left( \frac{\partial u}{\partial \theta} + i \frac{\partial v}{\partial \theta} \right) \cos \theta - \frac{\partial w}{\partial \theta} \left( \frac{\sin \theta}{r} \right) \\ &= -\frac{i}{r} \frac{\partial}{\partial \theta} (u + iv) \cos \theta - \frac{\partial w}{\partial \theta} \left( \frac{\sin \theta}{r} \right) & [w = 0] \\ &= -\frac{i}{r} \frac{\partial w}{\partial \theta} \cos \theta - \frac{\partial w}{\partial \theta} \frac{\sin \theta}{r} = -\frac{i}{r} (\cos \theta - i \sin \theta) \frac{\partial w}{\partial r} & \dots (2) \\ \boxed{\frac{dw}{dz} = (\cos \theta - i \sin \theta) \frac{\partial w}{\partial r}} & \quad \left[ -\frac{i}{r} \frac{\partial w}{\partial \theta} = \frac{\partial w}{\partial r} \right] \\ \boxed{\frac{dw}{dz} = -\frac{i}{r} (\cos \theta - i \sin \theta) \frac{\partial w}{\partial \theta}} \end{aligned}$$

These are the two forms for  $\frac{dw}{dz}$ .

**Example 14.** If  $n$  is real, show that  $r^n (\cos n\theta + i \sin n\theta)$  is analytic except possible when  $r = 0$  and that its derivative is

$$nr^{n-1} [\cos(n-1)\theta + i \sin(n-1)\theta].$$

**Solution.** Let

$$w = f(z) = u + iv = r^n (\cos n\theta + i \sin n\theta)$$

Here,

$$u = r^n \cos n\theta, \quad v = r^n \sin n\theta$$

then,

$$\frac{\partial u}{\partial r} = nr^{n-1} \cos n\theta, \quad \frac{\partial v}{\partial r} = nr^{n-1} \sin n\theta$$

$$\frac{\partial u}{\partial \theta} = -nr^n \sin n\theta, \quad \frac{\partial v}{\partial \theta} = nr^n \cos n\theta$$

Here,

$$\frac{\partial u}{\partial r} = nr^{n-1} \cos n\theta = \frac{1}{r}(nr^n \cos n\theta)$$

$$\frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta} \quad \dots(1)$$

and  $\frac{\partial v}{\partial r} = nr^{n-1} \sin n\theta \quad \frac{\partial v}{\partial r} = -\frac{1}{r}(-nr^n \sin n\theta)$

$$\frac{\partial v}{\partial r} = -\frac{1}{r} \frac{\partial u}{\partial \theta} \quad \dots(2)$$

Equations (1) and (2) satisfied C-R equations.

We have,

$$\begin{aligned} \frac{dw}{dz} &= (\cos \theta - i \sin \theta) \frac{\partial w}{\partial r} = (\cos \theta - i \sin \theta) \left( \frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right) \\ &= (\cos \theta - i \sin \theta) (nr^{n-1} \cos n\theta + inr^{n-1} \sin n\theta) \\ &= (\cos \theta - i \sin \theta) nr^{n-1} (\cos n\theta + i \sin n\theta) \\ &= nr^{n-1} \{(\cos n\theta \cos \theta + \sin n\theta \sin \theta) \\ &\quad + i(\sin n\theta \cos \theta - \cos n\theta \sin \theta)\} \\ &= nr^{n-1} \{ \cos(n-1)\theta + i \sin(n-1)\theta \} \end{aligned}$$

This exists for all finite values of  $r$  including zero, except when  $r = 0$  and  $n \leq 1$ . **Proved.**

### EXERCISE 27.1

Determine which of the following functions are analytic:

1.  $x^2 + iy^2$  **Ans.** Analytic at all points  $y = x$     2.  $2xy + i(x^2 - y^2)$  **Ans.** Not analytic
3.  $\frac{x - iy}{x^2 + y^2}$  **Ans.** Not analytic    4.  $\frac{1}{(z-1)(z+1)}$  **Ans.** Analytic at all points, except  $z = \pm 1$
5.  $\frac{x - iy}{x - iy + a}$  **Ans.** Not analytic    6.  $\sin x \cosh y + i \cos x \sinh y$  **Ans.** Yes, analytic
7.  $xy + iy^2$  **Ans.** Yes, analytic at origin
8. Discuss the analyticity of the function  $f(z) = z\bar{z} + \bar{z}^2$  in the complex plane, where  $\bar{z}$  is the complex conjugate of  $z$ . Also find the points where it is differentiable but not analytic.  
**Ans.** Differentiable only at  $z = 0$ , No where analytic.

9. Show the function of  $\bar{z}$  is not analytic anywhere.

10. If 
$$\begin{cases} \frac{x^2y(y-ix)}{x^4+y^2}, & \text{when } z \neq 0 \\ 0, & \text{when } z = 0 \end{cases}$$

prove that  $\frac{f(z) - f(0)}{z} \rightarrow 0$ , as  $z \rightarrow 0$ , along any radius vector but not as  $z \rightarrow 0$  in any manner.

(AMIETE, Dec. 2010)

11. If  $f(z)$  is an analytic function with constant modulus, show that  $f(z)$  is constant. (AMIETE, Dec. 2009)

**Choose the correct answer :**

12. The Cauchy-Riemann equations for  $f(z) = u(x, y) + iv(x, y)$  to be analytic are :
 

$(a) \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0, \quad \frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} = 0$	$(b) \frac{\partial u}{\partial x} = -\frac{\partial v}{\partial y}, \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$
$(c) \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$	$(d) \frac{\partial u}{\partial x} = -\frac{\partial v}{\partial y}, \quad \frac{\partial u}{\partial y} = \frac{\partial v}{\partial x}$

**Ans. (c)**

(R.G.P.V., Bhopal, III Semester, Dec. 2006)

**13. Polar form of C-R equations are :**

(a)  $\frac{\partial u}{\partial \theta} = \frac{1}{r} \frac{\partial v}{\partial r}, \quad \frac{\partial u}{\partial r} = r \frac{\partial v}{\partial \theta}$

(b)  $\frac{\partial u}{\partial \theta} = r \frac{\partial v}{\partial r}, \quad \frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta}$

(c)  $\frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta}, \quad \frac{\partial u}{\partial \theta} = -r \frac{\partial v}{\partial r}$

(d)  $\frac{\partial u}{\partial r} = r \frac{\partial v}{\partial \theta}, \quad \frac{\partial u}{\partial \theta} = -r \frac{\partial v}{\partial r}$

**Ans. (c)**

(R.G.P.V., Bhopal, III Semester, June, 2007)

**14. The curve  $u(x, y) = C$  and  $v(x, y) = C^1$  are orthogonal if**(a)  $u$  and  $v$  are complex functions      (b)  $u + iv$  is an analytic function.(c)  $u - v$  is an analytic function.      (d)  $u + v$  is an analytic function**Ans. (b)****15. If  $f(z) = \frac{1}{2} \log_e(x^2 + y^2) + i \tan^{-1}\left(\frac{\alpha x}{y}\right)$  be an analytic function if  $\alpha$  is equal to**

(a) +1      (b) -1

(c) +2      (d) -2

(AMIETE, Dec. 2009) **Ans. (a)****27.12 ORTHOGONAL CURVES**

(U.P. III Semester, June 2009)

Two curves are said to be orthogonal to each other, when they intersect at right angle at each of their points of intersection.

The analytic function  $f(z) = u + iv$  consists of two families of curves  $u(x, y) = c_1$  and  $v(x, y) = c_2$  which form an orthogonal system.

$u(x, y) = c_1 \quad \dots(1)$

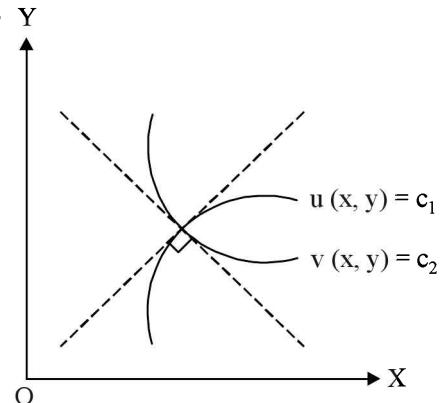

$v(x, y) = c_2 \quad \dots(2)$

Differentiating (1),  $\frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy = 0$

$$\Rightarrow \frac{dy}{dx} = -\frac{\frac{\partial u}{\partial x}}{\frac{\partial u}{\partial y}} = m_1 \text{ (say)}$$

$$\text{Similarly from (2), } \frac{dy}{dx} = -\frac{\frac{\partial v}{\partial x}}{\frac{\partial v}{\partial y}} = m_2 \text{ (say)}$$

The product of two slopes

$$m_1 m_2 = \left( -\frac{\frac{\partial u}{\partial x}}{\frac{\partial u}{\partial y}} \right) \left( -\frac{\frac{\partial v}{\partial x}}{\frac{\partial v}{\partial y}} \right) = \left( -\frac{\frac{\partial u}{\partial x}}{\frac{\partial u}{\partial y}} \right) \left( -\frac{-\frac{\partial u}{\partial y}}{\frac{\partial u}{\partial x}} \right) = -1 \quad (\text{C-R equations})$$

Since  $m_1 m_2 = -1$ , two curves  $u = c_1$  and  $v = c_2$  are orthogonal, and  $c_1, c_2$  are parameters,  $u = c_1$  and  $v = c_2$  form an orthogonal system.

**27.13 HARMONIC FUNCTION**

(U.P., III Semester 2009-2010)

Any function which satisfies the Laplace's equation is known as a harmonic function.

**Theorem.** If  $f(z) = u + iv$  is an analytic function, then  $u$  and  $v$  are both harmonic functions.**Proof.** Let  $f(z) = u + iv$ , be an analytic function, then we have

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \quad \dots(1)$$

$$\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x} \quad \dots(2)$$

$C - R$  equations.

Differentiating (1) with respect to  $x$ , we get  $\frac{\partial^2 u}{\partial x^2} = \frac{\partial^2 v}{\partial x \partial y}$  ... (3)

Differentiating (2) w.r.t. 'y' we have  $\frac{\partial^2 u}{\partial y^2} = -\frac{\partial^2 v}{\partial y \partial x}$  ... (4)

Adding (3) and (4) we have  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = \frac{\partial^2 v}{\partial x \partial y} - \frac{\partial^2 v}{\partial y \partial x}$

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \quad \left( \frac{\partial^2 v}{\partial x \partial y} = \frac{\partial^2 v}{\partial y \partial x} \right)$$

Similarly  $\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} = 0$

Therefore both  $u$  and  $v$  are harmonic functions.

Such functions  $u, v$  are called **Conjugate harmonic functions if  $u + iv$  is also analytic function.**

**Example 15.** Define a harmonic function and conjugate harmonic function. Find the harmonic conjugate function of the function  $U(x, y) = 2x(1-y)$ . (U.P., III Semester Dec. 2009)

**Solution.** See Art. 27.13.

Here, we have  $U(x, y) = 2x(1-y)$  Let  $V$  be the harmonic conjugate of  $U$ .

By total differentiation

$$\begin{aligned} dV &= \frac{\partial V}{\partial x} dx + \frac{\partial V}{\partial y} dy \\ &= -\frac{\partial U}{\partial y} dx + \frac{\partial U}{\partial x} dy \\ &= -(-2x) dx + (2-2y) dy + \\ &= 2x dx + (2 dy - 2y dy) + C \\ V &= x^2 + 2y - y^2 + C \end{aligned}$$

Hence, the harmonic conjugate of  $U$  is  $x^2 + 2y - y^2 + C$

**Ans.**

**Example 16.** Show that the function  $u = \frac{1}{2} \log(x^2 + y^2)$  is harmonic. Find its harmonic conjugate.

$$\text{Solution. } u = \frac{1}{2} \log(x^2 + y^2)$$

$$\frac{\partial u}{\partial x} = \frac{1}{2} \frac{1}{x^2 + y^2} \cdot (2x) = \frac{x}{x^2 + y^2}, \quad \frac{\partial u}{\partial y} = \frac{y}{x^2 + y^2}$$

$$\frac{\partial^2 u}{\partial x^2} = \frac{(x^2 + y^2) \cdot 1 - x(2x)}{(x^2 + y^2)^2} = \frac{y^2 - x^2}{(x^2 + y^2)^2}$$

$$\frac{\partial^2 u}{\partial y^2} = \frac{(x^2 + y^2) \cdot 1 - y(2y)}{(x^2 + y^2)^2} = \frac{x^2 - y^2}{(x^2 + y^2)^2} \Rightarrow \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

Hence  $u$  is a harmonic function.

Let  $v$  be the harmonic conjugate of  $u$ .

$$dv = \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy = -\frac{\partial u}{\partial y} dx + \frac{\partial u}{\partial x} dy \quad (\text{By C - R equations})$$

$$dv = -\frac{y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy$$

$$dv = \frac{xdy - ydx}{x^2 + y^2} = d\left(\tan^{-1}\frac{y}{x}\right)$$

Integrating, we get  $v = \tan^{-1}\frac{y}{x} + C$ , where  $C$  is a real constant.

This is the required harmonic conjugate.

**Ans.**

**Example 17.** Prove that  $u = x^2 - y^2$  and  $v = \frac{y}{x^2 + y^2}$  are harmonic functions of  $(x, y)$ , but are not harmonic conjugates.

**Solution.** We have,  $u = x^2 - y^2$

$$\frac{\partial u}{\partial x} = 2x, \quad \frac{\partial^2 u}{\partial x^2} = 2, \quad \frac{\partial u}{\partial y} = -2y, \quad \frac{\partial^2 u}{\partial y^2} = -2$$

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 2 - 2 = 0$$

$u(x, y)$  satisfies Laplace equation, hence  $u(x, y)$  is harmonic

$$\begin{aligned} v &= \frac{y}{x^2 + y^2}, \quad \frac{\partial v}{\partial x} = -\frac{2xy}{(x^2 + y^2)^2} & U &= 2x \cdot 2xy \\ \frac{\partial^2 v}{\partial x^2} &= \frac{(x^2 + y^2)^2(-2y) - (-2xy)2(x^2 + y^2)2x}{(x^2 + y^2)^4} & \frac{\partial U}{\partial x} &= 2 - 2y \\ &= \frac{(x^2 + y^2)(-2y) - (-2xy)4x}{(x^2 + y^2)^3} = \frac{6x^2y - 2y^3}{(x^2 + y^2)^3} & \frac{\partial U}{\partial y} &= -2x \quad \dots (1) \end{aligned}$$

$$\frac{\partial v}{\partial y} = \frac{(x^2 + y^2) \cdot 1 - y(2y)}{(x^2 + y^2)^2} = \frac{x^2 - y^2}{(x^2 + y^2)^2}$$

$$\begin{aligned} \frac{\partial^2 v}{\partial y^2} &= \frac{(x^2 + y^2)^2(-2y) - (x^2 - y^2)2(x^2 + y^2)(2y)}{(x^2 + y^2)^4} = \frac{(x^2 + y^2)(-2y) - (x^2 - y^2)(4y)}{(x^2 + y^2)^3} \\ &= \frac{-2x^2y - 2y^3 - 4x^2y + 4y^3}{(x^2 + y^2)^3} = \frac{-6x^2y + 2y^3}{(x^2 + y^2)^3} \quad \dots (2) \end{aligned}$$

On adding (1) and (2), we get  $\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} = 0$

$v(x, y)$  also satisfies Laplace equations, hence  $v(x, y)$  is also harmonic function.

But  $\frac{\partial u}{\partial x} \neq \frac{\partial v}{\partial y}$  and  $\frac{\partial u}{\partial y} \neq -\frac{\partial v}{\partial x}$

Therefore  $u$  and  $v$  are not harmonic conjugates.

**Proved.**

**Example 18.** Show that the function  $x^2 - y^2 + 2y$  which is harmonic remains harmonic under the transformation  $z = w^3$

**Solution.**  $u = x^2 - y^2 + 2y$

$$\frac{\partial u}{\partial x} = 2x, \quad \frac{\partial^2 u}{\partial x^2} = 2 \quad \dots (1)$$

$$\Rightarrow \frac{\partial u}{\partial y} = -2y + 2 \quad \frac{\partial^2 u}{\partial y^2} = -2 \quad \dots (2)$$

Adding (1) and (2), we get

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 2 - 2 = 0 \Rightarrow \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

Hence function is harmonic.

**Transformation:**  $z = w^3, z = re^{i\theta}$  and  $w = Re^{i\phi}$

$$\Rightarrow re^{i\theta} = (Re^{i\phi})^3 \Rightarrow re^{i\theta} = R^3 e^{3i\phi}$$

By comparing both side  $r = R^3, \theta = 3\phi$

Given function,  $f(x, y) = x^2 - y^2 + 2y$  where  $x = r \cos \theta$  and  $y = r \sin \theta$

$$\begin{aligned} f(r \cos \theta, r \sin \theta) &= (r \cos \theta)^2 - (r \sin \theta)^2 + 2 \times r \sin \theta \\ &= r^2 \cos^2 \theta - r^2 \sin^2 \theta + 2r \sin \theta \\ &= r^2 (\cos^2 \theta - \sin^2 \theta) + 2r \sin \theta = r^2 \cos 2\theta + 2r \sin \theta \end{aligned}$$

$$f(R^3 \cos 3\phi, R^3 \sin 3\phi) = R^6 \cos 6\phi + 2R^3 \sin 3\phi$$

This is a function in cosine and sine. Hence it will be harmonic function. **Proved.**

**Example 19.** If  $u(x, y)$  and  $v(x, y)$  are harmonic functions in a region  $R$ , prove that the function

$$\left[ \left( \frac{\partial u}{\partial y} - \frac{\partial v}{\partial x} \right) + i \left( \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \right) \right]$$

is an analytic function of  $z = x + iy$ . (R.G.P.V., Bhopal, III Semester, Dec. 2004)

**Solution.** Since  $u(x, y)$  and  $v(x, y)$  are harmonic functions in a region  $R$ , therefore

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \quad \dots (1)$$

$$\text{and} \quad \frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} = 0 \quad \dots (2)$$

$$\text{Let} \quad F(z) = R + iS = \left( \frac{\partial u}{\partial y} - \frac{\partial v}{\partial x} \right) + i \left( \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \right)$$

Equating real and imaginary parts, we get

$$R = \frac{\partial u}{\partial y} - \frac{\partial v}{\partial x}, \quad \dots (3)$$

$$\frac{\partial R}{\partial x} = \frac{\partial^2 u}{\partial x \partial y} - \frac{\partial^2 v}{\partial x^2} \quad \dots (4)$$

$$\frac{\partial R}{\partial y} = \frac{\partial^2 u}{\partial y^2} - \frac{\partial^2 v}{\partial x \partial y} \quad \dots (5)$$

$$S = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \quad \dots (6)$$

$$\frac{\partial S}{\partial x} = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 v}{\partial x \partial y} \quad \dots (7)$$

$$\frac{\partial S}{\partial y} = \frac{\partial^2 u}{\partial x \partial y} + \frac{\partial^2 v}{\partial y^2} \quad \dots (8)$$

Putting the value of  $\frac{\partial^2 u}{\partial x^2}$  from (1) in (5), we get

$$\frac{\partial S}{\partial x} = - \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 v}{\partial x \partial y} \quad \dots (7)$$

Putting the value of  $\frac{\partial^2 v}{\partial y^2}$  from (2) in (6), we get

$$\frac{\partial S}{\partial y} = \frac{\partial^2 u}{\partial x \partial y} - \frac{\partial^2 v}{\partial x^2} \quad \dots (8)$$

$$\text{From (3) and (8), } \frac{\partial R}{\partial x} = \frac{\partial S}{\partial y}$$

$$\text{From (4) and (7), } \frac{\partial R}{\partial y} = - \frac{\partial S}{\partial x}$$

Therefore, C-R equations are satisfied and hence the given function is analytic. **Proved.**

## 27.14 APPLICATIONS TO FLOW PROBLEMS

As the real part  $u$  and imaginary part  $v$  of an analytic function  $f(z)$  are the solution of Laplace equation.

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

$$\text{and} \quad \frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} = 0$$

So, we get a solution to a number of field and flow problems.

## 27.15 VELOCITY POTENTIAL

Consider the two dimensional irrotational motion of an incompressible fluid, in planes parallel to  $xy$ -plane.

Let  $\vec{V}$  be the velocity of a fluid particle, then it can be expressed as

$$\vec{V} = v_x \hat{i} + v_y \hat{j} \quad \dots (1)$$

Since the motion is irrotational, there exists a scalar function  $\phi(x, y)$ , such that

$$\vec{V} = \nabla \phi(x, y) = \frac{\partial \phi}{\partial x} \hat{i} + \frac{\partial \phi}{\partial y} \hat{j} \quad \dots (2)$$

$$\text{From (1) and (2), we have } v_x = \frac{\partial \phi}{\partial x} \quad \text{and} \quad v_y = \frac{\partial \phi}{\partial y} \quad \dots (3)$$

The scalar function  $\phi(x, y)$ , which gives the velocity components, is called the velocity potential function or simply the velocity potential.

Also the fluid being incompressible,  $\operatorname{div} \vec{V} = 0$

$$\Rightarrow \left( \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} \right) \cdot (v_x \hat{i} + v_y \hat{j}) = 0$$

$$\Rightarrow \frac{\partial v_x}{\partial x} + \frac{\partial v_y}{\partial y} = 0 \quad \dots (4)$$

Substituting the values of  $v_x$  and  $v_y$  from (3) in (4), we get

$$\frac{\partial}{\partial x} \left( \frac{\partial \phi}{\partial x} \right) + \frac{\partial}{\partial y} \left( \frac{\partial \phi}{\partial y} \right) = 0 \Rightarrow \left( \frac{\partial^2 \phi}{\partial x^2} \right) + \left( \frac{\partial^2 \phi}{\partial y^2} \right) = 0$$

Thus the function  $\phi$  is harmonic.

This is the real part of an analytic function.

$$f(z) = \phi(x, y) + i \psi(x, y)$$

$$\frac{df}{dz} = \frac{\partial \phi}{\partial x} + i \frac{\partial \psi}{\partial x} = \frac{\partial \phi}{\partial x} - i \frac{\partial \phi}{\partial y} \quad \left( \frac{\partial \psi}{\partial x} = -\frac{\partial \phi}{\partial y} \right)$$

$$= v_x - i v_y$$

The magnitude of the resultant velocity

$$= \left| \frac{df}{dz} \right| = \sqrt{v_x^2 + v_y^2}.$$

$\phi(x, y) = C_1$  and  $\psi(x, y) = C_2$  are called equipotential lines and lines of force respectively.

In heat flow problem the curves  $\phi(x, y) = C_1$  and  $\psi(x, y) = C_2$  are known as isotherms and heat flow lines respectively.

## 27.16 METHOD TO FIND THE CONJUGATE FUNCTION

**Case I. Given.** If  $f(z) = u + iv$ , and  $u$  is known.

**To find.**  $v$ , conjugate function.

**Method.** We know that  $dv = \frac{\partial v}{\partial x} \cdot dx + \frac{\partial v}{\partial y} \cdot dy$  ... (1)

Replacing  $\frac{\partial v}{\partial x}$  by  $-\frac{\partial u}{\partial y}$  and  $\frac{\partial v}{\partial y}$  by  $\frac{\partial u}{\partial x}$  in (1), we get [C-R equations]

$$dv = -\frac{\partial u}{\partial y} \cdot dx + \frac{\partial u}{\partial x} \cdot dy$$

$$v = - \int \frac{\partial u}{\partial y} dx + \int \frac{\partial u}{\partial x} dy$$

$$\Rightarrow v = \int M dx + \int N dy \quad \dots (2)$$

where  $M = -\frac{\partial u}{\partial y}$  and  $N = \frac{\partial u}{\partial x}$

so that  $\frac{\partial M}{\partial y} = \frac{\partial}{\partial y} \left( -\frac{\partial u}{\partial y} \right) = -\frac{\partial^2 u}{\partial y^2}$  and  $\frac{\partial N}{\partial x} = \frac{\partial}{\partial x} \left( \frac{\partial u}{\partial x} \right) = \frac{\partial^2 u}{\partial x^2}$

since  $u$  is a conjugate function, so  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$

$$\Rightarrow -\frac{\partial^2 u}{\partial y^2} = \frac{\partial^2 u}{\partial x^2} \Rightarrow \frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} \quad \dots (3)$$

Equation (3) satisfies the condition of an exact differential equation.

So equation (2) can be integrated and thus  $v$  is determined.

**Case II.** Similarly, if  $v = v(x, y)$  is given

To find out  $u$ .

We know that  $du = \frac{\partial u}{\partial x} dx + i \frac{\partial u}{\partial y} dy$  ... (4)

On substituting the values of  $\frac{\partial u}{\partial x}$  and  $\frac{\partial u}{\partial y}$  in (4), we get

$$du = \frac{\partial v}{\partial y} dx - \frac{\partial v}{\partial x} dy$$

On integrating, we get

$$u = \int \frac{\partial v}{\partial y} dx - \int \frac{\partial v}{\partial x} dy \quad \dots(5)$$

(since  $v$  is already known so  $\frac{\partial v}{\partial y}, \frac{\partial v}{\partial x}$  on R.H.S. are also known)

Equation (5) is an exact differential equation. On solving (5),  $u$  can be determined. Consequently  $f(z) = u + iv$  can also be determined.

**Example 20.** Let  $f(z) = u(x, y) + iv(x, y)$  be an analytic function. If  $u = 3x - 2xy$ , then find  $v$  and express  $f(z)$  in terms of  $z$ .

**Solution.** Here, we have  $u = 3x - 2xy$

$$\frac{\partial u}{\partial x} = 3 - 2y, \quad \frac{\partial u}{\partial y} = -2x$$

We know that

$$dv = \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy \quad (\text{Total differentiation})$$

$$\begin{aligned} &= \left( -\frac{\partial u}{\partial y} \right) dx + \left( \frac{\partial u}{\partial x} \right) dy \quad \left( \frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y}, \frac{\partial v}{\partial y} = \frac{\partial u}{\partial x} \right) \\ &= 2x dx + (3 - 2y) dy \\ v &= \int 2x dx + \int (3 - 2y) dy = x^2 + 3y - y^2 + c \end{aligned}$$

$$\begin{aligned} f(z) &= u(x, y) + iv(x, y) = (3x - 2xy) + i(x^2 + 3y - y^2 + c) \\ &= (ix^2 - iy^2 - 2xy) + (3x + 3yi) + ic = i(x^2 - y^2 + 2ixy) + 3(x + iy) + ic \\ &= i(x + iy)^2 + 3(x + iy) + ic = iz^2 + 3z + ic \end{aligned} \quad \text{Ans.}$$

Which is the required expression of  $f(z)$  in terms of  $z$ .

**Example 21.** Prove that  $u = x^2 - y^2 - 2xy - 2x + 3y$  is harmonic. Find a function  $v$  such that  $f(z) = u + iv$  is analytic. Also express  $f(z)$  in terms of  $z$ .

(R.G.P.V., Bhopal, III Semester, June 2005)

**Solution.** We have,

$$\begin{aligned} u &= x^2 - y^2 - 2xy - 2x + 3y \\ \frac{\partial u}{\partial x} &= 2x - 2y - 2 \quad \Rightarrow \quad \frac{\partial^2 u}{\partial x^2} = 2 \\ \frac{\partial u}{\partial y} &= -2y - 2x + 3 \quad \Rightarrow \quad \frac{\partial^2 u}{\partial y^2} = -2 \\ \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} &= 2 - 2 \quad \Rightarrow \quad \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \end{aligned}$$

Since Laplace equation is satisfied, therefore  $u$  is harmonic.

**Proved.**

$$\text{We know that } dv = \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy$$

$$\Rightarrow dv = -\frac{\partial u}{\partial y} dx + \frac{\partial u}{\partial x} dy \quad \dots(1) \quad \left[ \because \frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y} \text{ and } \frac{\partial v}{\partial y} = \frac{\partial u}{\partial x} \right]$$

Putting the values of  $\frac{\partial u}{\partial y}$  and  $\frac{\partial u}{\partial x}$  in (1), we get

$$dv = -(-2y - 2x + 3) dx + (2x - 2y - 2) dy$$

$$\Rightarrow v = \int (2y + 2x - 3) dx + \int (-2y - 2) dy + C \quad (\text{Ignoring } 2x)$$

$$\text{Hence, } v = 2xy + x^2 - 3x - y^2 - 2y + C \quad \text{Ans.}$$

$$\begin{aligned} \text{Now, } f(z) &= u + iv \\ &= (x^2 - y^2 - 2xy - 2x + 3y) + i(2xy + x^2 - 3x - y^2 - 2y) + iC \\ &= (x^2 - y^2 + 2ixy) + (ix^2 - iy^2 - 2xy) - (2 + 3i)x - i(2 + 3i)y + iC \\ &= (x^2 - y^2 + 2ixy) + i(x^2 - y^2 + 2ixy) - (2 + 3i)x - i(2 + 3i)y + iC \\ &= (x + iy)^2 + i(x + iy)^2 - (2 + 3i)(x + iy) + iC \\ &= z^2 + iz^2 - (2 + 3i)z + iC \\ &= (1 + i)z^2 - (2 + 3i)z + iC \end{aligned}$$

Which is the required expression of  $f(z)$  in terms of  $z$ . Ans.

**Example 22.** Define a harmonic function. Show that the function  $u(x, y) = x^4 - 6x^2y^2 + y^4$

is harmonic. Also find the analytic function  $f(z) = u(x, y) + iv(x, y)$ .

**Solution.** See Art. 27.13 on page 685 for definition of harmonic function.

We have,

$$\begin{aligned} u(x, y) &= x^4 - 6x^2y^2 + y^4, \quad \frac{\partial u}{\partial x} = 4x^3 - 12xy^2 \\ \frac{\partial u}{\partial y} &= -12x^2y + 4y^3, \quad \frac{\partial^2 u}{\partial x^2} = 12x^2 - 12y^2 \quad \dots (1) \end{aligned}$$

$$\frac{\partial^2 u}{\partial y^2} = -12x^2 + 12y^2 \quad \dots (2)$$

Adding (1), and (2), we get

$$\begin{aligned} \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} &= 12x^2 - 12y^2 - 12x^2 + 12y^2 \\ \Rightarrow \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} &= 0 \end{aligned}$$

Hence,  $u$  is a harmonic function.

