where the path of integration is along  $AB$ , and curves  $c_2$  in clockwise direction and along  $BA$  and along  $c_1$  in anticlockwise direction.

$$\begin{aligned} \int_{AB} f(z) dz - \int_{c_2} f(z) dz + \int_{BA} f(z) dz + \int_{c_1} f(z) dz &= 0 \\ \Rightarrow -\int_{c_2} f(z) dz + \int_{c_1} f(z) dz &= 0 && \text{as } \int_{AB} f(z) dz = -\int_{BA} f(z) dz \\ \int_{c_1} f(z) dz &= \int_{c_2} f(z) dz \end{aligned}$$

**Proved.**

**Corollary.**  $\int_{c_1} f(z) dz = \int_{c_2} f(z) dz + \int_{c_3} f(z) dz + \int_{c_4} f(z) dz$

### 29.5 CAUCHY INTEGRAL FORMULA

If  $f(z)$  is analytic within and on a closed curve  $C$ , and if  $a$  is any point within  $C$ , then

$$f(a) = \frac{1}{2\pi i} \int_C \frac{f(z)}{z-a} dz$$

(AMIETE June 2010, U.P., III Semester Dec. 2009 R.G.P.V., Bhopal, III Semester, June 2008)

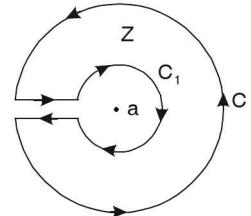

**Proof.** Consider the function  $\frac{f(z)}{z-a}$ , which is analytic at all points

within  $C$ , except  $z = a$ . With the point  $a$  as centre and radius  $r$ , draw a small circle  $C_1$  lying entirely within  $C$ .

Now  $\frac{f(z)}{z-a}$  is analytic in the region between  $C$  and  $C_1$ ; hence by

Cauchy's Integral Theorem for multiple connected region, we have

$$\begin{aligned} \int_C \frac{f(z) dz}{z-a} &= \int_{C_1} \frac{f(z)}{z-a} dz = \int_{C_1} \frac{f(z) - f(a) + f(a)}{z-a} . dz \\ &= \int_{C_1} \frac{f(z) - f(a)}{z-a} dz + f(a) \int_{C_1} \frac{dz}{z-a} \end{aligned} \quad \dots (1)$$

For any point on  $C_1$

$$\begin{aligned} \text{Now, } \int_{C_1} \frac{f(z) - f(a)}{z-a} dz &= \int_0^{2\pi} \frac{f(a + re^{i\theta}) - f(a)}{re^{i\theta}} ire^{i\theta} d\theta & [z-a = re^{i\theta} \text{ and } dz = ire^{i\theta} d\theta] \\ &= \int_0^{2\pi} [f(a + re^{i\theta}) - f(a)] id\theta = 0 & (\text{where } r \text{ tends to zero}). \end{aligned}$$

$$\int_{C_1} \frac{dz}{z-a} = \int_0^{2\pi} \frac{ire^{i\theta} d\theta}{re^{i\theta}} = \int_0^{2\pi} id\theta = i[\theta]_0^{2\pi} = 2\pi i$$

Putting the values of the integrals in R.H.S. of (1), we have

$$\int_C \frac{f(z) dz}{z-a} = 0 + f(a) (2\pi i) \Rightarrow f(a) = \frac{1}{2\pi i} \int_C \frac{f(z) dz}{z-a} \quad \text{Proved.}$$

### 29.6 CAUCHY INTEGRAL FORMULA FOR THE DERIVATIVE OF AN ANALYTIC FUNCTION

(R.G.P.V., Bhopal, III Semester, Dec. 2007)

If a function  $f(z)$  is analytic in a region  $R$ , then its derivative at any point  $z = a$  of  $R$  is also analytic in  $R$ , and is given by

$$f'(a) = \frac{1}{2\pi i} \int_C \frac{f(z)}{(z-a)^2} dz$$

where  $c$  is any closed curve in  $R$  surrounding the point  $z = a$ .

**Proof.** We know Cauchy's Integral formula

$$f(a) = \frac{1}{2\pi i} \int_c \frac{f(z)}{(z-a)} dz \quad \dots (1)$$

Differentiating (1) w.r.t. ' $a$ ', we get

$$f'(a) = \frac{1}{2\pi i} \int_c f(z) \frac{\partial}{\partial a} \left( \frac{1}{z-a} \right) dz$$

$$f'(a) = \frac{1}{2\pi i} \int_c \frac{f(z)}{(z-a)^2} dz$$

Similarly,

$$f''(a) = \frac{2!}{2\pi i} \int_c \frac{f(z) dz}{(z-a)^3}$$

$$f''(a) = \frac{n!}{2\pi i} \int_c \frac{f(z) dz}{(z-a)^{n+1}}$$

### 29.7 MORERA THEOREM (Converse of Cauchy's Theorem)

If a function  $f(z)$  is continuous in region  $D$  and if the integral  $\int f(z) dz$ , taken around any simple closed contour in  $D$ , is zero then  $f(z)$  is an analytic function inside  $D$ .

**Proof.**  $\int_{z_0}^z f(z) dz$  is independent of path from  $z_0$  fixed point to a variable point  $z$  and hence must be function of  $z$  only. Thus  $\int_{z_0}^z f(z) dz = \phi(z)$

$$\int (u+iv)(dx+idy) = U+iV \text{ and } f(z) = u+iv$$

$$\Rightarrow \int_{(x_0,y_0)}^{(x,y)} (udx-vdy) = U \text{ and } \int_{(x_0,y_0)}^{(x,y)} vdx+udy = V$$

Differentiating under the sign of integral, we get

$$\frac{\partial U}{\partial x} = u, \quad \frac{\partial V}{\partial x} = v, \quad \frac{\partial U}{\partial y} = -v, \quad \frac{\partial V}{\partial y} = u$$

$$\therefore \frac{\partial U}{\partial x} = \frac{\partial V}{\partial y} \text{ and } \frac{\partial U}{\partial y} = -\frac{\partial V}{\partial x}$$

Thus,  $U$  and  $V$  satisfy  $C-R$  equations.

$\therefore \phi(z) = U + iV$  is an analytic function.

$$\phi'(z) = \frac{\partial U}{\partial x} + i \frac{\partial V}{\partial x} = u + iv = f(z)$$

$f(z)$  is the derivative of an analytic function  $\phi(z)$ .

**Proved.**

### 29.8 CAUCHY'S INEQUALITY

If  $f(z)$  is analytic within a circle  $C$  i.e.,  $|z-a| = R$  and if  $|f(z)| \leq M$  on  $C$ , then

$$|f^n(a)| \leq \frac{Mn!}{R^n}$$

$$\text{Proof. We know that } f^n(a) = \frac{n!}{2\pi i} \int_c \frac{f(z) dz}{(z-a)^{n+1}} \leq \frac{n!}{|2\pi i|} \int_c \frac{|f(z)| |dz|}{|z-a|^{n+1}}$$

$$\leq \frac{n!}{2\pi} \frac{M}{R^{n+1}} \int_0^{2\pi} R d\theta \quad [\text{since } z = Re^{i\theta}, |dz| = |iRe^{i\theta}| d\theta = R d\theta]$$

$$\leq \frac{n!}{2\pi} \frac{M}{R^{n+1}} 2\pi R \leq \frac{Mn!}{R^n}$$

**Proved.**

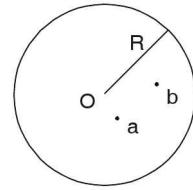

**Second Proof.** Let  $a$  and  $b$  be any two points of  $z$  plane. Draw a large circle  $c_n$  with centre at the origin, of radius  $R$ , enclosing the points  $a$  and  $b$ . So that

$$R > |a|, \text{ and also } R > |b|.$$

By Cauchy's integral formula

$$\int_c \frac{f(z) dz}{z-a} = 2\pi i f(a) \text{ and } \int_c \frac{f(z) dz}{z-b} = 2\pi i f(b)$$

$$2\pi i [f(a) - f(b)] = \int_c \frac{f(z) dz}{z-a} - \int_c \frac{f(z) dz}{z-b} = \int_c \frac{a-b}{(z-a)(z-b)} f(z) dz$$

$$\begin{aligned} |2\pi i [f(a) - f(b)]| &= \left| \int_c \frac{a-b}{(z-a)(z-b)} f(z) dz \right| \\ |f(a) - f(b)| &\leq \left| \frac{1}{2\pi i} \int_c \frac{|a-b| |f(z)| |dz|}{|z-a||z-b|} \right| \\ &\leq \frac{1}{2\pi} |a-b| M \int_c \frac{|dz|}{(|z|-|a|)(|z|-|b|)} \quad [\text{Since } f(z) \leq M] \\ &= \frac{1}{2\pi} \frac{|a-b| M}{(R-|a|)(R-|b|)} \int_c |dz| \quad [\text{Since } |z|=R] \\ &= \frac{1}{2\pi} \frac{(a-b)M}{(R-|a|)(R-|b|)} \int_0^{2\pi} R d\theta \quad [z = Re^{i\theta}, |dz|=Rd\theta] \\ &= \frac{|a-b|M 2\pi R}{2\pi(R-|a|)(R-|b|)} = \frac{|a-b|M}{R \left(1-\frac{a}{R}\right) \left(1-\frac{b}{R}\right)} \\ &= 0 \text{ as } R \rightarrow \infty \end{aligned}$$

$\therefore f(a) = f(b)$ . Since this holds for all values of  $a$  and  $b$ , therefore  $f(x)$  is constant.

### 29.9 LIOUVILLE THEOREM

(U.P., III Semester, June 2009)

If a function  $f(z)$  is analytic for all finite values of  $z$ , and is bounded, is a constant.

**Proof.** Since  $f(z)$  is bounded so  $|f(z)| \leq M$ , where  $M$  is positive constant.

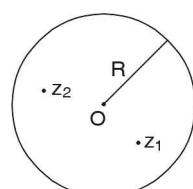

Let  $z_1, z_2$  be any two points of the  $z$ -plane.

Let us draw a circle with centre at origin and large radius  $R$  enclosing the points  $z_1$  and  $z_2$ . So that  $R > |z_1|$  and  $R > |z_2|$

$$f(z_1) - f(z_2) = \frac{1}{2\pi i} \int_c \frac{f(z)}{z-z_1} dz - \frac{1}{2\pi i} \int_c \frac{f(z)}{z-z_2} dz$$

(Cauchy's Integral formula)

$$\begin{aligned} &= \frac{1}{2\pi i} \int_c \frac{z_1 - z_2}{(z-z_1)(z-z_2)} \cdot f(z) dz \\ |f(z_1) - f(z_2)| &= \left| \frac{1}{2\pi i} \int_c \frac{(z_1 - z_2) f(z)}{(z-z_1)(z-z_2)} dz \right| \\ &\leq \left| \frac{1}{2\pi i} \int_c \frac{|(z_1 - z_2)| |f(z)|}{|z-z_1||z-z_2|} |dz| \right| \\ &\leq \frac{1}{2\pi} |z_1 - z_2| M \int_c \frac{|dz|}{(|z|-|z_1|)(|z|-|z_2|)} \quad [|f(z)| < M] \end{aligned}$$

$$\begin{aligned}
 &\leq \frac{1}{2\pi} \cdot \frac{|z_1 - z_2| M}{[R - |z_1|][R - |z_2|]} \oint_C |dz| \\
 &= \frac{1}{2\pi} \frac{|z_1 - z_2| M}{[R - |z_1|][R - |z_2|]} \int_0^{2\pi} R d\theta \\
 &= \frac{(z_1 - z_2) M \cdot 2\pi R}{2\pi [R - |z_1|][R - |z_2|]} = 0 \quad \text{Since } R \rightarrow \infty
 \end{aligned}$$

(Since  $|z| = R$ )  
 $(\because z = R e^{i\theta})$   
 $|dz| = R d\theta$

Hence,  $f(z_1) = f(z_2)$   
 $f(z)$  is constant.

**Proved.**

**Alternative.** On putting  $n = 1$  in Cauchy's inequality

$$|f'(z)| \leq \frac{M}{R}$$

As  $R \rightarrow \infty$ ,  $f'(z) = 0$ , i.e.,  $f(z)$  is constant for all finite values of  $z$ .

**Proved.**

## 29.10 FUNDAMENTAL THEOREM OF ALGEBRA

Every polynomial of degree  $\geq 1$  has atleast one zero (root) in  $C$ .

**Proof.** Let  $f(z)$  be a polynomial of degree  $\geq 1$ . Suppose,  $f(z)$  has no zero in  $C$ , then  
 $f(z) \neq 0$  for all  $z$ .

Further  $f(z)$  is an entire function in the complex plane.

$\therefore \frac{1}{f(z)}$  is also an entire function. Also as  $z \rightarrow \infty$ ,  $f(z) \rightarrow \infty$   
 $\therefore \frac{1}{f(z)} \rightarrow 0$  as  $z \rightarrow \infty$   $\therefore \frac{1}{f(z)}$  is a bounded function.

Thus, by Liouville's theorem  $\frac{1}{f(z)}$  is a constant function.

$\therefore f(z)$  is a constant function and hence it is a polynomial of degree zero which is a contradiction.

Hence,  $f(z)$  has at least one root in  $C$ .

**Proved.**

## 29.11 POISSON INTEGRAL FORMULA FOR A CIRCLE

If  $f(z)$  is analytic within and on the circle  $C$  given by

$|z| = R$  and  $z = re^{i\theta}$  is any point within  $C$ , then

$$f(re^{i\theta}) = \frac{1}{2\pi} \int_0^{2\pi} \frac{(R^2 - r^2)f(Re^{i\phi})}{R^2 - 2rR\cos(\theta - \phi) + r^2} d\phi$$

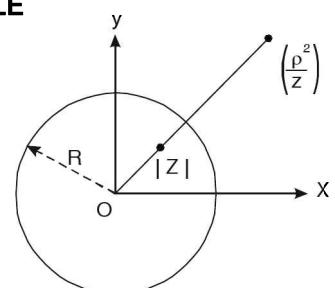

**Proof.** Since  $z = re^{i\theta}$  is any point within  $C$ , by Cauchy's integral formula, we have

$$f(z) = \frac{1}{2\pi i} \oint_C \frac{f(w)}{w - z} dw$$

The inverse of the point  $z$  w.r.t.  $C$  is given by  $\frac{R^2}{z}$  and lies outside  $C$ .

$\therefore$  By Cauchy's theorem, we have

$$0 = \oint_C \frac{f(w)}{w - \frac{R^2}{z}} dw \quad \text{or} \quad 0 = \frac{1}{2\pi i} \oint_C \frac{f(w)}{w - \frac{R^2}{z}} dw \quad \dots (2)$$

Subtracting (2) from (1), we get

$$\begin{aligned} f(z) &= \frac{1}{2\pi i} \oint_C \left( \frac{1}{w-z} - \frac{1}{w-\frac{R^2}{z}} \right) f(w) dw = \frac{1}{2\pi i} \oint_C \frac{\bar{z}z - R^2}{zw^2 - (\bar{z}z + R^2)w + R^2 z} f(w) dw \\ &= \frac{1}{2\pi i} \oint_C \frac{r^2 - R^2}{zw^2 - (r^2 + R^2)w + R^2 z} f(w) dw \dots (3) \quad [\text{since } \bar{z}z = |z|^2 = r^2] \end{aligned}$$

Taking  $w = Re^{i\phi}$ , we have from (3),

$$\begin{aligned} f(re^{i\theta}) &= \frac{1}{2\pi i} \int_0^{2\pi} \frac{(r^2 - R^2)f(Re^{i\phi}).Re^{i\phi} d\phi}{re^{-i\theta}.R^2 e^{2i\phi} - (r^2 + R^2)Re^{i\phi} + R^2 re^{i\theta}} \\ &= \frac{1}{2\pi} \int_0^{2\pi} \frac{(r^2 - R^2)f(Re^{i\phi}).e^{i\phi} d\phi}{rRe^{i(2\phi-\theta)} - (r^2 + R^2)e^{i\phi} + Rre^{i\theta}} \end{aligned}$$

Dividing the numerator and denominator by  $e^{i\phi}$ , we get

$$\begin{aligned} &= \frac{1}{2\pi} \int_0^{2\pi} \frac{(r^2 - R^2)f(Re^{i\phi}) d\phi}{rRe^{i(\phi-\theta)} - (r^2 + R^2) + Rre^{i(\theta-\phi)}} = \frac{1}{2\pi} \int_0^{2\pi} \frac{(R^2 - r^2)f(Re^{i\phi})}{r^2 + R^2 - rR[e^{i(\theta-\phi)} + e^{-i(\theta-\phi)}]} d\phi \\ &= \frac{1}{2\pi} \int_0^{2\pi} \frac{(R^2 - r^2)f(Re^{i\phi})}{R^2 - 2rR\cos(\theta-\phi) + r^2} d\phi \quad [\text{Since } e^{ix} + e^{-ix} = 2\cos x.] \end{aligned}$$

This is called *Poisson's integral formula for a circle*. It expresses the values of a harmonic function within a circle in terms of its values on the boundary.

If  $f(re^{i\theta}) = u(r, \theta) + iv(r, \theta)$  and  $f(Re^{i\phi}) = u(R, \phi) + iv(R, \phi)$ , then we have

$$u(r, \theta) + iv(r, \theta) = \frac{1}{2\pi} \int_0^{2\pi} \frac{(R^2 - r^2)[u(R, \phi) + iv(R, \phi)]}{R^2 - 2rR\cos(\theta-\phi) + r^2} d\phi$$

Equating real and imaginary parts, we get

$$u(r, \theta) = \frac{1}{2\pi} \int_0^{2\pi} \frac{(R^2 - r^2)u(R, \phi)}{R^2 - 2rR\cos(\theta-\phi) + r^2} d\phi$$

$$\text{and } v(r, \theta) = \frac{1}{2\pi} \int_0^{2\pi} \frac{(R^2 - r^2)v(R, \phi)}{R^2 - 2rR\cos(\theta-\phi) + r^2} d\phi$$

**Example 18.** Using Poisson's integral formula for a circle, show that

$$\int_0^{2\pi} \frac{e^{\cos\phi} \cos(\sin\phi)}{5 - 4\cos(\theta-\phi)} d\phi = \frac{2\pi}{3} e^{\cos\theta} \cos(\sin\theta).$$

**Solution.** Poisson's integral formula for the circle  $|z| = R$  is

$$f(re^{i\theta}) = \frac{1}{2\pi} \int_0^{2\pi} \frac{(R^2 - r^2)f(Re^{i\phi})}{R^2 - 2rR\cos(\theta-\phi) + r^2} d\phi \dots (1)$$

Comparing the given integral with the integral on R.H.S. of (1), we get

$$R^2 + r^2 = 5, rR = 2, f(Re^{i\phi}) = e^{\cos\phi} \cos(\sin\phi)$$

$$\text{whence } R = 2, r = 1, f(re^{i\theta}) = e^{\cos\theta} \cos(\sin\theta)$$

Substituting these values in (1), we get

$$\begin{aligned} e^{\cos\theta} \cos(\sin\theta) &= \frac{1}{2\pi} \int_0^{2\pi} \frac{(2^2 - 1^2) e^{\cos\phi} \cos(\sin\phi)}{5 - 4\cos(\theta - \phi)} d\phi \\ \therefore \int_0^{2\pi} \frac{e^{\cos\phi} \cos(\sin\phi)}{5 - 4\cos(\theta - \phi)} d\phi &= \frac{2\pi}{3} e^{\cos\theta} \cos(\sin\theta). \end{aligned}$$

Proved.

### 29.12 POISSON INTEGRAL FORMULA FOR A HALF PLANE

If  $f(z)$  is an analytic function in the upper half of the  $z$ -plane and  $a = \alpha + i\beta$  is any point in this upper half plane, then

$$f(a) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\beta f(x)}{(x - \alpha)^2 + \beta^2} dx \quad \dots (1)$$

Consider a semi-circle of radius  $R$  with centre at the origin. Let  $C$  denote the boundary of the semi-circle along with its bounding diameter. Since  $a = \alpha + i\beta$  is an interior point,  $\bar{a} = \alpha - i\beta$  lies outside  $C$ .

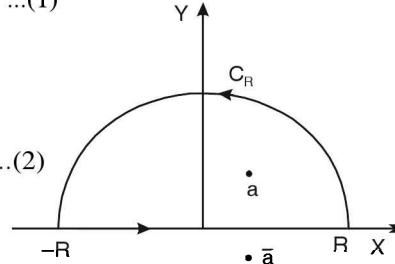

$$\therefore \text{By Cauchy integral formula, } f(a) = \frac{1}{2\pi i} \oint_C \frac{f(z)}{z - a} dz \quad \dots (1)$$

$$\text{Also, by Cauchy theorem, we have } \oint_C \frac{f(z)}{z - \bar{a}} dz = 0$$

$$\Rightarrow 0 = \frac{1}{2\pi i} \oint_C \frac{f(z)}{z - \bar{a}} dz \quad \dots (2)$$

Subtracting (2) from (1), we get

$$\begin{aligned} f(a) &= \frac{1}{2\pi i} \oint_C \left( \frac{1}{z - a} - \frac{1}{z - \bar{a}} \right) f(z) dz \\ &= \frac{1}{2\pi i} \oint_C \frac{a - \bar{a}}{(z - a)(z - \bar{a})} f(z) dz = \frac{1}{2\pi i} \oint_C \frac{a - \bar{a}}{z^2 - (a + \bar{a})z + a\bar{a}} f(z) dz \\ &= \frac{1}{2\pi i} \oint_C \frac{i 2\beta f(z)}{z^2 - 2az + a^2 + \beta^2} dz = \frac{1}{\pi} \oint_{C_R} \frac{\beta f(z)}{(z - \alpha)^2 + \beta^2} dz \quad [\because a = \alpha + i\beta] \\ &= \frac{1}{\pi} \int_{-R}^R \frac{\beta f(x)}{(x - \alpha)^2 + \beta^2} dx + \frac{1}{\pi} \oint_{C_R} \frac{\beta f(z)}{(z - \alpha)^2 + \beta^2} dz \end{aligned}$$

where  $C_R$  is the semi-circular arc of  $C$ .

As  $R \rightarrow \infty$ , the second integral becomes zero.

$$\therefore f(a) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\beta f(x)}{(x - \alpha)^2 + \beta^2} dx \quad \dots (3)$$

This is called *Poisson integral formula for a half-plane*. It expresses the values of a harmonic function in the upper half-plane in terms of the values on the real axis.

If  $f(a) = f(\alpha + i\beta) = u(\alpha, \beta) + iv(\alpha, \beta)$

and  $f(x) = u(x, 0) + iv(x, 0)$ , then we have

$$u(\alpha, \beta) + iv(\alpha, \beta) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\beta[u(x, 0) + iv(x, 0)]}{(x - \alpha)^2 + \beta^2} dx$$

Equating real and imaginary parts, we get

$$u(\alpha, \beta) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\beta u(x, 0)}{(x - \alpha)^2 + \beta^2} dx \quad \text{and} \quad v(\alpha, \beta) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\beta v(x, 0)}{(x - \alpha)^2 + \beta^2} dx.$$

**Example 19.** Find a function harmonic in the upper half of the  $z$ -plane which takes the following values on the  $x$ -axis.

$$G(x) = \begin{cases} 1, & x < -1 \\ 0, & -1 < x < 1 \\ -1, & x > 1 \end{cases}$$

**Solution.** Let  $\phi(x, y)$  be the function harmonic in the upper half of the  $z$ -plane, then

$$\phi(x, y) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{y G(w)}{(w - x)^2 + y^2} dw \quad (\text{Poisson's Integral Formula})$$

[Obtained from (Article 35.12) on page 949, on replacing  $\alpha, \beta$  by  $x, y$  and the variable of integration  $x$  by  $w$ ]

$$\begin{aligned} &= \frac{1}{\pi} \left[ \int_{-\infty}^{-1} \frac{y \cdot 1}{(w - x)^2 + y^2} dw + \int_{-1}^1 \frac{y \cdot 0}{(w - x)^2 + y^2} dw + \int_1^{\infty} \frac{y \cdot (-1)}{(w - x)^2 + y^2} dw \right] \\ &= \frac{1}{\pi} \left[ \left\{ \tan^{-1} \frac{w - x}{y} \right\}_{-\infty}^{-1} + 0 - \left\{ \tan^{-1} \frac{w - x}{y} \right\}_1^{\infty} \right] \\ &= \frac{1}{\pi} \left[ -\tan^{-1} \frac{1+x}{y} + \frac{\pi}{2} - \left\{ \frac{\pi}{2} - \tan^{-1} \frac{1-x}{y} \right\} \right] = \frac{1}{\pi} \left[ \tan^{-1} \frac{1-x}{y} - \tan^{-1} \frac{1+x}{y} \right] \\ &= \frac{1}{\pi} \tan^{-1} \frac{\frac{1-x}{y} - \frac{1+x}{y}}{1 + \frac{1-x}{y} \cdot \frac{1+x}{y}} = \frac{1}{\pi} \tan^{-1} \frac{2xy}{x^2 - y^2 - 1}. \end{aligned}$$

Which is the required harmonic function.

**Ans.**

**Example 20.** Prove that  $\int_C \frac{dz}{z-a} = 2\pi i$ , where  $C$  is the circle  $|z-a| = r$

(R.G.P.V., Bhopal, III Semester, Dec. 2006)

**Solution.** We have,

$$\int_C \frac{dz}{z-a}, \text{ where } C \text{ is the circle with centre } (a, 0) \text{ and radius } r.$$

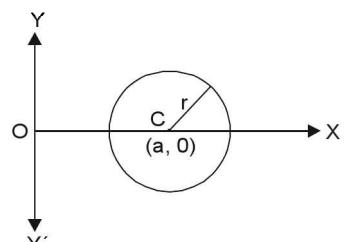

By Cauchy Integral Formula

$$\left[ \int_C \frac{f(z)}{z-a} dz = 2\pi i f(a) \right]$$

$$\int_C \frac{dz}{z-a} = 2\pi i \quad (1)$$

$$\Rightarrow \int_C \frac{dz}{z-a} = 2\pi i$$

**Proved.**

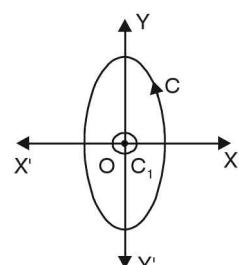

**Example 21.** Evaluate the following integral

$$\int_C \frac{1}{z} \cos z dz.$$

where  $C$  is the ellipse  $9x^2 + 4y^2 = 1$ .

**Solution.** The given ellipse  $9x^2 + 4y^2 = 1$  encloses a simple pole  $z = 0$ .

By Cauchy Integral formula

$$\int_C \frac{\cos z}{z} dz = 2\pi i (\cos z)_{z=0} = 2\pi i.$$

Which is the required value of the given integral.

**Ans.**

**Example 22.** Use Cauchy's integral formula to evaluate  $\int_C \frac{z}{(z^2 - 3z + 2)} dz$

$$\text{where } C \text{ is the circle } |z - 2| = \frac{1}{2}$$

(U.P. III Semester, June 2009)

**Solution.** Here, we have

$$\int_C \frac{z}{(z^2 - 3z + 2)} dz$$

The poles are determined by putting the denominator equal to zero  
i.e.;  $z^2 - 3z + 2 = 0 \Rightarrow (z - 1)(z - 2) = 0$

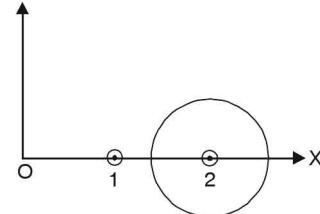

$$\Rightarrow z = 1, 2$$

So, there are two poles  $z = 1$  and  $z = 2$ .

There is only one pole at  $z = 2$  inside the given circle.

$$\begin{aligned} \int_C \frac{z}{(z^2 - 3z + 2)} dz &= \int_C \frac{z}{(z-1)(z-2)} dz \\ &= \int_C \frac{\frac{z}{z-1}}{z-2} dz \quad \left[ \int_C \frac{f(z)}{z-a} dz = 2\pi i f(a) \right] \\ &= 2\pi i \left[ \frac{z}{z-1} \right]_{z=2} = 2\pi i \left( \frac{2}{2-1} \right) = 4\pi i \end{aligned}$$

**Ans.**

**Example 23.** Use Cauchy's integral formula to calculate

$$\int_C \frac{2z+1}{z^2+z} dz \quad \text{where } C \text{ is } |z| = \frac{1}{2}. \quad (\text{AMIETE, Dec. 2009})$$

**Solution.** Poles are given by

$$z^2 + z = 0$$

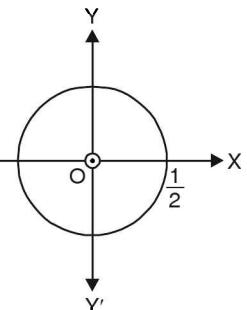

$$\Rightarrow z(z+1) = 0 \Rightarrow z = 0, -1$$

$|z| = \frac{1}{2}$  is a circle with centre at origin and radius  $\frac{1}{2}$ .

Therefore it encloses only one pole  $z = 0$ .

$$\therefore \int_C \frac{2z+1}{z(z+1)} dz = \int_C \frac{\frac{2z+1}{z+1}}{z} dz = 2\pi i \left[ \frac{2z+1}{z+1} \right]_{z=0} = 2\pi i$$

**Ans.**

**Example 24.** Evaluate by Cauchy's integral formula

$$\int_C \frac{dz}{z(z+\pi i)}, \text{ where } C \text{ is } |z + 3i| = 1$$

**Solution.** Poles of the integrand are

$$z = 0, -\pi i \quad (\text{simple poles})$$

The given curve C is a circle with centre at  $z = -3i$  i.e. at  $(0, -3)$  and radius 1.

Clearly, only the pole  $z = -\pi i$  lies inside the circle.

$$\therefore \int_C \frac{dz}{z(z+\pi i)} = \int_C \frac{\frac{1}{z}}{z+\pi i} dz$$

$$\begin{aligned}
 &= 2\pi i \left( \frac{1}{z} \right)_{z=-\pi i} \\
 &\quad [\text{By Cauchy's Integral formula}] \\
 &= \frac{2\pi i}{-\pi i} = -2
 \end{aligned}$$

Which is the required value of the given integral.

**Example 25.** Evaluate the complex integral

$$\int_C \tan z \, dz \text{ where } C \text{ is } |z|=2.$$

**Solution.**  $\int_C \tan z \, dz = \int_C \frac{\sin z}{\cos z} \, dz$

$|z| = 2$ , is a circle with centre at origin and radius = 2.

Poles are given by putting the denominator equal to zero.

$$\cos z = 0, z = -\frac{\pi}{2}, \frac{\pi}{2}, \frac{3\pi}{2}, \dots$$

The integrand has two poles at  $z = \frac{\pi}{2}$  and  $z = -\frac{\pi}{2}$  inside

the given circle  $|z| = 2$ .

On applying Cauchy integral formula

$$\begin{aligned}
 \int_C \frac{\sin z}{\cos z} \, dz &= \int_{C_1} \frac{\sin z}{\cos z} \, dz + \int_{C_2} \frac{\sin z}{\cos z} \, dz = 2\pi i [\sin z]_{z=\frac{\pi}{2}} + 2\pi i [\sin z]_{z=-\frac{\pi}{2}} \\
 &= 2\pi i (1) + 2\pi i (-1) = 0
 \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 26.** Evaluate  $\oint_C \frac{e^{-z}}{z+1} \, dz$ , where  $C$  is the circle  $|z|=2$

**Solution.**  $f(z) = e^{-z}$  is an analytic function

The point  $z = -1$  lies inside the circle  $|z| = 2$ .

$\therefore$  By Cauchy's integral formula,

$$\oint_C \frac{e^{-z}}{z+1} \, dz = 2\pi i (e^{-z})_{z=-1} = 2\pi ie. \quad \text{Ans.}$$

**Example 27.** Evaluate:  $\int_C \frac{e^z}{(z-1)(z-4)} \, dz$  where  $C$  is the circle  $|z|=2$  by using Cauchy's

Integral Formula.

(R.G.P.V., Bhopal, III Semester, June 2006)

**Solution.** We have,

$$\int_C \frac{e^z}{(z-1)(z-4)} \, dz \text{ where } C \text{ is the circle with centre at origin and radius 2.}$$

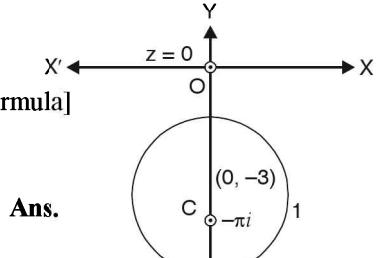

Poles are given by putting the denominator equal to zero.

$$(z-1)(z-4) = 0$$

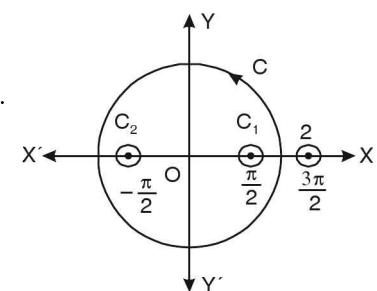

$$\Rightarrow z = 1, 4$$

Here there are two simple poles at  $z = 1$  and  $z = 4$ .

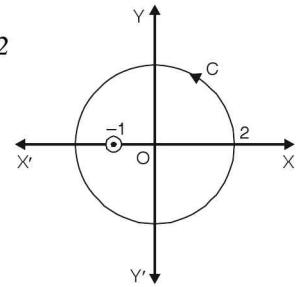

There is only one pole at  $z = 1$  inside the contour. Therefore

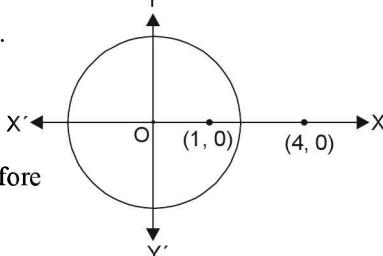

**Ans.**

**Ans.**

**Ans.**

$$\int_C \frac{e^z}{(z-1)(z-4)} dz = \int \frac{\frac{e^z}{(z-4)}}{(z-1)} dz = 2\pi i \left[ \frac{e^z}{z-4} \right]_{z=1} \quad (\text{By Cauchy Integral Theorem})$$

$$= 2\pi i \left( \frac{e}{1-4} \right) = -\frac{2\pi i e}{3}$$

Which is the required value of the given integral.

**Ans.**

**Example 28.** If  $f(z_1) = \int_C \frac{3z^2 + 7z + 1}{z - z_1} dz$ , where  $C$  is the circle  $x^2 + y^2 = 4$ , find the values of  
 (i)  $f(3)$ , (ii)  $f'(1 - i)$ , (iii)  $f''(1 - i)$ .

**Solution.** The given circle  $C$  is  $x^2 + y^2 = 4$  or  $|z| = 2$ .

The point  $z = 3$  lies outside the circle  $|z| = 2$ .

(i)  $f(3) = \oint_C \frac{3z^2 + 7z + 1}{z - 3} dz$  and  $\frac{3z^2 + 7z + 1}{z - 3}$  is analytic within and on  $C$ .

∴ By Cauchy's integral theorem, we have

$$\oint_C \frac{3z^2 + 7z + 1}{z - 3} dz = 0 \Rightarrow f(3) = 0. \quad \text{Ans.}$$

(ii)  $z_1 = 1 - i$  lies inside the circle  $C$ .

By Cauchy's Integral formula, we have

$$\int_C \frac{3z^2 + 7z + 1}{z - z_1} dz = 2\pi i (3z^2 + 7z + 1)_{z=z_1}$$

$$f(z) = 2\pi i (3z^2 + 7z + 1)$$

$$f'(z) = 2\pi i (6z + 7)$$

$$f'(1 - i) = 2\pi i [6(1 - i) + 7]$$

$$\Rightarrow f'(1 - i) = 2\pi i [13 - 6i]$$

$$\Rightarrow f'(1 - i) = 2\pi [6 + 13i] \quad \text{Ans.}$$

$$(iii) f''(z) = 2\pi i 6$$

$$f''(1 - i) = 12\pi i \quad \text{Ans.}$$

**Example 29.** Evaluate

$$\int_C \frac{e^z}{z^2 + 1} dz \text{ over the circular path } |z| = 2.$$

**Solution.** Poles of the integrand are given by putting the denominator equal to zero.

$$z^2 + 1 = 0 \Rightarrow z^2 = -1 \Rightarrow z = \pm i$$

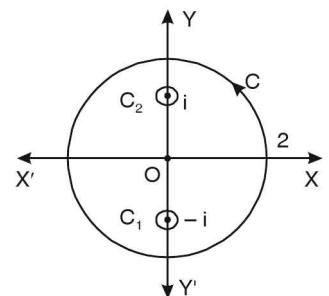

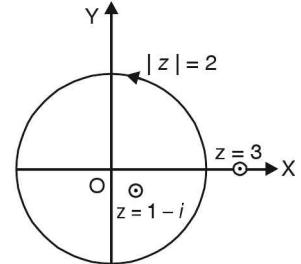

The integrand has two simple poles at  $z = i$  and  $z = -i$ . Both poles are inside the given circle with centre at origin and radius 2.

$$\begin{aligned} \int_C \frac{1}{2i} \left( \frac{e^z}{z-i} - \frac{e^z}{z+i} \right) dz &= \int_C \frac{1}{2i} \frac{e^z}{z-i} dz - \frac{1}{2i} \int_C \frac{e^z}{z+i} dz = \frac{1}{2i} \left[ 2\pi i (e^z)_{z=i} - 2\pi i (e^z)_{z=-i} \right] \\ &= \frac{2\pi i}{2i} [e^i - e^{-i}] = \pi 2 i \sin 1 = 2\pi i \sin 1 \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

$$\text{Second Method. } \int_C \frac{e^z}{z^2 + 1} dz = \int_C \frac{e^z dz}{(z+i)(z-i)} = \int_{C_1} \frac{e^z}{z+i} dz + \int_{C_2} \frac{e^z}{z-i} dz$$

$$\begin{aligned}
 &= 2\pi i \left( \frac{e^z}{z-i} \right)_{z=-i} + 2\pi i \left( \frac{e^z}{z+i} \right)_{z=i} = \left[ 2\pi i \frac{e^{-i}}{-i-i} + 2\pi i \frac{e^i}{i+i} \right] = \pi [-e^{-i} + e^i] \\
 &= \pi(2i \sin 1) = 2\pi i \sin 1
 \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 30.** State the Cauchy's integral formula. Show that  $\int_C \frac{e^{zt}}{z^2+1} dz = 2\pi i \sin t$

if  $t > 0$  and  $C$  is the circle  $|z| = 3$

(U.P., III Semester, Dec. 2009)

**Solution.**

See Art. 29.5 on page 754

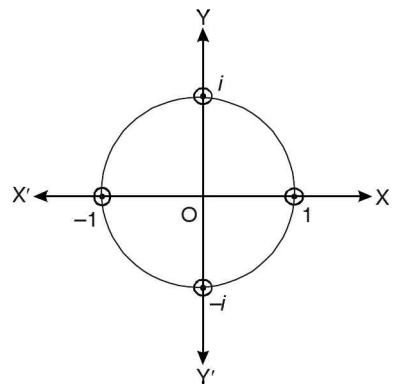

$$\text{Here, we have } \int_C \frac{e^{zt}}{z^2+1} dz$$

The poles are determined by putting the denominator equal to zero.

$$\begin{aligned}
 &\text{i.e., } z^2 + 1 = 0 \\
 &\Rightarrow z^2 = -1 \\
 &\Rightarrow z = \pm \sqrt{-1} = \pm i \\
 &\Rightarrow z = i, -i
 \end{aligned}$$

The integrand has two simple poles at  $z = i$  and at  $z = -i$ . Both poles are inside the given circle with centre at origin and radius 3.

$$\begin{aligned}
 \text{Now, } \int_C \frac{e^{zt}}{z^2+1} dz &= \frac{1}{2i} \int_C \left( \frac{e^{zt}}{z-i} - \frac{e^{zt}}{z+i} \right) dz \\
 &= \frac{1}{2i} \left[ \int_{C_1} \frac{e^{zt}}{z-i} dz - \int_{C_2} \frac{e^{zt}}{z+i} dz \right] = \frac{1}{2i} \left[ 2\pi i (e^{zt})_{z=i} - 2\pi i (e^{zt})_{z=-i} \right] \\
 &= \frac{2\pi i}{2i} \left[ e^{ti} - e^{-ti} \right] = \pi \cdot 2i \sin t
 \end{aligned}$$

**Example 31.** Evaluate  $\int_C \frac{dz}{z^2-1}$ , where  $C$  is the circle  $x^2+y^2 = 4$ .

**Solution.** Poles are given by putting the denominator equal to zero.

$$z^2 - 1 = 0, z^2 = 1, z = \pm 1$$

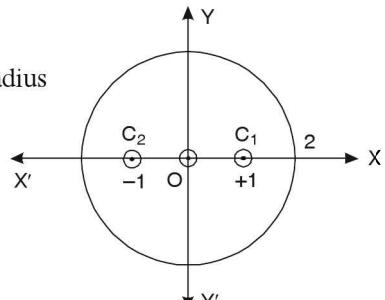

The given circle  $x^2 + y^2 = 4$  with centre at  $z=0$  and radius

2 encloses two simple poles at  $z=1$  and  $z=-1$ .

$$\begin{aligned}
 \therefore \int_C \frac{dz}{z^2-1} &= \int_{C_1} \frac{dz}{z^2-1} + \int_{C_2} \frac{dz}{z^2-1} \\
 &= \int_{C_1} \frac{1}{z+1} dz + \int_{C_2} \frac{1}{z-1} dz \\
 &= 2\pi i \left( \frac{1}{z+1} \right)_{z=1} + 2\pi i \left( \frac{1}{z-1} \right)_{z=-1} = 2\pi i \left( \frac{1}{1+1} \right) + 2\pi i \left( \frac{1}{-1-1} \right) \\
 &= \pi i - \pi i = 0
 \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 32.** Evaluate the following integral using Cauchy integral formula

$$\int_c \frac{4-3z}{z(z-1)(z-2)} dz \text{ where } c \text{ is the circle } |z| = \frac{3}{2}.$$

(AMIETE, Dec. 2009, R.G.P.V., Bhopal, III Semester, June 2008)

**Solution.** Poles of the integrand are given by putting the denominator equal to zero.

$$z(z-1)(z-2) = 0 \text{ or } z = 0, 1, 2$$

The integrand has three simple poles at  $z = 0, 1, 2$ .

The given circle  $|z| = \frac{3}{2}$  with centre at  $z = 0$  and radius  $= \frac{3}{2}$  encloses two poles  $z = 0$ , and  $z = 1$ .

$$\begin{aligned} \int_C \frac{4-3z}{z(z-1)(z-2)} dz &= \int_{C_1} \frac{4-3z}{z} dz + \int_{C_2} \frac{4-3z}{z-1} dz \\ &= 2\pi i \left[ \frac{4-3z}{(z-1)(z-2)} \right]_{z=0} + 2\pi i \left[ \frac{4-3z}{z(z-2)} \right]_{z=1} \\ &= 2\pi i \cdot \frac{4}{(-1)(-2)} + 2\pi i \cdot \frac{4-3}{1(1-2)} = 2\pi i(2-1) \\ &= 2\pi i \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 33.** Evaluate  $\int_c \frac{z^2 - 2z}{(z+1)^2 (z^2 + 4)} dz$

where  $c$  is the circle  $|z| = 10$ .

(U.P. III Semester, June 2009)

**Solution.** Here, we have

$$\int_c \frac{z^2 - 2z}{(z+1)^2 (z^2 + 4)} dz$$

The poles are determined by putting the denominator equal to zero.

i.e.;  $(z+1)^2 (z^2 + 4) = 0$

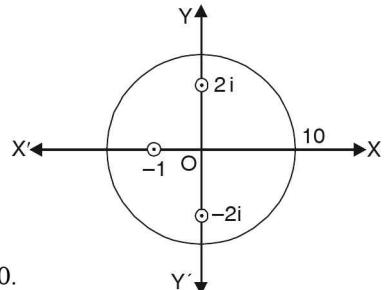

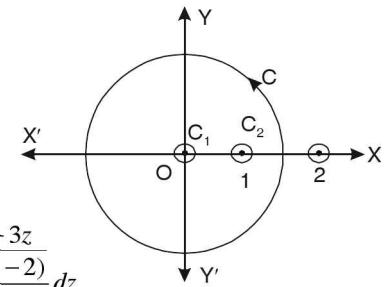

$\Rightarrow z = -1, -1$  and  $z = \pm 2i$

The circle  $|z| = 10$  with centre at origin and radius = 10.

encloses a pole at  $z = -1$  of second order and simple poles  $z = \pm 2i$

The given integral =  $I_1 + I_2 + I_3$

$$\begin{aligned} I_1 &= \int_{C_1} \frac{z^2 - 2z}{(z+1)^2 (z^2 + 4)} dz = \int_{C_1} \frac{\frac{z^2 - 2z}{z^2 + 4}}{(z+1)^2} dz = 2\pi i \left[ \frac{d}{dz} \frac{z^2 - 2z}{z^2 + 4} \right]_{z=-1} \\ &= 2\pi i \left[ \frac{(z^4 + 4)(2z-2) - (z^2 - 2z)2z}{(z^2 + 4)^2} \right]_{z=-1} = 2\pi i \left[ \frac{(1+4)(-2-2) - (1+2)2(-1)}{(1+4)^2} \right] \\ &= 2\pi i \left( -\frac{14}{25} \right) = -\frac{28\pi i}{25} \end{aligned}$$

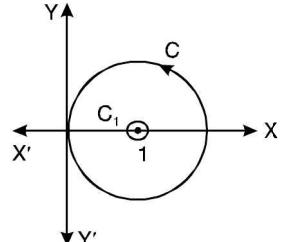

$$\begin{aligned}
 I_2 &= \int_{C_2} \frac{z^2 - 2z}{(z+1)^2(z+2i)} dz = 2\pi i \left[ \frac{z^2 - 2z}{(z+1)^2(z+2i)} \right]_{z=2i} = 2\pi i \left[ \frac{-4-4i}{(2i+1)^2(2i+2i)} \right] = 2\pi i \frac{(1+i)}{4+3i} \\
 I_3 &= \int_{C_3} \frac{z^2 - 2z}{(z+1)^2(z-2i)} dz = 2\pi i \left[ \frac{z^2 - 2z}{(z+1)^2(z-2i)} \right]_{z=-2i} = 2\pi i \left[ \frac{-4+4i}{(-2i+1)^2(-2i-2i)} \right] = 2\pi i \frac{(i-1)}{(3i-4)} \\
 \int_C \frac{z^2 - 2z}{(z+1)^2(z^2 + 4)} dz &= I_1 + I_2 + I_3 \\
 &= \frac{-28\pi i}{25} + 2\pi i \left( \frac{1+i}{4+3i} \right) + 2\pi i \left( \frac{i-1}{3i-4} \right) \\
 &= 2\pi i \left[ \frac{-14}{25} + \frac{1+i}{(4+3i)} + \frac{(i-1)}{(3i-4)} \right] \\
 &= 2\pi i \left[ \frac{-14}{25} + \frac{(1+i)(3i-4) + (i-1)(4+3i)}{(-9-16)} \right] \\
 &= \frac{2\pi i}{-25} [14 + (3i-4-3-4i) + (4i-3-4-3i)] \\
 &= 0
 \end{aligned}$$

Ans.

**Example 34.** Integrate  $\frac{1}{(z^3 - 1)^2}$  the counter clock-wise sense around the circle  $|z - 1| = 1$ .

**Solution.** Poles of the given function are found by putting denominator equal to zero.

$$\begin{aligned}
 (z^3 - 1)^2 &= 0, \\
 (z-1)^2(z^2 + z + 1)^2 &= 0 \\
 z = 1, 1, \quad z = \frac{-1 \pm \sqrt{1-4}}{2} &= \frac{-1 \pm \sqrt{-3}}{2} = -\frac{1}{2} \pm \frac{\sqrt{3}}{2}i
 \end{aligned}$$

The circle  $|z - 1| = 1$  with centre at  $z = 1$  and unit radius encloses a pole of order two at  $z = 1$ . By Cauchy Integral formula

$$\begin{aligned}
 \int_C \frac{1}{(z^3 - 1)^2} dz &= \int_{C_1} \frac{1}{(z-1)^2(z^2+z+1)^2} dz = \int_{C_1} \frac{(z^2+z+1)^2}{(z-1)^2} dz \\
 &= 2\pi i \left[ \frac{d}{dz} \frac{1}{(z^2+z+1)^2} \right]_{z=1} = 2\pi i \left[ \frac{-2(2z+1)}{(z^2+z+1)^3} \right]_{z=1} = 2\pi i \left[ \frac{-2(2+1)}{(1+1+1)^3} \right] = -\frac{4\pi i}{9} \quad \text{Ans.}
 \end{aligned}$$

**Example 35.** Find the value of  $\int_C \frac{3z^2 + z}{z^2 - 1} dz$ .

If  $C$  is circle  $|z - 1| = 1$  (R.G.P.V., Bhopal, III Semester, June 2007)

**Solution.** Poles of the integrand are given by putting the denominator equal to zero.

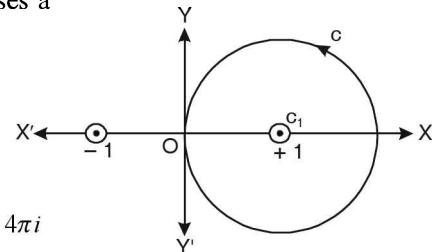

$$z^2 - 1 = 0, z^2 = 1, z = \pm 1$$

The circle with centre  $z = 1$  and radius unity encloses a simple pole at  $z = 1$ .

By Cauchy Integral formula

$$\begin{aligned} \int_C \frac{3z^2 + z}{z^2 - 1} dz &= \int_C \frac{3z^2 + z}{z - 1} dz \\ &= 2\pi i \left[ \frac{3z^2 + z}{z + 1} \right]_{z=1} = 2\pi i \left( \frac{3+1}{1+1} \right) = 4\pi i \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 36.** Evaluate  $\oint_C \frac{z^2 + 1}{z^2 - 1} dz$  where  $C$  is circle,

$$(i) |z| = \frac{3}{2} \quad (ii) |z-1| = 1, \quad (iii) |z| = \frac{1}{2}.$$

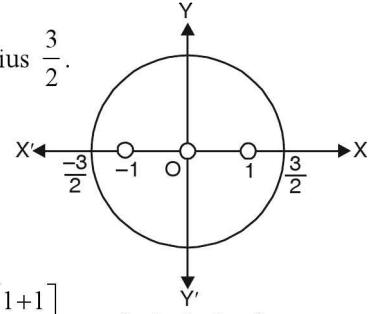

**Solution.** Poles of the integrand are given by putting the denominator equal to zero.

i.e.;  $z^2 - 1 = 0 \Rightarrow z = 1, -1$

(i)  $|z| = \frac{3}{2}$  is equation of circle  $C$  with centre  $O$  and radius  $\frac{3}{2}$ .

Both poles  $z = 1, -1$  lie inside  $C$ .

$$\begin{aligned} \oint_C \frac{z^2 + 1}{z^2 - 1} dz &= \oint_{C_1} \frac{\left( \frac{z^2 + 1}{z - 1} \right)}{z + 1} dz + \oint_{C_2} \frac{\left( \frac{z^2 + 1}{z + 1} \right)}{z - 1} dz \\ &= 2\pi i \left[ \frac{z^2 + 1}{z - 1} \right]_{z=-1} + 2\pi i \left[ \frac{z^2 + 1}{z + 1} \right]_{z=1} = 2\pi i \left[ \frac{1+1}{-1-1} \right] + 2\pi i \left[ \frac{1+1}{1+1} \right] = -2\pi i + 2\pi i = 0. \end{aligned}$$

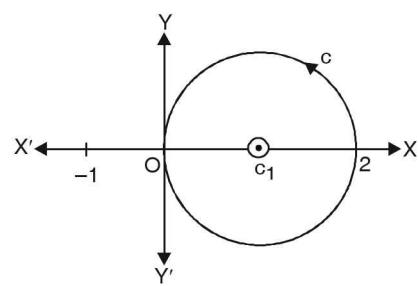

Which is the required value of the given integral.

**Ans.**

(ii)  $|z-1|=1$  is equation of circle  $C$  with centre 1 and radius 1 encloses only pole  $z=1$ .

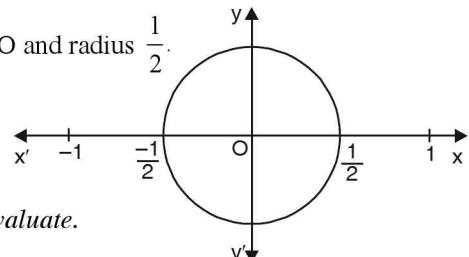

$$\begin{aligned} \oint_C \frac{z^2 + 1}{z^2 - 1} dz &= \oint_{C_1} \frac{\left( \frac{z^2 + 1}{z + 1} \right)}{z - 1} dz. \\ &= 2\pi i \left[ \frac{z^2 + 1}{z + 1} \right]_{z=1} \\ &= 2\pi i \left[ \frac{1+1}{1+1} \right] = 2\pi i \end{aligned}$$

(iii)  $|z| = \frac{1}{2}$  is equation of circle  $C$  with centre  $O$  and radius  $\frac{1}{2}$ .

There is no pole inside  $C$ .

Hence,  $\oint_C \frac{z^2 + 1}{z^2 - 1} dz = 0$ . **Ans.**

**Example 37.** Use Cauchy integral formula to evaluate.

$$\int_C \frac{\sin \pi z^2 + \cos \pi z^2}{(z-1)(z-2)} dz$$

where  $C$  is the circle  $|z| = 3$ .

(AMIETE, Dec. 2010, R.G.P.V., Bhopal, III Semester, June 2003)

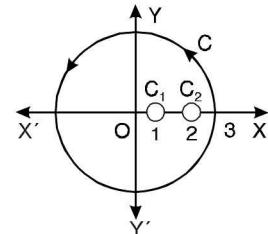

**Solution.**  $\oint_C \frac{\sin \pi z^2 + \cos \pi z^2}{(z-1)(z-2)} dz$

Poles of the integrand are given by putting the denominator equal to zero.

$$(z-1)(z-2) = 0 \Rightarrow z = 1, 2$$

The integrand has two poles at  $z = 1, 2$ .

The given circle  $|z| = 3$  with centre at  $z = 0$  and radius 3 encloses both the poles  $z = 1$ , and  $z = 2$ .

$$\begin{aligned} \oint_C \frac{\sin \pi z^2 + \cos \pi z^2}{(z-1)(z-2)} dz &= \int_{C_1} \frac{\sin \pi z^2 + \cos \pi z^2}{(z-2)} dz + \int_{C_2} \frac{\sin \pi z^2 + \cos \pi z^2}{(z-1)} dz \\ &= 2\pi i \left[ \frac{\sin \pi z^2 + \cos \pi z^2}{z-2} \right]_{z=1} + 2\pi i \left[ \frac{\sin \pi z^2 + \cos \pi z^2}{z-1} \right]_{z=2} \\ &= 2\pi i \left( \frac{\sin \pi + \cos \pi}{1-2} \right) + 2\pi i \left( \frac{\sin 4\pi + \cos 4\pi}{2-1} \right) \\ &= 2\pi i \left( \frac{-1}{-1} \right) + 2\pi i \left( \frac{1}{1} \right) = 4\pi i \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 38.** Evaluate the following complex integration using Cauchy's integral formula

$$\int_C \frac{3z^2 + z + 1}{(z^2 - 1)(z + 3)} dz$$

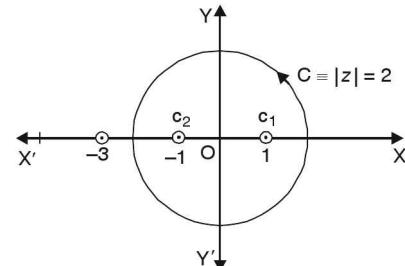

where  $C$  is the circle  $|z| = 2$ .

**Solution.** Poles of the integrand are given by putting the denominator equal to zero.

$$i.e., (z^2 - 1)(z + 3) = 0$$

$$\Rightarrow z = 1, -1, -3 \quad (\text{Simple poles})$$

The circle  $|z| = 2$  has centre at  $z = 0$  and radius 2. Clearly the poles  $z = 1$  and  $z = -1$  lie inside the given circle while the pole  $z = -3$  lies outside it.

$$\begin{aligned} \therefore \int_C \frac{3z^2 + z + 1}{(z^2 - 1)(z + 3)} dz &= \int_{C_1} \frac{3z^2 + z + 1}{(z+1)(z+3)} dz + \int_{C_2} \frac{3z^2 + z + 1}{(z-1)(z+3)} dz \\ &= 2\pi i \left[ \frac{3z^2 + z + 1}{(z+1)(z+3)} \right]_{z=1} + 2\pi i \left[ \frac{3z^2 + z + 1}{(z-1)(z+3)} \right]_{z=-1} \quad (\text{Using Cauchy's Integral formula}) \\ &= 2\pi i \left( \frac{5}{8} \right) + 2\pi i \left( -\frac{3}{4} \right) = 2\pi i \left( \frac{-1}{8} \right) = -\frac{\pi i}{4} \end{aligned}$$

Which is the required value of the given integral.

**Ans.**

**Example 39.** Using Cauchy's integral formula, evaluate  $\frac{1}{2\pi i} \int_C \frac{ze^z}{(z-a)^3} dz$ , where the point  $a$  lies within the closed curve  $C$ .

$$\begin{aligned} \text{Solution. } \int_C \frac{ze^z}{(z-a)^3} dz &= \frac{2\pi i}{2!} \left[ \frac{d^2}{dz^2} (ze^z) \right]_{z=a} = \frac{2\pi i}{2} \left[ \frac{d}{dz} \{(z+1)e^z\} \right]_{z=a} \end{aligned}$$

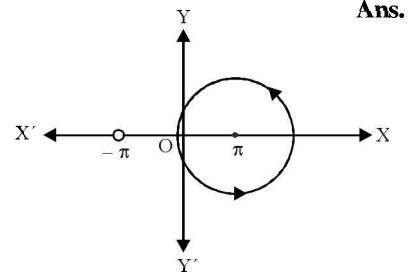

$$\begin{aligned}
 &= \frac{2\pi i}{2} \left[ (z+1)e^z + e^z \cdot 1 \right]_{\text{at } z=a} = \frac{2\pi i}{2} \left[ (z+2)e^z \right]_{\text{at } z=a} = 2\pi i \frac{(a+2)e^a}{2} = \pi i(a+2)e^a \\
 &\quad \frac{1}{2\pi i} \int_C \frac{ze^z}{(z-a)^3} dz = \frac{\pi i}{2\pi i} (a+2)e^a = \frac{1}{2}(a+2)e^a
 \end{aligned}$$

Which is the required value of the given integral.

**Example 40.** Derive Cauchy Integral Formula.

$$\begin{aligned}
 &\text{Evaluate } \int_C \frac{e^{3iz}}{(z+\pi)^3} dz \\
 &\text{where } C \text{ is the circle } |z-\pi| = 3.2
 \end{aligned}$$

**Solution.** Here,  $I = \int_C \frac{e^{3iz}}{(z+\pi)^3} dz$

**Ans.**

Where  $C$  is a circle  $\{|z-\pi| = 3.2\}$  with centre  $(\pi, 0)$  and radius 3.2.

Poles are determined by putting the denominator equal to zero.

$$(z+\pi)^3 = 0 \Rightarrow z = -\pi, -\pi, -\pi$$

There is a pole at  $z = -\pi$  of order 3. But there is no pole within  $C$ .

$$\text{By Cauchy Integral Formula } \int_C \frac{e^{3iz}}{(z+\pi)^3} dz = 0 \quad \text{Ans.}$$

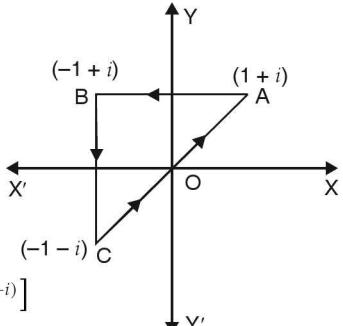

**Example 41.** Verify, Cauchy theorem by integrating  $e^{iz}$  along the boundary of the triangle with the vertices at the points  $1+i$ ,  $-1+i$  and  $-1-i$ .

**Solution.**

$$\begin{aligned}
 \int_{AB} e^{iz} dz &= \left( \frac{e^{iz}}{i} \right)_{1+i}^{-1+i} \\
 &= \frac{1}{i} [e^{i(-1+i)} - e^{i(1+i)}] \\
 &= \frac{1}{i} [e^{-i-1} - e^{i-1}] \quad \dots(1)
 \end{aligned}$$

$$\begin{aligned}
 \int_{BC} e^{iz} dz &= \left[ \frac{e^{iz}}{i} \right]_{-1+i}^{-1-i} = \frac{1}{i} [e^{i(-1-i)} - e^{i(-1+i)}] \\
 &= \frac{1}{i} [e^{-i+1} - e^{-i-1}] \quad \dots(2)
 \end{aligned}$$

$$\int_{CA} e^{iz} dz = \left[ \frac{e^{iz}}{i} \right]_{-1-i}^{1+i} = \frac{1}{i} [e^{i(1+i)} - e^{i(-1-i)}] = \frac{1}{i} [e^{i-1} - e^{-i+1}] \quad \dots(3)$$

On adding (1), (2) and (3), we get

$$\begin{aligned}
 \int_{AB} e^{iz} dz + \int_{BC} e^{iz} dz + \int_{CA} e^{iz} dz &= \frac{1}{i} [(e^{-i-1} - e^{i-1}) + (e^{-i+1} - e^{-i-1}) + (e^{i-1} - e^{-i+1})] \\
 \Rightarrow \int_{\Delta ABC} e^{iz} dz &= 0 \quad \dots(4)
 \end{aligned}$$

The given function has no pole. So there is no pole in  $\Delta ABC$ .

The given function  $e^{iz}$  is analytic inside and on the triangle ABC.

By Cauchy Theorem, we have  $\int_C e^{iz} dz = 0$  ... (5)

From (4) and (5) theorem is verified.

## EXERCISE 29.2

**Evaluate the following**

1.  $\int_C \frac{1}{z-a} dz$ , where  $c$  is a simple closed curve and the point  $z = a$  is
  - (i) outside  $c$ ; (ii) inside  $c$ .