**Proved.**

Let us find out  $v$ :

$$\begin{aligned} \text{We know that } dv &= \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy \\ \Rightarrow dv &= -\frac{\partial u}{\partial y} dx + \frac{\partial u}{\partial x} dy \quad \left[ \because \frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y} \text{ and } \frac{\partial v}{\partial y} = \frac{\partial u}{\partial x} \right] \\ \Rightarrow dv &= (12x^2y - 4y^3) dx + (4x^3 - 12xy^2) dy \\ v &= \int (12x^2y - 4y^3) dx + \int (4x^3 - 12xy^2) dy \\ &\quad (\text{y is constant}) \quad (\text{Integrate only those terms which do not contain } x) \\ v &= 4x^3y - 4xy^3 + C \end{aligned}$$

$$f(z) = u + iv = x^4 - 6x^2y^2 + y^4 + i(4x^3y - 4xy^3) + iC$$

$$f(z) = x^4 + 4x^3(iy) + 6x^2(iy)^2 + 4x(iy)^3 + (iy)^4 + iC$$

$$\begin{aligned}
 &= (x+i y)^4 + i C \\
 &= z^4 + i C
 \end{aligned}
 \quad [\because z = x+iy]$$

This is the required analytic function.

**Ans.**

**Example 23.** If  $w = \phi + i\psi$  represents the complex potential for an electric field and

$$\psi = x^2 - y^2 + \frac{x}{x^2 + y^2},$$

determine the function  $\phi$ .

**Solution.**  $w = \phi + i\psi \quad \text{and} \quad \psi = x^2 - y^2 + \frac{x}{x^2 + y^2}$

$$\begin{aligned}
 \frac{\partial \psi}{\partial x} &= 2x + \frac{(x^2 + y^2) \cdot 1 - x \cdot 2x}{(x^2 + y^2)^2} = 2x + \frac{y^2 - x^2}{(x^2 + y^2)^2} \\
 \frac{\partial \psi}{\partial y} &= -2y - \frac{x(2y)}{(x^2 + y^2)^2} = -2y - \frac{2xy}{(x^2 + y^2)^2}
 \end{aligned}$$

$$\begin{aligned}
 \text{We know that, } d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy = \frac{\partial \psi}{\partial y} dx - \frac{\partial \psi}{\partial x} dy \\
 &= \left( -2y - \frac{2xy}{(x^2 + y^2)^2} \right) dx - \left( 2x + \frac{y^2 - x^2}{(x^2 + y^2)^2} \right) dy \\
 \phi &= \int \left[ -2y - \frac{2xy}{(x^2 + y^2)^2} \right] dx + c
 \end{aligned}$$

This is an exact differential equation.

$$\phi = -2xy + \frac{y}{x^2 + y^2} + C \quad \text{Ans.}$$

Which is the required function.

**Example 24.** An electrostatic field in the  $xy$ -plane is given by the potential function  $\phi = 3x^2y - y^3$ , find the stream function. (R.G.P.V., Bhopal, III Semester, Dec. 2001)

**Solution.** Let  $\psi(x, y)$  be a stream function

$$\begin{aligned}
 \text{We know that} \quad d\psi &= \frac{\partial \psi}{\partial x} dx + \frac{\partial \psi}{\partial y} dy = \left( -\frac{\partial \phi}{\partial y} \right) dx + \left( \frac{\partial \phi}{\partial x} \right) dy \quad [\text{C-R equations}] \\
 &= \{-(3x^2 - 3y^2)\} dx + 6xy dy \\
 &= -3x^2 dx + (3y^2 dx + 6xy dy) \\
 &= -d(x^3) + 3d(xy^2) \\
 \psi &= \int -d(x^3) + 3d(xy^2) + c \\
 \psi &= -x^3 + 3xy^2 + c
 \end{aligned}$$

$\psi$  is the required stream function.

**Ans..**

**Example 25.** Find the imaginary part of the analytic function whose real part is  $x^3 - 3xy^2 + 3x^2 - 3y^2$ . (R.G.P.V., Bhopal, III Semester, Dec. 2008, 2005)

**Solution.**

$$\text{Let } u(x, y) = x^3 - 3xy^2 + 3x^2 - 3y^2$$

$$\frac{\partial u}{\partial x} = 3x^2 - 3y^2 + 6x$$

$$\frac{\partial u}{\partial y} = -6xy - 6y$$

We know that

$$\begin{aligned} dv &= \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy \Rightarrow dv = -\frac{\partial u}{\partial y} dx + \frac{\partial u}{\partial x} dy \\ \Rightarrow dv &= (6xy + 6y) dx + (3x^2 - 3y^2 + 6x) dy \end{aligned}$$

This is an exact differential equation.

$$\begin{aligned} v &= \int (6xy + 6y) dx + \int -3y^2 dy + C \\ &= 3x^2 y + 6xy - y^3 + C \end{aligned}$$

Which is the required imaginary part. Ans.

**Example 26.** If  $u - v = (x - y)(x^2 + 4xy + y^2)$  and  $f(z) = u + iv$  is an analytic function of  $z = x + iy$ , find  $f(z)$  in terms of  $z$ .

**Solution.**  $u + iv = f(z) \Rightarrow iu - v = i f(z)$

Adding these,  $(u - v) + i(u + v) = (1 + i)f(z)$

Let

$$\begin{aligned} U + iV &= (1 + i)f(z) \text{ where } U = u - v \text{ and } V = u + v \\ F(z) &= (1 + i)f(z) \\ U &= u - v = (x - y)(x^2 + 4xy + y^2) \\ &= x^3 + 3x^2y - 3xy^2 - y^3 \end{aligned}$$

$$\frac{\partial U}{\partial x} = 3x^2 + 6xy - 3y^2,$$

$$\frac{\partial U}{\partial y} = 3x^2 - 6xy - 3y^2$$

$$\text{We know that } dV = \frac{\partial V}{\partial x} dx + \frac{\partial V}{\partial y} dy = -\frac{\partial U}{\partial x} dx + \frac{\partial U}{\partial y} dy \quad [\text{C-R equations}]$$

On putting the values of  $\frac{\partial U}{\partial x}$  and  $\frac{\partial U}{\partial y}$ , we get

$$= (-3x^2 + 6xy + 3y^2) dx + (3x^2 + 6xy - 3y^2) dy$$

Integrating, we get

$$\begin{aligned} V &= \int_{(y \text{ as constant})} (-3x^2 + 6xy + 3y^2) dx + \int_{(\text{Ignoring terms of } x)} (-3y^2) dy \\ &= -x^3 + 3x^2y + 3xy^2 - y^3 + c \\ F(z) &= U + iV \\ &= (x^3 + 3x^2y - 3xy^2 - y^3) + i(-x^3 + 3x^2y + 3xy^2 - y^3) + ic \\ &= (1-i)x^3 + (1+i)3x^2y - (1-i)3xy^2 - (1+i)y^3 + ic \\ &= (1-i)x^3 + i(1-i)3x^2y - (1-i)3xy^2 - i(1-i)y^3 + ic \\ &= (1-i)[x^3 + 3ix^2y - 3xy^2 - iy^3] + ic \\ &= (1-i)(x+iy)^3 + iC = (1-i)z^3 + ic \\ (1+i)f(z) &= (1-i)z^3 + ic, \quad [F(z) = (1+i)f(z)] \end{aligned}$$

$$f(z) = \frac{1-i}{1+i}z^3 + \frac{ic}{1+i} = -\frac{i(1+i)}{(1+i)(1-i)}z^3 + \frac{i(1-i)}{(1+i)(1-i)}c = -iz^3 + \frac{1+i}{2}c \quad \text{Ans.}$$

**Example 27.** If  $f(z) = u + iv$ , is any analytic function of the complex variable  $z$  and  $u - v = e^x(\cos y - \sin y)$ , find  $f(z)$  in terms of  $z$

**Solution.**  $u + iv = f(z) \Rightarrow iu - v = i f(z)$

Adding, we have

$$u + iv + iu - v = f(z) + i f'(z)$$

$$(u - v) + i(u + v) = (1 + i)f(z) = F(z) \text{ say}$$

Put  $u - v = U$  and  $u + v = V$ , then  $F(z) = U + iV$  is an analytic function.

Now  $U = e^x (\cos y - \sin y)$

$$\therefore \frac{\partial U}{\partial x} = e^x (\cos y - \sin y) \text{ and } \frac{\partial U}{\partial y} = e^x (-\sin y - \cos y)$$

$$\begin{aligned} \text{We know that } dV &= \frac{\partial V}{\partial x} dx + \frac{\partial V}{\partial y} dy = -\frac{\partial U}{\partial y} dx + \frac{\partial U}{\partial x} dy \\ &= e^x (\sin y + \cos y) dx + e^x (\cos y - \sin y) dy. \end{aligned}$$

Integrating, we have

$$\begin{aligned} V &= e^x (\sin y + \cos y) + c \\ F(z) &= U + iV \\ &= e^x (\cos y - \sin y) + ie^x (\sin y + \cos y) + ic \\ &= e^x (\cos y + i \sin y) + ie^x (\cos y + i \sin y) + ic \\ &= e^x \cdot e^{iy} + ie^x e^{iy} + ic = e^{x+iy} + ie^{x+iy} + ic = e^z + ie^z + ic \\ (1+i)f(z) &= (1+i)e^z + ic \end{aligned}$$

$$f(z) = e^z + \frac{ic}{1+i}, \quad f(z) = e^z + c_1$$

**Ans.**

This is the required result.

**Example 28.** If  $f(z) = u + iv$  is an analytic function of  $z = x + iy$  and

$$u - v = e^{-x} [(x - y) \sin y - (x + y) \cos y] \quad (\text{U.P. III Semester, 2009-2010})$$

**Solution.** We know that,

$$f(z) = u + iv \quad \dots (1)$$

$$if(z) = i(u - v) \quad \dots (2)$$

$$F(z) = U + iV$$

$$U = u - v = e^{-x} [(x - y) \sin y - (x + y) \cos y]$$

$$\frac{\partial U}{\partial x} = -e^{-x} [(x - y) \sin y - (x + y) \cos y] + e^{-x} [\sin y - \cos y]$$

$$\frac{\partial U}{\partial y} = e^{-x} [(x - y) \cos y - \sin y - (x + y) (-\sin y - \cos y)]$$

We know that,

$$dV = \frac{\partial V}{\partial x} dx + \frac{\partial V}{\partial y} dy = -\frac{\partial U}{\partial y} dx + \frac{\partial U}{\partial x} dy \quad [\text{C - R equations}]$$

$$= -e^{-x} [(x - y) \cos y - \sin y + (x + y) \sin y - \cos y] dx$$

$$-e^{-x} [(x - y) \sin y - (x + y) \cos y - \sin y + \cos y] dy$$

$$= -e^{-x} x \{(\cos y + \sin y) dx - e^{-x} (-y \cos y - \sin y + y \sin y - \cos y) dx\}$$

$$-e^{-x} [(x - y) \sin y - (x + y) \cos y - \sin y + \cos y] dy$$

$$V = (\cos y + \sin y) (x e^{-x} + e^{-x}) + e^{-x} (-y \cos y - \sin y + y \sin y - \cos y) + C$$

$$F(z) = U + iV$$

$$\begin{aligned} F(z) &= e^{-x} [(x - y) \sin y - (x + y) \cos y] + i e^{-x} [x \cos y + \cos y + x \sin y + \sin y \\ &\quad - y \cos y - \sin y + y \sin y - \cos y] + iC \\ &= e^{-x} \{x \sin y - y \sin y - x \cos y - y \cos y\} + i \{x \cos y + x \sin y - y \cos y + y \sin y\} + iC \\ &= e^{-x} [(x + i y) \sin y - (x + i y) \cos y + (-y + i x) \sin y + (-y + i x) \cos y] + iC \end{aligned}$$

$$\begin{aligned}
&= e^{-x} [(x + iy) \sin y - (x + iy) \cos y + i(x + iy) \sin y + i(x + iy) \cos y] + iC \\
&= e^{-x} (x + iy) [\sin y - \cos y + i \sin y + i \cos y] + iC \\
&= e^{-x} (x + iy) [(1+i) \sin y + i(1+i) \cos y] + iC \\
(1+i)f(z) &= e^{-x} (x + iy) (\sin y + i \cos y) + iC \\
f(z) &= e^{-x} (x + iy) (\sin y + i \cos y) + \frac{iC}{1+i} \\
&= i z e^{-x} (\cos y - i \sin y) + \frac{iC}{1+i} \\
&= i z e^{-x} e^{-iy} = i z e^{-(x+iy)} = i z e^{-z} + \frac{iC}{1+i} \tag{Ans.}
\end{aligned}$$

Let  $\phi_1(x, y) = -e^{-x} [(x-y) \sin y - (x+y) \cos y] + e^{-x} [\sin y - \cos y]$   
 $\phi_1(z, 0) = -e^{-z} [z \sin 0 - z \cos 0] + e^{-z} [\sin 0 + \cos 0]$   
 $= -e^{-z} [z - 1]$

Let  $\phi_2(x, y) = e^{-x} [(x-y) \cos y - \sin y + (x+y) \sin y - \cos y]$   
 $\phi_2(z, 0) = e^{-z} [(z) \cos 0 - \sin 0 + z \sin 0 - \cos 0]$   
 $= e^{-z} [z - 1]$   
 $F(z) = U + iV$

$$\begin{aligned}
F'(z) &= \frac{\partial U}{\partial x} + i \frac{\partial V}{\partial x} = \frac{\partial U}{\partial x} - i \frac{\partial U}{\partial y} = f_1(z, 0) - i f_2(z, 0) \\
&= e^{-z} (z - 1) - i e^{-z} (z - 1) = (1 - i) e^{-z} (z - 1) = (1 - i) e^{-z} (z - 1)
\end{aligned}$$

$$F(z) = (1 - i) \left[ z \frac{e^{-z}}{-1} - \int \frac{e^{-z}}{-1} dz \right] + C = (1 - i) [-z e^{-z} - e^{-z}] + C$$

$$\begin{aligned}
(1+i)f(z) &= (-1+i)(z+1)e^{-z} + C \\
f(z) &= \frac{(-1+i)}{1+i}(z+1)e^{-z} + C = \frac{(-1+i)(1-i)}{(1+i)(1-i)}(z+1)e^{-z} + C \\
&= i(z+1)e^{-z} + C \tag{Ans.}
\end{aligned}$$

**Example 29.** Let  $f(z) = u(r, \theta) + iv(r, \theta)$  be an analytic function and  $u = -r^3 \sin 3\theta$ , then construct the corresponding analytic function  $f(z)$  in terms of  $z$ .

**Solution.**

$$u = -r^3 \sin 3\theta$$

$$\frac{\partial u}{\partial r} = -3r^2 \sin 3\theta, \quad \frac{\partial u}{\partial \theta} = -3r^3 \cos 3\theta$$

We know that

$$\begin{aligned}
dv &= \frac{\partial v}{\partial r} dr + \frac{\partial v}{\partial \theta} d\theta \\
&= \left( -\frac{1}{r} \frac{\partial u}{\partial \theta} \right) dr + \left( r \frac{\partial u}{\partial r} \right) d\theta \\
&= -\frac{1}{r} (-3r^3 \cos 3\theta) dr + r(-3r^2 \sin 3\theta) d\theta
\end{aligned}$$

$$\begin{cases} C - R \text{ equations} \\ \frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta} \\ \frac{\partial u}{\partial \theta} = -r \frac{\partial v}{\partial r} \end{cases}$$

$$\begin{aligned}
v &= \int (3r^2 \cos 3\theta) dr - c = r^3 \cos 3\theta + c
\end{aligned}$$

$$f(z) = u + iv = -r^3 \sin 3\theta + ir^3 \cos 3\theta + ic = ir^3(\cos 3\theta + i \sin 3\theta) + ic$$

$$= ir^3 e^{i3\theta} + ic = i(r e^{i\theta})^3 + ic = iz^3 + ic \tag{Ans.}$$

This is the required analytic function.

**Example 30.** Find analytic function  $f(z) = u(r, \theta) + iv(r, \theta)$  such that

$$v(r, \theta) = r^2 \cos 2\theta - r \cos \theta + 2.$$

**Solution.** We have,  $v = r^2 \cos 2\theta - r \cos \theta + 2$  ... (1)  
Differentiating (1), we get

$$\frac{\partial v}{\partial \theta} = -2r^2 \sin 2\theta + r \sin \theta \quad \dots (2)$$

$$\frac{\partial v}{\partial r} = 2r \cos 2\theta - \cos \theta \quad \dots (3)$$

Using C-R equations in polar coordinates, we get

$$r \frac{\partial u}{\partial r} = \frac{\partial v}{\partial \theta} = -2r^2 \sin 2\theta + r \sin \theta \quad [\text{From (2)}]$$

$$\Rightarrow \frac{\partial u}{\partial r} = -2r \sin 2\theta + \sin \theta \quad \dots (4)$$

$$-\frac{1}{r} \frac{\partial u}{\partial \theta} = \frac{\partial v}{\partial r} = 2r \cos 2\theta - \cos \theta \quad [\text{From (3)}]$$

$$\Rightarrow \frac{\partial u}{\partial \theta} = -2r^2 \cos 2\theta + r \cos \theta \quad \dots (5)$$

By total differentiation formula

$$\begin{aligned} du &= \frac{\partial u}{\partial r} dr + \frac{\partial u}{\partial \theta} d\theta = (-2r \sin 2\theta + \sin \theta) dr + (-2r^2 \cos 2\theta + r \cos \theta) d\theta \\ &= -[(2r dr) \sin 2\theta + r^2 (2 \cos 2\theta d\theta)] + [\sin \theta \cdot dr + r(\cos \theta d\theta)] \\ &= -[(2r dr) \sin 2\theta - \sin \theta dr] + [-r^2 2 \cos 2\theta d\theta + r \cos \theta d\theta] \\ &= -d(r^2 \sin 2\theta) + d(r \sin \theta) \quad (\text{Exact differential equation}) \end{aligned}$$

Integrating, we get

$$u = -r^2 \sin 2\theta + r \sin \theta + c$$

Hence,

$$\begin{aligned} f(z) &= u + iv \\ &= (-r^2 \sin 2\theta + r \sin \theta + c) + i(r^2 \cos 2\theta - r \cos \theta + 2) \\ &= ir^2 (\cos 2\theta + i \sin 2\theta) - ir(\cos \theta + i \sin \theta) + 2i + c \\ &= ir^2 e^{2i\theta} - ir e^{i\theta} + 2i + c = i(r^2 e^{2i\theta} - r e^{i\theta}) + 2i + c. \end{aligned}$$

**Ans.**

This is the required analytic function.

**Example 31.** Deduce the following with the polar form of Cauchy-Riemann equations :

$$(a) \frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} = 0 \quad (b) f'(z) = \frac{r}{z} \left[ \frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right]$$

**Solution.** We know that polar form of C-R equations are

$$\frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta} \quad \dots (1)$$

$$\frac{\partial u}{\partial \theta} = -r \frac{\partial v}{\partial r} \quad \dots (2)$$

(a) Differentiating (1) partially w.r.t. r., we get

$$\frac{\partial^2 u}{\partial r^2} = -\frac{1}{r^2} \frac{\partial v}{\partial \theta} + \frac{1}{r} \frac{\partial^2 v}{\partial r \partial \theta} \quad \dots (3)$$

Differentiating (2) partially w.r.t.  $\theta$ , we have

$$\frac{\partial^2 u}{\partial \theta^2} = -r \frac{\partial^2 v}{\partial \theta \partial r} \quad \dots(4)$$

Thus using (1), (3) and (4), we get

$$\frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} = -\frac{1}{r^2} \frac{\partial v}{\partial \theta} + \frac{1}{r} \frac{\partial^2 v}{\partial r \partial \theta} + \frac{1}{r} \left( \frac{1}{r} \frac{\partial v}{\partial \theta} \right) + \frac{1}{r^2} \left( -r \frac{\partial^2 v}{\partial \theta \partial r} \right) = 0 \quad \left[ \frac{\partial^2 v}{\partial \theta \partial r} = \frac{\partial^2 v}{\partial \theta \partial r} \right]$$

**Proved.**

$$(b) \text{ Now, } r \left( \frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right) = r \left[ \left( \frac{\partial u}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial r} \right) + i \left( \frac{\partial v}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial r} \right) \right] \\ = r \left[ \left( \frac{\partial u}{\partial x} \cos \theta + \frac{\partial u}{\partial y} \sin \theta \right) + i \left( \frac{\partial v}{\partial x} \cos \theta + \frac{\partial v}{\partial y} \sin \theta \right) \right] \\ = r \cos \theta \left( \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right) + r \sin \theta \left( \frac{\partial u}{\partial y} + i \frac{\partial v}{\partial y} \right) \\ = x \left( \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right) + iy \left( \frac{\partial v}{\partial y} - i \frac{\partial u}{\partial y} \right) \quad (\text{By C-R equations}) \\ = x f'(z) + iy f'(z) = (x + iy) f'(z) = z f'(z).$$

$$\therefore f'(z) = \frac{r}{z} \left( \frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} \right) \quad \text{Proved.}$$

### 27.17 MILNE THOMSON METHOD (To construct an Analytic function)

By this method  $f(z)$  is directly constructed without finding  $v$  and the method is given below:

Since  $z = x + iy$  and  $\bar{z} = x - iy$

$$\therefore x = \frac{z + \bar{z}}{2}, y = \frac{z - \bar{z}}{2i}$$

$$f(z) \equiv u(x, y) + iv(x, y) \quad \dots(1)$$

$$f(z) \equiv u \left( \frac{z + \bar{z}}{2}, \frac{z - \bar{z}}{2i} \right) + iv \left( \frac{z + \bar{z}}{2}, \frac{z - \bar{z}}{2i} \right)$$

This relation can be regarded as a formal identity in two independent variables  $z$  and  $\bar{z}$ .  
Replacing  $\bar{z}$  by  $z$ , we get

$$f(z) \equiv u(z, 0) + iv(z, 0)$$

Which can be obtained by replacing  $x$  by  $z$  and  $y$  by 0 in (1)

#### Case I. If $u$ is given

We have

$$f(z) = u + iv$$

$$\therefore f'(z) = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x}, \quad f'(z) = \frac{\partial u}{\partial x} - i \frac{\partial u}{\partial y} \quad (C - R \text{ equations})$$

$$\text{If we write} \quad \frac{\partial u}{\partial x} = \phi_1(x, y), \quad \frac{\partial u}{\partial y} = \phi_2(x, y)$$

$$f'(z) = \phi_1(x, y) - i\phi_2(x, y) \quad \text{or} \quad f'(z) = \phi_1(z, 0) - i\phi_2(z, 0)$$

$$\text{On integrating} \quad f(z) = \int \phi_1(z, 0) dz - i \int \phi_2(z, 0) dz + c$$

#### Case II. If $v$ is given

$$f(z) = u + iv$$

$$f'(z) = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} = \frac{\partial v}{\partial y} + i \frac{\partial v}{\partial x} = \psi_1(x, y) + i \psi_2(x, y)$$

when  $\psi_1(x, y) = \frac{\partial v}{\partial y}, \quad \psi_2(x, y) = \frac{\partial v}{\partial x}$

$$f(z) = \int \psi_1(z, 0) dz + i \int \psi_2(z, 0) dz + c$$

### 27.18 WORKING RULE: TO CONSTRUCT AN ANALYTIC FUNCTION BY MILNE THOMSON METHOD

**Case I.** When  $u$  is given

**Step 1.** Find  $\frac{\partial u}{\partial x}$  and equate it to  $\phi_1(x, y)$ .

**Step 2.** Find  $\frac{\partial u}{\partial y}$  and equate it to  $\phi_2(x, y)$ .

**Step 3.** Replace  $x$  by  $z$  and  $y$  by 0 in  $\phi_1(x, y)$  to get  $\phi_1(z, 0)$ .

**Step 4.** Replace  $x$  by  $z$  and  $y$  by 0 in  $\phi_2(x, y)$  to get  $\phi_2(z, 0)$ .

**Step 5.** Find  $f(z)$  by the formula  $f(z) = \int \{\phi_1(z, 0) - i\phi_2(z, 0)\} dz + c$

**Case II.** When  $v$  is given

**Step 1.** Find  $\frac{\partial v}{\partial x}$  and equate it to  $\psi_2(x, y)$ .

**Step 2.** Find  $\frac{\partial v}{\partial y}$  and equate it to  $\psi_1(x, y)$ .

**Step 3.** Replace  $x$  by  $z$  and  $y$  by 0 in  $\psi_1(x, y)$  to get  $\psi_1(z, 0)$ .

**Step 4.** Replace  $x$  by  $z$  and  $y$  by 0 in  $\psi_2(x, y)$  to get  $\psi_2(z, 0)$ .

**Step 5.** Find  $f(z)$  by the formula

$$f(z) = \int \{\psi_1(z, 0) + i\psi_2(z, 0)\} dz + c$$

**Case III.** When  $u - v$  is given.

We know that

$$f(z) = u + iv \quad \dots(1)$$

$$if(z) = iu - v \quad \dots(2) \text{ [Multiplying by } i\text{]}$$

Adding (1) and (2), we get

$$(1 + i)f(z) = (u - v) + i(u + v)$$

$$\Rightarrow F(z) = U + iV$$

where

$$F(z) = (1 + i)f(z) \quad \dots(3) \quad \begin{bmatrix} U = u - v \\ V = u + v \end{bmatrix}$$

Here,

$U = (u - v)$  is given

Find out  $F(z)$  by the method described in case I, then substitute the value of  $F(z)$  in (3), we get

$$f(z) = \frac{F(z)}{1+i}$$

**Case IV.** When  $u + v$  is given.

We know that

$$f(z) = u + iv \quad \dots(1)$$

$$if(z) = iu - v \quad \dots(2) \text{ [Multiplying by } i\text{]}$$

Adding (1) and (2), we get

$$(1 + i)f(z) = (u - v) + i(u + v)$$

$$\Rightarrow F(z) = U + iV$$

where

$$F(z) = (1 + i)f(z) \quad \dots(3) \quad \begin{bmatrix} U = u - v \\ V = u + v \end{bmatrix}$$

Here,

$V = (u + v)$  is given

Find out  $F(z)$  by the method described in case II, then substitute the value of  $F(z)$  in (3), we get

$$f(z) = \frac{F(z)}{1+i}$$

**Example 32.** If  $u = x^2 - y^2$ , find a corresponding analytic function.

**Solution.**  $\frac{\partial u}{\partial x} = 2x = \phi_1(x, y), \quad \frac{\partial u}{\partial y} = -2y = \phi_2(x, y)$

On replacing  $x$  by  $z$  and  $y$  by 0, we have

$$\begin{aligned} \phi_1(z, 0) &= 2z \text{ and } \phi_2(z, 0) = 0 \quad f(z) = \int [\phi_1(z, 0) - i\phi_2(z, 0)] dz + C \\ &= \int [2z - i(0)] dz + c = \int 2z dz + c = z^2 + C \end{aligned} \quad \text{Ans.}$$

This is the required analytic function.

**Example 33.** Show that the function  $u = e^{-2xy} \sin(x^2 - y^2)$  is harmonic. Find the conjugate function  $v$  and express  $u + iv$  as an analytic function of  $z$ .

(R.G.P.V. Bhopal, III Semester, June, 2007, Dec. 2006)

**Solution.** We have,

$$u = e^{-2xy} \sin(x^2 - y^2) \quad \dots (1)$$

Differentiating (1), w.r.t.  $x$ , we get

$$\begin{aligned} \frac{\partial u}{\partial x} &= 2x e^{-2xy} \cos(x^2 - y^2) - 2y e^{-2xy} \sin(x^2 - y^2) \\ \Rightarrow \quad \frac{\partial u}{\partial x} &= e^{-2xy} [2x \cos(x^2 - y^2) - 2y \sin(x^2 - y^2)] = \phi_1(x, y) \quad \dots (2) \\ \phi_1(z, 0) &= 2z \cos z^2 \end{aligned}$$

Differentiating (1), w.r.t.  $y$ , we get

$$\begin{aligned} \frac{\partial u}{\partial y} &= -2y e^{-2xy} \cos(x^2 - y^2) - 2x e^{-2xy} \sin(x^2 - y^2) \\ \Rightarrow \quad \frac{\partial u}{\partial y} &= e^{-2xy} [-2y \cos(x^2 - y^2) - 2x \sin(x^2 - y^2)] = \phi_2(x, y) \quad \dots (3) \\ \phi_2(z, 0) &= -2z \sin z^2 \end{aligned}$$

Differentiating (2), w.r.t. 'x', we get

$$\begin{aligned} \frac{\partial^2 u}{\partial x^2} &= -2y e^{-2xy} [2x \cos(x^2 - y^2) - 2y \sin(x^2 - y^2)] \\ &\quad + e^{-2xy} [2 \cos(x^2 - y^2) + 2x (2x) \{-\sin(x^2 - y^2)\} - 2y (2x) \cos(x^2 - y^2)] \\ \Rightarrow \quad \frac{\partial^2 u}{\partial x^2} &= e^{-2xy} [-4xy \cos(x^2 - y^2) + 4y^2 \sin(x^2 - y^2) + 2 \cos(x^2 - y^2) \\ &\quad - 4x^2 \sin(x^2 - y^2) - 4xy \cos(x^2 - y^2)] \\ &= e^{-2xy} [-8xy \cos(x^2 - y^2) + 4y^2 \sin(x^2 - y^2) + 2 \cos(x^2 - y^2) - 4x^2 \sin(x^2 - y^2)] \quad \dots (4) \end{aligned}$$

Differentiating (3), w.r.t. 'y', we get

$$\begin{aligned} \frac{\partial^2 u}{\partial y^2} &= -2x e^{-2xy} [-2y \cos(x^2 - y^2) - 2x \sin(x^2 - y^2)] \\ &\quad + e^{-2xy} [-2 \cos(x^2 - y^2) + 2y (-2y) \sin(x^2 - y^2) - 2x (-2y) \cos(x^2 - y^2)] \\ \Rightarrow \quad \frac{\partial^2 u}{\partial y^2} &= e^{-2xy} [4xy \cos(x^2 - y^2) + 4x^2 \sin(x^2 - y^2) - 2 \cos(x^2 - y^2) \\ &\quad - 4y^2 \sin(x^2 - y^2) + 4xy \cos(x^2 - y^2)] \end{aligned}$$

$$\frac{\partial^2 u}{\partial y^2} = e^{-2xy} [8xy \cos(x^2 - y^2) + 4x^2 \sin(x^2 - y^2) - 2 \cos(x^2 - y^2) - 4y^2 \sin(x^2 - y^2)] \dots (5)$$

Adding (4) and (5), we get  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$

Which proves that  $u$  is harmonic.

Now we have to express  $u + iv$  as a function of  $z$

$$\begin{aligned} f(z) &= \int [\phi_1(z, 0) - i\phi_2(z, 0)] dz = \int [2z \cos z^2 - i(-2z \sin z^2)] dz \\ &= \sin z^2 - i \cos z^2 + C = -i(\cos z^2 + i \sin z^2) + C = -i e^{iz^2} + C \end{aligned} \quad \text{Ans.}$$

**Example 34.** If  $u = \frac{\sin 2x}{\cosh 2y + \cos 2x}$ , find  $f(z)$ .

(R.G.P.V., Bhopal, III Semester, Dec. 2003)

**Solution.**  $\frac{\partial u}{\partial x} = \frac{(\cosh 2y + \cos 2x)2 \cos 2x - \sin 2x(-2 \sin 2x)}{(\cosh 2y + \cos 2x)^2}$

$$= \frac{2 \cosh 2y \cos 2x + 2(\cos^2 2x + \sin^2 2x)}{(\cosh 2y + \cos 2x)^2} = \frac{2 \cosh 2y \cos 2x + 2}{(\cosh 2y + \cos 2x)^2} = \phi_1(x, y) \dots (1)$$

On putting  $x = z$  and  $y = 0$  in (1), we get

$$\begin{aligned} \phi_1(z, 0) &= \frac{2 \cos 2z + 2}{(1 + \cos 2z)^2} \\ \frac{\partial u}{\partial y} &= \frac{-\sin 2x(2 \sinh 2y)}{(\cosh 2y + \cos 2x)^2} = \frac{-2 \sin 2x \sinh 2y}{(\cosh 2y + \cos 2x)^2} = \phi_2(x, y) \end{aligned} \quad \dots (2)$$

On putting  $x = z$ ,  $y = 0$  in (2), we get

$$\begin{aligned} \phi_2(z, 0) &= 0 \\ f(z) &= \int [\phi_1(z, 0) - i\phi_2(z, 0)] dz + C = \int \frac{(2 \cos 2z + 2)}{(1 + \cos 2z)^2} dz + C = 2 \int \frac{1}{1 + \cos 2z} dz + C \\ &= 2 \int \frac{1}{2 \cos^2 z} dz + C = \int \sec^2 z dz + C = \tan z + C \end{aligned} \quad \text{Ans.}$$

which is the required function.

**Example 35.** Find the analytic function  $f(z) = u + iv$ , given that  $v = e^x(x \sin y + y \cos y)$ .

**Solution.**  $\frac{\partial v}{\partial x} = e^x(x \sin y + y \cos y) + e^x \sin y = \psi_2(x, y) \Rightarrow \psi_2(z, 0) = 0$

$$\frac{\partial v}{\partial y} = e^x(x \cos y + \cos y - y \sin y) = \phi_1(x, y) \Rightarrow \psi_1(z, 0) = ze^z + e^z$$

$$\begin{aligned} f(z) &= \int [\psi_1(z, 0) + i\psi_2(z, 0)] dz + C \\ &= \int [e^z(z+1) + i(0)] dz + C = (z+1)e^z - \int e^z dz + C \\ &= (z+1)e^z - e^z + C = z e^z + C \end{aligned} \quad \text{Ans.}$$

Which is the required function.

**Example 36.** Show that  $e^x(x \cos y - y \sin y)$  is a harmonic function. Find the analytic function for which  $e^x(x \cos y - y \sin y)$  is imaginary part.

(U.P., III Semester, June 2009, R.G.P.V., Bhopal, III Semester, June 2004)

**Solution.** Here  $v = e^x(x \cos y - y \sin y)$

Differentiating partially w.r.t.  $x$  and  $y$ , we have

$$\frac{\partial v}{\partial x} = e^x (x \cos y - y \sin y) + e^x \cos y = \psi_2(x, y), \quad (\text{say}) \quad \dots (1)$$

$$\frac{\partial v}{\partial y} = e^x (-x \sin y - y \cos y - \sin y) = \psi_1(x, y) \quad (\text{say}) \quad \dots (2)$$

$$\begin{aligned} \frac{\partial^2 v}{\partial x^2} &= e^x (x \cos y - y \sin y) + e^x \cos y + e^x \cos y \\ &= e^x (x \cos y - y \sin y + 2 \cos y) \end{aligned} \quad \dots (3)$$

$$\text{and} \quad \frac{\partial^2 v}{\partial y^2} = e^x (-x \cos y + y \sin y - 2 \cos y) \quad \dots (4)$$

Adding equations (3) and (4), we have

$$\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} = 0 \Rightarrow v \text{ is a harmonic function.}$$

Now putting  $x = z, y = 0$  in (1) and (2), we get

$$\psi_2(z, 0) = ze^z + e^z \quad \psi_1(z, 0) = 0$$

Hence by Milne-Thomson method, we have

$$\begin{aligned} f(z) &= \int [\psi_1(z, 0) + i \psi_2(z, 0)] dz + C \\ &= \int [0 + i(ze^z + e^z)] dz + C = i(ze^z - e^z + e^z) + C = iz e^z + C. \end{aligned}$$

This is the required analytic function.

**Ans.**

**Example 37.** If  $u - v = (x - y)(x^2 + 4xy + y^2)$  and  $f(z) = u + iv$  is an analytic function of  $z = x + iy$ , find  $f(z)$  in terms of  $z$  by Milne Thomson method.

**Solution.** We know that

$$f(z) = u + iv \quad \dots (1)$$

$$if(z) = i(u - v) \quad \dots (2)$$

Adding (1) and (2), we get

$$(1 + i)f(z) = (u - v) + i(u + v)$$

$$\text{Let} \quad F(z) = U + iV$$

$$U = u - v = (x - y)(x^2 + 4xy + y^2)$$

$$\begin{aligned} \frac{\partial U}{\partial x} &= (x^2 + 4xy + y^2) + (x - y)(2x + 4y) \\ &= x^2 + 4xy + y^2 + 2x^2 + 4xy - 2xy - 4y^2 = 3x^2 + 6xy - 3y^2 \end{aligned}$$

$$\phi_1(x, y) = 3x^2 + 6xy - 3y^2$$

$$\phi_1(z, 0) = 3z^2$$

$$\begin{aligned} \frac{\partial U}{\partial y} &= -(x^2 + 4xy + y^2) + (x - y)(4x + 2y) \\ &= -x^2 - 4xy - y^2 + 4x^2 + 2xy - 4xy - 2y^2 = 3x^2 - 6xy - 3y^2 \end{aligned}$$

$$\phi_2(x, y) = 3x^2 - 6xy - 3y^2$$

$$\phi_2(z, 0) = 3z^2$$

$$F(z) = U + iV$$

$$F'(z) = \frac{\partial U}{\partial x} + i \frac{\partial V}{\partial x} = \frac{\partial U}{\partial x} - i \frac{\partial U}{\partial y} = \phi, (z, 0) - i \phi_2(z, 0) = 3z^2 - i 3z^2$$

$$\begin{aligned}
 &= 3(1-i)z^2 \\
 F(z) &= (1-i)z^3 + C \\
 (1+i)f(z) &= (1-i)z^3 + C \\
 f(z) &= \frac{1-i}{1+i}z^3 + \frac{C}{1+i} = \frac{(1-i)(1-i)}{(1+i)(1-i)}z^3 + C_1 \\
 &= \frac{1-2i+(-i)^2}{1+1}z^3 + C_1 = \frac{1-2i-1}{2}z^3 + C_1 = -iz^3 + C_1 \quad \text{Ans.}
 \end{aligned}$$

**Note:** This example has already been solved on page 694 as Example 26.

**Example 38.** If  $f(z) = u + iv$  is an analytic function of  $z$  and  $u - v = \frac{\cos x + \sin x - e^{-y}}{2 \cos x - 2 \cosh y}$ , prove that

$$f(z) = \frac{1}{2} \left[ 1 - \cot \frac{z}{2} \right] \text{ when } f\left(\frac{\pi}{2}\right) = 0. \quad (\text{R.G.P.V. Bhopal, III Semester, Dec. 2007})$$

**Solution.** We know that  $f(z) = u + iv$   
 $\therefore i f(z) = iu - iv$  [Multiplying by  $i$ ]  
On adding, we get  $(1+i)f(z) = (u-v) + i(u+v)$   
 $\Rightarrow F(z) = U + iV$

$$\begin{aligned}
 \Rightarrow & \quad \left[ \begin{array}{l} U = u - v \\ V = u + v \end{array} \right] \\
 (1+i)f(z) &= F(z)
 \end{aligned}$$

$$\begin{aligned}
 \text{We have, } U &= u - v = \frac{\cos x + \sin x - e^{-y}}{2 \cos x - 2 \cosh y} \\
 \Rightarrow U &= \frac{\cos x + \sin x - \cosh y + \sinh y}{2 \cos x - 2 \cosh y} \quad [\because e^{-y} = \cosh y - \sinh y] \\
 &= \frac{\cos x - \cosh y}{2(\cos x - \cosh y)} + \frac{\sin x + \sinh y}{2(\cos x - \cosh y)} = \frac{1}{2} + \frac{\sin x + \sinh y}{2(\cos x - \cosh y)} \quad \dots(1)
 \end{aligned}$$

Differentiating (1) w.r.t.  $x$  partially, we get

$$\begin{aligned}
 \frac{\partial U}{\partial x} &= \frac{1}{2} \left[ \frac{(\cos x - \cosh y) \cos x - (\sin x + \sinh y)(-\sin x)}{(\cos x - \cosh y)^2} \right] \\
 &= \frac{1}{2} \left[ \frac{(\cos^2 x + \sin^2 x - \cosh y \cos x + \sinh y \sin x)}{(\cos x - \cosh y)^2} \right] \quad \left[ \begin{array}{l} (1+i)f(z) = F(z) \\ u - v = U \\ u + v = V \end{array} \right] \\
 f(x, y) &= \frac{1}{2} \left[ \frac{1 - \cosh y \cos x + \sinh y \sin x}{(\cos x - \cosh y)^2} \right] = \frac{1}{2} \frac{1 - \cos iy \cos x - i \sin iy \sin x}{(\cos x - \cosh y)^2}
 \end{aligned}$$

Replacing  $x$  by  $z$  and  $y$  by 0 in (2), we get

$$\phi_1(z, 0) = \frac{1}{2} \left[ \frac{1 - \cos z}{(\cos z - 1)^2} \right] = \frac{1}{2} \frac{-(1 - \cos z)}{(1 - \cos z)^2} = \frac{1}{2(1 - \cos z)}$$

Differentiating (1) partially w.r.t.  $y$ , we get

$$\begin{aligned}
 \frac{\partial U}{\partial y} &= \frac{1}{2} \left[ \frac{(\cos x - \cosh y) \cdot \cosh y - (\sin x + \sinh y)(-\sinh y)}{(\cos x - \cosh y)^2} \right] \\
 &= \frac{1}{2} \left[ \frac{(\cos x \cosh y + \sin x \sinh y) - (\cosh^2 y - \sinh^2 y)}{(\cos x - \cosh y)^2} \right]
 \end{aligned}$$

$$\phi_2(x, y) = \frac{1}{2} \left[ \frac{\cos x \cosh y + \sin x \sinh y - 1}{(\cos x - \cosh y)^2} \right] \quad \dots(3)$$

Replacing  $x$  by  $z$  and  $y$  by 0 in (3), we have

$$\begin{aligned}\phi_2(z, 0) &= \frac{1}{2} \left[ \frac{\cos z - 1}{(\cos z - 1)^2} \right] = \frac{1}{2} \cdot \left( \frac{-1}{1 - \cos z} \right) \\ F'(z) &= \frac{\partial U}{\partial x} + i \frac{\partial V}{\partial x} = \frac{\partial U}{\partial x} - i \frac{\partial U}{\partial y} \quad [\text{C-R equations}] \\ &= \phi_1(z, 0) - i \phi_2(z, 0)\end{aligned}$$

By Milne Thomson Method,

$$\begin{aligned}F(z) &= \int [\phi_1(z, 0) - i \phi_2(z, 0)] dz \\ &= \int \left[ \frac{1}{2} \cdot \frac{1}{(1 - \cos z)} + \frac{i}{2} \cdot \frac{1}{1 - \cos z} \right] dz \\ &= \frac{1+i}{2} \int \frac{1}{2 \sin^2 z/2} dz = \frac{1+i}{4} \int \operatorname{cosec}^2(z/2) dz \\ &= \left( \frac{1+i}{4} \right) \cdot \left( \frac{-\cot z/2}{1} \right) + C = -\left( \frac{1+i}{2} \right) \cot \frac{z}{2} + C \quad F(z) = (1+i)f(z) \\ \Rightarrow \quad (1+i)f(z) &= -\left( \frac{1+i}{2} \right) \cot \frac{z}{2} + C \quad \Rightarrow \quad f(z) = -\frac{1}{2} \cot \frac{z}{2} + \frac{C}{1+i} \quad \dots(4)\end{aligned}$$

On putting  $z = \frac{\pi}{2}$  in (4), we get

$$\begin{aligned}f\left(\frac{\pi}{2}\right) &= -\frac{1}{2} \cot \frac{\pi}{4} + \frac{C}{1+i} \\ 0 &= -\frac{1}{2} + \frac{C}{1+i} \Rightarrow \frac{C}{1+i} = \frac{1}{2} \quad [f\left(\frac{\pi}{2}\right) = 0, \text{ given}]\end{aligned}$$

On putting the value of  $\frac{C}{1+i}$  in (4), we get

$$f(z) = -\frac{1}{2} \cot \frac{z}{2} + \frac{1}{2}$$

$$\text{Hence, } f(z) = \frac{1}{2} \left( 1 - \cot \frac{z}{2} \right), \text{ when } f\left(\frac{\pi}{2}\right) = 0. \quad \text{Proved.}$$

## EXERCISE 27.2

Show that the following functions are harmonic and determine the conjugate functions.

$$1. u = 2x(1-y) \quad \text{Ans. } v = x^2 - y^2 + 2y + C \quad 2. u = 2x - x^3 + 3xy + 3xy^2$$

$$\text{Ans. } v = -\frac{3}{2}(x^2 - y^2) + \frac{3}{2}y^2 + y^3 + 2y + C$$

Determine the analytic function, whose real part is

$$3. \log \sqrt{x^2 + y^2} \quad \text{Ans. } \log z + C \quad 4. \cos x \cosh y \quad \text{Ans. } \cos z + c$$

$$5. e^{-x} (\cos y + \sin y) \quad (\text{AMIETE, June 2010}) \quad \text{Ans. } e^{-x} (1 + i + C)$$

$$6. e^{2x} (x \cos 2y - y \sin 2y) \quad \text{Ans. } ze^{2z} + iC \quad 7. e^{-x} (x \cos y + y \sin y) \text{ and } f(0) = i. \quad \text{Ans. } ze^{-z} + i$$

Determine the analytic function, whose imaginary part is

$$8. v = \log(x^2 + y^2) + x - 2y \quad (\text{GBTU, III Sem. April 2012}) \quad \text{Ans. } 2i \log z - (2 - i)z + C$$

9.  $v = \sinh x \cos y$

**Ans.**  $\sin iz + C$

10.  $v = \left(r - \frac{1}{r}\right) \sin 0$

**Ans.**  $z + \frac{1}{z} + C$

11. If  $f(z) = u + iv$  is an analytic function of  $z = x + iy$  and  $u - v = \frac{e^y - \cos x + \sin x}{\cosh y - \cos x}$ , find  $f(z)$  subject to the condition that  $f\left(\frac{\pi}{2}\right) = \frac{3-i}{2}$ .

**Ans.**  $f(z) = \cot \frac{z}{2} + \frac{1-i}{2}$

12. Find an analytic function  $f(z) = u(r, \theta) + iv(r, \theta)$  such that  $V(r, 0) = r^2 \cos 2\theta - r \cos \theta + 2$ .

**Ans.**  $i [z^2 - z + 2]$

13. Show that the function  $u = x^2 - y^2 - 2xy - 2x - y - 1$  is harmonic. Find the conjugate harmonic function  $v$  and express  $u + iv$  as a function of  $z$  where  $z = x + iy$ .

**Ans.**  $(1+i)z^2 + (-2+i)z - 1$

14. Construct an analytic function of the form  $f(z) = u + iv$ , where  $v$  is  $\tan^{-1}(y/x)$ ,  $x \neq 0$ ,  $y \neq 0$ .

**Ans.**  $\log cz$

15. Show that the function  $u = e^{-2xy} \sin(x^2 - y^2)$  is harmonic. Find the conjugate function  $v$  and express  $u + iv$  as an analytic function of  $z$ .

**Ans.**  $v = e^{-2xy} \cos(x^2 - y^2) + C$   
 $f(z) = -ie^{iz^2} + C_1$

16. Show that the function  $v(x, y) = e^x \sin y$  is harmonic. Find its conjugate harmonic function  $u(x, y)$  and the corresponding analytic function  $f(z)$ .

(AMIETE, June 2009)

**Ans.**  $u = e^x \cos y, f(z) = e^z$

Choose the correct answer:

21. The harmonic conjugate of  $u = x^3 - 3xy^2$  is

(a)  $y^3 - 3xy^2$       (b)  $3x^2 y - y^3$       (c)  $3xy^2 - y^3$       (d)  $3xy^2 - x^3$       (AMIETE, June 2010)      **Ans.** (b)

## 27.19 PARTIAL DIFFERENTIATION OF FUNCTION OF COMPLEX VARIABLE

**Example 39.** Prove that

$$4 \frac{\partial^2}{\partial z \partial \bar{z}} = \left[ \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right]$$

**Solution.** We know that

$$x + iy = z \quad \dots (1), \quad x - iy = \bar{z} \quad \dots (2)$$

From (1) and (2), we get

$$\begin{array}{l|l} x = \frac{1}{2}(z + \bar{z}), & y = \frac{-i}{2}(z - \bar{z}) \\ \Rightarrow \frac{\partial x}{\partial z} = \frac{1}{2}, & \frac{\partial y}{\partial z} = -\frac{i}{2} \\ \text{and } \frac{\partial x}{\partial \bar{z}} = \frac{1}{2}, & \frac{\partial y}{\partial \bar{z}} = \frac{i}{2} \end{array}$$

We know that,

$$\frac{\partial}{\partial z} = \frac{\partial}{\partial x} \left( \frac{\partial x}{\partial z} \right) + \frac{\partial}{\partial y} \left( \frac{\partial y}{\partial z} \right) = \frac{\partial}{\partial x} \left( \frac{1}{2} \right) + \frac{\partial}{\partial y} \left( \frac{-i}{2} \right) = \frac{1}{2} \left( \frac{\partial}{\partial x} - i \frac{\partial}{\partial y} \right) \quad \dots (3)$$

$$\frac{\partial}{\partial \bar{z}} = \frac{\partial}{\partial x} \left( \frac{\partial x}{\partial \bar{z}} \right) + \frac{\partial}{\partial y} \left( \frac{\partial y}{\partial \bar{z}} \right) = \frac{\partial}{\partial x} \left( \frac{1}{2} \right) + \frac{\partial}{\partial y} \left( \frac{i}{2} \right) = \frac{1}{2} \left( \frac{\partial}{\partial x} + i \frac{\partial}{\partial y} \right) \quad \dots (4)$$

From (3) and (4), we get

$$\frac{\partial^2}{\partial z \partial \bar{z}} = \frac{\partial}{\partial z} \left( \frac{\partial}{\partial \bar{z}} \right) = \frac{1}{4} \left( \frac{\partial}{\partial x} - i \frac{\partial}{\partial y} \right) \left( \frac{\partial}{\partial x} + i \frac{\partial}{\partial y} \right)$$

$$\begin{aligned}
 &= \frac{1}{4} \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + i \frac{\partial^2}{\partial x \partial y} - i \frac{\partial^2}{\partial y \partial x} \right) = \frac{1}{4} \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) \\
 \Rightarrow \quad 4 \frac{\partial^2}{\partial z \partial \bar{z}} &= \left[ \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right] \quad \text{Proved.}
 \end{aligned}$$

**Example 40.** If  $f(z)$  is a harmonic function of  $z$ , show that

$$\left\{ \frac{\partial}{\partial x} |f(z)| \right\}^2 + \left\{ \frac{\partial}{\partial y} |f(z)| \right\}^2 = |f'(z)|^2 \quad (\text{U.P. III Semester, June 2009})$$

**Solution.** Since  $f(z) = u(x, y) + i v(x, y)$

$$\text{so } |f(z)| = \sqrt{u^2 + v^2} \quad \dots (1)$$

Differentiating (1) partially w.r.t. 'x', we get

$$\begin{aligned}
 \frac{\partial}{\partial x} |f(z)| &= \frac{\partial}{\partial x} (\sqrt{u^2 + v^2}) \\
 &= \frac{1}{2} (u^2 + v^2)^{-\frac{1}{2}} \left( 2u \frac{\partial u}{\partial x} + 2v \frac{\partial v}{\partial x} \right) = \frac{u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial x}}{\sqrt{u^2 + v^2}} = \frac{u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial x}}{|f(z)|} \quad \dots (2)
 \end{aligned}$$

$$\text{Similarly } \frac{\partial}{\partial y} |f(z)| = \frac{u \frac{\partial u}{\partial y} + v \frac{\partial v}{\partial y}}{|f(z)|} \quad \dots (3)$$

Squaring (2) and (3) adding, we get

$$\begin{aligned}
 \left[ \frac{\partial}{\partial x} |f(z)| \right]^2 + \left[ \frac{\partial}{\partial y} |f(z)| \right]^2 &= \frac{\left( u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial x} \right)^2 + \left( u \frac{\partial u}{\partial y} + v \frac{\partial v}{\partial y} \right)^2}{|f(z)|^2} \\
 &= \frac{\left( u \frac{\partial u}{\partial x} \right)^2 + 2uv \frac{\partial u}{\partial x} \frac{\partial v}{\partial x} + \left( v \frac{\partial v}{\partial x} \right)^2 + \left( u \frac{\partial u}{\partial y} \right)^2 + 2u \frac{\partial u}{\partial y} \cdot v \frac{\partial v}{\partial y} + \left( v \frac{\partial v}{\partial y} \right)^2}{|f(z)|^2}
 \end{aligned}$$

$$\text{By C-R equation } \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \text{ and } \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

$$\text{Now, } 2uv \frac{\partial u}{\partial x} \frac{\partial v}{\partial x} = 2uv \left( \frac{\partial v}{\partial y} \right) \left( -\frac{\partial u}{\partial y} \right)$$

$$\text{Putting the value of } 2uv \frac{\partial u}{\partial x} \cdot \frac{\partial v}{\partial x} = -2uv \frac{\partial v}{\partial y} \cdot \frac{\partial u}{\partial y} \text{ in (4), we get}$$

$$\begin{aligned}
 \left[ \frac{\partial}{\partial x} |f(z)| \right]^2 + \left[ \frac{\partial}{\partial y} |f(z)| \right]^2 &= \frac{\left( u \frac{\partial u}{\partial x} \right)^2 - 2uv \frac{\partial v}{\partial y} \cdot \frac{\partial u}{\partial y} + \left( v \frac{\partial v}{\partial x} \right)^2 + \left( u \frac{\partial u}{\partial y} \right)^2 + 2uv \frac{\partial u}{\partial y} \cdot \frac{\partial v}{\partial y} + \left( v \frac{\partial v}{\partial y} \right)^2}{|f(z)|^2} \\
 &= \frac{u^2 \left( \frac{\partial u}{\partial x} \right)^2 + u^2 \left( \frac{\partial u}{\partial y} \right)^2 + v^2 \left( \frac{\partial v}{\partial x} \right)^2 + v^2 \left( \frac{\partial v}{\partial y} \right)^2}{|f(z)|^2} \\
 &= \frac{u^2 \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial u}{\partial y} \right)^2 \right] + v^2 \left[ \left( \frac{\partial v}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial y} \right)^2 \right]}{|f(z)|^2}
 \end{aligned}$$

$$\begin{aligned}
&= \frac{u^2 \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{-\partial v}{\partial x} \right)^2 \right] + v^2 \left[ \left( \frac{\partial v}{\partial x} \right)^2 + \left( \frac{\partial u}{\partial x} \right)^2 \right]}{|f(z)|^2} \quad [\text{C - R equations}] \\
&= \frac{(u^2 + v^2) \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial x} \right)^2 \right]}{|f(z)|^2} = \frac{|f(z)|^2 \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial x} \right)^2 \right]}{|f(z)|^2} = \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial x} \right)^2 \\
&\quad [ |f'(z)|^2 = u^2 + v^2 ] \\
&= |f'(z)|^2 \quad \text{Proved.}
\end{aligned}$$

**Example 41.** Prove that  $\left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) |u|^P = P(P-1) |u|^{P-2} |f'(z)|^2$

**Solution.** We know that  $\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} = 4 \frac{\partial^2}{\partial z \partial \bar{z}}$  [Example 39, page 705]

$$\begin{aligned}
\left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) |u|^P &= \frac{1}{2^P} \frac{4\partial^2}{\partial z \partial \bar{z}} [f(z) + f(\bar{z})]^P \quad \left[ \because u = \frac{1}{2} [f(z) + f(\bar{z})] \right] \\
&= \frac{4}{2^P} \frac{\partial}{\partial z} P [f(z) + f(\bar{z})]^{P-1} f'(z) = \frac{1}{2^{P-2}} P(P-1) [f(z) + f(\bar{z})]^{P-2} f'(z) f'(\bar{z}) \\
&= P(P-1) \left[ \frac{1}{2} \{f(z) + f(\bar{z})\} \right]^{P-2} [f'(z) f'(\bar{z})] = P(P-1) |u|^{P-2} |f'(z)|^2
\end{aligned}$$

Proved.

**Example 42.** Prove that  $\left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) \log |f'(z)| = 0$

**Solution.** We have,  $\left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) = 4 \frac{\partial^2}{\partial z \partial \bar{z}}$  [Example 39 on page 705]

$$\begin{aligned}
\text{Hence } \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) \{\log |f'(z)|\} &= 4 \frac{\partial^2}{\partial z \partial \bar{z}} \{\log |f'(z)|\} = 4 \frac{\partial^2}{\partial z \partial \bar{z}} \frac{1}{2} \log |f'(z)|^2 \\
&= 2 \frac{\partial^2}{\partial z \partial \bar{z}} \log \{f'(z) f'(\bar{z})\} \\
&= 2 \frac{\partial^2}{\partial z \partial \bar{z}} [\log f'(z) + \log f'(\bar{z})] = 2 \frac{\partial}{\partial z} \left( 0 + \frac{1}{f'(\bar{z})} f''(\bar{z}) \right) \\
&= 2 \frac{\partial}{\partial z} \frac{f''(\bar{z})}{f'(\bar{z})} = 2 \times 0 = 0 \quad \text{Proved.} \quad \left[ \begin{array}{l} \bar{z} \text{ is constant in regards to} \\ \text{differentiation w.r.t. } z \end{array} \right]
\end{aligned}$$

**Example 43.** Prove that  $\left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) |Rf(z)|^2 = 2 |f'(z)|^2$

**Solution.**  $f(z) = u + iv$  or  $Rf(z) = u \Rightarrow$  Real part of  $f(z) = u$

$$\begin{aligned}
\frac{\partial}{\partial x} u^2 &= 2u \frac{\partial u}{\partial x} \\
\frac{\partial^2}{\partial x^2} u^2 &= 2 \left( \frac{\partial u}{\partial x} \right)^2 + 2u \frac{\partial^2 u}{\partial x^2} \quad \dots (1)
\end{aligned}$$

Similarly,

$$\frac{\partial^2}{\partial y^2} u^2 = 2 \left( \frac{\partial u}{\partial y} \right)^2 + 2u \frac{\partial^2 u}{\partial y^2} \quad \dots (2)$$

Adding (1) and (2), we get

$$\begin{aligned} \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) u^2 &= 2 \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial u}{\partial y} \right)^2 \right] + 2u \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) \\ &= 2 \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial u}{\partial y} \right)^2 \right] + 0 = 2 \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( -\frac{\partial v}{\partial x} \right)^2 \right] = 2 |f'(z)|^2 \quad \left( \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x} \right) \\ \Rightarrow \quad \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) |R f(z)|^2 &= 2 |f'(z)|^2 \end{aligned}$$

**Proved.**

**Example 44.** If  $f(z)$  is regular function of  $z$ , show that

$$\left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) |f(z)|^2 = 4 |f'(z)|^2 \quad (\text{R.G.P.V., Bhopal, III Semester, June 2004})$$

**Solution.**

$$f(z) = u + iv$$

$$|f(z)|^2 = u^2 + v^2 \quad \dots (1)$$

Let

$$\phi = u^2 + v^2$$

Differentiating (1) w.r.t.  $x$ , we get

$$\begin{aligned} \frac{\partial \phi}{\partial x} &= 2u \frac{\partial u}{\partial x} + 2v \frac{\partial v}{\partial x} \\ \frac{\partial^2 \phi}{\partial x^2} &= 2 \left[ u \frac{\partial^2 u}{\partial x^2} + \left( \frac{\partial u}{\partial x} \right)^2 + v \frac{\partial^2 v}{\partial x^2} + \left( \frac{\partial v}{\partial x} \right)^2 \right] \end{aligned} \quad \dots (2)$$

$$\text{Similarly, } \frac{\partial^2 \phi}{\partial y^2} = 2 \left[ u \frac{\partial^2 u}{\partial y^2} + \left( \frac{\partial u}{\partial y} \right)^2 + v \frac{\partial^2 v}{\partial y^2} + \left( \frac{\partial v}{\partial y} \right)^2 \right] \quad \dots (3)$$

Adding (2) and (3), we get

$$\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = 2 \left[ u \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) + v \left( \frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} \right) + \left\{ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial u}{\partial y} \right)^2 + \left( \frac{\partial v}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial y} \right)^2 \right\} \right] \quad \dots (4)$$

By C – R equations

$$\begin{aligned} \left( \frac{\partial u}{\partial x} \right)^2 &= \left( \frac{\partial v}{\partial y} \right)^2 \\ \left( \frac{\partial u}{\partial y} \right)^2 &= \left( -\frac{\partial v}{\partial x} \right)^2 = \left( \frac{\partial v}{\partial x} \right)^2 \end{aligned} \quad \dots (5)$$

$$\text{By Laplace equations } \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

$$\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} = 0$$

On putting the values of  $\left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right)$ ,  $\left( \frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} \right)$ ,  $\frac{\partial v}{\partial x}$ ,  $\frac{\partial v}{\partial y}$  from (5) in (4), we get

$$\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = 4 \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial y} \right)^2 \right], \quad \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) \phi = 4 \left| \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right|^2$$

$$\left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) |f(z)|^2 = 4 |f'(z)|^2$$

**Proved.**

**Example 45.** If  $|f(z)|$  is constant, prove that  $f(z)$  is also constant.

**Solution.**

$$f(z) = u + iv$$

$$|f(z)|^2 = u^2 + v^2$$

$$|f(z)| = \text{constant} = c \text{ (given)}$$

$$u^2 + v^2 = c^2$$

... (1)

$$\text{Differentiating (1) w.r.t. } x, \text{ we get } 2u \frac{\partial u}{\partial x} + 2v \frac{\partial v}{\partial x} = 0 \Rightarrow u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial x} = 0 \quad \dots (2)$$

$$\begin{aligned} \text{Differentiating (1) w.r.t. 'y', we get } & 2u \frac{\partial u}{\partial y} + 2v \frac{\partial v}{\partial y} = 0 \\ & -u \frac{\partial v}{\partial x} + v \frac{\partial u}{\partial x} = 0 \end{aligned} \quad \dots (3)$$

Squaring (2) and (3) and then adding, we get

$$\begin{aligned} u^2 \left( \frac{\partial u}{\partial x} \right)^2 + v^2 \left( \frac{\partial v}{\partial x} \right)^2 + u^2 \left( \frac{\partial v}{\partial x} \right)^2 + v^2 \left( \frac{\partial u}{\partial x} \right)^2 &= 0 \\ (u^2 + v^2) \left[ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial x} \right)^2 \right] &= 0 \\ \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial x} \right)^2 &= 0 \end{aligned}$$

As

$$f(z) = u + iv \Rightarrow f'(z) = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x}$$

$$f'(\bar{z}) = \frac{\partial u}{\partial x} - i \frac{\partial v}{\partial x}$$

$$|f'(z)|^2 = \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial x} \right)^2 = 0$$

$$|f'(z)|^2 = 0 \Rightarrow f(z) \text{ is constant.}$$

**Proved.**

### EXERCISE 27.3

1. If  $f(z) = u + iv$  is an analytic function of  $z = x + iy$ , and  $\psi$  is any function of  $x$  and  $y$  with differential coefficients of the first two orders, then show that

$$\left( \frac{\partial \psi}{\partial x} \right)^2 + \left( \frac{\partial \psi}{\partial y} \right)^2 = \left[ \left( \frac{\partial \psi}{\partial u} \right)^2 + \left( \frac{\partial \psi}{\partial v} \right)^2 \right] |f'(z)|^2$$

$$\text{and } \frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} = \left( \frac{\partial^2 \psi}{\partial u^2} + \frac{\partial^2 \psi}{\partial v^2} \right) |f'(z)|^2.$$

2. If  $|f'(z)|$  is the product of a function of  $x$  and a function of  $y$ , show that

$$f'(z) = \exp(\alpha z^2 + \beta z + \gamma)$$

where  $\alpha$  is a real and  $\beta$  and  $\gamma$  are complex constants.