**Ans.** (i) 0 (ii)  $2\pi i$
2.  $\int_c \frac{e^z}{z-1} dz$ , where  $c$  is the circle  $|z| = 2$ . **Ans.**  $2\pi ie$
3.  $\int_c \frac{\cos \pi z}{z-1} dz$ , where  $c$  is the circle  $|z| = 3$ . **Ans.**  $-2\pi i$
4.  $\int_c \frac{\cos \pi z^2}{(z-1)(z-2)} dz$ , where  $c$  is the circle  $|z| = 3$ . **Ans.**  $4\pi i$
5.  $\int_c \frac{e^{-z}}{(z+2)^5} dz$ , where  $c$  is the circle  $|z| = 3$ . **Ans.**  $\frac{\pi ie^2}{12}$
6.  $\int_c \frac{e^{2z}}{(z+1)^4} dz$ , where  $c$  is the circle  $|z| = 2$ . **Ans.**  $\frac{8\pi}{3}ie^{-2}$
7.  $\int_c \frac{2z^2+z}{z^2-1} dz$  where  $c$  is the circle  $|z-1| = 1$  **Ans.**  $3\pi i$
8.  $\int_c \frac{e^z}{z^2(z+1)^3} dz$ ,  $C : |z| = 2$ . (AMIETE, June 2009) **Ans.**  $2\pi i \left( \frac{11}{e} - 2 \right)$

**Choose the correct alternative:**

9. The value of the integral  $\int_c \frac{z^2+1}{(z+1)(z+2)} dz$ , where  $c$  is  $|z| = \frac{3}{2}$  is
  - (i)  $\pi i$
  - (ii) 0
  - (iii)  $2\pi i$
  - (iv)  $4\pi i$

**Ans.** (iv)  
(AMIETE, June 2010)
10. Cauchy's Integral formula states that if  $f(z)$  is analytic within  $a$  and on a closed curve  $C$  and if  $a$  is any point within  $C$  then  $f(a) = :$  (R.G.P.V., Bhopal, III Semester, June 2007)
- (i)  $\frac{1}{2\pi i} \oint \frac{f(z)dz}{z-a}$
- (ii)  $\frac{1}{2\pi i} \oint f(z)dz$
- (iii)  $\frac{1}{2\pi i} \oint \frac{dz}{z-a}$
- (iv) none of these. **Ans.** (i)
11. The value of  $\int_c \frac{z^2-z+1}{z-1} dz$ ,  $C$  being  $|z| = \frac{1}{2}$  is :
  - (i)  $2\pi i$
  - (ii)  $\frac{1}{2\pi i}$
  - (iii) 0
  - (iv)  $\pi i$  (R.G.P.V., Bhopal, III Sem., Dec. 2006) **Ans.** (iii)
12. If  $f(z) = \frac{z^2}{(z-1)^2(z+2)}$ , then Res.  $f(-2)$  is :
  - (i)  $\frac{5}{9}$
  - (ii)  $\frac{4}{9}$
  - (iii)  $\frac{1}{9}$
  - (iv)  $\frac{3}{9}$  (RGPV, Bhopal, III Sems, Dec. 2006) **Ans.** (ii)
13. Let  $f(z) = \frac{1}{(z-2)^4(z+3)^6}$ , then  $z=2$  and  $z=-3$  are the poles of order :
  - (i) 6 and 4
  - (ii) 2 and 3
  - (iii) 3 and 4
  - (iv) 4 and 6

(RGPV, Bhopal, III Sem., June 2006) **Ans.** (iv)
14. The value of the integral  $\int_c \frac{z+1}{z^3-2z^2} dz$ , where  $c$  is the circle  $|z| = 1$  is equal to.
  - (i)  $2\pi i$
  - (ii)  $-\frac{2}{3}\pi i$
  - (iii) zero
  - (iv)  $-\frac{3}{2}\pi i$

(AMIETE, Dec. 2010) **Ans.** (iv)

## **TAYLOR'S AND LAURENT'S SERIES**

---

---

### **30.1 INTRODUCTION**

An analytic function within a circle can be expanded by Taylor's series.

If a function which is not analytic within a circle is expanded by Laurent's series.

### **30.2 CONVERGENCE OF A SERIES OF COMPLEX TERMS**

Let  $(u_1 + iv_1) + (u_2 + iv_2) + (u_3 + iv_3) + \dots + (u_n + iv_n) + \dots$  ... (1)

be an infinite series of complex terms:  $u_1, u_2, \dots, v_1, v_2, \dots$  being real numbers.

(a) If the series  $\sum u_n$  and  $\sum v_n$  converge to the sums  $U$  and  $V$  then series (1) is said to converge to the sum  $U + iV$ .

(b) If (1) is a convergent series, then

$$\lim_{n \rightarrow \infty} (u_n + iv_n) = 0$$

(c) The series (1) is said to be **absolutely convergent** if the series

$$|u_1 + iv_1| + |u_2 + iv_2| + |u_3 + iv_3| + \dots + |u_n + iv_n| + \dots$$

is convergent. Since  $|u_n|$  and  $|v_n|$  are both less than  $|u_n + iv_n|$ .

(d) Let the series

$$a_1(z) + a_2(z) + a_3(z) + \dots + a_n(z) + \dots \quad \dots (2)$$

converge to the sum  $S(z)$  and  $S_n(z)$  be the sum of its first  $n$  terms.

The series (2) is said to be absolutely convergent in region  $R$ , if corresponding to any positive number  $\epsilon$ , there exists a positive number  $N$ .

$$|S(z) - S_n(z)| < \epsilon \text{ for } n > N$$

(e) Weirstrass's, M-test holds good for series of complex terms also.

Series (2) is uniformly convergent in a region  $R$  if there is a convergent series  $\sum M_n$ . Such

that  $|a_n(z)| \leq M_n$

A uniformly convergent series can be integrated term by term.

### **30.3 POWER SERIES**

A series in powers of  $(z - z_0)$  is called power series.

$$\sum_{n=0}^{\infty} a_n (z - z_0)^n = a_0 + a_1(z - z_0) + a_2(z - z_0)^2 + \dots + a_n(z - z_0)^n + \dots \dots \dots (1)$$

Here  $a_0, a_1, a_2, \dots, a_n, \dots$  are known as the coefficient of the series.

Here  $z$  is a complex variable and  $z_0$  is called the centre of the series.

(1) is also called the power series about the point  $z_0$

$$\sum_{n=0}^{\infty} a_n z^n = a_0 + a_1 z + a_2 z^2 + \dots + a_n z^n + \dots$$

Here the centre of the series is zero.

### 30.4 REGION OF CONVERGENCE

The region of convergence is the set of all points  $z$  for which the series converges.

There are three distinct possibilities for a convergent series.

(1) The series converges only at the point  $z = z_0$

(2) The series converges for all the points in the whole plane.

(3) The series converges everywhere inside a circular plane  $|z - z_0| < R$ , where  $R$  is the radius of convergence and diverges everywhere outside the circle/circular ring.

### 30.5 RADIUS OF CONVERGENCE OF POWER SERIES

Consider the power series  $\sum a_n z^n$ .

By Cauchy theorem on limits, radius of convergence  $R$  is given by

$$(i) \frac{1}{R} = \lim_{n \rightarrow \infty} |a_n|^{1/n} \quad (ii) \frac{1}{R} = \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right|$$

**Example 1.** Find the radius of convergence of the power series

$$f(z) = \sum_{n=0}^{\infty} \frac{z^n}{n!}$$

**Solution.** Here,  $a_n = \frac{1}{n!} \Rightarrow a_{n+1} = \frac{1}{(n+1)!}$

Radius of convergence is given by

$$\frac{1}{R} = \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0$$

$$R = \infty$$

Hence, the radius of convergence of the given power series is  $\infty$ .

**Ans.**

**Example 2.** Find the radius of convergence of the power series

$$f(z) = \sum_{n=0}^{\infty} \frac{z^n}{2^n + 3}$$

**Solution.** Here,

$$a_n = \frac{1}{2^n + 3} \Rightarrow a_{n+1} = \frac{1}{2^{n+1} + 3}$$

Radius of convergence is given by

$$\frac{1}{R} = \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{2^n + 3}{2^{n+1} + 3} = \lim_{n \rightarrow \infty} \frac{1 + \frac{3}{2^n}}{2 + \frac{3}{2^n}} = \frac{1}{2}$$

$$R = 2$$

Hence, the radius of convergence of the given power series is 2.

**Ans.**

**Example 3.** Find the radius of convergence of the power series:

$$f(z) = \sum_{n=0}^{\infty} \frac{z^n}{n^n}$$

**Solution.** Here,

$$a_n = \frac{1}{n^n}, \quad a_{n+1} = \frac{1}{(n+1)^{n+1}}$$

Radius of convergence is given by

$$\begin{aligned} \frac{1}{R} &= \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{n^n}{(n+1)^{n+1}} \\ &= \lim_{n \rightarrow \infty} \frac{n^n}{(n+1)^n (n+1)} = \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{1}{n}\right)^n (n+1)} = 0 \end{aligned}$$

$$\Rightarrow R = \infty$$

Hence, the radius of convergence of the given power series is  $\infty$ . Ans.

**Example 4.** Find the radius of convergence of the power series:

$$f(z) = \sum_{n=0}^{\infty} \frac{n!}{n^n} z^n$$

**Solution.** Here,  $a_n = \frac{n!}{n^n}$

$$\therefore a_{n+1} = \frac{(n+1)!}{(n+1)^{n+1}}$$

$$\text{Now, } \frac{a_{n+1}}{a_n} = \frac{(n+1)!}{(n+1)^{n+1}} \cdot \frac{n^n}{n!} = \frac{n!}{(n+1)^n} \cdot \frac{n^n}{n!} = \frac{n^n}{(n+1)^n} = \left(\frac{n}{n+1}\right)^n = \frac{1}{\left(1 + \frac{1}{n}\right)^n}$$

Radius of convergence is given by

$$\frac{1}{R} = \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{1}{n}\right)^n} = \frac{1}{e}$$

$$\Rightarrow R = e.$$

Hence, the radius of convergence of the given power series is  $e$ . Ans.

### EXERCISE 30.1

Find the radius of convergence of following power series:

$$1. \sum_{n=1}^{\infty} \frac{z^n}{n^p}$$

Ans. 1

$$2. \sum_{n=0}^{\infty} \frac{z^n}{3^{n+1}}$$

Ans. 3

$$3. \sum_{n=0}^{\infty} \left(1 + \frac{1}{n}\right)^{n^2} z^n$$

Ans.  $\frac{1}{e}$

$$4. \sum_{m=0}^{\infty} (5+12i)^m z^m$$

Ans. 13

$$5. \sum_{n=0}^{\infty} \frac{2n+3}{(2n+5)(n+5)} z^n$$

Ans. 1

### 30.6 METHOD OF EXPANSION OF A FUNCTION

- (1) Taylor's series      (2) Binomial series      (3) Exponential series

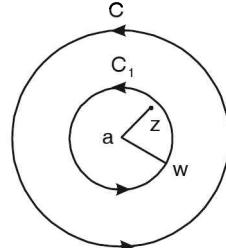

### 30.7 TAYLOR'S THEOREM

If a function  $f(z)$  is analytic at all points inside a circle  $C$ , with its centre at the point  $a$  and radius  $R$ , then at each point  $z$  inside  $C$ .

$$f(z) = f(a) + f'(a)(z-a) + \frac{f''(a)}{2!}(z-a)^2 + \dots + \frac{f^n(a)}{n!}(z-a)^n + \dots$$

**Proof.** Take any point  $z$  inside  $C$ . Draw a circle  $C_1$  with centre  $a$ , enclosing the point  $z$ . Let  $w$  be a point on circle  $C_1$ .

$$\begin{aligned}\frac{1}{w-z} &= \frac{1}{w-a+a-z} = \frac{1}{w-a-(z-a)} \\ &= \frac{1}{(w-a)} \frac{1}{\left(1 - \frac{z-a}{w-a}\right)} = \frac{1}{w-a} \left(1 - \frac{z-a}{w-a}\right)^{-1}\end{aligned}$$

Apply Binomial theorem

$$\begin{aligned}\frac{1}{w-z} &= \frac{1}{w-a} \left[ 1 + \frac{z-a}{w-a} + \left( \frac{z-a}{w-a} \right)^2 + \dots + \left( \frac{z-a}{w-a} \right)^n + \dots \right] \\ \Rightarrow \quad \frac{1}{w-z} &= \frac{1}{w-a} + \frac{z-a}{(w-a)^2} + \frac{(z-a)^2}{(w-a)^3} + \dots + \frac{(z-a)^n}{(w-a)^{n+1}} + \dots \quad \dots (1)\end{aligned}$$

$$\text{As } |z-a| < |w-a| \quad \Rightarrow \quad \frac{|z-a|}{|w-a|} < 1,$$

So the series converges uniformly. Hence the series is integrable.

Multiply (1) by  $f(w)$ .

$$\frac{f(w)}{w-z} = \frac{f(w)}{w-a} + (z-a) \frac{f(w)}{(w-a)^2} + (z-a)^2 \frac{f(w)}{(w-a)^3} + \dots + (z-a)^n \frac{f(w)}{(w-a)^{n+1}} + \dots$$

On integrating w.r.t. ' $w$ ', we get

$$\begin{aligned}\int_{c_1} \frac{f(w)}{w-z} dw &= \int_{c_1} \frac{f(w)}{w-a} dw + (z-a) \int_{c_1} \frac{f(w)}{(w-a)^2} dw + (z-a)^2 \int_{c_1} \frac{f(w)}{(w-a)^3} dw + \\ &\dots + (z-a)^n \int_{c_1} \frac{f(w)}{(w-a)^{n+1}} dw + \dots \quad \dots (2)\end{aligned}$$

We know that

$$\begin{aligned}\int_{c_1} \frac{f(w)}{w-z} dz &= 2\pi i f(z) \quad \text{and} \quad \int_{c_1} \frac{f(w)}{w-a} dw = 2\pi i f(a) \\ \int_{c_1} \frac{f(w)}{(w-a)^2} dw &= 2\pi i f'(a) \quad \text{and so on.}\end{aligned}$$

Substituting these values in (2), we get

Taylor's series as given below

$$f(z) = f(a) + f'(a)(z-a) + \frac{f''(a)}{2!}(z-a)^2 + \dots + \frac{f^n(a)(z-a)^n}{n!} + \dots \quad \dots (3) \quad \text{Proved.}$$

**Corollary 1.** Putting  $z = a + h$  in (3), we get

$$f(a+h) = f(a) + hf'(a) + \frac{h^2}{2!} f''(a) + \dots + \frac{h^n}{n!} f^n(a) + \dots$$

**Corollary 2.** If  $a = 0$ , the series (3) becomes

$$f(z) = f(0) + z f'(0) + \frac{z^2}{2!} f''(0) + \dots + \frac{z^n}{n!} f^n(0) + \dots$$

This series is called **Maclaurin series**.

**Example 5.** Expand  $e^z$  about  $a$ .

**Solution.** Here, we have

$$f(z) = e^z \quad \Rightarrow \quad f(a) = e^a$$

$$\begin{aligned} \Rightarrow f'(z) &= e^z & \Rightarrow f'(a) &= e^a \\ f''(z) &= e^z & \Rightarrow f''(a) &= e^a \\ \dots & & & \\ \dots & f^n(z) = e^z & \Rightarrow f^n(a) &= e^a \end{aligned}$$

By Taylor's series of  $f(z)$  is

$$\begin{aligned} f(z) &= f(a) + (z-a)f'(a) + \frac{(z-a)^2}{2!}f''(a) + \dots \\ e^z &= e^a + \frac{(z-a)}{1!}e^a + \frac{(z-a)^2}{2!}e^a + \dots \quad \text{Ans.} \end{aligned}$$

**Example 6.** Expand the function

$$f(z) = \frac{1}{z}$$

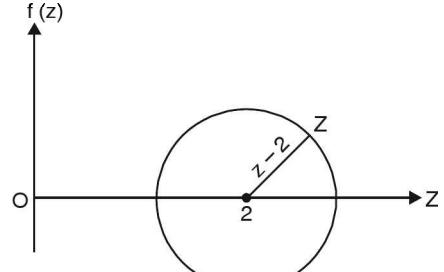

about  $z = 2$  in Taylor's series. Obtain its radius of convergence.

**Solution.** Here, we have,

$$\begin{aligned} f(z) &= \frac{1}{z} \\ \Rightarrow f'(z) &= -\frac{1}{z^2} \\ \Rightarrow f''(z) &= \frac{2}{z^3} \\ \dots & \\ f^n(z) &= (-1)^n \frac{n!}{z^{n+1}} \end{aligned}$$

By Taylor's series

$$\begin{aligned} f(z) &= f(2) + (z-2)f'(2) + \frac{(z-2)^2}{2!}f''(2) + \dots + \frac{(z-2)^n}{n!}f^n(2) + \dots \\ &= \frac{1}{2} + (z-2)\left(-\frac{1}{2^2}\right) + \frac{(z-2)^2}{2!}\left(\frac{2}{2^3}\right) + \dots + \frac{(z-2)^n}{n!}(-1)^n \frac{n!}{2^{n+1}} + \dots \\ &= \frac{1}{2} - \frac{1}{4}(z-2) + \frac{1}{8}(z-2)^2 - \dots + \frac{(-1)^n}{2^{n+1}}(z-2)^n + \dots \quad \text{Ans.} \end{aligned}$$

**Alternative.**

We can expand the given function by Binomial expansion.

$$\begin{aligned} \frac{1}{z} &= \frac{1}{2+z-2} = \frac{1}{2} \left[ \frac{1}{1+\frac{z-2}{2}} \right] = \frac{1}{2} \left[ \left( 1 + \frac{z-2}{2} \right)^{-1} \right] \quad \left| \frac{z-2}{2} \right| < 1 \\ &= \frac{1}{2} \left[ 1 - \frac{z-2}{2} + \frac{(-1)(-2)}{2!} \left( \frac{z-2}{2} \right)^2 + \frac{(-1)(-2)(-3)}{3!} \left( \frac{z-2}{2} \right)^3 + \dots \right] \\ &= \frac{1}{2} - \frac{z-2}{4} + \frac{1}{8}(z-2)^2 - \frac{1}{16}(z-2)^3 + \dots \quad \text{Ans.} \end{aligned}$$

**Radius of convergence**  $\frac{1}{R} = \lim_{n \rightarrow \infty} \left( \frac{a^{n+1}}{a^n} \right) = \lim_{n \rightarrow \infty} \left| \frac{(-1)^{n+1}}{2^{n+2}} \cdot \frac{2^{n+1}}{(-1)^n} \right| = \frac{1}{2}$

$$\Rightarrow R = 2 \quad \text{Ans.}$$

**Example 7.** Expand  $f(z) = \cosh z$  about  $\pi i$ .

**Solution.** Here, we have

$$\begin{aligned} f(z) = \cosh z &= \frac{e^z + e^{-z}}{2} \Rightarrow f(\pi i) = \cosh(\pi i) \\ f'(z) = \sinh z &\Rightarrow f'(\pi i) = \sinh(\pi i) \\ f''(z) = \cosh z &\Rightarrow f''(\pi i) = \cosh(\pi i) \\ f'''(z) = \sinh z &\Rightarrow f'''(\pi i) = \sinh(\pi i) \end{aligned}$$

By Taylor's series

$$\begin{aligned} f(z) &= f(\pi i) + (z - \pi i)f'(\pi i) + \frac{(z - \pi i)^2}{2!}f''(\pi i) + \frac{(z - \pi i)^3}{3!}f'''(\pi i) + \dots \\ &= \cosh \pi i + (z - \pi i)\sinh \pi i + \frac{(z - \pi i)^2}{2!}\cosh(\pi i) \\ &\quad + \frac{(z - \pi i)^3}{3!}\sinh(\pi i) + \dots \quad \text{Ans.} \end{aligned}$$

**Example 8.** Expand  $f(z) = \frac{a}{bz+c}$  about  $z_0$ .

**Solution.** Here, we have

$$\begin{aligned} f(z) &= \frac{a}{bz+c} = \frac{a}{bz - bz_0 + bz_0 + c} = \frac{a}{b(z - z_0) + bz_0 + c} \\ &= \frac{a}{(bz_0 + c) \left[ 1 + \left( \frac{b(z - z_0)}{bz_0 + c} \right) \right]} = \frac{a}{bz_0 + c} \left[ 1 + \frac{b(z - z_0)}{bz_0 + c} \right]^{-1} \quad (\text{Binomial series}) \\ &= \frac{a}{bz_0 + c} \left[ 1 - \frac{b(z - z_0)}{bz_0 + c} + \frac{(-1)(-2)}{2!} \left( \frac{b(z - z_0)}{bz_0 + c} \right)^2 + \right. \\ &\quad \left. \frac{(-1)(-2)(-3)}{3!} \left( \frac{b(z - z_0)}{bz_0 + c} \right)^3 + \dots \right] \\ &= \frac{a}{bz_0 + c} \left[ 1 - \frac{b(z - z_0)}{bz_0 + c} + \left( \frac{b(z - z_0)}{bz_0 + c} \right)^2 - \left( \frac{b(z - z_0)}{bz_0 + c} \right)^3 + \dots \right] \\ &= \frac{a}{bz_0 + c} \left[ 1 - \frac{b}{bz_0 + c}(z - z_0) + \left( \frac{b}{bz_0 + c} \right)^2 (z - z_0)^2 - \left( \frac{b}{bz_0 + c} \right)^3 (z - z_0)^3 + \dots \right] \end{aligned}$$

**Radius of curvature**

$$\begin{aligned} \frac{1}{R} &= \lim_{n \rightarrow \infty} \left( \frac{a^{n+1}}{a^n} \right) = \lim_{n \rightarrow \infty} \frac{\left( \frac{b}{bz_0 + c} \right)^{n+1}}{\left( \frac{b}{bz_0 + c} \right)^n} = \lim_{n \rightarrow \infty} \frac{b}{bz_0 + c} = \frac{b}{bz_0 + c} \\ \Rightarrow R &= \frac{bz_0 + c}{b} = z_0 + \frac{c}{b} \quad \text{Ans.} \end{aligned}$$

**Example 9.** Show that :

$$\log z = (z - 1) - \frac{(z - 1)^2}{2} + \frac{(z - 1)^3}{3} + \dots$$

**Solution.** Let  $f(z) = \log(z) \Rightarrow f(1) = \log 1 = 0$

$$\begin{aligned}
 f'(z) &= \frac{1}{z}, & f'(1) &= \frac{1}{1} = 1 \\
 f''(z) &= -\frac{1}{z^2}, & f''(1) &= -1 \\
 f'''(z) &= \frac{2 \times 1}{z^3}, & f'''(1) &= 2 \\
 f^{iv}(z) &= -3 \times 2 \times 1 \times \frac{1}{z^4}, & f^{iv}(1) &= -3!
 \end{aligned}$$

By Taylor series

$$\begin{aligned}
 f(z) &= f(a) + f'(a) \cdot (z-a) + \frac{f''(a)(z-a)^2}{2!} + \frac{f'''(a)}{3!}(z-a)^3 + \dots \\
 f(z) &= \log z = \log(1 + \overline{z-1})
 \end{aligned}$$

On substituting the values of  $f(1)$ ,  $f'(1)$ ,  $f''(1)$  etc., we get

$$\begin{aligned}
 \log z &= 0 + 1(z-1) - \frac{1}{2!}(z-1)^2 + \frac{2}{3!}(z-1)^3 - \frac{3!}{4!}(z-1)^4 + \dots \\
 \Rightarrow \log z &= (z-1) - \frac{1}{2}(z-1)^2 + \frac{1}{3}(z-1)^3 - \frac{1}{4}(z-1)^4 + \dots \quad \text{Proved.}
 \end{aligned}$$

**Example 10.** Expand  $\frac{1}{z^2 - 3z + 2}$  in the region

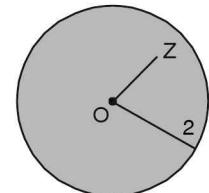

(a)  $|z| < 1$       (b)  $|z| > 2$ .      (R.G.P.V., Bhopal, III Semester, Dec. 2005)

$$\text{Solution. Here, } f(z) = \frac{1}{z^2 - 3z + 2} = \frac{1}{(z-1)(z-2)} = \frac{1}{z-2} - \frac{1}{z-1}$$

(a) If  $|z| < 1$

Taking common, bigger term out of  $|z|$  and 2, here 2 is bigger than  $|z|$ . So we take 2 common.

$$\begin{aligned}
 f(z) &= \frac{1}{-2\left(1-\frac{z}{2}\right)} + \frac{1}{1-z} \\
 &= -\frac{1}{2}\left(1-\frac{z}{2}\right)^{-1} + (1-z)^{-1} \\
 &= -\frac{1}{2}\left(1+\frac{z}{2}+\frac{z^2}{4}+\frac{z^3}{8}+\dots\right) + (1+z+z^2+z^3+\dots) \\
 &= \frac{1}{2} + \frac{3z}{4} + \frac{7}{8}z^2 + \frac{15}{16}z^3 + \dots
 \end{aligned}$$

[By Binomial theorem]

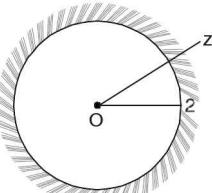

Which is the required expansion.

(b) If  $|z| > 2$

$$\text{We have, } f(z) = \frac{1}{z-2} - \frac{1}{z-1}$$

Taking common, bigger term out of  $|z|$  and 2, here  $z$  is bigger than 2. So we take  $|z|$  common.

$$\begin{aligned}
 f(z) &= \frac{1}{z\left(1-\frac{2}{z}\right)} - \frac{1}{z\left(1-\frac{1}{z}\right)} = \frac{1}{z}\left(1-\frac{2}{z}\right)^{-1} - \frac{1}{z}\left(1-\frac{1}{z}\right)^{-1} \\
 &= \frac{1}{z}\left(1+\frac{2}{z}+\frac{4}{z^2}+\frac{8}{z^3}+\dots\right) - \frac{1}{z}\left(1+\frac{1}{z}+\frac{1}{z^2}+\frac{1}{z^3}+\dots\right) \quad \text{[By Binomial theorem]} \\
 &= \frac{1}{z^2} + 3\frac{1}{z^3} + 7\frac{1}{z^4} + \dots
 \end{aligned}$$

Which is the required expansion.

**Ans.**

**Example 11.** Show that when  $|z + 1| < 1$ ,

$$z^{-2} = 1 + \sum_{n=1}^{\infty} (n+1)(z+1)^n.$$

**Solution.**  $f(z) = z^{-2} = \frac{1}{z^2} = \frac{1}{[(z+1)-1]^2}$

Taking common, bigger term out of 1 and  $|z + 1|$ , here,  $1 > |z + 1|$ .  
So, we take 1 common.

$$\begin{aligned} f(z) &= \frac{1}{[1-(z+1)]^2} = [1-(z+1)]^{-2} = 1 + 2(z+1) + 3(z+1)^2 + 4(z+1)^3 + \dots \\ &= 1 + \sum_{n=1}^{\infty} (n+1)(z+1)^n \end{aligned}$$

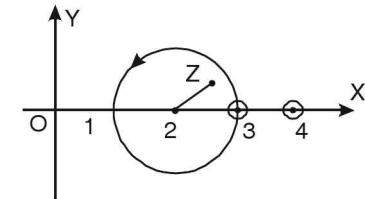

**Proved.**

**Example 12.** Find the first four terms of the Taylor's series expansion of the complex variable function

$$f(z) = \frac{z+1}{(z-3)(z-4)}$$

about  $z = 2$ . Find the region of convergence.

**Solution.**  $f(z) = \frac{z+1}{(z-3)(z-4)}$

If centre of a circle is at  $z = 2$ , then the distances of the singularities  $z = 3$  and  $z = 4$  from the centre are 1 and 2.

Hence if a circle is drawn with centre  $z = 2$  and radius 1, then within the circle  $|z - 2| = 1$ , the given function  $f(z)$  is analytic, hence it can be expanded in a Taylor's series within the circle  $|z - 2| = 1$ , which is therefore the circle of convergence.

$$\begin{aligned} f(z) &= \frac{z+1}{(z-3)(z-4)} = \frac{-4}{z-3} + \frac{5}{z-4} \quad (\text{By Partial fraction method}) \\ &= \frac{-4}{(z-2)-1} + \frac{5}{(z-2)-2} = 4[1-(z-2)]^{-1} - \frac{5}{2}\left[1-\frac{z-2}{2}\right]^{-1} \quad [|z-2| < 1] \\ &= 4[1+(z-2)+(z-2)^2+(z-2)^3+\dots] - \frac{5}{2}\left[1+\frac{z-2}{2}+\frac{(z-2)^2}{4}+\frac{(z-2)^3}{8}+\dots\right] \\ &= \left(4-\frac{5}{2}\right) + \left(4-\frac{5}{4}\right)(z-2) + \left(4-\frac{5}{8}\right)(z-2)^2 + \left(4-\frac{5}{16}\right)(z-2)^3\dots \\ &= \frac{3}{2} + \frac{11}{4}(z-2) + \frac{27}{8}(z-2)^2 + \frac{59}{16}(z-2)^3 + \dots \quad \text{Ans.} \end{aligned}$$

**Alternative method.** In obtaining the Taylor series we evaluate the coefficients by contour integration.

$$f(z) = \frac{z+1}{(z-3)(z-4)}, \quad f(2) = \frac{2+1}{(2-3)(2-4)} = \frac{3}{2}.$$

To make the differentiation easier let us convert the given fraction into partial fractions

$$f(z) = \frac{-4}{z-3} + \frac{5}{z-4}$$

$$f'(z) = \frac{4}{(z-3)^2} - \frac{5}{(z-4)^2}, \quad f'(2) = \frac{4}{(2-3)^2} - \frac{5}{(2-4)^2} = \frac{11}{4}$$

$$f''(z) = \frac{-8}{(z-3)^3} + \frac{10}{(z-4)^3},$$

$$f''(2) = \frac{-8}{(2-3)^3} + \frac{10}{(2-4)^3} = \frac{27}{4}$$

$$f'''(z) = \frac{24}{(z-3)^4} - \frac{30}{(z-4)^4}.$$

$$f'''(2) = \frac{24}{(2-3)^4} - \frac{30}{(2-4)^4} = \frac{177}{8}$$

Taylor series is  $f(z) = f(a) + (z-a)f'(a) + \frac{(z-a)^2}{2!}f''(a) + \frac{(z-a)^3}{3!}f'''(a) + \dots$

$$\begin{aligned} \frac{z+1}{(z-3)(z-4)} &= \frac{3}{2} + (z-2)\frac{11}{4} + \frac{(z-2)^2}{2!}\left(\frac{27}{4}\right) + \frac{(z-2)^3}{3!}\frac{177}{8} + \dots \\ &= \frac{3}{2} + (z-2)\frac{11}{4} + (z-2)^2 \cdot \frac{27}{8} + (z-2)^3 \cdot \frac{59}{16} + \dots \end{aligned}$$

Ans.

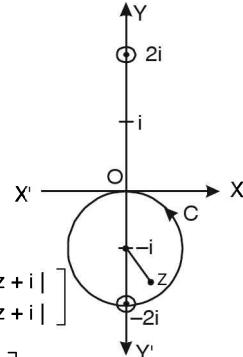

**Example 13.** Find the first three terms of the Taylor series expansion of  $f(z) = \frac{1}{z^2 + 4}$  about  $z = -i$ . Find the region of convergence.

**Solution.**  $f(z) = \frac{1}{z^2 + 4}$

Poles are given by  $z^2 + 4 = 0, \Rightarrow z^2 = -4, \Rightarrow z = \pm 2i$

If the centre of a circle is  $z = -i$ , then the distances of the singularities  $z = 2i$  and  $z = -2i$  from the centre are 3 and 1. Hence if a circle of radius 1 is drawn with centre at  $z = -i$ , then within the circle  $|z + i| = 1$ , the given function  $f(z)$  is analytic. Thus the function can be expanded in Taylor series within the circle  $|z + i| = 1$ , which is therefore the circle of convergence.

$$\begin{aligned} f(z) &= \frac{1}{z^2 + 4} = \frac{1}{(z+2i)(z-2i)} = \frac{1}{4i} \left[ \frac{1}{z-2i} - \frac{1}{z+2i} \right] \\ &= \frac{1}{4i} \left[ \frac{1}{(z+i)-3i} - \frac{1}{(z+i)+i} \right] \\ &= \frac{1}{4i} \left[ \frac{1}{3i} \frac{1}{1-\frac{z+i}{3i}} - \frac{1}{i} \frac{1}{1+\frac{z+i}{i}} \right] = \frac{1}{4} \left[ \frac{1}{3} \frac{1}{1-\frac{z+i}{3i}} + \frac{1}{i} \frac{1}{1+\frac{z+i}{i}} \right] \left[ \begin{matrix} 3 > |z+i| \\ 1 > |z+i| \end{matrix} \right] \\ &= \frac{1}{4} \left[ \frac{1}{3} \frac{1}{1+\frac{i}{3}(z+i)} + \frac{1}{1-i(z+i)} \right] = \frac{1}{4} \left[ \frac{1}{3} \left\{ 1 + \frac{i}{3}(z+i) \right\}^{-1} + \left\{ 1 - i(z+i) \right\}^{-1} \right] \\ &= \frac{1}{4} \left[ \frac{1}{3} \left\{ 1 - \frac{i}{3}(z+i) + \frac{(-1)(-2)}{2!} \left( \frac{i}{3} \right)^2 (z+i)^2 + \frac{(-1)(-2)(-3)}{3!} \left( \frac{i}{3} \right)^3 (z+i)^3 + \dots \right\} \right. \\ &\quad \left. + \left\{ 1 + i(z+i) + \frac{(-1)(-2)}{2!} \cdot (-i)^2 (z+i)^2 + \frac{(-1)(-2)(-3)}{3!} (-i)^3 (z+i)^3 + \dots \right\} \right] \\ &= \frac{1}{4} \left[ \frac{1}{3} - \frac{i}{9}(z+i) - \frac{1}{27}(z+i)^2 + \frac{i}{81}(z+i)^3 + \dots + 1 + i(z+i) - (z+i)^2 - i(z+i)^3 + \dots \right] \\ &= \frac{1}{4} \left[ \frac{4}{3} + \frac{8i}{9}(z+i) - \frac{28}{27}(z+i)^2 - \frac{80}{81}i(z+i)^3 + \dots \right] \\ &= \frac{1}{3} + \frac{2i}{9}(z+i) - \frac{7}{27}(z+i)^2 - \frac{20}{81}i(z+i)^3 + \dots \end{aligned}$$

Ans.

**Alternative method**

$$f(z) = \frac{1}{z^2 + 4}$$

By Taylor expansion  $f(z) = f(a) + (z-a)f'(a) + \frac{(z-a)^2}{2!}f''(a) + \frac{(z-a)^3}{3!}f'''(a) + \dots$

Putting  $a = -i$  in above, we get

$$\begin{aligned} f(z) &= f(-i) + (z+i)f'(-i) + \frac{(z+i)^2}{2!}f''(-i) + \dots \\ f(z) &= \frac{1}{z^2 + 4} \quad \Rightarrow \quad f(-i) = \frac{1}{(-i)^2 + 4} = \frac{1}{-1+4} = \frac{1}{3} \\ f'(z) &= \frac{-2z}{(z^2 + 4)^2} \quad \Rightarrow \quad f'(-i) = \frac{2i}{(-1+4)^2} = \frac{2i}{9} \\ f''(z) &= -\frac{(z^2 + 4)^2(2) - 2z \cdot 2(z^2 + 4)2z}{(z^2 + 4)^4} \\ f''(z) &= -\frac{(z^2 + 4)2 - 8z^2}{(z^2 + 4)^3} \quad \Rightarrow \quad f''(-i) = -\frac{(-1+4)2 - 8(-1)}{(-1+4)^3} = -\frac{14}{27} \end{aligned}$$

On substituting the value of  $f(-i), f'(-i), f''(-i)$ , we get

$$\begin{aligned} f(z) &= \frac{1}{3} + (z+i)\left(\frac{2i}{9}\right) + \frac{(z+i)^2}{2!}\left(-\frac{14}{27}\right) + \dots \\ \Rightarrow \quad f(z) &= \frac{1}{3} + \frac{2i}{9}(z+i) - \frac{7}{27}(z+i)^2 + \dots \end{aligned}$$

Region of convergence is  $|z+i| < 1$ .

**Ans.**

**Example 14.** For the function  $f(z) = \frac{4z-1}{z^4-1}$ , find all Taylor series about the centre zero. (U.P., III Semester, Dec. 2006)

**Solution.**  $f(z) = \frac{4z-1}{z^4-1}$ ,

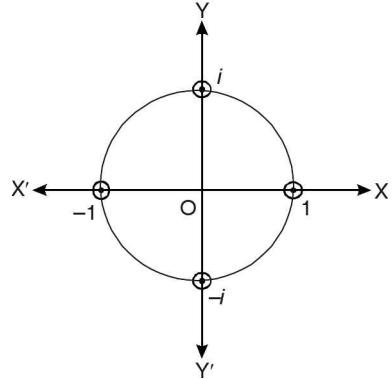

Poles are determined by  $z^4 - 1 = 0$

$$\Rightarrow (z-1)(z+1)(z^2+1) = 0$$

$$\Rightarrow z = 1, -1, \pm i$$

By Partial fractions

$$\begin{aligned} f(z) &= \frac{\frac{3}{4}}{z-1} + \frac{\frac{5}{4}}{z+1} + \frac{-2z+\frac{1}{2}}{z^2+1} \\ &= -\frac{3}{4} \frac{1}{1-z} + \frac{5}{4} \frac{1}{1+z} + \left(-2z+\frac{1}{2}\right) \frac{1}{1+z^2} \\ &= -\frac{3}{4}(1-z)^{-1} + \frac{5}{4}(1+z)^{-1} + \left(-2z+\frac{1}{2}\right)(1+z^2)^{-1} \\ &= -\frac{3}{4}[1+z+z^2+z^3+z^4+\dots] + \frac{5}{4}[1-z+z^2-z^3+z^4\dots] + \left(-2z+\frac{1}{2}\right)[1-z^2+z^4+\dots] \\ &= -\frac{3}{4} - \frac{3}{4}z - \frac{3}{4}z^2 - \frac{3}{4}z^3 - \frac{3}{4}z^4 + \dots + \frac{5}{4} - \frac{5}{4}z + \frac{5}{4}z^2 - \frac{5}{4}z^3 + \frac{5}{4}z^4 + \dots \\ &\quad -2z + 2z^3 - 2z^5 + \dots + \frac{1}{2} - \frac{z^2}{2} + \frac{z^4}{2} + \dots \\ &= 1 - 4z + z^4 + \dots \end{aligned}$$

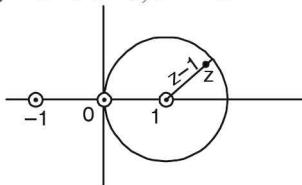

**Ans.**

Which is the required series.

**Example 15.** Find Taylor expansion of  $f(z) = \frac{2z^3+1}{z^2+z}$  about the point  $z = 1$ .

**Solution.**  $f(z) = \frac{2z^3+1}{z(z+1)}$ , singularities are given by  $z(z+1) = 0 \Rightarrow z=0, z=-1$

If centre of the circle is at  $z = 1$ , then the distance of the singularities  $z = 0$  and  $z = -1$  from the centre are 1 and 2. Hence, if a circle is drawn with centre  $z=1$  and radius 1, then within the circle  $|z-1|=1$ , the given function  $f(z)$  is analytic & therefore, it can be expanded in a Taylor series within the circle  $|z-1|=1$ , which is thus the circle of convergence.

$$\begin{aligned} \frac{2z^3+1}{z(z+1)} &= 2z-2 + \frac{1}{z+1} + \frac{1}{z} = 2z-2 + \frac{1}{z-1+2} + \frac{1}{z-1+1} \quad [|z-1|<1] \\ &= 2z-2 + \frac{1}{2} \left( 1 + \frac{z-1}{2} \right)^{-1} + [1+(z-1)]^{-1} \\ &= 2z-2 + \frac{1}{2} \left[ 1 - \left( \frac{z-1}{2} \right) + \left( \frac{z-1}{2} \right)^2 - \left( \frac{z-1}{2} \right)^3 + \dots \right] + [1-(z-1)+(z-1)^2-(z-1)^3+\dots] \\ &= 2z-2 + \frac{3}{2} - \frac{3}{2} \left( \frac{z-1}{2} \right) + \frac{9}{8} (z-1)^2 - \frac{17}{16} (z-1)^3 + \dots \end{aligned}$$

Which is the required expansion.

**Ans.**

**Example 16.** Expand  $\cos z$  in a Taylor series about  $z = \frac{\pi}{4}$ .

**Solution.** Here  $f(z) = \cos z$ ,  $f'(z) = -\sin z$ ,  $f''(z) = -\cos z$ ,  $f'''(z) = \sin z$ , .....

$$\therefore f\left(\frac{\pi}{4}\right) = \frac{1}{\sqrt{2}}, \quad f'\left(\frac{\pi}{4}\right) = -\frac{1}{\sqrt{2}}, \quad f''\left(\frac{\pi}{4}\right) = -\frac{1}{\sqrt{2}}, \quad f'''\left(\frac{\pi}{4}\right) = \frac{1}{\sqrt{2}}, \dots$$

$$\text{Hence } \cos z = f(z)$$

$$\begin{aligned} &= f\left(\frac{\pi}{4}\right) + \left(z - \frac{\pi}{4}\right) f'\left(\frac{\pi}{4}\right) + \frac{\left(z - \frac{\pi}{4}\right)^2}{2!} f''\left(\frac{\pi}{4}\right) + \frac{\left(z - \frac{\pi}{4}\right)^3}{3!} f'''\left(\frac{\pi}{4}\right) + \dots \\ &= \frac{1}{\sqrt{2}} \left[ 1 - \left(z - \frac{\pi}{4}\right) - \frac{1}{2!} \left(z - \frac{\pi}{4}\right)^2 + \frac{1}{3!} \left(z - \frac{\pi}{4}\right)^3 + \dots \right] \end{aligned}$$

**Ans.**

Which is the required expansion.

**Example 17.** Expand the function  $\frac{\sin z}{z-\pi}$  about  $z = \pi$ .

**Solution.** Putting  $z - \pi = t$ , we have

$$\begin{aligned} \frac{\sin z}{z-\pi} &= \frac{\sin(\pi+t)}{t} = \frac{-\sin t}{t} \\ &= -\frac{1}{t} \left( t - \frac{t^3}{3!} + \frac{t^5}{5!} \dots \right) = -1 + \frac{t^2}{3!} - \frac{t^4}{5!} + \dots = -1 + \frac{(z-\pi)^2}{3!} - \frac{(z-\pi)^4}{5!} + \dots \end{aligned}$$

Which is the required expansion.

**Ans.**

**Example 18.** Expand the function  $\sin^{-1} z$  in powers of  $z$ . (U.P. III Semester, Dec. 2006)

**Solution.** Let  $w = \sin^{-1} z$

$$\frac{dw}{dz} = \frac{1}{\sqrt{1-z^2}} = (1-z^2)^{-\frac{1}{2}} \quad \dots (1)$$

On expanding the R.H.S. of (1) by Binomial Theorem, we get

$$\frac{dw}{dz} = 1 - \frac{1}{2}(-z^2) + \frac{\frac{-1}{2}\left(-\frac{3}{2}\right)}{2!}(-z^2)^2 + \frac{\frac{-1}{2}\left(-\frac{3}{2}\right)\left(\frac{-5}{2}\right)}{3!}(-z^2)^3 + \dots$$

$$\frac{dw}{dz} = 1 + \frac{z^2}{2} + \frac{3}{8}z^4 + \frac{5}{16}z^6 + \dots$$

On integrating, we get

$$w = z + \frac{z^3}{6} + \frac{3z^5}{40} + \frac{5z^7}{112} + \dots + C \quad \dots (2)$$

On putting  $z = 0$  and  $w = \sin^{-1} z = 0$  in (2), we get

$$0 = 0 + C \Rightarrow C = 0$$

On putting the value of  $C$  in (2), we get

$$\sin^{-1} z = z + \frac{z^3}{6} + \frac{3z^5}{40} + \frac{5z^7}{112} + \dots$$

Which is the required expansion.

**Ans.**

**Example 19.** Expand the function  $f(z) = \tan^{-1} z$  in powers of  $z$ . (U.P. III Sem. 2009-2010)

**Solution.** We have,  $f(z) = \tan^{-1} z$

$$\Rightarrow \frac{d f(z)}{dz} = \frac{1}{1+z^2} = (1+z^2)^{-1} \quad \dots (1)$$

On expanding the R.H.S of (1) by Binomial Theorem, we get

$$\frac{d f(z)}{dz} = 1 - z^2 + \frac{-1(-1-1)}{2!}(z^2)^2 + \frac{-1(-1-1)(-1-2)}{3!}(z^2)^3 + \dots$$

$$\Rightarrow \frac{d f(z)}{dz} = 1 - z^2 + z^4 - z^6 + \dots$$

On integration, we get

$$f(z) = z - \frac{z^3}{3} + \frac{z^5}{5} - \frac{z^7}{7} + \dots + C \quad \dots (2)$$

On putting  $z = 0$  and  $f(z) = \tan^{-1} z = 0$  in (2), we get

$$0 = 0 + C \Rightarrow C = 0$$

On putting the value of  $C$  in (2), we get

$$\tan^{-1} z = z - \frac{z^3}{3} + \frac{z^5}{5} - \frac{z^7}{7} + \dots \quad \text{Ans.}$$

### EXERCISE 30.2

Expand the following functions in Taylor's series

1.  $\frac{1}{z+1}$ , about  $z = 1$ .

**Ans.**  $- \frac{1}{2} \left( 1 + \frac{z}{2} + \frac{z^2}{4} + \frac{z^3}{8} + \dots \right) - (z^{-1} + z^{-2} + z^{-3} + \dots)$

2.  $\frac{z-1}{z+1}$       (a) about  $z = 0$       (b) about  $z = 1$ .

**Ans.** (a)  $-1 + 2(z - z^2 + z^3 - z^4 + \dots)$  (b)  $\frac{1}{2}(z-1) - \frac{1}{2^2}(z-1)^2 + \frac{1}{2^3}(z-1)^3 - \dots$

3.  $\frac{1}{4-3z}$  about  $(1+i)$

**Ans.**  $\frac{1}{1-3i} \sum_{n=0}^{\infty} (-1)^n \left(\frac{-3}{1-3i}\right)^n (z-(1+i))^n$   
Region of convergence  $|z-(1+i)| < \sqrt{\frac{10}{3}}$

4.  $\frac{1}{z^2-z-6}$  about (a)  $z = -1$ , (b)  $z = 1$

**Ans.** (a)  $\frac{1}{20} \sum_{n=0}^{\infty} \frac{(-4)^{n+1}-1}{4^n} (z+1)^n$

Region of convergence  $|z+1| \leq 1$ .

**Ans.** (b)  $-\frac{1}{10} \sum_{n=0}^{\infty} \left(\frac{z-1}{2}\right)^n - \frac{1}{15} \sum_{n=0}^{\infty} (-1)^n \left(\frac{z-1}{3}\right)^n$

Region of convergence  $\left|\frac{z-1}{2}\right| < 1$  and  $\left|\frac{z-1}{3}\right| < 1$  common region  $|z-1| < 2$ .

5.  $\frac{2z^2+9z+5}{z^3+z^2-8z-12}$  about  $z = 1$

**Ans.**  $\sum_{n=0}^{\infty} \left[ (-1)^n \frac{n+1}{3^{n+2}} - \frac{1}{2^n} \right] (z-1)^n$

Region of convergence  $|z-1| < 2$ .

6.  $\log\left(\frac{1+z}{1-z}\right)$  about  $z = 0$

**Ans.**  $\sum_{n=0}^{\infty} \frac{2z^{2n+1}}{2n+1}, \quad |z| < 1$

7.  $\frac{1}{z^2+(1+2i)z+2i}$  about  $z = 0$ .

**Ans.**  $\frac{1}{(1-2i)} \left[ \sum_{n=0}^{\infty} \left\{ \left(\frac{1}{2i}\right)^{n+1} - 1 \right\} (-1)^n z^n \right]$

8.  $\frac{1}{(z+i)^2}$ , about  $z = 0$

**Ans.**  $\frac{1+i}{\sqrt{2}} \left[ \sum_{n=0}^{\infty} \frac{1}{2} C_r \left(\frac{z}{i}\right)^r \right], \quad R = 1$

9.  $\frac{1}{(z^2-1)(z^2-2)}$  about  $z = 0$ .

**Ans.**  $\sum_{n=0}^{\infty} \left[ 1 - \frac{1}{2^{n+1}} \right] z^{2n}, \quad R = 1$

10.  $\tan z$  about  $z = 0$

**Ans.**  $z + \frac{z^3}{3} + \frac{2z^5}{15} + \dots$

11.  $z \cot z$  about  $z = 0$  **Ans.**  $1 - \frac{z^2}{3} - \frac{z^4}{45} + \dots$

12.  $\frac{e^z}{1+e^z}$  about  $z = 0$  **Ans.**  $\frac{1}{2} + \frac{z}{4} - \frac{z^3}{48}$

### 30.8 LAURENT'S THEOREM

(U.P., III Semester, Dec. 2009)

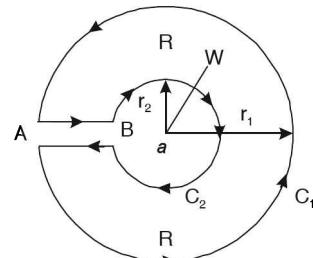

If we are required to expand  $f(z)$  about a point where  $f(z)$  is not analytic, then it is expanded by Laurent's Series and not by Taylor's Series.

**Statement.** If  $f(z)$  is analytic on  $c_1$  and  $c_2$ , and the annular region  $R$  bounded by the two concentric circles  $c_1$  and  $c_2$  of radii  $r_1$  and  $r_2$  ( $r_2 < r_1$ ) and with centre at  $a$ , then for all  $z$  in  $R$

$$f(z) = a_0 + a_1(z-a) + a_2(z-a)^2 + \dots + \frac{b_1}{z-a} + \frac{b_2}{(z-a)^2} + \dots$$

where  $a_n = \frac{1}{2\pi i} \int_{c_1} \frac{f(w)}{(w-a)^{n+1}} dw,$

$$b_n = \frac{1}{2\pi i} \int_{c_2} \frac{f(w)}{(w-a)^{-n+1}} dw$$

**Proof.** By introducing a cross cut  $AB$ , multi-connected region  $R$  is converted to a simply connected region. Now  $f(z)$  is analytic in this region.

Now by Cauchy's integral formula

$$f(z) = \frac{1}{2\pi i} \int_{c_1} \frac{f(w) dw}{w-z} + \frac{1}{2\pi i} \int_{AB} \frac{f(w) dw}{w-z} - \frac{1}{2\pi i} \int_{c_2} \frac{f(w) dw}{w-z} + \frac{1}{2\pi i} \int_{BA} \frac{f(w) dw}{w-z}$$

Integral along  $c_2$  is clockwise, so it is negative. Integrals along  $AB$  and  $BA$  cancel.

$$\therefore f(z) = \frac{1}{2\pi i} \int_{c_1} \frac{f(w) dw}{w-z} - \frac{1}{2\pi i} \int_{c_2} \frac{f(w) dw}{w-z} \quad \dots (1)$$

For the first integral,  $\frac{f(w)}{w-z}$  can be expanded exactly as in Taylor's series as  $z$  lies on  $c_1$ .

$$\begin{aligned} \frac{1}{2\pi i} \int_{c_1} \frac{f(w) dw}{w-z} &= \frac{1}{2\pi i} \int_{c_1} \frac{f(w) dw}{w-a} + \frac{(z-a)}{2\pi i} \int_{c_1} \frac{f(w)}{(w-a)^2} dw + \frac{(z-a)^2}{2\pi i} \int_{c_1} \frac{f(w)}{(w-a)^3} dw + \dots \\ &= a_0 + a_1(z-a) + a_2(z-a)^2 + \dots \quad \dots (2) \qquad \left[ a_n = \frac{1}{2\pi i} \int_{c_1} \frac{f(w) dw}{(w-a)^{n+1}} \right] \end{aligned}$$

In the second integral,  $z$  lies on  $c_2$ . Therefore

$$\begin{aligned} |w-a| < |z-a| \quad \text{or} \quad \frac{|w-a|}{|z-a|} < 1 \\ \text{so here} \quad \frac{1}{w-z} &= \frac{1}{w-a+a-z} = \frac{1}{(w-a)-(z-a)} \\ &= -\frac{1}{(z-a)} \frac{1}{\left(1-\frac{w-a}{z-a}\right)} = -\frac{1}{z-a} \left(1-\frac{w-a}{z-a}\right)^{-1} \\ &= -\frac{1}{z-a} \left[ 1 + \frac{w-a}{z-a} + \left(\frac{w-a}{z-a}\right)^2 + \dots + \left(\frac{w-a}{z-a}\right)^{n+1} + \dots \right] \end{aligned}$$

Multiplying by  $-\frac{f(w)}{2\pi i}$ , we get

$$\begin{aligned} -\frac{1}{2\pi i} \frac{f(w)}{w-z} &= \frac{1}{2\pi i} \frac{f(w)}{z-a} + \frac{1}{2\pi i} \frac{(w-a)}{(z-a)^2} f(w) + \frac{1}{2\pi i} \frac{(w-a)^2}{(z-a)^3} f(w) + \dots \\ &= \left(\frac{1}{z-a}\right) \frac{1}{2\pi i} f(w) + \frac{1}{(z-a)^2} \frac{1}{2\pi i} \frac{f(w)}{(w-a)^{-1}} + \frac{1}{(z-a)^3} \frac{1}{2\pi i} \frac{f(w)}{(w-a)^{-2}} + \dots \end{aligned}$$

Integrating, we have

$$\begin{aligned} -\frac{1}{2\pi i} \int_{c_2} \frac{f(w) dw}{w-z} &= \left(\frac{1}{z-a}\right) \frac{1}{2\pi i} \int_{c_2} f(w) dw + \frac{1}{(z-a)^2} \frac{1}{2\pi i} \int_{c_2} \frac{f(w) dw}{(w-a)^{-1}} \\ &\quad + \frac{1}{(z-a)^3} \frac{1}{2\pi i} \int_{c_2} \frac{f(w) dw}{(w-a)^{-2}} + \dots, \\ &= \frac{b_1}{z-a} + \frac{b_2}{(z-a)^2} + \frac{b_3}{(z-a)^3} + \dots \quad \dots (3) \qquad \left[ b_n = \frac{1}{2\pi i} \int_{c_2} \frac{f(w) dw}{(w-a)^{-n+1}} \right] \end{aligned}$$

Substituting the values of both integrals from (2) and (3) in (1), we get

$$\begin{aligned} f(z) &= a_0 + a_1(z-a) + a_2(z-a)^2 + b_1(z-a)^{-1} + b_2(z-a)^{-2} + \dots \\ \Rightarrow f(z) &= \sum_{n=0}^{n=\infty} a_n(z-a)^n + \sum_{n=1}^{n=\infty} \frac{b_n}{(z-a)^n} \quad \text{Proved.} \end{aligned}$$

**Note.** To expand a function by Laurent Theorem is cumbersome. By Binomial theorem, the expansion of a function can be done easily.

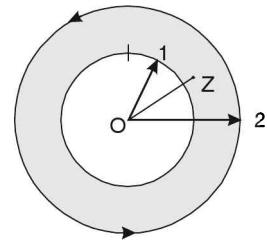

**Example 20.** Expand  $f(z) = \frac{1}{(z-1)(z-2)}$  for  $1 < |z| < 2$

**Solution.**  $f(z) = \frac{1}{(z-1)(z-2)} = \frac{1}{z-2} - \frac{1}{z-1}$

In first bracket  $|z| < 2$ , we take out 2 as common and from second

bracket  $z$  is taken out common as  $1 < |z|$ .

$$\begin{aligned} f(z) &= -\frac{1}{2} \left( \frac{1}{1-\frac{z}{2}} \right) - \frac{1}{z} \left( \frac{1}{1-\frac{1}{z}} \right) = -\frac{1}{2} \left( 1 - \frac{z}{2} \right)^{-1} - \frac{1}{z} \left( 1 - \frac{1}{z} \right)^{-1} \\ &= -\frac{1}{2} \left[ 1 + \frac{z}{2} + \frac{z^2}{4} + \frac{z^3}{8} + \dots \right] - \frac{1}{z} \left[ 1 + \frac{1}{z} + \frac{1}{z^2} + \frac{1}{z^3} + \dots \right] \\ &= -\frac{1}{2} - \frac{z}{4} - \frac{z^2}{8} - \frac{z^3}{16} - \dots - \frac{1}{z} - \frac{1}{z^2} - \frac{1}{z^3} - \frac{1}{z^4} - \dots \end{aligned}$$

Which is the required expansion.

**Ans.**

**Example 21.** Obtain the Taylor or Laurent series which represents the function

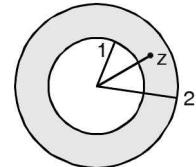

$$f(z) = \frac{1}{(1+z^2)(z+2)} \text{ when}$$

$$(i) 1 < |z| < 2; \quad (ii) |z| > 2$$

**Solution.**  $f(z) = \frac{1}{(1+z^2)(z+2)} = \frac{-\frac{z}{5} + \frac{2}{5}}{1+z^2} + \frac{\frac{1}{5}}{z+2} = -\frac{1}{5} \frac{z-2}{1+z^2} + \frac{1}{5} \frac{1}{z+2}, \quad 1 < |z| < 2$

(i) In first expression  $1 < |z|$  and in second expression  $|z| < 2$

$$\begin{aligned} f(z) &= -\frac{1}{5} \frac{1}{z^2} \frac{z-2}{1+\frac{1}{z^2}} + \frac{1}{5} \frac{1}{2} \frac{1}{1+\frac{z}{2}} \\ &= -\frac{1}{5z^2} (z-2) \left( 1 + \frac{1}{z^2} \right)^{-1} + \frac{1}{10} \left( 1 + \frac{z}{2} \right)^{-1} \\ &= -\frac{1}{5} \left( \frac{1}{z} - \frac{2}{z^2} \right) \left( 1 - \frac{1}{z^2} + \frac{1}{z^4} - \frac{1}{z^6} + \dots \right) + \frac{1}{10} \left[ 1 - \frac{z}{2} + \frac{z^2}{4} - \frac{z^3}{8} + \dots \right] \\ &= \frac{1}{5} \left[ -\frac{1}{z} + \frac{1}{z^3} - \frac{1}{z^5} + \frac{1}{z^7} + \dots + \frac{2}{z^2} - \frac{2}{z^4} + \frac{2}{z^6} - \frac{2}{z^8} + \dots + \frac{1}{2} - \frac{z}{4} + \frac{z^2}{8} - \frac{z^3}{16} \dots \right] \\ &= \frac{1}{5} \left[ \dots - 2z^{-8} + z^{-7} + 2z^{-6} - z^{-5} - 2z^{-4} + z^{-3} + 2z^{-2} - z^{-1} + \frac{1}{2} - \frac{z}{4} + \frac{z^2}{8} - \frac{z^3}{16} \dots \right] \end{aligned}$$

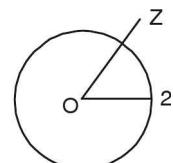

Which is the required series.

**Ans.**

$$(ii) \text{ Here } |z| > 2$$

$$\begin{aligned} f(z) &= -\frac{1}{5} \frac{z-2}{1+z^2} + \frac{1}{5} \frac{1}{z+2} = -\frac{1}{5} \frac{1}{z^2} \frac{z-2}{1+\frac{1}{z^2}} + \frac{1}{5} \frac{1}{z} \frac{1}{1+\frac{2}{z}} \\ &= -\frac{1}{5z^2} (z-2) \left[ 1 + \frac{1}{z^2} \right]^{-1} + \frac{1}{5z} \left[ 1 + \frac{2}{z} \right]^{-1} \end{aligned}$$

$$\begin{aligned}
 &= \frac{1}{5} \left[ -\frac{1}{z} + \frac{2}{z^2} \right] \left[ 1 - \frac{1}{z^2} + \frac{1}{z^4} - \frac{1}{z^6} + \dots \right] + \frac{1}{5z} \left[ 1 - \frac{2}{z} + \frac{4}{z^2} - \frac{8}{z^3} + \frac{16}{z^4} + \dots \right] \\
 &= \frac{1}{5} \left[ -\frac{1}{z} + \frac{1}{z^3} - \frac{1}{z^5} + \frac{1}{z^7} + \dots + \frac{2}{z^2} - \frac{2}{z^4} + \frac{2}{z^6} - \frac{2}{z^8} + \dots + \frac{1}{z} - \frac{2}{z^2} + \frac{4}{z^3} - \frac{8}{z^4} + \dots \right]
 \end{aligned}$$

Which is the required series.

**Ans.**

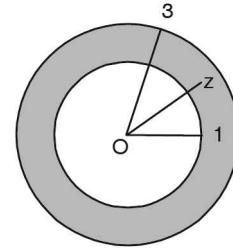

**Example 22.** Expand  $f(z) = \frac{1}{(z+1)(z+3)}$  in Laurent series valid for

- (i)  $1 < |z| < 3$
- (ii)  $|z| > 3$
- (iii)  $0 < |z+1| < 2$
- (iv)  $|z| < 1$

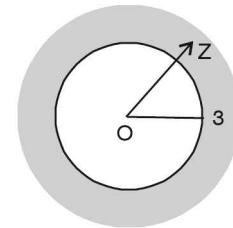

**Solution.**  $f(z) = \frac{1}{(z+1)(z+3)} = \frac{1}{2} \left( \frac{1}{z+1} - \frac{1}{z+3} \right)$

(i)  $1 < |z| < 3 \Rightarrow \frac{1}{|z|} < 1 \text{ and } \frac{|z|}{3} < 1.$

$\Rightarrow 1 < |z| \text{ and } |z| < 3.$

$$\begin{aligned}
 f(z) &= \frac{1}{2} \left[ \frac{1}{z \left( 1 + \frac{1}{z} \right)} - \frac{1}{3 \left( 1 + \frac{z}{3} \right)} \right] = \frac{1}{2} \left[ \frac{1}{z} \left( 1 + \frac{1}{z} \right)^{-1} - \frac{1}{3} \left( 1 + \frac{z}{3} \right)^{-1} \right] \\
 &= \frac{1}{2} \left[ \frac{1}{z} \left( 1 - \frac{1}{z} + \frac{1}{z^2} - \frac{1}{z^3} \dots \right) - \frac{1}{3} \left( 1 - \frac{z}{3} + \frac{z^2}{3^2} - \frac{z^3}{3^3} \dots \right) \right] \\
 &= \left( \frac{1}{2z} - \frac{1}{2z^2} + \frac{1}{2z^3} - \frac{1}{2z^4} \dots \right) - \frac{1}{6} + \frac{z}{18} - \frac{z^2}{54} + \frac{z^3}{162} \dots \\
 &= -\frac{1}{2z^4} + \frac{1}{2z^3} - \frac{1}{2z^2} + \frac{1}{2z} - \frac{1}{6} + \frac{z}{18} - \frac{z^2}{54} + \frac{z^3}{162} \dots
 \end{aligned}$$

Which is the required series.

**Ans.**

(ii)  $|z| > 3 \Rightarrow \frac{3}{|z|} < 1$

$$\begin{aligned}
 f(z) &= \frac{1}{2} \left[ \frac{1}{z} \left( 1 + \frac{1}{z} \right)^{-1} - \frac{1}{z} \left( 1 + \frac{3}{z} \right)^{-1} \right] \\
 &= \frac{1}{2z} \left( 1 - \frac{1}{z} + \frac{1}{z^2} - \frac{1}{z^3} \dots \right) - \frac{1}{2z} \left( 1 - \frac{3}{z} + \frac{3^2}{z^2} \dots \right) \\
 &= \left( \frac{1}{2z} - \frac{1}{2z} \right) + \left( \frac{-1}{2z^2} + \frac{3}{2z^2} \right) + \left( \frac{1}{2z^3} - \frac{9}{2z^3} \right) + \left( -\frac{1}{2z^4} + \frac{27}{2z^4} \right) \\
 &= \frac{1}{z^2} - \frac{4}{z^3} + \frac{13}{z^4} - \frac{50}{z^5} + \dots
 \end{aligned}$$

Which is required expansion.