**Choose the correct alternative:**

3. If  $|f(z)|$  is constant then  $f(z)$  is  
 (a) Variable      (b) Partially variable and constant      (c) Constant      (d) None of these      **Ans. (c)**

4. If  $f(z) = u + iv$  then  $|f(z)|$  is equal to

$$(a) \sqrt{u^2 + v^2} \quad (b) u^2 + v^2 \quad (c) u + v \quad (d) \sqrt{u^2 - v^2} \quad \text{Ans. (a)}$$

5. If  $z = r(\cos \theta + i \sin \theta)$  then  $|z|^3$  is equal to  
 (a)  $(\cos \theta + i \sin \theta)^3$       (b)  $r^3 (\cos \theta + i \sin \theta)^3$       (c)  $r^3/2$       (d)  $r^3$       **Ans. (d)**

## CONFORMAL TRANSFORMATION

---

### 28.1 GEOMETRICAL REPRESENTATION

To draw a curve of complex variable  $(x, y)$  on  $z$ -plane we take two axes *i.e.*, one real axis and the other imaginary axis. A number of points  $(x, y)$  are plotted on  $z$ -plane, by taking different value of  $z$  (different values of  $x$  and  $y$ ). The curve  $C$  is drawn by joining the plotted points. The diagram obtained is called *Argand diagram* in  $z$ -plane.

But a complex function  $w = f(z)$  *i.e.*,  $(u + iv) = f(x + iy)$  involves four variables  $x, y$  and  $u, v$ .

A figure of only three dimensions  $(x, y, z)$  is possible in a plane. A figure of four dimensional region for  $x, y, u, v$  is not possible.

So, we choose two complex planes  $z$ -plane and  $w$ -plane. In the  $w$ -plane we plot the corresponding points  $w = u + iv$ . By joining these points we have a corresponding curve  $C'$  in  $w$ -plane.

### 28.2 TRANSFORMATION

For every point  $(x, y)$  in the  $z$ -plane, the relation  $w = f(z)$  defines a corresponding point  $(u, v)$  in the  $w$ -plane. We call this “transformation or mapping of  $z$ -plane into  $w$ -plane”. If a point  $z_0$  maps into the point  $w_0$ ,  $w_0$  is also known as the image of  $z_0$ .

If the point  $P(x, y)$  moves along a curve  $C$  in  $z$ -plane, the point  $P'(u, v)$  will move along a corresponding curve  $C'$  in  $w$ -plane, then we say that a curve  $C$  in the  $z$ -plane is mapped into the corresponding curve  $C'$  in the  $w$ -plane by the relation  $w = f(z)$ .

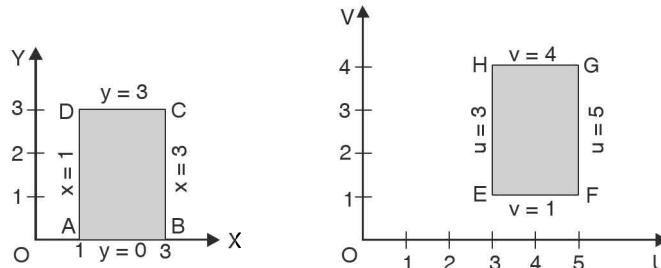

**Example 1.** Transform the rectangular region  $ABCD$  in  $z$ -plane bounded by  $x = 1$ ,  $x = 3$ ;  $y = 0$  and  $y = 3$ . Under the transformation  $w = z + (2 + i)$ .

**Solution.** Here,  $w = z + (2 + i)$   
 $\Rightarrow u + iv = x + iy + (2 + i)$   
 $= (x + 2) + i(y + 1)$

By equating real and imaginary quantities, we have  $u = x + 2$  and  $v = y + 1$ .

$z$ -plane	$w$ -plane	$z$ -plane	$w$ -plane
$x$	$u = x + 2$	$y$	$v = y + 1$
1	$= 1 + 2 = 3$	0	$= 0 + 1 = 1$
3	$= 3 + 2 = 5$	3	$= 3 + 1 = 4$

Here the lines  $x = 1$ ,  $x = 3$ ;  $y = 0$  and  $y = 3$  in the  $z$ -plane are transformed onto the line  $u = 3$ ,  $u = 5$ ;  $v = 1$  and  $v = 4$  in the  $w$ -plane. The region  $ABCD$  in  $z$ -plane is transformed into the region  $EFGH$  in  $w$ -plane.

**Example 2.** Transform the curve  $x^2 - y^2 = 4$  under the mapping  $w = z^2$ .

**Solution.**  $w = z^2 = (x+iy)^2, u+iv = x^2 - y^2 + 2ixy$

This gives  $u = x^2 - y^2$  and  $v = 2xy$

**Table of (x, y) and (u, v)**

$x$	2	2.5	3	3.5	4	4.5	5
$y = \pm\sqrt{x^2 - 4}$	0	$\pm 1.5$	$\pm 2.2$	$\pm 2.9$	$\pm 3.5$	$\pm 4.1$	$\pm 4.6$
$u = x^2 - y^2$	4	4	4	4	4	4	4
$v = 2xy$	0	$\pm 7.5$	$\pm 13.2$	$\pm 20.3$	$\pm 28$	$\pm 36.9$	$\pm 46$

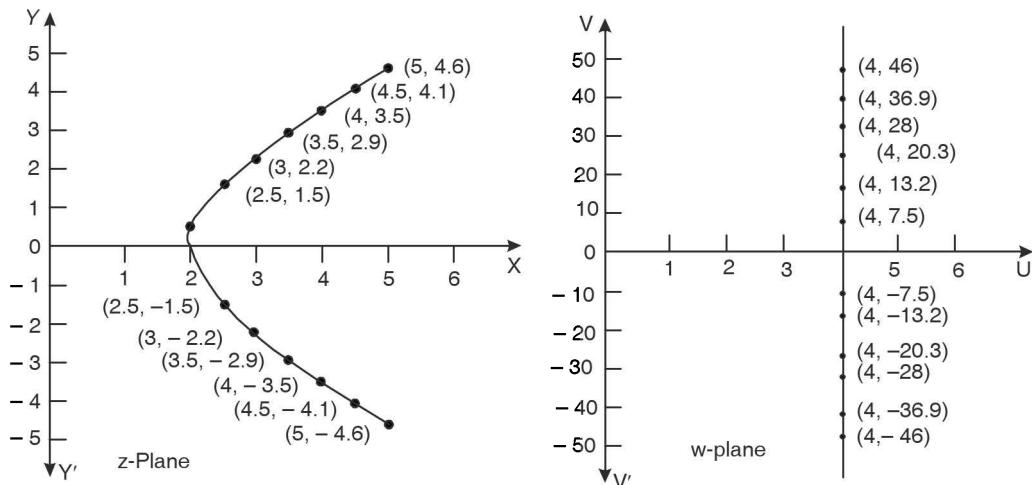

Image of the curve  $x^2 - y^2 = 4$  is a straight line,  $u = 4$  parallel to the  $v$ -axis in  $w$ -plane. **Ans.**

### 28.3 CONFORMAL TRANSFORMATION

(U.P. III Semester Dec., 2006, 2005)

Let two curves  $C, C_1$  in the  $z$ -plane intersect at the point  $P$  and the corresponding curve  $C', C'_1$  in the  $w$ -plane intersect at  $P'$ . **If the angle of intersection of the curves at  $P$  in  $z$ -plane**

is the same as the angle of intersection of the curves of  $w$ -plane at  $P'$  in magnitude and sense, then the transformation is called **conformal**:

**conditions:** (i)  $f(z)$  is analytic. (ii)  $f'(z) \neq 0$       Or

If the sense of the rotation as well as the magnitude of the angle is preserved, the transformation is said to be **conformal**.

If only the magnitude of the angle is preserved, transformation is **Isogonal**.

#### 28.4 THEOREM. If $f(z)$ is analytic, mapping is conformal (U.P. III Semester Dec. 2005)

**Proof.** Let  $C_1$  and  $C_2$  be the two curves in the  $z$ -plane intersecting at the point  $z_0$  and let the tangents at this point make angles  $\alpha_1$  and  $\alpha_2$  with the real axis. Let  $z_1$  and  $z_2$  be the points on the curves  $C_1$  and  $C_2$  near to  $z_0$  at the same distance  $r$  from  $z_0$ , so that we have

$$z_1 - z_0 = r e^{i\theta_1}, z_2 - z_0 = r e^{i\theta_2}$$

As

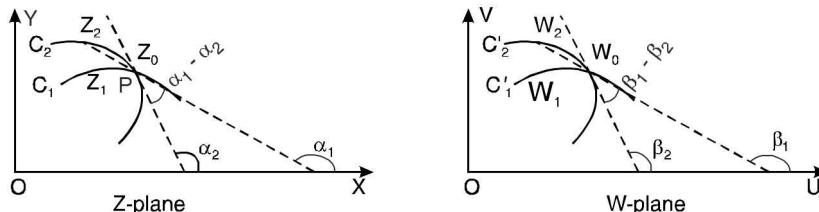

$$r \rightarrow 0, \theta_1 \rightarrow \alpha_1 \text{ and } \theta_2 \rightarrow \alpha_2.$$

Let the image of the curves  $C_1$ ,  $C_2$  be  $C'_1$  and  $C'_2$  in  $w$ -plane and images of  $z_0$ ,  $z_1$  and  $z_2$  be  $w_0$ ,  $w_1$  and  $w_2$ .

Let

$$w_1 - w_0 = r e^{i\phi_1}, w_2 - w_0 = r e^{i\phi_2}$$

$$f'(z_0) = \lim_{z_1 \rightarrow z_0} \frac{w_1 - w_0}{z_1 - z_0}$$

$$\operatorname{Re}^{i\lambda} = \lim_{r \rightarrow 0} \frac{r_1 e^{i\phi_1}}{r e^{i\theta_1}} \quad (\text{since } f'(z_0) = \operatorname{Re}^{i\lambda})$$

$$\operatorname{Re}^{i\lambda} = \frac{r_1}{r} e^{i\phi_1 - i\theta_1} = \frac{r_1}{r} e^{i(\phi_1 - \theta_1)}$$

Hence

$$\lim_{r \rightarrow 0} \left[ \frac{r_1}{r} \right] = R = |f'(z_0)| \text{ and } \lim (\phi_1 - \theta_1) = \lambda$$

$$\Rightarrow \lim \phi_1 - \lim \theta_1 = \lambda \text{ or } \beta_1 - \alpha_1 = \lambda \text{ i.e., } \beta_1 = \alpha_1 + \lambda$$

Similarly it can be proved  $\beta_2 = \alpha_2 + \lambda$  curve  $C'_1$  has a definite tangent at  $w_0$  making angles  $\alpha_1 + \lambda$  and  $\alpha_2 + \lambda$  so curve  $C'_2$ .

Angle between two curves  $C'_1$  and  $C'_2$

$$= \beta_1 - \beta_2 = (\alpha_1 + \lambda) - (\alpha_2 + \lambda) = (\alpha_1 - \alpha_2)$$

so the transformation is conformal at each point where  $f'(z) = 0$

**Note 1.** The point at which  $f'(z) = 0$  is called a **critical point** of the transformation. Also the points where  $\frac{dw}{dz} \neq 0$  are called **ordinary points**.

**2.** Let  $\phi = \alpha_1 - \alpha_2$  or  $\alpha_1 = \alpha_2 + \phi$  shows that the tangent at  $P$  to the curve is rotated through an  $\angle\phi = \text{amp } \{f'(z)\}$  under the given transformation.

$$\text{Angle of rotation} = \tan^{-1} \frac{v}{u}.$$

**3.** In formal transformation, element of arc passing through  $P$  is magnified by the factor  $|f'(z)|$ .

The area element is also magnified by the factor  $|f'(z)|$  or  $J = \frac{\partial(u, v)}{\partial(x, y)}$  in a conformal transformation.

$$\begin{aligned} J &= \frac{\partial(u, v)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{\partial u}{\partial x} & -\frac{\partial v}{\partial x} \\ \frac{\partial v}{\partial x} & \frac{\partial u}{\partial x} \end{vmatrix} = \left( \frac{\partial u}{\partial x} \right)^2 + \left( \frac{\partial v}{\partial x} \right)^2 \\ &= \left| \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \right|^2 = |f'(z)|^2 = |f'(x + iy)|^2 \end{aligned}$$

$|f'(z)|$  is called the **coefficient of magnification**.

**4.** Conjugate functions remain conjugate functions after conformal transformation. A function which is the solution of Laplace's equation, its transformed function again remains the solution of Laplace's equation after conformal transformation.

## 28.5 THEOREM

*Prove that an analytic function  $f(z)$  ceases to be conformal at the points where  $f'(z) = 0$ . (U.P. III Semester, Dec. 2006)*

**Proof.** Let  $f'(z) = 0$  and  $f'(z_0) = 0$  at  $z = z_0$

Suppose that  $f'(z_0)$  has a zero of order  $(n - 1)$  at the point  $z_0$ , then first  $(n - 1)$  derivatives of  $f(z)$  vanish at  $z_0$  but  $f''(z_0) \neq 0$ , hence at any point  $z$  in the neighbourhood of  $z_0$ , we have by Taylor's Theorem.

$$f(z) = f(z_0) + a_n(z - z_0)^n + \dots$$

$$\text{where } a_n = \frac{f''(z_0)}{n!}, \text{ so that } a_n \neq 0.$$

$$\text{Hence, } f(z_1) - f(z_0) = a_n(z_1 - z_0)^n + \dots$$

$$\text{i.e. } w_1 - w_0 = a_n(z_1 - z_0)^n + \dots$$

$$\text{or } \rho_1 e^{i\phi_1} = |a_n| \cdot r^n e^{i(n\theta_1 + \lambda)} + \dots \quad \text{where } \lambda = \text{amp } a_n$$

$$\text{Hence, } \lim \phi_1 = \lim (n\theta_1 + \lambda) = n\alpha_1 + \lambda$$

$$\text{Similary, } \lim \phi_2 = n\alpha_2 + \lambda.$$

Thus the curves  $\gamma_1$  and  $\gamma_2$  still have definite tangents at  $w_0$ .

But the angle between the tangents

$$= \lim \phi_2 - \lim \phi_1 = n(\alpha_2 - \alpha_1).$$

So magnitude of the angle is not preserved.

Also the linear magnification  $R = \lim (\rho_1 / r) = 0$ .

Hence, the conformal property does not hold good at a point where  $f'(z) = 0$ .

**Example 3.** If  $u = 2x^2 + y^2$  and  $v = \frac{y^2}{x}$ , show that the curves  $u = \text{constant}$  and  $v = \text{constant}$  cut orthogonally at all intersections but that the transformation  $w = u + iv$  is not conformal.  
(Q. Bank U.P. III Semester 2002)

**Solution.** For the curve,  $2x^2 + y^2 = u$

$$2x^2 + y^2 = \text{constant} = k_1 \text{ (say)} \quad \dots(1)$$

Differentiating (1), we get

$$\begin{aligned} 4x + 2y \frac{dy}{dx} &= 0 \quad \Rightarrow \quad \frac{dy}{dx} = -\frac{2x}{y} \\ \frac{y^2}{x} &= v \end{aligned} \quad \dots(2)$$

For the curve,  $\frac{y^2}{x} = \text{constant} = k_2$  (say),

$$\Rightarrow y^2 = k_2 x. \quad \dots(3)$$

Differentiating (3), we get

$$2y \frac{dy}{dx} = k_2 \quad \Rightarrow \quad \frac{dy}{dx} = \frac{k_2}{2y} = \frac{y^2}{x} \times \frac{1}{2y} = \frac{y}{2x} \quad \dots(4)$$

From (2) and (4), we see that

$$m_1 m_2 = \left( \frac{-2x}{y} \right) \left( \frac{y}{2x} \right) = -1$$

Hence, two curves cut orthogonally.

However, since  $\frac{\partial u}{\partial x} = 4x, \quad \frac{\partial u}{\partial y} = 2y$   
 $\frac{\partial v}{\partial x} = -\frac{y^2}{x^2}, \quad \frac{\partial v}{\partial y} = \frac{2y}{x}$

The Cauchy-Riemann equations are not satisfied by  $u$  and  $v$ .

Hence, the function  $u + iv$  is not analytic. So, the transformation is not conformal. **Proved**

**Example 4.** (i) For the conformal transformation  $w = z^2$ , show that

- (a) The coefficient of magnification at  $z = 2 + i$  is  $2\sqrt{5}$ .
- (b) The angle of rotation at  $z = 2 + i$  is  $\tan^{-1} 0.5$ .

(Q. Bank U.P. III Semester 2002)

(ii) For the conformal transformation  $w = z^2$ , show that

- (a) The co-efficient of magnification at  $z = 1 + i$  is  $2\sqrt{2}$ .

(b) The angle of rotation at  $z = 1 + i$  is  $\frac{\pi}{4}$ .

**Solution.** (i) Let  $w = f(z) = z^2$

$$\therefore f'(z) = 2z$$

$$f'(2+i) = 2(2+i) = 4+2i.$$

(a) Coefficient of magnification at  $z = 2 + i$  is  $|f'(2+i)| = |4+2i| = \sqrt{16+4} = 2\sqrt{5}$ .

(b) Angle of rotation at  $z = 2 + i$  is  $\text{amp. } f'(2+i) = (4+2i) = \tan^{-1} \left( \frac{2}{4} \right) = \tan^{-1} (0.5)$ .

(ii) Here  $f(z) = w = z^2$

$$\therefore f'(z) = 2z$$

$$\text{and } f'(1+i) = 2(1+i) = 2+2i$$

$\therefore$  (a) The co-efficient of magnification at  $z = 1 + i$  is  $|f'(1+i)| = |2+2i| = \sqrt{4+4} = 2\sqrt{2}$

(b) The angle of rotation at  $z = 1 + i$  is amp.  $|f'(1+i)| = 2(1+i) = 2+2i = \tan^{-1} \frac{2}{2} = \frac{\pi}{4}$

**Ans.**

### Standard transformations

#### 28.6 TRANSLATION

$$w = z + C,$$

where

$$C = a + ib$$

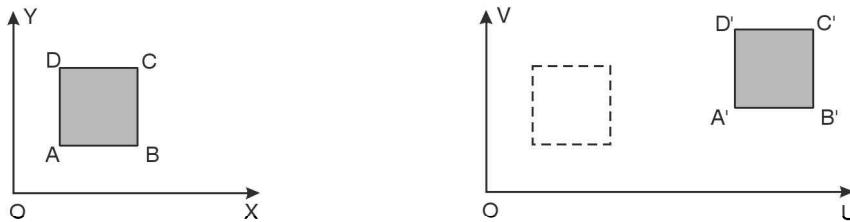

$$u + iv = x + iy + a + ib$$

$$u = x + a \text{ and } v = y + b$$

$$x = u - a \text{ and } y = v - b$$

On substituting the values of  $x$  and  $y$  in the equation of the curve to be transformed, we get the equation of the image in the  $w$ -plane.

The point  $P(x, y)$  in the  $z$ -plane is mapped onto the point  $P'(x+a, y+b)$  in the  $w$ -plane. Similarly other points of  $z$ -plane are mapped onto  $w$ -plane. Thus if  $w$ -plane is superimposed on the  $z$ -plane, the figure of  $w$ -plane is shifted through a vector  $C$ .

In other words the transformation is mere translation of the axes.

#### 28.7 ROTATION

$$w = ze^{i\theta}$$

The figure in  $z$ -plane rotates through an angle  $\theta$  in anticlockwise in  $w$ -plane.

**Example 5.** Consider the transformation  $w = ze^{i\pi/4}$  and determine the region  $R'$  in  $w$ -plane corresponding to the triangular region  $R$  bounded by the lines  $x = 0$ ,  $y = 0$  and  $x + y = 1$  in  $z$ -plane.

**Solution.**

$$w = ze^{i\pi/4}$$

$$w = (x+iy)\left(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4}\right)$$

$$\Rightarrow u + iv = (x+iy)\left(\frac{1+i}{\sqrt{2}}\right) = \frac{1}{\sqrt{2}}[x-y + i(x+y)]$$

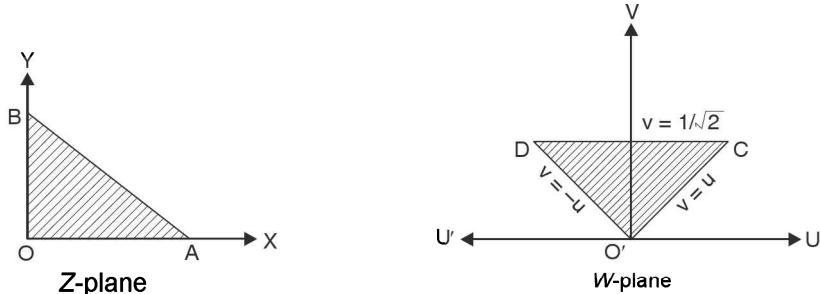

Equating real and imaginary parts, we get

$$\Rightarrow u = \frac{1}{\sqrt{2}}(x-y), \quad v = \frac{1}{\sqrt{2}}(x+y)$$

$$(i) \text{ Put } x = 0, \quad u = -\frac{1}{\sqrt{2}}y, \quad v = \frac{1}{\sqrt{2}}y \text{ or } v = -u$$

$$(ii) \text{ Put } y = 0, \quad u = \frac{1}{\sqrt{2}}x, \quad v = \frac{1}{\sqrt{2}}x \text{ or } v = u$$

$$(iii) \text{ Putting } x + y = 1 \text{ in (1), we get } v = \frac{1}{\sqrt{2}}$$

Hence the triangular region OAB in z-plane is mapped on a triangular region O'CD of w-

plane bounded by the lines  $v = u$ ,  $v = -u$ ,  $v = \frac{1}{\sqrt{2}}$ .

$$f'(z) = \frac{1}{\sqrt{2}}(1+i)$$

$$f(z) = \frac{1}{\sqrt{2}}[(x-y) + i(x+y)]$$

$$\text{Amp. } f'(z) = \tan^{-1}(1) = \frac{\pi}{4}$$

The mapping  $w = ze^{i\pi/4}$  performs a rotation of  $R$  through an angle  $\pi/4$ .

**Ans.**

### 28.8 MAGNIFICATION

$$w = cz$$

where  $c$  is a real quantity.

- (i) The figure in  $w$ -plane is magnified  $c$ -times the size of the figure in  $z$ -plane.
- (ii) Both figures in  $z$ -plane and  $w$ -plane are similar.

**Example 6.** Determine the region in  $w$ -plane on the transformation of rectangular region enclosed by  $x = 1$ ,  $y = 1$ ,  $x = 2$  and  $y = 2$  in the  $z$ -plane. The transformation is  $w = 3z$ .

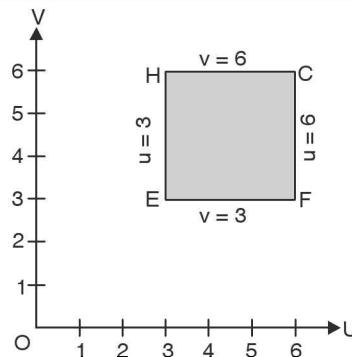

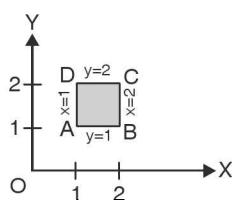

**Solution.** We have,  $w = 3z$

$$u + iv = 3(x + iy)$$

Equating the real and imaginary parts, we get

$$u = 3x \quad \text{and} \quad v = 3y$$

z-plane		w-plane	
$x$	$y$	$u = 3x$	$v = 3y$
1	1	3	3
2	2	6	6

### 28.9 MAGNIFICATION AND ROTATION

$$w = c z \quad \dots (1)$$

where  $c, z, w$  all are complex numbers.

$$c = ae^{i\alpha}, \quad z = re^{i\theta}, \quad w = Re^{i\phi}$$

Putting these values in (1), we have

$$Re^{i\phi} = (ae^{i\alpha})(re^{i\theta}) = are^{i(\theta+\alpha)}$$

i.e.  $R = ar$  and  $\phi = \theta + \alpha$

Thus we see that the transform  $w = c z$  corresponding to a rotation, together with magnification.

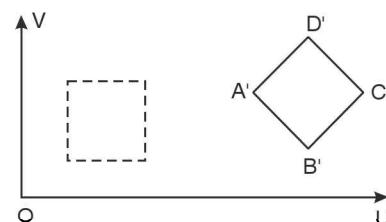

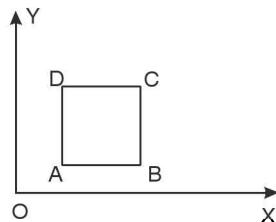

Algebraically  $w = c z$  or  $u + iv = (a + ib)(x + iy)$

$$\Rightarrow u + iv = ax - by + i(ay + bx)$$

$$u = ax - by \text{ and } v = ay + bx$$

On solving these equations, we can get the values of  $x$  and  $y$ .

$$x = \frac{au + bv}{a^2 + b^2}, \quad y = \frac{-bu + av}{a^2 + b^2}$$

On putting values of  $x$  and  $y$  in the equation of the curve to be transformed we get the equation of the image.

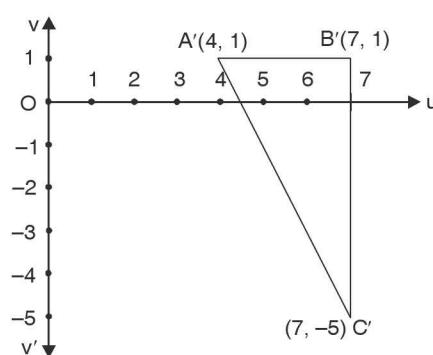

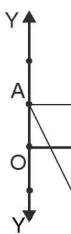

**Example 7.** Find the image of the triangle with vertices at  $i, 1+i, 1-i$  in the  $z$ -plane, under the transformation

$$(i) \quad w = 3z + 4 - 2i, \quad (ii) \quad w = e^{\frac{5\pi i}{3}} \cdot z - 2 + 4i$$

**Solution.** (i)  $w = 3z + 4 - 2i$

$$\Rightarrow u + iv = 3(x + iy) + 4 - 2i \Rightarrow u = 3x + 4, v = 3y - 2$$

S. No.	$x$	$y$	$u = 3x + 4$	$v = 3y - 2$
1.	0	1	4	1
2.	1	1	7	1
3.	1	-1	7	-5

$$\begin{aligned}
 & (ii) \quad w = e^{\frac{5\pi i}{3}} \cdot z - 2 + 4i \\
 \Rightarrow \quad u + iv &= \left( \cos \frac{5\pi}{3} + i \sin \frac{5\pi}{3} \right) (x + iy) - 2 + 4i \\
 &= \left( \frac{1}{2} - \frac{\sqrt{3}}{2}i \right) (x + iy) - 2 + 4i \\
 &= \frac{x}{2} - 2 + \frac{\sqrt{3}}{2}y + i \left( -\frac{\sqrt{3}}{2}x + \frac{y}{2} + 4 \right) \\
 \Rightarrow \quad u &= \frac{x}{2} - 2 + \frac{\sqrt{3}}{2}y \quad \text{and} \quad v = -\frac{\sqrt{3}}{2}x + \frac{y}{2} + 4
 \end{aligned}$$

S.No.	z-Plane		w-plane	
	x	y	$u = \frac{x}{2} - 2 + \frac{\sqrt{3}}{2}y$	$v = -\frac{\sqrt{3}}{2}x + \frac{y}{2} + 4$
1.	0	1	$-2 + \frac{\sqrt{3}}{2}$	$\frac{9}{2}$
2.	1	1	$-\frac{3}{2} + \frac{\sqrt{3}}{2}$	$-\frac{\sqrt{3}}{2} + \frac{9}{2}$
3.	1	-1	$-\frac{3}{2} - \frac{\sqrt{3}}{2}$	$-\frac{\sqrt{3}}{2} + \frac{7}{2}$

## 28.10 INVERSION AND REFLECTION

$$w = \frac{1}{z} \quad \dots (1)$$

If  $z = r e^{i\theta}$  and  $w = R e^{i\phi}$

Putting these values in (1), we get

$$R e^{i\phi} = \frac{1}{r e^{i\theta}} = \frac{1}{r} e^{-i\theta}$$

$$\text{On equating, } R = \frac{1}{r} \text{ and } \phi = -\theta$$

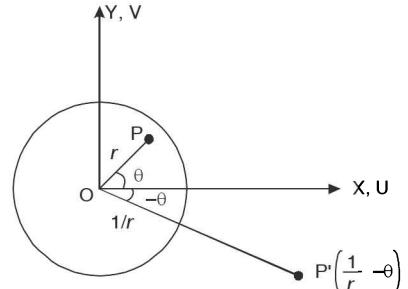

Thus the point  $P(r, \theta)$  in the  $z$ -plane is mapped onto the point  $P' \left( \frac{1}{r}, -\theta \right)$  in the  $w$ -plane.

Hence the transformation is an inversion of  $z$  and followed by reflection into the real axis.  
The points inside the unit circle ( $|z| = 1$ ) map onto points outside it, and points outside the unit circle into points inside it.

$$\text{Algebraically} \quad w = \frac{1}{z} \text{ or } z = \frac{1}{w}$$

$$x + iy = \frac{1}{u + iv}$$

$$\Rightarrow x + iy = \frac{u - iv}{(u + iv)(u - iv)} = \frac{u - iv}{u^2 + v^2}$$

$$x = \frac{u}{u^2 + v^2}, \quad y = -\frac{v}{u^2 + v^2}$$

Let the circle  $x^2 + y^2 + 2gx + 2fy + c = 0 \dots (1)$  be in  $z$ -plane.

On substituting the values of  $x$  and  $y$  in (1), we get

$$\frac{u^2}{(u^2 + v^2)^2} + \frac{v^2}{(u^2 + v^2)^2} + 2g \frac{u}{u^2 + v^2} + 2f \frac{(-v)}{u^2 + v^2} + c = 0$$

This is the equation of circle in  $w$ -plane. This shows that a circle in  $z$ -plane transforms to another circle in  $w$ -plane.

But a circle through origin transforms into a straight line.

**Example 8.** Find the image of  $|z - 3i| = 3$  under the mapping  $w = \frac{1}{z}$ .

(Uttarakhand, III Semester 2008)

$$\text{Solution.} \quad w = \frac{1}{z} \quad \Rightarrow \quad z = \frac{1}{w}$$

$$\Rightarrow x + iy = \frac{1}{u+iv} = \frac{u-iv}{(u+iv)(u-iv)} = \frac{u-iv}{u^2+v^2}$$

$$\Rightarrow x = \frac{u}{u^2+v^2} \quad \text{and} \quad y = -\frac{v}{u^2+v^2} \quad \dots (1)$$

The given curve is  $|z - 3i| = 3$

$$\Rightarrow |x + iy - 3i| = 3 \quad \Rightarrow \quad x^2 + (y - 3)^2 = 9 \quad \dots (2)$$

On substituting the values of  $x$  and  $y$  from (1) into (2), we get

$$\begin{aligned} & \frac{u^2}{(u^2+v^2)^2} + \left( -\frac{v}{u^2+v^2} - 3 \right)^2 = 9 \\ & \frac{u^2}{(u^2+v^2)^2} + \frac{(-v-3u^2-3v^2)^2}{(u^2+v^2)^2} = 9 \\ & u^2 + (-v-3u^2-3v^2)^2 = 9(u^2+v^2)^2 \\ & u^2 + v^2 + 9u^4 + 9v^4 + 6u^2v + 6v^3 + 18u^2v^2 = 9u^4 + 18u^2v^2 + 9v^4 \\ & u^2 + v^2 + 6u^2v + 6v^3 = 0 \\ & u^2 + v^2 + 6v(u^2+v^2) = 0 \\ & (u^2+v^2)(6v+1) = 0 \\ & 6v+1 = 0 \quad \text{is the equation of the image.} \end{aligned}$$

**Ans.**

$$\text{Aliter.} \quad |z - 3i| = 3, \quad z = \frac{1}{w}$$

$$\left| \frac{1}{w} - 3i \right| = 3 \quad \Rightarrow \quad |1 - 3iw| = 3 |w|$$

$$\Rightarrow |1 - 3i(u+iv)| = 3 |u+iv| \quad \Rightarrow \quad |1+3v-3iu| = 3 |u+iv|$$

$$\Rightarrow (1+3v)^2 + 9u^2 + 9(u^2+v^2) \quad \Rightarrow \quad 1+6v+9v^2+9u^2 = 9(u^2+v^2)$$

$$\Rightarrow 1+6v=0$$

**Ans.**

$$\text{Aliter.} \quad |z - 3i| = 3 \quad \Rightarrow \quad z - 3i = 3e^{i\theta} \quad \Rightarrow \quad z = 3i + 3e^{i\theta}$$

$$\begin{aligned} w = \frac{1}{z} &= \frac{1}{3i + 3e^{i\theta}} \quad \Rightarrow \quad 3w = \frac{1}{i + e^{i\theta}} \\ \Rightarrow \quad 3(u+iv) &= \frac{1}{i + \cos\theta + i\sin\theta} \\ (3u + 3iv) &= \frac{\cos\theta - i(1+\sin\theta)}{\cos^2\theta + (1+\sin\theta)^2} \quad \Rightarrow \quad 3v = -\frac{1+\sin\theta}{2+2\sin\theta} = -\frac{1}{2} \\ 6v + 1 &= 0 \end{aligned} \quad \text{Ans.}$$

**Example 9.** Image of  $|z+1|=1$  under the mapping  $w = \frac{1}{z}$  is

- (a)  $2v+1=1$     (b)  $2v-1=0$     (c)  $2u+1=0$     (d)  $2u-1=0$   
 (AMIETE, June 2009)

**Solution.**  $w = \frac{1}{z} \Rightarrow u+iv = \frac{1}{x+iy} = \frac{x-iy}{x^2+y^2}$

$$\Rightarrow u = \frac{x}{x^2+y^2}, \quad v = -\frac{y}{x^2+y^2}$$

Given  $|z+1|=1 \Rightarrow |x+iy+1|=1 \Rightarrow (x+1)^2+y^2=1$

$$\Rightarrow x^2+y^2+2x=0 \Rightarrow x^2+y^2=-2x \Rightarrow \frac{1}{2} = \frac{-x}{x^2+y^2} = -u$$

$$\Rightarrow \frac{1}{2} = -u \Rightarrow 2u+1=0$$

Hence (c) is correct answer. Ans.

**Example 10.** Show that under the transformation  $w = \frac{1}{z}$ , the image of the hyperbola  $x^2 - y^2 = 1$  is the lemniscate  $R^2 = \cos 2\phi$ .

**Solution.**  $x^2 - y^2 = 1$

Putting  $x = r \cos\theta$

and  $y = r \sin\theta$

$$\Rightarrow r^2 \cos^2\theta - r^2 \sin^2\theta = 1 \Rightarrow r^2(\cos^2\theta - \sin^2\theta) = 1$$

$$\Rightarrow r^2 \cos 2\theta = 1 \quad \dots (1)$$

And  $w = \frac{1}{z} \Rightarrow z = \frac{1}{w} \Rightarrow re^{i\theta} = \frac{1}{Re^{i\phi}} \Rightarrow re^{i\theta} = \frac{1}{R}e^{-i\phi}$

$$\therefore r = \frac{1}{R} \quad \text{and} \quad \theta = -\phi$$

Putting the values of  $r$  and  $\theta$  in (1), we get

$$\frac{1}{R^2} \cos 2(-\phi) = 1 \Rightarrow R^2 = \cos 2\phi \quad \text{Proved.}$$

### EXERCISE 28.1

1. Find the image of the semi infinite, strip  $x > 0, 0 < y < 2$  under the transformation  $w = iz + 1$ .

Ans. Strip  $-1 < u < 1, v > 0$

2. Determine the region in the  $w$ -plane in which the rectangle bounded by the lines  $x = 0, y = 0, x = 2$  and  $y = 1$  is mapped under the transformation  $w = \sqrt{2} e^{i\pi/4} z$ . (Q. Bank U.P. III Semester 2002)

Ans. Region bounded by the lines  $v = -u, v = u, u + v = 4$  and  $v - u = 2$ .

3. Show that the condition for transformation  $w = a^2 + blcz + d$  to make the circle  $|w| = 1$  correspond to a straight line in the  $z$ -plane is  $(a) = (c)$ .
4. What is the region of the  $w$ -plane in two ways the rectangular region in the  $z$ -plane bounded by the lines  $x = 0, y = 0, x = 1$  and  $y = 2$  is mapped under the transformation  $w = z + (2 - i)$ ?

**Ans.** Region bounded by  $u = 2, v = -1, u = 3$  and  $v = 1$ .

5. For the mapping  $w(z) = 1/z$ , find the image of the family of circles  $x^2 + y^2 = ax$ , where  $a$  is real.

**Ans.**  $u = \frac{1}{a}$  is a straight line  $\parallel$  to  $v$ -axis.

6. Show that the function  $w = \frac{4}{z}$  transforms the straight line  $x = c$  in the  $z$ -plane into a circle in the  $w$ -plane.
7. If  $(w+1)^2 = \frac{4}{z}$ , then prove that the unit circle in the  $w$ -plane corresponds to a parabola in the  $z$ -plane, and the inside of the circle to the outside of the parabola.
8. Find the image of  $|z - 2i| = 2$  under the mapping  $w = \frac{1}{z}$  (Q. Bank U.P. 2002) **Ans.**  $4v + 1 = 0$

### 28.11 BILINEAR TRANSFORMATION (Mobius Transformation)

$$\boxed{w = \frac{az+b}{cz+d}} \quad ad - bc \neq 0 \quad \dots (1)$$

(1) is known as bilinear transformation.

If  $ad - bc \neq 0$  then  $\frac{dw}{dz} \neq 0$  i.e. transformation is conformal.

$$\text{From (1), } z = \frac{-dw + b}{cw - a} \quad \dots (2)$$

This is also bilinear except  $w = \frac{a}{c}$ .

**Note.** From (1), every point of  $z$ -plane is mapped into unique point in  $w$ -plane except  $z = -\frac{d}{c}$ .

From (2), every point of  $w$ -plane is mapped into unique point in  $z$ -plane except  $w = \frac{a}{c}$ .

### 28.12 INVARIANT POINTS OF BILINEAR TRANSFORMATION.

$$\text{We know that } w = \frac{az+b}{cz+d} \quad \dots (1)$$

If  $z$  maps into itself, then  $w = z$

$$(1) \text{ becomes } z = \frac{az+b}{cz+d} \quad \dots (2)$$

Roots of (2) are the invariants or fixed points of the bilinear transformation.

If the roots are equal, the bilinear transformation is said to be parabolic.

### 28.13 CROSS-RATIO

If there are four points  $z_1, z_2, z_3, z_4$  taken in order, then the ratio  $\frac{(z_1 - z_2)(z_3 - z_4)}{(z_2 - z_3)(z_4 - z_1)}$  is called

the cross-ratio of  $z_1, z_2, z_3, z_4$ .

### 28.14 THEOREM

A bilinear transformation preserves cross-ratio of four points

**Proof.** We know that  $w = \frac{az+b}{cz+d}$ .

As  $w_1, w_2, w_3, w_4$  are images of  $z_1, z_2, z_3, z_4$  respectively, so

$$w_1 = \frac{az_1+b}{cz_1+d}, \quad w_2 = \frac{az_2+b}{cz_2+d}$$

$$\therefore w_1 - w_2 = \frac{(ad-bc)}{(cz_1+d)(cz_2+d)}(z_1 - z_2) \quad \dots(1)$$

$$\text{Similarly } w_2 - w_3 = \frac{ad-bc}{(cz_2+d)(cz_3+d)}(z_2 - z_3) \quad \dots(2)$$

$$w_3 - w_4 = \frac{ad-bc}{(cz_3+d)(cz_4+d)}(z_3 - z_4) \quad \dots(3)$$

$$w_4 - w_1 = \frac{ad-bc}{(cz_4+d)(cz_1+d)}(z_4 - z_1) \quad \dots(4)$$

From (1), (2), (3) and (4), we have

$$\begin{aligned} \frac{(w_1 - w_2)(w_3 - w_4)}{(w_1 - w_4)(w_3 - w_2)} &= \frac{(z_1 - z_2)(z_3 - z_4)}{(z_1 - z_4)(z_3 - z_2)} \\ \Rightarrow (w_1, w_2, w_3, w_4) &= (z_1, z_2, z_3, z_4). \end{aligned}$$

### 28.15 PROPERTIES OF BILINEAR TRANSFORMATION

1. A bilinear transformation maps circles into circles.

2. A bilinear transformation preserves cross ratio of four points.

If four points  $z_1, z_2, z_3, z_4$  of the  $z$ -plane map onto the points  $w_1, w_2, w_3, w_4$  of the  $w$ -plane respectively.

$$\Rightarrow \frac{(w_1 - w_2)(w_3 - w_4)}{(w_1 - w_4)(w_3 - w_2)} = \frac{(z_1 - z_2)(z_3 - z_4)}{(z_1 - z_4)(z_3 - z_2)}$$

Hence, under the **bilinear** transform of four points cross-ratio is preserved.

### 28.16 METHODS TO FIND BILINEAR TRANSFORMATION

1. By finding  $a, b, c, d$  for  $w = \frac{az+b}{cz+d}$  with the given conditions.

2. With the help of cross-ratio

$$\boxed{\frac{(w - w_1)(w_2 - w_3)}{(w - w_3)(w_2 - w_1)} = \frac{(z - z_1)(z_2 - z_3)}{(z - z_3)(z_2 - z_1)}}$$

**Example 11.** Find the bilinear transformation which maps the points  $z = 1, i, -1$  into the points  $w = i, 0, -i$ .

Hence find the image of  $|z| < 1$ .

(U.P., III Semester, 2008, Summer 2002, U.P. (Agri. Engg.) 2002)

**Solution.** Let the required transformation be  $w = \frac{az+b}{cz+d}$

$$\text{or } w = \frac{\frac{a}{d}z + \frac{b}{d}}{\frac{c}{d}z + 1} = \frac{pz + q}{rz + 1} \quad \dots(1) \quad \left[ p = \frac{a}{d}, q = \frac{b}{d}, r = \frac{c}{d} \right]$$

		On substituting the values of $z$ and corresponding values of $w$ in (1), we get
$z$	$w$	$i = \frac{p+q}{r+1} \Rightarrow p+q = ir+i \quad \dots (2)$
1	$i$	$0 = \frac{pi+q}{ri+1} \Rightarrow pi+q=0 \quad \dots (3)$
-1	$-i$	$-i = \frac{-p+q}{-r+1} \Rightarrow -p+q=ir-i \quad \dots (4)$

On subtracting (4) from (2), we get  $2p = 2i$  or  $p = i$

On putting the value of  $p$  in (3), we have  $i(i) + q = 0$  or  $q = 1$

On substituting the values of  $p$  and  $q$  in (2), we obtain

$$i+1 = ir+i \quad \text{or} \quad 1 = ir \quad \text{or} \quad r = -i$$

By using the values of  $p, q, r$  and (1), we have

$$w = \frac{iz+1}{-iz+1}$$

$$u+iv = \frac{i(x+iy)+1}{-i(x+iy)+1} = \frac{(ix-y+1)(ix+y+1)}{(-ix+y+1)(ix+y+1)} = \frac{-x^2-y^2+1+2ix}{x^2+(y+1)^2}$$

Equating real and imaginary parts, we get

$$u = \frac{-x^2-y^2+1}{x^2+(y+1)^2} \quad \dots (5)$$

$$\text{But } |z| < 1 \Rightarrow x^2 + y^2 < 1 \Rightarrow 1 - x^2 - y^2 > 0$$

From (5)  $u > 0$  As denominator is positive

Ans.

**Example 12.** Find a bilinear transformation which maps the points  $i, -i, 1$  of the  $z$ -plane into  $0, 1, \infty$  of the  $w$ -plane respectively. (Q. Bank U.P. III Semester 2002)

**Solution.** By Cross ratio

$$\frac{(w-w_1)(w_2-w_3)}{(w-w_3)(w_2-w_1)} = \frac{(z-z_1)(z_2-z_3)}{(z-z_3)(z_2-z_1)} \quad \dots (1)$$

Here  $w_1 = 0, w_2 = 1, w_3 = \infty$  and  $z_1 = i, z_2 = -i, z_3 = 1$   
From (1),

$$\frac{(w-w_1)\left(\frac{w_2}{w_3}-1\right)}{\left(\frac{w}{w_3}-1\right)(w_2-w_1)} = \frac{(z-z_1)(z_2-z_3)}{(z-z_3)(z_2-z_1)}$$

$$\Rightarrow \frac{(w-0)\left(\frac{1}{\infty}-1\right)}{\left(\frac{w}{\infty}-1\right)(1-0)} = \frac{(z-i)(-i-1)}{(z-1)(-i-i)}$$

$$\Rightarrow w = \frac{(z-i)(i+1)}{(z-1)(2i)} = \frac{(z-i)(-1+i)}{(z-1)(-2)} = \frac{(i-1)z+(i+1)}{-2z+2} \quad \text{Ans.}$$

**Example 13.** Find the bilinear transformation which maps the points  $z = 1, -i, -1$  to the points  $w = i, 0, -i$  respectively. Show also that transformation maps the region outside the circle  $|z| = 1$  into the half-plane  $R(w) \geq 0$ . (Q. Bank U.P. III Semester 2002)

**Solution.** On putting  $z = 1, -i, -1$  and  $w = i, 0, -i$  in

$$\begin{array}{|c|c|} \hline z & w \\ \hline 1 & i \\ \hline -i & 0 \\ \hline -1 & -i \\ \hline \end{array}
 \Rightarrow \frac{(w-w_1)(w_2-w_3)}{(w-w_3)(w_2-w_1)} = \frac{(z-z_1)(z_2-z_3)}{(z-z_3)(z_2-z_1)}$$

$$\frac{(w-i)(0+i)}{(w+i)(-i)} = \frac{(z-1)(-i+1)}{(z+1)(-i-1)}$$

$$\frac{i-w}{i+w} = \frac{(z-1)(i-1)}{(z+1)(i+1)}$$

$$\frac{i-w}{i+w} = \frac{(i-1)z+1-i}{(i+1)z+1+i}$$

$$\frac{2i}{-2w} = \frac{2iz+2}{-2z-2i} \quad (\text{Applying Componendo and Dividendo})$$

$$\frac{i}{-w} = \frac{iz+1}{-(z+i)} \Rightarrow w = \frac{i(z+i)}{iz+1}$$

$$w = \frac{iz-1}{iz+1} \quad \dots (1) \quad \text{Ans.}$$

From (1), 
$$z = i \left( \frac{w+1}{w-1} \right)$$

$|z| \geq 1$  is transformed into  $\left| \frac{w+1}{w-1} \right| |i| \geq 1$

$$\begin{aligned} \Rightarrow |w+1|^2 &\geq |w-1|^2 \Rightarrow |u+iv+1|^2 \geq |u+iv-1|^2 \\ \Rightarrow (u+1)^2 + v^2 &\geq (u-1)^2 + v^2 \Rightarrow u \geq 0 \\ \Rightarrow R(w) &\geq 0. \end{aligned}$$

Thus exterior of the circle  $|z| = 1$  is transformed into the half-plane  $R(w) \geq 0$ . **Proved.**

**Example 14.** Find the bilinear transformation which maps the points  $z = 0, -1, i$  onto  $w = i, 0, \infty$ . Also find the image of the unit circle  $|z| = 1$ .

[Uttarakhand, III Semester 2008, U.P. III semester (C.O.) 2003]

**Solution.** On putting  $z = 0, -1, i$  into  $w = i, 0, \infty$  respectively in

$$\frac{(w-w_1)(w_2-w_3)}{(w-w_3)(w_2-w_1)} = \frac{(z-z_1)(z_2-z_3)}{(z-z_3)(z_2-z_1)} \quad \dots (1)$$

$$\begin{array}{|c|c|} \hline z & w \\ \hline 0 & i \\ \hline -1 & 0 \\ \hline i & \infty \\ \hline \end{array}
 \Rightarrow \frac{(w-w_1)\left(\frac{w_2}{w_3}-1\right)}{\left(\frac{w}{w_3}-1\right)(w_2-w_1)} = \frac{(z-z_1)(z_2-z_3)}{(z-z_3)(z_2-z_1)}$$

$$\Rightarrow \frac{(w-i)(-1)}{(-1)(0-i)} = \frac{(z-0)(-1-i)}{(z-i)(-1-0)} \Rightarrow \left( \frac{w-i}{-i} \right) = \frac{z(1+i)}{z-i}$$

$$\Rightarrow w-i = \frac{(-i+1)z}{z-i} \Rightarrow w = \frac{(1-i)z}{z-i} + i = \frac{(1-i)z + iz + 1}{z-i}$$

$$\Rightarrow w = \frac{z+1}{z-i} \quad \dots (2) \quad \text{Ans.}$$

From (2) 
$$z = \frac{iw + 1}{w - 1} \quad \dots(3)$$

Inverse transformation is  

$$z = \frac{-dw + b}{cw - a}$$

And

$$|z| = 1$$

$$\Rightarrow \left| \frac{iw + 1}{w - 1} \right| = 1 \Rightarrow |1 + iw| = |w - 1|$$

$$\Rightarrow |1 + i(u + iv)| = |u + iv - 1| \Rightarrow |1 - v + iu| = |u - 1 + iv|$$

$$\Rightarrow (1 - v)^2 + u^2 = (u - 1)^2 + v^2 \Rightarrow 1 + v^2 - 2v + u^2 = u^2 + 1 - 2u + v^2$$

$$\Rightarrow u - v = 0 \Rightarrow v = u$$

**Ans.**

**Example 15.** Find the fixed points and the normal form of the following bilinear transformations.

$$(a) w = \frac{3z - 4}{z - 1} \quad \text{and} \quad (b) w = \frac{z - 1}{z + 1}$$

Discuss the nature of these transformations.

**Solution.** (a) The fixed points are obtained by

$$z = \frac{3z - 4}{z - 1} \quad \text{or} \quad z^2 - 4z + 4 = 0 \quad \text{or} \quad (z - 2)^2 = 0 \Rightarrow z = 2$$

$z = 2$  is the only fixed point. This transformation is parabolic.

**Normal Form**

$$w = \frac{3z - 4}{z - 1} \Rightarrow \frac{1}{w - 2} = \frac{1}{\frac{3z - 4}{z - 1} - 2} = \frac{z - 1}{3z - 4 - 2z + 2} = \frac{z - 1}{z - 2}$$

$$\Rightarrow \frac{1}{w - 2} = \frac{1}{z - 2} + 1$$

(b) The fixed points are obtained by

$$z = \frac{z - 1}{z + 1} \Rightarrow z^2 + z = z - 1 \Rightarrow z^2 = -1 \Rightarrow z = \pm i$$

Hence  $\pm i$  are the two fixed points.

**Normal Form**

$$w = \frac{z - 1}{z + 1}$$

$$w - i = \frac{z - 1}{z + 1} - i = \frac{z - 1 - i(z + 1)}{z + 1} \quad \dots(1)$$

$$\text{and} \quad w + i = \frac{z - 1}{z + 1} + i = \frac{z - 1 + i(z + 1)}{z + 1} \quad \dots(2)$$

On dividing (1) by (2), we get

$$\frac{w - i}{w + i} = \frac{z - 1 - i(z + 1)}{z - 1 + i(z + 1)} = \frac{(1 - i)(z - i)}{(1 + i)(z + i)} = \frac{(-i^2 - i)(z - i)}{(1 + i)(z + i)}$$

$$\frac{w - 1}{w + 1} = -i \left( \frac{z - i}{z + i} \right) = k \left( \frac{z - i}{z + i} \right) \text{ where } k = -i$$

The transformation is elliptic.

**Ans.**

**Example 16.** The fixed points of the transformation  $w = \frac{2z-5}{z+4}$  are given by:

- (a)  $\left(\frac{5}{2}, 0\right)$     (b)  $(-4, 0)$     (c)  $(-1 + 2i, -1 - 2i)$     (d)  $(-1 + \sqrt{6}, -1 - \sqrt{6})$

(AMIETE, Dec. 2010)

**Solution.** Here  $f(z) = \frac{2z-5}{z+4}$

$$\text{In the case of fixed point } z = \frac{2z-5}{z+4}$$

$$\Rightarrow z^2 + 4z = 2z - 5 \quad \Rightarrow \quad z^2 + 2z + 5 = 0$$

$$\Rightarrow z = \frac{-2 \pm \sqrt{4-20}}{2} = \frac{-2 \pm 4i}{2} = -1 \pm 2i$$

$z = -1 \pm 2i$  are the only fixed points

Hence (c) is correct answer.

**Ans.**

**Example 17.** Show that the transformation  $w = i \frac{1-z}{1+z}$  transforms the circle  $|z|=1$  onto the real axis of the  $w$ -plane and the interior of the circle into the upper half of the  $w$ -plane.  
(U.P., III Semester, Dec. 2003)

**Solution.**  $w = i \left( \frac{1-z}{1+z} \right)$

$$(u+iv) = i \left( \frac{1-(x+iy)}{1+(x+iy)} \right) = \frac{(i-i)x+y}{[1+(x+iy)][(1+x)-iy]}$$

$$= \frac{i+ix+y-i(x-ix^2-xy+y+xy-iy^2)}{(1+x)^2+y^2} = \frac{y-xy+y+xy+i+ix-ix-ix^2-iy^2}{(1+x)^2+y^2}$$

$$= \frac{2y+i(1-x^2-y^2)}{(1+x)^2+y^2}$$

Equating the real and imaginary parts, we get

$$u = \frac{2y}{(1+x)^2+y^2} \quad \dots (1)$$

$$\text{and} \quad v = \frac{1-(x^2+y^2)}{(1+x)^2+y^2} \quad \dots (2)$$

when  $x^2+y^2=1$ , then  $v = \frac{1-1}{(1+x)^2+y^2} = 0$

$v=0$  is the equation of the real axis in the  $w$ -plane.

**Proved.**

(b) Now the equation of the interior of the circle is  $x^2+y^2<1$ .

Dividing (1) by (2), we get

$$\frac{u}{v} = \frac{2y}{1-(x^2+y^2)}, \quad u-u(x^2+y^2) = 2vy, \quad u(x^2+y^2) = u-^2$$

$$x^2+y^2 = 1 - \frac{2vy}{u}, \quad 1 - \frac{2vy}{u} < 1 \quad [\text{as } x^2+y^2 < 1]$$

$$-\frac{2vy}{u} < 0, \quad 2vy > 0$$

$$v > 0$$

$v>0$  is the equation of the upper half of  $w$ -plane.

**Proved.**

**Example 18.** Show that  $\omega = \frac{i-z}{i+z}$  maps the real axis of the  $z$ -plane into the circle  $|w| = 1$

and (ii) the half-plane  $y > 0$  into the interior of the unit circle  $|\omega| < 1$  in the  $w$ -plane.

(U.P., III Semester, Dec. 2005, 2002)

**Solution.** We have  $\omega = \frac{i-z}{i+z}$

$$|\omega| = \left| \frac{i-z}{i+z} \right| = \frac{|i-z|}{|i+z|} = \frac{|i-x-iy|}{|i+x+iy|}$$

$$|\omega| = \left| \frac{-x+i(1-y)}{x+i(1+y)} \right|, \quad |\omega| = \frac{\sqrt{x^2+(1-y)^2}}{\sqrt{x^2+(1+y)^2}}$$

Now the real axis in  $z$ -plane i.e.  $y = 0$ , transform into

$$|\omega| = \frac{\sqrt{x^2+1}}{\sqrt{x^2+1}} = 1, \quad |\omega| = 1 \quad |z| = 1$$

Hence the real axis in the  $z$ -plane is mapped into the circle  $|\omega|=1$ .

(ii) The interior of the circle i.e.  $|w| < 1$  gives.

$$\begin{aligned} & \frac{\sqrt{x^2+(1-y)^2}}{\sqrt{x^2+(1+y)^2}} < 1 \\ \Rightarrow & \frac{x^2+(1-y)^2}{x^2+(1+y)^2} < 1 \quad \Rightarrow \quad x^2+(1-y)^2 < x^2+(1+y)^2 \\ \Rightarrow & 1+y^2-2y < 1+y^2+2y \quad \Rightarrow \quad -4y < 0, \quad \Rightarrow \quad y > 0. \end{aligned}$$

Thus the upper half of the  $z$ -plane corresponds to the interior of the circle  $|w| = 1$ . **Proved.**

**Example 19.** Show that the transformation  $w = \frac{3-z}{z-2}$  transforms the circle with centre  $\left(\frac{5}{2}, 0\right)$

and radius  $\frac{1}{2}$  in the  $z$ -plane into the imaginary axis in the  $w$ -plane and the interior of the circle into the right half of the plane. (A.M.I.E.T.E. Summer 2000)

**Solution.**  $w = \frac{3-z}{z-2} \Rightarrow u+iv = \frac{3-x-iy}{x+iy-2} \Rightarrow (u+iv)(x+iy-2) = 3-x-iy$

$$\Rightarrow ux + iuy - 2u + ivx - vy - 2iv = 3 - x - iy$$

$$\Rightarrow ux - 2u - vy + i(uy + vx - 2v) = 3 - x - iy$$

Equating real and imaginary quantities, we have

$$ux - vy - 2u = 3 - x \text{ and } vx - 2v + uy = -y$$

$$\Rightarrow (u+1)x - vy = 2u+3 \text{ and } vx + (u+1)y = 2v$$

On solving the equations for  $x$  and  $y$ , we have

$$x = \frac{2u^2 + 2v^2 + 5u + 3}{u^2 + v^2 + 2u + 1}, \quad y = \frac{-v}{u^2 + v^2 + 2u + 1}$$

Here, the equation of the given circle is  $\left(x - \frac{5}{2}\right)^2 + y^2 = \frac{1}{4}$  ... (1)

Putting the values of  $x$  and  $y$  in (1), we have

$$\begin{aligned} & \left( \frac{2u^2 + 2v^2 + 5u + 3}{u^2 + v^2 + 2u + 1} - \frac{5}{2} \right)^2 + \left( \frac{-v}{u^2 + v^2 + 2u + 1} \right)^2 = \frac{1}{4} \\ \Rightarrow & \left( \frac{-u^2 - v^2 + 1}{2(u^2 + v^2 + 2u + 1)} \right)^2 + \left( \frac{-v}{u^2 + v^2 + 2u + 1} \right)^2 = \frac{1}{4} \\ \Rightarrow & (-u^2 - v^2 + 1)^2 + 4v^2 = (u^2 + v^2 + 2u + 1)^2 \\ \Rightarrow & (u^2 + v^2 - 1)^2 + 4v^2 = [(u^2 + v^2 - 1) + (2u + 2)]^2 \\ \Rightarrow & (u^2 + v^2 - 1)^2 + 4v^2 = (u^2 + v^2 - 1)^2 + (2u + 2)^2 + 2(u^2 + v^2 - 1)(2u + 2) \\ \Rightarrow & v^2 = (u + 1)^2 + (u^2 + v^2 - 1)(u + 1) \\ \Rightarrow & v^2 = u^2 + 2u + 1 + u^3 + uv^2 - u + u^2 + v^2 - 1 \\ \Rightarrow & 0 = u^3 + 2u^2 + u + uv^2 \\ \Rightarrow & u(u^2 + 2u + 1 + v^2) = 0 \Rightarrow u = 0 \text{ i.e., equation of imaginary axis.} \end{aligned}$$

Equation of the interior of the circle is  $\left(x - \frac{5}{2}\right)^2 + y^2 < \frac{1}{4}$ .