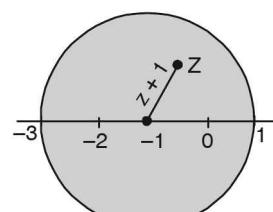

**Ans.**

(iii)  $0 < |z+1| < 2.$

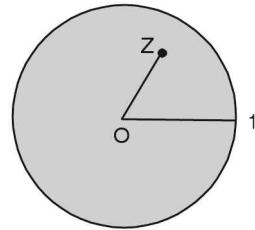

$|z+1| > 0 \text{ and } |z+1| < 2.$

$\frac{|z+1|}{2} < 1.$

$$f(z) = \frac{1}{2} \left[ \frac{1}{1+z} - \frac{1}{z+1+2} \right] = \frac{1}{2} \left[ \frac{1}{1+z} - \left( 2 + \overline{z+1} \right)^{-1} \right]$$

$$\begin{aligned}
 &= \frac{1}{2(1+z)} - \frac{1}{2} \cdot \frac{1}{2} \left(1 + \frac{z+1}{2}\right)^{-1} \\
 &= \frac{1}{2(1+z)} - \frac{1}{4} \left[1 - \frac{(z+1)}{2} + \frac{(z+1)^2}{4} - \dots\right] \\
 &= \frac{1}{2(1+z)} - \frac{1}{4} + \frac{(z+1)}{8} - \frac{(z+1)^2}{16} + \dots
 \end{aligned}$$

Ans.

Which is required expansion.

(iv)  $|z| < 1$

$$\begin{aligned}
 f(z) &= \frac{1}{2} \left[ \frac{1}{(1+z)} - \frac{1}{3+z} \right] \\
 &= \frac{1}{2} (1+z)^{-1} - \frac{1}{2} (3+z)^{-1} \\
 &= \frac{1}{2} (1+z)^{-1} - \frac{1}{6} \left(1 + \frac{z}{3}\right)^{-1} \quad \left[ |z| < 1 \text{ and } \frac{|z|}{3} < 1. \right] \\
 &= \frac{1}{2} (1 - z + z^2 - z^3 + \dots) - \frac{1}{6} \left(1 - \frac{z}{3} + \frac{z^2}{9} - \frac{z^3}{27} + \dots\right) \\
 &= \left(\frac{1}{2} - \frac{1}{6}\right) + \left(\frac{-z}{2} + \frac{z}{18}\right) + \left(\frac{z^2}{2} - \frac{z^2}{54}\right) + \left(-\frac{z^3}{2} + \frac{z^3}{162}\right) + \dots \\
 &= \frac{1}{3} - \frac{4}{9}z + \frac{13}{27}z^2 - \frac{40}{81}z^3 + \dots
 \end{aligned}$$

Which is required expansion.

Ans.

**Example 23.** Expand the following function in a Laurent series about the point  $z = 0$ .

$$\begin{aligned}
 f(z) &= \frac{1 - \cos z}{z^3} \\
 \text{Solution.} \quad f(z) &= \frac{1 - \cos z}{z^3} = \frac{1}{z^3} \left[ 1 - \left\{ 1 - \frac{z^2}{2!} + \frac{z^4}{4!} - \dots \right\} \right] \\
 &= \frac{1}{z^3} \left( \frac{z^2}{2!} - \frac{z^4}{4!} + \frac{z^6}{6!} - \dots \right) = \frac{1}{2!z} - \frac{1}{4!z} + \frac{1}{6!z^3} - \dots \\
 &= \sum_{n=2}^{\infty} \frac{(-1)^n z^{2n-5}}{(2n-2)!}
 \end{aligned}$$

which is a Laurent's series.

Ans.

**Example 24.** Find the terms in the Laurent expansion of  $\frac{1}{z(e^z - 1)}$  for the region  $0 < |z| < 2\pi$ .  
(AMIETE, June 2010, 2009)

$$\begin{aligned}
 \text{Solution.} \quad f(z) &= \frac{1}{z(e^z - 1)} = \frac{1}{z \left[ \left(1 + z + \frac{z^2}{2!} + \frac{z^3}{3!} + \dots\right) - 1 \right]} \\
 &= z^{-1} \left( z + \frac{z^2}{2!} + \frac{z^3}{3!} + \dots \right)^{-1} = z^{-2} \left( 1 + \frac{z}{2!} + \frac{z^2}{3!} + \dots \right)^{-1} \\
 &= z^{-2} \left[ 1 - \left( \frac{z}{2} + \frac{z^2}{6} + \frac{z^3}{24} + \dots \right) + \left( \frac{z}{2} + \frac{z^2}{6} + \frac{z^3}{24} + \dots \right)^2 - \left( \frac{z}{2} + \frac{z^2}{6} + \frac{z^3}{24} + \dots \right)^3 + \dots \right]
 \end{aligned}$$

$$\begin{aligned}
&= z^{-2} \left[ 1 - \left( \frac{z}{2} + \frac{z^2}{6} + \frac{z^3}{24} + \frac{z^4}{120} + \dots \right) + \frac{1}{4} z^2 \left( 1 + \frac{z}{3} + \frac{z^2}{12} + \dots \right)^2 \right. \\
&\quad \left. - \frac{1}{8} z^3 \left( 1 + \frac{z}{3} + \dots \right)^3 + \frac{z^4}{16} (1 + \dots)^4 + \dots \right] \\
&= z^{-2} \left[ 1 - \frac{z}{2} + z^2 \left( \frac{1}{4} - \frac{1}{6} \right) - z^3 \left( \frac{1}{8} - \frac{1}{6} + \frac{1}{24} \right) + z^4 \left( \frac{1}{16} - \frac{1}{8} + \frac{1}{24} + \frac{1}{36} - \frac{1}{120} \right) + \dots \right] \\
&= z^{-2} \left[ 1 - \frac{z}{2} + \frac{z^2}{12} - \frac{z^4}{720} + \dots \right] = z^{-2} - \frac{1}{2} z^{-1} + \frac{1}{12} - \frac{z^2}{720} + \dots \quad \text{Ans.}
\end{aligned}$$

**30.9 IF  $f(z)$  HAS A POLE AT  $z = a$  THEN  $|f(z)| \rightarrow \infty$  AS  $z \rightarrow a$**

**Solution.** Suppose the pole is of order  $m$ , then  $f(z) = \sum_{n=1}^{\infty} a_n (z-a)^n + \sum_{n=0}^m b_n (z-a)^{-n}$

Its principal part is  $\sum_{n=0}^m b_n (z-a)^{-n}$

$$\begin{aligned}
\sum_{n=1}^m b_n (z-a)^{-n} &= \frac{b_1}{z-a} + \frac{b_2}{(z-a)^2} + \frac{b_3}{(z-a)^3} + \dots + \frac{b_m}{(z-a)^m} \\
&= \frac{1}{(z-a)^m} [b_m + b_{m-1}(z-a) + \dots + b_1(z-a)^{m-1}] \\
&= \frac{1}{(z-a)^m} \left[ b_m + \sum_{n=1}^{m-1} b_n (z-a)^{m-n} \right] \\
\left| \sum_{n=1}^m b_n (z-a)^{-n} \right| &= \left| \frac{1}{(z-a)^m} \left[ b_m + \sum_{n=1}^{m-1} b_n (z-a)^{m-n} \right] \right| \\
&\geq \left| \frac{1}{(z-a)^m} \left[ |b_m| - \sum_{n=1}^{m-1} |b_n| |z-a|^{m-n} \right] \right|
\end{aligned}$$

This tends to  $b_m$  as  $|a_1 + a_2| \geq |a_1| - |a_2|$

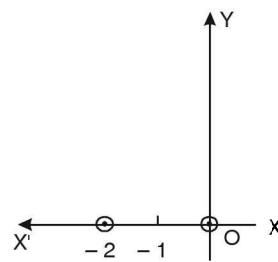

As  $z \rightarrow a$  R.H.S.  $\infty$ .

**Example 25.** Write all possible Laurent series for the function

$$f(z) = \frac{1}{z(z+2)^3}$$

about the pole  $z = -2$ . Using appropriate Laurent series

**Solution.** To expand  $\frac{1}{z(z+2)^3}$  about  $z = -2$ , i.e., in powers of  $(z+2)$ , we put  $z+2 = t$ .

$$\begin{aligned}
\text{Then } f(z) &= \frac{1}{z(z+2)^3} = \frac{1}{(t-2)t^3} = \frac{1}{t^3} \cdot \frac{1}{t-2} \\
&= \frac{1}{t^3} \cdot \frac{1}{-2} \cdot \left( \frac{1}{1 - \frac{t}{2}} \right) = -\frac{1}{2t^3} \left( 1 - \frac{t}{2} \right)^{-1} \\
&= -\frac{1}{2t^3} \left[ 1 + \frac{t}{2} + \frac{t^2}{4} + \frac{t^3}{8} + \frac{t^4}{16} + \frac{t^5}{32} + \dots \right] \\
&\quad [0 < |z+2| < 1 \text{ or } 0 < |t| < 1]
\end{aligned}$$

$$\begin{aligned}
 &= -\frac{1}{2t^3} - \frac{1}{4t^2} - \frac{1}{8t} - \frac{1}{16} - \frac{t}{32} - \frac{t^2}{64} + \dots \\
 &= -\frac{1}{2(z+2)^3} - \frac{1}{4(z+2)^2} - \frac{1}{8(z+2)} - \frac{1}{16} - \frac{z+2}{32} - \frac{(z+2)^2}{64} + \dots \quad \text{Ans.}
 \end{aligned}$$

**Example 26.** Expand  $\frac{e^z}{(z-1)^2}$  about  $z = 1$

**Solution.** Let.  $f(z) = \frac{e^z}{(z-1)^2} = \frac{e^{1+t}}{t^2}$  [Put  $z-1 = t \Rightarrow z = 1+t$ ]

$$\begin{aligned}
 &= \frac{e \cdot e^t}{t^2} = \frac{e}{t^2} \left[ 1 + t + \frac{t^2}{2!} + \frac{t^3}{3!} + \dots \right] = e \left[ \frac{1}{t^2} + \frac{1}{t} + \frac{1}{2!} + \frac{t}{3!} \dots \right] \\
 &= e \left[ \frac{1}{(z-1)^2} + \frac{1}{z-1} + \frac{1}{2!} + \frac{z-1}{3!} + \dots \right]
 \end{aligned}$$

Which is required expansion. Ans.

**Example 27.** Expand  $f(z) = \sin \left\{ c \left( z + \frac{1}{z} \right) \right\}$

**Solution.**  $f(z)$  is not analytic at  $z = 0$ .

Therefore  $f(z)$  can be expanded by Laurent theorem.

$$\therefore f(z) = \sum_{n=0}^{\infty} a_n z^n + \sum_{n=1}^{\infty} \frac{b_n}{z^n}$$

where  $a_n = \frac{1}{2\pi i} \int_c \frac{f(z) dz}{(z-0)^{n+1}}$  and  $b_n = \frac{1}{2\pi i} \int_c f(z) z^{n-1} dz$

Now, 
$$\begin{aligned}
 a_n &= \frac{1}{2\pi i} \int_c \frac{\sin c \left( z + \frac{1}{z} \right) dz}{z^{n+1}} & \left[ \begin{array}{l} z = e^{i\theta} \\ dz = ie^{i\theta} d\theta \end{array} \right] \\
 &= \frac{1}{2\pi i} \int_0^{2\pi} \frac{\sin [c(2\cos\theta)] ie^{i\theta} d\theta}{e^{(n+1)i\theta}} = \frac{1}{2\pi} \int_0^{2\pi} \sin(2c\cos\theta) e^{-ni\theta} d\theta \\
 &= \frac{1}{2\pi} \int_0^{2\pi} \sin(2c\cos\theta) \cos n\theta d\theta - \frac{i}{2\pi} \int_0^{2\pi} \sin(2c\cos\theta) \sin n\theta d\theta
 \end{aligned}$$

$$= \frac{1}{2\pi} \int_0^{2\pi} \sin(2c\cos\theta) \cos n\theta d\theta + 0 \quad [\text{If } f(2a-x) = -f(x) \text{ then } \int_0^{2a} f(x) dx = 0]$$

Similarly,  $b_n = \frac{1}{2\pi} \int_0^{2\pi} \sin(2c\cos\theta) \cos n\theta d\theta$

Since the function remains unaltered by putting  $z$  for  $\frac{1}{z}$ .

$$\begin{aligned}
 f(z) &= a_0 + \sum_{n=1}^{\infty} a_n z^n + \sum_{n=1}^{\infty} \frac{b_n}{z^n} & [a_n = b_n] \\
 &= a_0 + \sum a_n \left( z^n + \frac{1}{z^n} \right) & \text{Ans.}
 \end{aligned}$$

**Example 28.** Expand  $f(z) = e^{\frac{c}{2} \left( \frac{z-1}{z} \right)} = \sum_{n=0}^{\infty} a_n z^n$

**Solution.**  $f(z)$  is also analytic function at  $z = 0$  so  $f(z)$  can be expanded by Taylor's theorem.

$$\begin{aligned} f(z) &= \sum_{n=0}^{\infty} a_n z^n \\ \text{where } a_n &= \frac{1}{2\pi i} \int_c \frac{f(z) dz}{z^{n+1}} \\ &= \frac{1}{2\pi i} \int_c \frac{e^{\frac{c}{2} \left( \frac{z-1}{z} \right)}}{z^{n+1}} dz \\ &= \frac{1}{2\pi i} \int_0^{2\pi} \frac{e^{\frac{c}{2}(2i\sin\theta)}}{e^{(n+1)i\theta}} ie^{i\theta} d\theta & [z = e^{i\theta}, dz = ie^{i\theta} d\theta] \\ &= \frac{1}{2\pi} \int_0^{2\pi} e^{i(c\sin\theta - n\theta)} d\theta \\ &= \frac{1}{2\pi} \int_0^{2\pi} [\cos(c\sin\theta - n\theta) - i\sin(c\sin\theta - n\theta)] d\theta \\ &= \frac{1}{2\pi} \int_0^{2\pi} \cos(c\sin\theta - n\theta) d\theta & \left\{ \begin{array}{l} \text{If } f(2a-x) = -f(x) \\ \text{then } \int_0^{2a} f(x) dx = 0 \end{array} \right. \\ b_n &= (-1)^n a_n \text{ since } f(z) \text{ remains unaltered if } \frac{-1}{z} \text{ is written for } z \end{aligned}$$

$$\begin{aligned} \text{So, } f(z) &= \sum a_n z^n + \sum \frac{b_n}{z^n} \\ &= \sum_{n=0}^{\infty} a_n (z^n) + (-1)^n \sum_{n=1}^{\infty} \frac{a_n}{z^n} = \sum_{n=-\infty}^{\infty} a_n z^n & \text{Ans.} \end{aligned}$$

**Example 29.** Find the Laurent expansion for  $f(z) = \frac{7z-2}{z^3-z^2-2z}$

in the regions given by

- (i)  $0 < |z+1| < 1$       (ii)  $1 < |z+1| < 3$  (AMIETE, June 2010)      (iii)  $|z+1| > 3$ .

**Solution.** We have,

$$\begin{aligned} f(z) &= \frac{7z-2}{z^3-z^2-2z} = \frac{1}{z} - \frac{3}{z+1} + \frac{2}{z-2} & [\text{By partial fractions}] \\ &= \frac{1}{(z+1)-1} - \frac{3}{z+1} + \frac{2}{(z+1)-3} \end{aligned}$$

- (i)  $0 < |z+1| < 1$

$$\begin{aligned} f(z) &= -\{1-(z+1)\}^{-1} - \frac{3}{z+1} - \frac{2}{3} \left\{ 1 - \left( \frac{z+1}{3} \right) \right\}^{-1} \\ &= -\left[ 1 + (z-1) + (z-1)^2 + (z-1)^3 + \dots \right] - \frac{3}{z+1} \\ &\quad - \frac{2}{3} \left[ 1 + \frac{(z+1)}{3} + \frac{(z+1)^2}{9} + \frac{(z+1)^3}{27} + \dots \right] \end{aligned}$$

Which is the required Laurent expansion.

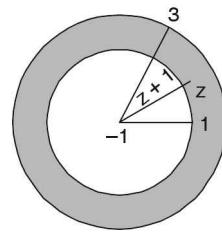

(ii)  $1 < |z + 1| < 3$

$$f(z) = \frac{1}{(z+1)-1} - \frac{3}{z+1} + \frac{2}{(z+1)-3}$$

Taking common, bigger term out of  $|z + 1|$  and 1 in first fraction, here  $|z + 1|$  is bigger than 1, so we take  $|z + 1|$  common from the first fraction.

Similarly, we take 3 common from the third fraction as 3 is bigger than  $|z + 3|$ .

$$\begin{aligned} \Rightarrow f(z) &= \frac{1}{z+1} \left[ \frac{1}{1 - \left( \frac{1}{z+1} \right)} \right] - \frac{3}{z+1} - \frac{2}{3} \left[ \frac{1}{1 - \left( \frac{z+1}{3} \right)} \right] \\ &= \frac{1}{(z+1)} \left( 1 - \frac{1}{z+1} \right)^{-1} - \frac{3}{z+1} - \frac{2}{3} \left\{ 1 - \left( \frac{z+1}{3} \right) \right\}^{-1} \\ &= \frac{1}{z+1} \left[ 1 + \frac{1}{z+1} + \frac{1}{(z+1)^2} + \frac{1}{(z+1)^3} + \dots \right] \\ &\quad - \frac{3}{z+1} - \frac{2}{3} \left[ 1 + \frac{z+1}{3} + \frac{(z+1)^2}{9} + \frac{(z+1)^3}{27} + \dots \right] \end{aligned}$$

Which is the required Laurent expansion.

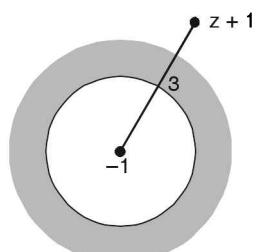

(iii)  $|z + 1| > 3$ .

$$f(z) = \frac{1}{(z+1)-1} - \frac{3}{(z+1)} + \frac{2}{(z+1)-3}$$

Taking common bigger term out of  $|z + 1|$  and 3 here  $|z + 1|$  is greater than 3, so we take  $|z + 1|$  common from third fraction.

Similarly,  $|z + 1|$  is also greater than 1, so we take  $|z + 1|$  common from the first fraction.

$$\begin{aligned} f(z) &= \frac{1}{z+1} \left( \frac{1}{1 - \frac{1}{z+1}} \right) - \frac{3}{z+1} + \frac{2}{z+1} \left( \frac{1}{1 - \frac{3}{z+1}} \right) \\ \Rightarrow f(z) &= \frac{1}{z+1} \left( 1 - \frac{1}{z+1} \right)^{-1} - \frac{3}{z+1} + \frac{2}{z+1} \left( 1 - \frac{3}{z+1} \right)^{-1} \\ &= \frac{1}{z+1} \left[ 1 + \frac{1}{z+1} + \frac{1}{(z+1)^2} + \frac{1}{(z+1)^3} + \dots \right] \\ &\quad - \frac{3}{z+1} + \frac{2}{z+1} \left[ 1 + \frac{3}{z+1} + \frac{9}{(z+1)^2} + \frac{27}{(z+1)^3} + \dots \right] \end{aligned}$$

Which is the required Laurent expansion.

**Ans.**

## EXERCISE 30.3

1. Find the Taylor's and Laurent series which represents the function  $\frac{z^2 - 1}{(z+2)(z+3)}$  when  
 (i)  $|z| < 2$       (ii)  $2 < |z| < 3$ .

$$\text{Ans. (i)} \quad -\frac{1}{6} + \frac{5}{36}z + \frac{17}{216}z^2 - \frac{115}{1296}z^3 + \dots \quad \text{(ii)} \quad -\frac{5}{3} + \frac{3}{z} - \frac{6}{z^2} + \frac{12}{z^3} - \frac{24}{z^4} + \dots \frac{8z}{9} - \frac{8z^2}{27} + \frac{8z^3}{81} + \dots$$

2. Find four terms of the Laurent series expansion valid in the region  $0 < |z-1| < 1$  for the function  
 $f(z) = \frac{2z+1}{z^3+z^2-2z}$

$$\text{Ans. } -\frac{1}{2}[1 - (z-1) + (z-1)^2 - (z-1)^3 + \dots] - \frac{1}{6}\left[1 - \frac{z-1}{3} + \frac{(z-1)^2}{9} - \frac{(z-1)^3}{27} + \dots\right] + \frac{1}{z-1}$$

3. Expand  $\frac{z}{(z^2-1)(z^2+4)}$  in  $1 < |z| < 2$

$$\text{Ans. } \frac{1}{10}\left[\left(\frac{2}{z} + \frac{2}{z^3} + \frac{2}{z^5} + \dots\right) - \left(\frac{z}{2} + \frac{z^3}{8} + \dots\right)\right]$$

4. Represent the function  $f(z) = \frac{4z+3}{z(z-3)(z+2)}$  in Laurent series

(i) within  $|z| = 1$  (ii) in the annular region between  $|z| = 2$  and  $|z| = 3$ .

$$\text{Ans. (i)} \quad -\frac{1}{2z} + \sum_{n=0}^{\infty} \left[ (-1)^{n+1} \frac{1}{2^{n+2}} - \frac{1}{3^{n+1}} \right] z^n. \quad \text{(ii)} \quad -\frac{1}{2z} - \frac{1}{2z} \sum_{n=0}^{\infty} (-1)^n \left( \frac{2}{z} \right)^n - \frac{1}{3} \sum_{n=0}^{\infty} \left( \frac{z}{3} \right)^n.$$

5. Write all possible Laurent Series for the function  $f(z) = \frac{z^2}{(z-1)^2(z+3)}$  about the singularity  $z = 1$ , stating the region of convergence in each case.

$$\text{Ans. When } |z-1| > 4, \frac{1}{z-1} - \frac{2}{(z-1)^2} + \frac{9}{(z-1)^3} - \frac{36}{(z-1)^4} + \dots$$

$$\text{When } 0 < |z-1| < 4, \frac{1}{4} \left[ 1 - \frac{1}{(z-1)^2} + \frac{7}{4} \frac{1}{z-1} + \frac{9}{16} - \frac{9}{64} (z-1) - \dots \right]$$

6. Obtain the expansion

$$f(z) = f(a) + 2 \left\{ \frac{z-a}{2} f' \left( \frac{z+a}{2} \right) + \frac{(z-a)^3}{2^3 \cdot 3!} f''' \left( \frac{z+a}{2} \right) + \frac{(z-a)^5}{2^5 \cdot 5!} f'''' \left( \frac{z+a}{2} \right) + \dots \right\}$$

7. Expand  $\frac{z^2 - 6z - 1}{(z-1)(z+2)(z-3)}$  in  $3 < |z+2| < 5$ .

$$\text{Ans. } \frac{2}{z+2} + \frac{3}{(z+2)^2} + \frac{3^2}{(z+2)^3} + \dots + \frac{1}{5} \left[ 1 + \frac{z+2}{5} + \frac{(z+2)^2}{5} + \frac{(z+2)^3}{5^3} + \dots \right]$$

9. Find Taylor expansion of  $f(z) = \frac{2z^3 + 1}{z^2 + z}$  about the point  $z = i$ . [ Hint.  $f(z) = 2z - 2 + \frac{1}{z} + \frac{1}{z+1}$  ]

$$\text{Ans. } \left( \frac{i}{2} - \frac{3}{2} \right) + \left( 3 + \frac{i}{2} \right) (z-i) + \sum_{n=2}^{\infty} (-1)^n \left\{ \frac{1}{(1+i)^{n+1}} + \frac{1}{(i)^{n+1}} \right\} (z-i)^n$$

10. Find the Laurent's series of  $f(z) = \frac{1}{z^2(1-z^2)}$  and determine the precise region of its convergence.

(AMIETE, Dec. 2010)

**CHAPTER**  
**31**

## THE CALCULUS OF RESIDUES (INTEGRATION)

---

### 31.1 ZERO OF ANALYTIC FUNCTION

A zero of analytic function  $f(z)$  is the value of  $z$  for which  $f(z) = 0$ .

**Example 1.** Find out the zeros and discuss the nature of the singularities of

$$f(z) = \frac{(z-2)}{z^2} \sin\left(\frac{1}{z-1}\right) \quad (\text{R.G.P.V. Bhopal, III Semester, Dec. 2004})$$

**Solution.** Poles of  $f(z)$  are given by equating to zero the denominator of  $f(z)$  i.e.  $z = 0$  is a pole of order two.

zeros of  $f(z)$  are given by equating to zero the numerator of  $f(z)$  i.e.,  $(z-2) \sin\left(\frac{1}{z-1}\right) = 0$

$$\Rightarrow \quad \text{Either } z - 2 = 0 \quad \text{or} \quad \sin\left(\frac{1}{z-1}\right) = 0$$

$$\Rightarrow \quad z = 2 \quad \text{and} \quad \frac{1}{z-1} = n\pi$$

$$\Rightarrow \quad z = 2, \quad z = \frac{1}{n\pi} + 1, \quad n = \pm 1, \pm 2, \dots$$

Thus,  $z = 2$  is a simple zero. The limit point of the zeros are given by

$$z = \frac{1}{n\pi} + 1 \quad (n = \pm 1, \pm 2, \dots) \text{ is } z = 1.$$

Hence  $z = 1$  is an isolated essential singularity.

Ans.

### 31.2 SINGULAR POINT

A point at which a function  $f(z)$  is not analytic is known as a singular point or **singularity** of the function.

*For example,* the function  $\frac{1}{z-2}$  has a singular point at  $z - 2 = 0$  or  $z = 2$ .

**Isolated singular point.** If  $z = a$  is a singularity of  $f(z)$  and if there is no other singularity within a small circle surrounding the point  $z = a$ , then  $z = a$  is said to be an isolated singularity of the function  $f(z)$ ; otherwise it is called non-isolated.

*For example,* the function  $\frac{1}{(z-1)(z-3)}$  has two isolated singular points, namely  $z = 1$  and  $z = 3$ .  $[(z-1)(z-3) = 0 \text{ or } z = 1, 3]$ .

**Example of non-isolated singularity.** Function  $\frac{1}{\sin \frac{\pi}{z}}$  is not analytic at the points where  $\sin \frac{\pi}{z} = 0$ , i.e., at the points  $\frac{\pi}{z} = n\pi$  i.e., the points  $z = \frac{1}{n}$  ( $n = 1, 2, 3, \dots$ ). Thus  $z = 1, \frac{1}{2}, \frac{1}{3}, \dots, z = 0$  are the points of singularity.  $z = 0$  is the **non-isolated singularity** of the function  $\frac{1}{\sin \frac{\pi}{z}}$  because in the neighbourhood of  $z = 0$ , there are infinite number of other singularities  $z = \frac{1}{n}$ , where  $n$  is very large.

**Pole of order  $m$ .** Let a function  $f(z)$  have an isolated singular point  $z = a$ ,  $f(z)$  can be expanded in a Laurent's series around  $z = a$ , giving

$$\begin{aligned} f(z) &= a_0 + a_1(z-a) + a_2(z-a)^2 + \dots \\ &\quad + \frac{b_1}{z-a} + \frac{b_2}{(z-a)^2} + \dots + \frac{b_m}{(z-a)^m} + \frac{b_{m+1}}{(z-a)^{m+1}} + \frac{b_{m+2}}{(z-a)^{m+2}} + \dots \end{aligned} \quad \dots (1)$$

In some cases it may happen that the coefficients  $b_{m+1} = b_{m+2} = b_{m+3} = 0$ , then (1) reduces to

$$\begin{aligned} f(z) &= a_0 + a_1(z-a) + a_2(z-a)^2 + \dots + \frac{b_1}{(z-a)} + \frac{b_2}{(z-a)^2} + \dots + \frac{b_m}{(z-a)^m} \\ f(z) &= a_0 + a_1(z-a) + a_2(z-a)^2 + \dots + \frac{1}{(z-a)^m} \{b_1(z-a)^{m-1} + b_2(z-a)^{m-2} \\ &\quad + b_3(z-a)^{m-3} + \dots + b_m\} \end{aligned}$$

then  $z = a$  is said to be a **pole of order  $m$**  of the function  $f(z)$ , when  $m = 1$ , the pole is said to be **simple pole**. In this case

$$f(z) = a_0 + a_1(z-a) + a_2(z-a)^2 + \dots + \frac{b_1}{z-a}$$

If the number of the terms of negative powers in expansion (1) is infinite, then  $z = a$  is called an essential singular point of  $f(z)$ .

**Example 2.** Define the singularity of a function. Find the singularity (ties) of the functions

$$(i) \quad f(z) = \sin \frac{1}{z} \quad (ii) \quad g(z) = \frac{e^z}{z^2} \quad (\text{U.P. III Semester, 2009-2010})$$

**Solution.** See Art. 31.2 on page 793 for definition.

(i) We know that

$$\sin \frac{1}{z} = \frac{1}{z} - \frac{1}{3! z^3} + \frac{1}{5! z^5} + \dots + (-1)^n \frac{1}{(2n+1)! z^{2n+1}}$$

Obviously, there is a number of singularity.

$$\sin \frac{1}{z} \text{ is not analytic at } z = 0. \quad \left( \frac{1}{z} = \infty \text{ at } z = 0 \right)$$

Hence,  $\sin \frac{1}{z}$  has a singularity at  $z = 0$ .

$$(ii) \quad \text{Here, we have } g(z) = \frac{e^z}{z^2}$$

$$\text{We know that, } \left( \frac{1}{z^2} \right) \left( e^z \right) = \frac{1}{z^2} \left( 1 + \frac{1}{z} + \frac{1}{2! z^2} + \frac{1}{3! z^3} + \dots + \frac{1}{n! z^n} + \dots \right)$$

$$= \frac{1}{z^2} + \frac{1}{z^3} + \frac{1}{2! z^4} + \frac{1}{3! z^5} + \dots + \frac{1}{n! z^{n+2}} + \dots$$

Here,  $f(z)$  has infinite number of terms in negative powers of  $z$ .

Hence,  $f(z)$  has essential singularity at  $z = 0$ .

Ans.

**Example 3.** Find the pole of the function  $\frac{e^{z-a}}{(z-a)^2}$

$$\text{Solution. } \frac{e^{z-a}}{(z-a)^2} = \frac{1}{(z-a)^2} \left[ 1 + (z-a) + \frac{(z-a)^2}{2!} + \dots \right]$$

The given function has negative power 2 of  $(z-a)$ .

So, the given function has a pole at  $z = a$  of order 2.

Ans.

**Example 4.** Find the poles of  $f(z) = \sin\left(\frac{1}{z-a}\right)$

$$\text{Solution. } \sin\left(\frac{1}{z-a}\right) = \frac{1}{z-a} - \frac{1}{3!} \frac{1}{(z-a)^3} + \frac{1}{5!} \frac{1}{(z-a)^5} - \dots$$

The given function  $f(z)$  has infinite number of terms in the negative powers of  $z-a$ .

So,  $f(z)$  has essential singularity at  $z = a$ .

Ans.

**Example 5.** Find the pole of  $f(z) = \frac{\sin(z-a)}{(z-a)^4}$

$$\begin{aligned} \text{Solution. } \frac{\sin(z-a)}{(z-a)^4} &= \frac{1}{(z-a)^4} \left[ (z-a) - \frac{(z-a)^3}{3!} + \frac{(z-a)^5}{5!} - \frac{(z-a)^7}{7!} + \dots \right] \\ &= \frac{1}{(z-a)^3} \left[ 1 - \frac{(z-a)^2}{3!} + \frac{(z-a)^4}{5!} - \frac{(z-a)^6}{7!} + \dots \right] \end{aligned}$$

The given function has a negative power 3 of  $(z-a)$ .

So,  $f(z)$  has a pole at  $z = a$  of order 3.

Ans.

**Example 6.** Prove that  $f(z) = \lim_{z \rightarrow a} e^{\frac{1}{z-a}}$  does not exist.

$$\text{Solution. } \lim_{z \rightarrow a} e^{\frac{1}{z-a}} = \lim_{z \rightarrow a} \left( 1 + \frac{1}{z-a} + \frac{1}{2!(z-a)^2} + \frac{1}{3!(z-a)^3} + \dots + \frac{1}{n!(z-a)^n} + \dots \infty \right)$$

Here  $n \rightarrow \infty$ ,  $f(z)$  has infinite number of terms in negative power of  $(z-a)$ .

Thus,  $f(z)$  has essential singularity at  $z = a$ .

$$\text{Hence, } f(z) = \lim_{z \rightarrow a} e^{\frac{1}{z-a}} \text{ does not exist.}$$

Ans.

**Example 7.** Discuss singularity of  $\frac{1}{1-e^z}$  at  $z = 2\pi i$ .

$$\text{Solution. We have, } f(z) = \frac{1}{1-e^z}$$

The poles are determined by putting the denominator equal to zero.

$$\text{i.e., } 1 - e^z = 0$$

$$\Rightarrow e^z = 1 = (\cos 2n\pi + i \sin 2n\pi) = e^{2n\pi i}$$

$$\Rightarrow z = 2n\pi i$$

$$(n = 0, \pm 1, \pm 2, \dots)$$

Clearly  $z = 2\pi i$  is a simple pole.

Ans.

**Example 8.** Discuss singularity of  $\frac{\cot \pi z}{(z-a)^2}$  at  $z = a$  and  $z = \infty$ .

(R.G.P.V., Bhopal, III Semester, Dec. 2002)

**Solution.** Let  $f(z) = \frac{\cot \pi z}{(z-a)^2} = \frac{\cos \pi z}{\sin \pi z (z-a)^2}$

The poles are given by putting the denominator equal to zero.

i.e.,  $\sin \pi z (z-a)^2 = 0 \Rightarrow (z-a)^2 = 0 \text{ or } \sin \pi z = 0 = \sin n\pi$

$$\Rightarrow z = a, \pi z = n\pi, \quad (n \in \mathbb{I})$$

$$\Rightarrow z = a, n$$

$f(z)$  has essential singularity at  $z = \infty$ .

Also,  $z = a$  being repeated twice gives the double pole.

**Ans.**

**Example 9.** Show that  $e^{-\left(\frac{1}{z^2}\right)}$  has no singularities.

**Solution.**  $f(z) = e^{-\left(\frac{1}{z^2}\right)} = \frac{1}{e^{(1/z^2)}}$

The poles are determined by putting the denominator

$$e^{\left(\frac{1}{z^2}\right)} = 0 \quad \dots(1)$$

It is not possible to find the value of  $z$  which can satisfy equation (1).

Hence, there is no pole or singularity of the given function.

**Proved.**

**Example 10.** Find the nature of singularities of

$$f(z) = \frac{z - \sin z}{z^3} \text{ at } z = 0.$$

**Solution.**  $f(z) = \frac{1}{z^3}(z - \sin z) = \frac{1}{z^3} \left[ z - \left( z - \frac{z^3}{3!} + \frac{z^5}{5!} - \frac{z^7}{7!} + \dots \right) \right]$

$$= \frac{1}{z^3} \left( \frac{z^3}{3!} - \frac{z^5}{5!} + \frac{z^7}{7!} - \dots \right) = \frac{1}{3!} - \frac{z^2}{5!} + \frac{z^4}{7!} - \dots$$

There is no negative power of  $z$ ;

Hence, there is no pole.

**Ans.**

**Example 11.** Determine the poles of the function  $z$

$$f(z) = \frac{1}{z^4 + 1} \quad (\text{R.G.P.V., Bhopal, III Semester, June 2003})$$

**Solution.**  $f(z) = \frac{1}{z^4 + 1}$

The poles of  $f(z)$  are determined by putting the denominator equal to zero.

i.e.,  $z^4 + 1 = 0 \Rightarrow z^4 = -1$

$$z = (-1)^{\frac{1}{4}} = (\cos \pi + i \sin \pi)^{\frac{1}{4}}$$

$$= [\cos(2n+1)\pi + i \sin(2n+1)\pi]^{\frac{1}{4}} \quad [\text{By De Moivre's theorem}]$$

$$= \left[ \cos \frac{(2n+1)\pi}{4} + i \sin \frac{(2n+1)\pi}{4} \right]$$

$$\begin{aligned}
 \text{If } n = 0, \text{ Pole at} & \quad z = \left[ \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right] = \left( \frac{1}{\sqrt{2}} + i \frac{1}{\sqrt{2}} \right) \\
 \text{If } n = 1, \text{ Pole at} & \quad z = \left[ \cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4} \right] = \left( -\frac{1}{\sqrt{2}} + i \frac{1}{\sqrt{2}} \right) \\
 \text{If } n = 2, \text{ Pole at} & \quad z = \left[ \cos \frac{5\pi}{4} + i \sin \frac{5\pi}{4} \right] = \left( -\frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right) \\
 \text{If } n = 3, \text{ Pole at} & \quad z = \left[ \cos \frac{7\pi}{4} + i \sin \frac{7\pi}{4} \right] = \left( \frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right) \quad \text{Ans.}
 \end{aligned}$$

**Example 12.** Show that the function  $e^z$  has an isolated essential singularity at  $z = \infty$ .  
(R.G.P.V., Bhopal, III Semester, Dec. 2003)

**Solution.** Let  $f(z) = e^z$

$$\text{Putting } z = \frac{1}{t}, \text{ we get } f\left(\frac{1}{t}\right) = e^{\frac{1}{t}} = 1 + \frac{1}{t} + \frac{1}{2!t^2} + \frac{1}{3!t^3} + \dots$$

Here, the principal part of  $f\left(\frac{1}{t}\right)$ :

$$\frac{1}{t} + \frac{1}{2!t^2} + \frac{1}{3!t^3} + \dots$$

Contains infinite number of terms.

Hence  $t = 0$  is an isolated essential singularity of  $e^{\frac{1}{t}}$  and  $z = \infty$  is an isolated essential singularity of  $e^z$ .  
**Ans.**

### EXERCISE 31.1

**Find the poles or singularity of the following functions:**

1.  $\frac{1}{(z-2)(z-3)}$  **Ans.** 2 simple poles at  $z = 2$  and  $z = 3$ .
2.  $\frac{e^z}{(z-2)^3}$  **Ans.** Pole at  $z = 2$  of order 3.
3.  $\frac{1}{\sin z - \cos z}$  **Ans.** Simple pole at  $z = \frac{\pi}{4}$
4.  $\cot \frac{1}{z}$  **Ans.** Essential singularity at  $z = 0$
5.  $z \operatorname{cosec} z$  **Ans.** Non-isolated essential singularity
6.  $\sin \frac{1}{z}$  **Ans.** Essential singularity

**Choose the correct alternative :**

7. Let  $f(z) = \frac{1}{(z-2)^4(z+3)^6}$ , then  $z = 2$  and  $z = -3$  are the poles of order :  
(a) 6 and 4      (b) 2 and 3      (c) 3 and 4      (d) 4 and 6      **Ans. (d)**  
(R.G.P.V., Bhopal III Semester, June 2007)

### 31.3 THEOREM

If  $f(z)$  has a pole at  $z = a$ , then  $|f(z)| \rightarrow \infty$  as  $z \rightarrow a$ .

**Proof.** Let  $z = a$  be a pole of order  $m$  of  $f(z)$ . Then by Laurent's theorem

$$\begin{aligned}
 f(z) &= \sum_0^{\infty} a_n (z-a)^n + \sum_1^m b_n (z-a)^{-n} \\
 &= \sum_0^{\infty} a_n (z-a)^n + \frac{b_1}{z-a} + \frac{b_2}{(z-a)^2} + \dots + \frac{b_m}{(z-a)^m}
 \end{aligned}$$

$$\begin{aligned}
 &= \sum_{n=0}^{\infty} a_n (z-a)^n + \frac{1}{(z-a)^m} [b_1(z-a)^{m-1} + b_2(z-a)^{m-2} + \dots + b_{m-1}(z-a) + b_m] \\
 &= \sum_{n=0}^{\infty} a_n (z-a)^n + \frac{\varphi(z)}{(z-a)^m}
 \end{aligned}$$

Now  $\varphi(z) \rightarrow b_m$  as  $z \rightarrow a$ .

Hence  $|f(z)| \rightarrow \infty$  as  $z \rightarrow a$ .

**Proved.**

**Example 13.** If an analytic function  $f(z)$  has a pole of order  $m$  at  $z = a$ , then  $\frac{1}{f(z)}$  has a zero of order  $m$  at  $z = a$ .

**Solution.** If  $f(z)$  has a pole of order  $m$  at  $z = a$ , then

$$\begin{aligned}
 f(z) &= \frac{\varphi(z)}{(z-a)^m} \quad \text{where } \varphi(z) \text{ is analytic and non-zero at } z = a. \\
 \therefore \quad \frac{1}{f(z)} &= \frac{(z-a)^m}{\varphi(z)}
 \end{aligned}$$

Clearly,  $\frac{1}{f(z)}$  has a zero of order  $m$  at  $z = a$ , since  $\varphi(a) \neq 0$ .

### 31.4 DEFINITION OF THE RESIDUE AT A POLE

Let  $z = a$  be a pole of order  $m$  of a function  $f(z)$  and  $C_1$  circle of radius  $r$  with centre at  $z = a$  which does not contain any other singularities except at  $z = a$  then  $f(z)$  is analytic within the annulus  $r < |z - a| < R$  can be expanded within the annulus. Laurent's series:

$$f(z) = \sum_{n=0}^{\infty} a_n (z-a)^n + \sum_{n=1}^{\infty} b_n (z-a)^{-n} \quad \dots(1)$$

where

$$a_n = \frac{1}{2\pi i} \int_C \frac{f(z) dz}{(z-a)^{n+1}} \quad \dots(2)$$

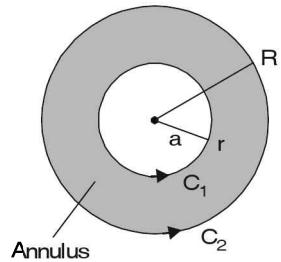

and

$$b_n = \frac{1}{2\pi i} \int_{C_1} \frac{f(z) dz}{(z-a)^{-n+1}} \quad \dots(3)$$

$|z - a| = r$  being the circle  $C_1$ .

$$\text{Particularly, } b_1 = \frac{1}{2\pi i} \int_{C_1} f(z) dz$$

The coefficient  $b_1$  is called residue of  $f(z)$  at the pole  $z = a$ . It is denoted by symbol  
 $\text{Res. } (z = a) = b_1$ .

### 31.5 RESIDUE AT INFINITY

Residue of  $f(z)$  at  $z = \infty$  is defined as  $-\frac{1}{2\pi i} \int_C f(z) dz$  where the integration is taken round  $C$  in anti-clockwise direction.

where  $C$  is a large circle containing all finite singularities of  $f(z)$ .

### 31.6 METHOD OF FINDING RESIDUES

#### (a) Residue at simple pole

(i) If  $f(z)$  has a simple pole at  $z = a$ , then

$$\text{Res } f(a) = \lim_{z \rightarrow a} (z-a)f(z)$$

$$\text{Proof. } f(z) = a_0 + a_1(z-a) + a_2(z-a)^2 + \dots + \frac{b_1}{z-a}$$

$$\Rightarrow (z-a)f(z) = a_0(z-a) + a_1(z-a)^2 + a_2(z-a)^3 + \dots + b_1$$

$$\Rightarrow b_1 = (z-a)f(z) - [a_0(z-a) + a_1(z-a)^2 + a_2(z-a)^3 + \dots]$$

Taking limit as  $z \rightarrow a$ , we have  $b_1 = \lim_{z \rightarrow a} (z-a)f(z)$

$$\text{Res (at } z = a) = \lim_{z \rightarrow a} (z-a)f(z)$$

**Proved.**

(ii) If  $f(z)$  is of the form  $f(z) = \frac{\phi(z)}{\psi(z)}$  where  $\psi(a) = 0$ , but  $\phi(a) \neq 0$

$$\text{Res (at } z = a) = \frac{\phi(a)}{\psi'(a)}$$

**Proof .**  $f(z) = \frac{\phi(z)}{\psi(z)}$

$$\begin{aligned} \text{Res (at } z = a) &= \lim_{z \rightarrow a} (z-a)f(z) = \lim_{z \rightarrow a} (z-a) \frac{\phi(z)}{\psi(z)} \\ &= \lim_{z \rightarrow a} \frac{(z-a)[\phi(a) + (z-a)\phi'(a) + \dots]}{\psi(a) + (z-a)\psi'(a) + \frac{(z-a)^2}{2!}\psi''(a) + \dots} \quad (\text{By Taylor's Theorem}) \\ &= \lim_{z \rightarrow a} \frac{(z-a)[\phi(a) + (z-a)\phi'(a) + \dots]}{(z-a)\psi'(a) + \frac{(z-a)^2}{2!}\psi''(a) + \dots} \quad [\text{since } \psi(a) = 0] \\ &= \lim_{z \rightarrow a} \frac{\phi(a) + (z-a)\phi'(a) + \dots}{\psi'(a) + \frac{z-a}{2!}\psi''(a) + \dots} \\ \text{Res (at } z = a) &= \frac{\phi(a)}{\psi'(a)} \end{aligned}$$

**Proved.**

(b) **Residue at a pole of order  $n$ .** If  $f(z)$  has a pole of order  $n$  at  $z = a$ , then

$$\text{Res (at } z = a) = \frac{1}{(n-1)!} \left\{ \frac{d^{n-1}}{dz^{n-1}} [(z-a)^n f(z)] \right\}_{z=a}$$

**Proof.** If  $z = a$  is a pole of order  $n$  of function  $f(z)$ , then by Laurent's theorem

$$f(z) = a_0 + a_1(z-a) + a_2(z-a)^2 + \dots + \frac{b_1}{z-a} + \frac{b_2}{(z-a)^2} + \dots + \frac{b_n}{(z-a)^n}$$

Multiplying by  $(z-a)^n$ , we get

$$(z-a)^n f(z) = a_0(z-a)^n + a_1(z-a)^{n+1} + a_2(z-a)^{n+2} + \dots$$

$$+ b_1(z-a)^{n-1} + b_2(z-a)^{n-2} + b_3(z-a)^{n-3} + \dots + b_n$$

Differentiating both sides w.r.t. 'z'  $n-1$  times and putting  $z = a$ , we get

$$\left\{ \frac{d^{n-1}}{dz^{n-1}} [(z-a)^n f(z)] \right\}_{z=a} = (n-1)! b_1$$

$$\Rightarrow b_1 = \frac{1}{(n-1)!} \left\{ \frac{d^{n-1}}{dz^{n-1}} [(z-a)^n f(z)] \right\}_{z=a}$$

$$\text{Residue } f(a) = \frac{1}{(n-1)!} \left\{ \frac{d^{n-1}}{dz^{n-1}} [(z-a)^n f(z)] \right\}_{z=a}$$

(c) **Residue at a pole  $z = a$  of any order (simple or of order  $m$ )**

$$\text{Res } f(a) = \text{coefficient of } \frac{1}{t}$$

**Proof.** If  $f(z)$  has a pole of order  $m$ , then by Laurent's theorem

$$f(z) = a_0 + a_1(z-a) + a_2(z-a)^2 + \dots + \frac{b_1}{z-a} + \frac{b_2}{(z-a)^2} + \dots + \frac{b_m}{(z-a)^m}$$

If we put  $z - a = t$  or  $z = a + t$ , then

$$f(a+t) = a_0 + a_1t + a_2t^2 + \dots + \frac{b_1}{t} + \frac{b_2}{t^2} + \dots + \frac{b_m}{t^m}$$

$$\text{Res } f(a) = b_1, \text{ Res } f(a) = \text{coefficient of } \frac{1}{t}$$

**Rule.** Put  $z = a + t$  in the function  $f(z)$ , expand it in powers of  $t$ . Coefficient of  $\frac{1}{t}$  is the residue of  $f(z)$  at  $z = a$ .

$$(d) \text{ Residue of } f(z) \text{ at } z = \infty = \lim_{z \rightarrow \infty} \{-z f(z)\}$$

$$\text{or} \quad \text{The residue of } f(z) \text{ at infinity} = -\frac{1}{2\pi i} \int_c f(z) dz$$

### 31.7 RESIDUE BY DEFINITION

**Example 14.** Find the residue at  $z = 0$  of  $z \cos \frac{1}{z}$ .

**Solution.** Expanding the function in powers of  $\frac{1}{z}$ , we have

$$z \cos \frac{1}{z} = z \left[ 1 - \frac{1}{2z^2} + \frac{1}{4!z^4} - \dots \right] = z - \frac{1}{2z} + \frac{1}{24z^3} - \dots$$

This is the Laurent's expansion about  $z = 0$ .

The coefficient of  $\frac{1}{z}$  in it is  $-\frac{1}{2}$ . So the residue of  $z \cos \frac{1}{z}$  at  $z = 0$  is  $-\frac{1}{2}$ . **Ans.**

**Example 15.** Find the residue of  $f(z) = \frac{z^3}{z^2 - 1}$  at  $z = \infty$ .

**Solution.** We have,  $f(z) = \frac{z^3}{z^2 - 1}$

$$f(z) = \frac{z^3}{z^2 \left( 1 - \frac{1}{z^2} \right)} = z \left( 1 - \frac{1}{z^2} \right)^{-1} = z \left( 1 + \frac{1}{z^2} + \frac{1}{z^4} + \dots \right) = z + \frac{1}{z} + \frac{1}{z^3} + \dots$$

$$\text{Residue at infinity} = -\left( \text{coeff. of } \frac{1}{z} \right) = -1. \quad \text{Ans.}$$

### 31.8 FORMULA: RESIDUE = $\lim_{z \rightarrow a} (z - a) f(z)$

**Example 16.** Determine the pole and residue at the pole of the function  $f(z) = \frac{z}{z-1}$

**Solution.** The poles of  $f(z)$  are given by putting the denominator equal to zero.

$$\therefore z - 1 = 0 \Rightarrow z = 1$$

The function  $f(z)$  has a simple pole at  $z = 1$ .

Residue is calculated by the formula

$$\text{Residue} = \lim_{z \rightarrow a} (z - a) f(z)$$

$$\text{Residue of } f(z) \text{ at (at } z = 1) = \lim_{z \rightarrow 1} (z - 1) \left( \frac{z}{z - 1} \right) = \lim_{z \rightarrow 1} (z) = 1$$

Hence,  $f(z)$  has a simple pole at  $z = 1$  and residue at the pole is 1.

**Ans.**

**Example 17.** Determine the poles and the residue at simple pole of the function

$$f(z) = \frac{z^2}{(z-1)^2(z+2)}$$

**Solution.** The pole of  $f(z)$  are given by putting the denominator equal to zero.

$$(z-1)^2(z+2) = 0 \Rightarrow z = 1, 1, -2$$

The function  $f(z)$  has simple pole at  $z = -2$  and at  $z = 1$  pole of second order.

$$\begin{aligned} \text{Residue of } f(z) \text{ at } z = -2 \text{ is } &= \lim_{z \rightarrow -2} (z+2)f(z) \quad [\text{Residue} = \lim_{z \rightarrow a} (z-a)f(z)] \\ &= \lim_{z \rightarrow -2} (z+2) \frac{z^2}{(z-1)^2(z+2)} = \lim_{z \rightarrow -2} \frac{z^2}{(z-1)^2} = \frac{(-2)^2}{(-2-1)^2} = \frac{4}{9} \end{aligned}$$

Hence, residue at simple pole is  $\frac{4}{9}$ .

**Ans.**

**Example 18.** Find the order of each pole and residue at it of  $\frac{1-2z}{z(z-1)(z-2)}$ .

(R.G.P.V., Bhopal, III Semester, Dec. 2001)

$$\text{Solution. Let } f(z) = \frac{1-2z}{z(z-1)(z-2)}$$

The poles of  $f(z)$  are given by  $z(z-1)(z-2) = 0$

$\Rightarrow z = 0, 1, 2$  all are simple poles.

$$\begin{aligned} \text{Residue of } f(z) \text{ at } (z = 0) &= \lim_{z \rightarrow 0} (z-0)f(z) = \lim_{z \rightarrow 0} \frac{z(1-2z)}{z(z-1)(z-2)} \\ &= \lim_{z \rightarrow 0} \frac{1-2z}{(z-1)(z-2)} = \frac{1}{2} \end{aligned}$$

$$\text{Residue of } f(z) \text{ at } (z = 1) = \lim_{z \rightarrow 1} (z-1)f(z) = \lim_{z \rightarrow 1} \frac{(z-1)(1-2z)}{z(z-1)(z-2)} = \lim_{z \rightarrow 1} \frac{1-2z}{z(z-2)} = 1$$

$$\begin{aligned} \text{Residue of } f(z) \text{ at } (z = 2) &= \lim_{z \rightarrow 2} (z-2)f(z) = \lim_{z \rightarrow 2} \frac{(z-2)(1-2z)}{z(z-1)(z-2)} \\ &= \lim_{z \rightarrow 2} \frac{1-2z}{z(z-1)} = -\frac{3}{2} \end{aligned}$$

Hence, the residue of  $f(z)$  at  $z = 0, z = 1$  and  $z = 2$  are  $\frac{1}{2}, 1$  and  $-\frac{3}{2}$  respectively. **Ans.**

**Example 19.** Determine the residue of  $f(z) = \frac{z^3}{(z-1)^4(z-2)(z-3)}$  at its simple poles.

**Solution.** The poles of  $f(z)$  are determined by putting the denominator equal to zero.

$$\text{i.e. } (z-1)^4(z-2)(z-3) = 0$$

$$\Rightarrow z = 1, 1, 1, 1 \text{ and } z = 2 \text{ and } z = 3$$

The simple poles of the function  $f(z)$  are at  $z = 2$  and  $z = 3$ .

Pole at  $z = 2$

$$\begin{aligned} \text{Residue, } R(2) &= \lim_{z \rightarrow 2} (z-2) \frac{z^3}{(z-1)^4(z-2)(z-3)} \\ &\quad [\text{Residue } R(2) = \lim_{z \rightarrow 2} [(z-2)f(z)]] \\ &= \lim_{z \rightarrow 2} \frac{z^3}{(z-1)^4(z-3)} = \frac{(2)^3}{(1)^4(-1)} = -8 \end{aligned}$$

Pole at  $z = 3$

$$\begin{aligned}\text{Residue, } R(3) &= \lim_{z \rightarrow 3} (z - 3) \frac{z^3}{(z - 1)^4 (z - 2)(z - 3)} \\ &= \lim_{z \rightarrow 3} \frac{z^3}{(z - 1)^4 (z - 2)} = \frac{(3)^3}{(3 - 1)^4 (3 - 2)} = \frac{27}{16}\end{aligned}$$

Hence, residue at  $z = 2$  and  $z = 3$  are  $-8$  and  $\frac{27}{16}$  respectively. Ans.

**Example 20.** Evaluate the residues of  $\frac{z^2}{(z-1)(z-2)(z-3)}$  at  $z = 1, 2, 3$  and infinity and show that their sum is zero. (R.G.P.V., Bhopal, III Semester Dec. 2002)

$$\text{Solution. Let } f(z) = \frac{z^2}{(z-1)(z-2)(z-3)}$$

The poles of  $f(z)$  are determined by putting the denominator equal to zero.

$$\therefore (z-1)(z-2)(z-3) = 0 \Rightarrow z = 1, 2, 3$$

$$\begin{aligned}\text{Residue of } f(z) \text{ at } (z = 1) &= \lim_{z \rightarrow 1} (z-1) f(z) = \lim_{z \rightarrow 1} (z-1) \cdot \frac{z^2}{(z-1)(z-2)(z-3)} \\ &= \lim_{z \rightarrow 1} \frac{z^2}{(z-2)(z-3)} = \frac{1}{2}\end{aligned}$$

$$\begin{aligned}\text{Residue of } f(z) \text{ at } (z = 2) &= \lim_{z \rightarrow 2} (z-2) f(z) = \lim_{z \rightarrow 2} (z-2) \frac{z^2}{(z-1)(z-2)(z-3)} \\ &= \lim_{z \rightarrow 2} \frac{z^2}{(z-1)(z-3)} = \frac{4}{(1)(-1)} = -4\end{aligned}$$

$$\begin{aligned}\text{Residue of } f(z) \text{ at } (z = 3) &= \lim_{z \rightarrow 3} (z-3) f(z) \\ &= \lim_{z \rightarrow 3} (z-3) \frac{z^2}{(z-1)(z-2)(z-3)} = \lim_{z \rightarrow 3} \frac{z^2}{(z-1)(z-2)} = \frac{9}{2}\end{aligned}$$

$$\begin{aligned}\text{Residue of } f(z) \text{ at } (z = \infty) &= \lim_{z \rightarrow \infty} -z f(z) = \lim_{z \rightarrow \infty} \frac{-z(z^2)}{(z-1)(z-2)(z-3)} \\ &= \lim_{z \rightarrow \infty} \frac{-1}{\left(1 - \frac{1}{z}\right)\left(1 - \frac{2}{z}\right)\left(1 - \frac{3}{z}\right)} = -1\end{aligned}$$

$$\text{Sum of the residues at all the poles of } f(z) = \frac{1}{2} - 4 + \frac{9}{2} - 1 = 0$$

Hence, the sum of the residues is zero.

**Proved.**

**31.9 RESIDUE FORMULA:**  $f(a) = \frac{1}{(n-1)!} \left\{ \frac{d^{n-1}}{dz^{n-1}} [(z-a)^n f(z)] \right\}_{z=a}$

**Example 21.** Find the residue of a function

$$f(z) = \frac{z^2}{(z+1)^2 (z-2)} \text{ at its double pole.}$$

$$\text{Solution. We have, } f(z) = \frac{z^2}{(z+1)^2 (z-2)}$$

Poles are determined by putting denominator equal to zero.

$$i.e.; \quad (z+1)^2 (z-2) = 0$$

$$\Rightarrow z = -1, -1 \quad \text{and} \quad z = 2$$

The function has a double pole at  $z = -1$

$$\begin{aligned}\text{Residue at } (z = -1) &= \lim_{z \rightarrow -1} \frac{1}{(2-1)!} \left[ \frac{d}{dz} \left\{ (z+1)^2 \frac{z^2}{(z+1)^2 (z-2)} \right\} \right] \\ &= \left[ \frac{d}{dz} \left( \frac{z^2}{z-2} \right) \right]_{z=-1} = \left( \frac{(z-2)2z - z^2 \cdot 1}{(z-2)^2} \right)_{z=-1} = \left[ \frac{z^2 - 4z}{(z-2)^2} \right]_{z=-1} = \frac{(-1)^2 - 4(-1)}{(-1-2)^2} \\ \text{Residue at } (z = -1) &= \frac{1+4}{9} = \frac{5}{9}\end{aligned}$$

**Ans.**

**Example 22.** Find the residue of  $\frac{1}{(z^2 + 1)^3}$  at  $z = i$ .

**Solution.** Let  $f(z) = \frac{1}{(z^2 + 1)^3}$

The poles of  $f(z)$  are determined by putting denominator equal to zero.

i.e.;  $(z^2 + 1)^3 = 0$   
 $\Rightarrow (z+i)^3 (z-i)^3 = 0$   
 $\Rightarrow z = \pm i$

Here,  $z = i$  is a pole of order 3 of  $f(z)$ .

Residue at  $z = i$

$$\begin{aligned}&= \lim_{z \rightarrow i} \frac{1}{(3-1)!} \left\{ \frac{d^{3-1}}{dz^{3-1}} \left[ (z-i)^3 \frac{1}{(z^2+1)^3} \right] \right\} = \lim_{z \rightarrow i} \frac{1}{2!} \left\{ \frac{d^2}{dz^2} \left( \frac{1}{(z+i)^3} \right) \right\} \\ &= \lim_{z \rightarrow i} \frac{1}{2} \left( \frac{3 \times 4}{(z+i)^5} \right) = \frac{1}{2} \times \frac{12}{(i+i)^5} = \frac{6}{32i} = \frac{3}{16i} = -\frac{3i}{16}\end{aligned}$$

Hence, the residue of the given function at  $z = i$  is  $-\frac{3i}{16}$ .

**Ans.**

**31.10 FORMULA: RES. (AT  $z = a$ ) =  $\frac{\phi(a)}{\psi'(a)}$**

**Example 23.** Determine the poles and residue at each pole of the function  $f(z) = \cot z$ .

**Solution.**  $f(z) = \cot z = \frac{\cos z}{\sin z}$

The poles of the function  $f(z)$  are given by

$$\sin z = 0, \quad z = n\pi, \quad \text{where } n = 0, \pm 1, \pm 2, \pm 3\dots$$

$$\text{Residue of } f(z) \text{ at } z = n\pi \text{ is } = \frac{\cos z}{\frac{d}{dz}(\sin z)} = \frac{\cos z}{\cos z} = 1 \quad \left[ \text{Res. at } (z=a) = \frac{\phi(a)}{\psi'(a)} \right] \quad \text{Ans.}$$

**Example 24.** Determine the poles of the function and residue at the poles.

$$f(z) = \frac{z}{\sin z}$$

**Solution.**  $f(z) = \frac{z}{\sin z}$

Poles are determined by putting  $\sin z = 0 = \sin n\pi \Rightarrow z = n\pi$

$$\text{Residue} = \left( \frac{z}{\cos z} \right)_{z=n\pi} \quad \left[ \text{Residue} = \frac{\phi(a)}{\psi'(a)} \right]$$

$$= \frac{n\pi}{\cos n\pi} = \frac{n\pi}{(-1)^n}$$

Hence, the residue of the given function at pole  $z = n\pi$  is  $\frac{n\pi}{(-1)^n}$ .

**Ans.**

### 31.11 FORMULA: RESIDUE = COEFFICIENT OF $\frac{1}{t}$ IN $f(1+t)$

where  $z = \frac{1}{t}$

**Example 25.** Find the residue of  $\frac{z^3}{(z-1)^4(z-2)(z-3)}$  at a pole of order 4.

**Solution.** The poles of  $f(z)$  are determined by  $(z-1)^4(z-2)(z-3) = 0 \Rightarrow z = 1, 2, 3$   
Here  $z = 1$  is a pole of order 4.

$$f(z) = \frac{z^3}{(z-1)^4(z-2)(z-3)} \quad \dots(1)$$

Putting  $z-1=t$  or  $z=1+t$  in (1), we get

$$\begin{aligned} f(1+t) &= \frac{(1+t)^3}{t^4(t-1)(t-2)} = \frac{1}{t^4}(t^3 + 3t^2 + 3t + 1)(1-t)^{-1} \frac{1}{2}\left(1 - \frac{t}{2}\right)^{-1} \\ &= \frac{1}{2}\left(\frac{1}{t} + \frac{3}{t^2} + \frac{3}{t^3} + \frac{1}{t^4}\right)(1+t+t^2+t^3+\dots) \times \left(1 + \frac{t}{2} + \frac{t^2}{4} + \frac{t^3}{8} \dots\right) \\ &= \frac{1}{2}\left(\frac{1}{t} + \frac{3}{t^2} + \frac{3}{t^3} + \frac{1}{t^4}\right)\left(1 + \frac{3}{2}t + \frac{7}{4}t^2 + \frac{15}{8}t^3 + \dots\right) = \frac{1}{2}\left(\frac{1}{t} + \frac{9}{2t} + \frac{21}{4t} + \frac{15}{8t}\right) + \dots \\ &= \frac{1}{2}\left(1 + \frac{9}{2} + \frac{21}{4} + \frac{15}{8}\right)\frac{1}{t} \quad \left[\text{Res } f(a) = \text{coeffi. of } \frac{1}{t}\right] \end{aligned}$$

$$\text{Coefficient of } \frac{1}{t} = \frac{1}{2}\left(1 + \frac{9}{2} + \frac{21}{4} + \frac{15}{8}\right) = \frac{101}{16},$$

Hence, the residue of the given function at a pole of order 4 is  $\frac{101}{16}$ .