Then corresponding equation in  $u, v$  is

$$u(u^2 + 2u + 1 + v^2) > 0 \text{ or } u[(u + 1)^2 + v^2] > 0$$

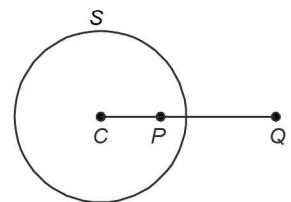

As  $(u + 1)^2 + v^2 > 0$  so  $u > 0$  i.e., equation of the right half plane.

**Ans.**

### 28.17 INVERSE POINT WITH RESPECT TO A CIRCLE

Two points  $P$  and  $Q$  are said to be the inverse points with respect to a circle  $S$  if they are collinear with the centre  $C$  on the same side of it, and if the product of their distances from the centre is equal to  $r^2$  where  $r$  is the radius of the circle.

Thus when  $P$  and  $Q$  are the inverse points of the circle, then the three points  $C, P, Q$  are collinear, and also  $CP \cdot CQ = r^2$

**Example 20.** Show that the inverse of a point  $a$ , with respect to the circle  $|z - c| = R$  is the

$$\text{point } c + \frac{R^2}{\bar{a} - \bar{c}}$$

**Solution.** Let  $b$  be the inverse point of the point  $a'$  with respect to the circle  $|z - c| = R$ .

**Condition I.** The points  $a, b, c$  are collinear. Hence

$$\arg(\bar{b} - \bar{c}) = \arg(\bar{a} - \bar{c}) = -\arg(\bar{a} - \bar{c}) \quad (\text{since } \arg z = -\arg \bar{z})$$

$$\Rightarrow \arg(\bar{b} - \bar{c}) + \arg(\bar{a} - \bar{c}) = 0 \quad \text{or} \quad \arg(\bar{b} - \bar{c})(\bar{a} - \bar{c}) = 0$$

$\therefore (\bar{b} - \bar{c})(\bar{a} - \bar{c})$  is real, so that

$$(\bar{b} - \bar{c})(\bar{a} - \bar{c}) = |(\bar{b} - \bar{c})(\bar{a} - \bar{c})|$$

$$\begin{aligned}
 \textbf{Condition II.} \quad & |\bar{b} - \bar{c}| |\bar{a} - \bar{c}| = R^2 \Rightarrow |\bar{b} - \bar{c}| |\bar{a} - \bar{c}| = R^2 \quad \{ |z| = |\bar{z}| \} \\
 & |(\bar{b} - \bar{c})(\bar{a} - \bar{c})| = R^2 \Rightarrow (\bar{b} - \bar{c})(\bar{a} - \bar{c}) = R^2 \Rightarrow \bar{b} - \bar{c} = \frac{R^2}{\bar{a} - \bar{c}} \\
 & \Rightarrow b = c + \frac{R^2}{a - c}. \quad \textbf{Proved.}
 \end{aligned}$$

**Example 21.** Find a Möbius transformation which maps the circle  $|w| \leq 1$  into the circle  $|z - 1| < 1$  and maps  $w = 0, w = 1$  respectively into  $z = \frac{1}{2}, z = 0$ .

**Solution.** Let the transformation be,

$z$	$w$
$\frac{1}{2}$	0
0	1

Since,  $w = 0$  maps into  $z = \frac{1}{2}$ ,

From (1), we get

$$0 = \frac{\frac{a}{2} + b}{\frac{c}{2} + d} \Rightarrow \frac{a}{2} + b = 0 \quad \dots (2)$$

Since  $w = 1$  maps into  $z = 0$ , from (1), we get

$$1 = \frac{0+b}{0+d} \Rightarrow b = d \quad \dots (3)$$

Here  $|w| = 1$  corresponding to  $|z - 1| = 1$

Therefore points  $w, \frac{1}{w}$  inverse with respect to the circle  $|w| = 1$  correspond to the points

$z, 1 + \frac{1}{z-1}$  inverse with respect to the circle  $|z - 1| = 1$

[ $z$  and  $a + \frac{R^2}{z-a}$  are inverse points on the circle  $|z - a| = R$ ]

Particular  $w = 0$  and  $\infty$  correspond to

$$z = \frac{1}{2}, 1 + \frac{1}{\frac{1}{2} - 1} \Rightarrow z = \frac{1}{2}, -1$$

Since  $w = 0$  maps into  $z = -1$ , from (1), we get

$$\infty = \frac{-a+b}{-c+d} \Rightarrow -c + d = 0 \Rightarrow c = d \quad \dots (4)$$

From (2), (3) and (4),  $b = -\frac{a}{2}, c = d$

$$\text{From (1)} \quad w = \frac{az+b}{cz+d} = \frac{-2bz+b}{bz+b} = \frac{-2z+1}{z+1} \quad \textbf{Ans.}$$

**Example 22.** Find two bilinear transformations whose fixed points are 1 and 2.

(Q. Bank U.P.T.U. 2002)

**Solution.** We have,  $w = \frac{az+b}{cz+d}$  ... (1)

Fixed points are given by

$$z = \frac{az+b}{cz+d}$$

$$\Rightarrow cz^2 - (a-d)z - b = 0 \quad \Rightarrow \quad z^2 - \frac{(a-d)}{c}z - \frac{b}{c} = 0 \quad \dots (2)$$

Fixed points are 1 and 2, so

$$(z-1)(z-2) = 0 \\ \Rightarrow z^2 - 3z + 2 = 0$$

Equating the coefficients of  $z$  and constants in (2) and (3), we get

$$\therefore \frac{a-d}{c} = 3 \quad \text{and} \quad -\frac{b}{c} = 2 \\ \Rightarrow b = -2c \quad \text{and} \quad d = a - 3c$$

Putting the values of  $b$  and  $d$  in (1), we get

$$w = \frac{az - 2c}{cz + a - 3c} \text{ has its fixed points at } z = 1 \text{ and } z = 2.$$

Taking  $a = 1$ ,  $c = -1$  and  $a = 2$ ,  $c = -1$ , we have

$$w = \frac{z+2}{4-z} \quad \text{and} \quad w = \frac{2(z+1)}{5-z} \quad \text{Ans.}$$

**Example 23.** Show that the transformation  $w = \frac{2z+3}{z-4}$  maps the circle  $x^2 + y^2 - 4x = 0$  onto the straight line  $4u + 3 = 0$ .

**Solution.** We have,  $w = \frac{2z+3}{z-4}$

The inverse transformation is  $z = \frac{4w+3}{w-2}$  ... (1)

Now the circle  $x^2 + y^2 - 4x = 0$  can be written as  $z\bar{z} - 2(z + \bar{z}) = 0$

$$\begin{cases} z = x + iy \\ \bar{z} = x - iy \end{cases}$$

Substituting for  $z$  and  $\bar{z}$  from (1), we get

$$\frac{4w+3}{w-2} \cdot \frac{4\bar{w}+3}{\bar{w}-2} - 2 \left( \frac{4w+3}{w-2} + \frac{4\bar{w}+3}{\bar{w}-2} \right) = 0$$

$$\Rightarrow 16w\bar{w} + 12w + 12\bar{w} + 9 - 2(4w\bar{w} + 3\bar{w} - 8w - 6 + 4w\bar{w} + 3w - 8\bar{w} - 6) = 0$$

$$\Rightarrow 22(w + \bar{w}) + 33 = 0 \quad \Rightarrow \quad 22(2u) + 33 = 0 \Rightarrow 4u + 3 = 0 \quad \begin{bmatrix} w = u + iv \\ w = u - iv \end{bmatrix}$$

Thus, circle is transformed into a straight line. Ans.

**Example 24.** Show that the transformation  $w = \frac{5-4z}{4z-2}$  transform the circle  $|z| = 1$  into a

circle of radius unity in  $w$ -plane and find the centre of the circle.

(Q. Bank U.P. III Semester 2002)

**Solution.** Here,  $w = \frac{5-4z}{4z-2}$

$$\Rightarrow z = \frac{2w+5}{4w+4} \quad \Rightarrow \quad |z| = \left| \frac{2w+5}{4w+4} \right|$$

$$|z| = 1 \quad \Rightarrow \quad \left| \frac{2w+5}{4w+4} \right| = 1$$

$$\Rightarrow |2w+5| = |4w+4|$$

$$\begin{aligned}
 \Rightarrow & |2u + 5 + 2iv| = |4u + 4 + 4iv| & [\because w = u + iv] \\
 \Rightarrow & (2u + 5)^2 + 4v^2 = (4u + 4)^2 + (4v)^2 & \dots(1) \\
 \Rightarrow & 4u^2 + 25 + 20u + 4v^2 = 16u^2 + 16 + 32u + 16v^2 \\
 \Rightarrow & 12u^2 + 12v^2 + 12u - 9 = 0 \\
 \Rightarrow & u^2 + v^2 + u - \frac{3}{4} = 0.
 \end{aligned}$$

This is the equation of circle in  $w$  plane. ... (2)

Now we have to find its centre.

$$u^2 + v^2 + 2gu + 2fv + c = 0 \quad \dots(3)$$

$$\text{From (2) and (3), } g = \frac{1}{2}, f = 0, c = -\frac{3}{4}$$

Centre is  $(-g, -f)$  i.e.,  $\left(-\frac{1}{2}, 0\right)$

$$\text{Radius} = \sqrt{g^2 + f^2 - c} = \sqrt{\frac{1}{4} + 0 + \frac{3}{4}} = 1$$

Thus (2) is circle with its centre at  $\left(-\frac{1}{2}, 0\right)$  and of radius unity in  $w$ -plane. **Proved.**

**Example 25.** Find the image of  $x^2 + y^2 - 4y + 2 = 0$  under the mapping  $w = \frac{z-i}{iz-1}$ .

(Q. Bank U.P. III Semester 2002)

$$\begin{aligned}
 \text{Solution.} \quad w &= \frac{z-i}{iz-1} \Rightarrow w(iz-1) = z-i \\
 x^2 + y^2 - 4y + 2 &= 0 \quad \dots(1)
 \end{aligned}$$

$$\begin{aligned}
 \Rightarrow z &= \frac{w-i}{iw-1} \\
 \Rightarrow x+iy &= \frac{u+i(v-1)}{iu-(v+1)} \quad \dots(2)
 \end{aligned}$$

$$\therefore x-iy = \frac{u-i(v-1)}{-iu-(v+1)} \quad \dots(3)$$

Multiplying (2) and (3) we get

$$\Rightarrow x^2 + y^2 = \frac{u^2 + (v-1)^2}{u^2 + (v+1)^2} \quad \dots(4)$$

Subtracting (3) from (2), we get

$$2iy = \frac{-2iu^2 - 2i(v^2 - 1)}{u^2 + (v+1)^2} \quad \dots(5)$$

Putting the values of  $(x^2 + y^2)$  and  $y$  in (1), we get

$$\begin{aligned}
 \frac{u^2 + (v-1)^2}{u^2 + (v+1)^2} + 4 \cdot \frac{u^2 + (v^2 - 1)}{u^2 + (v+1)^2} + 2 &= 0 \\
 \Rightarrow u^2 + (v-1)^2 + 4[u^2 + (v^2 - 1)] + 2[u^2 + (v+1)^2] &= 0 \\
 \Rightarrow 7(u^2 + v^2) + 2v - 1 &= 0
 \end{aligned}$$

This is the image.

**Ans.**

**EXERCISE 28.2**

1. Find the bilinear transformation that maps the points  $z_1 = 2$ ,  $z_2 = i$ ,  $z_3 = -2$  into the points  $w_1 = 1$ ,  $w_2 = i$  and  $w_3 = -1$  respectively.

$$\text{Ans. } w = \frac{3z + 2i}{iz + 6}$$

2. Determine the bilinear transformation which maps  $z_1 = 0$ ,  $z_2 = 1$ ,  $z_3 = \infty$  onto  $w_1 = i$ ,  $w_2 = -1$ ,  $w_3 = -i$  respectively.

$$\text{Ans. } w = \frac{z - i}{iz - 1}$$

3. Verify that the equation  $w = \frac{1+iz}{1+z}$  maps the exterior of the circle  $|z| = 1$  into the upper half plane  $v > 0$ .

4. Find the bilinear transformation which maps  $1, i, -1$  to  $2, i, -2$  respectively. Find the fixed and critical points of the transformation.

**Ans.  $i, 2i$**

5. Show that the transformation  $w = \frac{i(1-z)}{1+z}$  maps the circle  $|z| = 1$  into the real axis of the  $w$ -plane and the interior of the circle  $|z| < 1$  into the upper half of the  $w$ -plane.

6. Show that the transformation  $w = \frac{iz+2}{4z+i}$  transforms the real axis in the  $z$ -plane into circle in the  $w$ -plane. Find the centre and the radius of this circle. (A.M.I.E.T.E., Winter 2000) **Ans.  $\left(0, \frac{7}{8}\right), \frac{9}{8}$**

7. If  $z_0$  is the upper half of the  $z$ -plane show that the bilinear transformation

$$w = e^{i\alpha} \left( \frac{z - z_0}{z - \bar{z}_0} \right)$$

maps the upper half of the  $z$ -plane into the interior of the unit circle at the origin in the  $w$ -plane.

8. Find the condition that the transformation  $w = \frac{az+b}{cz+d}$  transforms the unit circle in the  $w$ -plane into straight line in the  $z$ -plane.

$$\text{Ans. If } \left| \frac{c}{a} \right| = 1 \text{ or } |a| = |c|$$

9. Prove that  $w = \frac{z}{1-z}$  maps the upper half of the  $z$ -plane onto the upper half of the  $w$ -plane. What is the image of the circle  $|z| = 1$  under this transformation ?

**Ans. Straight line  $2u + 1 = 0$**

10. Show that the map of the real axis of the  $z$ -plane on the  $w$ -plane by the transformation  $w = \frac{1}{z+i}$  is a circle and find its centre and radius.

$$\text{Ans. Centre } \left(0, -\frac{1}{2}\right), \text{ Radius} = \frac{1}{2}$$

11. Find the invariant points of the transformation  $w = -\left(\frac{2z+4i}{iz+1}\right)$ . Prove also that these two points together with any point  $z$  and its image  $w$ , form a set of four points having a constant cross ratio.

**Ans.  $4i$  and  $-i$**

12. Show that under the transformation  $w = \frac{z-i}{z+i}$ , the real axis in  $z$ -plane is mapped into the circle  $|w| = 1$ .

What portion of the  $z$ -plane corresponds to the interior of the circle ?

**Ans. The half  $z$ -plane above the real axis corresponds to the interior of the circle  $|w| = 1$ .**

13. Discuss the application of the transformation  $w = \frac{iz+1}{z+i}$  to the areas in the  $z$ -plane which are respectively inside and outside the unit circle with its centre at the origin.

14. What is the form of a bilinear transformation which has one fixed point  $\alpha$  and the other fixed point  $\infty$ ?

Choose the correct alternative:

15. The fixed points of the mapping  $w = (5z + 4)/(z + 5)$  are

- (i)  $-4/5, -5$       (ii)  $2, 2$       (iii)  $-2, -2$       (iv)  $2, -2$       Ans. (iv)

16. The invariant points of the bilinear transformation are

- (i)  $1 \pm 2i$       (ii)  $-1 \pm 2i$       (iii)  $\pm 2i$       (iv) invariant point does not exist  
(AMIETE, June 2010) Ans. (iv)

### 28.18 TRANSFORMATION: $w = z^2$

(U.P., III Semester, Summer 2002)

**Solution.**

$$w = z^2$$

$$u + iv = (x + iy)^2 = x^2 - y^2 + 2ixy$$

Equating real and imaginary parts, we get  $u = x^2 - y^2$ ,  $v = 2xy$

(i) (a) Any line parallel to  $x$ -axis, i.e.,  $y = c$ , maps into

$$u = x^2 - c^2, \quad v = 2cx$$

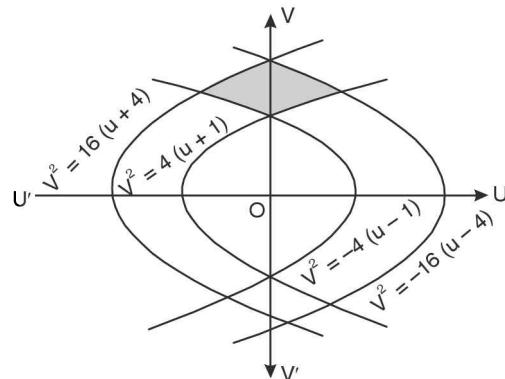

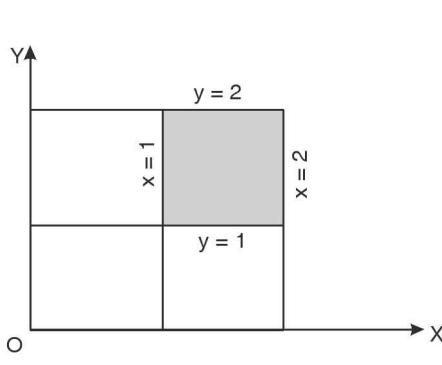

Eliminating  $x$ , we get  $v^2 = 4c^2(u + c^2)$  ... (1) which is a parabola.

(b) Any line parallel to  $y$ -axis, i.e.,  $x = b$ , maps into a curve

$$u = b^2 - y^2, \quad v = 2by$$

Eliminating  $y$ , we get  $v^2 = -4b^2(u - b^2)$ , ... (2) which is a parabola.

(c) The rectangular region bounded by the lines  $x = 1$ ,  $x = 2$ , and  $y = 1$ ,  $y = 2$  maps into the region bounded by the parabolas.

By putting  $x = 1 = b$  in (2) we get  $v^2 = -4(u - 1)$ ,

By putting  $x = 2 = b$  in (2) we get  $v^2 = -16(u - 4)$  and

By putting  $y = 1 = c$  in (1) we get  $v^2 = 4(u + 1)$ ,

By putting  $y = 2 = c$  in (1) we get  $v^2 = 16(u + 4)$

(ii) (a) In polar co-ordinates:  $z = r e^{i\theta}$ ,  $w = R e^{i\phi}$

$$w = z^2$$

$$R e^{i\phi} = r^2 e^{2i\theta}$$

Then

$$R = r^2, \quad \phi = 2\theta$$

In  $z$ -plane, a circle  $r = a$  maps into  $R = a^2$  in  $w$ -plane.

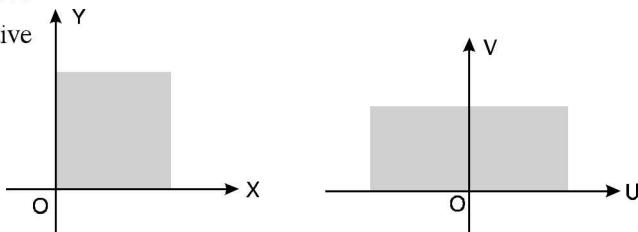

Thus, circles with centre at the origin map into circles with centre at the origin.

(b) If  $\theta = 0, \phi = 0$ , i.e., real axis in  $z$ -plane maps into real axis in  $w$ -plane

If  $\theta = \frac{\pi}{2}$ ,  $\phi = \pi$ , i.e., the positive imaginary axis in  $z$ -plane maps into negative real axis in  $w$ -plane.

Thus, the first quadrant in

$z$ -plane  $0 \leq \theta \leq \frac{\pi}{2}$ , maps into upper half of  $w$ -plane  $0 \leq \phi \leq \pi$ .

The angles in  $z$ -plane at origin maps into double angle in  $w$ -plane at origin.

Hence, the mapping  $w = z^2$  is not conformal at the origin.

It is conformal in the entire  $z$ -plane except origin. Since  $\frac{dw}{dz} = 2z = 0$  for  $z = 0$ , therefore, it is critical point of mapping.

**Example 26.** For the conformal transformation  $w = z^2$ , show that

(a) the coefficient of magnification at  $z = 2+i$  is  $2\sqrt{5}$

(b) the angle of rotation at  $z = 2+i$  is  $\tan^{-1}(0.5)$ .

**Solution.**

$$\begin{aligned} z &= 2 + i \\ f(z) &= w = z^2 \end{aligned}$$

$$= (2+i)^2 = 4 - 1 + 4i = 3 + 4i$$

$$f'(z) = 2z = 2(2+i) = 4 + 2i$$

$$(a) \text{ Coefficient of magnification} = |f'(z)| = \sqrt{4^2 + 2^2} = \sqrt{20} = 2\sqrt{5}$$

**Proved.**

$$(b) \quad \text{The angle of rotation} = \tan^{-1} \frac{v}{u} = \tan^{-1} \frac{2}{4} = \tan^{-1}(0.5)$$

**Proved.**

**Example 27.** For the conformal transformation  $w = z^2$ , show that the circle  $|z - 1| = 1$

transforms into the cardioid  $R = 2(1 + \cos \phi)$  where  $w = \operatorname{Re}^{i\phi}$  in the  $w$ -plane.

**Solution.**

$$|z - 1| = 1$$

... (1)

Equation (1) represents a circle with centre at  $(1, 0)$  and radius 1.

Shifting the pole to the point  $(1, 0)$ , any point on (1) is  $1 + e^{i\theta}$

Transformation is under  $w = z^2$ .

$$\begin{aligned} \operatorname{Re}^{i\phi} &= (1 + e^{i\theta})^2 \\ &= e^{i\theta} \left( e^{\frac{i\theta}{2}} + e^{-\frac{i\theta}{2}} \right)^2 \\ &= e^{i\theta} \left( 2 \cos \frac{\theta}{2} \right)^2 = 4 e^{i\theta} \cos^2 \frac{\theta}{2} \end{aligned}$$

This gives

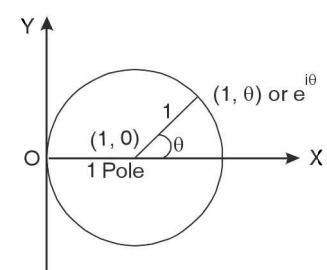

$$R = 4 \cos^2 \frac{\theta}{2},$$

$\Rightarrow$

$$R = 2 \left( 2 \cos^2 \frac{\phi}{2} \right)$$

$\Rightarrow$

$$R = 2(\cos \phi + 1)$$

$[\phi = \theta]$

**Proved**

**28.19 TRANSFORMATION:**  $w = z^n$ 

(n ∈ N)

$$Re^{i\phi} = (re^{i\theta})^n = r^n e^{in\theta}$$

Hence,

$$R = r^n, \phi = n\theta$$

**Mapping of simple figures**

<i>z</i> -plane	<i>w</i> -plane
Circle, $r = a$ The initial line, $\theta = 0$ The straight line, $\theta = \theta_0$	Circle, $R = a^n$ The initial line, $\phi = 0$ The straight line, $\phi = n\theta_0$

**28.20 TRANSFORMATION:**  $w = z + \frac{1}{z}$ 

$$\frac{dw}{dz} = 1 - \frac{1}{z^2}$$

At  $z = \pm 1$ ,  $\frac{dw}{dz} = 0$ , so transformation is not conformal at  $z = \pm 1$ .

$$\begin{aligned} w &= z + \frac{1}{z} = r(\cos\theta + i\sin\theta) + \frac{1}{r(\cos\theta + i\sin\theta)} \\ &= r(\cos\theta + i\sin\theta) + \frac{1}{r}(\cos\theta - i\sin\theta) \\ u + iv &= \left(r + \frac{1}{r}\right)\cos\theta + i\left(r - \frac{1}{r}\right)\sin\theta \\ u &= \left(r + \frac{1}{r}\right)\cos\theta \quad \text{and} \quad v = \left(r - \frac{1}{r}\right)\sin\theta \\ \frac{u}{r + \frac{1}{r}} &= \cos\theta \quad \text{and} \quad \frac{v}{r - \frac{1}{r}} = \sin\theta \end{aligned}$$

$$\sin^2\theta + \cos^2\theta = \frac{u^2}{\left(r + \frac{1}{r}\right)^2} + \frac{v^2}{\left(r - \frac{1}{r}\right)^2} \Rightarrow 1 = \frac{u^2}{\left(r + \frac{1}{r}\right)^2} + \frac{v^2}{\left(r - \frac{1}{r}\right)^2}$$

<i>z</i> -plane	<i>w</i> -plane
Circle, $r = r$ Circle, $r = 1$ Lines, $\theta = \theta_0$	Ellipses Lines $u = 2$ Hyperbola : $\frac{u^2}{4\cos^2\theta} - \frac{v^2}{4\sin^2\theta} = 1$

**28.21 TRANSFORMATION:**  $w = e^z$ 

$$u + iv = e^{x+iy} = e^x(\cos y + i\sin y)$$

Equating real and imaginary parts, we have

$$u = e^x \cos y, \quad v = e^x \sin y$$

Again

$$w = e^z$$

$$Re^{i\phi} = e^{x+iy} = e^x \cdot e^{iy}$$

Hence

$$R = e^x \text{ or } x = \log_e R \text{ and } y = \phi$$

### Mapping of simple figures

<i>z</i> -plane	<i>w</i> -plane
The straight line $x = c$	Circle $R = e^c$
$y$ -axis ( $x = 0$ )	Unit Circle $R = e^0 = 1$
Region between $y = 0, y = \pi$	Upper half plane
Region between $y = 0, y = -\pi$	Lower half plane
Region between the lines $y = c$ and $y = c + 2\pi$	Whole plane

**Example 28.** Find the image and draw a rough sketch of the mapping of the region  $1 \leq x \leq 2$  and  $2 \leq y \leq 3$  under the mapping  $w = e^z$ .

**Solution.**

$$z = x + iy$$

Let

$$w = Re^{i\phi} \quad \dots (1)$$

But

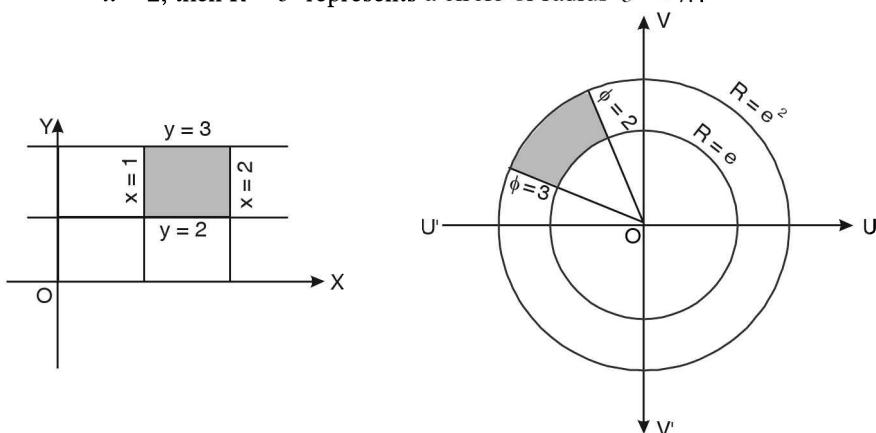

$$w = e^z = e^{x+iy} \quad \dots (2)$$

From (1) and (2);  $Re^{i\phi} = e^{x+iy} = e^x \cdot e^{iy}$

Equating real and imaginary parts, we get  $R = e^x$   $\dots (3)$  and  $\phi = y$

(i) Here  $1 \leq x$ , then  $R = e^1$  is circle of radius  $e^1 = 2.7$

$x = 2$ , then  $R = e^2$  represents a circle of radius  $e^2 = 7.4$

(ii)  $y = 2$ , then  $\phi = 2$  represents radial line making an angle of 2 radians with the  $x$ -axis.

$y = 3$ , then  $\phi = 3$  represents radial line making an angle of 3 radians with  $x$ -axis.

Hence, the mapping of the region  $1 \leq x \leq 2$  and  $2 \leq y \leq 3$  maps the shaded sectors in the figure. **Ans.**

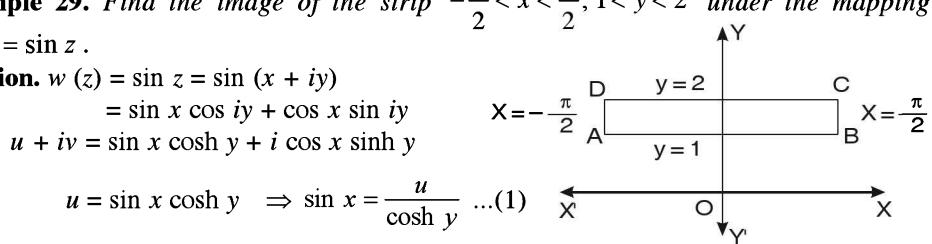

**Example 29.** Find the image of the strip  $-\frac{\pi}{2} < x < \frac{\pi}{2}, 1 < y < 2$  under the mapping  $w(z) = \sin z$ .

**Solution.**  $w(z) = \sin z = \sin(x + iy)$

$$= \sin x \cos iy + \cos x \sin iy$$

$$u + iv = \sin x \cosh y + i \cos x \sinh y$$

$$u = \sin x \cosh y \Rightarrow \sin x = \frac{u}{\cosh y} \dots (1)$$

$$v = \cos x \sinh y \Rightarrow \cos x = \frac{v}{\sinh y} \quad \dots(2)$$

Eliminating  $x$  from (1) and (2), we get

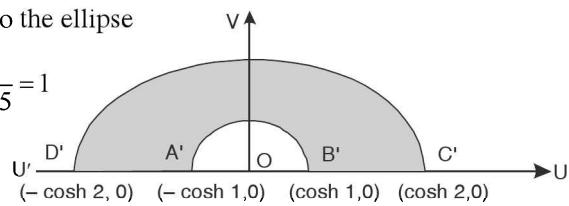

$$\sin^2 x + \cos^2 x = \frac{u^2}{\cosh^2 y} + \frac{v^2}{\sinh^2 y} \Rightarrow 1 = \frac{u^2}{\cosh^2 y} + \frac{v^2}{\sinh^2 y}$$

Hence

$y = 2$ , maps into the ellipse

$$\frac{u^2}{\cosh^2 2} + \frac{v^2}{\sinh^2 2} = 1 \Rightarrow \frac{u^2}{14.15} + \frac{v^2}{13.15} = 1$$

Also  $y = 1$ , maps into the ellipse.