**Ans.**

**Example 26.** Find the residue of  $f(z) = \frac{ze^z}{(z-a)^3}$  at its pole.

**Solution.** The pole of  $f(z)$  is given by  $(z-a)^3 = 0$  i.e.,  $z = a$   
Here  $z = a$  is a pole of order 3.

Putting  $z-a=t$  where  $t$  is small.

$$\begin{aligned} f(z) &= \frac{ze^z}{(z-a)^3} \Rightarrow f(z) = \frac{(a+t)e^{a+t}}{t^3} = \left(\frac{a}{t^3} + \frac{1}{t^2}\right)e^{a+t} = e^a\left(\frac{a}{t^3} + \frac{1}{t^2}\right)e^t \quad (z = a + t) \\ &= e^a\left(\frac{a}{t^3} + \frac{1}{t^2}\right)\left(1 + \frac{t}{1!} + \frac{t^2}{2!} + \dots\right) = e^a\left[\frac{a}{t^3} + \frac{a}{t^2} + \frac{a}{2t} + \frac{1}{t^2} + \frac{1}{t} + \frac{1}{2} + \dots\right] \\ &= e^a\left[\frac{1}{2} + \left(\frac{a}{2} + 1\right)\frac{1}{t} + (a+1)\frac{1}{t^2} + (a)\frac{1}{t^3} + \dots\right] \end{aligned}$$

$$\text{Coefficient of } \frac{1}{t} = e^a\left(\frac{a}{2} + 1\right)$$

Hence the residue at  $z = a$  is  $e^a\left(\frac{a}{2} + 1\right)$ .

**Ans.**

**Example 27.** Find the sum of the residues of the function  $f(z) = \frac{\sin z}{z \cos z}$  at its poles inside the circle  $|z| = 2$ .

**Solution.** We have,

$$f(z) = \frac{\sin z}{z \cos z}$$

The pole can be determined by putting denominator

$$\begin{aligned} z \cos z &= 0 \\ \Rightarrow z &= 0, \pm \frac{\pi}{2}, \pm \frac{3\pi}{2}, \dots \end{aligned}$$

Of these poles only  $z = 0, z = \pm \frac{\pi}{2}$  lie inside a circle  $|z| = 2$ .

$$\text{Residue of } f(z) \text{ at } z = 0 \text{ is } \lim_{z \rightarrow 0} |z \cdot f(z)| = \lim_{z \rightarrow 0} \frac{\sin z}{\cos z} = 0 \quad \dots(1)$$

Residue of  $f(z)$  at  $z = \frac{\pi}{2}$  is

$$\begin{aligned} \lim_{z \rightarrow \frac{\pi}{2}} \left( z - \frac{\pi}{2} \right) f(z) &= \lim_{z \rightarrow \frac{\pi}{2}} \frac{\left( z - \frac{\pi}{2} \right) \sin z}{z \cos z} && \left[ \text{From } \frac{0}{0} \right] \\ &= \lim_{z \rightarrow \frac{\pi}{2}} \frac{\left( z - \frac{\pi}{2} \right) \cos z + \sin z}{\cos z - z \sin z} && [\text{By L' Hopital's Rule}] \\ &= \frac{1}{-\frac{\pi}{2}} = -\frac{2}{\pi} && \dots(2) \end{aligned}$$

Similarly, residue of  $f(z)$  at  $z = -\frac{\pi}{2}$  is  $\frac{2}{\pi}$  ...(3)

$$\therefore \text{Sum of the residues} = 0 - \frac{2}{\pi} + \frac{2}{\pi} = 0. \quad \text{Ans.}$$

### EXERCISE 31.2

1. Determine the poles of the following functions. Find the order of each pole.

$$(i) \frac{z^2}{(z-a)(z-b)(z-c)}$$

**Ans.** Simple poles at  $z = a, z = b, z = c$

$$(ii) \frac{z-3}{(z-2)^2(z+1)}$$

**Ans.** Pole at  $z = 2$  of second order and  $z = -1$  of first order.

$$(iii) \frac{ze^{iz}}{z^2+a^2}$$

**Ans.** Poles at  $z = \pm ia$ , order 1.

$$(iv) \frac{1}{(z-1)(z-2)}$$

**Ans.**  $z = 2, z = 1$

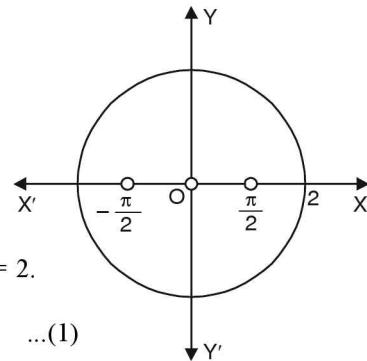

**Find the residue of**

$$2. \frac{z^3}{(z-2)(z-3)} \text{ at its poles.} \quad \text{Ans. } 27, -8$$

$$3. \frac{z^2}{z^2+a^2} \text{ at } z = ia. \quad \text{Ans. } \frac{1}{2}ia$$

$$4. \frac{1}{(z^2+a^2)^2} \text{ at } z = ia \quad \text{Ans. } -\frac{i}{4a^3}$$

$$5. \tan z \text{ at its pole.} \quad \text{Ans. } f\left(n + \frac{\pi}{2}\right) = -1 \text{ at its pole}$$

6.  $z^2 e^{1/z}$  at the point  $z = 0$ .      Ans.  $\frac{1}{6}$

7.  $z^2 \sin\left(\frac{1}{z}\right)$  at  $z = 0$       Ans.  $-\frac{1}{6}$

8.  $\frac{1}{z^2(z-i)}$  at  $z = i$       Ans. -1

9.  $\frac{e^{2z}}{1-e^z}$  at its pole      Ans. -1

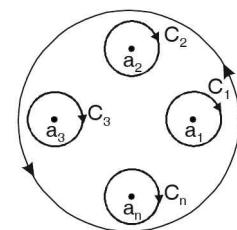

10.  $\frac{1+e^z}{\sin z + z \cos z}$  at  $z = 0$       Ans. 1

11.  $\frac{1}{z(e^z - 1)}$  at its poles      Ans.  $-\frac{1}{2}$

### 31.12 RESIDUE THEOREM

If  $f(z)$  is analytic in a closed curve  $C$ , except at a finite number of poles within  $C$ , then  $\int_c f(z) dz = 2\pi i$  (sum of residues at the poles within  $C$ ).

**Proof.** Let  $C_1, C_2, C_3, \dots, C_n$  be the non-intersecting circles with centres at  $a_1, a_2, a_3, \dots, a_n$  respectively, and radii so small that they lie entirely within the closed curve  $C$ . Then  $f(z)$  is analytic in the multiple connected region lying between the curves  $C$  and  $C_1, C_2, \dots, C_n$ .

Applying Cauchy's theorem

$$\begin{aligned} \int_c f(z) dz &= \int_{c_1} f(z) dz + \int_{c_2} f(z) dz + \int_{c_3} f(z) dz + \dots + \int_{c_n} f(z) dz \\ &= 2\pi i [\text{Res } f(a_1) + \text{Res } f(a_2) + \text{Res } f(a_3) + \dots + \text{Res } f(a_n)] \quad \text{Proved.} \end{aligned}$$

**Example 28.** Evaluate the following integral using residue theorem

$$\int_c \frac{1+z}{z(2-z)} dz$$

where  $c$  is the circle  $|z| = 1$ .

**Solution.** The poles of the integrand are given by putting the denominator equal to zero.

$$z(2-z) = 0 \text{ or } z = 0, 2$$

The integrand is analytic on  $|z| = 1$  and all points inside except  $z = 0$ , as a pole at  $z = 0$  is inside the circle  $|z| = 1$ . Hence by residue theorem

$$\int_c \frac{1+z}{z(2-z)} dz = 2\pi i [\text{Res } f(0)] \quad \dots (1)$$

$$\text{Residue } f(0) = \lim_{z \rightarrow 0} z \cdot \frac{1+z}{z(2-z)} = \lim_{z \rightarrow 0} \frac{1+z}{2-z} = \frac{1}{2}$$

Putting the value of Residue  $f(0)$  in (1), we get

$$\int_c \frac{1+z}{z(2-z)} dz = 2\pi i \left(\frac{1}{2}\right) = \pi i \quad \text{Ans.}$$

**Example 29.** Evaluate the following integral using residue theorem

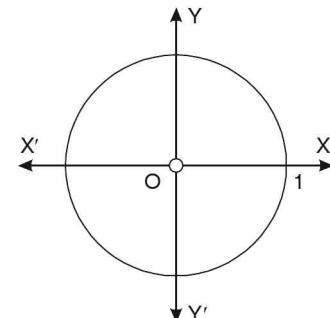

$$\int_c \frac{4-3z}{z(z-1)(z-2)} dz$$

$$\text{where } c \text{ is the circle } |z| = \frac{3}{2}.$$

**Solution.** The poles of the function  $f(z)$  are given by equating the denominator to zero.

$$z(z-1)(z-2) = 0, \quad z = 0, 1, 2$$

The function has poles at  $z = 0, z = 1$  and  $z = 2$  of which the

given circle encloses the pole at  $z = 0$  and  $z = 1$ .  
Residue of  $f(z)$  at the simple pole  $z = 0$  is

$$\begin{aligned} &= \lim_{z \rightarrow 0} z \frac{4 - 3z}{z(z-1)(z-2)} = \lim_{z \rightarrow 0} \frac{4 - 3z}{(z-1)(z-2)} \\ &= \frac{4 - 0}{(0-1)(0-2)} = 2 \end{aligned}$$

Residue of  $f(z)$  at the simple pole  $z = 1$  is

$$= \lim_{z \rightarrow 1} (z-1) \frac{4 - 3z}{z(z-1)(z-2)} = \lim_{z \rightarrow 1} \frac{4 - 3z}{z(z-2)} = \frac{4 - 3}{1(1-2)} = -1$$

By Cauchy's integral formula

$$\begin{aligned} \int_C f(z) dz &= 2\pi i \times \text{sum of the residue within } C \\ &= 2\pi i \times (2 - 1) = 2\pi i \end{aligned}$$

Ans.

**Example 30. Evaluate**

$$\int_C \frac{12z - 7}{(z-1)^2(2z+3)} dz, \text{ where } C \text{ is the circle}$$

$$(i) |z| = 2$$

$$(ii) |z + i| = \sqrt{3}$$

**Solution.** We have,  $f(z) = \frac{12z - 7}{(z-1)^2(2z+3)}$

Poles are given by

$$z = 1 \text{ (double pole)} \quad \text{and} \quad z = -\frac{3}{2} \text{ (simple pole)}$$

Residue at  $(z = 1)$  is

$$\begin{aligned} R_1 &= \frac{1}{(2-1)!} \left[ \frac{d}{dz} \left( (z-1)^2 \cdot \frac{12z-7}{(z-1)^2(2z+3)} \right) \right]_{z=1} \\ &= \left[ \frac{d}{dz} \left( \frac{12z-7}{2z+3} \right) \right]_{z=1} = \left[ \frac{(2z+3) \cdot 12 - (12z-7) \cdot 2}{(2z+3)^2} \right]_{z=1} \\ &= \frac{60-10}{25} = \frac{50}{25} = 2 \end{aligned}$$

Residue at simple pole  $\left(z = -\frac{3}{2}\right)$  is

$$\begin{aligned} R_2 &= \lim_{z \rightarrow -3/2} \left( z + \frac{3}{2} \right) \cdot \frac{12z-7}{(z-1)^2(2z+3)} \\ &= \lim_{z \rightarrow -3/2} \frac{1}{2} \cdot \frac{(12z-7)}{(z-1)^2} = -2. \end{aligned}$$

(i) The contour  $|z| = 2$  encloses both the poles 1 and  $-\frac{3}{2}$ .

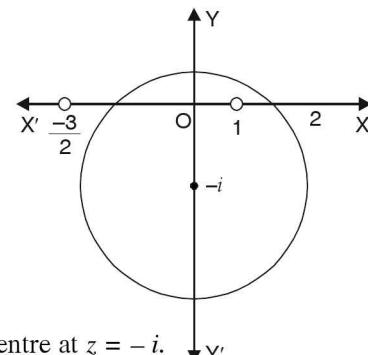

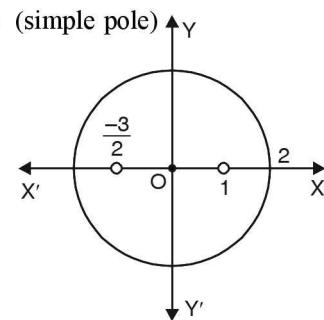

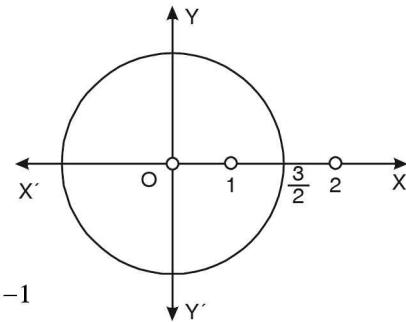

$\therefore$  The given integral  $= 2\pi i (R_1 + R_2) = 2\pi i (2 - 2) = 0$ .

(ii) The contour  $|z + i| = \sqrt{3}$  is a circle of radius  $\sqrt{3}$  and centre at  $z = -i$ .

The distances of the centre from  $z = 1$  and  $-\frac{3}{2}$  are respectively  $\sqrt{2}$  and  $\sqrt{\frac{13}{4}}$ . The first of these is  $< \sqrt{3}$  and the second is  $> \sqrt{3}$ .

$\therefore$  The second contour includes only the first singularity  $z = 1$ .

Hence, the given integral  $= 2\pi i (R_1) = 2\pi i (2) = 4\pi i$ .

Ans.

**Example 31.** Determine the poles of the following function and residue at each pole:

$$f(z) = \frac{z^2}{(z-1)^2(z+2)} \text{ and hence evaluate}$$

$$\int_c \frac{z^2 dz}{(z-1)^2(z+2)} \quad \text{where } c: |z| = 3. \quad (\text{R.G.P.V. Bhopal, III Sem. Dec. 2007})$$

**Solution.**  $f(z) = \frac{z^2}{(z-1)^2(z+2)}$

Poles of  $f(z)$  are given by  $(z-1)^2(z+2) = 0$  i.e.  $z = 1, 1, -2$

The pole at  $z = 1$  is of second order and the pole at  $z = -2$  is simple.

$$\begin{aligned} \text{Residue of } f(z) \text{ (at } z = 1) &= \lim_{z \rightarrow 1} \frac{1}{(2-1)!} \frac{d}{dz} \frac{(z-1)^2 z^2}{(z-1)^2(z+2)} \\ &= \lim_{z \rightarrow 1} \frac{d}{dz} \frac{z^2}{z+2} = \lim_{z \rightarrow 1} \frac{(z+2)2z-1.z^2}{(z+2)^2} \\ &= \lim_{z \rightarrow 1} \frac{z^2 + 4z}{(z+2)^2} = \frac{1+4}{(1+2)^2} = \frac{5}{9} \end{aligned}$$

$$\text{Residue of } f(z) \text{ (at } z = -2) = \lim_{z \rightarrow -2} \frac{(z+2)z^2}{(z-1)^2(z+2)} = \lim_{z \rightarrow -2} \frac{z^2}{(z-1)^2} = \frac{4}{(-2-1)^2} = \frac{4}{9} \quad \text{Ans.}$$

$$\int_c \frac{z^2 dz}{(z-1)^2(z+2)} = 2\pi i \left( \frac{5}{9} + \frac{4}{9} \right) = 2\pi i \quad \text{Ans.}$$

**Example 32.** Using Residue theorem, evaluate  $\frac{1}{2\pi i} \int_C \frac{e^z dz}{z^2(z^2 + 2z + 2)}$

where  $C$  is the circle  $|z| = 3$ .

(U.P., III Semester, Dec. 2009)

**Solution.** Here, we have

$$\frac{1}{2\pi i} \int_C \frac{e^z dz}{z^2(z^2 + 2z + 2)}$$

Poles are given by

$$z = 0 \text{ (double pole)}$$

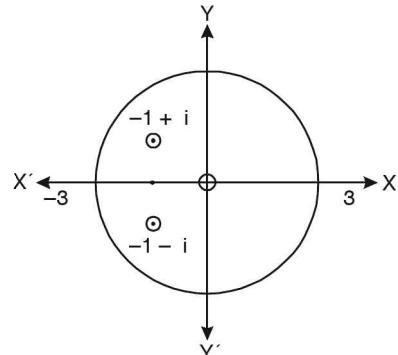

$$z = -1 \pm i \text{ (simple poles)}$$

All the four poles are inside the given circle.

$$|z| = 3$$

$$\text{Residue at } z = 0 \text{ is } \lim_{z \rightarrow 0} \frac{d}{dz} z^2 \frac{e^z}{z^2(z^2 + 2z + 2)}$$

$$\begin{aligned} &= \lim_{z \rightarrow 0} \frac{d}{dz} \frac{e^z}{z^2 + 2z + 2} \\ &= \lim_{z \rightarrow 0} \frac{(z^2 + 2z + 2)te^z - (2z+2)e^z}{(z^2 + 2z + 2)^2} \\ &= \frac{2te^0 - 2e^0}{4} = \frac{(t-1)}{2} \end{aligned}$$

$$\begin{aligned} z^2 + 2z + 2 &= 0 \\ \Rightarrow z^2 + 2z + 1 &= -1 \\ \Rightarrow (z+1)^2 &= -1 \\ \Rightarrow z+1 &= \pm i \\ \Rightarrow z &= -1 \pm i \end{aligned}$$

Residue at  $z = -1 + i$

$$\begin{aligned} &= \lim_{z \rightarrow -1+i} \frac{(z+1-i)e^{zt}}{z^2(z+1-i)(z+1+i)} = \lim_{z \rightarrow -1+i} \frac{e^{zt}}{z^2(z+1+i)} \\ &= \frac{e^{(-1+i)t}}{(-1+i)^2(-1+i+1+i)} = \frac{e^{(-1+i)t}}{(1-2i-1)(2i)} = \frac{e^{(-1+i)t}}{4} \end{aligned}$$

Similarly Residue at  $z = -1 - i = \frac{e^{(-1-i)t}}{4}$

$$\int \frac{e^{zt}}{z^2(z^2+2z+2)} dz = 2\pi i \quad (\text{Sum of the Residues})$$

$$\begin{aligned} \Rightarrow \frac{1}{2\pi i} \int \frac{e^{zt}}{z^2(z^2+2z+2)} dz &= \frac{t-1}{2} + \frac{e^{(-1+i)t}}{4} + \frac{e^{(-1-i)t}}{4} \\ &= \frac{t-1}{2} + \frac{e^{-t}}{4} (e^{it} + e^{-it}) = \frac{t-1}{2} + \frac{e^{-t}}{4} (2 \cos t) \\ &= \frac{t-1}{2} + \frac{e^{-t}}{2} \cos t \end{aligned}$$

**Example 33.** Evaluate  $\oint_C \frac{1}{\sinh z} dz$ , where  $C$  is the circle  $|z| = 4$ .

**Solution.** Here,  $f(z) = \frac{1}{\sinh z}$ .

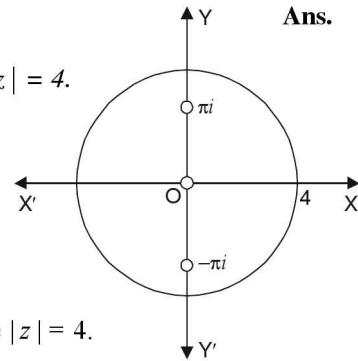

Poles are given by

$$\begin{aligned} \sinh z &= 0 \\ \Rightarrow \sin iz &= 0 \\ \Rightarrow z &= n\pi i \text{ where } n \text{ is an integer.} \end{aligned}$$

Out of these, the poles  $z = -\pi i, 0$  and  $\pi i$  lie inside the circle  $|z| = 4$ .

The given function  $\frac{1}{\sinh z}$  is of the form  $\frac{\phi(z)}{\psi(z)}$

Its pole at  $z = a$  is  $\frac{\phi(a)}{\psi'(a)}$ .

$$\text{Residue (at } z = -\pi i\text{)} = \frac{1}{\cosh(-\pi i)} = \frac{1}{\cos i(-\pi i)} = \frac{1}{\cos \pi} = \frac{1}{-1} = -1$$

$$\text{Residue (at } z = 0\text{)} = \frac{1}{\cosh 0} = \frac{1}{1} = 1$$

$$\text{Residue (at } z = \pi i\text{)} = \frac{1}{\cosh(\pi i)} = \frac{1}{\cos i(\pi i)} = \frac{1}{\cos(-\pi)} = \frac{1}{\cos \pi} = \frac{1}{-1} = -1$$

Residue at  $-\pi i, 0, \pi i$  are respectively  $-1, 1$  and  $-1$ .

Hence, the required integral  $= 2\pi i (-1 + 1 - 1) = -2\pi i$ .

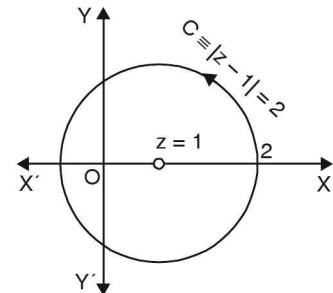

**Ans.**

**Example 34.** Obtain Laurent's expansion for the function  $f(z) = \frac{1}{z^2 \sinh z}$  at the isolated singularity and hence evaluate  $\oint_C \frac{1}{z^2 \sinh z} dz$ , where  $C$  is the circle  $|z-1| = 2$ .

**Solution.** Here,

$$f(z) = \frac{1}{z^2 \sinh z} = \frac{2}{z^2(e^z - e^{-z})} = \frac{2}{z^2 \left[ \left( 1 + z + \frac{z^2}{2!} + \frac{z^3}{3!} + \dots \right) - \left( 1 - z + \frac{z^2}{2!} - \frac{z^3}{3!} + \dots \right) \right]}$$

$$\begin{aligned}
 &= \frac{2}{z^2 \left( 2z + \frac{2z^3}{3!} + \frac{2z^5}{5!} + \dots \right)} = \frac{1}{z^3 \left( 1 + \frac{z^2}{3!} + \frac{z^4}{5!} + \dots \right)} \\
 &= z^{-3} \left[ 1 + \left( \frac{z^2}{6} + \frac{z^4}{120} \right) + \dots \right]^{-1} \\
 &= z^{-3} \left( 1 - \frac{z^2}{6} - \frac{z^4}{120} + \dots \right) \\
 &= z^{-3} - \frac{z^{-1}}{6} - \frac{z}{120} + \dots = \frac{1}{z^3} - \frac{1}{6z} - \frac{z}{120} + \dots
 \end{aligned}$$

which is the required Laurent's expansion.

Only pole  $z = 0$  of order three lies inside the circle  $C \equiv |z - 1| = 2$ .

Residue of  $f(z)$  at  $(z = 0)$  is

$$= \text{coeff. of } \frac{1}{z} \text{ in the Laurent's expansion of } f(z) = -\frac{1}{6}. \quad \text{Ans.}$$

**Example 35.** Evaluate  $\int_c \frac{dz}{z \sin z}$ :  $c$  is the unit circle about origin.

$$\begin{aligned}
 \frac{1}{z \sin z} &= \frac{1}{z \left[ z - \frac{z^3}{3!} + \frac{z^5}{5!} - \dots \right]} = \frac{1}{z^2 \left[ 1 - \frac{z^2}{3!} + \frac{z^4}{5!} - \dots \right]} \\
 &= \frac{1}{z^2} \left[ 1 - \left( \frac{z^2}{6} - \frac{z^4}{120} \dots \right) \right]^{-1} = \frac{1}{z^2} \left[ 1 + \left( \frac{z^2}{6} - \frac{z^4}{120} \dots \right) + \left( \frac{z^2}{6} - \frac{z^4}{120} \dots \right)^2 \dots \right] \\
 &= \frac{1}{z^2} \left[ 1 + \frac{z^2}{6} - \frac{z^4}{120} + \frac{z^4}{36} + \dots \right] = \frac{1}{z^2} + \frac{1}{6} - \frac{z^2}{120} + \frac{z^2}{36} \dots \\
 &= \frac{1}{z^2} + \frac{1}{6} + \frac{7}{360} z^2 \dots
 \end{aligned}$$

This shows that  $z = 0$  is a pole of order 2 for the function  $\frac{1}{z \sin z}$  and the residue at the pole is zero, (coefficient of  $\frac{1}{z}$ ).

Now the pole at  $z = 0$  lies within  $C$ .

$$\therefore \int \frac{1}{z \sin z} dz = 2\pi i \text{ (Sum of Residues)} = 0 \quad \text{Ans.}$$

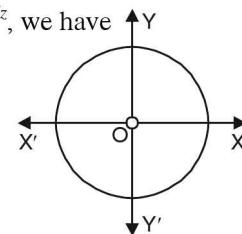

**Example 36.** Find the value of  $\oint_C z e^{1/z} dz$ , around the unit circle.

**Solution.** The only singularity of  $z e^{1/z}$  is at the origin. Expanding  $e^{1/z}$ , we have

$$\begin{aligned}
 z e^{1/z} &= z \left[ 1 + \frac{1}{z} + \frac{1}{2z^2} + \frac{1}{6z^3} + \dots \right] \\
 &= z + 1 + \frac{1}{2z} + \frac{1}{6z^2} + \dots
 \end{aligned}$$

$$\text{Residue at origin} = \text{coeff. of } \frac{1}{z} = \frac{1}{2}.$$

$$\text{Hence, the required integral} = 2\pi i \left( \frac{1}{2} \right) = \pi i. \quad \text{Ans.}$$

**Example 37.** Find the value of the complex integral  $\int_c z^4 e^{1/z} dz$ , where  $c$  is  $|z| = 1$ .

**Solution.**  $\int_c z^4 \cdot e^{1/z} dz$  where  $c$  is  $|z| = 1$

At  $z = 0$ , there is a simple pole. Now we have to find out the residue at  $z = 0$ .

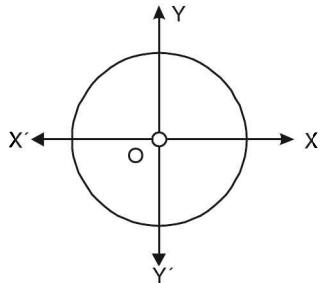

Put  $z - 0 = t$

$$\begin{aligned} z^4 e^{1/z} &= t^4 e^{1/t} \\ &= t^4 \left[ 1 + \frac{1}{t} + \frac{1}{2! t^2} + \frac{1}{3! t^3} + \frac{1}{4! t^4} + \frac{1}{5! t^5} + \dots \right] \\ &= t^4 + t^3 + \frac{t^2}{2!} + \frac{t}{3!} + \frac{1}{4!} + \frac{1}{5!} \frac{1}{t} + \dots \end{aligned}$$

Coefficient of  $\frac{1}{t} = \frac{1}{5!} = \frac{1}{120}$

$$\int_c z^4 e^{1/z} dz = 2\pi i \text{ Residue}$$

$$\Rightarrow \int_c z^4 e^{1/z} dz = (2\pi i) \left( \frac{1}{120} \right) = \frac{\pi i}{60}$$

Ans.

### EXERCISE 31.3

Evaluate the following complex integrals :

1.  $\int_c \frac{1-2z}{z(z-1)(z-2)} dz$ , where  $c$  is the circle  $|z| = 1.5$  Ans.  $3\pi i$
2.  $\int_c \frac{z^2 e^{zt}}{z^2 + 1} dz$ , where  $c$  is the circle  $|z| = 2$  Ans.  $-2\pi i \sin t$
3.  $\int_c \frac{z-1}{(z+1)^2(z-2)} dz$ , where  $c$  is the circle  $|z-i| = 2$ . Ans.  $-\frac{2\pi i}{9}$
4.  $\int_c \frac{2z^2 + z}{z^2 - 1} dz$ , where  $c$  is the circle  $|z-1| = 1$ . Ans.  $3\pi i$
5.  $\int_c \frac{e^{2z} + z^2}{(z-1)^5} dz$ , where  $c$  is the circle  $|z| = 2$  Ans.  $\frac{4\pi e^2 i}{3}$
6.  $\int_c \frac{dz}{(z^2 + 1)(z^2 - 4)}$ , where  $c$  is the circle  $|z| = 1.5$  Ans. 0
7.  $\int_c \frac{4z^2 - 4z + 1}{(z-2)(z^2 + 4)} dz$ , where  $c$  is the circle  $|z| = 1$  Ans. 0
8.  $\int_c \frac{\sin z}{z^6} dz$ , where  $c$  is the circle  $|z| = 2$  Ans.  $\frac{\pi i}{60}$
9. Let  $\left[ \frac{P(z)}{Q(z)} \right]$ , where both  $P(z)$  and  $Q(z)$  are complex polynomial of degree two. If  $f(0) = f(-1) = 0$  and only singularity of  $f(z)$  is of order 2 at  $z = 1$  with residue  $-1$ , then find  $f(z)$ . Ans.  $f(z) = -\frac{1}{3} \frac{z(z+1)}{(z-1)^2}$

### 31.13 EVALUATION OF REAL DEFINITE INTEGRALS BY CONTOUR INTEGRATION

A large number of real definite integrals, whose evaluation by usual methods become sometimes very tedious, can be easily evaluated by using Cauchy's theorem of residues. For finding the integrals

we take a closed curve  $C$ , find the poles of the function  $f(z)$  and calculate residues at those poles only which lie within the curve  $C$ .

$$\int_C f(z) dz = 2\pi i \text{ (sum of the residues of } f(z) \text{ at the poles within } C\text{)}$$

We call the curve, a contour and the process of integration along a contour is called contour integration.

### 31.14 INTEGRATION ROUND UNIT CIRCLE OF THE TYPE

$$\int_0^{2\pi} f(\cos\theta, \sin\theta) d\theta$$

where  $f(\cos\theta, \sin\theta)$  is a rational function of  $\cos\theta$  and  $\sin\theta$ .

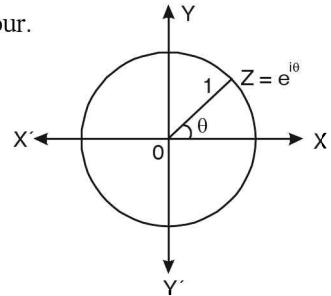

Convert  $\sin\theta, \cos\theta$  into  $z$ .

Consider a circle of unit radius with centre at origin, as contour.

$$\begin{aligned}\sin\theta &= \frac{e^{i\theta} - e^{-i\theta}}{2i} = \frac{1}{2i} \left[ z - \frac{1}{z} \right], & z = re^{i\theta} = 1, e^{i\theta} = e^{i\theta} \\ \cos\theta &= \frac{e^{i\theta} + e^{-i\theta}}{2} = \frac{1}{2} \left[ z + \frac{1}{z} \right]\end{aligned}$$

As we know

$$z = e^{i\theta} \Rightarrow dz = e^{i\theta} i d\theta = z i d\theta \text{ or } d\theta = \frac{dz}{iz}$$

The integrand is converted into a function of  $z$ .

Then apply Cauchy's residue theorem to evaluate the integral.

Some examples of these are illustrated below.

**Example 38.** Evaluate the integral:

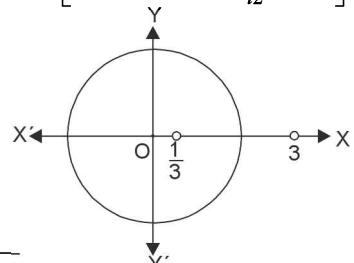

$$\int_0^{2\pi} \frac{d\theta}{5-3\cos\theta}$$

(R.G.P.V., Bhopal, III Semester, June 2007)

**Solution.**

$$\begin{aligned}\int_0^{2\pi} \frac{d\theta}{5-3\cos\theta} &= \int_0^{2\pi} \frac{d\theta}{5-3\left(\frac{e^{i\theta}+e^{-i\theta}}{2}\right)} \\ &= \int_0^{2\pi} \frac{2d\theta}{10-3e^{i\theta}-3e^{-i\theta}} \\ &= \int_C \frac{2}{10-3z-\frac{3}{z}} \frac{dz}{iz} &= \frac{2}{i} \int_C \frac{dz}{10z-3z^2-3} \\ &= -\frac{2}{i} \int_C \frac{dz}{3z^2-10z+3} & [C \text{ is the unit circle } |z| = 1] \\ &= -\frac{2}{i} \int_C \frac{dz}{(3z-1)(z-3)} & = 2i \int_C \frac{dz}{(3z-1)(z-3)}\end{aligned}$$

$\left[ e^{i\theta} = z \Rightarrow i.e^{i\theta} d\theta = dz \right]$   
 $d\theta = \frac{dz}{iz}$

Let  $I = 2i \int_C \frac{dz}{(3z-1)(z-3)}$

Poles of the integrand are given by

$$(3z-1)(z-3) = 0 \Rightarrow z = \frac{1}{3}, 3$$

There is only one pole at  $z = \frac{1}{3}$  inside the unit circle  $C$ .

$$\begin{aligned} \text{Residue at } z = \frac{1}{3} &= \lim_{z \rightarrow \frac{1}{3}} \left( z - \frac{1}{3} \right) f(z) = \lim_{z \rightarrow \frac{1}{3}} \frac{2i \left( z - \frac{1}{3} \right)}{(3z-1)(z-3)} = \lim_{z \rightarrow \frac{1}{3}} \frac{2i}{3(z-3)} \\ &= \frac{2i}{3 \left( \frac{1}{3} - 3 \right)} = -\frac{i}{4} \end{aligned}$$

Hence, by Cauchy's Residue Theorem

$$\begin{aligned} I &= 2\pi i \text{ (Sum of the residues within Contour)} = 2\pi i \left( -\frac{i}{4} \right) = \frac{\pi}{2} \\ &+ \int_0^{2\pi} \frac{d\theta}{5-3\cos\theta} = \frac{\pi}{2} \end{aligned}$$

Ans.

**Example 39.** Use residue calculus to evaluate the following integral

$$\int_0^{2\pi} \frac{1}{5-4\sin\theta} d\theta$$

$$\text{Solution. Let } I = \int_0^{2\pi} \frac{1}{5-4\sin\theta} d\theta = \int_0^{2\pi} \frac{1}{5-4\left(\frac{e^{i\theta}-e^{-i\theta}}{2i}\right)} d\theta$$

$$\begin{aligned} &= \int_0^{2\pi} \frac{d\theta}{5+2ie^{i\theta}-2ie^{-i\theta}} && [\text{writing } e^{i\theta} = z, d\theta = \frac{dz}{iz}] \\ &= \int_c \frac{1}{5+2iz-\frac{2i}{z}} \frac{dz}{iz} && \text{where } c \text{ is the unit circle } |z| = 1. \\ &= \int_c \frac{dz}{5iz-2z^2+2} \end{aligned}$$

Poles of integrand are given by

$$-2z^2 + 5iz + 2 = 0 \Rightarrow z = \frac{-5i \pm \sqrt{-25+16}}{-4} = \frac{-5i \pm 3i}{-4} = 2i, \frac{i}{2}$$

Only  $z = \frac{i}{2}$  lies inside  $c$ .

Residue at the simple pole at  $z = \frac{i}{2}$  is

$$\lim_{z \rightarrow \frac{i}{2}} \left( z - \frac{i}{2} \right) \times \left[ \frac{1}{(2z-i)(-z+2i)} \right] = \lim_{z \rightarrow \frac{i}{2}} \frac{1}{2(-z+2i)} = \frac{1}{2\left(-\frac{i}{2}+2i\right)} = \frac{1}{3i}$$

Hence, by Cauchy's residue theorem

$$I = 2\pi i \times \text{ Sum of residues within the contour} = 2\pi i \times \frac{1}{3i} = \frac{2\pi}{3}$$

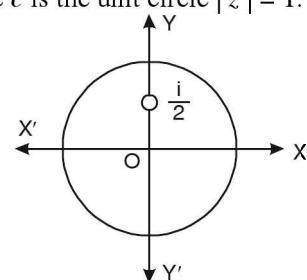

Hence, given integral =  $\frac{2\pi}{3}$

Ans.

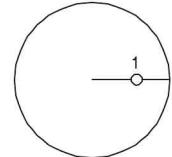

**Example 40.** Evaluate  $\int_0^{2\pi} \frac{d\theta}{a+b\sin\theta}$  if  $a > |b|$

(GBTU, III Sem. April 2012, U.P. III Semester 2009-2010)

**Solution.** Let  $I = \int_0^{2\pi} \frac{d\theta}{a+b\sin\theta}$

$$\begin{aligned}
 &= \int_0^{2\pi} \frac{1}{a + b \frac{e^{i\theta} - e^{-i\theta}}{2i}} d\theta \quad \left[ \text{Writing } e^{i\theta} = z, d\theta = \frac{dz}{iz} \right] \\
 &= \int_C \frac{1}{a + \frac{b}{2i} \left( z - \frac{1}{z} \right)} \frac{dz}{iz} \quad (\text{where } C \text{ is the unit circle } |z| = 1) \\
 &= \int_c \frac{2}{bz^2 + 2azi z - b} dz \\
 &= \frac{1}{b} \int \frac{2dz}{z^2 + \frac{2azi}{b} z - 1} \\
 &= \frac{1}{b} \int_c \frac{2}{(z-\alpha)(z-\beta)} dz \quad \left[ bz^2 + 2azi z - b = b \left\{ z^2 + \frac{2azi}{b} z - 1 \right\} \right]
 \end{aligned}$$

Where  $\alpha + \beta = -\frac{2ai}{b}$   
 $\alpha \beta = -1 \Rightarrow |\alpha \beta| = 1$

$|\alpha| < 1$  then  $|\beta| > 1$   
i.e.; Pole lies at  $z = \alpha$  in the unit circle.

$$\begin{aligned}
 &(\alpha - \beta)^2 = (\alpha + \beta)^2 - 4\alpha\beta \\
 &= -\frac{4a^2}{b^2} + 4 \\
 &\alpha - \beta = 2 \frac{\sqrt{b^2 - a^2}}{b}
 \end{aligned}$$

Residue at  $z = a = \lim_{z \rightarrow \alpha} (z - \alpha) \frac{2}{(z - \alpha)(z - \beta)} = \frac{2}{\alpha - \beta} = \frac{b}{\sqrt{b^2 - a^2}} = \frac{b}{i\sqrt{a^2 - b^2}}$

$$\int_0^{2\pi} \frac{1}{a + b \sin \theta} d\theta = \frac{1}{b} \int_c \frac{2}{z^2 + 2\frac{azi}{b} z - 1} dz = 2\pi i \frac{b}{bi\sqrt{a^2 - b^2}} = \frac{2\pi}{\sqrt{a^2 - b^2}} \quad \text{Ans.}$$

**Example 41.** Use the complex variable technique to find the value of the integral :

$$\int_0^{2\pi} \frac{d\theta}{2 + \cos \theta}. \quad (\text{R.G.P.V., Bhopal, III Semester, Dec. 2003})$$

**Solution.** Let  $I = \int_0^{2\pi} \frac{d\theta}{2 + \cos \theta} = \int_0^{2\pi} \frac{d\theta}{2 + \frac{e^{i\theta} + e^{-i\theta}}{2}} = \int_0^{2\pi} \frac{2d\theta}{4 + e^{i\theta} + e^{-i\theta}}$

Put  $e^{i\theta} = z$  so that  $e^{i\theta}(i d\theta) = dz \Rightarrow iz d\theta = dz \Rightarrow d\theta = \frac{dz}{iz}$

$$\begin{aligned}
 I &= \int_c \frac{2 \frac{dz}{iz}}{4 + z + \frac{1}{z}} \quad \text{where } c \text{ denotes the unit circle } |z| = 1. \\
 &= \frac{1}{i} \int_c \frac{2 dz}{z^2 + 4z + 1}
 \end{aligned}$$

The poles are given by putting the denominator equal to zero.

$$z^2 + 4z + 1 = 0 \text{ or } z = \frac{-4 \pm \sqrt{16-4}}{2} = \frac{-4 \pm 2\sqrt{3}}{2} = -2 \pm \sqrt{3}$$

The pole within the unit circle  $C$  is a simple pole at  $z = -2 + \sqrt{3}$ . Now we calculate the residue at this pole.

$$\begin{aligned}\text{Residue at } (z = -2 + \sqrt{3}) &= \lim_{z \rightarrow (-2+\sqrt{3})} \frac{1}{i} \frac{(z+2-\sqrt{3})2}{(z+2-\sqrt{3})(z+2+\sqrt{3})} \\ &= \lim_{z \rightarrow (-2+\sqrt{3})} \frac{2}{i(z+2+\sqrt{3})} = \frac{2}{i(-2+\sqrt{3}+2+\sqrt{3})} = \frac{1}{\sqrt{3}i}\end{aligned}$$

Hence by Cauchy's Residue Theorem, we have

$$\begin{aligned}\int_0^{2\pi} \frac{d\theta}{2+\cos\theta} &= 2\pi i \text{ (sum of the residues within the contour)} \\ &= 2\pi i \frac{1}{i\sqrt{3}} = \frac{2\pi}{\sqrt{3}}\end{aligned}$$

**Ans.**

**Example 42.** Using complex variable techniques evaluate the real integral

$$\int_0^{2\pi} \frac{\sin^2\theta}{5-4\cos\theta} d\theta$$

**Solution.** If we write  $z = e^{i\theta}$

$$\cos\theta = \frac{1}{2} \left( z + \frac{1}{z} \right), \quad d\theta = \frac{dz}{iz}$$

$$\text{and so } I = \int_0^{2\pi} \frac{\sin^2\theta}{5-4\cos\theta} d\theta = \frac{1}{2} \int_0^{2\pi} \frac{1-\cos 2\theta}{5-4\cos\theta} d\theta$$

$$I = \text{Real part of } \frac{1}{2} \int_0^{2\pi} \frac{1-\cos 2\theta - i\sin 2\theta}{5-4\cos\theta} d\theta \quad \left[ \begin{array}{l} \text{where } C \text{ is a circle of unit} \\ \text{radius with centre } z = 0 \end{array} \right]$$

$$\begin{aligned}&= \text{Real part of } \frac{1}{2} \int_0^{2\pi} \frac{1-e^{2i\theta}}{5-4\cos\theta} d\theta \\ &= \text{Real part of } \frac{1}{2} \int_C \frac{1-z^2}{5-2(z+\frac{1}{z})} \left( \frac{dz}{iz} \right) = \text{Real part of } \frac{1}{2i} \int_C \frac{1-z^2}{5z-2z^2-2} dz \\ &= \text{Real part of } \frac{1}{2i} \int_C \frac{z^2-1}{2z^2-5z+2} dz\end{aligned}$$

$$\text{Poles are determined by } 2z^2 - 5z + 2 = 0 \text{ or } (2z-1)(z-2) = 0 \text{ or } z = \frac{1}{2}, 2$$

So inside the contour  $C$  there is a simple pole at  $z = \frac{1}{2}$

$$\begin{aligned}\text{Residue at the simple pole } \left( z = \frac{1}{2} \right) &= \lim_{z \rightarrow \frac{1}{2}} \left( z - \frac{1}{2} \right) \frac{z^2-1}{(2z-1)(z-2)} \\ &= \lim_{z \rightarrow \frac{1}{2}} \frac{z^2-1}{2(z-2)} = \frac{\frac{1}{4}-1}{2\left(\frac{1}{2}-2\right)} = \frac{1}{4}\end{aligned}$$

$$I = \text{Real part of } \frac{1}{2i} \int_C \frac{(z^2-1)}{2z^2-5z+2} dz = \frac{1}{2i} 2\pi i \text{ (sum of the residues)}$$

$$\Rightarrow \int_0^{2\pi} \frac{\sin^2\theta}{5-4\cos\theta} d\theta = \pi \left( \frac{1}{4} \right) = \frac{\pi}{4}$$

**Ans.**

**Example 43.** Using contour integration, evaluate the real integral

$$\int_0^\pi \frac{1+2\cos\theta}{5+4\cos\theta} d\theta \quad (R.G.P.V., Bhopal, III Semester, Dec. 2004)$$

**Solution.** Let  $I = \int_0^\pi \frac{1+2\cos\theta}{5+4\cos\theta} d\theta = \frac{1}{2} \int_0^{2\pi} \frac{1+2\cos\theta}{5+4\cos\theta} d\theta$  [Even function]

$$= \text{Real part of } \frac{1}{2} \int_0^{2\pi} \frac{1+2e^{i\theta}}{5+4\cos\theta} d\theta$$

$$= \text{Real part of } \frac{1}{2} \int_0^{2\pi} \frac{1+2e^{i\theta}}{5+2(e^{i\theta} + e^{-i\theta})} d\theta$$

$$\text{writing } e^{i\theta} = z, d\theta = \frac{dz}{iz} \text{ where } C \text{ is the unit circle } |z| = 1.$$

$$= \text{Real part of } \frac{1}{2} \int_C \frac{1+2z}{5+2\left(z+\frac{1}{z}\right)} \frac{dz}{iz}, = \text{Real part of } \frac{1}{2} \int_C \frac{-i(1+2z)}{2z^2+5z+2} dz$$

$$= \text{Real part of } \frac{1}{2} \int_C \frac{-i(2z+1)}{(2z+1)(z+2)} dz = \text{Real part of } -\frac{i}{2} \int_C \frac{1}{z+2} dz$$

Pole is given by  $z+2=0$  i.e.  $z=-2$ .

Thus there is no pole of  $f(z)$  inside the unit circle  $C$ . Hence  $f(z)$  is analytic in  $C$ .

By Cauchy's Theorem  $\int_C f(z) dz = 0$  if  $f(z)$  is analytic in  $C$ .

$$\therefore I = \text{Real part of zero} = 0$$

Hence, the given integral = 0

**Ans.**

**Example 44.** Using complex variables, evaluate the real integral

$$\int_0^{2\pi} \frac{d\theta}{1-2p\sin\theta+p^2}, \text{ where } p^2 < 1.$$

**Solution.**  $\int_0^{2\pi} \frac{d\theta}{1-2p\sin\theta+p^2} = \int_0^{2\pi} \frac{d\theta}{1-2p \frac{(e^{i\theta}-e^{-i\theta})}{2i} + p^2}$

Let  $I = \int_0^{2\pi} \frac{d\theta}{1+ip(e^{i\theta}-e^{-i\theta})+p^2}$

Writing  $z = e^{i\theta}$ ,  $dz = ie^{i\theta} d\theta = iz d\theta$ ,  $d\theta = \frac{dz}{zi}$

$$I = \int_C \frac{1}{1+ip\left(z-\frac{1}{z}\right)+p^2} \frac{dz}{zi} \quad \text{where } c \text{ is the unit circle } |z| = 1.$$

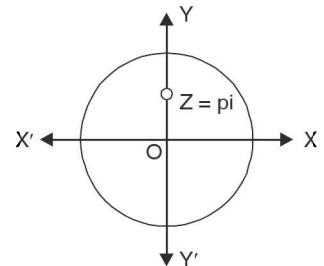

$$= \int_C \frac{dz}{zi-pz^2+p+p^2zi} = \int_C \frac{dz}{-pz^2+ip^2z+zi+p} = \int_C \frac{dz}{(iz+p)(izp+1)}$$

Poles are given by  $(iz+p)(izp+1) = 0$

$$\Rightarrow z = -\frac{p}{i} = ip \text{ and } z = -\frac{1}{pi} = \frac{i}{p} \quad |ip| < 1 \text{ and } \left|\frac{i}{p}\right| > 1 \text{ as } p^2 < 1$$

$ip$  is the only pole inside the unit circle.

$$\text{Residue } (z = pi) = \lim_{z \rightarrow pi} \frac{(z-pi)}{(iz+p)(izp+1)} = \lim_{z \rightarrow pi} \left[ \frac{1}{i(izp+1)} \right] = \frac{1}{i} \frac{1}{(-p^2+1)}$$

Hence by Cauchy's residue theorem

$$\int_0^{2\pi} \frac{d\theta}{1-2p\sin\theta+p^2} = 2\pi i \left( \frac{1}{i} \frac{1}{1-p^2} \right) = \frac{2\pi}{1-p^2} \quad \text{Ans.}$$

**Example 45.** Apply calculus of residue to prove that :

$$\int_0^{2\pi} \frac{\cos 2\theta d\theta}{1-2a\cos\theta+a^2} = \frac{2\pi a^2}{1-a^2}, \quad (a^2 < 1)$$

(R.G.P.V., Bhopal, III Semester, June 2003)

$$\begin{aligned} \text{Solution.} \quad \text{Let } I &= \int_0^{2\pi} \frac{\cos 2\theta d\theta}{1-2a\cos\theta+a^2} = \int_0^{2\pi} \frac{\cos 2\theta d\theta}{1-a(e^{i\theta}+e^{-i\theta})+a^2} \\ &= \text{Real part of } \int_0^{2\pi} \frac{e^{2i\theta}}{(1-ae^{i\theta})(1-ae^{-i\theta})} d\theta \\ &= \text{Real part of } \oint_C \frac{z^2}{(1-az)\left(1-\frac{a}{z}\right)} \frac{dz}{iz} \quad [\text{Put } e^{i\theta}=z \text{ so that } d\theta=\frac{dz}{iz}] \\ &= \text{Real part of } \oint_C \frac{-iz^2}{(1-az)(z-a)} dz \quad [C \text{ is the unit circle } |z|=1] \end{aligned}$$

Poles of  $\frac{-iz^2}{(1-az)(z-a)}$  are given by

$$(1-az)(z-a)=0$$

Thus,  $z=\frac{1}{a}$  and  $z=a$  are the simple poles. Only  $z=a$  lies within the unit circle  $C$  as  $a < 1$ .

The residue of  $f(z)$  at  $(z=a)$   $= \lim_{z \rightarrow a} (z-a) \frac{-iz^2}{(1-az)(z-a)} = \lim_{z \rightarrow a} \frac{-iz^2}{(1-az)} = -\frac{ia^2}{1-a^2}$

Hence, by Cauchy's Residue Theorem, we have

$$\begin{aligned} \oint_C f(z) dz &= 2\pi i \quad [\text{Sum of residues within the contour}] \\ &= 2\pi i \left( -\frac{ia^2}{1-a^2} \right) = \frac{2\pi a^2}{1-a^2} \quad \text{which is purely real.} \end{aligned}$$

Thus,  $I = \text{Real part of } \oint_C f(z) dz = \frac{2\pi a^2}{1-a^2}$

Hence,  $\int_0^{2\pi} \frac{\cos 2\theta}{1-2a\cos\theta+a^2} d\theta = \frac{2\pi a^2}{1-a^2}$ . Proved.

**Example 46.** Using complex variable techniques, evaluate the integral

$$\int_0^{2\pi} \frac{\sin^2\theta - 2\cos\theta}{2+\cos\theta} d\theta.$$

$$\begin{aligned} \text{Solution.} \quad \int_0^{2\pi} \frac{\sin^2\theta - 2\cos\theta}{2+\cos\theta} d\theta &= \int_0^{2\pi} \frac{\frac{1}{2} - \frac{1}{2}\cos 2\theta - 2\cos\theta}{2+\cos\theta} d\theta \\ &= \frac{1}{2} \int_0^{2\pi} \frac{1 - \cos 2\theta - 4\cos\theta}{2+\cos\theta} d\theta = \text{Real part of } \frac{1}{2} \int_0^{2\pi} \frac{1-e^{2i\theta} - 4e^{i\theta}}{2+\cos\theta} d\theta \end{aligned}$$

$$\begin{aligned} \text{write } e^{i\theta} = z \text{ so that } ie^{i\theta} d\theta = dz \text{ or } iz d\theta = dz \text{ or } d\theta = \frac{dz}{iz} \\ = \text{Real part of } \frac{1}{2} \int_C \frac{1-z^2-4z}{2+\frac{1}{2}\left(z+\frac{1}{z}\right)} \frac{dz}{iz} = \text{Real part of } \frac{1}{i} \int_C \frac{(1-z^2-4z)dz}{4z+z^2+1} \end{aligned}$$

The poles are given by  $z^2 + 4z + 1 = 0$

$$z = \frac{-4 \pm \sqrt{16-4}}{2} = -2 \pm \sqrt{3}$$

The pole within the unit circle  $C$  is  $-2 + \sqrt{3}$

Residue at the simple pole  $z = -2 + \sqrt{3}$

$$\begin{aligned} &= \lim_{z \rightarrow -2+\sqrt{3}} (z+2-\sqrt{3}) \frac{1-z^2-4z}{(z+2-\sqrt{3})(z+2+\sqrt{3})} = \lim_{z \rightarrow -2+\sqrt{3}} \frac{1-z^2-4z}{z+2+\sqrt{3}} \\ &= \frac{1-(-2+\sqrt{3})^2-4(-2+\sqrt{3})}{(-2+\sqrt{3})+2+\sqrt{3}} = \frac{1}{\sqrt{3}} \end{aligned}$$

Real part of  $\frac{1}{i} \int_C \frac{(1-z^2-4z)dz}{4z+z^2+1}$  = Real part of  $\left(\frac{1}{i}\right) 2\pi i$  (Residue)

$$= \text{Real part of } 2\pi \left(\frac{1}{\sqrt{3}}\right) \text{ or } I = \frac{2\pi}{\sqrt{3}}$$

Hence, the given integral  $= \frac{2\pi}{\sqrt{3}}$ .

**Ans.**

**Example 47.** Evaluate:  $\int_0^{2\pi} \frac{\cos 2\theta}{5+4\cos\theta} d\theta$  by using contour integration.

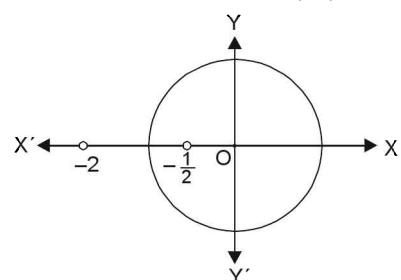

(R.G.P.V., Bhopal, III Semester, June 2007)

**Solution.**

$$\begin{aligned} \text{Let } I &= \int_0^{2\pi} \frac{\cos 2\theta}{5+4\cos\theta} d\theta \\ &= \text{Real part of } \int_0^{2\pi} \frac{\cos 2\theta + i \sin 2\theta}{5+4\cos\theta} d\theta \\ &= \text{Real part of } \int_0^{2\pi} \frac{e^{2i\theta}}{5+2(e^{i\theta}+e^{-i\theta})} d\theta \\ &= \text{Real part of } \oint_C \frac{z^2}{5+2\left(z+\frac{1}{z}\right)} \frac{dz}{iz} \\ &= \text{Real part of } \oint_C \frac{z^2}{5z+2z^2+2} \frac{dz}{i} \\ &= \text{Real part of } \oint_C \frac{-iz^2}{2z^2+5z+2} dz \\ &= \text{Real part of } \oint_C \frac{-iz^2}{(2z+1)(z+2)} dz \end{aligned}$$

$$\begin{bmatrix} e^{i\theta} = z \\ \Rightarrow i.e^{i\theta} d\theta = dz \\ \Rightarrow d\theta = \frac{dz}{ie^{i\theta}} = \frac{dz}{iz} \end{bmatrix}$$

[ $C$  is the unit circle  $|z| = 1$ ]

Poles are determined by putting denominator equal to zero.

$$(2z+1)(z+2) = 0 \Rightarrow z = -\frac{1}{2}, -2$$

The only simple pole at  $z = -\frac{1}{2}$  is inside the contour.

$$\begin{aligned} \text{Residue at } \left(z = -\frac{1}{2}\right) &= \lim_{z \rightarrow -\frac{1}{2}} \left(z + \frac{1}{2}\right) f(z) = \lim_{z \rightarrow -\frac{1}{2}} \left(z + \frac{1}{2}\right) \frac{-iz^2}{(2z+1)(z+2)} \\ &= \lim_{z \rightarrow -\frac{1}{2}} \frac{-iz^2}{2(z+2)} = \frac{-i\left(-\frac{1}{2}\right)^2}{2\left(-\frac{1}{2}+2\right)} = \frac{-i}{12} \end{aligned}$$

By Cauchy's Integral Theorem

$$\int_C f(z) dz = 2\pi i \text{ (Sum of the residues within } C\text{)}$$

$$= 2\pi i \left(\frac{-i}{12}\right) = \frac{\pi}{6}, \text{ which is real}$$

$$\int_0^{2\pi} \frac{\cos 2\theta}{5+4\cos\theta} d\theta = \frac{\pi}{6}$$

**Ans.**

**Example 48.** Evaluate contour integration of the real integral

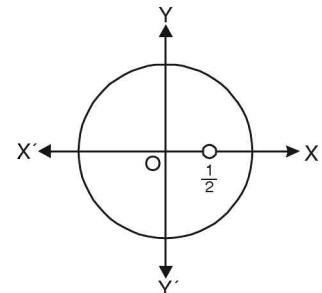

$$\int_0^{2\pi} \frac{\cos 3\theta}{5-4\cos\theta} d\theta. \quad (\text{U.P., III Sem., 2009, R.G.P.V., Bhopal, III Semester, Dec. 2007})$$

$$\begin{aligned} \text{Solution. } \int_0^{2\pi} \frac{\cos 3\theta}{5-4\cos\theta} d\theta &= \text{Real part of } \int_0^{2\pi} \frac{e^{3i\theta}}{5-4\cos\theta} d\theta \\ &= \text{Real part of } \int_0^{2\pi} \frac{e^{3i\theta}}{5-2(e^{i\theta}+e^{-i\theta})} d\theta \quad \text{On writing } z = e^{i\theta} \text{ and } d\theta = \frac{dz}{iz} \\ &= \text{Real part of } \int_c \frac{z^3}{5-2\left(z+\frac{1}{z}\right)} \frac{dz}{iz} \quad c \text{ is the unit circle.} \\ &= \text{Real part of } \frac{1}{i} \int_c \frac{z^3}{5z-2z^2-2} dz = \text{Real part of } -\frac{1}{i} \int \frac{z^3}{2z^2-5z+2} dz \\ &= \text{Real part of } i \int \frac{z^3}{(2z-1)(z-2)} dz \end{aligned}$$

Poles are given by  $(2z-1)(z-2) = 0$  i.e.  $z = \frac{1}{2}, z = 2$

$z = \frac{1}{2}$  is the only pole inside the unit circle.

$$\begin{aligned} \text{Residue } \left(\text{at } z = \frac{1}{2}\right) &= \lim_{z \rightarrow \frac{1}{2}} \frac{i\left(z - \frac{1}{2}\right)z^3}{(2z-1)(z-2)} \\ &= \lim_{z \rightarrow \frac{1}{2}} \frac{iz^3}{2(z-2)} = \frac{i\frac{1}{8}}{2\left(\frac{1}{2}-2\right)} = -\frac{i}{24} \end{aligned}$$

$$\int_0^{2\pi} \frac{\cos 3\theta}{5 - 4 \cos \theta} d\theta = \text{Real part of } 2\pi i \left( -\frac{i}{24} \right) = \frac{\pi}{12} \quad \text{Ans.}$$

**Question.** Evaluate :  $\int_0^\infty \frac{\cos 3\theta}{5 + 4 \cos \theta} d\theta$  (U.P. III Semester, Dec. 2008, 2006)

**Example 49.** Use the residue theorem to show that

$$\int_0^{2\pi} \frac{d\theta}{(a + b \cos \theta)^2} = \frac{2\pi a}{(a^2 - b^2)^{3/2}} \quad \text{where } a > 0, b > 0, a > b.$$

(R.G.P.V., Bhopal, III Semester, June 2004)

$$\text{Solution. } \int_0^{2\pi} \frac{d\theta}{(a + b \cos \theta)^2} = \int_0^{2\pi} \frac{d\theta}{\left( a + b \cdot \frac{e^{i\theta} + e^{-i\theta}}{2} \right)^2}$$

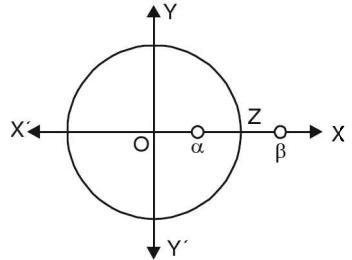

$$\text{Put } e^{i\theta} = z, \text{ so that } e^{i\theta}(id\theta) = dz \Rightarrow izd\theta = dz \Rightarrow d\theta = \frac{dz}{iz}$$

$$= \int_c \frac{1}{\left\{ a + \frac{b}{2} \left( z + \frac{1}{z} \right) \right\}^2} \frac{dz}{iz} \quad \text{where } C \text{ is the unit circle } |z| = 1.$$

$$\begin{aligned} \int_c \frac{1}{\left( a + \frac{bz}{2} + \frac{b}{2z} \right)^2} \frac{dz}{iz} &= \int_c \frac{-4iz}{\left( a + \frac{bz}{2} + \frac{b}{2z} \right)^2 (2z)^2} \frac{dz}{(2z)^2} \\ &= \int_c \frac{-4iz dz}{(bz^2 + 2az + b)^2} = \frac{-4i}{b^2} \int_c \frac{z dz}{\left( z^2 + \frac{2az}{b} + 1 \right)^2} \end{aligned}$$

The poles are given by putting the denominator equal to zero.

$$\begin{aligned} \text{i.e., } &\left( z^2 + \frac{2a}{b} z + 1 \right)^2 = 0 \\ \Rightarrow &(z - \alpha)^2 (z - \beta)^2 = 0 \\ \text{where } &\alpha = \frac{-\frac{2a}{b} + \sqrt{\frac{4a^2}{b^2} - 4}}{2} = \frac{-a + \sqrt{a^2 - b^2}}{b} \\ &\beta = \frac{-\frac{2a}{b} - \sqrt{\frac{4a^2}{b^2} - 4}}{2} = \frac{-a - \sqrt{a^2 - b^2}}{b} \end{aligned}$$

There are two poles, at  $z = \alpha$  and at  $z = \beta$ , each of order 2.

Since  $|\alpha\beta| = 1$  or  $|\alpha| |\beta| = 1$  if  $|\alpha| < 1$  then  $|\beta| > 1$ .