The image of  $A\left(\frac{-\pi}{2}, 1\right)$  in  $z$ -plane is  $(-\cosh 1, 0)$  i.e.  $(-1.543, 0)$  in  $w$ -plane

The image of the point  $D\left(-\frac{\pi}{2}, 2\right)$  in  $z$ -plane is  $(-\cosh 2, 0)$  i.e.,  $(-7.524, 0)$ .

Hence,  $AD$  line in  $z$ -plane maps into  $A'D'$  line in  $w$ -plane.

The image of  $B\left(\frac{\pi}{2}, 1\right)$  is  $(\cosh 1, 0)$  i.e.,  $(1.543, 0)$  in  $w$ -plane.

The image of  $C\left(\frac{\pi}{2}, 2\right)$  is  $(\cosh 2, 0)$  i.e.,  $(7.524, 0)$  in  $w$ -plane.

Hence,  $BC$  line maps into  $B'C'$  line in  $w$ -plane.

Hence, the strip  $\frac{-\pi}{2} < x < \frac{\pi}{2}$ ,  $1 < y < 2$  maps into the shaded region of  $w$ -plane bounded by the ellipses and  $u$ -axis. Ans.

## 28.22 TRANSFORMATION:

$$w = \cosh z$$

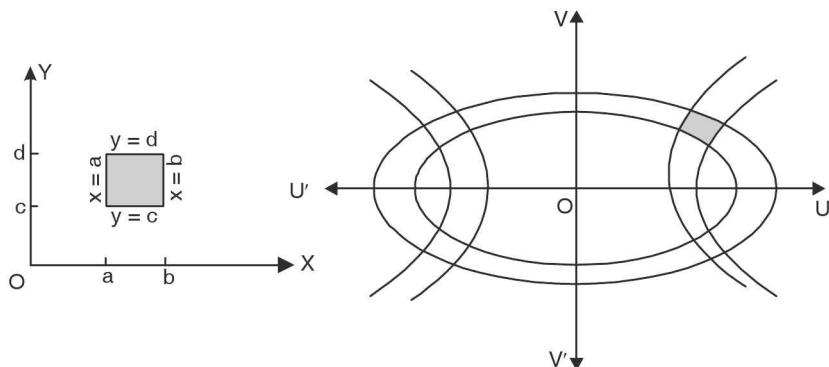

$$\begin{aligned} u + iv &= \cosh(x+iy) = \cos i(x+iy) = \cos(ix-y) \\ &= \cos ix \cos y + \sin ix \sin y = \cosh x \cos y + i \sinh x \sin y \end{aligned}$$

So

$$u = \cosh x \cos y, \quad v = \sinh x \sin y$$

$$\text{On eliminating } x, \text{ we get } (\cosh^2 x - \sinh^2 x = 1) \quad \frac{u^2}{\cosh^2 y} - \frac{v^2}{\sinh^2 y} = 1 \quad \dots(1)$$

$$\text{If } y \text{ is eliminated } (\cos^2 y + \sin^2 y = 1) \quad \frac{u^2}{\cosh^2 x} + \frac{v^2}{\sinh^2 x} = 1 \quad \dots(2)$$

(a) On putting  $y = a$  (constant) in (1), we get

$$\frac{u^2}{\cos^2 a} - \frac{v^2}{\sin^2 a} = 1 \text{ i.e., Hyperbola.}$$

It shows that the lines parallel to  $x$ -axis in the  $z$ -plane map into hyperbolas in the  $w$ -plane.

(b) On substituting  $x = b$  (constant) in (2), we obtain

$$\frac{u^2}{\cosh^2 b} + \frac{v^2}{\sinh^2 b} = 1$$

It means that lines parallel to  $y$ -axis in the  $z$ -plane map into ellipses in  $w$ -plane.

(c) The rectangular region  $a \leq x \leq b, c \leq y \leq d$  in the  $z$ -plane transforms into the shaded portion in the  $w$ -plane.

### EXERCISE 28.3

1. Determine the region of the  $w$ -plane into which the region bounded by  $x = 1, y = 1, x + y = 1$  is mapped by the transformation  $w = z^2$ . (U.P. III Semester Dec. 2004)

**Ans.**  $4u + v^2 = 4, 4u - v^2 = -4, u^2 - 2v^2 = 1$

2. By the transformation  $w = z^2$ , show that the circle  $|z - a| = c$  in the  $z$ -plane correspond to the limacon in the  $w$ -plane. Ans.  $R = 2c(a + c \cos \phi)$

3. Under the mapping  $w = z^2$ , show that the family of circles  $|w - 1| = c$  is transformed into the family of lemniscates  $|z - 1||z + 1| = c$ , where  $c$  is the parameter.

4. Discuss the conformal transformation  $w = \sqrt{z}$ .

5. Show that the transformation  $w(z+i)^2 = 1$  maps the inside of the circle  $|z| = 1$  in the  $z$ -plane on the exterior of the parabola.

6. Show that the transformation  $w = z + \frac{1}{z}$  maps the circle  $|r| = c$  into the ellipse in  $w$ -plane. Discuss the case  $c = 1$ .  $u = \left(c + \frac{1}{c}\right) \cos \theta, v = \left(c - \frac{1}{c}\right) \sin \theta$

Discuss the case when  $c = 1$ .

7. Show that the transformation  $w = z + 1/z$  converts the straight line  $\arg z = \alpha$  ( $|\alpha| < \pi/2$ ) into a branch of hyperbola of eccentricity  $\sec \alpha$ .

8. If  $w = z + \frac{a^2}{z}$ , prove that when  $z$  describes the circle  $x^2 + y^2 = a^2$ ,  $w$  describes a st. line of length  $4a$ .

Also prove that if  $z$  describes the circle  $x^2 + y^2 = b^2$ , ( $b > a$ ),  $w$  describes an ellipse whose foci are the extremities of the above line.

9. Find the region of the  $z$ -plane which corresponds to the interior of the circle  $|w| = 1$  by means of the transformation  $(w+1)^2 z = 4$  Ans.  $y^2 + 4x - 4 > 0$  which is the exterior of the parabola.

10. Show that the transformation  $\omega = \sin z$  maps the families of lines  $x = \text{constant}$  and  $y = \cos$  into confocal hyperbolas and confocal ellipse respectively. (AMIETE, Dec. 2009)

11. Let  $z = re^{i\theta}$ . Then the image of  $\theta = \text{constant}$ , under the mapping  $w = Re^{i\theta} = iz^2$  is (AMIETE, Dec. 2009)

### 28.23 SCHWARZ-CHRISTOFFEL TRANSFORMATION

The interior of a polygon of  $w$ -plane is mapped into the upper half of the  $z$ -plane and the sides of the polygon into the real axis. This transformation is called Schwarz-Christoffel transformation.

The formula of the mapping is

$$\frac{dw}{dz} = A(z - x_1)^{\alpha_1/\pi-1}(z - x_2)^{\alpha_2/\pi-1} \dots (z - x_n)^{\alpha_n/\pi-1} \quad \dots (1)$$

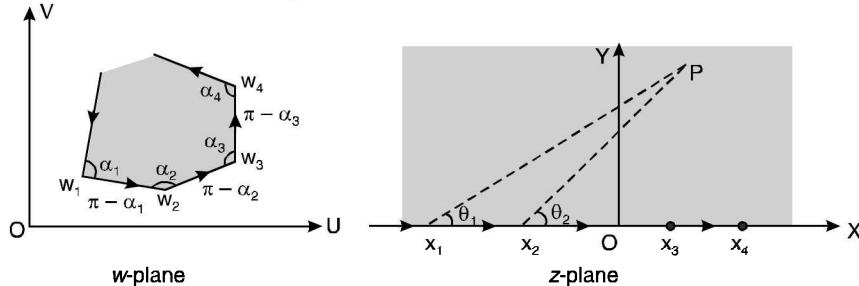

where  $A$  is a complex constant.

$\alpha_1, \alpha_2, \dots, \alpha_n$  are the interior angles of the polygon of the  $w$ -plane with vertices  $w_1, w_2, \dots, w_n$  are mapped into the points  $x_1, x_2, \dots, x_n$  on the real axis of the  $z$ -plane.

$$w = A \int (z - x_1)^{\alpha_1/\pi-1} (z - x_2)^{\alpha_2/\pi-1} \dots (z - x_n)^{\alpha_n/\pi-1} dz + B \quad \dots (2)$$

**Proof.** From (1), we have

$$\text{Arg. } dw = \arg dz + \arg A + \left( \frac{\alpha_1}{\pi} - 1 \right) \arg(z - x_1) + \dots + \left( \frac{\alpha_n}{\pi} - 1 \right) \arg(z - x_n) \quad \dots (3)$$

As  $z$  moves from left towards  $x_1$ , let  $w$  move along a side of a polygon towards the vertex  $w_1$ . So long as  $z$  remains to the left of  $x_1$ , the arg of  $w$  remains unchanged.

When  $z$  crosses  $x_1$  from left to right,  $\theta_1 = \arg(z - x_1)$  changes from  $\pi$  to zero, while all other terms in (3) remain unchanged. Hence, the arg  $dw$  decreases by  $\left( \frac{\alpha_1}{\pi} - 1 \right)\pi = \alpha_1 - \pi$ , i.e., increases by  $\pi - \alpha_1$ , in the anticlockwise direction. It means amp  $\frac{dw}{dz}$  increases by  $\pi - \alpha_1$ . Thus, the direction of  $w_1$  turns through the angle  $\pi - \alpha_1$  and  $w$  now moves along the side  $w_1 w_2$  of the polygon.

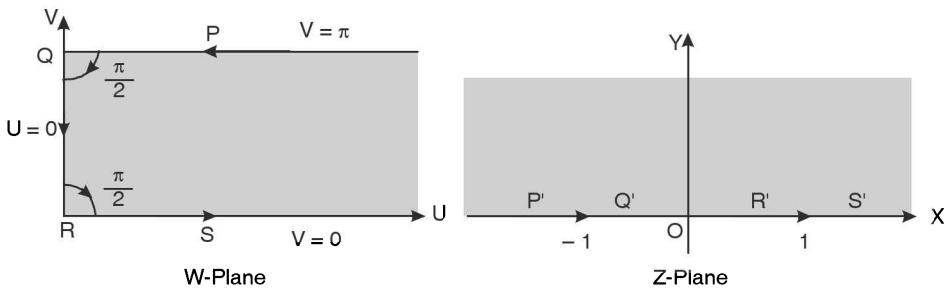

Similarly, as the point  $z$  moves from left to right of  $x_2$ , the point  $w$  moves along the side  $w_1 w_2$  of the polygon. Now as the point  $z$  crosses  $x_2$  from left to right, the amplitude  $(z - x_2)$  changes from  $\pi$  to 0, while the amplitude of all the other terms unaltered. Thus, amp  $dw$  increasingly  $\left( \frac{\alpha_2}{\pi} - 1 \right)(-\pi)$  by  $\pi - \alpha_2$ . Hence, the direction at the point  $w_2$  rotates through an angle  $\pi - \alpha_2$ . Consequently  $w$  begins moving along the third side of the polygon towards  $w_3$ .

By continuing the process we find that as the point  $w$  moves along the sides of the polygon in the  $w$ -plane, the point  $z$  moves along the  $x$ -axis in the  $z$ -plane.

It can also be proved that interior of polygon (if it is closed) maps into upper half of the

$z$ -plane.

**Example 30.** Find the transformation which transforms, the semi infinite strip bounded by  $v = 0$ ,  $v = \pi$  and  $u = 0$  onto the upper half  $z$ -plane.

**Solution.**

Let the points,  $P, Q, R, S$  map into  $P', Q', R', S'$  respectively. Let us consider  $PQRS$  as a limiting case of polygon with vertices  $Q$  and  $R$  and the third vertex  $P$  or  $S$  at infinity.

By Schwarz-Christoffel transformation

$$\begin{aligned} \frac{dw}{dz} &= A(z+1)^{\frac{\pi/2-1}{\pi}}(z-1)^{\frac{\pi/2-1}{\pi}} & \left\{ \angle Q = \frac{\pi}{2}, \angle R = \frac{\pi}{2} \right\} \\ &= A(z+1)^{-1/2}(z-1)^{-1/2} = \frac{A}{\sqrt{z^2-1}} \\ w &= A \int \frac{1}{\sqrt{z^2-1}} dz + B \\ w &= A \cosh^{-1} z + B \end{aligned} \quad \dots (1)$$

when

$$w = 0, z = 1 \text{ (At } R, w = 0 \text{ and } R', z = 1)$$

$$0 = A \cosh^{-1} (1) + B \quad [\cosh^{-1} x = \log (x + \sqrt{x^2 - 1})]$$

$$0 = A \log (1 + \sqrt{1-1}) + B$$

$$0 = 0 + B \text{ or } B = 0$$

$$\text{Equation (1) is reduced to } w = A \cosh^{-1} z \quad \dots (2)$$

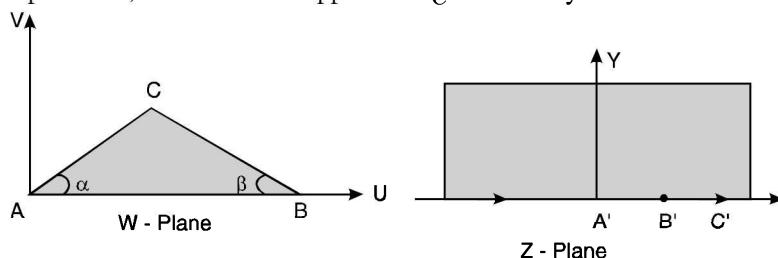

At  $Q, w = \pi i$ ; at  $Q', z = -1$ ,

$$\text{Putting these values of } w, z \text{ in (2), we get } \pi i = A \cosh^{-1}(-1) = A(\pi i) \Rightarrow A = 1$$

Equation (2) is reduced to  $w = \cosh^{-1} z$  or  $\cosh z = w$  is the required transformation. **Ans.**

**Example 31.** Find a transformation which maps the interior of a triangle  $ABC$  in  $w$ -plane onto the upper half of the  $z$ -plane.

**Solution.** Let us consider a triangle  $ABC$  in  $w$ -plane. Suppose vertices  $A, B$ , of the triangle  $ABC$  map into  $A', B'$  and  $C$  be mapped into  $C'$  at infinity.

By Schwarz-Christoffel transformation

$$\begin{aligned}
 & [\angle A = \alpha, \angle B = \beta; \text{ At } A', z = 0; \text{ At } B', z = 1] \\
 \frac{dw}{dz} &= K(z - 0)^{\theta/\pi-1}(z - 1)^{\beta/\pi-1} = Kz^{\alpha/\pi-1}(z - 1)^{\beta/\pi-1} \\
 w &= \int Kz^{\alpha/\pi-1}(z - 1)^{\beta/\pi-1} dz + k_1 \quad \dots (1) \\
 (\text{At } A, w &= 0; \text{ at } A', z = 0, \text{ so } k_1 = 0)
 \end{aligned}$$

At  $B$ ,  $w = 1$ , at  $B'$ ,  $z = 1$ , we get  $1 = K \int_0^1 z^{\alpha/\pi-1}(1-z)^{\beta/\pi-1} dz$

$$1 = K \frac{\frac{\alpha}{\pi} \left| \frac{\beta}{\pi} \right|}{\frac{\alpha + \beta}{\pi}} \quad \text{or} \quad K = \frac{\frac{\alpha + \beta}{\pi}}{\frac{\alpha}{\pi} \left| \frac{\beta}{\pi} \right|}$$

The required transformation, from (1)

$$w = \frac{\frac{\alpha + \beta}{\pi}}{\frac{\alpha}{\pi} \left| \frac{\beta}{\pi} \right|} \int_0^z z^{\alpha/\pi-1}(1-z)^{\beta/\pi-1} dz \quad \text{Ans.}$$

#### EXERCISE 28.4

1. Find the transformation which will map the interior of the infinite strip bounded by the lines  $v = 0$ ,  $v = \pi$  onto the upper half of the  $z$ -plane. Ans.  $w = \log z$

2. Determine the function which maps the semi-infinite strip bounded by  $v = -b$ ,  $u = 0$  and  $v = b$  into upper half of the  $z$ -plane. Ans.  $w = \frac{2b}{\pi} \cosh^{-1} z - bi$

3. Find the transformation that maps the semi-infinite strip  $u = b$ ,  $u = -b$ ,  $v = 0$  in  $w$ -plane into the upper half of  $z$ -plane. Ans.  $z = \sin \frac{\pi w}{2b}$

## COMPLEX INTEGRATION

### (Cauchy's Integral Theorem, Cauchy's Integral Formula for Derivatives of analytic function)

---

#### 29.1 INTRODUCTION (LINE INTEGRAL)

In case of real variable, the path of integration of  $\int_a^b f(x) dx$  is always along the  $x$ -axis from  $x = a$  to  $x = b$ . But in case of a complex function  $f(z)$  the path of the definite integral  $\int_a^b f(z) dz$  can be along any curve from  $z = a$  to  $z = b$ .

$$z = x + iy \Rightarrow dz = dx + idy \dots (1) \quad dz = dx \text{ if } y = 0 \dots (2) \quad dz = idy \text{ if } x = 0 \dots (3)$$

In (1), (2), (3) the direction of  $dz$  are different. Its value depends upon the path (curve) of integration. But the value of integral from  $a$  to  $b$  remains the same along any regular curve from  $a$  to  $b$ .

In case the initial point and final point coincide so that  $c$  is a closed curve, then this integral is called *contour integral* and is denoted by  $\oint_C f(z) dz$ .

If  $f(z) = u(x, y) + iv(x, y)$ , then since  $dz = dx + idy$ , we have

$$\oint_C f(z) dz = \int_C (u + iv)(dx + idy) = \int_C (u dx - v dy) + i \int_C (v dx + u dy)$$

which shows that the evaluation of the line integral of a complex function can be reduced to the evaluation of two line integrals of real functions.

Let us consider a few examples:

#### Real integral

**Example 1.** Find the value of the integral  $\int_C (x+y)dx + x^2y dy$

(a) along  $y = x^2$ , having  $(0, 0)$ ,  $(3, 9)$  end points.

(b) along  $y = 3x$  between the same points.

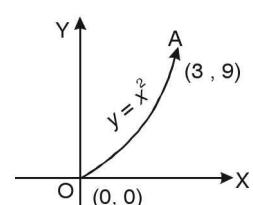

Do the values depend upon path.

**Solution.**  $\int_C (x+y)dx + x^2y dy \dots (1)$

Let  $P = x + y$ ,  $Q = x^2y$

$$\frac{\partial P}{\partial y} = 1, \quad \frac{\partial Q}{\partial x} = 2xy \quad \text{or} \quad \frac{\partial P}{\partial y} \neq \frac{\partial Q}{\partial x}$$

The integrals are not independent of path.

$$(a) \text{ Along } y = x^2 \Rightarrow dy = 2x dx$$

Putting the values of  $y$  and  $dy$  in (1), we get

$$\begin{aligned} \int_0^3 (x + x^2) dx + x^2 x^2 (2x dx) &= \int_0^3 (x + x^2 + 2x^5) dx = \left[ \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^6}{3} \right]_0^3 \\ &= \frac{9}{2} + 9 + 243 = 256 \frac{1}{2} \end{aligned}$$

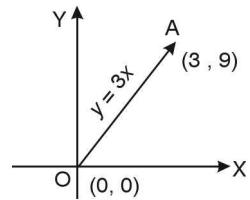

Which is the required value of given integral.

$$(b) \text{ Along } y = 3x, dy = 3dx$$

Substituting these values in (1), we get

$$\begin{aligned} \int_0^3 (x + 3x) dx + x^2 (3x)(3dx) &= \int_0^3 (4x + 9x^3) dx = \left[ 2x^2 + \frac{9x^4}{4} \right]_0^3 \\ &= 18 + \frac{729}{4} = 200 \frac{1}{4} \end{aligned}$$

Which is the required value of given integral.

**Ans.**

**Example 2.** Evaluate  $\int_{1-i}^{2+i} (2x+iy+1) dz$  along the two paths:

$$(i) x = t + 1, \quad y = 2t^2 - 1$$

$$(ii) \text{ The straight line joining } 1 - i \text{ and } 2 + i. \quad (\text{RGPV, Bhopal, Dec. 2008})$$

**Solution.** (i) Here we have

$$\begin{aligned} x &= t + 1 \Rightarrow dx = dt \\ y &= 2t^2 - 1 \Rightarrow dy = 4t dt \\ dz &= dx + idy \\ &= dt + i 4t dt = (1 + i4t) dt \end{aligned}$$

The limits of the integral are  $(1, -1)$  and  $(2, 1)$ .

Corresponding to these points, the limits of  $t$  are 0 and 1.

$$\begin{bmatrix} \text{If } t = 0, & x = 1, & y = -1 \\ \text{If } t = 1, & x = 2, & y = 1 \end{bmatrix}$$

$$\begin{aligned} &\int_{1-i}^{2+i} (2x+iy+1) dz \\ &= \int_0^1 [2(t+1) + i(2t^2-1) + 1] (1 + i4t) dt \\ &= \int_0^1 [\{2(t+1) + i(2t^2-1) + 1\} + \{8it(t+1) - 4t(2t^2-1) + 4it\}] dt \\ &= \int_0^1 [2(t+1) + 1 - 4t(2t^2-1) + i\{2t^2-1 + 8t(t+1) + 4t\}] dt \\ &= \int_0^1 \{(2t+2+1-8t^3+4t) + i(2t^2-1+8t^2+8t+4t)\} dt \\ &= \int_0^1 \{(-8t^3+6t+3) + i(10t^2+12t-1)\} dt \\ &= \left[ -2t^4 + 3t^2 + 3t + i\left(\frac{10}{3}t^3 + 6t^2 - t\right) \right]_0^1 \\ &= -2 + 3 + 3 + i\left(\frac{10}{3} + 6 - 1\right) - 0 = 4 + \frac{25}{3}i \end{aligned}$$

$$(ii) \int_{1-i}^{2+i} (2x+iy+1) dz$$

The equation of the straight line joining  $(1, -1)$  and  $(2, 1)$  is

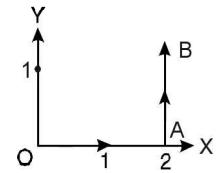

$$\begin{aligned} y+1 &= \frac{1+1}{2-1}(x-1) \Rightarrow y+1 = 2x-2 \Rightarrow y = 2x-3 \Rightarrow dy = 2dx \\ \int_{(1,-1)}^{(2,1)} (2x+iy+1) (dx+idy) &= \int_1^2 (2x+2ix-3i+1)(dx+2idx) \\ &= \int_1^2 (2x+2ix-3i+1)(1+2i) dx = \int_1^2 (2x+2ix-3i+1+4ix-4x+6+2i) dx \\ &= \int_1^2 (-2x+6ix-i+7) dx = (-x^2+3ix^2-ix+7x)_1^2 \\ &= [-4+12i-2i+14+1-3i+i-7] \\ &= 4+8i \end{aligned}$$

**Ans.**

### Complex Integral

**Example 3.** Evaluate  $\int_0^{2+i} (\bar{z})^2 dz$  along the real axis from  $z = 0$  to  $z = 2$  and then along a line parallel to  $y$ -axis from  $z = 2$  to  $z = 2 + i$ .  
(R.G.P.V., Bhopal, III Semester, June 2005)

$$\begin{aligned} \text{Solution. } \int_0^{2+i} (\bar{z})^2 dz &= \int_0^{2+i} (x-iy)^2 (dx+idy) \\ &= \int_{OA} (x^2) dx + \int_{AB} (2-iy)^2 idy \\ &\quad [\text{Along } OA, y = 0, dy = 0, x \text{ varies } 0 \text{ to } 2. \\ &\quad \text{Along } AB, x = 2, dx = 0 \text{ and } y \text{ varies } 0 \text{ to } 1] \\ &= \int_0^2 x^2 dx + \int_0^1 (2-iy)^2 i dy \\ &= \left[ \frac{x^3}{3} \right]_0^2 + i \int_0^1 (4-4iy-y^2) dy = \frac{8}{3} + i \left[ 4y - 2iy^2 - \frac{y^3}{3} \right]_0^1 \\ &= \frac{8}{3} + i \left[ 4 - 2i - \frac{1}{3} \right] = \frac{8}{3} + \frac{i}{3} (11-6i) = \frac{1}{3} (8+11i+6) = \frac{1}{3} (14+11i) \end{aligned}$$

Which is the required value of the given integral.

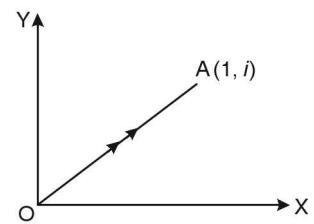

**Ans.**

**Example 4.** Find the value of the integral  $\int_0^{1+i} (x-y+ix^2) dz$

- (a) Along the straight line from  $z = 0$  to  $z = 1 + i$ ;
- (b) Along real axis from  $z = 0$  to  $z = 1$  and then along a line parallel to the imaginary axis from  $z = 1$  to  $z = 1 + i$ .

**Solution.** (a) Along  $OA$  line: Equation of a straight line  $OA$  passing through  $(0, 0)$  and  $(1, 1)$  is

$$\begin{aligned} y-0 &= \frac{1-0}{1-0}(x-0) \Rightarrow y = x. \\ z &= x+iy = x+ix = (1+i)x \\ dz &= (1+i) dx \end{aligned}$$

$$\begin{aligned} \int_{OA} (x-y+ix^2) dz &= \int_0^1 (x-x+ix^2)(1+i) dx \\ &= (1+i) \int_0^1 ix^2 dx = (1+i)i \left( \frac{x^3}{3} \right)_0^1 = (1+i) \frac{i}{3} = \frac{1}{3}(i-1) \end{aligned}$$

**Ans.**

(b) Along  $OB$  and then along  $BA$ . Along  $OB$ , from  $z = 0$  to  $z = 1$ . Along  $BA$ , from  $z = 1$  to  $z = 1 + i$ .

$$\text{Required integral} = \int_{OB} (x - y + ix^2) dz + \int_{BA} (x - y + ix^2) dz \quad \dots (1)$$

$$\text{Now first integral} = \int_{OB} (x - y + ix^2) dz = \int_0^1 (x - 0 + ix^2) dx$$

(Along  $OB$ ,  $y = 0$ ,  $dy = 0$ ,  $x$  varies 0 to 1)

$$= \left( \frac{x^2}{2} + i \frac{x^3}{3} \right)_0^1 = \frac{1}{2} + \frac{i}{3} \quad \dots (2)$$

$$\text{Now second integral} = \int_{BA} (x - y + ix^2) dz$$

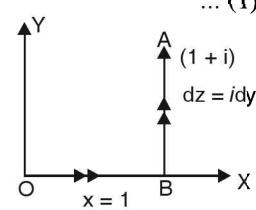

$$= \int_0^1 (1 - y + iy) idy \quad [z = x + iy = 1 + iy \Rightarrow dz = idy]$$

(Along  $BA$ ,  $x = 1$ ,  $dx = 0$ , and  $y$  varies 0 to 1.)

$$= i \left( y - \frac{y^2}{2} + iy \right)_0^1 = i \left( 1 - \frac{1}{2} + i \right) = \frac{i}{2} - 1 \quad \dots (3)$$

Substituting the values of the first and second integral from (2) and (3) in (1), we get

$$\text{Required integral} = \left( \frac{1}{2} + \frac{i}{3} \right) + \left( \frac{i}{2} - 1 \right) = -\frac{1}{2} + \frac{5}{6}i \quad \text{Ans.}$$

**Example 5.** Evaluate  $\int_0^{1+i} (x^2 - iy) dz$ , along the path

$$(a) y = x \quad (\text{R.G.P.V., Bhopal, III Semester, Dec. 2007}) \quad (b) y = x^2.$$

**Solution.** (a) Along the line  $y = x$ ,

$$dy = dx \text{ so that } dz = dx + idy \Rightarrow dz = dx + i dx = (1 + i) dx$$

$$\therefore \int_0^{1+i} (x^2 - iy) dz$$

[On putting  $y = x$  and  $dz = (1 + i)dx$ ]

$$\begin{aligned} &= \int_0^1 (x^2 - ix)(1 + i) dx \\ &= (1 + i) \left[ \frac{x^3}{3} - i \frac{x^2}{2} \right]_0^1 = (1 + i) \left( \frac{1}{3} - \frac{1}{2}i \right) \\ &= \frac{(1 + i)(2 - 3i)}{6} = \frac{5}{6} - \frac{1}{6}i. \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

(b) Along the parabola  $y = x^2$ ,  $dy = 2x dx$  so that

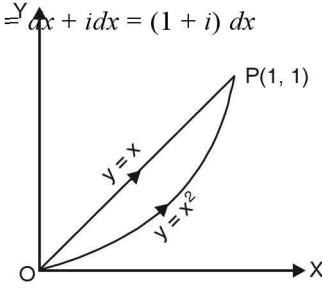

$$dz = dx + idy \Rightarrow dz = dx + 2ix dx = (1 + 2ix) dx$$

and  $x$  varies from 0 to 1.

$$\begin{aligned} \therefore \int_0^{1+i} (x^2 - iy) dx &= \int_0^1 (x^2 - ix^2)(1 + 2ix) dx = \int_0^1 x^2 (1 - i)(1 + 2ix) dx \\ &= (1 - i) \int_0^1 x^2 (1 + 2ix) dx = (1 - i) \left[ \frac{x^3}{3} + i \frac{x^4}{2} \right]_0^1 \\ &= (1 - i) \left[ \frac{1}{3} + \frac{1}{2}i \right] = \frac{(1 - i)(2 + 3i)}{6} = \frac{1}{6}(2 + 3i - 2i + 3) = \frac{5}{6} + \frac{1}{6}i \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 6.** Integrate  $z^2$  along the straight line OM and also along the path OLM consisting of two line segments OL and OM where O is the origin, L is the point  $z = 3$  and M the point  $z = 3 + i$ .  
(R.G.P.V., Bhopal, III Semester, Dec. 2004)

**Solution.** We have,  $z = x + iy$ ,  $dz = dx + idy$ . curve C is line OM.

$$\int_C z^2 dz = \int_C (x+iy)^2 (dx+idy) = \int_C (x^2 - y^2 + 2ixy) (dx+idy) \quad \dots (1)$$

The point M is  $z = 3 + i$ , i.e., M is  $(3, 1)$ .