There is only one pole ( $|\alpha| < 1$ ) of order 2 within the unit circle  $c$ .

$$\text{Residue (at the double pole } z = \alpha) = \lim_{z \rightarrow \alpha} \frac{d}{dz} (z - \alpha)^2 \frac{(-4iz)}{b^2 (z - \alpha)^2 (z - \beta)^2}$$

$$= \lim_{z \rightarrow \alpha} \frac{d}{dz} \frac{-4iz}{b^2 (z - \beta)^2}$$

$$\begin{aligned}
&= -\frac{4i}{b^2} \lim_{z \rightarrow \alpha} \frac{(z-\beta)^2 \cdot 1 - 2(z-\beta)z}{(z-\beta)^4} = \frac{-4i}{b^2} \lim_{z \rightarrow \alpha} \frac{z-\beta-2z}{(z-\beta)^3} = \frac{-4i}{b^2} \lim_{z \rightarrow \alpha} \frac{-(z+\beta)}{(z-\beta)^3} \\
&= \frac{4i}{b^2} \frac{(\alpha+\beta)}{(\alpha-\beta)^3} = \frac{4i}{b^2} \frac{\alpha+\beta}{[(\alpha+\beta)^2 - 4\alpha\beta]^{\frac{3}{2}}} = \frac{4i}{b^2} \frac{\frac{-2a}{b}}{\left[\left(-\frac{2a}{b}\right)^2 - 4(1)\right]^{\frac{3}{2}}} \\
&= \frac{-8ai}{(4a^2 - 4b^2)^{\frac{3}{2}}} = -\frac{ai}{(a^2 - b^2)^{\frac{3}{2}}}
\end{aligned}$$

$$\text{Hence, } \int_0^{2\pi} \frac{d\theta}{(a+b\cos\theta)^2} = 2\pi i \times \frac{-ai}{(a^2 - b^2)^{3/2}} = \frac{2\pi a}{(a^2 - b^2)^{3/2}}$$

**Proved.****Example 50.** Show by the method of residues, that

$$\int_0^\pi \frac{ad\theta}{a^2 + \sin^2 \theta} = \frac{\pi}{\sqrt{1+a^2}}$$

$$\begin{aligned}
\text{Solution. Let } I &= \int_0^\pi \frac{ad\theta}{a^2 + \sin^2 \theta} = \int_0^\pi \frac{2ad\theta}{2a^2 + 2\sin^2 \theta} \quad (\cos 2\theta = 1 - 2\sin^2 \theta) \\
&= \int_0^\pi \frac{2ad\theta}{2a^2 + 1 - \cos 2\theta} = \int_0^{2\pi} \frac{ad\phi}{2a^2 + 1 - \cos \phi} \quad [\text{Putting } 2\theta = \phi, 2d\theta = d\phi] \\
&= \int_0^{2\pi} \frac{ad\phi}{2a^2 + 1 - \frac{1}{2}(e^{i\phi} + e^{-i\phi})} = \int_0^{2\pi} \frac{2ad\phi}{4a^2 + 2 - (e^{i\phi} + e^{-i\phi})}
\end{aligned}$$

$$\text{Writing } e^{i\phi} = z, e^{i\phi}(id\phi) = dz \text{ or } z(id\phi) = dz, d\phi = \frac{dz}{iz}$$

$$\begin{aligned}
&= \int_C \frac{2a}{4a^2 + 2 - \left(z + \frac{1}{z}\right)} \cdot \frac{dz}{iz} \quad \text{where } C \text{ is unit circle } |z| = 1 \\
&= \frac{2a}{i} \int_C \frac{dz}{(4a^2 + 2)z - z^2 - 1} = \frac{2a}{-i} \int_C \frac{dz}{z^2 - (4a^2 + 2)z + 1} \\
&= 2ai \int_C \frac{dz}{z^2 - (4a^2 + 2)z + 1}
\end{aligned}$$

The poles are given by  $z^2 - (4a^2 + 2)z + 1 = 0$ 

$$\begin{aligned}
\Rightarrow z &= \frac{(4a^2 + 2) \pm \sqrt{(4a^2 + 2)^2 - 4}}{2} = \frac{(4a^2 + 2) \pm \sqrt{16a^4 + 16a^2}}{2} \\
&= 2a^2 + 1 \pm 2a\sqrt{a^2 + 1}
\end{aligned}$$

$$\text{Let } \alpha = 2a^2 + 1 + 2a\sqrt{a^2 + 1}$$

$$\beta = 2a^2 + 1 - 2a\sqrt{a^2 + 1}$$

$$z^2 - (4a^2 + 2)z + 1 = (z - \alpha)(z - \beta)$$

$$I = 2ai \int \frac{dz}{(z - \alpha)(z - \beta)}$$

Product of the roots =  $\alpha\beta = 1$  or  $|\alpha\beta| = 1$

But  $|\alpha| > 1 \therefore |\beta| < 1$

Only  $\beta$  lies inside the circle  $c$ .

Now we calculate the residue at  $z = \beta$ .

$$\begin{aligned}\text{Residue (at } z = \beta \text{) is} &= \lim_{z \rightarrow \beta} (z - \beta) \frac{2ai}{(z - \alpha)(z - \beta)} = \lim_{z \rightarrow \beta} \frac{2ai}{z - \alpha} \\ &= \frac{2ai}{(\beta - \alpha)} = \frac{2ai}{(2a^2 + 1 - 2a\sqrt{a^2 + 1}) - (2a^2 + 1 + 2a\sqrt{a^2 + 1})} \\ &= \frac{2ai}{-4a\sqrt{a^2 + 1}} = -\frac{i}{2\sqrt{a^2 + 1}}\end{aligned}$$

Hence by Cauchy's residue theorem

$$I = 2\pi i \text{ (sum of the residues within the contour } c)$$

$$= 2\pi i \frac{-i}{2\sqrt{a^2 + 1}} = \frac{\pi}{\sqrt{a^2 + 1}}$$

$$\text{Hence, } \int_0^\pi \frac{ad\theta}{a^2 + \sin^2 \theta} = \frac{\pi}{\sqrt{1+a^2}}$$

**Proved.**

**Example 51.** Evaluate by Contour integration:

$$\int_0^{2\pi} e^{\cos \theta} \cos(\sin \theta - n\theta) d\theta.$$

**Solution.** Let

$$\begin{aligned}I &= \int_0^{2\pi} e^{\cos \theta} [\cos(\sin \theta - n\theta) + i \sin(\sin \theta - n\theta)] d\theta \\ &= \int_0^{2\pi} e^{\cos \theta} e^{i(\sin \theta - n\theta)} d\theta = \int_0^{2\pi} e^{\cos \theta + i \sin \theta} \cdot e^{-ni\theta} d\theta \\ &= \int_0^{2\pi} e^{e^{i\theta}} \cdot e^{-in\theta} d\theta\end{aligned} \quad \dots(1)$$

Put  $e^{i\theta} = z$  so that  $d\theta = \frac{dz}{iz}$  then,

$$I = \int_C e^z \cdot \frac{1}{z^n} \cdot \frac{dz}{iz} = -i \int_C \frac{e^z}{z^{n+1}} dz$$

Pole is at  $z = 0$  of order  $(n + 1)$ .

It lies inside the unit circle.

Residue of  $f(z)$  at  $z = 0$  is

$$= \frac{1}{(n+1-1)!} \left[ \frac{d^n}{dz^n} \left\{ z^{n+1} \cdot \frac{-ie^z}{z^{n+1}} \right\} \right]_{z=0} = \frac{-i}{n!} \left[ \frac{d^n}{dz^n} (e^z) \right]_{z=0} = \frac{-i}{n!} (e^z)_{z=0} = \frac{-i}{n!}$$

$\therefore$  By Cauchy's Residue theorem,

$$I = 2\pi i \left( \frac{-i}{n!} \right) = \frac{2\pi}{n!}$$

Comparing real part of  $\int_0^{2\pi} e^{\cos \theta} [\cos(\sin \theta - n\theta) + i \sin(\sin \theta - n\theta)] d\theta = \frac{2\pi}{n!}$ ,

we have

$$\int_0^{2\pi} e^{\cos \theta} \cos(\sin \theta - n\theta) d\theta = \frac{2\pi}{n!}$$

**Ans.**

## EXERCISE 31.4

Evaluate the following integrals:

1.  $\int_0^{2\pi} \frac{\sin^2 \theta}{a+b \cos \theta} d\theta$  (R.G.P.V., Bhopal, III Semester, June 2008) Ans.  $\frac{2\pi}{b^2} \{a - \sqrt{a^2 - b^2}\}$ ,  $a > b > 0$

2.  $\int_0^{2\pi} \frac{(1+2 \cos \theta)^n \cos n\theta}{3+2 \cos \theta} d\theta$  Ans.  $\frac{2\pi}{\sqrt{5}} (3-\sqrt{5})^n$ ,  $n > 0$

3.  $\int_0^{2\pi} \frac{4}{5+4 \sin \theta} d\theta$  Ans.  $\frac{8\pi}{3}$

4.  $\int_0^\pi \frac{d\theta}{17-8 \cos \theta}$  Ans.  $\frac{\pi}{15}$

5.  $\int_0^\pi \frac{d\theta}{a+b \cos \theta}$ , where  $a > |b|$ . Hence or otherwise evaluate  $\int_0^{2\pi} \frac{d\theta}{\sqrt{2}-\cos \theta}$ . Ans.  $\frac{\pi}{\sqrt{a^2-b^2}}$ ;  $\pi$

**31.15 EVALUATION OF**  $\int_{-\infty}^{\infty} \frac{f_1(x)}{f_2(x)} dx$  where  $f_1(x)$  and  $f_2(x)$  are polynomials in  $x$ .

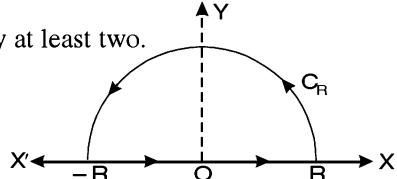

Such integrals can be reduced to contour integrals, if

(i)  $f_2(x)$  has no real roots.

(ii) the degree of  $f_2(x)$  is greater than that of  $f_1(x)$  by at least two.

**Procedure:** Let  $f(x) = \frac{f_1(x)}{f_2(x)}$

Consider  $\int_C f(z) dz$

where  $C$  is a curve, consisting of the upper half  $C_R$  of the circle  $|z| = R$ , and part of the real axis from  $-R$  to  $R$ .

If there are no poles of  $f(z)$  on the real axis, the circle  $|z| = R$  which is arbitrary can be taken such that there is no singularity on its circumference  $C_R$  in the upper half of the plane, but possibly some poles inside the contour  $C$  specified above.

Using Cauchy's theorem of residues, we have

$$\begin{aligned} \int_C f(z) dz &= 2\pi i \times (\text{sum of the residues of } f(z) \text{ at the poles within } C) \\ \text{i.e. } \int_{-R}^R f(x) dx + \int_{CR} f(z) dz &= 2\pi i (\text{sum of residues within } C) \\ \Rightarrow \int_{-R}^R f(x) dx &= - \int_{CR} f(z) dz + 2\pi i (\text{sum of residues within } C) \\ \therefore \lim_{R \rightarrow \infty} \int_{-R}^R f(x) dx &= - \lim_{R \rightarrow \infty} \int_{CR} f(z) dz + 2\pi i (\text{sum of residues within } C) \end{aligned} \quad \dots (1)$$

Now,  $\lim_{R \rightarrow \infty} \int_{CR} f(z) dz = \int_0^\pi f(R e^{i\theta}) R i e^{i\theta} d\theta = 0$  when  $R \rightarrow \infty$

(1) reduces  $\int_{-\infty}^{\infty} f(x) dx = 2\pi i (\text{sum of residues within } C)$

**Example 52.** Evaluate  $\int_0^{\infty} \frac{\cos mx}{(x^2+1)} dx$ . (R.G.P.V., Bhopal, III Semester, Dec. 2006)

**Solution.**  $\int_0^{\infty} \frac{\cos mx}{x^2+1} dx$

Consider the integral  $\int_C f(z) dz$ , where

$f(z) = \frac{e^{imz}}{z^2+1}$ , taken round the closed contour  $c$  consisting of the upper half of a large circle  $|z| = R$  and the real axis from  $-R$  to  $R$ .

Poles of  $f(z)$  are given by

$$z^2 + 1 = 0 \text{ i.e. } z^2 = -1 \text{ i.e. } z = \pm i$$

The only pole which lies within the contour is at  $z = i$ .

The residue of  $f(z)$  at  $z = i$

$$= \lim_{z \rightarrow i} \frac{(z-i)e^{imz}}{(z^2+1)} = \lim_{z \rightarrow i} \frac{e^{imz}}{z+i} = \frac{e^{-m}}{2i}$$

Hence by Cauchy's residue theorem, we have

$$\int_C f(z) dz = 2\pi i \times \text{sum of the residues}$$

$$\Rightarrow \int_C \frac{e^{imz}}{z^2+1} dz = 2\pi i \times \frac{e^{-m}}{2i} \quad \Rightarrow \quad \int_{-R}^R \frac{e^{imx}}{x^2+1} dx = \pi e^{-m}$$

Equating real parts, we have

$$\int_{-\infty}^{\infty} \frac{\cos mx}{x^2+1} dx = \pi e^{-m} \quad \Rightarrow \quad \int_0^{\infty} \frac{\cos mx}{x^2+1} dx = \frac{\pi e^{-m}}{2} \quad \text{Ans.}$$

**Example 53.** Evaluate  $\int_{-\infty}^{\infty} \frac{x \sin \pi x}{x^2+2x+5} dx$  (U.P. III Semester 2009-2010)

**Solution.** Here, we have  $\int_{-\infty}^{\infty} \frac{x \sin \pi x}{x^2+2x+5} dx$

Let us consider  $\int_C \frac{z \sin \pi z}{z^2+2z+5} dz$

The pole can be determined by putting the denominator equal to zero.

$$z^2 + 2z + 5 = 0 \quad \Rightarrow \quad z = \frac{-2 \pm \sqrt{4-20}}{2} \quad \Rightarrow \quad z = -1 \pm 2i$$

Out of two poles, only  $z = -1 + 2i$  is inside the contour.

Residue at  $z = -1 + 2i$

$$\begin{aligned} &= \lim_{z \rightarrow -1+2i} (z+1-2i) \frac{z \sin \pi z}{z^2+2z+5} = \lim_{z \rightarrow -1+2i} (z+1-2i) \frac{z \sin \pi z}{(z+1-2i)(z+1+2i)} \\ &= \lim_{z \rightarrow -1+2i} \frac{z \sin \pi z}{(z+1+2i)} = \frac{(-1+2i) \sin \pi (-1+2i)}{(-1+2i+1+2i)} \\ &= \frac{(-1+2i) \sin \pi (-1+2i)}{4i} \end{aligned}$$

$$\int_{-R}^R \frac{z \sin \pi z}{z^2+2z+5} dz = 2\pi i \text{ (Residue)}$$

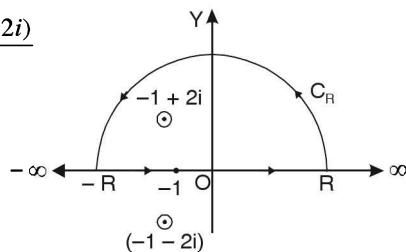

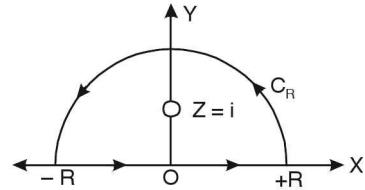

$$= 2\pi i \frac{(-1+2i) \sin \pi (-1+2i)}{4i} = \frac{\pi}{2} (2i-1) \sin(-\pi+2\pi i)$$

$$= \frac{\pi}{2} (2i-1) (-\sin 2\pi i) \quad \left[ \begin{aligned} \sin(-\pi+\theta) &= -\sin(\pi-\theta) \\ &= -\sin \theta \end{aligned} \right]$$

$$= \frac{\pi}{2} (1-2i) \sin 2\pi i = \frac{\pi}{2} (1-2i) i \sinh 2\pi$$

$$= \frac{\pi}{2} (i+2) \sinh 2\pi \quad (\text{Taking real parts})$$

Hence  $\int_{-\infty}^{\infty} \frac{x \sin \pi x}{x^2+2x+5} dx = \pi \sinh 2\pi$  Ans.

**Example 54.** Use contour integration to evaluate the real integral  $\int_0^\infty \frac{dx}{(1+x^2)^3}$ .

**Solution.** Consider  $\int_C f(z)dz$ , where  $f(z) = \frac{1}{(z^2+1)^3}$  taken round the closed contour  $C$  consisting of real axis and upper half  $C_R$  of a large semi-circle  $|z| = R$ .  
Poles of  $f(z)$  are given by

$$(z^2 + 1)^3 = 0 \text{ i.e. } (z - i)^3(z + i)^3 = 0$$

i.e.  $z = \pm i$  are the poles each of order 3.

The only pole which lies within  $C$  is  $z = i$  of order 3.

$$\begin{aligned} \therefore \text{Residue of } & \frac{1}{(z-i)^3} \cdot \frac{1}{(z+i)^3} \text{ (at } z=i) \\ &= \frac{1}{2} \left[ \frac{d^2}{dz^2} (z-i)^3 \cdot \frac{1}{(z-i)^3(z+i)^3} \right]_{z=i} = \frac{1}{2} \left[ \frac{d^2}{dz^2} \frac{1}{(z+i)^3} \right]_{z=i} = \frac{1}{2} \left[ \frac{(-3)(-4)}{(z+i)^5} \right]_{z=i} = \frac{3}{16i} \end{aligned}$$

Hence by Cauchy's residue theorem, we have

$$\int f(z)dz = 2\pi i \times \text{sum of residues within } c.$$

$$\int_{-R}^R f(x)dx + \int_{CR} f(z)dz = 2\pi i \times \frac{3}{16i} \Rightarrow \int_{-R}^R \frac{1}{(x^2+1)^3} dx + \int_{CR} \frac{1}{(z^2+1)^3} dz = \frac{3\pi}{8} \quad \dots (1)$$

$$\begin{aligned} \text{Now, } \left| \int_{CR} \frac{1}{(z^2+1)^3} dz \right| &\leq \int_{CR} \left| \frac{1}{(z^2+1)^3} \right| |dz| \leq \int_{CR} \frac{|dz|}{(|z|^2-1)^3} \\ &= \int_0^\pi \frac{R d\theta}{(R^2-1)^3} \quad [\text{since } z = Re^{i\theta}, |dz| = R d\theta] \\ &= \frac{\pi R}{(R^2-1)^3}, \text{ which } \rightarrow 0 \text{ as } R \rightarrow \infty \end{aligned}$$

Hence making  $R \rightarrow \infty$ , relation (1) becomes

$$\int_{-\infty}^{\infty} \frac{1}{(x^2+1)^3} dx = \frac{3\pi}{8} \quad \text{or} \quad \int_0^{\infty} \frac{1}{(x^2+1)^3} dx = \frac{3\pi}{16} \quad \text{Ans.}$$

**Example 55.** Evaluate by the method of complex variables, the integral

$$\int_{-\infty}^{\infty} \frac{x^2}{(1+x^2)^3} dx$$

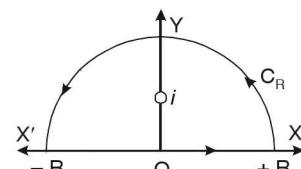

**Solution.** Consider  $\int_C \frac{z^2}{(1+z^2)^3} dz$  where  $c$  is a closed contour consisting of the upper half  $C_R$  of a large circle  $|z| = R$  and the real axis from  $-R$  to  $+R$ .

Poles of  $\frac{z^2}{(1+z^2)^3}$  are given by

$$(z^2 + 1)^3 = 0 \quad \text{or} \quad z^2 = -1 \Rightarrow z = \pm i$$

$\therefore z = i$  and  $z = -i$  are the two poles each of order 3. But only  $z = i$  lies within the contour.  
To get residue at  $z = i$ , put  $z = i + t$ , then

$$\frac{z^2}{(1+z^2)^3} = \frac{(i+t)^2}{[1+(i+t)^2]^3} = \frac{-1+2it+t^2}{[1-1+2it+t^2]^3}$$

$$\begin{aligned}
 &= \frac{(-1+2it+t^2)}{(2it)^3 \left(1+\frac{1}{2i}t\right)^3} = \frac{(-1+2it+t^2)}{-8it^3} \left(1+\frac{t}{2i}\right)^{-3} = -\frac{1}{8i} \left(-\frac{1}{t^3} + \frac{2i}{t^2} + \frac{1}{t}\right) \left(1 - \frac{3t}{2i} + \frac{(-3)(-4)}{2} \frac{t^2}{-4} + \dots\right) \\
 &= -\frac{1}{8i} \left[-\frac{1}{t^3} + \frac{2i}{t^2} + \frac{1}{t}\right] \left[1 - \frac{3}{2i}t - \frac{3}{2}t^2 + \dots\right]
 \end{aligned}$$

Here coefficient of  $\frac{1}{t}$  is  $\frac{-1}{8i} \left(\frac{3}{2} - 3 + 1\right)$  or  $\frac{i}{8} \left(-\frac{1}{2}\right)$  or  $\frac{-i}{16}$  which is therefore the residue at  $z = i$ .

Hence by Cauchy's residue theorem, we have

$$\int f(z) dz = 2\pi i \times \text{sum of the residues within } c$$

$$\begin{aligned}
 \text{i.e.} \quad &\int_{-R}^R f(x) dx + \int_{C_R} f(z) dz = 2\pi i \left(-\frac{i}{16}\right) \\
 &\int_{-R}^R \frac{x^2}{(1+x^2)^3} dx + \int_{C_R} \frac{z^2}{(1+z^2)^3} dz = \frac{\pi}{8} \quad \dots (1)
 \end{aligned}$$

$$\text{Now } \left| \int_{C_R} \frac{z^2}{(1+z^2)^3} dz \right| \leq \int_{C_R} \frac{|z|^2 |dz|}{|1+z^2|^3} \leq \frac{R^2}{(R^2-1)^3} \int_0^\pi R d\theta$$

$$\text{since } z = Re^{\theta i}, \quad |dz| = Rd\theta = \frac{R^3\pi}{(R^2-1)^3}, \text{ which } \rightarrow 0 \text{ as } R \rightarrow \infty$$

$$\text{Hence by making } R \rightarrow \infty, \text{ equation (1) becomes } \int_{-\infty}^{\infty} \frac{x^2}{(1+x^2)^3} dx = \frac{\pi}{8} \quad \text{Ans.}$$

$$\text{Example 56. Evaluate } \int_{-\infty}^{\infty} \frac{x^2 dx}{(x^2+1)(x^2+4)}.$$

$$\text{Solution. We consider } \int_C \frac{z^2 dz}{(z^2+1)(z^2+4)} = \int_C f(z) dz$$

where  $C$  is the contour consisting of the semi-circle  $C_R$  of radius  $R$  together with the part of the real axis from  $-R$  to  $+R$ .

The integral has simple poles at

$$z = \pm i, z = \pm 2i$$

of which  $z = i, 2i$  only lie inside  $C$ .

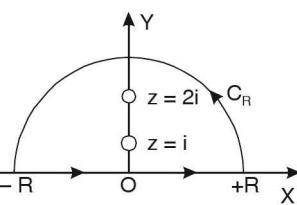

$$\begin{aligned}
 \text{The residue (at } z = i\text{)} &= \lim_{z \rightarrow i} (z-i) \frac{z^2}{(z+i)(z-i)(z^2+4)} \\
 &= \lim_{z \rightarrow i} \frac{z^2}{(z+i)(z^2+4)} = \frac{-1}{2i(-1+4)} = \frac{-1}{6i}
 \end{aligned}$$

$$\begin{aligned}
 \text{The residue (at } z = 2i\text{)} &= \lim_{z \rightarrow 2i} (z-2i) \frac{z^2}{(z^2+1)(z+2i)(z-2i)} \\
 &= \lim_{z \rightarrow 2i} \frac{z^2}{(z^2+1)(z+2i)} = \frac{(2i)^2}{(-4+1)(2i+2i)} = \frac{1}{3i}
 \end{aligned}$$

By theorem of residue;

$$\int_C f(z) dz = 2\pi i [\text{Res } f(i) + \text{Res } f(2i)] = 2\pi i \left(-\frac{1}{6i} + \frac{1}{3i}\right) = \frac{\pi}{3}$$

$$\text{i.e. } \int_{-R}^R f(x) dx + \int_{C_R} f(z) dz = \frac{\pi}{3} \quad \dots (1)$$

Hence by making  $R \rightarrow \infty$ , relation (1) becomes

$$\int_{-\infty}^{\infty} f(x) dx + \lim_{z \rightarrow \infty} \int_{C_R} f(z) dz = \frac{\pi}{3}$$

Now  $R \rightarrow \infty$ ,  $\int_{C_R} f(z) dz$  vanishes.

For any point on  $C_R$  as  $|z| \rightarrow \infty$ ,  $f(z) = 0$

$$\begin{aligned} \lim_{|z| \rightarrow \infty} \int_{C_R} f(z) dz &= 0, \quad \int_{-\infty}^{\infty} f(x) dx = \frac{\pi}{3} \\ \Rightarrow \quad \int_{-\infty}^{\infty} \frac{x^2 dx}{(x^2+1)(x^2+4)} &= \frac{\pi}{3} \end{aligned} \quad \text{Ans.}$$

**Example 57.** Using the complex variable techniques, evaluate the integral

$$\int_{-\infty}^{\infty} \frac{1}{x^4+1} dx \quad (\text{AMIETE, June 2010, U.P. III Semester, Dec. 2006})$$

**Solution.**  $\int_{-\infty}^{\infty} \frac{1}{x^4+1} dx$

Consider  $\int_C f(z) dz$ , where  $f(z) = \frac{1}{z^4+1}$

taken around the closed contour consisting of real axis and upper half  $C_R$ , i.e.  $|z| = R$ .

Poles of  $f(z)$  are given by

$$z^4 + 1 = 0 \text{ i.e. } z^4 = -1 = (\cos \pi + i \sin \pi)$$

$$\Rightarrow z^4 = [\cos(2n+1)\pi + i \sin(2n+1)\pi]$$

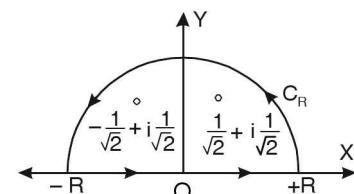

$$z = [\cos(2n+1)\pi + i \sin(2n+1)\pi]^{\frac{1}{4}} = \left[ \cos\left(2n+1\right)\frac{\pi}{4} + i \sin\left(2n+1\right)\frac{\pi}{4} \right]$$

$$\text{If } n = 0, \quad z_1 = \left( \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right) = \left( \frac{1}{\sqrt{2}} + i \frac{1}{\sqrt{2}} \right) = e^{i\frac{\pi}{4}}$$

$$n = 1, \quad z_2 = \left( \cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4} \right) = \left( -\frac{1}{\sqrt{2}} + i \frac{1}{\sqrt{2}} \right) = e^{i\frac{3\pi}{4}}$$

$$n = 2, \quad z_3 = \left( \cos \frac{5\pi}{4} + i \sin \frac{5\pi}{4} \right) = \left( -\frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right)$$

$$n = 3, \quad z_4 = \left( \cos \frac{7\pi}{4} + i \sin \frac{7\pi}{4} \right) = \left( \frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right)$$

There are four poles, but only two poles at  $z_1$  and  $z_2$  lie within the contour.

$$\begin{aligned} \text{Residue} \left( \text{at } z = e^{i\frac{\pi}{4}} \right) &= \left[ \frac{1}{\frac{d}{dz}(z^4+1)} \right]_{z=e^{\frac{i\pi}{4}}} = \left[ \frac{1}{4z^3} \right]_{z=e^{\frac{i\pi}{4}}} = \frac{1}{4 \left( e^{\frac{i\pi}{4}} \right)^3} = \frac{1}{4e^{\frac{3i\pi}{4}}} \\ &= \frac{1}{4} e^{-i\frac{3\pi}{4}} = \frac{1}{4} \left[ \cos \frac{3\pi}{4} - i \sin \frac{3\pi}{4} \right] = \frac{1}{4} \left[ -\frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right] \end{aligned}$$

$$\begin{aligned}\text{Residue} \left( \text{at } z = e^{\frac{3i\pi}{4}} \right) &= \left[ \frac{1}{\frac{d}{dz}(z^4+1)} \right]_{z=e^{\frac{3i\pi}{4}}} = \frac{1}{[4z^3]_{z=\frac{3i\pi}{4}}} = \frac{1}{4 \left( e^{\frac{3i\pi}{4}} \right)^3} = \frac{1}{4e^{\frac{9\pi i}{4}}} \\ &= \frac{1}{4} e^{-i\frac{9\pi}{4}} = \frac{1}{4} \left( \cos \frac{9\pi}{4} - i \sin \frac{9\pi}{4} \right) = \frac{1}{4} \left( \frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right)\end{aligned}$$

$\int_C f(z) dz = 2\pi i$  (sum of residues at poles within c)

$\int_{-R}^R f(z) dz + \int_{C_R} f(z) dz = 2\pi i$  (sum of the residues)

$\int_{-R}^R \frac{1}{x^4+1} dx + \int_{C_R} \frac{1}{z^4+1} dz = 2\pi i$  (sum of the residues)

$$\begin{aligned}\text{Now, } \left| \int_{C_R} \frac{1}{z^4+1} dz \right| &\leq \int_{C_R} \frac{1}{|z^4+1|} |dz| \\ &\leq \int_{C_R} \frac{1}{(|z^4|-1)} |dz| \quad [\text{Since } z = Re^{i\theta}, |dz| = |Re^{i\theta}| d\theta = R d\theta] \\ &\leq \int_0^\pi \frac{1}{R^4-1} R d\theta \leq \frac{R}{R^4-1} \int_0^\pi d\theta \\ &\leq \frac{R\pi}{R^4-1} = \frac{\pi/R^3}{1-1/R^4} \quad \text{which } \rightarrow 0 \\ &\quad \text{as } R \rightarrow \infty.\end{aligned}$$

Hence,  $\int_{-R}^R \frac{1}{x^4+1} dx = 2\pi i$  (Sum of the residues within contour)

As  $R \rightarrow \infty$

Hence,  $\int_{-\infty}^{\infty} \frac{1}{x^4+1} dx = 2\pi i$  (Sum of the residues within contour) ... (1)

$$\begin{aligned}\int_{-\infty}^{\infty} \frac{1}{x^4+1} dx &= 2\pi i \left[ \frac{1}{4} \left( -\frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right) + \frac{1}{4} \left( \frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right) \right] \\ &= \frac{\pi}{2} i \left( -\frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} - i \frac{1}{\sqrt{2}} \right) = \frac{\pi i}{2} \left( -i \frac{2}{\sqrt{2}} \right) = \frac{\pi}{\sqrt{2}}\end{aligned}$$

Hence, the given integral =  $\frac{\pi}{\sqrt{2}}$

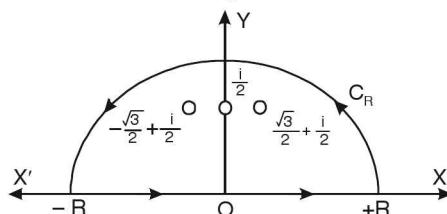

Ans.

**Example 58.** Using complex variable techniques, evaluate the real integral

$$\int_0^{\infty} \frac{dx}{1+x^6}$$

**Solution.** Let  $f(z) = \frac{1}{1+z^6}$

We consider  $\int_C \frac{1}{1+z^6} dz$

where  $C$  is the contour consisting of the semi-circle  $C_R$  of radius  $R$  together with the part of real axis from  $-R$  to  $R$ .

Poles are given by  $1+z^6=0$

$$\begin{aligned} z^6 &= -1 = \cos \pi + i \sin \pi = \cos(2n\pi + \pi) + i \sin(2n\pi + \pi) \\ &= e^{(2n+1)\pi i} \end{aligned}$$

$$z = e^{\frac{2n+1}{6}\pi i} = \left[ \cos \frac{2n\pi + \pi}{6} + i \sin \frac{2n\pi + \pi}{6} \right] \text{ where } n = 0, 1, 2, 3, 4, 5$$

$$\text{If } n = 0, \quad z = e^{\frac{\pi i}{6}} = \cos \frac{\pi}{6} + i \sin \frac{\pi}{6} = \frac{\sqrt{3}}{2} + \frac{i}{2}$$

$$\text{If } n = 1, \quad z = e^{\frac{i\pi}{2}} = \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} = i$$

$$\text{If } n = 2, \quad z = e^{\frac{i5\pi}{6}} = \cos \frac{5\pi}{6} + i \sin \frac{5\pi}{6} = \frac{-\sqrt{3}}{2} + \frac{i}{2}$$

$$\text{If } n = 3, \quad z = e^{\frac{i7\pi}{6}} = \cos \frac{7\pi}{6} + i \sin \frac{7\pi}{6} = \frac{-\sqrt{3}}{2} - \frac{i}{2}$$

$$\text{If } n = 4, \quad z = e^{\frac{i3\pi}{2}} = \cos \frac{3\pi}{2} + i \sin \frac{3\pi}{2} = -i$$

$$\text{If } n = 5, \quad z = e^{\frac{i11\pi}{6}} = \cos \frac{11\pi}{6} + i \sin \frac{11\pi}{6} = \frac{\sqrt{3}}{2} - \frac{i}{2}$$

Only first three poles i.e.,  $e^{\frac{i\pi}{6}}, e^{\frac{i\pi}{2}}, e^{\frac{i5\pi}{6}}$  are inside the contour.

$$\text{Residue at } z = e^{\frac{i\pi}{6}} = \lim_{z \rightarrow e^{\frac{i\pi}{6}}} \frac{1}{d} \frac{1}{dz} (1+z^6) = \lim_{z \rightarrow e^{\frac{i\pi}{6}}} \frac{1}{6z^5} = \frac{1}{6} e^{\frac{-i5\pi}{6}}$$

$$\text{Residue at } z = e^{\frac{i\pi}{2}} = \lim_{z \rightarrow e^{\frac{i\pi}{2}}} \frac{1}{d} \frac{1}{dz} (1+z^6) = \lim_{z \rightarrow e^{\frac{i\pi}{2}}} \frac{1}{6z^5} = \frac{1}{6} e^{\frac{-i5\pi}{2}}$$

$$\text{Residue at } z = e^{\frac{i5\pi}{6}} = \lim_{z \rightarrow e^{\frac{i5\pi}{6}}} \frac{1}{d} \frac{1}{dz} (1+z^6) = \lim_{z \rightarrow e^{\frac{i5\pi}{6}}} \frac{1}{6z^5} = \frac{1}{6} e^{\frac{-i25\pi}{6}}$$

$$\text{Sum of the residues} = \frac{1}{6} \left[ e^{\frac{-5i\pi}{6}} + e^{\frac{-i5\pi}{2}} + e^{\frac{-i25\pi}{6}} \right] = \frac{1}{6} \left( -\frac{\sqrt{3}}{2} - \frac{i}{2} + 0 - i + \frac{\sqrt{3}}{2} - \frac{i}{2} \right) = \frac{1}{6} (-2i) = -\frac{i}{3}$$

$$\Rightarrow \int_C \frac{dz}{1+z^6} = 2\pi i \text{ (Residue)} = 2\pi i \left( -\frac{i}{3} \right) = \frac{2\pi}{3}$$

$$\Rightarrow \int_{-\infty}^{\infty} \frac{dx}{1+x^6} = \frac{2\pi}{3}$$

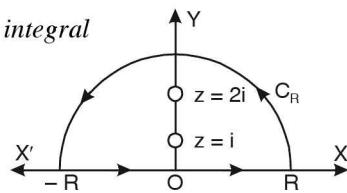

$$\Rightarrow \int_0^{\infty} \frac{dx}{1+x^6} = \frac{\pi}{3}$$

**Example 59.** Using complex variables, evaluate the real integral

$$\int_0^{\infty} \frac{\cos 3x \, dx}{(x^2+1)(x^2+4)}$$

$$\text{Solution. Let } f(z) = \frac{e^{3iz}}{(z^2+1)(z^2+4)}$$

**Ans.**

Poles are given by

$$(z^2 + 1)(z^2 + 4) = 0$$

i.e.,

$$z^2 + 1 = 0 \text{ or } z = \pm i$$

$$z^2 + 4 = 0 \text{ or } z = \pm 2i$$

Let  $C$  be a closed contour consisting of the upper half  $C_R$  of a large circle  $|z| = R$  and the real axis from  $-R$  to  $+R$ . The poles at  $z = i$  and  $z = 2i$  lie within the contour.

$$\text{Residue (at } z = i\text{)} = \lim_{z \rightarrow i} \frac{(z-i)e^{3iz}}{(z^2+1)(z^2+4)} = \lim_{z \rightarrow i} \frac{e^{3iz}}{(z+i)(z^2+4)} = \frac{e^{-3}}{6i}$$

$$\text{Residue (at } z = 2i\text{)} = \lim_{z \rightarrow 2i} \frac{(z-2i)e^{3iz}}{(z^2+1)(z^2+4)} = \lim_{z \rightarrow 2i} \frac{e^{3iz}}{(z^2+1)(z+2i)} = \frac{e^{-6}}{-12i}$$

$$\text{By theorem of Residue} \quad \int_C f(z) dz = 2\pi i [\text{Sum of Residues}]$$

$$\begin{aligned} \int_{-R}^R \frac{e^{3iz} dz}{(z^2+1)(z^2+4)} + \int_{C_R} \frac{e^{3iz} dz}{(z^2+1)(z^2+4)} &= 2\pi i \left[ \frac{e^{-3}}{6i} + \frac{e^{-6}}{-12i} \right] \\ \left[ \int_{C_R} \frac{e^{3iz} dz}{(z^2+1)(z^2+4)} \right] &= 0 \text{ as } z = Re^{i\theta} \text{ and } R \rightarrow \infty \end{aligned}$$

$$\int_{-R}^R \frac{e^{3ix} dx}{(x^2+1)(x^2+4)} = \pi \left[ \frac{e^{-3}}{3} - \frac{e^{-6}}{6} \right]$$

$$\int_0^\infty \frac{\cos 3x dx}{(x^2+1)(x^2+4)} = \text{Real part of } \frac{1}{2} \int_{-\infty}^\infty \frac{e^{3ix} dx}{(x^2+1)(x^2+4)}$$

$$= \text{Real part of } \frac{\pi}{2} \left( \frac{e^{-3}}{3} - \frac{e^{-6}}{6} \right)$$

$$\text{Hence,} \quad \text{given integral} = \frac{\pi}{2} \left[ \frac{e^{-3}}{3} - \frac{e^{-6}}{6} \right] \quad \text{Ans.}$$

**Example 60.** Using the calculus of residues, evaluate the integral given by the following:

$$\int_0^\infty \frac{\cos ax}{(x^2+b^2)^2} dx, \quad a > 0, \quad b > 0$$

**Solution.** Consider the integral  $\int_C f(z) dz$

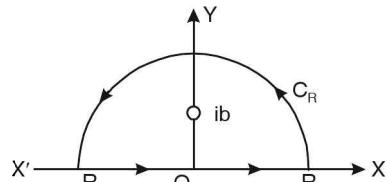

$$\text{where} \quad f(z) = \frac{e^{iaz}}{(z^2+b^2)^2}$$

taken around the closed contour  $C$  consisting of the upper half of a large circle  $|z| = R$  and the real axis from  $-R$  to  $R$ .

Poles of  $f(z)$  are given by  $(z^2+b^2)^2 = 0$

i.e.,  $z = ib$  and  $z = -ib$  are the two poles of order two. The only pole which lies within the contour is  $z = ib$  of order two.

$$\text{Residue at } (z = ib) = \lim_{z \rightarrow ib} \frac{d}{dz} (z - ib)^2 \frac{e^{iaz}}{(z^2+b^2)^2} = \lim_{z \rightarrow ib} \frac{d}{dz} \frac{e^{iaz}}{(z+ib)^2}$$

$$\begin{aligned}
 &= \lim_{z \rightarrow ib} \frac{(z+ib)^2 iae^{iaz} - e^{iaz} 2(z+ib)}{(z+ib)^4} = \lim_{z \rightarrow ib} \frac{[(z+ib)i a - 2]e^{iaz}}{(z+ib)^3} \\
 &= \frac{[(2ib)ia - 2]e^{ia(ib)}}{(2ib)^3} = \frac{(-2ab - 2)e^{-ab}}{-8ib^3} = \frac{(ab+1)e^{-ab}}{4ib^3}
 \end{aligned}$$

Hence, by Cauchy's residue theorem, we have

$$\begin{aligned}
 \int_C f(z) dz &= 2\pi i \times \text{Sum of the residues within } C \\
 \int_{-R}^R f(x) dx + \int_{C_R} f(z) dz &= 2\pi i \frac{(ab+1)e^{-ab}}{4ib^3} \\
 \int_{-R}^R \frac{e^{iaz}}{(x^2 + b^2)^2} dx + \int_{C_R} \frac{e^{iaz}}{(z^2 + b^2)^2} dz &= \frac{\pi(ab+1)e^{-ab}}{2b^3} \quad \dots (1) \\
 \text{Now } \left| \int_{C_R} \frac{e^{iaz} dz}{(z^2 + b^2)^2} \right| &\leq \int_{C_R} \frac{|e^{iaz}| |dz|}{(z^2 + b^2)^2} \leq \int_{C_R} \frac{|e^{iaz}| |dz|}{|z|^2 - b^2)^2} \\
 &\leq \int_0^\pi \frac{e^{-aR \sin \theta} R d\theta}{(R^2 - b^2)^2} \leq \frac{R}{(R^2 - b^2)^2} \int_0^\pi e^{-aR \sin \theta} d\theta \leq \frac{R}{(R^2 - b^2)^2} 2 \int_0^{\frac{\pi}{2}} e^{-aR \frac{2\theta}{\pi}} d\theta \\
 &\leq \frac{R}{a(R^2 - b^2)^2} (1 - e^{-aR}) \quad \text{which } \rightarrow 0, \text{ as } R \rightarrow \infty
 \end{aligned}$$

$$\text{Hence by making } R \rightarrow \infty, (1) \text{ becomes } \int_{-\infty}^{\infty} \frac{e^{iaz} dx}{(x^2 + b^2)^2} = \frac{\pi(ab+1)e^{-ab}}{2b^3}$$

$$\text{Equating real parts, we have } \int_{-\infty}^{\infty} \frac{\cos ax}{(x^2 + b^2)^2} dx = \frac{\pi(ab+1)e^{-ab}}{2b^3}$$

$$\Rightarrow \int_0^{\infty} \frac{\cos ax dx}{(x^2 + b^2)^2} = \frac{\pi(ab+1)e^{-ab}}{4b^3} \quad \text{Ans.}$$

**Example 61.** Using complex variable techniques, evaluate the real integral

$$\int_0^{\infty} \frac{\cos 2x}{(x^2 + 9)^2 (x^2 + 16)} dx$$

**Solution.** Consider the integral  $\int_C f(z) dz$ ,

$$\text{where } f(z) = \frac{e^{2iz}}{(z^2 + 9)^2 (z^2 + 16)},$$

taken around the closed contour  $C$  consisting of the upper half of a large circle  $|z| = R$  and the real axis from  $-R$  to  $R$ .

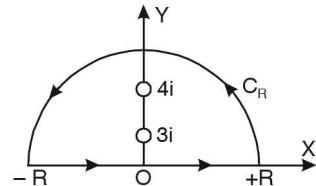

Poles of  $f(z)$  are given by

$$(z^2 + 9)^2 (z^2 + 16) = 0$$

$$\text{i.e. } (z + 3i)^2 (z - 3i)^2 (z + 4i)(z - 4i) = 0$$

$$\text{i.e. } z = 3i, -3i, 4i, -4i$$

The poles which lie within the contour are  $z = 3i$  of the second order and  $z = 4i$  simple pole.  
Residue of  $f(z)$  at  $z = 3i$

$$\begin{aligned}
&= \frac{1}{1!} \left[ \frac{d}{dz} \left\{ (z-3i)^2 \frac{e^{2iz}}{(z-3i)^2 (z+3i)^2 (z^2+16)} \right\} \right]_{z=3i} = \left[ \frac{d}{dz} \left\{ \frac{e^{2iz}}{(z+3i)^2 (z^2+16)} \right\} \right]_{z=3i} \\
&= \left[ \frac{(z+3i)^2 (z^2+16) 2ie^{2iz} - e^{2iz} [2(z+3i)(z^2+16) + 2z(z+3i)^2]}{(z+3i)^4 (z^2+16)^2} \right]_{z=3i} \\
&= \left[ \frac{(z+3i)(z^2+16) 2ie^{2iz} - e^{2iz} [2(z^2+16) + 2z(z+3i)]}{(z+3i)^3 (z^2+16)^2} \right]_{z=3i} \\
&= \frac{6i \times 7 \times 2i e^{-6} - e^{-6} (2 \times 7 + 6i \times 6i)}{(6i)^3 (7)^2} = \frac{e^{-6} [-84 + 22i]}{216 \times 49} = \frac{e^{-6} (-62)i}{216 \times 49} = -\frac{i31e^{-6}}{108 \times 49}
\end{aligned}$$

$$\begin{aligned}
\text{Residue of } f(z) \text{ at } (z = 4i) &= \lim_{z \rightarrow 4i} (z-4i) \frac{e^{2iz}}{(z^2+9)^2 (z-4i)(z+4i)} \\
&= \frac{e^{-8}}{(-16+9)^2 (4i+4i)} = \frac{e^{-8}}{49 \times 8i} = \frac{-ie^{-8}}{392}
\end{aligned}$$

$$\text{Sum of the residues} = -\frac{i31e^{-6}}{108 \times 49} - \frac{ie^{-8}}{392}$$

Hence by Cauchy's Residue Theorem, we have

$$\int_C f(z) dz = 2\pi i \times \text{Sum of the residues within } C$$

$$\text{i.e. } \int_{-R}^R f(x) dx + \int_{C_R} f(z) dz = 2\pi i \times \text{sum of residues}$$

$$\text{or } \int_{-R}^R \frac{e^{2ix}}{(x^2+9)^2 (x^2+16)} dx + \int_{C_R} \frac{e^{2iz}}{(z^2+9)^2 (z^2+16)} dz = 2\pi i \times \text{Sum of residues} \quad \dots (1)$$

Now let  $R \rightarrow \infty$ , so as to show that the second integral in above relation vanishes. For any point on  $C_R$ , as  $|z| \rightarrow \infty$

$$\begin{aligned}
\text{Let } F(z) &= \frac{1}{z^6} \frac{e^{2iz}}{\left(1+\frac{9}{z^2}\right)^2 \left(1+\frac{16}{z^2}\right)} \\
\lim_{|z| \rightarrow \infty} F(z) &= 0 \quad \text{or} \quad \int_{C_R} \frac{e^{2iz}}{(z^2+9)^2 (z^2+16)} dz = 0 \text{ as } z \rightarrow \infty
\end{aligned}$$

Hence by making  $R \rightarrow \infty$ , relation (1) becomes

$$\therefore \int_{-\infty}^{\infty} \frac{e^{2ix}}{(x^2+9)^2 (x^2+16)} dx = 2\pi i \left[ \frac{-i31e^{-6}}{108 \times 49} - i \frac{e^{-8}}{392} \right] = \frac{2\pi}{196} \left[ \frac{31e^{-6}}{27} + \frac{e^{-8}}{2} \right]$$

Equating real parts, we have

$$\int_{-\infty}^{\infty} \frac{\cos 2x dx}{(x^2+9)^2 (x^2+16)} = \frac{\pi}{98} \left( \frac{31e^{-6}}{27} + \frac{e^{-8}}{2} \right)$$

$$\int_0^{\infty} \frac{\cos 2x}{(x^2+9)^2 (x^2+16)} dx = \frac{\pi}{196} \left( \frac{31e^{-6}}{27} + \frac{e^{-8}}{2} \right) \quad \left[ \because \int_{-\infty}^{\infty} f(x) dx = 2 \int_0^{\infty} f(x) dx \right]$$

If  $f(x)$  is even function.

**Ans.**

## EXERCISE 31.5

Evaluate the following :

1.  $\int_0^\infty \frac{1}{1+x^2} dx$

Ans.  $\frac{\pi}{2}$

2.  $\int_{-\infty}^\infty \frac{1}{(x^2+1)^2} dx$

Ans.  $\frac{\pi}{2}$

3.  $\int_0^\infty \frac{x^3 \sin x}{(x^2+a^2)(x^2+b^2)} dx$

Ans.  $\frac{\pi}{2(a^2-b^2)}[a^2e^{-a}-b^2e^{-b}]$

4.  $\int_{-\infty}^\infty \frac{\cos x}{(x^2+a^2)(x^2+b^2)} dx, \quad a > b > 0$

Ans.  $\frac{\pi}{a^2-b^2} \left( \frac{e^{-b}}{b} - \frac{e^{-a}}{a} \right)$

5. Show that  $\int_0^\infty \frac{\cos x}{x^2+a^2} dx = \frac{\pi e^{-a}}{2a}$

6. Show that  $\int_0^\infty \frac{x^3 \sin x}{(x^2+a^2)} dx = -\frac{\pi}{4}(a-2)a^{-a}, a > 0$

Evaluate the following :

7.  $\int_{-\infty}^\infty \frac{\sin mx}{x(x^2+a^2)} dx, \quad m > 0, a > 0$

Ans.  $\frac{\pi}{a^2}(2-e^{-ma})$

8.  $\int_0^\infty \frac{x^2}{x^6+1} dx$

Ans.  $\frac{\pi}{6}$

9.  $\int_0^\infty \frac{x \sin ax}{x^4+a^4} dx$

Ans.  $\frac{\pi}{2a^2} e^{-\frac{a^2}{\sqrt{2}} \sin \frac{a^2}{\sqrt{2}}}$

10.  $\int_0^\infty \frac{x^6}{(a^4+x^4)^2} dx$

Ans.  $\frac{3\pi\sqrt{2}}{16a}, a > 0$

11.  $\int_0^\infty \frac{\cos x^2 + \sin x^2 - 1}{x^2} dx$

Ans. 0

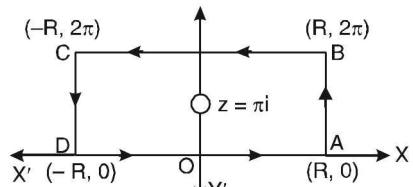

12.  $\int_0^\infty \frac{\cos mx}{x^4+x^2+1} dx$

Ans.  $\frac{\pi}{\sqrt{3}} \sin \frac{1}{2} \left( m + \frac{\pi}{3} \right) e^{-\frac{1}{2}m\sqrt{3}}$

13.  $\int_0^\infty \frac{\log(1+x^2)}{1+x^2} dx$

Ans.  $\pi \log 2$

## 31.16 RECTANGULAR CONTOUR

Example 62. Evaluate  $\int_{-\infty}^{+\infty} \frac{e^{az}}{e^z+1} dz$ Solution. We consider  $\int_C \frac{e^{az}}{e^z+1} dz = \int_C f(z) dz$ where  $C$  is the rectangle  $ABCD$  with vertices at  $(R, 0), (R, 2\pi), (-R, 2\pi)$  and  $(-R, 0)$ . $f(z)$  has simple poles,  $e^z = -1$ 

$$= \cos((2n+1)\pi) + i \sin((2n+1)\pi) = e^{i(2n+1)\pi}$$

 $\Rightarrow$ 

$$z = (2n+1)\pi i,$$

where  $n = 0, \pm 1, \pm 2, \dots$ The only pole inside the rectangle is  $z = \pi i$ .

∴ By Residue theorem

$$\int_C f(z) dz = 2\pi i \text{ Residue } f(\pi i) = 2\pi i \left[ \frac{e^{az}}{\frac{d}{dz}(e^z+1)} \right]_{z=\pi i} \quad \left[ R(a) = \frac{\phi(a)}{\psi'(a)} \right]$$

$$= 2\pi i \left[ \frac{e^{az}}{e^z} \right]_{z=\pi i} = 2\pi i \frac{e^{a\pi i}}{e^{\pi i}} = -2\pi i e^{a\pi i} \quad \left[ \begin{array}{l} \because e^{\pi i} = \cos \pi + i \sin \pi \\ = -1 + 0 \\ = -1 \end{array} \right]$$

$$\text{Also } \int_C f(z) dz = \int_{AB} f(z) dz + \int_{BC} f(z) dz + \int_{CD} f(z) dz + \int_{DA} f(z) dz \quad \dots (1)$$

$$= \int_0^{2\pi} f(R+iy) idy + \int_R^{-R} f(x+2\pi i) dx + \int_{2\pi}^0 (-R+iy) idy + \int_{-R}^R f(x) dx \quad \dots (2)$$

[ $\because z = R + iy$  along  $AB$ ,  $z = x + 2\pi i$  along  $BC$ ,  $z = -R + iy$  along  $CD$  and  $z = x$  along  $DA$ ].

$$\int_C f(z) dz = i \int_0^{2\pi} \frac{e^{a(R+iy)}}{e^{R+iy} + 1} dy - \int_{-R}^R \frac{e^{a(x+2\pi i)}}{e^{x+2\pi i} + 1} dx - i \int_0^{2\pi} \frac{e^{a(-R+iy)}}{e^{-R+iy} + 1} dy + \int_{-R}^R \frac{e^{ax}}{e^x + 1} dx$$

Now for any two complex numbers  $z_1, z_2$ ,  $|z_1| \geq |z_2|$

we have  $|z_1 + z_2| \geq |z_1| - |z_2|$ .

So that  $|e^{R+iy} + 1| \geq e^R - 1$ . Also  $|e^{a(R+iy)}| = e^{aR}$ .

$\therefore$  For the integrand of first integral in (2), we have

$$\left| \frac{e^{a(R+iy)}}{e^{R+iy} + 1} \right| \leq \frac{e^{aR}}{e^R - 1} \text{ which } \rightarrow 0, \text{ as } R \rightarrow \infty \quad [\because a > 1]$$

Similarly, for the integrand of the third integral in (2), we get

$$\left| \frac{e^{a(-R+iy)}}{e^{-R+iy} + 1} \right| \leq \frac{e^{-aR}}{1 - e^{-r}} \text{ which also } \rightarrow 0, \text{ as } R \rightarrow \infty \quad [\because a < 0]$$

Hence as  $R \rightarrow \infty$ , since the first and third integrals in (2) approach zero, we get

$$\begin{aligned} \int_C f(z) dz &= -e^{2a\pi i} \int_{-\infty}^{\infty} \frac{e^{ax}}{e^x + 1} dx + \int_{-\infty}^{\infty} \frac{e^{ax}}{e^x + 1} dx \\ &= (1 - e^{2a\pi i}) \int_{-\infty}^{\infty} \frac{e^{ax}}{e^x + 1} dx. \end{aligned} \quad \dots (3)$$

Thus from (1) and (3), we obtain

$$\begin{aligned} (1 - e^{2a\pi i}) \int_{-\infty}^{\infty} \frac{e^{ax}}{e^x + 1} dx &= -2\pi i e^{a\pi i} \quad \text{or} \quad \int_{-\infty}^{\infty} \frac{e^{ax}}{e^x + 1} dx = \frac{2\pi i}{e^{a\pi i} - e^{-a\pi i}} \\ \int_{-\infty}^{\infty} \frac{e^{ax}}{e^x + 1} dx &= \frac{\pi}{\sin a\pi} \end{aligned} \quad \text{Ans.}$$

**Example 63.** By integrating  $e^{-z^2}$  round the rectangle whose vertices are  $0, R, R + ia, ia$ , show that

$$(i) \int_0^{\infty} e^{-x^2} \cos 2ax dx = \frac{e^{-a^2}}{2} \sqrt{\pi} \quad \text{and (ii) } \int_0^{\infty} e^{-x^2} \sin 2ax dx = e^{-a^2} \int_0^a e^{y^2} dy.$$

**Solution.** Let  $f(z) = e^{-z^2}$

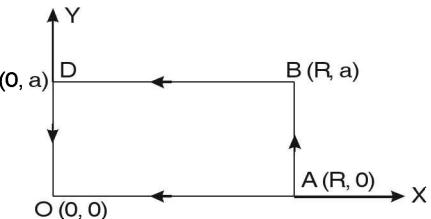

$$\therefore \int_C f(z) dz = \int_C e^{-z^2} dz.$$

where  $C$  is the closed contour, a rectangle  $OABD$ .

Since  $f(z)$  is analytic within and on the contour  $C$  (There is no pole within rectangle  $OABD$ ). Hence by Cauchy's residue theorem, we have

$$\int_{OABD} e^{-z^2} dz = 0$$

$$\text{i.e. } \int_{OA} e^{-z^2} dz + \int_{AB} e^{-z^2} dz + \int_{BD} e^{-z^2} dz + \int_{DO} e^{-z^2} dz = 0 \quad \dots (1)$$

Since on  $OA, z = x, dz = dx$ . On  $AB, z = R + iy, dz = idy$   
 On  $BD, z = x + ia, dz = dx$ . On  $DO, z = iy, dz = idy$

Hence (1) becomes

$$\int_0^R e^{-x^2} dx + \int_0^a e^{-(R+iy)^2} \cdot idy + \int_R^0 e^{-(x+ia)^2} \cdot dx + \int_a^0 e^{-(iy)^2} \cdot idy = 0 \quad \dots (2)$$

$$\begin{aligned} \text{Now } \left| \int_0^a e^{-(R+iy)^2} \cdot idy \right| &\leq \left| \int_0^a e^{-(R+iy)^2} \right| |idy| \leq \int_0^a e^{-R^2+y^2} dy \\ &\leq \int_0^a e^{-R^2+a^2} \cdot dy \quad [\text{since } y \leq a \text{ on } AB] \\ &\leq e^{-R^2+a^2} \cdot a = 0 \text{ as } R \rightarrow \infty \end{aligned}$$

Hence by making  $R \rightarrow \infty$ , equation (2) becomes

$$\begin{aligned} \int_0^\infty e^{-(x+ia)^2} dx &= \int_0^\infty e^{-x^2} dx - i \int_0^\infty e^{y^2} dy \\ \Rightarrow \int_0^\infty e^{(-x^2+a^2-2aix)} dx &= \frac{\sqrt{\pi}}{2} - i \int_0^\infty e^{y^2} dy \quad \left[ \text{since } \int_0^\infty e^{-x^2} dx = \frac{\sqrt{\pi}}{2} \right] \\ \int_0^\infty e^{-x^2+a^2} e^{-2aix} dx &= \frac{\sqrt{\pi}}{2} - i \int_0^\infty e^{y^2} dy \\ \int_0^\infty e^{-x^2+a^2} (\cos 2ax - i \sin 2ax) dx &= \frac{\sqrt{\pi}}{2} - i \int_0^\infty e^{y^2} dy \\ \int_0^\infty e^{-x^2} (\cos 2ax - i \sin 2ax) dx &= \frac{\sqrt{\pi}}{2} e^{-a^2} - i e^{-a^2} \int_0^\infty e^{y^2} dy \end{aligned}$$

Equating real and imaginary parts, we have

$$\begin{aligned} \int_0^\infty e^{-x^2} \cos 2ax dx &= \frac{e^{-a^2}}{2} \sqrt{\pi} \\ \int_0^\infty e^{-x^2} \sin 2ax dx &= e^{-a^2} \int_0^\infty e^{y^2} dy \quad \text{Proved.} \end{aligned}$$

### EXERCISE 31.6

1. Using contour integration, show that

$$\int_0^\infty \frac{x^6 dx}{(a^4 + x^4)^2} = \frac{3\sqrt{2}\pi}{16a}, \quad (a > 0)$$

2. Using method of contour integration, evaluate

$$\int_0^\infty \frac{x \sin ax dx}{x^4 + 4} \quad \text{Ans. } \frac{\pi}{8} e^{-a} \sin a$$

3. Integrating  $\frac{e^{iz}}{z+a}$  along the boundary of the square defined by

$$x = 0, x = R, y = 0, y = R.$$

$$\text{Prove that } (i) \int_0^\infty \frac{\cos x}{x+a} dx = \int_0^\infty \frac{xe^{-ax}}{1+x^2} dx \quad (ii) \int_0^\infty \frac{\sin x}{x+a} dx = \int_0^\infty \frac{e^{-ax}}{1+x^2} dx$$

4. Evaluate, using Cauchy's integral formula

$$\oint_c \frac{\cos \pi z dz}{z^2 - 1} \text{ around a rectangle}$$

$$(i) 2 \pm i, -2 \pm i \quad \text{Ans. 0} \quad (ii) -i, 2-i, 2+i \text{ and } i$$

$$\text{Ans. } -\pi i$$

5. By integrating  $\frac{e^{iaz^2}}{\sinh \pi z}$  round the rectangle with vertices  $\pm R \pm \frac{i}{2}$ , show that

$$\int_0^\infty \frac{\cos(ax^2) \cosh(ax)}{\cosh \pi x} dx = \frac{1}{2} \cos\left(\frac{a}{4}\right) \quad \text{and} \quad \int_0^\infty \frac{\sin(ax^2) \cosh(ax)}{\cosh \pi x} dx = \frac{1}{2} \sin\left(\frac{a}{4}\right) \quad (0 < a \leq \pi)$$

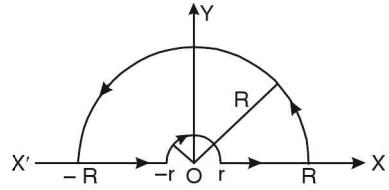

### 31.17 INDED SEMI-CIRCULAR CONTOUR

When the integrand has a simple pole on real axis, it is deleted from the region by indenting the contour (a small semi-circle having pole is drawn)

**Example 64.** By contour integration, prove that

$$\int_0^\infty \frac{\sin mx}{x} dx = \frac{\pi}{2}.$$

**Solution.** Consider the integral  $\int_C \frac{e^{miz}}{z} dz$

where  $C$  is a large semi-circle  $|z| = R$  indented at  $z = 0$  (pole), let  $r$  be the radius of indentation. There is no singularity within the given contour.