The equation of the line OM is  $y = 0 = \frac{1-0}{3-0} (x-0)$  i.e.,  $x = 3y$

Now on the line OM,  $x = 3y$ ,  $\therefore dx = 3dy$  and y varies from 0 to 1. Therefore, from (1), we have

$$\begin{aligned} \int_{OM} z^2 dz &= \int_0^1 (9y^2 - y^2 + 2i3y \cdot y) \cdot (3dy + idy) = \int_0^1 (8+6i)(3+i)y^2 dy \\ &= (18+26i) \left[ \frac{y^3}{3} \right]_0^1 = \frac{1}{3} (18+26i) \\ &= 6+i \frac{26}{3} \end{aligned} \quad \dots (2)$$

Now, we have to integrate along OL and LM.

$$\begin{aligned} \text{Again, } \int_{OLM} z^2 dz &= \int_{OL+LM} z^2 dz = \int_{OL} z^2 dz + \int_{LM} z^2 dz \\ &= \int_{OL} (x^2 - y^2 + 2ixy) (dx + idy) + \int_{LM} (x^2 - y^2 + 2ixy) (dx + idy) \end{aligned} \quad \dots (3)$$

On the line OL,  $y = 0 \therefore dy = 0$  and x varies from 0 to 3.

On the line LM,  $x = 3 \therefore dx = 0$  and y varies from 0 to 1.

$\therefore$  From (3), we obtain

$$\begin{aligned} \int_{OLM} z^2 dz &= \int_0^3 x^2 dx + \int_0^1 (9-y^2 + 6iy) idy = \left[ \frac{x^3}{3} \right]_0^3 + i \left[ 9y - \frac{y^3}{3} + 3iy^2 \right]_0^1 \\ &= 9+i \left[ 9 - \frac{1}{3} + 3i \right] = 6+i \frac{26}{3} \end{aligned} \quad \dots (4)$$

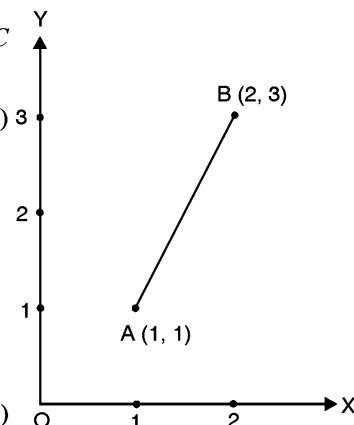

Which is the required result.

**Ans.**

**Example 7.** Evaluate  $\int_C (12z^2 - 4iz) dz$  along the curve C joining the points (1, 1) and (2, 3)  
(U.P., III Semester, Dec. 2009)

**Solution.** Here, we have

$$\begin{aligned} &\int_C (12z^2 - 4iz) dz \\ &= \int_C [12(x+iy)^2 - 4i(x+iy)] (dx + i dy) \\ &= \int_C [12(x^2 - y^2 + 2ixy) - 4ix + 4y] (dx + i dy) \\ &= \int_C (12x^2 - 12y^2 + 24ixy - 4ix + 4y) (dx + i dy) \dots (1) \end{aligned}$$

Equation of the time AB passing through (1, 1) and (2, 3) is

$$y - 1 = \frac{3-1}{2-1} (x-1)$$

$$y - 1 = 2(x-1) \Rightarrow y = 2x - 1 \Rightarrow dy = 2 dx$$

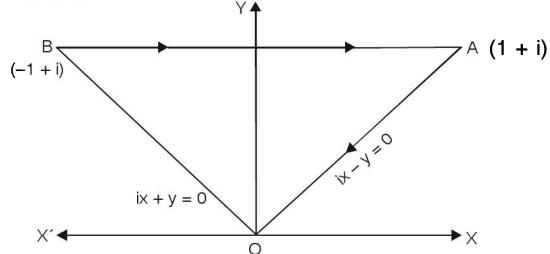

Putting the values of  $y$  and  $dy$  in (1), we get

$$\begin{aligned} &= \int_1^2 (12x^2 - 12(2x-1)^2 + 24ix(2x-1) - 4ix + 4(2x-1)) [dx + i2dx] \\ &= \int_1^2 [12x^2 - 48x^2 + 48x - 12 + 48ix^2 - 24ix - 4ix + 8x - 4] (1+2i) dx \\ &= (1+2i) \int_1^2 [-36 + 48i)x^2 + (56 - 28i)x - 16] dx \\ &= (1+2i) \left[ (-36 + 48i)\frac{x^3}{3} + (56 - 28i)\frac{x^2}{2} - 16x \right]_1^2 \\ &= (1+2i) \left[ (-36 + 48i)\frac{8}{3} + (56 - 28i)2 - 16 \times 2 - (36 + 48i)\frac{1}{3} - (56 - 28i)\frac{1}{2} + 16 \right] \\ &= (1+2i)(-96 + 128i + 112 - 56i - 32 + 12 - 16i - 28 + 14i + 16) \\ &= (1+2i)(-16 + 70i) = -16 + 70i - 32i - 140 = -156 + 38i \quad \text{Ans.} \end{aligned}$$

**Example 8.** Evaluate the line integral  $\int_C z^2 dz$  where  $C$  is the boundary of a triangle with vertices  $0, 1+i, -1+i$  clockwise.

**Solution.** Here,  $I = \int_C z^2 dz$

where  $C$  is the boundary of a triangle with vertices  $0, 1+i, -1+i$  clockwise.

$$\begin{aligned} I &= \int_{AO} (x+iy)^2 (dx + i dy) + \int_{OB} (x+iy)^2 (dx + i dy) + \int_{BA} (x+iy)^2 (dx + i dy) \\ &\quad (x = y) \qquad \qquad \qquad (x = -y) \qquad \qquad \qquad (y = 1) \\ &\quad dx = dy \qquad \qquad \qquad dx = -dy \qquad \qquad \qquad dy = 0 \\ &= \int_1^0 (x+ix)^2 (dx + i dx) + \int_0^{-1} (x-ix)^2 (dx - i dx) + \int_{-1}^1 (x+i)^2 (dx + 0) \\ &= \int_1^0 x^2 (1+i)^2 (1+i) dx + \int_0^{-1} x^2 (1-i)^2 (1-i) dx + \int_{-1}^1 (x+i)^2 dx \\ &= (1+i)^3 \int_1^0 x^2 dx + (1-i)^3 \int_0^{-1} x^2 dx + \int_{-1}^1 (x+i)^2 dx \\ &= (1+i)^3 \left[ \frac{x^3}{3} \right]_1^0 + (1-i)^3 \left[ \frac{x^3}{3} \right]_0^{-1} + \left[ \frac{(x+i)^3}{3} \right]_{-1}^1 \\ &= (1+i^3 + 3i + 3i^2) \left[ 0 - \frac{1}{3} \right] + (1-i^3 - 3i + 3i^2) \left[ \frac{(-1)^3}{3} - 0 \right] + \left[ \frac{(1+i)^3}{3} - \frac{(-1+i)^3}{3} \right] \\ &= (1-i+3i-3) \left( -\frac{1}{3} \right) + (1+i-3i-3) \left( -\frac{1}{3} \right) + \frac{1}{3} (1+i^3 + 3i + 3i^2 + 1 - i^3 - 3i + 3i^2) \end{aligned}$$

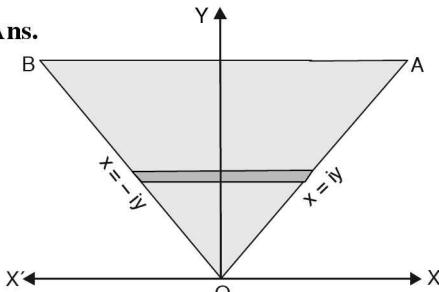

$$\begin{aligned}
 &= (2i-2) \left( -\frac{1}{3} \right) + (-2-2i) \left( -\frac{1}{3} \right) + \frac{1}{3} [1-i+3i-3+1+i-3i-3] \\
 &= \frac{1}{3} [2-2i+2i+2-4] = 0
 \end{aligned}$$

Which is the required value of the given integral. **Ans.**

**By Green's Theorem**

$$\begin{aligned}
 I &= \int (x+iy)^2 dx + (x+iy)^2 i dy \\
 &= \iint [2i(x+iy) - 2(x+iy)i] dx dy \\
 &= 0 \quad \text{Ans.}
 \end{aligned}$$

Which is the required value of the given integral.

**Example 9.** Evaluate  $\int_C (z+1)^2 dz$  where  $C$  is the boundary of the rectangle with vertices at the points  $a+ib$ ,  $-a+ib$ ,  $-a-ib$ ,  $a-ib$ .

**Solution.** Here,  $I = \int_C (z+1)^2 dz$

Where  $C$  is the boundary of the rectangle with vertices at the points  $a+ib$ ,  $-a+ib$ ,  $-a-ib$  and  $a-ib$ .

$$\begin{aligned}
 I &= \int_{ABCD} (x+iy+1)^2 (dx+idy) \\
 &= \int_{ABCD} (x^2-y^2+1+2ixy+2x+2iy) (dx+idy) \\
 &= \int_{AB} (x^2+b^2+1-2bx+2x-2b) dx
 \end{aligned}$$

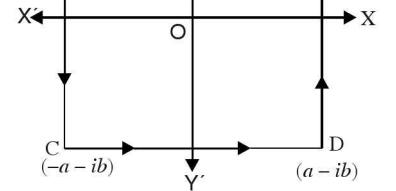

$$\begin{aligned}
 &\quad + \int_{BC} (a^2-y^2+1-2iay-2a+2iy) (idy) \\
 &\quad + \int_{CD} (x^2+b^2+1+2ix(-ib)+2x+2i(-ib)) dx \\
 &\quad + \int_{DA} (a^2-y^2+1+2iay+2a+2iy) (idy)
 \end{aligned}$$

$$\begin{aligned}
 &= \int_a^{-a} (x^2+b^2+1-2bx+2x-2b) dx \\
 &\quad + \int_{ib}^{-ib} (ia^2-iy^2+i+2ay-2ia-2y) dy \\
 &\quad + \int_{-a}^a (x^2+b^2+1+2bx+2x+2b) dx + \int_{-ib}^{ib} (a^2i-iy^2+i-2ay+2ia-2y) dy
 \end{aligned}$$

Along AB	$y = ib$	$dy = 0$
Along BC	$x = -a$	$dx = 0$
Along CD	$y = -ib$	$dy = 0$
Along DA	$x = a$	$dx = 0$

$$\left[ \begin{array}{ll} \int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx, & \text{if } f(x) \text{ is even.} \\ = 0, & \text{if } f(x) \text{ is odd} \end{array} \right]$$

$$\begin{aligned}
 &= -2 \int_0^a (x^2+b^2+1-2b) dx - 2 \int_0^{ib} (ia^2-iy^2+i-2ia) dy + 2 \int_0^a (x^2+b^2+1+2b) dx \\
 &\quad + 2 \int_0^{ib} (a^2i-iy^2+i+2ia) dy \\
 &= -2 \left[ \frac{x^3}{3} + b^2x + x - 2bx \right]_0^a - 2 \left[ ia^2y - i \frac{y^3}{3} + iy - 2iay \right]_0^{ib} + 2 \left[ \frac{x^3}{3} + b^2x + x + 2bx \right]_0^a \\
 &\quad + 2 \left[ a^2i y - \frac{iy^3}{3} + iy + 2ia y \right]_0^{ib}
 \end{aligned}$$

$$\begin{aligned}
&= -2 \left[ \frac{a^3}{3} + ab^2 + a - 2ab \right] - 2 \left[ -a^2b - \frac{b^3}{3} - b + 2ab \right] + 2 \left[ \frac{a^3}{3} + ab^2 + a + 2ab \right] \\
&\quad + 2 \left[ -a^2b - \frac{b^3}{3} - b - 2ab \right] \\
&= 2 \left[ -\frac{a^3}{3} - ab^2 - a + 2ab + a^2b + \frac{b^3}{3} + b - 2ab + \frac{a^3}{3} + ab^2 + a + 2ab - a^2b - \frac{b^3}{3} - b - 2ab \right] \\
&= 0
\end{aligned}$$

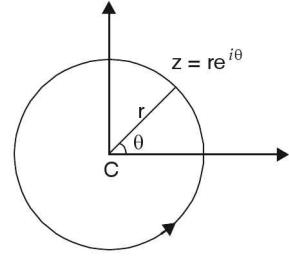

Which is the required value of the given integral.

**Ans.**

**Example 10.** Evaluate  $\int_C (z-a)^n dz$  where  $C$  is the circle with centre  $a$  and  $r$ . Discuss the case when  $n = -1$ .

**Solution.** The equation of circle  $C$  is  $|z-a| = r$  or  $z-a = re^{i\theta}$  where  $\theta$  varies from  $0$  to  $2\pi$

$$\begin{aligned}
dz &= ire^{i\theta} d\theta \\
\oint_C (z-a)^n dz &= \int_0^{2\pi} r^n e^{in\theta} \cdot ire^{i\theta} d\theta \\
&= ir^{n+1} \int_0^{2\pi} e^{i(n+1)\theta} d\theta = ir^{n+1} \left[ \frac{e^{i(n+1)\theta}}{i(n+1)} \right]_0^{2\pi} \\
&= \frac{r^{n+1}}{n+1} [e^{i2(n+1)\pi} - 1] \\
&= \frac{r^{n+1}}{n+1} [\cos 2(n+1)\pi + i \sin 2(n+1)\pi - 1] = \frac{r^{n+1}}{n+1} [1 + 0i - 1] \\
&= 0. \quad [\text{When } n \neq -1]
\end{aligned}$$

Which is the required value of the given integral.

When  $n = -1$ ,

$$\oint_C \frac{dz}{z-a} = \int_0^{2\pi} \frac{ire^{i\theta} d\theta}{re^{i\theta}} = i \int_0^{2\pi} d\theta = 2\pi i. \quad \text{Ans.}$$

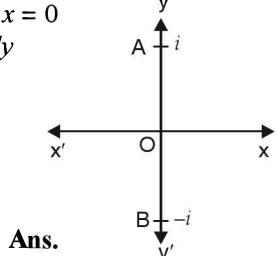

**Example 11.** Evaluate the integral  $\int_c |z| dz$ , where  $c$  is the straight line from  $z = -i$  to  $z = i$ .

**Solution.** Equation of the straight line AB from  $z = -i$  to  $z = i$  is  $x = 0$

$\Rightarrow z = x + iy = 0 + iy = iy$  so that  $dz = idy$

$$\begin{aligned}
\therefore \int_c |z| dz &= \int_{-1}^1 |iy| idy = i \int_{-1}^0 (-y) dy + i \int_0^1 y dy \\
&= -i \left( \frac{y^2}{2} \right)_{-1}^0 + i \left( \frac{y^2}{2} \right)_0^1 = -i \left( -\frac{1}{2} \right) + i \left( \frac{1}{2} \right) = i
\end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 12.** Evaluate the integral  $\int_c |z| dz$ , where  $c$  is the left half of the unit circle  $|z| = 1$  from  $z = -i$  to  $z = i$ .

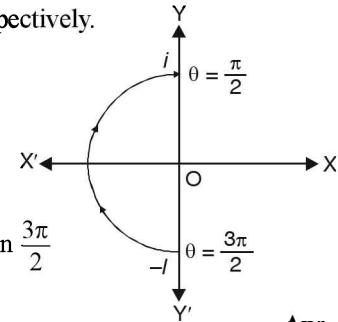

**Solution.** For a point on the unit circle  $|z| = 1$ ,

$$\begin{aligned}
z &= e^{i\theta} \\
dz &= ie^{i\theta} d\theta.
\end{aligned}$$

The points  $z = -i$  and  $i$  correspond to  $\theta = \frac{3\pi}{2}$  and  $\theta = \frac{\pi}{2}$  respectively.

$$\begin{aligned}\therefore \int_c |z| dz &= \int_{3\pi/2}^{\pi/2} 1 \cdot e^{i\theta} i d\theta \\ &= \left( e^{i\theta} \right)_{3\pi/2}^{\pi/2} = e^{i\pi/2} - e^{3i\pi/2} \\ &= \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} - \cos \frac{3\pi}{2} - i \sin \frac{3\pi}{2} \\ &= 0 + i - 0 - i(-1) = 2i.\end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 13.** Evaluate the integral  $\int_c \log z dz$ , where  $c$  is the unit circle  $|z|=1$ .

**Solution.** Here,  $c \equiv |z| = 1$  ... (1)

$$\begin{aligned}\int_c \log z dz &= \int_c \log(x+iy) dz = \int_c \left[ \frac{1}{2} \log(x^2+y^2) + i \tan^{-1} \frac{y}{x} \right] dz \\ &= \int_c \left[ \frac{1}{2} \log 1 + i \tan^{-1} \frac{y}{x} \right] dz \quad [\because x^2 + y^2 = 1] \\ &= \int_c \left[ 0 + i \tan^{-1} \frac{y}{x} \right] dz = i \int_c \tan^{-1} \left( \frac{y}{x} \right) dz \quad \dots (2)\end{aligned}$$

On the unit circle,

$$\begin{aligned}z &= e^{i\theta} \\ dz &= ie^{i\theta} d\theta\end{aligned}$$

Now (2) becomes,

$$\begin{aligned}\int_c \log z dz &= i \int_0^{2\pi} \tan^{-1}(\tan \theta) ie^{i\theta} d\theta = - \int_0^{2\pi} \theta e^{i\theta} d\theta \\ &= - \left[ \left( \theta \frac{e^{i\theta}}{i} \right)_0^{2\pi} - \int_0^{2\pi} 1 \cdot \frac{e^{i\theta}}{i} d\theta \right] = - \left[ \frac{2\pi}{i} e^{2\pi i} - \frac{1}{i} \left( \frac{e^{i\theta}}{i} \right)_0^{2\pi} \right] \\ &= - \left[ \frac{2\pi}{i} e^{2\pi i} + e^{2\pi i} - 1 \right] = 2\pi i e^{2\pi i} + 1 - e^{2\pi i} \\ &= (2\pi i - 1) e^{2\pi i} + 1 = (2\pi i - 1)(\cos 2\pi + i \sin 2\pi) + 1 \\ &= 2\pi i - 1 + 1 = 2\pi i\end{aligned}$$

Which is the required value of the given integral.

**Ans.**

### EXERCISE 29.1

1. Integrate  $f(z) = x^2 + ixy$  from  $A(1, 1)$  to  $B(2, 8)$  along

(i) the straight line  $AB$ ; (ii) the curve  $C$ ,  $x = t$ ,  $y = t^3$ . **Ans.** (i)  $-\frac{1}{3}(147 - 71)i$  (ii)  $-\left( \frac{1094}{21} - \frac{124i}{5} \right)$

2. Evaluate  $\int_{1-i}^{2+i} (2x + iy + 1) dz$  along

(i)  $x = t + 1$ ,  $y = 2t^2 - 1$ ; (ii) the straight line joining  $1 - i$  and  $2 + i$ . **Ans.** (i)  $4 + \frac{25}{3}i$  (ii)  $4 + 8i$

(R.G.P.V., Bhopal, Dec. 2008)

3. Evaluate the line integral  $\int_c (3y^2 dx + 2y dy)$ , where  $c$  is the circle  $x^2 + y^2 = 1$ , counter clockwise from  $(1, 0)$  to  $(0, 1)$ . **Ans.** - 1.

4. Integrate  $xz$  along the straight line from  $A(1, 1)$  to  $B(2, 4)$  in the complex plane. Is the value the same if the path of integration from  $A$  to  $B$  is along the curve  $x = t, y = t^2$ ? Ans.  $-\frac{151}{15} + \frac{45i}{4}$

5. Evaluate  $\int_0^{2+i} (\bar{z})^2 dz$ , along the line  $y = x/2$ .

$$(U.P., III Semester, June 2009) \quad \text{Ans. } \frac{5}{3}(2-i)$$

**Choose the correct answer:**

6. The value of the integral  $\int_C (4x^3 dx + 3y^2 z^2 dy + 2y^3 z dz)$  where  $C$  is any path joining  $A(-1, 1, 0)$  to  $B(1, 2, 1)$  is  
(i) 1   (ii) 0   (iii) -8   (iv) 8 Ans. (iv)

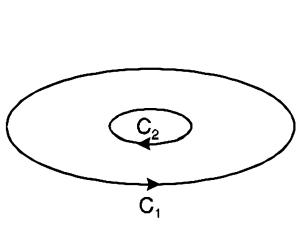

7. The value of  $\int_C \frac{4z^2 + z + 5}{z - 4} dz$ , where  $C : 9x^2 + 4y^2 = 36$   
(i) -1   (ii) 1   (iii) 2   (iv) 0 (AMIETE, June 2009) Ans. (iv)

## 29.2 IMPORTANT DEFINITIONS

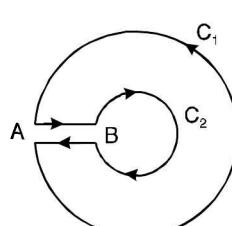

(i) **Simply connected Region.** A connected region is said to be a simply connected if all the interior points of a closed curve  $C$  drawn in the region  $D$  are the points of the region  $D$ .

(ii) **Multi-Connected Region.** Multi-connected region is bounded by more than one curve. We can convert a multi-connected region into a simply connected one, by giving it one or more cuts.

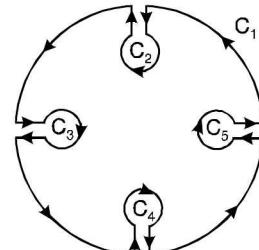

**Note.** A function  $f(z)$  is said to be **meromorphic** in a region  $R$  if it is analytic in the region  $R$  except at a finite number of poles.

Multi-Connected Region

Simply Connected Region

Simply Connected Region

(iii) **Single-valued and Multi-valued function**

If a function has only one value for a given value of  $z$ , then it is a single valued function.

For example  $f(z) = z^2$

If a function has more than one value, it is known as multi-valued function,

For example  $f(z) = z^{\frac{1}{2}}$

(iv) **Limit of a function**

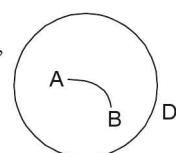

A function  $f(z)$  is said to have a limit  $l$  at a point  $z = z_0$ , if for a given an arbitrary chosen positive number  $\epsilon$ , there exists a positive number  $\delta$ , such that

$$|f(z) - l| < \epsilon \text{ for } |z - z_0| < \delta$$

It may be written as  $\lim_{z \rightarrow z_0} f(z) = l$

(v) **Continuity**

A function  $f(z)$  is said to be continuous at a point  $z = z_0$  if for a given an arbitrary positive number  $\epsilon$ , there exists a positive number  $\delta$ , such that

$$|f(z) - f(z_0)| < \epsilon \text{ for } |z - z_0| < \delta$$

In other words, a function  $f(z)$  is continuous at a point  $z = z_0$  if

$$(a) \quad f(z_0) \text{ exists} \quad (b) \quad \lim_{z \rightarrow z_0} f(z) = f(z)_{z=0}$$

(vi) **Multiple point.** If an equation is satisfied by more than one value of the variable in the given range, then the point is called a multiple point of the arc.

(vii) **Jordan arc.** A continuous arc without multiple points is called a Jordan arc.

**Regular arc.** If the derivatives of the given function are also continuous in the given range, then the arc is called a regular arc.

(viii) **Contour.** A contour is a Jordan curve consisting of continuous chain of a finite number of regular arcs.

The contour is said to be closed if the starting point A of the arc coincides with the end point B of the last arc.

(ix) **Zeros of an Analytic function.**

The value of  $z$  for which the analytic function  $f(z)$  becomes zero is said to be the zero of  $f(z)$ . **For example,** (1) Zeros of  $z^2 - 3z + 2$  are  $z=1$  and  $z=2$ .

$$(2) \text{ Zeros of } \cos z \text{ is } \pm (2n-1) \frac{\pi}{2}, \text{ where } n=1, 2, 3, \dots$$

### 29.3 CAUCHY'S INTEGRAL THEOREM

(AMIE TE, Dec. 2009, U.P. III Semester, 2009-2010, R.G.P.V., Bhopal, III Semester, Dec. 2002)

If a function  $f(z)$  is analytic and its derivative  $f'(z)$  continuous at all points inside and on a simple closed curve  $c$ , then  $\int_c f(z) dz = 0$ .

**Proof.** Let the region enclosed by the curve  $c$  be  $R$  and let

$$f(z) = u + iv, \quad z = x + iy, \quad dz = dx + idy$$

$$\begin{aligned} \int_c f(z) dz &= \int_c (u + iv)(dx + idy) = \int_c (u dx - v dy) + i \int_c (v dx + u dy) \\ &= \iint_R \left( -\frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right) dx dy + i \iint_c \left( \frac{\partial u}{\partial x} - \frac{\partial v}{\partial y} \right) dx dy \quad (\text{By Green's theorem}) \end{aligned}$$

Replacing  $-\frac{\partial v}{\partial x}$  by  $\frac{\partial u}{\partial y}$  and  $\frac{\partial v}{\partial y}$  by  $\frac{\partial u}{\partial x}$ , we get

$$\int_c f(z) dz = \iint_R \left( \frac{\partial u}{\partial y} - \frac{\partial u}{\partial y} \right) dx dy + i \iint_c \left( \frac{\partial u}{\partial x} - \frac{\partial u}{\partial x} \right) dx dy = 0 + i0 = 0$$

$$\Rightarrow \int_c f(z) dz = 0$$

**Proved.**

**Note.** If there is no pole inside and on the contour then the value of the integral of the function is zero.

**Example 14.** Find the integral  $\int_C \frac{3z^2 + 7z + 1}{z+1} dz$ , where  $C$  is the circle  $|z| = \frac{1}{2}$ .

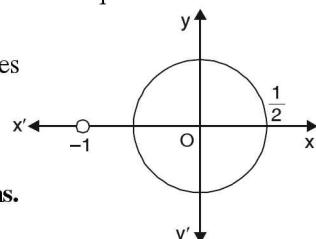

**Solution.** Poles of the integrand are given by putting the denominator equal to zero.

$$z + 1 = 0 \Rightarrow z = -1$$

The given circle  $|z| = \frac{1}{2}$  with centre at  $z = 0$  and radius  $\frac{1}{2}$  does

not enclose any singularity of the given function.

$$\int_C \frac{3z^2 + 7z + 1}{z+1} dz = 0 \quad (\text{By Cauchy Integral theorem}) \quad \text{Ans.}$$

**Example 15.** Find the value of  $\int_C \frac{z+4}{z^2+2z+5} dz$ , if  $C$  is the circle  $|z+1|=1$ .

**Solution.** Poles of integrand are given by putting the denominator equal to zero.

$$z^2 + 2z + 5 = 0$$

$$z = \frac{-2 \pm \sqrt{4-20}}{2} = \frac{-2 \pm 4i}{2} = -1 \pm 2i$$

The given circle  $|z+1|=1$  with centre at  $z = -1$  and radius unity does not enclose any singularity of the

function  $\frac{z+4}{z^2+2z+5}$ .

$$\therefore \int_C \frac{z+4}{z^2+2z+5} dz = 0 \text{ (By Cauchy Integral Theorem)}$$

**Example 16.** Evaluate  $\oint_c \frac{e^{-z}}{z+1} dz$ , where  $c$  is the circle  $|z|=\frac{1}{2}$ .

**Solution.** The point  $z = -1$  lies outside the circle  $|z| = \frac{1}{2}$ .

$\therefore$  The function  $\frac{e^{-z}}{z+1}$  is analytic within and on  $C$ .

By Cauchy's integral theorem, we have  $\oint_c \frac{e^{-z}}{z+1} dz = 0$ . **Ans.**

**Example 17.** Evaluate:  $\oint_C \frac{2z^2+5}{(z+2)^3(z^2+4)} dz$ .

where  $C$  is the square with the vertices at  $1+i, 2+i, 2+2i, 1+2i$ .

**Solution.** Here,  $f(z) = \frac{2z^2+5}{(z+2)^3(z^2+4)}$

Poles are given by

$$z = -2 \text{ (pole of order 3)}$$

$$z = \pm 2i \text{ (simple poles).}$$

Since the obtained poles do not lie inside the contour  $C$  with vertices at  $1+i, 2+i, 2+2i$  and  $1+2i$ , hence by Cauchy Integral theorem.

$$\oint_C \frac{2z^2+5}{(z+2)^3(z^2+4)} dz = 0. \quad \text{Ans.}$$

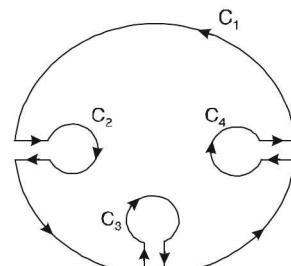

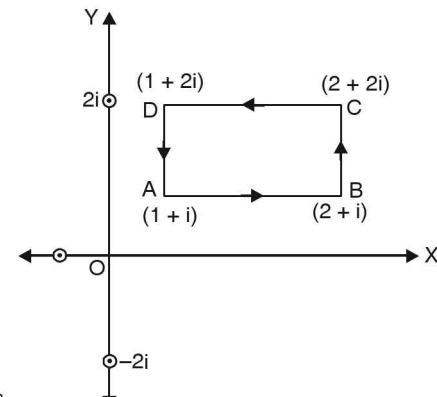

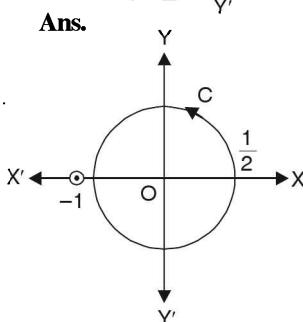

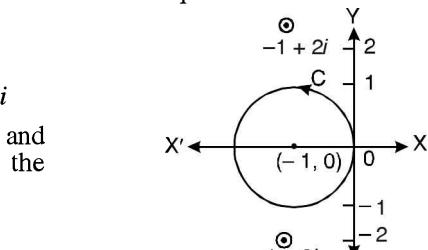

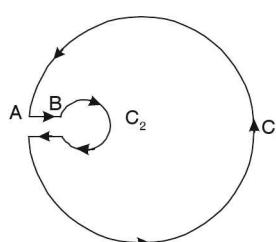

## 29.4 EXTENSION OF CAUCHY'S THEOREM TO MULTIPLE CONNECTED REGION

If  $f(z)$  is analytic in the region  $R$  between two simple closed curves  $c_1$  and  $c_2$  then

$$\int_{c_1} f(z) dz = \int_{c_2} f(z) dz$$

**Proof.**  $\int f(z) dz = 0$