Hence by Cauchy Theorem.

$$\begin{aligned} & \int_C \frac{e^{miz}}{z} dz = 0 \\ \text{i.e.,} \quad & \int_{-R}^{-r} \frac{e^{miz}}{x} dx + \int_{C_r} \frac{e^{miz}}{z} dz + \int_r^R \frac{e^{miz}}{x} dx + \int_{C_R} \frac{e^{miz}}{z} dz = 0 \quad \dots (1) \end{aligned}$$

Substituting  $-x$  for  $x$  in the first integral and combining it with the third integral, we get

$$\begin{aligned} & \int_r^R \frac{e^{miz} - e^{-imz}}{x} dx + \int_{C_2} \frac{e^{miz}}{z} dz + \int_{C_1} \frac{e^{miz}}{z} dz = 0 \quad [z = R e^{i\theta} \Rightarrow dz = R i e^{i\theta} d\theta] \\ \Rightarrow \quad & 2i \int_r^R \frac{\sin mx}{x} dx + \int_{C_2} \frac{e^{imz}}{z} dz + \int_{C_1} \frac{e^{imz}}{z} dz = 0 \quad \dots (2) \end{aligned}$$

$$\text{Now} \quad \int_{C_2} \frac{e^{imz}}{z} dz = \int_{C_2} \frac{1}{z} dz + \int_{C_2} \frac{e^{imz} - 1}{z} dz \quad \dots (3)$$

$$\text{On} \quad C_2: z = re^{i\theta}$$

$$\therefore \int_{C_2} \frac{1}{z} dz = \int_{\pi}^0 \frac{re^{i\theta} i d\theta}{re^{i\theta}} = - \int_0^{\pi} i d\theta = -i\pi$$

$$\text{Also} \quad \left| \int_{C_2} \frac{e^{imz} - 1}{z} dz \right| \leq M \int_{C_2} \frac{|dz|}{|z|} = \pi M$$

where  $M$  is the maximum value on  $C_2$  of  $|e^{imz} - 1| = |e^{imr(\cos\theta+i\sin\theta)} - 1|$

Clearly,  $M \rightarrow 0$  as  $r \rightarrow 0$

$$\therefore \text{From (3),} \quad \int_{C_2} \frac{e^{imz}}{z} dz = -i\pi \quad \dots (4)$$

Putting  $z = Re^{i\theta}$  in the integral over  $C_1$ , we get

$$\int_{C_1} \frac{e^{imz}}{z} dz = \int_0^\pi \frac{e^{imR(\cos\theta+i\sin\theta)}}{Re^{i\theta}} R e^{i\theta} id\theta = i \int_0^\pi e^{imR\cos\theta} \cdot e^{-mR\sin\theta} d\theta$$

Since  $|e^{imR \cos \theta}| \leq 1$

$$\therefore \left| \int_{C_1} \frac{e^{imz}}{z} dz \right| \leq \int_0^\pi e^{-mR \sin \theta} d\theta = 2 \int_0^{\pi/2} e^{-mR \sin \theta} d\theta$$

Also  $\frac{\sin \theta}{\theta}$  continuously decreases from 1 to  $\frac{2}{\pi}$  as  $\theta$  increases from 0 to  $\frac{\pi}{2}$ .

$\therefore$  For  $0 \leq \theta \leq \frac{\pi}{2}$ ,  $\frac{\sin \theta}{\theta} \geq \frac{2}{\pi}$  or  $\sin \theta \geq \frac{2\theta}{\pi}$

$$\therefore \left| \int_{C_1} \frac{e^{imz}}{z} dz \right| \leq 2 \int_0^{\pi/2} e^{-2mR\theta/\pi} d\theta = \left[ -\frac{\pi}{mR} e^{-2mR\theta/\pi} \right]_0^{\pi/2} = \frac{\pi}{mR} (1 - e^{-mR})$$

As  $R \rightarrow \infty$ ,  $\frac{\pi}{mR} (1 - e^{-mR}) \rightarrow 0$

$$\therefore \int_{C_1} \frac{e^{imz}}{z} dz = 0$$

Hence from (2), on taking the limit as  $r \rightarrow 0$  and  $R \rightarrow \infty$ , we get

$$2i \int_0^\infty \frac{\sin mx}{x} dx - i\pi = 0 \quad \text{or} \quad \int_0^\infty \frac{\sin mx}{x} dx = \frac{\pi}{2}. \quad \text{Ans.}$$

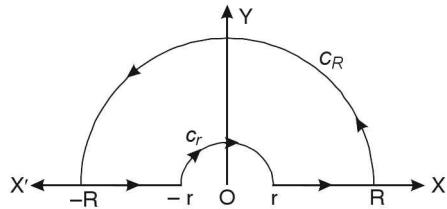

**Example 65.** Show that, if  $a \geq b \geq 0$ , then  $\int_0^\infty \frac{\cos 2ax - \cos 2bx}{x^2} dx = \pi(b-a)$

**Solution.** Consider the integral  $\int_C f(z) dz$

where

$$f(z) = \frac{e^{i2az} - e^{i2bz}}{z^2}$$

and  $C$  is a large semi-circle  $|z| = R$  indented at  $z = 0$  (pole), let  $r$  be the radius of indentation. Now there is no singularity within the given contour.

$$\int_C f(z) dz = 0 \quad (\text{By Cauchy Integral Theorem})$$

$$\Rightarrow \int_{-R}^{-r} f(x) dx + \int_{C_R} f(z) dz + \int_r^R f(x) dx + \int_{C_r} f(z) dz = 0 \quad \dots (1)$$

$$\text{Now } \left| \int_{C_R} f(z) dz \right| \leq \int_{C_R} \frac{|e^{i2az} - e^{i2bz}|}{|z|^2} |dz|$$

$$\leq \int_{C_R} \frac{|e^{i2az}| + |e^{i2bz}|}{|z|^2} |dz|$$

$$= \int_0^\pi \frac{e^{-2aR \sin \theta} + e^{-2bR \sin \theta}}{R^2} R d\theta \quad (z = Re^{i\theta})$$

$$\leq \frac{2}{R} \int_0^{\pi/2} \left[ e^{-\frac{-4aR\theta}{\pi}} + e^{-\frac{-4bR\theta}{\pi}} \right] d\theta \quad [\text{By Jordan's inequality}]$$

$$= \frac{2}{R} \left[ \frac{\pi}{4aR} (1 - e^{-2aR}) + \frac{\pi}{4bR} (1 - e^{-2bR}) \right] = 0 \text{ as } R \rightarrow \infty$$

We have,  $\lim_{z \rightarrow 0} \{z(f(z))\} = \lim_{z \rightarrow 0} \left\{ z \frac{e^{2iaz} - e^{2ibz}}{z^2} \right\} = \lim_{z \rightarrow 0} \{2i(a-b) - 2(a^2 - b^2)z^2 \dots\} = 2i(a-b)$

$$\lim_{r \rightarrow 0} \int_{C_r} f(z) dz = -i(\pi - 0) \times 2i(a-b) = -2\pi(b-a)$$

Hence, by making  $R \rightarrow \infty$  and  $r \rightarrow 0$ , equation (1) reduces to

$$\begin{aligned} \int_{-\infty}^0 f(x) dx - 2\pi(b-a) + \int_0^\infty f(x) dx + 0 &= 0 \Rightarrow \int_{-\infty}^\infty f(x) dx = 2\pi(b-a) \\ \int_{-\infty}^\infty \frac{e^{2iax} - e^{i2bx}}{x^2} dx &= 2\pi(b-a) \\ \int_{-\infty}^\infty \frac{(\cos 2ax + i\sin 2ax) - (\cos 2bx + i\sin 2bx)}{x^2} dx &= 2\pi(b-a) \end{aligned}$$

Equating real parts, we get

$$\int_{-\infty}^\infty \frac{\cos 2ax - \cos 2bx}{x^2} dx = 2\pi(b-a) \quad \left[ \int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx \right]$$

If  $f(x)$  is even function.

Hence,  $\int_0^\infty \frac{\cos 2ax - \cos 2bx}{x^2} dx = \pi(b-a)$  Proved.

**Example 66.** Using contour integration method, prove the integral

$$(i) \int_0^\infty \frac{x^{a-1}}{1+x} dx = \frac{\pi}{\sin \pi a}. \quad (0 < a < 1) \quad (ii) \int_0^\infty \frac{x^{a-1}}{1-x} dx = \pi \cot \pi a.$$

**Solution.** Let the integral be  $\int_C f(z) dz$ , where  $f(z) = \frac{z^{a-1}}{1-z}$

Taken around the closed contour  $C$  consisting of real axis from  $-R$  to  $R$ , and upper half of a large circle  $|z|=R$  indented at  $z=0$ ,  $z=1$ , the radii of indentations being  $r$  and  $r'$  respectively.

The singularities of  $f(z)$  are  $z=0$ ,  $z=1$  which have been avoided by the indentation, so there are no singularities within the contour.

Hence, by Cauchy's residue theorem, we have

$$\int_{-R}^{-r} f(x) dx + \int_{C_r} f(z) dz + \int_r^{1-r'} f(x) dx + \int_{Cr'} f(z) dz + \int_{1+r'}^R f(x) dx + \int_{CR} f(z) dz = 0 \dots (1)$$

Since  $\lim_{z \rightarrow \infty} z f(z) = \lim_{z \rightarrow \infty} z \frac{z^{a-1}}{1-z} = \lim_{z \rightarrow \infty} \frac{z^a}{1-z} = 0$ ,  $0 < a < 1$ .

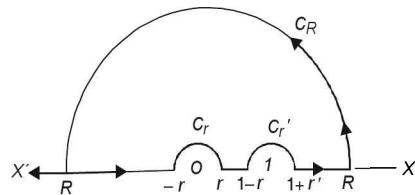

$$\therefore \lim_{R \rightarrow \infty} \int_{C_R} f(z) dz = i(\pi - 0) = 0$$

Again,  $\lim_{z \rightarrow 0} \{z f(z)\} = \lim_{z \rightarrow 0} \left\{ \frac{z \cdot z^{a-1}}{1-z} \right\} = \lim_{z \rightarrow 0} \left( \frac{z^a}{1-z} \right) = 0$ ,  $a > 0$ .

$$\therefore \lim_{r \rightarrow 0} \int_{C_r} f(z) dz = -i(\pi - 0) \cdot 0 = 0$$

Also,  $\lim_{r \rightarrow 1} \{(z-1) f(z)\} = \lim_{z \rightarrow 1} \left\{ (z-1) \frac{z^{a-1}}{1-z} \right\} = -1$

$$\therefore \lim_{r \rightarrow 0} \int_{C_r} f(z) dz = -i(\pi - 0) (-1) = i\pi$$

Hence making  $R \rightarrow \infty$ ,  $r \rightarrow 0$ ,  $r' \rightarrow 0$ , we have from (1)

$$\begin{aligned} & \int_{-\infty}^{\infty} f(x) dx + \int_0^1 f(x) dx + \pi i + \int_1^{\infty} f(x) dx = 0 \\ \Rightarrow & \int_{-\infty}^{\infty} f(x) dx + \pi i = 0 \quad \Rightarrow \quad \int_{-\infty}^{\infty} \frac{x^{a-1}}{1-x} dx + \pi i = 0 \\ \Rightarrow & \int_{-\infty}^0 \frac{x^{a-1}}{1-x} dx + \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = -\pi i \quad \Rightarrow \quad -\int_0^{-\infty} \frac{x^{a-1}}{1-x} dx + \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = -\pi i \end{aligned}$$

Putting  $-x$  for  $x$  in the first integral, we have

$$\begin{aligned} & \int_0^{\infty} \frac{(-1)^{a-1} x^{a-1}}{1+x} dx + \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = -\pi i \\ \Rightarrow & \int_0^{\infty} \frac{(e^{i\pi})^{a-1} x^{a-1}}{1+x} dx + \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = -\pi i \\ \Rightarrow & \int_0^{\infty} \frac{e^{-i\pi} e^{ia\pi} x^{a-1}}{1+x} dx + \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = -\pi i \\ \therefore & -e^{ia\pi} \int_0^{\infty} \frac{x^{a-1}}{1+x} dx + \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = -\pi i \quad [\text{since } e^{-i\pi} = -1] \\ & -(\cos a\pi + i \sin a\pi) \int_0^{\infty} \frac{x^{a-1}}{1+x} dx + \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = -\pi i \end{aligned}$$

Equating imaginary and real parts, we have

$$\begin{aligned} & -\sin a\pi \int_0^{\infty} \frac{x^{a-1}}{1+x} dx = -\pi \Rightarrow \int_0^{\infty} \frac{x^{a-1}}{1+x} dx = \frac{\pi}{\sin a\pi} \quad \dots(1) \\ & \text{and } -\cos a\pi \int_0^{\infty} \frac{x^{a-1}}{1+x} dx + \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = 0 \\ \Rightarrow & -\cos a\pi \int_0^{\infty} \frac{x^{a-1}}{1+x} dx = -\int_0^{\infty} \frac{x^{a-1}}{1-x} dx \\ \Rightarrow & \cos a\pi \times \frac{\pi}{\sin a\pi} = \int_0^{\infty} \frac{x^{a-1}}{1-x} dx \quad [\text{From (1)}] \\ \text{Thus} & \int_0^{\infty} \frac{x^{a-1}}{1-x} dx = \pi \cot a\pi \quad \text{Ans.} \end{aligned}$$

### EXERCISE 31.7

**Using the method of contour integration, evaluate the following :**

- |   |                        |   |                             |
|---|------------------------|---|-----------------------------|
| 1. $\int_0^{\infty} \frac{\cos x}{x} dx$              | Ans. 0                 | 2. $\int_0^{\infty} \frac{\log(1+x^2)}{x^{1+\alpha}} dx$ , $0 < \alpha < 1$ | Ans. 0                      |
| 3. $\int_0^{\infty} \frac{\log x}{(1+x)^3} dx$        | Ans. $-\frac{1}{2}$    | 4. $\int_{-\infty}^{\infty} \frac{1}{x^3+1} dx$                             | Ans. $\frac{\pi}{\sqrt{3}}$ |
| 5. $\int_{-\infty}^{\infty} \frac{x^2}{(x^2+1)^2} dx$ | Ans. $\frac{\pi}{2}$   | 6. $\int_0^{\infty} \frac{1}{x+1} dx$                                       | Ans. $\frac{\pi}{2}$        |
| 7. $\int_0^{\infty} \frac{\log x}{1+x^2} dx$          | Ans. $\frac{\pi^3}{8}$ |   |                             |

## SERIES SOLUTIONS OF SECOND ORDER DIFFERENTIAL EQUATIONS

---

---

### 32.1 INTRODUCTION

We have already studied how to find the solution of a differential equation with constant coefficients.

There are many differential equations with variable coefficients like Bessels equation, Legender's equation, Hermite's equations, Laguerre's differential equation whose solution are not the combination of elementary functions.

The solutions are infinite series. In this chapter we will solve the differential equations by power series method and Frobenius method (extended power series method).

### 32.2 POWER SERIES SOLUTIONS OF DIFFERENTIAL EQUATIONS

We know that the solution of the differential equation

$$\frac{d^2y}{dx^2} - y = 0$$

are

$$y = e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \quad \text{and} \quad y = e^{-x} = 1 - \frac{x}{1!} + \frac{x^2}{2!} - \frac{x^3}{3!} + \dots$$

These are power series solution of the given differential equation.

Another example of the differential equation  $\frac{d^2y}{dx^2} + y = 0$

is satisfied by the power series

$$y = \sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots$$

This idea leads to the methods of obtaining the solution of a linear differential equation of second order in series form.

The solution of the differential equation will be a series of ascending powers of  $x$ , the infinite series solution obtained will have its own region of convergence or validity.

### 32.3 ANALYTIC FUNCTION

A function  $f(x)$  which can be expended in Taylor's series on interval containing the point  $x_0$ . The series converges to  $f(x)$  for all  $x$  in the interval of convergence.

### 32.4 ORDINARY POINT

Consider the equation

$$\frac{d^2y}{dx^2} + P \frac{dy}{dx} + Qy = 0$$

where  $P, Q$  are polynomials in  $x$ .

$x = a$  is an ordinary point of the above equation if the denominators of  $P$  and  $Q$  do not vanish for  $x = a$ . i.e. ( $P \neq \infty$ ,  $Q \neq \infty$ )

For example :

$$(i) \quad (1+x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} - y = 0 \Rightarrow \frac{d^2y}{dx^2} + \frac{x}{1+x^2} \frac{dy}{dx} - \frac{1}{1+x^2} y = 0$$

Here, denominator of  $P$  and  $Q$  i.e.,  $1+x^2$  is not equal to zero at  $x = 0$ . Therefore  $x = 0$  is an ordinary point for this differential equation.

$$(ii) \quad x^2 \frac{d^2y}{dx^2} + (2x^2 - x) \frac{dy}{dx} + y = 0 \Rightarrow \frac{d^2y}{dx^2} + \frac{2x^2 - x}{x^2} \frac{dy}{dx} + \frac{1}{x^2} y = 0$$

Here, the denominator of  $P$  and  $Q$  i.e.,  $x^2$  is equal to zero for  $x = 0$  ( $P = \infty$ ,  $Q = \infty$ ). So,  $x = 0$  is not ordinary point for this equation.

Note. In this section, we have to solve those differential equation whose ordinary point is at  $x = 0$ .

### 32.5 SOLUTION OF THE DIFFERENTIAL EQUATION WHEN $X = 0$ IS AN ORDINARY POINT i.e. WHEN $P$ DOES NOT VANISH FOR $X = 0$ .

(i) Let  $y = a_0 + a_1x + a_2x^2 + a_3x^3 + \dots + a_kx^k + \dots = \sum_{k=0}^{\infty} a_k x^k$  be the solution of the given differential equation.

(ii) Find  $\frac{dy}{dx}$ ,  $\frac{d^2y}{dx^2}$  etc.

$$\frac{dy}{dx} = a_1 + 2a_2x + 3a_3x^2 + \dots + ka_k x^{k-1} + \dots = \sum_{k=1}^{\infty} k a_k x^{k-1}$$

$$\frac{d^2y}{dx^2} = 2a_2 + 2 \cdot 3 a_3 x + \dots + a_k k(k-1) x^{k-2} + \dots = \sum_{k=2}^{\infty} a_k \cdot k(k-1) \cdot x^{k-2}$$

(iii) Substitute the values of  $y$ ,  $\frac{dy}{dx}$ ,  $\frac{d^2y}{dx^2}$  etc. in the given differential equation.

(iv) Calculate  $a_0$ ,  $a_1$ ,  $a_2$  .... coefficients of various powers of  $x$  by equating the coefficients to zero.

(v) Substitute the values of  $a_0$ ,  $a_1$ ,  $a_2$  ... in the differential equation to get the required series solution.

### 32.6 WORKING RULE TO SOLVE A DIFFERENTIAL EQUATION IF $X = 0$ IS AN ORDINARY POINT OF THE EQUATION

**Step 1.** Assume the solution  $y = \sum a_k x^k$  i.e.,

$$y = a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + \dots$$

**Step 2.** Find  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  of step (1).

**Step 3.** Substitute the values of  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in the given differential equation.

**Step 4.** Equate to zero the coefficients of various power of  $x$ , to find out  $a_2$ ,  $a_3$  ..... in terms of  $a_0$  and  $a_1$ .

**Step 5.** Equate to zero the coefficient of  $x^k$  to get a recurrence relation of  $a$ 's.

**Step 6.** Substitute  $k = 0, 1, 2, 3, \dots$  in the recurrence relations to get the values of  $a_2$ ,  $a_3$ , ....  $a_n$ , .....

**Step 7.** Substitute the values of  $a_2$ ,  $a_3$ , ..... etc (obtained in step 6) in the solution (1)  
When  $x = 0$  is the ordinary point.

**Example 1.** Solve in series the equation  $\frac{d^2y}{dx^2} + x^2y = 0$ .

**Solution.** We have,  $\frac{d^2y}{dx^2} + x^2y = 0$  ... (1)

The denominator of  $P$  and  $Q$  is not zero so  $x = 0$  is the ordinary point.

Let  $y = a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + a_8x^8 + \dots + a_nx^n + \dots$  ... (2)

Here  $P \neq \infty$ , and  $Q \neq \infty$  for  $x = 0$ . So,  $x = 0$  is the ordinary point of the equation (1).

$$\text{Then } \frac{dy}{dx} = a_1 + 2a_2x + 3a_3x^2 + 4a_4x^3 + 5a_5x^4 + 6a_6x^5 + 7a_7x^6 + 8a_8x^7 + \dots$$

$$\frac{d^2y}{dx^2} = 2a_2 + 2 \cdot 3a_3x + 3 \cdot 4a_4x^2 + 4 \cdot 5a_5x^3 + 5 \cdot 6a_6x^4 + 6 \cdot 7a_7x^5 + 7 \cdot 8a_8x^6 + \dots$$

Substituting the values of  $\frac{d^2y}{dx^2}$  and  $y$  in (1), we get

$$\begin{aligned} 2a_2 + 2 \cdot 3a_3x + 3 \cdot 4a_4x^2 + 4 \cdot 5a_5x^3 + 5 \cdot 6a_6x^4 + 6 \cdot 7a_7x^5 + 7 \cdot 8a_8x^6 + \dots \\ + x^2(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + \dots) = 0 \\ 2a_2 + 6a_3x + (a_0 + 12a_4)x^2 + (a_1 + 20a_5)x^3 + (a_2 + 30a_6)x^4 + \dots \\ + [a_{n-2} + (n+2)(n+1)a_{n+2}]x^n + \dots = 0 \end{aligned}$$

Equating to zero the coefficients of the various powers of  $x$ , we obtain

$$a_2 = 0, \quad a_3 = 0$$

$$a_0 + 12a_4 = 0 \quad i.e. \quad a_4 = -\frac{1}{12}a_0$$

$$a_1 + 20a_5 = 0 \quad i.e. \quad a_5 = -\frac{1}{20}a_1$$

$$a_2 + 30a_6 = 0 \quad i.e. \quad a_6 = -\frac{1}{30}a_2 = 0 \quad (a_2 = 0)$$

and so on. In general

$$a_{n-2} + (n+2)(n+1)a_{n+2} = 0 \quad \Rightarrow \quad \boxed{a_{n+2} = -\frac{a_{n-2}}{(n+1)(n+2)}}$$

$$\text{Putting } n = 5, \quad a_7 = -\frac{a_3}{6 \times 7} = 0 \quad (a_3 = 0)$$

$$\text{Putting } n = 6, \quad a_8 = -\frac{a_4}{7 \times 8} = \frac{a_0}{12 \times 7 \times 8}$$

$$\text{Putting } n = 7, \quad a_9 = -\frac{a_5}{8 \times 9} = \frac{a_1}{20 \times 8 \times 9}$$

$$\text{Putting } n = 8, \quad a_{10} = -\frac{a_6}{9 \times 10} = 0, \quad (a_6 = 0)$$

$$\text{Putting } n = 9, \quad a_{11} = -\frac{a_7}{11 \times 10} = 0, \quad (a_7 = 0)$$

$$\text{Putting } n = 10, \quad a_{12} = -\frac{a_8}{12 \times 11} = -\frac{a_0}{12 \times 8 \times 7 \times 11 \times 12}$$

Substituting these values in (2), we get

$$y = a_0 + a_1x - \frac{1}{12}a_0x^4 - \frac{a_1}{20}x^5 + \frac{a_0}{12 \times 7 \times 8}x^8 + \frac{a_1}{20 \times 8 \times 9}x^9 - \frac{a_0}{12 \times 8 \times 7 \times 11 \times 12}x^{12} + \dots$$

$$y = a_0 \left( 1 - \frac{1}{12}x^4 + \frac{x^8}{12 \times 7 \times 8} - \frac{x^{12}}{12 \times 8 \times 7 \times 11 \times 12} + \dots \right) + a_1 \left( x - \frac{x^5}{20} + \frac{x^9}{20 \times 8 \times 9} - \dots \right) \quad \text{Ans.}$$

**Example 2.** Solve the following differential equation in series

$$(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + 4y = 0. \quad (\text{U.P. II Semester summer 2006})$$

**Solution.** We have,

$$(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + 4y = 0 \Rightarrow \frac{d^2y}{dx^2} - \frac{x}{1-x^2} \frac{dy}{dx} + \frac{4}{1-x^2} y = 0 \quad \dots (1)$$

Here,  $P \neq \infty$  and  $Q \neq \infty$  for  $x = 0$ . So,  $x = 0$  is an ordinary point of the given equation.

Assume the solution

$$\begin{aligned} y &= \sum a_k x^k \\ \Rightarrow y &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + \dots + a_n x^n + \dots \quad \dots (2) \\ y' &= \sum a_k (k) x^{k-1} \\ y'' &= \sum a_k (k-1) x^{k-2} \end{aligned}$$

Putting these values in the given equation, we get

$$\begin{aligned} (1-x^2) \sum a_k (k-1) x^{k-2} - x \sum a_k (k) x^{k-1} + 4 \sum a_k x^k &= 0 \\ \Rightarrow \sum a_k (k-1) x^{k-2} - \sum a_k (k-1) x^k - \sum a_k (k) x^k + 4 \sum a_k x^k &= 0 \\ \Rightarrow \sum a_k (k-1) x^{k-2} - \sum a_k x^k \{k(k-1)+k-4\} &= 0 \\ \Rightarrow \sum a_k k (k-1) x^{k-2} - \sum a_k x^k (k^2-4) &= 0 \end{aligned}$$

Now, equating the coefficient of  $x^k$  equal to zero. By putting  $k+2$  for  $k$  in first summation and  $k=k$  in second summation, we have

$$\begin{aligned} a_{k+2} (k+2)(k+1) - a_k (k^2-4) &= 0 \\ a_{k+2} (k+2)(k+1) &= a_k (k^2-4) \end{aligned}$$

$$a_{k+2} = \frac{k^2-4}{(k+2)(k+1)} a_k = \frac{k-2}{k+1} a_k \quad \Rightarrow \quad \boxed{a_{k+2} = \frac{k-2}{k+1} a_k}$$

$$\text{If } k=0, \quad a_2 = -2a_0$$

$$\text{If } k=1, \quad a_3 = -\frac{1}{2} a_1$$

$$\text{If } k=2, \quad a_4 = \frac{0}{3} a_2 = 0$$

$$\text{If } k=3, \quad a_5 = \frac{1}{4} a_3 = \frac{1}{4} \left( -\frac{1}{2} a_1 \right) a_1 = -\frac{a_1}{8}$$

$$\text{If } k=4, \quad a_6 = \frac{2}{5} a_4 = \frac{2}{5} \times 0 = 0$$

and so on.

Substituting these values in (2), we get

$$y = a_0 + a_1 x + (-2a_0)x^2 + \left( -\frac{1}{2} a_1 \right) x^3 + 0x^4 + \left( \frac{-a_1}{8} \right) x^5 + 0.x^6 + \dots$$

$$= a_0 + a_1 x - 2a_0 x^2 - \frac{1}{2} a_1 x^3 - \frac{a_1}{8} x^5 + \dots$$

$$= a_0 (1-2x^2) + a_1 x \left( 1 - \frac{x^2}{2} - \frac{x^4}{8} + \dots \right)$$

**Ans.**

**Example 3.** Find the power series solution of  $(1 - x^2) y'' - 2x y' + 2y = 0$  about  $x = 0$ .  
 (A.M.I.E.T.E., Winter 2000)

**Solution.** Here, we have

$$(1 - x^2) \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + 2y = 0 \Rightarrow \frac{d^2y}{dx^2} - \frac{2x}{1 - x^2} \frac{dy}{dx} + \frac{2}{1 - x^2} y = 0$$

Here  $P \neq \infty$  and  $Q \neq \infty$  for  $x = 0$ . So  $x = 0$  is an ordinary point.

Let  $y = a_0 + a_1 x + a_2 x^2 + a_3 x^3 + \dots + a_n x^n + \dots$  be the required solution.

$$\text{Then } y = \sum_{k=0}^{\infty} a_k x^k$$

$$\frac{dy}{dx} = \sum_{k=1}^{\infty} a_k \cdot k x^{k-1}, \quad \frac{d^2y}{dx^2} = \sum_{k=2}^{\infty} a_k \cdot k(k-1) x^{k-2}$$

Substituting the values of  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in the given equation, we get

$$(1 - x^2) \sum a_k k \cdot (k-1) x^{k-2} - 2x \sum a_k \cdot k x^{k-1} + 2 \sum a_k x^k = 0$$

$$\Rightarrow \sum a_k \cdot k \cdot (k-1) x^{k-2} - \sum a_k k(k-1) x^k - 2 \sum a_k \cdot k x^k + 2 \sum a_k x^k = 0$$

$$\Rightarrow \sum a_k \cdot k \cdot (k-1) x^{k-2} - \sum [k(k-1) + 2k - 2] a_k x^k = 0$$

$$\Rightarrow \sum a_k \cdot k \cdot (k-1) x^{k-2} - \sum (k^2 + k - 2) a_k x^k = 0$$

where the first summation extends over all values of  $k$  from 2 to  $\infty$  and the second from  $k = 0$  to  $\infty$ .

Now equating the coefficient of  $x^k$  equal to zero, we have

$$\Rightarrow (k+2)(k+1)a_{k+2} - (k^2 + k - 2)a_k = 0$$

$$\Rightarrow a_{k+2} = \frac{k^2 + k - 2}{(k+2)(k+1)} a_k = \frac{(k+2)(k-1)}{(k+2)(k+1)} a_k$$

$$\Rightarrow a_{k+2} = \boxed{\frac{k-1}{k+1} a_k}$$

$$\text{For } k = 0 \quad a_2 = -a_0, \quad a_3 = 0, \quad a_4 = \frac{a_2}{3} = -\frac{a_0}{3}, \quad a_5 = \frac{2}{4} a_3 = 0$$

$$\text{For } k = 4 \quad a_6 = \frac{3}{5} a_4 = \frac{3}{5} \left( -\frac{a_0}{3} \right) = -\frac{a_0}{5}, \quad a_7 = \frac{4}{6} a_5 = 0, \quad \text{etc.}$$

$$\begin{aligned} y &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + \dots \\ &= a_0 + a_1 x - a_0 x^2 + 0 - \frac{a_0}{3} x^4 + 0 - \frac{a_0}{5} x^6 + 0 + \dots \end{aligned}$$

$$\Rightarrow y = a_0 \left[ 1 - x^2 - \frac{x^4}{3} - \frac{x^6}{5} + \dots \right] + a_1 x \quad \text{Ans.}$$

### 32.7 SINGULAR POINTS ABOUT $x = a$

**Definition.** Consider the equation

$$y'' + P(x) y' + Q(x) y = 0 \quad \dots (1)$$

and assume that functions  $P$  and  $Q$  are not analytic ( $P = \infty$  or  $Q = \infty$ ) at  $x = a$ , so that  $x = a$  is not ordinary point but a singular point of (1).

There are two types of singular points. (1) Regular singular point, (2) Irregular singular points.

**1. Regular Singular Point:**

If  $(x - a)^P$  and  $(x - a)^Q$  are not infinite at  $x = a$ , then  $x = a$  is a regular singular point.

**2. Irregular Singular Point:**

If  $(x - a)^P$  and  $(x - a)^Q$  are infinite at  $x = a$ , then  $x = a$  is an irregular singular point.

**Example 4.** Solve the differential equation  $y'' + (x - 1)^2 y' - 4(x - 1)y = 0$  in series about the ordinary point  $x = 1$ .

**Solution.** Put  $x = t + 1$  (or  $x - 1 = t$ )

$$\begin{aligned} \frac{dy}{dx} &= \frac{dy}{dt} \cdot \frac{dt}{dx} = \frac{dy}{dt} & \left( \because \frac{dt}{dx} = 1 \right) \\ \Rightarrow \quad \frac{d}{dx} &= \frac{d}{dt} \\ \frac{d^2y}{dx^2} &= \frac{d}{dx} \left( \frac{dy}{dx} \right) = \frac{d}{dt} \left( \frac{dy}{dt} \right) = \frac{d^2y}{dt^2} \end{aligned}$$

∴ The given equation becomes,

$$\frac{d^2y}{dt^2} + t^2 y' - 4t y = 0 \quad \dots(1)$$

Now,  $t = 0$  is an ordinary point.

[given]

Assume the solution to be

$$\begin{aligned} y &= a_0 + a_1 t + a_2 t^2 + a_3 t^3 + \dots + a_n t^n + \dots & \dots(2) \\ \text{then } y' &= a_1 + 2a_2 t + 3a_3 t^2 + \dots + n a_{n-1} t^{n-1} + \dots \\ \text{and } y'' &= 2a_2 + 3.2. a_3 t + \dots + n(n-1) a_n t^{n-2} + \dots \end{aligned}$$

Substituting these values in equation (1), we get

$$\begin{aligned} [2a_2 + 3.2. a_3 t + 4.3. a_4 t^2 + \dots + n(n-1) a_n t^{n-2} + \dots] \\ + t^2 [a_1 + 2a_2 t + 3a_3 t^2 + 4a_4 t^3 + \dots + n a_{n-1} t^{n-1} + \dots] \\ - 4t [a_0 + a_1 t + a_2 t^2 + a_3 t^3 + \dots + a_n t^n + \dots] = 0 \end{aligned}$$

Coefficient of  $t^0 = 0$

$$\Rightarrow 2a_2 = 0 \quad \Rightarrow \quad \boxed{a_2 = 0}$$

Coefficient of  $t = 0$

$$\Rightarrow 3.2. a_3 - 4a_0 = 0 \quad \Rightarrow \quad \boxed{a_3 = \frac{2a_0}{3}}$$

Coefficient of  $t^2 = 0$

$$\Rightarrow 4.3. a_4 + a_1 - 4a_1 = 0$$

$$\Rightarrow 12a_4 = 3a_1 \quad \Rightarrow \quad \boxed{a_4 = \frac{a_1}{4}}$$

Coefficient of  $t^3 = 0$

$$\Rightarrow 5.4. a_5 + 2a_2 - 4a_2 = 0 \Rightarrow a_5 = \frac{1}{10} a_2 \quad \Rightarrow \quad \boxed{a_5 = 0}$$

Coefficient of  $t^4 = 0$

$$\Rightarrow 6.5. a_6 + 3a_3 - 4a_3 = 0$$

$$\Rightarrow a_6 = \frac{a_3}{6.5} = \frac{2a_0}{6.5.3} \quad \Rightarrow \quad \boxed{a_6 = \frac{a_0}{45}}$$

Now, coefficient of  $t^n = 0$

$$\Rightarrow (n+2)(n+1)a_{n+2} + (n-1)a_{n-1} - 4a_{n-1} = 0$$

$$\Rightarrow a_{n+2} = -\frac{(n-5)}{(n+2)(n+1)} a_{n-1}$$

Putting  $n = 5, 6, 7, 8, \dots$ , we get

$$a_7 = 0$$

$$a_8 = \frac{-1}{8.7} a_5 = 0$$

$$a_9 = \frac{-2}{9.8} a_6 = \frac{-2}{9.8} \frac{a_0}{45} = -\frac{a_0}{1620}$$

and so on.

Substituting these values in (2), we get

$$\begin{aligned} y &= a_0 + a_1 t + \frac{2}{3} a_0 t^3 + \frac{a_1}{4} t^4 + \frac{a_0}{45} t^6 - \frac{a_0}{1620} t^9 + \dots \\ &= a_0 \left( 1 + \frac{2}{3} t^3 + \frac{1}{45} t^6 - \frac{1}{1620} t^9 + \dots \right) + a_1 \left( t + \frac{t^4}{4} + \dots \right) \\ \Rightarrow y &= a_0 \left[ 1 + \frac{2}{3} (x-1)^3 + \frac{1}{45} (x-1)^6 - \frac{1}{1620} (x-1)^9 + \dots \right] + a_1 \left[ (x-1) + \frac{(x-1)^4}{4} + \dots \right] \end{aligned}$$

Where  $a_0$  and  $a_1$  are constants.

**Ans.**

**Note.** Example 4 is solved about the regular singular point  $x = 1$ . Now we will solve the problems about the regular singular point  $x = 0$ .

We can also find the solution about a point other than  $x = 0$ , say about  $x = a$ . In this case we have to find out the series solution of powers of  $(x-a)$ , and the series is valid (convergent) around the point  $x = a$ .

In this method first we shift the origin to the point  $x = c$ , by putting  $x = t + c$ . The differential equation so obtained is solved by the method already discussed.

### EXERCISE 32.1

Solve the following differential equation by power series method :

$$1. \quad \frac{d^2y}{dx^2} + xy = 0$$

$$\text{Ans. } y = a_0 \left( 1 - \frac{x^3}{3!} + \frac{4x^6}{6!} - \frac{28x^9}{9!} + \dots \right) + a_1 \left( x - \frac{2x^4}{4!} + \frac{10x^7}{7!} + \dots \right)$$

(AMIETE, June 2010)

$$2. \quad y'' - xy' + x^2 y = 0$$

$$\text{Ans. } y = a_0 \left( 1 - \frac{1}{12} x^4 - \dots \right) + a_1 \left( x + \frac{1}{6} x^3 - \frac{1}{40} x^5 - \dots \right)$$

$$3. \quad (x^2 + 1)y'' + xy' - xy = 0$$

(U.P. (C.O.) 2008)

$$\text{Ans. } y = a_0 \left( 1 + \frac{x^3}{6} - \frac{3}{40} x^5 + \dots \right) + a_1 \left( x - \frac{x^3}{6} + \frac{x^4}{12} + \frac{3}{40} x^5 - \dots \right)$$

$$4. \quad y'' - 2x^2 y' + 4xy = x^2 + 2x + 4$$

$$\text{Ans. } y = a_0 \left( 1 - \frac{2}{3} x^2 - \frac{2}{45} x^6 - \frac{2}{405} x^9 - \dots \right) + a_1 \left( x - \frac{1}{6} x^4 - \frac{1}{63} x^7 - \frac{1}{567} x^{10} - \dots \right)$$

$$+ 2x^2 + \frac{1}{3} x^3 + \frac{1}{12} x^4 + \frac{1}{45} x^6 + \frac{1}{126} x^7 + \frac{1}{405} x^9 + \frac{1}{1134} x^{10} + \dots$$

$$5. \quad (x^2 + 2)y'' + xy' - (1 + xy) = 0$$

$$\text{Ans. } y = a_0 \left( 1 + \frac{1}{4} x^2 + \frac{1}{12} x^3 - \frac{1}{32} x^4 - \dots \right) + a_1 \left( x + \frac{1}{24} x^4 + \dots \right)$$

### 32.8 SINGULAR POINT ABOUT $x = 0$ .

Consider the differential equation

$$\frac{d^2y}{dx^2} + P \frac{dy}{dx} + Qy = 0$$

If  $(x - 0)^{-1} P$  and  $(x - 0)^{-2} Q$  are not infinite at  $x = 0$ , then  $x = 0$  is a regular singular point. Otherwise it is an irregular singular point.

**Note:** In this section we will solve those differential equation where  $x_0$  is a regular singular point.

**Example 5.** Find regular singular points of the differential equation.

$$2x^2 \frac{d^2y}{dx^2} + 3x \frac{dy}{dx} + (x^2 - 4)y = 0 \quad \dots (1)$$

**Solution.** We have,  $\frac{d^2y}{dx^2} + \frac{3}{2x} \frac{dy}{dx} + \frac{x^2 - 4}{2x^2} y = 0$

$$P = \frac{3}{2x} \text{ and } Q = \frac{x^2 - 4}{2x^2}$$

$P$  and  $Q$  are not analytic (infinity) at  $x = 0$ . So,  $x = 0$  is not ordinary point but as  $(x - 0)^{-1} P$  and  $(x - 0)^{-2} Q$  are analytic (not infinite) so  $x = 0$  is a regular singular point.

$$x \cdot P = x \left( \frac{3}{2x} \right) = \frac{3}{2} \neq \infty \text{ at } x = 0.$$

$$x^2 Q = x^2 \cdot \frac{x^2 - 4}{2x^2} = \frac{1}{2}(x^2 - 4) \neq \infty \text{ at } x = 0 \quad \text{Ans.}$$

**Example 6.** Find regular singular points of the differential equation.

$$x(x-2)^2 y'' + 2(x-2)y' + (x+3)y = 0 \quad \dots (1)$$

**Solution.** Here, we have  $P = \frac{2(x-2)}{x(x-2)^2} = \frac{2}{x(x-2)}$  and  $Q = \frac{x+3}{x(x-2)^2}$

$P$  and  $Q$  are not analytic ( $P = \infty, Q = \infty$ ) at  $x = 0$  and  $x = 2$ .

Hence both these points are singular points of (1).

(i) At  $x = 0$

$$xP = x \cdot \frac{2}{x(x-2)} = \frac{2}{x-2} \neq \infty \text{ at } x = 0$$

$$x^2 Q = x^2 \cdot \frac{x+3}{x(x-2)^2} = \frac{x(x+3)}{(x-2)^2} \neq \infty \text{ at } x = 0$$

Hence,  $xP$  and  $x^2 Q$  are analytic ( $xP \neq \infty, x^2 P \neq \infty$ ) at  $x = 0$ . So  $x = 0$  is a regular singular point.

(ii) At  $x = 2$

$$(x-2)P = (x-2) \cdot \frac{2}{x(x-2)} = \frac{2}{x} \neq \infty \text{ at } x = 2$$

$$(x-2)^2 Q = (x-2)^2 \cdot \frac{x+3}{x(x-2)^2} = \frac{x+3}{x} \neq \infty \text{ at } x = 2.$$

Since both  $(x-2)P$  and  $(x-2)^2 Q$  are analytic ( $(x-2)P \neq \infty, (x-2)^2 Q \neq 0$ ) at  $x = 2$ , so  $x = 2$  is a regular singular point.

The solution of a differential equation about a regular singular point can be obtained.

The cases of irregular singular points are beyond the scope of this book.

Ans.

### 32.9 FROBENIUS METHOD

If  $x = 0$  is a regular singularity of the equation.

$$\frac{d^2y}{dx^2} + P(x)\frac{dy}{dx} + Q(x)y = 0 \quad [P_0(0) = 0] \dots (1)$$

Then the series solution is

$$y = x^m (a_0 + a_1 x + a_2 x^2 + a_3 x^3 + \dots) = \sum_{k=0}^{\infty} a_k x^{m+k}$$

The value of  $m$  will be determined by substituting the expressions for  $y, \frac{dy}{dx}, \frac{d^2y}{dx^2}$  in (1), we get the identity.

On equating the coefficient of lowest power of  $x$  in the identity to zero, a quadratic equation in  $m$  (**indicial equation**) is obtained.

Thus, we will get two values of  $m$ . The series solution of (1) will depend on the nature of the roots of the indicial equation.

(i) **Case 1 : When roots  $m_1, m_2$  are distinct and not differing by an integer i.e.**

$$m_1 - m_2 \neq 0 \text{ or a positive integer. e.g., } m_1 = \frac{1}{2}, m_2 = 2.$$

The complete solution is  $y = c_1(y)_{m_1} + c_2(y)_{m_2}$

(ii) **Case 2 : When roots  $m_1, m_2$  are equal i.e.  $m_1 = m_2$**

$$y = c_1(y)_{m_1} + c_2 \left( \frac{\partial y}{\partial m} \right)_{m_1}$$

(iii) **Case 3 : When roots  $m_1, m_2$  are distinct and differ by an integer ( $m_1 < m_2$ )**

$$\text{e.g., } m_1 = \frac{3}{2}, m_2 = \frac{5}{2} \text{ or } m_1 = 2, m_2 = 4.$$

If some of the coefficients of  $y$  series become infinite when  $m = m_1$ , to overcome this difficulty, replace  $a_0$  by  $b_0(m - m_1)$ . We get a solution which is only a constant multiple of the first solution.

$$a_0 = b_0(m - m_1)$$

Complete solution is  $y = c_1(y)_{m_1} + c_2 \left( \frac{\partial y}{\partial m} \right)_{m_1}$

(iv) **Case 4 : Roots are distinct and differing by an integer, making some coefficient indeterminate**

Complete solution is  $y = c_1(y)_{m_1} + c_2(y)_{m_2}$

if the coefficients do not become infinite when  $m_1 = m_2$ .

**Case I : When the roots are distinct and not differing by an integer.**

**Example 7.** Find solution in generalized series form about  $x = 0$  of the differential equation

$$3x \frac{d^2y}{dx^2} + 2 \frac{dy}{dx} + y = 0$$

**Solution.** We have,  $3x \frac{d^2y}{dx^2} + 2 \frac{dy}{dx} + y = 0 \dots (1)$

Here,  $xP(x)$  and  $x^2Q(x)$  are analytic (not infinite). So,  $x = 0$  is a regular singular point, we assume the solution in the form

$$y = \sum_{k=0}^{\infty} a_k x^{m+k}$$

Such that

$$\frac{dy}{dx} = \sum_{k=0}^{\infty} a_k (m+k) x^{m+k-1}$$

$$\frac{d^2y}{dx^2} = \sum_{k=0}^{\infty} a_k (m+k)(m+k-1) x^{m+k-2}$$

Substituting for  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in the given equation (1), we get

$$3 \sum a_k (m+k)(m+k-1) x^{m+k-1} + 2 \sum a_k (m+k) x^{m+k-1} + \sum a_k x^{m+k} = 0$$

$$\Rightarrow \sum a_k [3(m+k)(m+k-1) + 2(m+k)] x^{m+k-1} + \sum a_k x^{m+k} = 0 \quad \dots (2)$$

The coefficient of the lowest degree term  $x^{m-1}$  in the identity (2) is obtained by putting  $k = 0$  in first summation only and equating it to zero. Then the **indicial equation** is

$$a_0 [3m(m-1) + 2m] = 0 \Rightarrow a_0 [3m^2 - m] = 0 \Rightarrow \boxed{a_0 m(3m-1) = 0}$$

Since

$$a_0 \neq 0, m = 0, \text{ or } 1/3$$

The coefficient of next lowest degree term  $x^m$  in the identity (2) is obtained by putting  $k = 1$  in first summation and  $k = 0$  in the second summation and equating it to zero.

$$a_1 [3(m+1)m + 2(m+1)] + a_0 = 0$$

$$\Rightarrow a_1 [3m^2 + 5m + 2] + a_0 = 0 \Rightarrow a_1 (3m+2)(m+1) + a_0 = 0$$

$$\Rightarrow a_1 = -\frac{1}{(3m+2)(m+1)} a_0$$

Equating to zero the coefficient of  $x^{m+k}$ , the recurrence relation is given by

$$a_{k+1} [3(m+k+1)(m+k) + 2(m+k+1)] + a_k = 0.$$

$$\Rightarrow a_{k+1} (m+k+1)(3m+3k+2) + a_k = 0 \Rightarrow \boxed{a_{k+1} = \frac{-1}{(m+k+1)(3m+3k+2)} a_k}$$

This gives

$$\text{For } k = 0, \quad a_1 = \frac{-1}{(m+1)(3m+2)} a_0$$

$$\text{For } k = 1, \quad a_2 = \frac{-1}{(m+2)(3m+5)} a_1 = \frac{1}{(m+1)(m+2)(3m+2)(3m+5)} a_0$$

$$\text{For } k = 2, \quad a_3 = \frac{-1}{(m+3)(3m+8)} a_2$$

$$= \frac{-1}{(m+1)(m+2)(m+3)(3m+2)(3m+5)(3m+8)} a_0$$

**For  $m = 0$**

$$a_1 = -\frac{1}{2} a_0, \quad a_2 = \frac{1}{20} a_0, \quad a_3 = -\frac{1}{480} a_0$$

$$\text{Hence, for } m = 0, \quad y_1 = a_0 \left( 1 - \frac{1}{2}x + \frac{1}{20}x^2 - \frac{1}{480}x^3 + \dots \right)$$

**For  $m = \frac{1}{3}$**

$$a_1 = -\frac{1}{4}a_0, \quad a_2 = \frac{1}{56}a_0, \quad a_3 = \frac{-1}{1680}a_0$$

Hence for  $m = \frac{1}{3}$ , the second solution is

$$y_2 = a_0 \left( x^{\frac{1}{3}} - \frac{1}{4}x^{\frac{4}{3}} + \frac{1}{56}x^{\frac{7}{3}} - \frac{1}{1680}x^{\frac{10}{3}} + \dots \right)$$

Thus the complete solution is

$$y = Ay_1 + By_2$$

$$y = a_0 \left( 1 - \frac{x}{2} + \frac{x^2}{20} - \frac{x^3}{480} + \dots \right) + b_0 x^{1/3} \left( 1 - \frac{x}{4} + \frac{x^2}{56} - \frac{x^3}{1680} + \dots \right)$$

**Ans.**

**Example 8.** Solve  $9x(1-x)y'' - 12y' + 4y = 0$  ... (1)

**Solution.** Here,  $xP(x)$  and  $x^2Q(x)$  are analytic (not infinite) at  $x = 0$ . So, it is a regular singular point.

Let  $y = \sum_{k=0}^{\infty} a_k x^{m+k}$  be the solution of (1)

Differentiating twice in succession, we get

$$y' = \sum_{k=0}^{\infty} a_k (m+k)x^{m+k-1}, \quad y'' = \sum_{k=0}^{\infty} a_k (m+k)(m+k-1)x^{m+k-2}$$

Substituting the values of  $y'$  and  $y''$  in (1), we have

$$\begin{aligned} & 9x(1-x) \sum_{k=0}^{\infty} a_k (m+k)(m+k-1)x^{m+k-2} - 12 \sum_{k=0}^{\infty} a_k (m+k)x^{m+k-1} + 4 \sum_{k=0}^{\infty} a_k x^{m+k} = 0 \\ \Rightarrow & 9 \sum_{k=0}^{\infty} a_k (m+k)(m+k-1)x^{m+k-1} - 9 \sum_{k=0}^{\infty} a_k (m+k)(m+k-1)x^{m+k} \\ & \quad - 12 \sum_{k=0}^{\infty} a_k (m+k)x^{m+k-1} + 4 \sum_{k=0}^{\infty} a_k x^{m+k} = 0 \end{aligned}$$

$$\Rightarrow \sum_{k=0}^{\infty} a_k (m+k)(3m+3k-7)x^{m+k-1} - \sum_{k=0}^{\infty} a_k [9(m+k)^2 + (9m+9k+4)]x^{m+k} = 0$$

$$\Rightarrow 3 \sum_{k=0}^{\infty} a_k (m+k)(3m+3k-7)x^{m+k-1} - \sum_{k=0}^{\infty} a_k (3m+3k-4)(3m+3k+1)x^{m+k} = 0 \quad \dots (2)$$

The coefficient of the lowest degree term  $x^{m-1}$  in the identity (2) is obtained by putting  $k = 0$  in first summation only and equating it to zero. Then the indicial equation is

$$3a_0 m (3m-7) = 0 \Rightarrow m = 0, \quad m = \frac{7}{3}$$

The coefficient of next lowest degree term  $x^m$  in the identity (2) is obtained by putting  $k = 1$  in first summation and  $k = 0$  in the second summation and equating it to zero.

$$3a_1 (m+1)(3m+3-7) - a_0 (3m-4)(3m+1) = 0$$

$$a_1 = \frac{(3m-4)(3m+1)}{3(m+1)(3m-4)} a_0 = \frac{3m+1}{3m+3} a_0$$

Equating to zero the coefficient of  $x^{m+k}$ , the recurrence relation is given by

$$3a_{k+1}(m+k+1)(3m+3k-4) - a_k(3m+3k-4)(3m+3k+1) = 0$$

$$a_{k+1} = \frac{(m+3k-4)(3m+3k+1)}{3(m+k+1)(3m+3k-4)} a_k$$

$$\boxed{a_{k+1} = \frac{3m+3k+1}{3m+3k+3} a_k}$$

$$m = 0$$

$$m = \frac{7}{3}$$

$$a_{k+1} = \frac{3k+1}{3k+3} a_k$$

$$a_{k+1} = \frac{3k+8}{3k+10} a_k$$

$$k=0, \quad a_1 = \frac{1}{3} a_0$$

$$k=0, \quad a_1 = \frac{8}{10} a_0 = \frac{4}{5} a_0$$

$$k=1, \quad a_2 = \frac{2}{3} a_1 = \frac{2}{9} a_0$$

$$k=1, \quad a_2 = \frac{11}{13} a_1 = \frac{11}{13} \times \frac{4}{5} a_0 = \frac{44}{65} a_0$$

$$k=2, \quad a_3 = \frac{7}{9} a_2 = \frac{7}{9} \cdot \frac{2}{9} a_0 = \frac{14}{81} a_0$$

$$k=2, \quad a_3 = \frac{14}{16} a_2 = \frac{7}{8} \times \frac{44}{65} a_0 = \frac{77}{130} a_0$$

and so on

and so on

$$y_1 = a_0 \left( 1 + \frac{1}{3}x + \frac{2}{9}x^2 + \frac{14}{81}x^3 + \dots \right), \quad y_2 = a_0 x^{\frac{7}{3}} \left( 1 + \frac{4}{5}x + \frac{44}{65}x^2 + \frac{77}{130}x^3 + \dots \right)$$

Since two solutions are linearly independent, the general solution of (1) may be written as

$$y = A y_1 + B y_2$$

**Ans.**

**Example 9.** Solve the following equation in power series about  $x = 0$ .

$$2x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} - (x+1)y = 0 \quad (\text{U.P. II Semester Summer 2005})$$

$$\text{Solution. Given equation is } 2x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} - (x+1)y = 0 \quad \dots (1)$$

Here,  $x P(x)$  and  $x^2 Q(x)$  are analytic (not infinite) at  $x = 0$ . So,  $x = 0$  is a regular singular point, we assume the solution in the form

$$y = \sum_{k=0}^{\infty} a_k x^{m+k}$$

$$\frac{dy}{dx} = \sum a_k (m+k) x^{m+k-1}$$

$$\frac{d^2 y}{dx^2} = \sum a_k (m+k)(m+k-1) x^{m+k-2}$$

Putting the values of  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2 y}{dx^2}$  in equation (1), we get

$$2x^2 \sum a_k (m+k)(m+k-1) x^{m+k-2} + x \sum a_k (m+k) x^{m+k-1} - (x+1) \sum a_k x^{m+k} = 0$$

$$\Rightarrow 2\sum a_k (m+k)(m+k-1) x^{m+k} + \sum a_k (m+k) x^{m+k} - \sum a_k x^{m+k+1} - \sum a_k x^{m+k} = 0$$

$$\Rightarrow \sum a_k [2(m+k)(m+k-1) + (m+k)-1] x^{m+k} - \sum a_k x^{m+k+1} = 0 \quad \dots (2)$$

Equating the coefficient of lowest degree term  $x^m$  to zero by putting  $k = 0$  in first summation of (2)

$$\boxed{a_0[2m(m-1)+m-1]=0}$$

[Indicial equation]

Let  $a_0 \neq 0$

$$2m(m-1) + m - 1 = 0 \Rightarrow (m-1)(2m+1) = 0 \Rightarrow m = 1, -\frac{1}{2}$$

Now equating the coefficients of next lowest degree terms to zero by putting  $k=1$  and  $k=0$  in first and second summation of (2) respectively, we get

$$a_1[2(m+1)m+m+1-1] - a_0 = 0 \Rightarrow a_1(2m^2 + 2m + m) = a_0$$

$$\Rightarrow a_1 = \frac{a_0}{m(2m+3)}$$

Now equating to zero the coefficient of  $x^{m+k+1}$  by putting  $k=k+1$  in first summation and  $k=k$  in second summation, we get

$$a_{k+1}[2(m+k+1)(m+k)+(m+k+1)-1] - a_k = 0$$

$$\Rightarrow a_{k+1}[(m+k+1)\{2(m+k)+1\}-1] = a_k$$

$$\Rightarrow a_{k+1}[(m+k+1)(2m+2k+1)-1] = a_k$$

$$\Rightarrow \boxed{a_{k+1} = \frac{a_k}{(m+k+1)(2m+2k+1)-1}}$$

$$\text{If } k=1, \quad a_2 = \frac{a_1}{(m+2)(2m+3)-1},$$

$$\text{If } k=2, \quad a_3 = \frac{a_2}{(m+3)(2m+5)-1}$$

$$\text{If } k=3, \quad a_4 = \frac{a_3}{(m+4)(2m+7)-1}$$

$m=1$	$m=-\frac{1}{2}$
$a_1 = \frac{a_0}{5},$	$a_1 = -a_0,$
$a_2 = \frac{a_1}{14} = \frac{a_0}{70},$	$a_2 = -\frac{a_0}{2},$
$a_3 = \frac{a_2}{27} = \frac{a_0}{1890},$	$a_3 = \frac{a_2}{9} = \frac{a_0}{9(-2)} = -\frac{a_0}{18},$
$a_4 = \frac{a_3}{44} = \frac{a_0}{44 \times 1890}$	$a_4 = \frac{a_3}{20} = -\frac{a_0}{18 \times 20} = -\frac{a_0}{360}$

We have,  $y = x^m (a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + \dots)$

For  $m=1$

$$(y)_{m=1} = x \left( a_0 + \frac{a_0}{5}x + \frac{a_0}{70}x^2 + \frac{a_0}{1890}x^3 + \frac{a_0}{44(1890)}x^4 + \dots \right)$$

$$\Rightarrow (y)_{m=1} = a_0x \left( 1 + \frac{x}{5} + \frac{x^2}{70} + \frac{x^3}{1890} + \frac{x^4}{44(1890)} + \dots \right)$$

For  $m = -\frac{1}{2}$

$$(y)_{m=-\frac{1}{2}} = x^{-\frac{1}{2}} \left( a_0 - a_0 x - \frac{a_0}{2} x^2 - \frac{a_0}{18} x^3 - \frac{a_0}{360} x^4 + \dots \right)$$

$$\Rightarrow (y)_{m=-\frac{1}{2}} = a_0 x^{-\frac{1}{2}} \left( 1 - x - \frac{1}{2} x^2 - \frac{1}{18} x^3 - \frac{1}{360} x^4 + \dots \right)$$

Thus roots of indicial equation are distinct and not differing by an integer. Its solution is given by

$$y = c_1 (y)_{m=1} + c_2 (y)_{m=-\frac{1}{2}}$$

Thus, the required solution is

$$y = c_1 a_0 x \left( 1 + \frac{x}{5} + \frac{x^2}{70} + \frac{x^3}{1890} + \frac{1}{44(1890)} x^4 + \dots \right)$$

$$+ c_2 a_0 x^{-1/2} \left( 1 - x - \frac{x^2}{2} - \frac{x^3}{18} - \frac{x^4}{360} - \dots \right)$$

$$\Rightarrow y = Ax \left( 1 + \frac{x}{5} + \frac{x^2}{70} + \frac{x^3}{1890} + \frac{x^4}{44(1890)} + \dots \right) + Bx^{-1/2} \left( 1 - x - \frac{x^2}{2} - \frac{x^3}{18} - \frac{x^4}{360} - \dots \right) \quad \text{Ans.}$$

**Example 10.** Using Frobenius method, obtain a series solution in powers of  $x$  for differential

$$\text{equation : } 2x(1-x) \frac{d^2y}{dx^2} + (1-x) \frac{dy}{dx} + 3y = 0. \quad (\text{U.P. II. Sem 2010, June 2001})$$

**Solution.** Here, we have

$$2x(1-x) \frac{d^2y}{dx^2} + (1-x) \frac{dy}{dx} + 3y = 0 \quad \dots(1)$$

Here  $xP_1(x)$  and  $x^2P_2(x)$  are analytic (Not infinite) at  $x = 0$ . So,  $x = 0$  is a regular singular point, we assume the solution in the form

$$y = \sum_{k=0}^{\infty} a_k x^{m+k}$$

$$\text{such that} \quad \frac{dy}{dx} = \sum_{k=0}^{\infty} a_k (m+k) x^{m+k-1}$$

$$\frac{d^2y}{dx^2} = \sum_{k=0}^{\infty} a_k (m+k)(m+k-1) x^{m+k-2}$$

Substituting the expressions for  $y$ ,  $\frac{dy}{dx}$ ,  $\frac{d^2y}{dx^2}$  in (1), we have

$$2x(1-x) \sum_{k=0}^{\infty} a_k (m+k)(m+k-1) x^{m+k-2} + (1-x) \sum_{k=0}^{\infty} a_k (m+k) x^{m+k-1}$$

$$+ 3 \sum_{k=0}^{\infty} a_k x^{m+k} = 0$$

$$\Rightarrow \sum_{k=0}^{\infty} 2a_k (m+k)(m+k-1) x^{m+k-1} - 2 \sum_{k=0}^{\infty} a_k (m+k)(m+k-1) x^{m+k}$$

$$+ \sum_{k=0}^{\infty} a_k (m+k) x^{m+k-1} - \sum_{k=0}^{\infty} a_k (m+k) x^{m+k} + 3 \sum_{k=0}^{\infty} a_k x^{m+k} = 0$$

Collecting the coefficients of like powers of  $x$ , we get

$$\begin{aligned} & \sum_{k=0}^{\infty} [-2a_k(m+k)(m+k-1) - a_k(m+k) + 3a_k] x^{m+k} + \\ & \quad \sum_{k=0}^{\infty} [2a_k(m+k)(m+k-1) + a_k(m+k)] x^{m+k-1} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} a_k [-2m^2 - 2mk + 2m - 2mk - 2k^2 + 2k - m - k + 3] x^{m+k} + \\ & \quad \sum_{k=0}^{\infty} a_k [2m^2 + 2mk - 2m + 2mk + 2k^2 - 2k + m + k] x^{m+k-1} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} a_k [-2m^2 - 4mk + m - 2k^2 + k + 3] x^{m+k} + \\ & \quad + \sum_{k=0}^{\infty} a_k [2m^2 + (4k-1)m + 2k^2 - k] x^{m+k-1} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} a_k (m+k+1)(-2m-2k+3) x^{m+k} + \sum_{k=0}^{\infty} a_k (m+k)(2m+2k-1) x^{m+k-1} = 0 \dots (2) \end{aligned}$$

The coefficient of the lowest degree term  $x^{m-1}$  in (2) is obtained by putting  $k=0$  in second summation of (2) only and equating it to zero.

Then the *indicial equation* is

$$a_0 m (2m-1) = 0 \Rightarrow m = 0, \quad m = \frac{1}{2}, \quad a_0 \neq 0$$

The coefficient of the next lowest degree term  $x^m$  in (2) is obtained by putting  $k=0$  in first summation and  $k=0$  in the second summation, we get

$$a_0(m+1)(-2m+3) + a_1(m+1)(2m+1) = 0$$

$$a_1 = -\frac{(m+1)(-2m+3)}{(m+1)(2m+1)} \Rightarrow a_1 = \frac{2m-3}{2m+1}$$

Equating the coefficient of  $x^2$ .

On putting  $k \rightarrow k+1$  in second summation of (2), we get the coefficient of  $x^m$  and equation to zero, we get

$$a_k(m+k+1)(-2m-2k+3) + a_{k+1}(m+k+1)(2m+2k+1) = 0$$

$$\Rightarrow a_{k+1} = -\frac{(m+k+1)(-2m-2k+3)}{(m+k+1)(2m+2k+1)} a_k$$

$$\Rightarrow a_{k+1} = -\frac{-2m-2k+3}{2m+2k+1} a_k = \frac{2m+2k-3}{2m+2k+1} a_k$$

$$\text{If } k=0, \quad a_1 = \frac{2m-3}{2m+1} a_0$$

$$\text{If } k=1, \quad a_2 = \frac{2m-1}{2m+3} a_1$$

$$\text{If } k=2, \quad a_3 = \frac{2m+1}{2m+5} a_2$$

$$\text{If } k=3, \quad a_4 = \frac{2m+3}{2m+7} a_3$$

$$\text{If } k=4, \quad a_5 = \frac{2m+5}{2m+9} a_4$$

$$m = 0$$

$$a_1 = -3a_0$$

$$a_2 = -\frac{1}{3} a_1 = -\frac{1}{3} (-3a_0) = a_0$$

$$a_4 = \frac{3}{7} a_3 = \frac{3}{7} \left( -\frac{1}{5} \right) a_0 = \frac{3}{35} a_0$$

$$a_5 = \frac{5}{9} a_4 = \frac{5}{9} \left( \frac{3}{35} \right) a_0 = \frac{1}{21} a_0$$

$$y_1 = a_0 \left( 1 - 3x + x^2 + \frac{1}{5} x^3 + \frac{3}{35} x^4 + \frac{1}{21} x^5 + \dots \right)$$

$$y_1 = a_0 \left( 1 - 3x + \frac{3x^2}{1.3} + \frac{3x^3}{3.5} + \frac{3x^4}{5.7} + \frac{3x^5}{7.9} \dots \right)$$

$$m = \frac{1}{2}$$

$$a_1 = \frac{2\left(\frac{1}{2}\right) - 3}{2\left(\frac{1}{2}\right) + 1} a_0 = -a_0$$

$$a_2 = \frac{2\left(\frac{1}{2}\right) - 1}{2\left(\frac{1}{2}\right) + 3} a_1 = -\frac{1}{4} a_0 = 0$$

$$a_3 = a_4 = a_5 = \dots = 0$$

$$y_2 = a_0 x^{\frac{1}{2}} - a_0 x^{\frac{3}{2}}$$

$$= a_0 \sqrt{x} (1-x)$$

General Solution is

$$y = A y_1 + B y_2 \\ y = A \left( 1 - 3x + \frac{3x^2}{1.3} + \frac{3x^3}{3.5} + \frac{3}{5.7} x^4 + \frac{3}{7.9} x^5 + \dots \right) + B \sqrt{x} (1-x)$$

**Ans.**

### EXERCISE 32.2

Solve in series the following differential equation :

$$1. \quad 2x^2 \frac{d^2y}{dx^2} - x \frac{dy}{dx} + (1-x^2)y = x^2$$

$$\text{Ans. } y = ax \left( 1 + \frac{x^2}{2.5} + \frac{x^4}{2.4.5.9} + \dots \right) + bx^{\frac{1}{2}} \left( 1 + \frac{x^2}{2.3} + \frac{x^4}{2.4.3.7} + \dots \right)$$

$$2. \quad 2x(1-x) \frac{d^2y}{dx^2} + (5-7x) \frac{dy}{dx} - 3y = 0. \quad \text{Ans. } y = a \left( 1 + \frac{3}{5}x + \frac{3}{7}x^2 + \frac{3}{9}x^3 + \dots \right) + bx^{-\frac{3}{2}}$$

$$3. \quad 2x^2 \frac{d^2y}{dx^2} + (2x^2 - x) \frac{dy}{dx} + y = 0$$

$$\text{Ans. } ax \left( 1 - \frac{2}{3}x + \frac{2^2}{3.5}x^2 - \frac{2^3}{3.5.7}x^3 + \dots \right) + b\sqrt{x} \left( 1 - x + \frac{1}{2}x^2 - \frac{1}{6}x^3 + \dots \right)$$

$$4. \quad x(2+x^2) \frac{d^2y}{dx^2} - \frac{dy}{dx} - 6xy = 0$$

$$\text{Ans. } y = a \left( 1 + 3x^2 + \frac{3}{5}x^4 - \frac{1}{15}x^6 + \dots \right) + bx^{\frac{3}{2}} \left( 1 + \frac{3}{8}x^2 - \frac{3.1}{8.16}x^4 + \frac{5.3.1}{8.16.24}x^6 \dots \right)$$

**Case II. When the roots of indicial equation are equal.**

**Example 11.** Solve  $x(x-1)y'' + (3x-1)y' + y = 0$

**Solution.**  $x(x-1)y'' + (3x-1)y' + y = 0 \quad \dots (1)$

Here  $xP(x)$  and  $x^2Q(x)$  are analytic (Not infinite) at  $x = 0$ . So,  $x = 0$  is a regular singular point, we assume the solution in the form

$$y = \sum_{k=0}^{\infty} a_k x^{m+k}$$

such that  $\frac{dy}{dx} = \sum_{k=0}^{\infty} a_k (m+k) x^{m+k-1}$

$$\frac{d^2y}{dx^2} = \sum_{k=0}^{\infty} a_k (m+k)(m+k-1) x^{m+k-2}$$

Substituting the expressions for  $y, \frac{dy}{dx}, \frac{d^2y}{dx^2}$  in (1), we have

$$\begin{aligned} & x(x-1) \sum a_k (m+k)(m+k-1) x^{m+k-2} \\ & + (3x-1) \sum a_k (m+k) x^{m+k-1} + \sum a_k x^{m+k} = 0 \\ \Rightarrow & \sum a_k (m+k)(m+k-1) x^{m+k} - \sum a_k (m+k)(m+k-1) x^{m+k-1} \\ & + 3 \sum a_k (m+k) x^{m+k} - \sum a_k (m+k) x^{m+k-1} + \sum a_k x^{m+k} = 0 \\ \Rightarrow & \sum a_k [(m+k)(m+k-1) + 3(m+k) + 1] x^{m+k} \\ & - \sum a_k [(m+k)(m+k-1) + (m+k)] x^{m+k-1} = 0 \\ \Rightarrow & \sum a_k [(m+k)(m+k+2) + 1] x^{m+k} - \sum a_k (m+k)^2 x^{m+k-1} = 0 \quad \dots (2) \end{aligned}$$

The coefficient of lowest degree term  $x^{m-1}$  in (2) is obtained by putting  $k=0$  in the second summation only of (2) and equating it to zero. Then the **indicial equation** is

$$\boxed{a_0(m+0)^2 = 0} \Rightarrow m = 0, 0 \text{ as } a_0 \neq 0$$

The coefficient of the next lowest degree term  $x^m$  in (2) is obtained by putting  $k=0$  in the first summation and  $k=1$  in the second summation only of (2) and equating it to zero, we get

$$\begin{aligned} & a_0 [(m+0)(m+2) + 1] - a_1 (m+1)^2 = 0 \\ \Rightarrow & a_0 (m^2 + 2m + 1) - a_1 (m^2 + 2m + 1) = 0 \\ & a_1 - a_0 = 0 \Rightarrow a_1 = a_0 \text{ (as } m = 0) \end{aligned}$$

Equating the coefficient of  $x^{m+k}$  to zero, the recurrence relation is given by

$$\begin{aligned} & a_k [(m+k)(m+k+2) + 1] - a_{k+1} (m+k+1)^2 = 0 \\ & a_k (m+k+1)^2 - a_{k+1} (m+k+1)^2 = 0 \end{aligned}$$

Hence,  $a_{k+1} = a_k$   
 $y = x^m [a_0 + a_1 x + a_2 x^2 + \dots]$   
 $y = a_0 x^m [1 + x + x^2 + x^3 + \dots]$

**For  $m = 0$**

when  $m = 0, 0$ , this gives only one solution instead of two.  
Second solution is given by

$$\left( \frac{\partial y}{\partial m} \right)_{m=0} \quad \text{and} \quad y_1 = a_0 (1 + x + x^2 + x^3)$$

$$\frac{\partial y}{\partial m} = a_0 x^m \log x [1 + x + x^2 + x^3 + \dots]$$

$$y_2 = a_0 \log x [1 + x + x^2 + x^3 + \dots] \quad m = 0$$

$$y_1 = a_0 [1 + x + x^2 + x^3 + \dots] \quad m = 0$$

$$y = A y_1 + B y_2$$

$$y = A [1 + x + x^2 + x^3 + \dots] + B \log x (1 + x + x^2 + x^3 + \dots)$$

**Ans.**

**Example 12.** Using extended power series method find one solution of the differential equation  $xy'' + y' + x^2y = 0$ . Indicate the form of a second solution which is linearly independent of the first obtained above. (U.P. II Semester, June 2007)

**Solution.** Here  $xP(x)$  and  $x^2Q(x)$  are analytic (not infinity). So,  $x = 0$  is a regular singular

point of the equation.  $x \frac{d^2y}{dx^2} + \frac{dy}{dx} + x^2y = 0$

Let

$$y = \sum a_k x^{m+k} \quad \dots (1)$$

$$\frac{dy}{dx} = \sum a_k (m+k) x^{m+k-1}$$

$$\frac{d^2y}{dx^2} = \sum a_k (m+k)(m+k-1) x^{m+k-2}$$

Substituting the values of  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in (1), we get

$$\begin{aligned} & x \sum a_k (m+k)(m+k-1) x^{m+k-2} + \sum a_k (m+k) x^{m+k-1} + x^2 \sum a_k x^{m+k} = 0 \\ \Rightarrow & \sum a_k (m+k)(m+k-1) x^{m+k-1} + \sum a_k (m+k) x^{m+k-1} + \sum a_k x^{m+k+2} = 0 \\ \Rightarrow & \sum a_k [(m+k)(m+k-1) + (m+k)] x^{m+k-1} + \sum a_k x^{m+k+2} = 0 \\ \Rightarrow & \sum a_k (m+k)^2 x^{m+k-1} + \sum a_k x^{m+k+2} = 0 \end{aligned} \quad \dots (2)$$

The coefficient of lowest degree term  $x^{m-1}$  in (2) is obtained by putting  $k = 0$  in first summation of (2) only and equating it to zero. Then the **indicial equation** is

$$\boxed{a_0 m^2 = 0} \Rightarrow m^2 = 0 \text{ or } m = 0, 0$$

The coefficient of the next lowest degree term  $x^m$  in (2) is obtained by putting  $k = 1$  in first summation only and equating it to zero.

$$a_1(m+1)^2 = 0 \Rightarrow a_1 = 0$$

Equating the coefficient of  $x^{m+1}$  for  $k = 2$ , we get  $a_2(m+2)^2 = 0 \Rightarrow a_2 = 0$

Equating the coefficient of  $x^{m+k+2}$  to zero, we have  $a_{k+3}(m+k+3)^2 + a_k = 0$

$$\boxed{a_{k+3} = -\frac{a_k}{(m+k+3)^2}}$$

$$\text{If } k = 0, \quad a_3 = -\frac{1}{(m+3)^2} a_0$$

$$\text{If } k = 1, \quad a_4 = -\frac{1}{(m+4)^2} a_1 = 0, \quad a_7 = 0, \quad a_{10} = 0$$

$$\text{If } k = 2, \quad a_5 = -\frac{1}{(m+5)^2} a_2 = 0, \quad a_8 = 0, \quad a_{11} = 0$$

$$\text{If } k = 3, \quad a_6 = -\frac{1}{(m+6)^2} a_3 = \frac{1}{(m+3)^2(m+6)^2} a_0$$

$$a_9 = -\frac{1}{(m+9)^2} a_6 = -\frac{1}{(m+3)^2(m+6)^2(m+9)^2} a_0$$

$$y = x^m a_0 \left[ 1 - \frac{x^3}{(m+3)^2} + \frac{x^6}{(m+3)^2(m+6)^2} - \frac{x^9}{(m+3)^2(m+6)^2(m+9)^2} + \dots \right] \dots (3)$$

**For  $m = 0$**

To get the first solution, put  $m = 0$  in (3), then

$$y_1 = a_0 \left[ 1 - \frac{x^3}{3^2} + \frac{x^6}{3^2 \times 6^2} - \frac{x^9}{3^2 \times 6^2 \times 9^2} + \dots \right] \quad \dots (4)$$

To get the second independent solution, differentiate (3) w.r.t.  $m$ . Then

$$\begin{aligned} \frac{\partial y}{\partial m} &= (x^m \log x) a_0 \left[ 1 - \frac{x^3}{(m+3)^2} + \frac{x^6}{(m+3)^2(m+6)^2} - \frac{x^9}{(m+3)^2(m+6)^2(m+9)^2} + \dots \right] \\ &\quad + x^m a_0 \left[ \frac{2x^3}{(m+3)^3} - \frac{2x^6}{(m+3)^3(m+6)^2} - \frac{2x^6}{(m+3)^2(m+6)^3} \right. \\ &\quad \left. + \frac{2x^9}{(m+3)^3(m+6)^2(m+9)^2} + \frac{2x^9}{(m+3)^2(m+6)^3(m+9)^2} \right. \\ &\quad \left. + \frac{2x^9}{(m+3)^2(m+6)^2(m+9)^3} + \dots \right] \quad \dots (5) \end{aligned}$$

Putting  $m = 0$  in (5), we get

$$\begin{aligned} y_2 &= (\log x) a_0 \left[ 1 - \frac{x^3}{3^2} + \frac{x^6}{3^2 \times 6^2} - \frac{x^9}{3^2 \times 6^2 \times 9^2} + \dots \right] \\ &\quad + a_0 \left[ \frac{2x^3}{3^3} - \frac{2x^6}{3^3 \times 6^2} - \frac{2x^6}{3^2 \times 6^3} + \frac{2x^9}{3^3 \times 6^2 \times 9^2} + \frac{2x^9}{3^2 \times 6^3 \times 9^2} + \frac{2x^9}{3^2 \times 6^2 \times 9^3} + \dots \right] \quad \dots (6) \end{aligned}$$

Hence, the general solution is given by (4) and (6)

$$\begin{aligned} y &= c_1 y_1 + c_2 y_2 \\ y &= c_1 a_0 \left[ 1 - \frac{x^3}{3^2} + \frac{x^6}{3^2 \times 6^2} - \frac{x^9}{3^2 \times 6^2 \times 9^2} + \dots \right] \\ &\quad + c_2 (\log x) a_0 \left[ 1 - \frac{x^3}{3^2} + \frac{x^6}{3^2 \times 6^2} - \frac{x^9}{3^2 \times 6^2 \times 9^2} + \dots \right] \\ &\quad + c_2 a_0 \left[ \frac{2x^3}{3^3} - \frac{2x^6}{3^3 \times 6^2} \left( \frac{1}{3} + \frac{1}{6} \right) + \frac{2x^9}{3^2 \times 6^2 \times 9^2} \left( \frac{1}{3} + \frac{1}{6} + \frac{1}{9} \right) + \dots \right] \\ \Rightarrow \quad &= (c_1 + c_2 \log x) a_0 \left[ 1 - \frac{x^3}{3^2} + \frac{x^6}{3^2 \times 6^2} - \frac{x^9}{3^2 \times 6^2 \times 9^2} + \dots \right] \\ &\quad + 2 \cdot c_2 a_0 \left[ \frac{x^3}{3^3} - \frac{x^6}{3^5 \times 2^2} \left( 1 + \frac{1}{2} \right) + \frac{2x^9}{3^9 \times 2^2} \left( 1 + \frac{1}{2} + \frac{1}{3} \right) + \dots \right] \quad \text{Ans.} \end{aligned}$$

**Example 13.** Solve in series the differential equation:

$$x \frac{d^2 y}{dx^2} + \frac{dy}{dx} - y = 0 \quad [U.P., II Semester, (C.O.) 2003]$$

**Solution.** Comparing with the equation

$$\frac{d^2 y}{dx^2} + P(x) \frac{dy}{dx} + Q(x) y = 0, \text{ we get}$$

$$P(x) = \frac{1}{x} \quad \text{and} \quad Q(x) = -\frac{1}{x}$$

Since at  $x = 0$ , both  $P(x)$  and  $Q(x)$  are not analytic  $\therefore x = 0$  is a singular point.

Also,  $x P(x) = 1$  and  $x^2 Q(x) = -x$

Both  $x P(x)$  and  $x^2 Q(x)$  are analytic at  $x = 0 \therefore x = 0$  is a regular singular point.

Let us assume

$$y = a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots \quad \dots(1)$$

$$\text{Then, } y' = m a_0 x^{m-1} + (m+1) a_1 x^m + (m+2) a_2 x^{m+1} + (m+3) a_3 x^{m+2} + \dots$$

$$\text{and } y'' = m(m-1) a_0 x^{m-2} + (m+1) m a_1 x^{m-1} + (m+2)(m+1) a_2 x^m + (m+3)(m+2) a_3 x^{m+1} + \dots$$

Substituting these values in the given equation, we get

$$\begin{aligned} x [m(m-1) a_0 x^{m-2} + (m+1)m a_1 x^{m-1} + (m+2)(m+1) a_2 x^m \\ + (m+3)(m+2) a_3 x^{m+1} + \dots] \\ + [m a_0 x^{m-1} + (m+1) a_1 x^m + (m+2) a_2 x^{m+1} + (m+3) a_3 x^{m+2} + \dots] \\ - [a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots] = 0 \end{aligned}$$

Now, coefficient of  $x^{m-1} = 0$

$$\Rightarrow m(m-1) a_0 + m a_0 = 0$$

$$\Rightarrow m^2 a_0 = 0 \quad \Rightarrow \quad m^2 = 0 \quad (\because a_0 \neq 0)$$

Which is Indicial equation.

It roots are  $m = 0, 0$  which are equal.

Coefficient of  $x^m = 0$

$$\Rightarrow (m+1) m a_1 + (m+1) a_1 - a_0 = 0 \quad \Rightarrow \quad (m+1)^2 a_1 = a_0$$

$$\Rightarrow a_1 = \boxed{\frac{a_0}{(m+1)^2}}$$

Coefficient of  $x^{m+1} = 0$

$$\Rightarrow (m+2)(m+1) a_2 + (m+2) a_2 - a_1 = 0 \Rightarrow (m+2)^2 a_2 = a_1$$

$$\Rightarrow a_2 = \boxed{\frac{a_1}{(m+2)^2}} \Rightarrow a_2 = \boxed{\frac{a_0}{(m+1)^2 (m+2)^2}}$$

Similarly,  $a_3 = \frac{a_0}{(m+1)^2 (m+2)^2 (m+3)^2}$  and so on.

$$\text{From (1), } y = a_0 x^m \left[ 1 + \frac{x}{(m+1)^2} + \frac{x^2}{(m+1)^2 (m+2)^2} + \frac{x^3}{(m+1)^2 (m+2)^2 (m+3)^2} + \dots \right] \quad \dots(2)$$

$$\text{Now, } y_1 = (y)_{m=0} = a_0 \left[ 1 + x + \frac{x^2}{(2!)^2} + \frac{x^3}{(3!)^2} + \dots \right] \quad \dots(3)$$

To get the second independent solution, differentiate (1) partially w.r.t.  $m$ , we get

$$\frac{\partial y}{\partial m} = a_0 x^m \log x \left[ 1 + \frac{x}{(m+1)^2} + \frac{x^2}{(m+1)^2 (m+2)^2} + \frac{x^3}{(m+1)^2 (m+2)^2 (m+3)^2} + \dots \right]$$

$$+ a_0 x^m \left[ -\frac{2x}{(m+1)^3} - \frac{2}{(m+1)^2 (m+2)^2} \left\{ \frac{1}{m+1} + \frac{1}{m+2} \right\} x^2 \right]$$

$$- \frac{2}{(m+1)^2 (m+2)^2 (m+3)^2} \left\{ \frac{1}{m+1} + \frac{1}{m+2} + \frac{1}{m+3} \right\} x^3 - \dots \right]$$

$$\begin{aligned}
 \text{The second solution is } y_2 &= \left( \frac{\partial y}{\partial m} \right)_{m=0} = a_0 \log x \left[ 1 + x + \frac{x^2}{(2!)^2} + \frac{x^3}{(3!)^2} + \dots \right] \\
 &\quad - 2a_0 \left[ x + \frac{1}{(2!)^2} \left( 1 + \frac{1}{2} \right) x^2 + \frac{1}{(3!)^2} \left( 1 + \frac{1}{2} + \frac{1}{3} \right) x^3 + \dots \right] \\
 &= y_1 \log x - 2a_0 \left[ x + \frac{1}{(2!)^2} \left( 1 + \frac{1}{2} \right) x^2 + \frac{1}{(3!)^2} \left( 1 + \frac{1}{2} + \frac{1}{3} \right) x^3 + \dots \right]
 \end{aligned}$$

Hence the complete solution is

$$\begin{aligned}
 y &= c_1 y_1 + c_2 y_2 = (c_1 a_0 + c_2 a_0 \log x) \left[ 1 + x + \frac{x^2}{(2!)^2} + \frac{x^3}{(3!)^2} + \dots \right] \\
 &\quad - 2c_2 a_0 \left[ x + \frac{1}{(2!)^2} \left( 1 + \frac{1}{2} \right) x^2 + \frac{1}{(3!)^2} \left( 1 + \frac{1}{2} + \frac{1}{3} \right) x^3 + \dots \right] \\
 \Rightarrow y &= (A + B \log x) \left[ 1 + x + \frac{x^2}{(2!)^2} + \frac{x^3}{(3!)^2} + \dots \right] \\
 &\quad - 2B \left[ x + \frac{1}{(2!)^2} \left( 1 + \frac{1}{2} \right) x^2 + \frac{1}{(3!)^2} \left( 1 + \frac{1}{2} + \frac{1}{3} \right) x^3 + \dots \right]
 \end{aligned}$$

Where  $c_1 a_0 = A$ ,  $c_2 a_0 = B$ .

**Ans.**

### EXERCISE 32.3

Solve in series the following differential equations : (First part of the solution is denoted by  $y_1$ ).

1.  $x \frac{d^2y}{dx^2} + \frac{dy}{dx} + xy = 0$

$$\text{Ans. } y = a \left( 1 - \frac{x^2}{2^2} + \frac{x^4}{2^2 \cdot 4^2} - \frac{x^6}{2^2 \cdot 4^2 \cdot 6^2} + \dots \right) + b \left[ y_1 \log x + a_0 \left\{ \frac{x^2}{2^2} - \frac{1}{2^2 \cdot 4^2} \left( 1 + \frac{1}{2} \right) x^4 + \dots \right\} \right]$$

2.  $(x - x^2) \frac{d^2y}{dx^2} + (1 - 5x) \frac{dy}{dx} - 4y = 0$

$$\text{Ans. } y = a (1^2 + 2^2 x + 3^2 x^2 + 4^2 x^3 + \dots) + b(y_1 \log x - 2a_0(1.2x + 2.3x^2 + 3.4x^3 + \dots))$$

3.  $x \frac{d^2y}{dx^2} + (1+x) \frac{dy}{dx} + 2y = 0$

$$\text{Ans. } y = a \left( 1 - 2x + \frac{3}{2!} x^2 - \frac{4}{3!} x^3 + \dots \right) + b \left[ y_1 \log x + a_0 \left( 3x - \frac{13}{4} x^2 + \dots \right) \right]$$

4.  $x^2 \frac{d^2y}{dx^2} - x(1+x) \frac{dy}{dx} + y = 0$

$$\text{Ans. } y = ax \left( 1 + x + \frac{1}{2} x^2 + \frac{1}{2 \cdot 3} x^3 + \dots \right) + b \left[ y_1 \log x + a_0 x^2 \left( -1 - \frac{3}{4} x + \dots \right) \right]$$

**Case III : When  $m_1$  and  $m_2$  are distinct and differing by an integer, then**

$$y = c_1 (y)_{m_1} + c_2 \left( \frac{\partial y}{\partial m} \right)_{m_2} \quad \begin{cases} \text{If coefficient} = \infty \\ \text{when } m = m_2 \end{cases}$$

**Example 14.** Solve

$$x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} + (x^2 - 4)y = 0 \quad \dots (1)$$

**Solution.** Here  $xP(x)$  and  $x^2Q(x)$  are analytic (not infinite) at  $x = 0$ . So,  $x = 0$  is regular singular point of this equation.

Let  $y = \sum a_k x^{m+k}$

$$\frac{dy}{dx} = \sum a_k (m+k)x^{m+k-1}$$

$$\frac{d^2y}{dx^2} = \sum a_k (m+k)(m+k-1)x^{m+k-2}$$

Substituting the values of  $\frac{d^2y}{dx^2}$ ,  $\frac{dy}{dx}$  and  $y$  in (1), we get

$$x^2 \sum a_k (m+k)(m+k-1)x^{m+k-2} + x \sum a_k (m+k)x^{m+k-1} + (x^2 - 4) \sum a_k x^{m+k} = 0$$

$$\Rightarrow \sum a_k [(m+k)(m+k-1) + (m+k) - 4] x^{m+k} + \sum a_k x^{m+k+2} = 0$$

$$\Rightarrow \sum a_k (m+k+2)(m+k-2)x^{m+k} + \sum a_k x^{m+k+2} = 0 \quad \dots (2)$$

The coefficient of lowest degree term  $x^m$  in (2) is obtained by putting  $k = 0$  in first summation only and equating it to zero. Then the indicial equation is

$$a_0(m+2)(m-2) = 0 \Rightarrow m = 2, -2$$

The coefficient of next lowest term  $x^{m+1}$  in (2) is obtained by putting  $k = 1$  in first summation only and equating it to zero.

$$a_1(m+3)(m-1) = 0 \Rightarrow a_1 = 0$$

Equating to zero the coefficient of  $x^{m+k+2}$ , we get

$$a_{k+2}(m+k+4)(m+k) + a_k = 0 \Rightarrow a_{k+2} = -\frac{a_k}{(m+k+4)(m+k)}$$

$$a_1 = a_3 = a_5 = \dots = 0$$

$$a_2 = -\frac{a_0}{m(m+4)}$$

$$a_4 = -\frac{a_2}{(m+2)(m+6)} = \frac{a_0}{m(m+2)(m+4)(m+6)}$$

$$a_6 = -\frac{a_4}{(m+4)(m+8)} = -\frac{a_0}{m(m+2)(m+4)^2(m+6)(m+8)}$$

Hence

$$y = a_0 x^m \left[ 1 - \frac{x^2}{m(m+4)} + \frac{x^4}{m(m+2)(m+4)(m+6)} - \frac{x^6}{m(m+2)(m+4)^2(m+6)(m+8)} + \dots \right] \quad \dots (3)$$

Putting  $m = 2$  in (3), we get

$$y_1 = a_0 x^2 \left[ 1 - \frac{x^2}{2 \times 6} + \frac{x^4}{2 \times 4 \times 6 \times 8} - \frac{x^6}{2 \times 4 \times 6^2 \times 8 \times 10} + \dots \right] \quad \dots (4)$$

For  $m = -2$

Coefficient of  $x^4$ ,  $x^6$  etc. in (3) becomes infinite on putting  $m = -2$ . To overcome this difficulty, we put

$a_0 = b_0(m+2)$  in (1) and we get

$$y = b_0 x^m \left[ (m+2) - \frac{(m+2)x^2}{m(m+4)} + \frac{x^4}{m(m+4)(m+6)} - \frac{x^6}{m(m+4)^2(m+6)(m+8)} + \dots \right] \quad \dots (5)$$

On differentiating (5) w.r.t. ' $m$ ', we get

$$\begin{aligned} \frac{\partial y}{\partial m} &= b_0 (x^m \cdot \log x) \left[ (m+2) - \frac{(m+2)x^2}{m(m+4)} + \frac{x^4}{m(m+4)(m+6)} - \frac{x^6}{m(m+4)^2(m+6)(m+8)} + \dots \right] \\ &\quad + b_0 x^m \left[ 1 - \frac{(m+2)x^2}{m(m+4)} \left( \frac{1}{m+2} - \frac{1}{m} - \frac{1}{m+4} \right) + \frac{x^4}{m(m+4)(m+6)} \left( -\frac{1}{m} - \frac{1}{m+4} - \frac{1}{m+6} \right) + \dots \right] \end{aligned}$$

On replacing  $m$  by  $-2$ , we get

$$\begin{aligned} \left( \frac{\partial y}{\partial m} \right)_{m=-2} &= (b_0 x^{-2} \log x) \left[ 0 - 0 + \frac{x^4}{(-2)(2)(4)} - \frac{x^6}{(-2)(2)^2(4)(6)} + \dots \right] \\ &\quad + b_0 x^{-2} \left[ 1 + \frac{x^2}{2^2} + \frac{x^4}{2^2 \times 4} \left( \frac{1}{4} \right) + \dots \right] \\ \Rightarrow y_2 &= b_0 x^2 \log x \left( -\frac{1}{2^2 \times 4} + \frac{x^2}{2^3 \times 4 \times 6} - \frac{x^4}{2^3 \times 4^2 \times 6 \times 8} + \dots \right) + b_0 x^{-2} \left( 1 + \frac{x^2}{2^2} + \frac{x^4}{2^2 \times 4^2} + \dots \right) \end{aligned}$$

General solution is  $y = c_1 y_1 + c_2 y_2$

$$\begin{aligned} y &= c_1 x^2 \left( 1 - \frac{x^2}{2 \times 6} + \frac{x^4}{2 \times 4 \times 6 \times 8} - \frac{x^6}{2 \times 4 \times 6^2 \times 8 \times 10} + \dots \right) \\ &\quad + c_2 \left[ x^2 \log x \left( -\frac{1}{2^2 \times 4} + \frac{x^2}{2^3 \times 4 \times 6} - \frac{x^4}{2^3 \times 4^2 \times 6 \times 8} + \dots \right) + x^{-2} \left( 1 + \frac{x^2}{2^2} + \frac{x^4}{2^2 \times 4^2} + \dots \right) \right] \end{aligned}$$

Ans.

$$\text{Example 15. Solve: } x(1-x) \frac{d^2y}{dx^2} - (1+3x) \frac{dy}{dx} - y = 0 \quad \dots (1)$$

**Solution.** Here,  $xP(x)$  and  $x^2Q(x)$  are analytic (not infinite) at  $x = 0$ . So,  $x = 0$  is regular singular point of the equation (1).

Let

$$\begin{aligned} y &= \sum a_k x^{m+k} \\ \frac{dy}{dx} &= \sum a_k (m+k) x^{m+k-1} \\ \frac{d^2y}{dx^2} &= \sum a_k (m+k)(m+k-1) x^{m+k-2} \end{aligned}$$

Substituting the values of  $\frac{d^2y}{dx^2}, \frac{dy}{dx}$  and  $y$  in (1), we get

$$\begin{aligned} \sum_{k=0}^{\infty} a_k [(x-x^2)(m+k)(m+k-1)x^{m+k-2}] - \sum_{k=0}^{\infty} a_k (1+3x)(m+k)x^{m+k-1} - \sum_{k=0}^{\infty} a_k x^{m+k} &= 0 \\ \Rightarrow \sum_{k=0}^{\infty} a_k [(m+k)(m+k-1)x^{m+k-1}] - \sum_{k=0}^{\infty} a_k (m+k)(m+k-1)x^{m+k} - \sum_{k=0}^{\infty} a_k (m+k)x^{m+k-1} & \\ - 3 \sum_{k=0}^{\infty} a_k (m+k)x^{m+k} - \sum_{k=0}^{\infty} a_k x^{m+k} &= 0 \\ - \sum_{k=0}^{\infty} a_k [(m+k)(m+k-1) + 3(m+k) + 1] x^{m+k} + \sum_{k=0}^{\infty} a_k [(m+k)(m+k-1) - (m+k)] x^{m+k-1} &= 0 \end{aligned}$$

$$\begin{aligned} \Rightarrow & -\sum_{k=0}^{\infty} a_k [(m+k)^2 + 2(m+k)+1] x^{m+k} + \sum_{k=0}^{\infty} a_k [(m+k)^2 - 2(m+k)] x^{m+k-1} = 0 \\ \Rightarrow & -\sum_{k=0}^{\infty} a_k (m+k+1)^2 x^{m+k} + \sum_{k=0}^{\infty} a_k (m+k)(m+k-2) x^{m+k-1} = 0 \end{aligned} \quad \dots(2)$$

Now (2), being an identity, we will equate the coefficients of various powers of  $x$  to zero.

The coefficient of lowest degree term  $x^{m-1}$  is obtained by putting  $k=0$  in the second summation of (2) and equating it to zero. Then the **indicial equation** is

$$a_0 m(m-2) = 0 \Rightarrow m = 0, 2$$

The coefficient of  $x^{m+k-1}$  is obtained by putting  $k=k-1$  in the first summation and  $k=k$  in the second summation of (2), and equating it to zero.

$$\begin{aligned} & -a_{k-1}(m+k)^2 + a_k(m+k)(m+k-2) = 0 \\ \Rightarrow & -a_{k-1}(m+k) + a_k(m+k-2) = 0 \\ \Rightarrow & a_k = \frac{(m+k)}{(m+k-2)} a_{k-1} \end{aligned} \quad \dots(3)$$

$$\text{If } k=1, \quad a_1 = \frac{m+1}{m-1} a_0$$

$$\text{If } k=2, \quad a_2 = \frac{m+2}{m} a_1 = \left(\frac{m+2}{m}\right) \left(\frac{m+1}{m-1}\right) a_0$$

$$\text{If } k=3, \quad a_3 = \left(\frac{m+3}{m+1}\right) a_2 = \left(\frac{m+3}{m+1}\right) \left(\frac{m+2}{m}\right) \left(\frac{m+1}{m-1}\right) a_0$$

$$\text{We know that } y = \sum_{k=0}^{\infty} a_k x^{m+k} = a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + \dots$$

$$y = a_0 x^m + \left(\frac{m+1}{m-1}\right) a_0 x^{m+1} + \frac{(m+1)(m+2)}{(m-1)m} a_0 x^{m+2} + \frac{(m+1)(m+2)(m+3)}{(m-1)m(m+1)} a_0 x^{m+3} + \dots$$

$$\Rightarrow y = a_0 x^m \left[ 1 + \left(\frac{m+1}{m-1}\right) x + \frac{(m+1)(m+2)}{(m-1)m} x^2 + \frac{(m+1)(m+2)(m+3)}{(m-1)m(m+1)} x^3 + \dots \right] \quad \dots(4)$$

**For  $m=2$**

$$y = a_0 x^2 \left[ 1 + 3x + 6x^2 + 10x^3 + \dots \right] = a_0 u \quad \dots(5)$$

**For  $m=0$**

If we put  $m=0$  in the above series (4), the coefficients become infinite. To remove this difficulty, we modify the form (4) of  $y$  by putting  $a_0 = mb$ ,  $b \neq 0$

$$y = bx^m \left[ m + \frac{m(m+1)}{(m-1)} x + \frac{m(m+1)(m+2)}{(m-1)m} x^2 + \frac{m(m+1)(m+2)(m+3)}{(m-1)m(m+1)} x^3 + \dots \right] \quad \dots(6)$$

Now equation (6), gives only one solution instead of two solutions. The second solution is

given by  $\frac{\partial y}{\partial m}$ .

$$\begin{aligned} \frac{\partial y}{\partial m} &= bx^m \log x \left[ m + \frac{m(m+1)}{m-1} x + \frac{(m+1)(m+2)}{m-1} x^2 + \dots \right] \\ &\quad + bx^m \left[ 1 + \frac{m^2 - 2m - 1}{(m-1)^2} x + \frac{m^2 - m - 5}{(m-1)^2} x^2 + \frac{m^2 - 2m - 11}{(m-1)^2} x^3 + \dots \right] \end{aligned}$$

Putting  $m = 0$ , we have

$$\begin{aligned}\left(\frac{\partial y}{\partial m}\right)_{m=0} &= b \log x \left[ \frac{2}{-1} x^2 + \dots \right] + b \left[ 1 + \frac{(-1)}{1} x + (-5)x^2 + (-11)x^3 + \dots \right] \\ &= -b \log x [2x^2 + \dots] + b [1 - x - 5x^2 - 11x^3 + \dots] \\ &= b v\end{aligned}$$

The complete solution of (1) is given by  $y = a_0 u + b v$

**Example 16.** Solve in series the differential equation

**Ans.**

$$x^2 \frac{d^2 y}{dx^2} + 5x \frac{dy}{dx} + x^2 y = 0 \quad (U.P., II Semester, 2002)$$

**Solution.** Comparing the given equation with the form

$$\frac{d^2 y}{dx^2} + P(x) \frac{dy}{dx} + Q(x) y = 0, \text{ we get}$$

$$P(x) = \frac{5}{x}, \quad Q(x) = 1$$

At  $x = 0$ , since  $P(x)$  is not analytic therefore  $x = 0$  is a singular point.

$$\text{Also, } x P(x) = 5$$

$$x^2 Q(x) = x^2$$

Since both  $x P(x)$  and  $x^2 Q(x)$  are analytic at  $x = 0$  therefore  $x = 0$  is a regular singular point.

Let us assume

$$y = a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots \quad (1)$$

$$\therefore \frac{dy}{dx} = m a_0 x^{m-1} + (m+1) a_1 x^m + (m+2) a_2 x^{m+1} + \dots \quad (2)$$

$$\text{and } \frac{d^2 y}{dx^2} = m(m-1) a_0 x^{m-2} + (m+1) m a_1 x^{m-1} + (m+2)(m+1) a_2 x^m + \dots \quad (3)$$

Substituting the above values in given equation, we get

$$\begin{aligned}x^2 [m(m-1) a_0 x^{m-2} + (m+1) m a_1 x^{m-1} + (m+2)(m+1) a_2 x^m + \dots] \\ + 5x [m a_0 x^{m-1} + (m+1) a_1 x^m + (m+2) a_2 x^{m+1} + \dots] \\ + x^2 [a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots] = 0\end{aligned} \quad (4)$$

Equating the coefficient of lowest power of  $x$  to zero, we get

$$\begin{aligned}m(m-1) a_0 + 5m a_0 &= 0 && [\text{coeff. of } x^m = 0] \\ \Rightarrow (m^2 + 4m) a_0 &= 0 \\ \Rightarrow m(m+4) &= 0 && (\text{Indicial equation}) \\ \Rightarrow m &= 0, -4 && (\because a_0 \neq 0)\end{aligned}$$

Hence the roots are distinct and differing by an integer. Equating to zero, the coefficients of successive powers of  $x$ , we get

$$\begin{aligned}\text{Coefficient of } x^{m+1} &= 0 \\ (m+1) m a_1 + 5(m+1) a_1 &= 0 \\ \Rightarrow (m+5)(m+1) a_1 &= 0 \Rightarrow a_1 = 0 \quad \dots(5) \quad [\because m \neq -5, -1]\end{aligned}$$

$$\begin{aligned}\text{Coefficient of } x^{m+2} &= 0 \\ (m+2)(m+1) a_2 + 5(m+2) a_2 + a_0 &= 0 \\ (m+2)(m+6) a_2 + a_0 &= 0\end{aligned}$$

$$a_2 = \frac{-a_0}{(m+2)(m+6)} \quad \dots(6)$$

Again, Coefficient of  $x^{m+3} = 0$

$$(m+3)(m+2)a_3 + 5(m+3)a_3 + a_1 = 0$$

$$(m+3)(m+7)a_3 + a_1 = 0$$

$$\Rightarrow a_3 = \frac{-a_1}{(m+3)(m+7)}$$

$$\Rightarrow \boxed{a_3 = 0} \quad \dots(7)$$

Similarly,  $a_5 = a_7 = a_9 = \dots = 0$

Now, coefficient of  $x^{m+4} = 0$

$$(m+4)(m+3)a_4 + 5(m+4)a_4 + a_2 = 0$$

$$\Rightarrow (m+4)(m+8)a_4 = -a_2$$

$$a_4 = \frac{-a_2}{(m+4)(m+8)} = \frac{a_0}{(m+2)(m+4)(m+6)(m+8)} \text{ etc.} \quad \dots(8)$$

$$\text{These give } y = a_0 x^m \left[ 1 - \frac{x^2}{(m+2)(m+6)} + \frac{x^4}{(m+2)(m+4)(m+6)(m+8)} - \dots \right] \quad \dots(9)$$

Putting  $m = 0$  in (9), we get

$$y_1 = (y)_{m=0} = a_0 \left[ 1 - \frac{x^2}{2.6} + \frac{x^4}{2.4.6.8} - \dots \right] \quad \dots(10)$$

If we put  $m = -4$  in the series given by equation (9), the coefficients become infinite. To avoid this difficulty, we put  $a_0 = b_0(m+4)$ , so that

$$y = b_0 x^m \left[ (m+4) - \frac{(m+4)x^2}{(m+2)(m+6)} + \frac{x^4}{(m+2)(m+6)(m+8)} - \dots \right] \quad \dots(11)$$

$$\text{Now, } \frac{\partial y}{\partial m} = \log x b_0 x^m \left[ 1 + \frac{m^2 + 8m + 20}{(m^2 + 8m + 12)^2} x^2 - \frac{(3m^2 + 32m + 76)}{(m^3 + 16m^2 + 76m + 96)^2} x^4 + \dots \right]$$

Second solution is given by

$$\begin{aligned} y_2 &= \left( \frac{\partial y}{\partial m} \right)_{m=-4} = \log x b_0 x^{-4} \left( 1 + \frac{x^2}{4} - \frac{x^4}{4} + \dots \right) \\ &= b_0 x^{-4} \log x \left[ 0 - 0 + \frac{x^4}{(-2)(2)(4)} - \frac{x^6}{16} + \dots \right] + b_0 x^{-4} \left( 1 + \frac{x^2}{4} - \frac{x^4}{4} + \dots \right) \\ &= b_0 x^{-4} \log x \left( \frac{-x^4}{16} - \frac{x^6}{16} - \dots \right) + b_0 x^{-4} \left( 1 + \frac{x^2}{4} - \frac{x^4}{4} + \dots \right) \end{aligned}$$

Hence the complete solution is given by

$$\begin{aligned} y &= c_1 y_1 + c_2 y_2 \\ &= c_1 a_0 \left( 1 - \frac{x^2}{12} + \frac{x^4}{384} - \dots \right) + c_2 b_0 x^{-4} \log x \left( -\frac{x^4}{16} - \frac{x^6}{16} - \dots \right) + c_2 b_0 x^{-4} \left( 1 + \frac{x^2}{4} - \frac{x^4}{4} + \dots \right) \end{aligned}$$

$$\therefore y = A \left( 1 - \frac{x^2}{12} + \frac{x^4}{384} - \dots \right) + B x^{-4} \left( 1 + \frac{x^2}{4} - \frac{x^4}{4} + \dots \right) - B \log x \left( \frac{1}{16} + \frac{x^2}{16} + \dots \right)$$

where  $A = c_1 a_0$  and  $B = c_2 b_0$ .

**Ans.**

### EXERCISE 32.4

Solve in series the following differential equation

$$1. \quad x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} + (x^2 - 1)y = 0$$

$$\text{Ans. } y = a_0 x \left( 1 - \frac{x^2}{2.4} + \frac{x^4}{2.4^2.6} - \dots \right) + b_0 x^{-1} \log x \left[ -\frac{1}{2} x^2 + \frac{1}{2^2.4} x^4 - \frac{1}{2^2.4^2.6} x^6 + \dots \right]$$

$$2. \quad x(1-x) \frac{d^2y}{dx^2} - 3x \frac{dy}{dx} - y = 0$$

$$+ b_0 x^{-1} \left[ 1 + \frac{x^2}{2^2} - \frac{3}{2^2.2^3} x^4 + \dots \right]$$

$$\text{Ans. } y = a_0 x(1 + 2x + 3x^2 + \dots) + b_0 \log x[x + 2x^2 + 3x^3 + \dots] + b_0(1 + x + x^2 + \dots)$$

**Case IV.** If the roots differ by an integer such that one or more coefficients are indeterminate.

**Example 17.** Find the extended power series solution of the differential equation

$$x^2 y'' + 4xy' + (x^2 + 2)y = 0 \quad \dots (1)$$

**Solution.** Here  $xP(x)$  and  $x^2Q(x)$  are analytic (not infinity) at  $x = 0$ . So,  $x = 0$  is a regular singular point of this equation

Let  $y = \sum a_k x^{m+k}$  be the required solution of the given equation.

$$\text{Then } \frac{dy}{dx} = \sum a_k (m+k) x^{m+k-1}, \quad \frac{d^2y}{dx^2} = \sum a_k (m+k)(m+k-1) x^{m+k-2}$$

Substituting the values of  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in the given equation, we get

$$\begin{aligned} & x^2 \sum a_k (m+k)(m+k-1) x^{m+k-2} + 4x \sum a_k (m+k) x^{m+k-1} + (x^2 + 2) \sum a_k x^{m+k} = 0 \\ & \sum a_k (m+k)(m+k-1) x^{m+k} + 4 \sum a_k (m+k) x^{m+k} + \sum a_k x^{m+k+2} + \sum 2a_k x^{m+k} = 0 \\ & \sum a_k [(m+k)(m+k-1) + 4(m+k) + 2] x^{m+k} + \sum a_k x^{m+k+2} = 0 \\ & \sum a_k [(m+k)^2 + 3(m+k) + 2] x^{m+k} + \sum a_k x^{m+k+2} = 0 \end{aligned} \quad \dots (2)$$

The coefficient of lowest degree term  $x^m$  in (2) is obtained by putting  $k = 0$  in first summation only and equating it to zero. Then the indicial equation is

$$a_0(m^2 + 3m + 2) = 0$$

$$a_0 \neq 0, m^2 + 3m + 2 = 0 \Rightarrow (m+1)(m+2) = 0 \Rightarrow m = -1, -2$$

The coefficient of next lowest degree term  $x^{m+1}$  in (2) is obtained by putting  $k = 1$  in first summation only and equating it to zero.

$$a_1[m^2 + 5m + 6] = 0 \text{ or } a_1(m+2)(m+3) = 0 \Rightarrow a_1 = \frac{0}{(m+2)(m+3)}$$

when  $m = -2$ ,  $a_1$  becomes indeterminate  $\left(\frac{0}{0}\right)$ . When  $m = -2$  we get the identity  $a_1(0) = 0$  which is satisfied by every value of  $a_1$ . Therefore in this case we can take  $a_1$  as arbitrary constant.

Equating to zero the coefficient of  $x^{m+k+2}$

$$\begin{aligned} & a_{k+2} [(m+2+k)^2 + 3(m+2+k) + 2] + a_k = 0 \\ \Rightarrow & a_{k+2}[m^2 + (2k+4+3)m + (k+2)^2 + 3(k+2)+2] + a_k = 0 \\ \Rightarrow & a_{k+2}[m^2 + (2k+7)m + k^2 + 7k + 12] + a_k = 0 \end{aligned}$$

$$\Rightarrow a_{k+2} = -\frac{1}{m^2 + (2k+7)m + k^2 + 7k + 12} a_k$$

For  $k = 0$ ,  $a_2 = -\frac{1}{m^2 + 7m + 12} a_0 = -\frac{1}{(m+3)(m+4)} a_0$

$k = 1$   $a_3 = -\frac{1}{m^2 + 9m + 20} a_1 = -\frac{1}{(m+4)(m+5)} a_1$

$k = 2$   $a_4 = -\frac{1}{m^2 + 11m + 30} a_2 = \frac{1}{(m+3)(m+4)(m+5)(m+6)} a_0$

$k = 3$   $a_5 = -\frac{1}{m^2 + 13m + 42} a_3 = \left\{ \frac{1}{(m+4)(m+5)(m+6)(m+7)} a_1 \right\}$

For  $m = -1$   $a_2 = -\frac{1}{6} a_0, a_3 = \frac{1}{12} a_1, a_4 = \frac{1}{120} a_0, a_5 = \frac{1}{360} a_1$

First solution is  $y_1 = x^{-1} \left[ 1 - \frac{1}{6} x^2 + \frac{1}{120} x^4 + \dots \right] a_0 + \left[ 1 - \frac{1}{12} x^2 + \frac{x^4}{360} + \dots \right] a_1$

For  $m = -2$   $a_2 = -\frac{1}{2} a_0, a_3 = -\frac{1}{6} a_1, a_4 = \frac{1}{24} a_0, a_5 = \frac{1}{120} a_1$

Second solution is  $y_2 = x^{-2} \left[ 1 - \frac{x^2}{2} + \frac{x^4}{24} + \dots \right] a_0 + \left[ \frac{1}{x} - \frac{x}{6} + \frac{x^3}{120} + \dots \right] a_1$

$$y_2 = x^{-2} \left[ \left\{ 1 - \frac{x^2}{2} + \frac{x^4}{24} + \dots \right\} a_0 + \left\{ x - \frac{x^3}{6} + \frac{x^5}{120} + \dots \right\} a_1 \right]$$

$$y_2 = x^{-2} [a_0 \cos x + a_1 \sin x]$$

Thus the complete solution is  $y = Ay_1 + By_2$

Ans.

**Example 18.** Solve

$$x^2 y'' + (x^2 + x) y' + (x - 9) y = 0 \quad \dots (1)$$

**Solution.** Here,  $xP(x)$  and  $x^2 Q(x)$  are analytic (not infinity) at  $x = 0$ . So,  $x = 0$  is a regular singular point of (1).

Let  $y = \sum_{k=0}^{\infty} a_k x^{m+k}$

Differentiating it, we get

$$y' = \sum_{k=0}^{\infty} (m+k) a_k x^{m+k-1} \quad \text{and} \quad y'' = \sum_{k=0}^{\infty} (m+k)(m+k-1) a_k x^{m+k-2}$$

Substituting the values of  $y$ ,  $y'$  and  $y''$  in (1), we get

$$\begin{aligned} & x^2 \sum_{k=0}^{\infty} (m+k)(m+k-1) a_k x^{m+k-2} + (x^2 + x) \sum_{k=0}^{\infty} (m+k) a_k x^{m+k-1} + (x-9) \sum_{k=0}^{\infty} a_k x^{m+k} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} (m+k)(m+k-1) a_k x^{m+k} + \sum_{k=0}^{\infty} (m+k) a_k x^{m+k+1} + \sum_{k=0}^{\infty} (m+k) a_k x^{m+k} \\ & \quad + \sum_{k=0}^{\infty} a_k x^{m+k+1} - \sum_{k=0}^{\infty} 9 a_k x^{m+k} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} (m+k)^2 a_k x^{m+k} + \sum_{k=0}^{\infty} (m+k+1) a_k x^{m+k+1} - 9 \sum_{k=0}^{\infty} a_k x^{m+k} = 0 \end{aligned}$$

$$\begin{aligned} \Rightarrow & \sum_{k=0}^{\infty} [(m+k)^2 - 9] a_k x^{m+k} + \sum_{k=0}^{\infty} (m+k+1) a_k x^{m+k+1} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} [(m+k)^2 - 9] a_k x^{m+k} + \sum_{k=1}^{\infty} (m+k) a_{k-1} x^{m+k} = 0 \end{aligned} \quad \dots (2)$$

The coefficient of lowest degree term  $x^m$  in (2) is obtained by putting  $k = 0$  in first summation only and equating it to zero.

$$(m^2 - 9)a_0 = 0 \Rightarrow m^2 - 9 = 0 \Rightarrow m = \pm 3$$

The coefficient of next lowest degree  $x^{m+1}$  in (2) is obtained by putting  $k = 1$  in first summation and second summation, we get

$$[(m+1)^2 - 9] a_1 + (m+1) a_0 = 0$$

$$a_1 = \frac{(m+1) a_0}{9 - (m+1)^2}$$

Equating to zero the coefficient of  $x^{m+k}$ , we get  $[(m+k)^2 - 9] a_k + (m+k) a_{k-1} = 0$

$$a_k = \frac{(m+k) a_{k-1}}{9 - (m+k)^2} \quad k \geq 1$$

$$\text{For } k = 2, \quad a_2 = \frac{(m+2) a_1}{9 - (m+2)^2} = \frac{(m+1)(m+2) a_0}{[9 - (m+1)^2][9 - (m+2)^2]}$$

$$\text{For } k = 3, \quad a_3 = \frac{(m+3) a_2}{9 - (m+3)^2} = \frac{(m+1)(m+2)(m+3) a_0}{[9 - (m+1)^2][9 - (m+2)^2][9 - (m+3)^2]}$$

and so on.

$$\begin{aligned} y &= a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots \\ y &= a_0 x^m \left[ 1 + \frac{(m+1)}{9 - (m+1)^2} x + \frac{(m+1)(m+2)}{[9 - (m+1)^2][9 - (m+2)^2]} x^2 \right. \\ &\quad \left. + \frac{(m+1)(m+2)(m+3)}{[9 - (m+1)^2][9 - (m+2)^2][9 - (m+3)^2]} x^3 + \dots \right] \end{aligned}$$

**For  $m = 3$**

$$y = a_0 x^3 \left[ 1 + \frac{4}{-7} x + \frac{4 \times 5}{(-7)(-16)} x^2 + \frac{4 \times 5 \times 6}{(-7)(-16)(-27)} x^3 + \dots \right] \quad \dots (3)$$

**For  $m = -3$**

Coefficients of  $x^3, x^4, x^5$  become zero and the coefficients of remaining terms *indeterminate*. Thus for  $m = -3$

$$y = a_0 x^{-3} \left[ 1 + \frac{-2}{5} x + \frac{(-2)(-1)}{(5)(8)} x^2 \right] + a_6 x^3 \left[ 1 + \frac{4}{-7} x + \frac{(4)(5)}{(-7)(-16)} x^2 + \frac{(4)(5)(6)}{(-7)(-16)(-27)} x^3 \dots \right] \quad \dots (4)$$

Series (3) is a constant multiple of second series in (4). Solution (4) contains two arbitrary constants, so it may be taken as the required solution.

**Note.** In general, if  $m_1 - m_2 = a$  positive integer and some coefficients become indeterminate when  $m = m_2$ , the complete solution is given by putting  $m = m_2$  is  $y$  which then contains two arbitrary constants. The result by putting  $m = m_1$  in  $y$  nearly gives a numerical multiple of one of the series contained in the first solution.

**Example 19.** Solve in series the differential equation:

$$xy'' + 2y' + xy = 0.$$

(U.P., II Semester, 2003)

**Solution.** Comparing the given equation with the form

$$\frac{d^2y}{dx^2} + P(x) \frac{dy}{dx} + Q(x)y = 0, \text{ we get}$$

$$P(x) = \frac{2}{x} \quad \text{and} \quad Q(x) = 1$$

At  $x = 0$ ,  $P(x)$  is not analytic  $\therefore x = 0$  is a *singular point*.

Also,  $x P(x) = 2$  and  $x^2 Q(x) = x^2$

At  $x = 0$ , since  $x P(x)$  and  $x^2 Q(x)$  are analytic  $\therefore x = 0$  is a *regular singular point*.

Let us assume

$$y = a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots \quad \dots(1)$$

$$\text{Then, } \frac{dy}{dx} = m a_0 x^{m+1} + (m+1) a_1 x^m + (m+2) a_2 x^{m+1} + (m+3) a_3 x^{m+2} + \dots$$

$$\text{and } \frac{d^2y}{dx^2} = m(m-1) a_0 x^{m-2} + (m+1) m a_1 x^{m-1} + (m+2)(m+1) a_2 x^m + (m+3)(m+2) a_3 x^{m+1} + \dots$$

Substituting these values in the given equation, we get

$$\begin{aligned} x [m(m-1) a_0 x^{m-2} + (m+1)m a_1 x^{m-1} + (m+2)(m+1) a_2 x^m \\ + (m+3)(m+2) a_3 x^{m+1} + \dots] \\ + 2 [m a_0 x^{m-1} + (m+1) a_1 x^m + (m+2) a_2 x^{m+1} + \dots] \\ + x [a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots] = 0 \end{aligned}$$

Now, Coefficient of  $x^{m-1} = 0$

$$\Rightarrow m(m-1) a_0 + 2m a_0 = 0$$

$$(m^2 + m) a_0 = 0$$

$$\Rightarrow m^2 + m = 0$$

(Indicial equation)  $[\because a_0 \neq 0]$

$$\Rightarrow \boxed{m = 0, -1}$$

Hence, roots are distinct and differ by an integer.

Coefficient of  $x^m = 0$

$$\Rightarrow (m+1)m a_1 + 2(m+1)a_1 = 0$$

$$\Rightarrow (m+1)(m+2) a_1 = 0$$

$$\Rightarrow (m+1) a_1 = 0$$

$[\because m+2 \neq 0]$

Since  $m+1$  may be zero, hence  $a_1$  is arbitrary (or takes the form  $\frac{0}{0}$ ). In other words,  $a_1$

becomes indeterminate.

Hence the solution will contain  $a_0$  and  $a_1$  as arbitrary constants. The complete solution will be given by putting  $m = -1$  in  $y$ .

Now, Coefficient of  $x^{m+1} = 0$

$$\Rightarrow (m+2)(m+1) a_2 + 2(m+2)a_2 + a_0 = 0$$

$$\Rightarrow (m+2)(m+3) a_2 + a_0 = 0$$

$$\boxed{a_2 = \frac{-a_0}{(m+2)(m+3)}}$$

$$\begin{array}{l}
 \text{Coefficient of } x^{m+2} = 0 \\
 \Rightarrow (m+3)(m+2)a_3 + 2(m+3)a_3 + a_1 = 0 \\
 \quad (m+3)(m+4)a_3 + a_1 = 0 \\
 \boxed{a_3 = \frac{-a_1}{(m+3)(m+4)}}
 \end{array}
 \quad
 \begin{array}{l}
 \Rightarrow a_4 = \frac{-a_2}{(m+4)(m+5)} \\
 \boxed{a_4 = \frac{a_0}{(m+2)(m+3)(m+4)(m+5)}} \\
 \text{Coefficient of } x^{m+4} = 0 \\
 (m+5)(m+4)a_5 + 2(m+5)a_5 + a_3 = 0 \\
 \quad (m+5)(m+6)a_5 = -a_3 \\
 \boxed{a_5 = \frac{a_1}{(m+3)(m+4)(m+5)(m+6)}}
 \end{array}$$

and so on.

Substituting these values in equation (1), we get

$$\begin{aligned}
 y &= x^m \left[ a_0 + a_1 x - \frac{a_0}{(m+2)(m+3)} x^2 - \frac{a_1}{(m+3)(m+4)} x^3 + \frac{a_0}{(m+2)(m+3)(m+4)(m+5)} x^4 \right. \\
 &\quad \left. + \frac{a_1}{(m+3)(m+4)(m+5)(m+6)} x^5 + \dots \right] \\
 y &= x^m \left[ a_0 \left\{ 1 - \frac{x^2}{(m+2)(m+3)} + \frac{x^4}{(m+2)(m+3)(m+4)(m+5)} - \dots \right\} \right. \\
 &\quad \left. + a_1 \left\{ x - \frac{x^3}{(m+3)(m+4)} + \frac{x^5}{(m+3)(m+4)(m+5)(m+6)} - \dots \right\} \right]
 \end{aligned}$$

$$\begin{aligned}
 \text{Now, } (y)_{m=-1} &= x^{-1} \left[ a_0 \left( 1 - \frac{x^2}{1.2} + \frac{x^4}{1.2.3.4} - \dots \right) + a_1 \left( x - \frac{x^3}{2.3} + \frac{x^5}{2.3.4.5} - \dots \right) \right] \\
 &= x^{-1} [a_0 \cos x + a_1 \sin x]
 \end{aligned}$$

Hence complete solution is given by

$$y = (y)_{m=-1} \Rightarrow y = \frac{1}{x} (a_0 \cos x + a_1 \sin x). \quad \text{Ans.}$$

**Note.** All those problems, in which  $x = 0$ , was an ordinary point of  $y'' + P(x)y' + Q(x)y = 0$ , can also be solved by Frobenius method as given in Art. 32.9 and explained in above illustrative example.

### EXERCISE 32.5

Solve in series the following differential equations:

$$\begin{aligned}
 1. \quad (1-x^2) \frac{d^2y}{dx^2} + 2x \frac{dy}{dx} + y = 0 &\quad \text{Ans. } y = a_0 \left( 1 - \frac{1}{2}x^2 + \frac{1}{8}x^4 + \dots \right) + b \left( x - \frac{1}{2}x^3 + \frac{1}{40}x^5 + \dots \right) \\
 &\quad (\text{AMIETE, June 2010})
 \end{aligned}$$

$$\begin{aligned}
 2. \quad (2+x^2) \frac{d^2y}{dx^2} + x \frac{dy}{dx} + (1+x)y = 0 &\quad \text{Ans. } y = a_0 \left( 1 - \frac{1}{4}x^2 - \frac{1}{12}x^3 + \frac{5}{56}x^4 + \dots \right) + b \left( x - \frac{1}{6}x^3 - \frac{1}{24}x^4 + \dots \right)
 \end{aligned}$$

$$\begin{aligned}
 3. \quad \text{Find the power series solution about the point } x_0 = 2 \text{ of the equation } y'' + (x-1)y' + y = 0 &\quad (\text{AMIETE, Dec. 2009}) \\
 &\quad \text{Ans. } y = a_0 [1 - 1/2(x-2)^2 + 1/6(x-2)^3 + \dots] \\
 &\quad + b [(x-2) - 1/2(x-2)^2 - 1/6(x-2)^3 + \dots]
 \end{aligned}$$

# CHAPTER

# 33

## **BESSEL'S FUNCTIONS)**

---

### **33.1 BESSEL'S EQUATION**

The differential equation

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2)y = 0$$

is called the Bessel's differential equation, and particular solutions of this equation are called Bessel's functions of order  $n$ .

We find the Bessel's equation while solving Laplace equation in polar coordinates by the method of separation of variables. This equation has a number of applications in engineering.

Bessel's functions are involved in

- (i) The Oscillatory motion of a hanging chain
- (ii) Euler's theory of a circular membrane
- (iii) The studies of planetary motion
- (iv) The propagation of waves
- (v) The Elasticity
- (vi) The fluid motion
- (vii) The potential theory
- (viii) Cylindrical and spherical waves
- (ix) Theory of plane waves

Bessel's functions are also known as cylindrical and spherical function.

### **33.2 SOLUTION OF BESSEL'S EQUATION**

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2)y = 0. \quad \dots (1)$$

Let  $y = \sum_{r=0}^{\infty} a_r x^{m+r}$  or  $y = a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + \dots \quad \dots (2)$

So that  $\frac{dy}{dx} = \sum_{r=0}^{\infty} a_r (m+r) x^{m+r-1}$

and  $\frac{d^2 y}{dx^2} = \sum_{r=0}^{\infty} a_r (m+r)(m+r-1) x^{m+r-2}$

Substituting these values in (1), we get

$$x^2 \sum_{r=0}^{\infty} a_r (m+r)(m+r-1) x^{m+r-2} + x \sum_{r=0}^{\infty} a_r (m+r) x^{m+r-1} + (x^2 - n^2) \sum_{r=0}^{\infty} a_r x^{m+r} = 0$$

$$\begin{aligned}
 & \Rightarrow \sum_{r=0}^{\infty} a_r (m+r)(m+r-1)x^{m+r} + \sum_{r=0}^{\infty} a_r (m+r)x^{m+r} + \sum_{r=0}^{\infty} a_r x^{m+r+2} - n^2 \sum_{r=0}^{\infty} a_r x^{m+r} = 0 \\
 & \Rightarrow \sum_{r=0}^{\infty} a_r [(m+r)(m+r-1) + (m+r) - n^2]x^{m+r} + \sum_{r=0}^{\infty} a_r x^{m+r+2} = 0 \\
 & \Rightarrow \sum_{r=0}^{\infty} a_r [(m+r)^2 - n^2]x^{m+r} + \sum_{r=0}^{\infty} a_r x^{m+r+2} = 0. \quad \dots (3)
 \end{aligned}$$

Equating the coefficient of lowest degree term of  $x^m$  in the identity (3) to zero, by putting  $r = 0$  in the first summation we get the indicial equation.

$$\begin{aligned}
 a_0[(m+0)^2 - n^2] &= 0. \quad (r = 0) \\
 \Rightarrow m^2 &= n^2 \text{ i.e. } m = n, m = -n \quad a_0 \neq 0
 \end{aligned}$$

Equating the coefficient of the next lowest degree term  $x^{m+1}$  in the identity (3), we put  $r = 1$  in the first summation

$$a_1 [(m+1)^2 - n^2] = 0 \text{ i.e. } a_1 = 0, \text{ since } (m+1)^2 - n^2 \neq 0$$

Equating the coefficient of  $x^{m+r+2}$  in (3) to zero, to find relation in successive coefficients, we get

$$\begin{aligned}
 a_{r+2}[(m+r+2)^2 - n^2] + a_r &= 0 \\
 \Rightarrow a_{r+2} &= -\frac{1}{(m+r+2)^2 - n^2} \cdot a_r
 \end{aligned}$$

Therefore,  $a_3 = a_5 = a_7 = \dots = 0$ , since  $a_1 = 0$

$$\text{If } r = 0, \quad a_2 = -\frac{1}{(m+2)^2 - n^2} a_0$$

$$\text{If } r = 2, \quad a_4 = -\frac{1}{(m+4)^2 - n^2} a_2 = \frac{1}{[(m+2)^2 - n^2][(m+4)^2 - n^2]} a_0 \text{ and so on.}$$

On substituting the values of the coefficients  $a_1, a_2, a_3, a_4, \dots$  in (2), we have

$$\begin{aligned}
 y &= a_0 x^m - \frac{a_0}{(m+2)^2 - n^2} x^{m+2} + \frac{a_0}{[(m+2)^2 - n^2][(m+4)^2 - n^2]} x^{m+4} + \dots \\
 y &= a_0 x^m \left[ 1 - \frac{1}{(m+2)^2 - n^2} x^2 + \frac{1}{[(m+2)^2 - n^2][(m+4)^2 - n^2]} x^4 - \dots \right]
 \end{aligned}$$

For  $m = n$

$$y = a_0 x^n \left[ 1 - \frac{1}{4(n+1)} x^2 + \frac{1}{4^2 \cdot 2!(n+1)(n+2)} x^4 - \dots \right]$$

where  $a_0$  is an arbitrary constant.

For  $m = -n$

$$y = a_0 x^{-n} \left[ 1 - \frac{1}{4(-n+1)} x^2 + \frac{1}{4^2 \cdot 2!(-n+1)(-n+2)} x^4 - \dots \right]$$

### 33.3 BESSEL'S FUNCTIONS, $J_n(x)$

$$\text{The Bessel's equation is } x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2)y = 0 \quad \dots (1)$$

Solution of (1) is

$$y = a_0 x^n \left[ 1 - \frac{x^2}{2 \cdot 2(n+1)} + \frac{x^4}{2 \cdot 4 \cdot 2^2(n+1)(n+2)} - \dots + (-1)^r \frac{x^{2r}}{(2^r r!) \cdot 2^r (n+1)(n+2)\dots(n+r)} + \dots \right]$$

$$= a_0 x^n \sum_{r=0}^{\infty} (-1)^r \frac{x^{2r}}{2^{2r} r!(n+1)(n+2)\dots(n+r)}$$

where  $a_0$  is an arbitrary constant.

If  $a_0 = \frac{1}{2^n \sqrt{(n+1)}}$

The above solution is called Bessel's function denoted by  $J_n(x)$ .

$$\text{Thus } J_n(x) = \frac{1}{2^n \sqrt{(n+1)}} \sum_{r=0}^{\infty} (-1)^r \frac{x^{n+2r}}{2^{2r} r!(n+1)(n+2)\dots(n+r)} \quad (n+1 = n!)$$

$$\Rightarrow J_n(x) = \left(\frac{x}{2}\right)^n \left\{ \frac{1}{\sqrt{(n+1)}} - \frac{1}{1! \sqrt{(n+2)}} \left(\frac{x}{2}\right)^2 + \frac{1}{2! \sqrt{(n+3)}} \left(\frac{x}{2}\right)^4 - \frac{1}{3! \sqrt{(n+4)}} \left(\frac{x}{2}\right)^6 + \dots \right\}$$

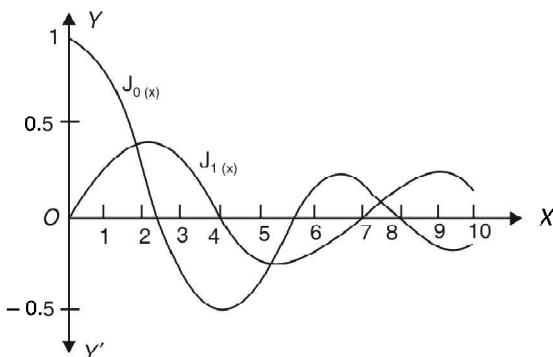

$$\Rightarrow J_n(x) = \frac{x^n}{2^n \sqrt{n+1}} \left[ 1 - \frac{x^2}{2 \cdot (2n+2)} + \frac{x^4}{2 \cdot 4 \cdot (2n+2) \cdot (2n+4)} + \dots \right] \quad \dots (2)$$

$$\Rightarrow J_n(x) = \sum_{r=0}^{\infty} \frac{(-1)^r}{r!(n+r+1)} \left(\frac{x}{2}\right)^{n+2r} \Rightarrow J_n(x) = \sum_{r=0}^{\infty} \frac{(-1)^r}{r!(n+r)!} \left(\frac{x}{2}\right)^{n+2r}$$

$$\text{If } n = 0, J_0(x) = \sum_{r=0}^{\infty} \frac{(-1)^r}{(r!)^2} \left(\frac{x}{2}\right)^{2r} \Rightarrow J_0(x) = 1 - \frac{x^2}{2^2} + \frac{x^4}{2^2 \cdot 4^2} - \frac{x^6}{2^2 \cdot 4^2 \cdot 6^2} + \dots$$

$$\text{If } n = 1, J_1(x) = \frac{x}{2} - \frac{x^3}{2^2 \cdot 4} + \frac{x^5}{2^2 \cdot 4^2 \cdot 6} - \dots$$

We draw the graph of these two functions. Both the functions are oscillatory with a varying period and a decreasing amplitude.

$$\text{Replacing } n \text{ by } -n \text{ in (2), we get } J_{-n}(x) = \sum_{r=0}^{\infty} \frac{(-1)^r}{r! \sqrt{(-n+r+1)}} \left(\frac{x}{2}\right)^{-n+2r}$$

**Case I.** If  $n$  is not integer or zero, then the complete solution of (1) is

$$y = A J_n(x) + B J_{-n}(x)$$

**Case II.** If  $n = 0$ , then  $y_1 = y_2$  and complete solution of (1) is the Bessel's function of order zero.

**Case III.** If  $n$  is positive integer, then  $y_2$  is not the solution of (1). And  $y_1$  fails to give a solution for negative values of  $n$ . Let us find out the general solution when  $n$  is an integer.

**Example 1.** Show that Bessel's function  $J_n(x)$  is an even function when  $n$  is even and is odd function when  $n$  is odd. (U.P., II Semester, 2009)

**Solution.** We know that

$$J_n(x) = \sum_{r=0}^{\infty} \frac{(-1)^r}{r!|n+r+1|} \left(\frac{x}{2}\right)^{n+2r} \quad \dots(1)$$

Replacing  $x$  by  $-x$  in (1), we get

$$J_n(-x) = \sum_{r=0}^{\infty} \frac{(-1)^r}{r!|n+r+1|} \left(\frac{-x}{2}\right)^{n+2r} \quad \dots(2)$$

**Case I. If  $n$  is even,** then  $n + 2r$  is even  $\Rightarrow \left(\frac{-x}{2}\right)^{n+2r} = \left(\frac{x}{2}\right)^{n+2r}$

Thus (2), becomes

$$\begin{aligned} J_n(-x) &= - \sum_{r=0}^{\infty} \frac{(-1)^r}{r!|n+r+1|} \left(\frac{x}{2}\right)^{n+2r} \\ &= J_n(x) \end{aligned} \quad \begin{bmatrix} \text{For even function} \\ f(-x) = f(x) \end{bmatrix}$$

Hence,  $J_n(x)$  is even function.

**Case II. If  $n$  is odd,** then  $n + 2r$  is odd  $\Rightarrow \left(\frac{-x}{2}\right)^{n+2r} = -\left(\frac{x}{2}\right)^{n+2r}$

Thus (2), becomes

$$\begin{aligned} J_n(-x) &= - \sum_{r=0}^{\infty} \frac{(-1)^r}{r!|n+r+1|} \left(\frac{x}{2}\right)^{n+2r} \\ &= -J_n(x) \end{aligned} \quad \begin{bmatrix} \text{For odd function} \\ f(-x) = -f(x) \end{bmatrix}$$

Hence,  $J_n(x)$  is odd function. Proved.

**Example 2.** Prove that:

$$\lim_{x \rightarrow 0} \frac{J_n(x)}{x^n} = \frac{1}{2^n |n+1|}; (n > -1).$$

**Solution.** From the equation (2) of Article 33.3 on page 872, we know that

$$J_n(x) = \frac{x^n}{2^n |n+1|} \left[ 1 - \frac{x^2}{2 \cdot (2n+2)} + \frac{x^4}{2 \cdot 4 \cdot (2n+2)(2n+4)} - \dots \right]$$

On taking limit on both sides when  $x \rightarrow 0$ , we get

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{J_n(x)}{x^n} &= \lim_{x \rightarrow 0} \frac{1}{2^n |n+1|} \left[ 1 - \frac{x^2}{2 \cdot (2n+2)} + \frac{x^4}{2 \cdot 4 \cdot (2n+2)(2n+4)} - \dots \right] \\ &= \frac{1}{2^n |n+1|} \end{aligned} \quad \begin{bmatrix} \text{Proved.} \end{bmatrix}$$

### 33.4. BESEL'S FUNCTION OF THE SECOND KIND OF ORDER $n$ .

$$x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2)y = 0 \quad \dots(1)$$

Let  $y = u(x) J_n(x)$  be the second solution of the Bessel's equation when  $n$  is integer.

$$\frac{dy}{dx} = u' J_n + u J'_n$$

$$\frac{d^2y}{dx^2} = u'' J_n + 2u' J'_n + u J''_n$$

Substituting these values of  $y, y', y''$  in (1), we get

$$\begin{aligned} & x^2(u''J_n + 2u'J'_n + uJ''_n) + x(u'J_n + uJ'_n) + (x^2 - n^2)uJ_n = 0 \\ \Rightarrow & u[x^2J''_n + xJ'_n + (x^2 - n^2)J_n] + x^2u''J_n + 2x^2u'J'_n + xu'J_n = 0 \quad \dots (2) \end{aligned}$$

$$\begin{aligned} \Rightarrow & x^2J''_n + xJ'_n + (x^2 - n^2)J_n = 0 \quad [\text{Since } J_n \text{ is a solution of (1)}] \\ (2) \text{ becomes } & x^2u''J_n + 2x^2u'J'_n + xu'J_n = 0 \quad \dots (3) \end{aligned}$$

Dividing (3) by  $x^2u'J_n$ , we have

$$\frac{u''}{u'} + 2\frac{J'_n}{J_n} + \frac{1}{x} = 0 \quad \dots (4)$$

(4) Can also be written as

$$\begin{aligned} & \frac{d}{dx}[\log u'] + 2\frac{d}{dx}[\log J_n] + \frac{d}{dx}(\log x) = 0 \\ \Rightarrow & \frac{d}{dx}[\log u' + 2\log J_n + \log x] = 0 \\ \Rightarrow & \frac{d}{dx}[\log(u'J_n^2 \cdot x)] = 0 \quad \dots (5) \end{aligned}$$

Integrating (5), we get

$$\begin{aligned} & \log u'J_n^2 \cdot x = \log C_1 \\ \Rightarrow & u'J_n^2 \cdot x = C_1 \quad \Rightarrow \quad u' = \frac{C_1}{J_n^2 \cdot x} \quad \dots (6) \end{aligned}$$

On integrating (6), we obtain

$$u = \int \frac{C_1}{J_n^2 \cdot x} dx + C_2$$

Putting the value of  $u$  in the assumed solution  $y = u(x)J_n(x)$ , we get

$$\begin{aligned} y &= \left[ \int \frac{C_1 dx}{J_n^2(x) \cdot x} + C_2 \right] J_n(x) \\ y &= C_2 J_n(x) + C_1 J_n(x) \int \frac{dx}{x J_n^2(x)} \quad \Rightarrow \quad = C_2 J_n(x) + C_1 y_n(x) \end{aligned}$$

$$\text{where, } y_n(x) = J_n(x) \int \frac{dx}{x J_n^2(x)}$$

The function  $y_n(x)$  is known as Bessel's function of second kind of order  $n$ . It is also called **Neumann function**.

When  $n$  is not an integer.

$$y_n(x) = \frac{1}{\sin n\pi} [J_n(x) \cos n\pi - J_{-n}(x)]$$

When  $n$  is an integer

$$y_n(x) = \lim_{m \rightarrow n} \left[ \frac{1}{\sin m\pi} \{J_m(x) \cos mx - J_{-m}(x)\} \right]$$

**General solution of Bessel's Equation is**

$$y = AJ_n(x) + BJ_{-n}(x)$$

**Example 3.** Prove that,  $J_{-n}(x) = (-1)^n J_n(x)$

where  $n$  is a positive integer.

(A.M.I.E.T.E., Winter 2001)

$$\text{Solution.} \quad J_{-n}(x) = \sum_{r=0}^{\infty} (-1)^r \frac{1}{r! |(r-n+1)|} \left(\frac{x}{2}\right)^{-n+2r}$$

$$\Rightarrow \sum_{r=0}^{r=n-1} \frac{(-1)^r \left(\frac{x}{2}\right)^{-n+2r}}{r! |(-n+r+1)|} + \sum_{r=n}^{\infty} \frac{(-1)^r \left(\frac{x}{2}\right)^{-n+2r}}{r! |(-n+r+1)|}$$

$$\Rightarrow = 0 + \sum_{r=n}^{\infty} \frac{(-1)^r \left(\frac{x}{2}\right)^{-n+2r}}{r! |(-n+r+1)|} \quad (\text{since - ve integer} = \infty)$$

On putting  $r = n + k$ , we get

$$J_{-n}(x) = \sum_{k=0}^{\infty} \frac{(-1)^{n+k} \left(\frac{x}{2}\right)^{n+2k}}{(n+k)! |(k+1)|} = (-1)^n \sum_{k=0}^{\infty} \frac{(-1)^k \left(\frac{x}{2}\right)^{n+2k}}{(n+k)! k!}$$

$$= (-1)^n J_n(x)$$

**Proved.**

**Example 4.** Prove that

$$(a) J_{1/2}(x) = \sqrt{\left(\frac{2}{\pi x}\right)} \sin x \quad (\text{AMIETE, June 2010, U.P., II Semester, 2009})$$

$$(b) J_{-1/2}(x) = \sqrt{\left(\frac{2}{\pi x}\right)} \cos x \quad (\text{AMIETE, June 2009})$$

**Solution.** We know that,

$$J_n(x) = \frac{x^n}{2^n |n+1|} \left[ 1 - \frac{x^2}{2.2(n+1)} + \frac{x^4}{2.4.2^2(n+1)(n+2)} - \dots \right] \quad \dots (1)$$

(a) Substituting  $n = \frac{1}{2}$  in (1), we obtain

$$J_{1/2}(x) = \frac{x^{1/2}}{2^{1/2} \left| \frac{1}{2} + 1 \right|} \left[ 1 - \frac{x^2}{2.2 \left( \frac{1}{2} + 1 \right)} + \frac{x^4}{2.4.2^2 \left( \frac{1}{2} + 1 \right) \left( \frac{1}{2} + 2 \right)} - \dots \right]$$

$$= \frac{\sqrt{x}}{\sqrt{2} \left| \frac{3}{2} \right|} \left[ 1 - \frac{x^2}{2.3} + \frac{x^4}{2.3.4.5} \dots \right] = \frac{\sqrt{x}}{\sqrt{2} \cdot \frac{1}{2} \left| \frac{1}{2} \right|} \left[ \frac{1}{x} \left[ x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \right] \right]$$

$$= \frac{1}{\sqrt{2x} \cdot \frac{1}{2} \sqrt{\pi}} \sin x = \sqrt{\left(\frac{2}{\pi x}\right)} \sin x \quad \left( \text{since } \left| \frac{1}{2} \right| = \sqrt{\pi} \right) \quad \text{Proved.}$$

(b) Again substituting  $n = -\frac{1}{2}$  in (1), we have

$$J_{-1/2}(x) = \frac{x^{-1/2}}{2^{-1/2} \left| -\frac{1}{2} + 1 \right|} \left[ 1 - \frac{x^2}{2.2 \left( -\frac{1}{2} + 1 \right)} + \frac{x^4}{2.4.2^2 \left( -\frac{1}{2} + 1 \right) \left( -\frac{1}{2} + 2 \right)} - \dots \right]$$

$$= \frac{\sqrt{2}}{\sqrt{x} \left| \frac{1}{2} \right|} \left[ 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots \right] = \sqrt{\left(\frac{2}{\pi x}\right)} \cos x \quad \left( \text{since } \left| \frac{1}{2} \right| = \sqrt{\pi} \right) \quad \text{Proved.}$$

**Example 5.** Show that

$$\sqrt{\left(\frac{1}{2}\pi x\right)} J_{\frac{3}{2}}(x) = \frac{\sin x}{x} - \cos x$$

**Solution.** We know that

$$J_n(x) = \frac{x^n}{2^n |(n+1)|} \left[ 1 - \frac{x^2}{2.2.(n+1)} + \frac{x^4}{2.4.2^2(n+1)(n+2)} - \dots \right] \quad \dots (1)$$

Putting  $n = \frac{3}{2}$  in (1), we get

$$\begin{aligned} J_{\frac{3}{2}}(x) &= \frac{x^{3/2}}{2^{3/2} \left| \frac{3}{2} + 1 \right|} \left[ 1 - \frac{x^2}{2.2.\left(\frac{3}{2} + 1\right)} + \frac{x^4}{2.4.2^2.\left(\frac{3}{2} + 1\right)\left(\frac{3}{2} + 2\right)} - \dots \right] \\ &= \frac{x^{\frac{1}{2}}}{2\sqrt{2} \cdot \frac{3}{2} \cdot \frac{1}{2} \cdot \sqrt{\pi}} \left[ x^2 - \frac{x^4}{2.5} + \frac{x^6}{2.4.5.7} - \dots \right] = \sqrt{\left(\frac{2}{\pi x}\right)} \left[ \frac{x^2}{2!} - \frac{x^2}{3!} + \frac{x^4}{5!} - \frac{x^4}{4!} + \frac{x^6}{6!} - \frac{x^6}{7!} + \dots \right] \\ &= \sqrt{\frac{2}{\pi x}} \left[ \frac{1}{x} \left\{ x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \right\} - \left\{ 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots \right\} \right] = \sqrt{\frac{2}{\pi x}} \left[ \frac{\sin x}{x} - \cos x \right] \\ \Rightarrow \quad \sqrt{\frac{\pi x}{2}} J_{\frac{3}{2}}(x) &= \frac{\sin x}{x} - \cos x \end{aligned}$$

**Proved.**

**Example 6.** Show that  $\sqrt{\left(\frac{1}{2}\pi x\right)} J_{-\frac{3}{2}}(x) = -\sin x - \frac{\cos x}{x}$

**Solution.** We know that

$$J_n(x) = \frac{x^n}{2^n |n+1|} \left[ 1 - \frac{x^2}{2.2.(n+1)} + \frac{x^4}{2.4.2^2(n+1)(n+2)} - \dots \right]$$

Multiplying numerator and denominator by  $(n+1)$ , we get

$$J_n(x) = \frac{x^n(n+1)}{2^n |n+2|} \left[ 1 - \frac{x^2}{2.2.(n+1)} + \frac{x^4}{2.4.2^2(n+1)(n+2)} - \dots \right]$$

Putting  $n = -\frac{3}{2}$ , we get

$$\begin{aligned} J_{-\frac{3}{2}}(x) &= \frac{x^{-3/2} \left( -\frac{3}{2} + 1 \right)}{2^{-3/2} \left| \frac{-3}{2} + 2 \right|} \left[ 1 + \frac{x^2}{2} - \frac{x^4}{2.4} - \dots \right] = \frac{x^{-\frac{3}{2}} \left( -\frac{1}{2} \right)}{2^{-3/2} \left| \frac{1}{2} \right|} \left[ 1 + \frac{x^2}{2} - \frac{x^4}{2.4} - \dots \right] \\ &= -\sqrt{\left(\frac{2}{\pi x}\right)} \frac{1}{x} \left[ 1 + \frac{x^2}{2} - \frac{x^4}{2.4} - \dots \right] = \sqrt{\left(\frac{2}{\pi x}\right)} \left[ -\frac{1}{x} \left\{ 1 + x^2 \left( 1 - \frac{1}{2} \right) - x^4 \left( \frac{1}{6} - \frac{1}{2.4} \right) - \dots \right\} \right] \\ &= \sqrt{\left(\frac{2}{\pi x}\right)} \left[ -\frac{1}{x} \left( 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots \right) - \left( x - \frac{x^3}{3!} + \dots \right) \right] = \sqrt{\left(\frac{2}{\pi x}\right)} \left[ -\frac{1}{x} \cos x - \sin x \right] \end{aligned}$$

$$\text{Hence, } \sqrt{\left(\frac{\pi x}{2}\right)} J_{-\frac{3}{2}}(x) = -\frac{1}{x} \cos x - \sin x$$

**Proved.**

### 33.5 RECURRENCE FORMULAE

These formulae are very useful in solving the questions. So, they are to be committed to memory.

1.	$x J'_n = n J_n - x J_{n+1}$
2.	$x J'_n = -n J_n + x J_{n-1}$
3.	$2 J'_n = J_{n-1} - J_{n+1}$
4.	$2n J_n = x (J_{n-1} + J_{n+1})$
5.	$\frac{d}{dx}(x^{-n} J_n) = -x^{-n} J_{n+1}$
6.	$\frac{d}{dx}(x^n J_n) = x^n J_{n-1}$

(AMIETE, June 2010)

(AMIETE, June 2010)

**Formula I.**  $x J'_n = n J_n - x J_{n+1}$

**Proof.** We know that

$$J_n = \sum_{r=0}^{\infty} \frac{(-1)^r}{r!} \frac{(n+r+1)}{(n+r+1)} \left(\frac{x}{2}\right)^{n+2r}$$

Differentiating with respect to  $x$ , we get

$$\begin{aligned} J'_n &= \sum_{r=1}^{\infty} \frac{(-1)^r (n+2r)}{r!} \left(\frac{x}{2}\right)^{n+2r-1} \frac{1}{2} \\ \Rightarrow x J'_n &= n \sum_{r=1}^{\infty} \frac{(-1)^r}{r!} \left(\frac{x}{2}\right)^{n+2r} + x \sum_{r=1}^{\infty} \frac{(-1)^r \cdot 2r}{2r!} \left(\frac{x}{2}\right)^{n+2r-1} \\ &= n J_n + x \sum_{r=1}^{\infty} \frac{(-1)^r}{(r-1)!} \left(\frac{x}{2}\right)^{n+2r-1} \\ &= n J_n + x \sum_{s=0}^{\infty} \frac{(-1)^{s+1}}{s!} \left(\frac{x}{2}\right)^{n+2s+1} \quad [\text{Putting } r-1=s] \\ &= n J_n - x \sum_{s=0}^{\infty} \frac{(-1)^s}{s!} \left(\frac{x}{2}\right)^{(n+1)+2s} \end{aligned}$$

$x J'_n = n J_n - x J_{n+1}$

**Proved.**

**Formula II.**  $x J'_n = -n J_n + x J_{n-1}$  (U.P., II Semester, summer 2006)

**Proof.** We know that

$$J_n = \sum_{r=0}^{\infty} \frac{(-1)^r}{r!} \frac{(n+r+1)}{(n+r+1)} \left(\frac{x}{2}\right)^{n+2r}$$

Differentiating w.r.t. ' $x$ ', we get

$$J'_n = \sum_{r=1}^{\infty} \frac{(-1)^r (n+2r)}{r!} \left(\frac{x}{2}\right)^{n+2r-1} \frac{1}{2}$$

$$\begin{aligned}
 xJ'_n &= \sum_{r=0}^{\infty} \frac{(-1)^r (n+2r)}{r!} \left(\frac{x}{2}\right)^{n+2r} = \sum_{r=0}^{\infty} \frac{(-1)^r [(2n+2r)-n]}{r!} \left(\frac{x}{2}\right)^{n+2r} \\
 &= \sum_{r=0}^{\infty} \frac{(-1)^r (2n+2r)}{r!} \left(\frac{x}{2}\right)^{n+2r} - n \sum_{r=0}^{\infty} \frac{(-1)^r}{r!} \left(\frac{x}{2}\right)^{n+2r} \\
 &= \sum_{r=0}^{\infty} \frac{(-1)^r 2}{r!} \left(\frac{x}{2}\right)^{n+2r} - n J_n = x \sum_{r=0}^{\infty} \frac{(-1)^r}{r!} \left(\frac{x}{2}\right)^{(n-1+2r)} - n J_n \\
 \Rightarrow xJ'_n &= xJ'_{n-1} - n J_n \quad \text{Proved.}
 \end{aligned}$$

**Formula III.**  $2J'_n = J_{n-1} - J_{n+1}$

**Proof.** We know that  $xJ'_n = nJ_n - xJ_{n+1}$  ... (1) (Recurrence formula I)

$xJ'_n = -nJ_n + xJ_{n-1}$  ... (2) (Recurrence formula II)

Adding (1) and (2), we get

$$2xJ'_n = -xJ_{n+1} + xJ_{n-1} \Rightarrow$$

$$2J'_n = J_{n-1} - J_{n+1}$$

Proved.

**Formula IV.**  $2nJ_n = x(J_{n-1} + J_{n+1})$  (U.P. II Semester, June 2007)

**Proof.** We know that

$$xJ'_n = nJ_n - xJ_{n+1} \quad \dots (1) \quad \text{(Recurrence formula I)}$$

$$xJ'_n = -nJ_n + xJ_{n-1} \quad \dots (2) \quad \text{(Recurrence formula II)}$$

Subtracting (2) from (1), we get

$$0 = 2nJ_n - xJ_{n+1} - xJ_{n-1} \Rightarrow 2nJ_n = x(J_{n-1} + J_{n+1}) \dots (3) \quad \text{Proved.}$$

The following examples are solved by using Recurrence formula IV.

**Example 7.** Prove that

$$J_{5/2}(x) = \sqrt{\frac{2}{\pi x}} \left[ \left( \frac{3-x^2}{x^2} \right) \sin x - \frac{3 \cos x}{x} \right] \quad (\text{AMIETE, June 2010, Q. Bank U.P.T.U. 2002})$$

**Solution.** From Recurrence relation (4), we have

$$2nJ_n(x) = x[J_{n-1}(x) + J_{n+1}(x)] \quad \dots (1)$$

$$J_{n+1}(x) = \frac{2n}{x} J_n(x) - J_{n-1}(x)$$

Putting  $n = 1/2$  in (1), we get

$$J_{3/2}(x) = \frac{1}{x} J_{1/2}(x) - J_{-1/2}(x) \quad \dots (2)$$

Again putting  $n = \frac{3}{2}$  in (1), we get

$$J_{5/2}(x) = \frac{3}{2} J_{3/2}(x) - J_{1/2}(x) \quad \dots (3)$$

Putting the value of  $J_{\frac{3}{2}}(x)$  from (2) in (3), we get

$$\begin{aligned}
 J_{5/2}(x) &= \frac{3}{x} \left[ \frac{1}{x} J_{1/2}(x) - J_{-1/2}(x) \right] - J_{1/2}(x) \quad \dots (4) \\
 &= \left( \frac{3}{x^2} - 1 \right) J_{1/2}(x) - \frac{3}{x} J_{-1/2}(x)
 \end{aligned}$$

Putting the values of  $J_{\frac{1}{2}}(x)$  and  $J_{-\frac{1}{2}}(x)$  in (4), we get

$$J_{5/2}(x) = \left(\frac{3-x^2}{x^2}\right)\sqrt{\frac{2}{\pi x}} \sin x - \frac{3}{x} \sqrt{\frac{2}{\pi x}} \cos x = \sqrt{\frac{2}{\pi x}} \left[ \left(\frac{3-x^2}{x^2}\right) \sin x - \frac{3}{x} \cos x \right] \text{Proved.}$$

**Example 8.** Express  $J_6(x)$  in terms of  $J_0(x)$  and  $J_1(x)$ . (U.P., II Semester, 2009)

**Solution.** We know that

$$J_{n+1} = \frac{2n}{x} J_n - J_{n-1} \quad \dots(1) \left[ \begin{array}{l} \text{From Recurrence} \\ \text{relation (4)} \end{array} \right]$$

Putting  $n = 5$  in (1), we get

$$J_6 = \frac{10}{x} J_5 - J_4 \quad \dots(2)$$

Putting  $n = 4$  in (1), we get

$$J_5 = \frac{8}{3} J_4 - J_3$$

Putting the value of  $J_5$  in (2), we get

$$J_6 = \frac{10}{x} \left[ \frac{8}{3} J_4 - J_3 \right] - J_4 = \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) - 1 \right] J_4 - \frac{10}{x} J_3 \quad \dots(3)$$

On putting the value of  $J_4$  in (3), we get

$$\begin{aligned} J_6 &= \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) - 1 \right] \left( \frac{6}{x} J_3 - J_2 \right) - \frac{10}{x} J_3 \\ &= \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) - \frac{16}{x} \right] J_3 - \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) - 1 \right] J_2 \end{aligned} \quad \dots(4)$$

$$\left[ \begin{array}{l} \text{If } n = 2 \text{ in (1), then} \\ J_3 = \frac{4}{x} J_2 - J_1 \end{array} \right]$$

On putting the values of  $J_3$  in (4), we get

$$\begin{aligned} J_6 &= \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) - \frac{16}{x} \right] \left[ \frac{4}{x} J_2 - J_1 \right] - \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) - 1 \right] J_2 \\ &= \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) \left(\frac{4}{x}\right) - \left(\frac{16}{x}\right) \left(\frac{4}{x}\right) - \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) + 1 \right] J_2 \\ &\quad - \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) - \frac{16}{x} \right] J_1 \quad \dots(5) \end{aligned} \quad \left[ \begin{array}{l} \text{If } n = 1 \text{ in (1) then} \\ J_2 = \frac{2}{x} J_1 - J_0 \end{array} \right]$$

On putting the value of  $J_2$  in (5), we get

$$\begin{aligned} J_6 &= \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) \left(\frac{4}{x}\right) - \left(\frac{16}{x}\right) \left(\frac{4}{x}\right) - \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) + 1 \right] \left[ \frac{2}{x} J_1 - J_0 \right] \\ &\quad - \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) - \frac{16}{x} \right] J_1 \\ \Rightarrow J_6 &= \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) \left(\frac{4}{x}\right) \left(\frac{2}{x}\right) - \left(\frac{16}{x}\right) \left(\frac{4}{x}\right) \left(\frac{2}{x}\right) - \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{2}{x}\right) + \frac{2}{x} \right. \\ &\quad \left. - \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) + \frac{16}{x} \right] J_1 \\ &\quad - \left[ \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) \left(\frac{6}{x}\right) \left(\frac{4}{x}\right) - \left(\frac{16}{x}\right) \left(\frac{4}{x}\right) - \left(\frac{10}{x}\right) \left(\frac{8}{3}\right) + 1 \right] J_0 \end{aligned}$$

$$\Rightarrow J_6 = \left[ \frac{3840}{x^5} - \frac{128}{x^3} - \frac{160}{x^3} + \frac{2}{x} - \frac{480}{x^3} + \frac{16}{x} \right] J_1 - \left[ \frac{1920}{x^4} - \frac{64}{x^2} - \frac{80}{x^2} + 1 \right] J_0 \\ = \left[ \frac{3840}{x^5} - \frac{768}{x^3} + \frac{18}{x} \right] J_1 - \left[ \frac{1920}{x^4} - \frac{144}{x^2} + 1 \right] J_0 \quad \text{Ans.}$$

**Example 9.** Express  $J_5$  in terms of  $J_1$  and  $J_2$ .

(AMIETE, Dec. 2009)

**Solution.** Putting  $n = 4$  in recurrence formula (4), we get

$$n = 4, 8J_4 = x(J_3 + J_5) \Rightarrow J_5 = \frac{8}{x} J_4 - J_3 \\ n = 3, J_4 = \frac{6}{x} J_3 - J_2, \quad J_5 = \frac{8}{x} \left( \frac{6}{x} J_3 - J_2 \right) - J_3 = \frac{48}{x^2} J_3 - \frac{8}{x} J_2 - J_3 \\ J_5 = \frac{48}{x^2} \left( \frac{4}{x} J_2 - J_1 \right) - \frac{8}{x} J_2 - \left( \frac{4}{x} J_2 - J_1 \right) - \frac{4}{x} J_2 + J_1 \\ \Rightarrow J_5 = \frac{192}{x^3} J_2 - \frac{48}{x^2} J_1 - \frac{8}{x} J_2 - \frac{4}{x} J_2 + J_1 \\ = \left( \frac{192}{x^3} - \frac{12}{x} \right) J_2 + \left( 1 - \frac{48}{x^2} \right) J_1 \quad \text{Ans.}$$

**Formula V.**  $\frac{d}{dx}(x^{-n} \cdot J_n) = -x^{-n} J_{n+1}$

**Proof.** We know that  $x J'_n = n J_n - x J_{n+1}$  (Recurrence formula I)

Multiplying by  $x^{-n-1}$ , we obtain  $x^{-n} J'_n = n x^{-n-1} J_n - x^{-n} J_{n+1}$

i.e.,  $x^{-n} J'_n - n x^{-n-1} J_n = -x^{-n} J_{n+1}$

$$\Rightarrow \boxed{\frac{d}{dx}(x^{-n} J_n) = -x^{-n} J_{n+1}} \quad \text{Proved.}$$

**Example 10.** If  $n > -1$ , show that:

$$\int_0^x x^{-n} J_{n+1}(x) dx = \frac{1}{2^n \sqrt{n+1}} - x^{-n} J_n(x)$$

**Solution.** From relation (5), we know that

$$\frac{d}{dx}[x^{-n} J_n(x)] = -x^{-n} J_{n+1}(x)$$

Integrating it between 0 and  $x$ , we get

$$\begin{aligned} \int_0^x x^{-n} J_{n+1}(x) dx &= - \left[ x^{-n} J_n(x) \right]_0^x \\ &= -x^{-n} J_n(x) + \lim_{x \rightarrow 0} \left[ \frac{J_n(x)}{x^n} \right] \\ &= -x^{-n} J_n(x) + \frac{1}{2^n \sqrt{n+1}} \\ &= \frac{1}{2^n \sqrt{n+1}} - x^{-n} J_n(x) \end{aligned} \quad \begin{array}{l} \text{If } n = 3 \text{ in (1), then} \\ J_4 = \frac{6}{x} J_3 - J_2 \end{array} \quad \text{Proved.}$$

**Formula VI.**  $\frac{d}{dx}(x^n J_n) = x^n J_{n-1}$

(U.P., II Semester, 2004, 2005)

**Proof.** We know that

$$x J'_n = -n J_n + x J_{n-1}$$

(Recurrence formula II)

Multiplying by  $x^{n-1}$ , we have

$$x^n J'_n = -n x^{n-1} J_n + x^n J_{n-1} \quad i.e., \quad x^n J'_n + n x^{n-1} J_n = x^n J_{n-1}$$

$$\Rightarrow \boxed{\frac{d}{dx}(x^n J_n) = x^n J_{n-1}} \quad \text{Proved.}$$

**Example 11.** Prove that  $\frac{d}{dx}[J_0(x)] = -J_1(x)$

**Solution.** We know that  $\frac{d}{dx} [x^{-n} J_n(x)] = -x^{-n} J_{n+1}(x)$  (Recurrence relation VI)

On putting  $n = 0$  in the formula VI, we get  $\frac{d}{dx}[x^0 J_0(x)] = -x^0 J_1(x)$

$$\frac{d}{dx}[J_0(x)] = -J_1(x) \quad \text{Proved.}$$

**Example 12.** Prove that

$$\int x J_0^2(x) dx = \frac{1}{2} x^2 [J_0^2(x) + J_1^2(x)] + c \quad (\text{U.P., II Semester, 2003, 2004})$$

**Solution.** L.H.S. =  $\int x J_0^2(x) dx$

On integrating by parts, we get

$$= J_0^2(x) \cdot \frac{x^2}{2} - \int 2J_0(x) J_0'(x) \cdot \frac{x^2}{2} dx + c$$

Putting the value of  $J_0'(x) = -J_1(x)$ , we get

$$= \frac{x^2}{2} J_0^2(x) - \int x^2 J_0(x) \{-J_1(x)\} dx + c$$

$$= \frac{x^2}{2} J_0^2(x) + \int x J_1(x) \cdot x J_0(x) dx + c$$

Putting the value of  $x J_0(x)$  from recurrence relation VI, we get

$$= \frac{x^2}{2} J_0^2(x) - \int x J_1(x) \cdot \frac{d}{dx}[x J_1(x)] dx + c$$

$$= \frac{x^2}{2} J_0^2(x) + \frac{[x J_1(x)]^2}{2} + c \quad \left[ \because \int t dt = \frac{t^2}{2}, \text{ put } x J_1(x) = t \right]$$

$$= \frac{x^2}{2} [J_0^2(x) + J_1^2(x)] + c \quad \text{Proved.}$$

**Example 13.** Show that (a)  $J_{n+3} + J_{n+5} = \frac{2}{x} (n+4) J_{n+4}$

(b) Express  $J_4(x)$  in terms of  $J_0(x)$  and  $J_1(x)$  (A.M.I.E.T.E., Summer, 2007, 2002)

**Solution.** (a) Recurrence relation IV is  $2n J_n = x (J_{n-1} + J_{n+1}) \Rightarrow J_{n-1} + J_{n+1} = \frac{2n}{x} J_n$

Putting  $n+4$  for  $n$ , we have  $J_{n+3} + J_{n+5} = \frac{2(n+4)}{x} J_{n+4}$  Proved.

(b) We know that  $J_{n+1} = \frac{2n}{x} J_n - J_{n-1}$  [From Recurrence relation (4)]

If  $n=1$ ,  $J_2 = \frac{2}{x} J_1 - J_0$ ,

If  $n=2$ ,  $J_3 = \frac{4}{x} J_2 - J_1$ ,

If  $n=3$ ,  $J_4 = \frac{6}{x} J_3 - J_2 = \frac{6}{x} \left( \frac{4}{x} J_2 - J_1 \right) - J_2$

$$\begin{aligned}
 &= \frac{24}{x^2} J_2 - \frac{6}{x} J_1 - J_0 = \frac{24}{x^2} \left( \frac{2}{x} J_1 - J_0 \right) - \frac{6}{x} J_1 - \left( \frac{2}{x} J_1 - J_0 \right) \\
 &= \frac{48}{x^3} J_1 - \frac{24}{x^2} J_0 - \frac{6}{x} J_1 - \frac{2}{x} J_1 + J_0 = \left( \frac{48}{x^3} - \frac{8}{x} \right) J_1 + \left( 1 - \frac{24}{x^2} \right) J_0 \quad \text{Ans.}
 \end{aligned}$$

**Example 14.** Prove that  $J'_2(x) = \left(1 - \frac{4}{x^2}\right)J_1(x) + \frac{2}{x}J_0(x)$  where  $J_n(x)$  is the Bessel's function of first kind. (AMIETE, Dec. 2010, U.P., III Semester, June 2008, Winter 2001)

**Solution.**  $xJ'_n = -nJ_n + xJ_{n-1}$  (Recurrence formula II) ... (1)

On putting  $n = 2$  in (1), we have  $xJ'_2 = -2J_2 + xJ_1$

$$\Rightarrow J'_2 = -\frac{2}{x}J_2 + J_1 \quad \dots (2)$$

$$xJ'_n = nJ_n - xJ_{n+1} \quad (\text{Recurrence formula I}) \quad \dots (3)$$

From (1) and (3), we have  $-nJ_n + xJ_n = nJ_n - xJ_{n+1}$   
On putting  $n = 1$ ,  $-J_1 + xJ_0 = J_1 - xJ_2$

$$\Rightarrow -\frac{1}{x}J_1 + J_0 = \frac{1}{x}J_1 - J_2 \quad \Rightarrow \quad J_2 = \frac{2}{x}J_1 - J_0 \quad \dots (4)$$

Putting the value of  $J_2$  from (4) in (2), we get

$$J'_2 = -\frac{2}{x} \left( \frac{2}{x}J_1 - J_0 \right) + J_1 = -\frac{4}{x^2}J_1 + \frac{2}{x}J_0 + J_1 = \left( 1 - \frac{4}{x^2} \right)J_1 + \frac{2}{x}J_0 \quad \text{Proved.}$$

**Example 15.** Using the recurrence relation, show that

$$4J''_n(x) = J_{n-2}(x) - 2J_n(x) + J_{n+2}(x).$$

**Solution.**  $2J'_n = J_{n-1} - J_{n+1}$  (Recurrence formula III) ... (1)

On differentiating (1), we have

$$2J''_n = J'_{n-1} - J'_{n+1} \quad \dots (2)$$

Replacing  $n$  by  $n - 1$  and  $n$  by  $n + 1$  in (1), we have

$$2J'_{n-1} = J_{n-2} - J_n \quad \Rightarrow \quad J'_{n-1} = \frac{1}{2}J_{n-2} - \frac{1}{2}J_n \quad \dots (3)$$

$$\text{and} \quad 2J'_{n+1} = J_n - J_{n+2} \quad \Rightarrow \quad J'_{n+1} = \frac{1}{2}J_n - \frac{1}{2}J_{n+2} \quad \dots (4)$$

Putting the values of  $J'_{n-1}$  and  $J'_{n+1}$  from (3) and (4) in (2), we get

$$2J''_n = \frac{1}{2}[J_{n-2} - J_n] - \frac{1}{2}[J_n - J_{n+2}]$$

$$\Rightarrow 4J''_n = J_{n-2} - J_n - J_n + J_{n+2}$$

$$\Rightarrow 4J''_n = J_{n-2} - 2J_n + J_{n+2} \quad \text{Proved.}$$

**Example 16.** Show that

$$\frac{d}{dx}(J_n^2 + J_{n+1}^2) = 2 \left( \frac{n}{x} J_n^2 - \frac{n+1}{x} J_{n+1}^2 \right) \quad (\text{U.P. II Semester Summer 2005})$$

**Solution.**  $xJ'_n = nJ_n - xJ_{n+1}$  (Recurrence formula I) ... (1)

and  $xJ'_n = -nJ_n + xJ_{n-1}$  (Recurrence formula II) ... (2)

Putting  $(n + 1)$  for  $n$  in (2), we get

$$xJ'_{n+1} = -(n+1)J_{n+1} + xJ_n \quad \dots (3)$$

Now  $\frac{d}{dx}(J_n^2 + J_{n+1}^2) = 2J_n \cdot J'_n + 2J_{n+1} \cdot J'_{n+1}$

$$\begin{aligned} &= 2J_n \cdot \frac{1}{x}(nJ_n - xJ_{n+1}) + 2J_{n+1} \cdot \frac{1}{x}[-(n+1)J_{n+1} + xJ_n] \quad [\text{From (1) \& (3)}] \\ &= 2 \left[ \frac{n}{x}J_n^2 - \frac{n+1}{x}J_{n+1}^2 \right] \end{aligned}$$

**Proved.**

**Example 17.** Prove that following relation:

$$x^2 J''_n(x) = (n^2 - n - x^2) J_n(x) + xJ_{n+1}(x)$$

(A.M.I.E.T.E., Summer 2001, U.P. II Semester Summer, 2007, 2006)

**Solution.**  $x^2 \frac{d^2y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2)y = 0$  (Bessel's equation) ... (1)

$J_n(x)$  is the solution of (1)

So  $x^2 J''_n + xJ'_n + (x^2 - n^2) J_n = 0$  ... (2)

We know that

$$xJ'_n = nJ_n - xJ_{n+1} \quad (\text{Recurrence relation I}) \dots (3)$$

Putting the value of  $xJ'_n$  from (3) in (2), we get

$$x^2 J''_n + nJ_n - xJ_{n+1} + (x^2 - n^2) J_n = 0$$

$$x^2 J''_n = -nJ_n + xJ_{n+1} + (n^2 - x^2) J_n$$

$$\Rightarrow x^2 J''_n = (n^2 - n - x^2) J_n + xJ_{n+1} \quad \text{Proved.}$$

**Example 18.** Show that  $J''_1(x) = -J_1(x) + \frac{1}{x}J_2(x)$  (U.P. II Semester 2010)

**Solution.** From example 17, we know that:

$$x^2 J''_n(x) = (n^2 - n - x^2) J_n(x) + xJ_{n+1}(x), \quad \dots (1)$$

Putting  $n = 1$ , we get

$$x^2 J''_1(x) = (1^2 - 1 - x^2) J_1(x) + xJ_{1+1}(x)$$

$$\Rightarrow x^2 J''_1(x) = -x^2 J_1(x) + xJ_2(x)$$

$$\Rightarrow J''_1 = -J_1 + \frac{1}{x}J_2 \quad \text{Proved.}$$

**Example 19.** Prove that following

$$J_3(x) + 3J'_0(x) + 4J''_0(x) = 0$$

(U.P. III Semester, Winter 2001, A.M.I.E.T.E., Summer 2000)

**Solution.** We know that

$$2J'_n = J_{n-1} - J_{n+1} \quad (\text{Recurrence relation II})$$

Differentiating and multiplying by 2, we get

$$\begin{aligned} 2^2 J''_n &= 2J'_{n-1} - 2J'_{n+1} = (J_{n-2} - J_n) - (J_n - J_{n+2}) \\ &= J_{n-2} - 2J_n + J_{n+2} \end{aligned}$$

Differentiating again and multiplying by 2, we get

$$\begin{aligned} 2^3 J'''_n &= 2J'_{n-2} - 4J'_n + 2J'_{n+2} \\ &= (J_{n-3} - J_{n-1}) - 2(J_{n-1} - J_{n+1}) + (J_{n+1} - J_{n+3}) \\ &= J_{n-3} - 3J_{n-1} + 3J_{n+1} - J_{n+3} \end{aligned}$$

Putting  $n = 0$ , we get

$$\begin{aligned} 2^3 \cdot J_0''' &= J_{-3} - 3J_{-1} + 3J_1 - J_3 = (-1)^3 J_3 - 3(-1)J_1 + 3J_1 - J_3 \\ &= -2J_3 + 6J_1 \\ 4J_0''' &= -J_3 + 3J_1 \\ &= -J_3 + 3(-J'_0) \quad [\text{From example 11, } J_1 = -J'_0] \\ J_3 + 3J'_0 + 4J_0''' &= 0 \end{aligned}$$

$$\Rightarrow J_3(x) + 3J'_0(x) + 4J_0'''(x) = 0 \quad \text{Proved.}$$

**Example 20.** Prove that  $\frac{d}{dx}(x J_n J_{n+1}) = x(J_n^2 - J_{n+1}^2)$

$$\begin{aligned} \text{Solution.} \quad \frac{d}{dx}(x J_n J_{n+1}) &= J_n J_{n+1} + x \frac{d}{dx}(J_n J_{n+1}) \\ &= J_n J_{n+1} + x(J_n J'_{n+1} + J'_n J_{n+1}) \\ &= J_n J_{n+1} + (x J'_n) J_{n+1} + J_n (x J'_{n+1}) \quad \dots (1) \end{aligned}$$

$$\text{Recurrence formula I, } x J'_n = n J_n - x J_{n+1} \quad \dots (2)$$

$$\text{Recurrence formula II, } x J'_n = -n J_n + x J_{n-1}$$

$$\text{Putting } n+1 \text{ for } n, x J'_{n+1} = -(n+1) J_{n+1} + x J_n \quad \dots (3)$$

Putting the values of  $x J'_n$  and  $x J'_{n+1}$  from (2) and (3) in (1), we obtain

$$\begin{aligned} \frac{d}{dx}(x J_n J_{n+1}) &= J_n J_{n+1} + (n J_n - x J_{n+1}) J_{n+1} + J_n [-(n+1) J_{n+1} + x J_n] \\ &= (1+n-n-1) J_n \cdot J_{n+1} + x(J_n^2 - J_{n+1}^2) \\ &= x(J_n^2 - J_{n+1}^2) \quad \text{Proved.} \end{aligned}$$

**Example 21.** Prove that

$$\int J_3(x) dx + J_2(x) + \frac{2}{x} J_1(x) = 0 \quad (\text{A.M.I.E.T.E., Summer 2000})$$

**Solution.** We know that

$$\frac{d}{dx}[x^{-n} J_n(x)] = -x^{-n} J_{n+1}(x) \quad (\text{Recurrence Relation V})$$

Integrating above relation, we get

$$x^{-n} J_n(x) = - \int x^{-n} J_{n+1}(x) dx \quad \dots (1)$$

On taking  $n = 2$  in (1), we have

$$\int x^{-2} J_3(x) dx = -x^{-2} J_2(x) \quad \dots (2)$$

$$\begin{aligned} \text{Again} \quad \int J_3(x) dx &= \int x^2 (x^{-2}) J_3(x) dx \\ &= x^2 \int (x^{-2}) J_3(x) dx - \int \left( 2x \int (x^{-2}) J_3(x) dx \right) dx \quad \dots (3) \end{aligned}$$

Putting the value of  $\int x^{-2} J_3(x) dx$  from (2) in (3), we get

$$\begin{aligned} \int J_3(x) dx &= x^2 (-x^{-2} J_2(x)) - \int 2x (-x^{-2} J_2(x)) dx \\ &= -J_2(x) + 2 \int x^{-1} J_2(x) dx = -J_2(x) + 2(-x^{-1} J_1(x)) \end{aligned}$$

On using (1), again, when  $n = 1$

$$\text{Hence,} \quad \int J_3(x) dx + J_2(x) + \frac{2}{x} J_1(x) = 0 \quad \text{Proved.}$$

**Example 22.** Show that  $\int_0^x x^{n+1} J_n(x) dx = x^{n+1} J_{n+1}(x)$   $(n > -1)$

**Solution.** Recurrence relation VI is  $\frac{d}{dx}[x^n J_n(x)] = x^n J_{n-1}(x)$

Putting  $n + 1$  for  $n$ , we get  $\frac{d}{dx}[x^{n+1} J_{n+1}(x)] = x^{n+1} J_n(x)$

Integrating both sides w.r.t.  $x$  between 0 and  $x$ , we get

$$x^{n+1} J_{n+1}(x) = \int_0^x x^{n+1} J_n(x) dx .$$

**Proved.**

**Example 23.** Prove that

$$2^r \cdot J_n^r = J_{n-r} - r J_{n-r+2} + \frac{r(r-1)}{2!} J_{n-r+4} + \dots + (-1)^r J_{n+r}$$

**Solution.** We know that

$$2 J'_n = J_{n-1} - J_{n+1} \quad (\text{Recurrence formula III})$$

Differentiating, we get

$$\begin{aligned} 2 J''_n &= J'_{n-1} - J'_{n+1} & \Rightarrow & 4 J''_n = 2 J'_{n-1} - 2 J'_{n+1} \\ \Rightarrow 2^2 J''_n &= (J_{n-2} - J_n) - (J_n - J_{n+2}) \\ 2^2 \cdot J''_n &= J_{n-2} - 2 J_n + J_{n+2} \end{aligned}$$

Again differentiating and multiplying by 2, we get

$$\begin{aligned} 2^3 J'''_n &= 2 J'_{n-2} - 2^2 J'_n + 2 J'_{n+2} \\ &= [J_{n-3} - J_{n-1}] - 2(J_{n-1} - \dots J_{n+1}) + (J_{n+1} - J_{n+3}) \\ &= J_{n-3} - 3 J_{n-1} + 3 J_{n+1} - \dots J_{n+3} \end{aligned}$$

And so on

$$2^r J_n^r = J_{n-r} - r J_{n-r+2} + \dots + (-1)^r J_{n+r}$$

**Example 24.** Show that

$$\frac{x}{2} J_{n-1} = n J_n - (n+2) J_{n+2} + (n+4) J_{n+4} + \dots$$

**Solution.** We know that

$$2 n J_n = x[J_{n+1} + J_{n-1}] \quad (\text{Recurrence Relation IV})$$

$$\begin{aligned} \Rightarrow n J_n &= \frac{x}{2} [J_{n+1} + J_{n-1}] \\ \Rightarrow \frac{x}{2} J_{n-1} &= n J_n - \frac{x}{2} J_{n+1} \quad \dots (1) \end{aligned}$$

$$\text{Replacing } n \text{ by } n+2, \text{ we get } \frac{x}{2} J_{n+1} = (n+2) J_{n+2} - \frac{x}{2} J_{n+3} \quad \dots (2)$$

On putting the value of  $\frac{x}{2} J_{n+1}$  from (2) in (1), we get

$$\frac{x}{2} J_{n-1} = n J_n - \left[ (n+2) J_{n+2} - \frac{x}{2} J_{n+3} \right] = n J_n - (n+2) J_{n+2} + \frac{x}{2} J_{n+3}$$

On putting the value of  $\frac{x}{2} J_{n+3}$ , we get

$$= n J_n - (n+2) J_{n+2} + (n+4) J_{n+4} - \frac{x}{2} J_{n+5} \text{ and so on}$$

$$= n J_n - (n+2) J_{n+2} + (n+4) J_{n+4} - (n+6) J_{n+6} + \dots$$

**Example 25.** Prove that

$$J'_n = \frac{2}{x} \left[ \frac{n}{2} J_n - (n+2) J_{n+2} + (n+4) J_{n+4} - \dots \right]$$

**Solution.** From Recurrence formula (2), we have

$$J'_n = -\frac{n}{x} J_n + J_{n-1}$$

From example 24, Page 886, putting value of  $J_{n-1}$ , we get

$$\begin{aligned} &= -\frac{n}{x} J_n + \frac{2}{x} [n J_n - (n+2) J_{n+2} + \dots] \\ &= \frac{2}{x} \left[ \frac{n}{2} J_n - (n+2) J_{n+2} + \dots \right] \end{aligned}$$

**Proved.**

**Example 26.** Prove that

$$\frac{d}{dx} \left[ \frac{J_{-n}(x)}{J_n(x)} \right] = \frac{-2 \sin n\pi}{\pi x J_n^2}$$

**Solution.**  $x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2) y = 0$  (Bessel's Equation)

$$\frac{d^2 y}{dx^2} + \frac{1}{x} \frac{dy}{dx} + \left(1 - \frac{n^2}{x^2}\right) y = 0 \quad \text{(Dividing by } x^2\text{)}$$

As  $J_n$  and  $J_{-n}$  are the solutions of the above equation, so

$$\Rightarrow J''_n + \frac{1}{x} J'_n + \left(1 - \frac{n^2}{x^2}\right) J_n = 0 \quad \dots (1)$$

$$\Rightarrow J''_{-n} + \frac{1}{x} J'_{-n} + \left(1 - \frac{n^2}{x^2}\right) J_{-n} = 0 \quad \dots (2)$$

On multiplying (1) by  $J_{-n}$  and (2) by  $J_n$ , we get

$$J''_n J_{-n} + \frac{1}{x} J'_n J_{-n} + \left(1 - \frac{n^2}{x^2}\right) J_n J_{-n} = 0 \quad \dots (3)$$

$$J''_{-n} J_n + \frac{1}{x} J'_{-n} J_n + \left(1 - \frac{n^2}{x^2}\right) J_{-n} J_n = 0 \quad (n \rightarrow -n) \quad \dots (4)$$

On subtracting (4) from (3), we get

$$\begin{aligned} &J''_n J_{-n} - J''_{-n} J_n + \frac{1}{x} (J'_n J_{-n} - J'_{-n} J_n) = 0 \\ \Rightarrow &\frac{J''_n J_{-n} - J''_{-n} J_n}{J'_n J_{-n} - J'_{-n} J_n} = -\frac{1}{x} \end{aligned}$$

On integrating, we get

$$\log (J'_n J_{-n} - J'_{-n} J_n) = -\log x + \log C = \log \frac{C}{x} \quad \dots (5)$$

Therefore,  $J_{-n} J'_n - J_n J'_{-n} = \frac{C}{x}$  ... (5)

Using definition of  $J_n$  and  $J_{-n}$ , (5) becomes

$$\frac{1}{2^{-n}(-n+1)} \left[ x^{-n} - \frac{x^{-n+2}}{2 \cdot (-2n+2)} + \frac{x^{-n+4}}{2 \cdot 4 \cdot (-2n+2)(-2n+4)} - \dots \right]$$

$$\begin{aligned} & \times \frac{1}{2^n |(n+1)|} \left[ nx^{n-1} - \frac{(n+2)x^{n+1}}{2 \cdot (2n+2)} + \frac{(n+4)x^{n+3}}{2 \cdot 4 \cdot (2n+2)(2n+4)} - \dots \right] \\ & - \frac{1}{2^n |(n+1)|} \left[ x^n - \frac{x^{n+2}}{2 \cdot (2n+2)} + \frac{x^{n+4}}{2 \cdot 4 \cdot (2n+2)(2n+4)} - \dots \right] \\ & \times \frac{1}{2^{-n} |(-n+1)|} \left[ -nx^{-n-1} - \frac{(-n+2)x^{-n+1}}{2 \cdot (-2n+2)} + \frac{(-n+4)x^{-n+3}}{2 \cdot 4 \cdot (-2n+2)(-2n+4)} \right] = \frac{C}{x} \end{aligned}$$

Now comparing the coefficients of  $1/x$  on both sides, we get

$$\begin{aligned} & \frac{n}{|n+1|} \frac{-n}{|-n+1|} = C \\ & \frac{1}{|(-n+1)|} [n - (-n)] = C \\ \Rightarrow & C = \frac{2 \sin n\pi}{\pi} \quad \left[ \text{Since } |(n)| |(1-n)| = \frac{\pi}{\sin n\pi} \right] \end{aligned}$$

Substituting the value of  $C$  in (5), we get

$$\begin{aligned} & J'_n \cdot J_{-n} - J'_{-n} J_n = \frac{2 \sin n\pi}{\pi x} \\ \Rightarrow & \frac{J'_n J_{-n} - J'_{-n} J_n}{J_n^2} = \frac{2 \sin n\pi}{\pi x J_n^2} \\ \Rightarrow & \frac{d}{dx} \left( \frac{J_{-n}(x)}{J_n(x)} \right) = \frac{-2 \sin n\pi}{\pi x J_n^2} \quad \text{Proved.} \end{aligned}$$

### 33.6 EQUATIONS REDUCIBLE TO BESSEL'S EQUATION

There are some differential equations which can be reduced to Bessel's equation and therefore, can be solved.

(a) We shall reduce the following differential equation to Bessel's equation.

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (k^2 x^2 - n^2) y = 0 \quad \dots (1)$$

$$\begin{aligned} \text{Put } t = kx, \quad & \frac{dt}{dx} = k, \quad \frac{dy}{dx} = \frac{dy}{dt} \frac{dt}{dx} = k \frac{dy}{dt} \\ & \frac{d^2 y}{dx^2} = \frac{d}{dx} \left( k \frac{dy}{dt} \right) = \frac{d}{dt} \left( k \frac{dy}{dt} \right) \frac{dt}{dx} = k^2 \frac{d^2 y}{dt^2} \end{aligned}$$

Thus (1) becomes

$$\left( \frac{t^2}{k^2} \right) \left( k^2 \frac{d^2 y}{dt^2} \right) + \left( \frac{t}{k} \right) \left( k \frac{dy}{dt} \right) + (t^2 - n^2) y = 0 \quad \Rightarrow \quad t^2 \frac{d^2 y}{dt^2} + t \frac{dy}{dt} + (t^2 - n^2) y = 0$$

$\therefore$  Its solution is  $y = c_1 J_n(t) + c_2 J_{-n}(t)$ ,

Hence solution of (1) is  $y = c_1 J_n(kx) + c_2 J_{-n}(kx)$ .

Ans.

(b) Let us reduce the following differential equation to Bessel's equation.

$$x \frac{d^2 y}{dx^2} + a \frac{dy}{dx} + k^2 x y = 0 \quad \dots (2)$$

$$\text{Put } y = x^n z, \quad \frac{dy}{dx} = x^n \frac{dz}{dx} + n x^{n-1} z$$

$$\begin{aligned}\frac{d^2y}{dx^2} &= x^n \frac{d^2y}{dx^2} + n x^{n-1} \frac{dy}{dx} + n x^{n-1} \frac{dz}{dx} + n(n-1) x^{n-2} z \\ &= x^n \frac{d^2y}{dx^2} + 2 n x^{n-1} \frac{dy}{dx} + n(n-1) x^{n-2} z.\end{aligned}$$

Then (2) becomes

$$\begin{aligned}x \left[ x^n \frac{d^2z}{dx^2} + 2 n x^{n-1} \frac{dz}{dx} + n(n-1) x^{n-2} z \right] + a \left[ x^n \frac{dz}{dx} + n x^{n-1} z \right] + k^2 x x^n z &= 0 \\ \Rightarrow x^{n+1} \frac{d^2z}{dx^2} + (2n+a)x^n \frac{dz}{dx} + [k^2 x^2 + n^2 + (a-1)n] x^{n-1} z &= 0 \quad \dots (3)\end{aligned}$$

Dividing (3) by  $x^{n-1}$ , we get

$$x^2 \frac{d^2z}{dx^2} + (2n+a)x \frac{dz}{dx} + [k^2 x^2 + n^2 + (a-1)n] z = 0$$

$$\text{Let us put } 2n + a = 1, \text{ then } x^2 \frac{d^2z}{dx^2} + x \frac{dz}{dx} + (k^2 x^2 - n^2) z = 0$$

Its solution is  $z = c_1 J_n(kx) + c_2 J_{-n}(kx)$

Hence, the solution of (2) is  $y = x^n [c_1 J_n(kx) + c_2 J_{-n}(kx)]$ ,  $n \neq 1$

**Ans.**

$$\text{where } n = \frac{1-a}{2}$$

(c) To reduce the following differential equation to Bessel's equation.

$$x \frac{d^2y}{dx^2} + c \frac{dy}{dx} + k^2 x^r y = 0 \quad \dots (4)$$

Put

$$x = t^m, \quad t = x^{1/m}$$

$$\text{So that } \frac{dy}{dx} = \frac{dy}{dt} \frac{dt}{dx} = \frac{dy}{dt} \left( \frac{1}{m} x^{m-1} \right) = \frac{dy}{dt} \left( \frac{1}{m} t^{1-m} \right)$$

$$\begin{aligned}\frac{d^2y}{dx^2} &= \frac{d}{dx} \left( \frac{1}{m} t^{1-m} \frac{dy}{dt} \right) = \frac{d}{dt} \left( \frac{1}{m} t^{1-m} \frac{dy}{dt} \right) \frac{dt}{dx} \\ &= \left( \frac{1}{m} t^{1-m} \frac{d^2y}{dt^2} + \frac{1}{m} (1-m) t^{-m} \frac{dy}{dt} \right) \frac{1}{m} t^{1-m-1} = \frac{1}{m^2} t^{2-2m} \frac{d^2y}{dt^2} + \frac{1-m}{m^2} t^{1-2m} \frac{dy}{dt}\end{aligned}$$

Now, (4) becomes.

$$\begin{aligned}t^m \left[ \frac{1}{m^2} t^{2-2m} \frac{d^2y}{dt^2} + \frac{1-m}{m^2} t^{1-2m} \frac{dy}{dt} \right] + c \frac{1}{m} t^{1-m} \frac{dy}{dt} + k^2 t^{mr} y &= 0 \\ \Rightarrow \frac{1}{m^2} t^{2-m} \frac{d^2y}{dt^2} + \frac{1-m+cm}{m^2} t^{1-m} \frac{dy}{dt} + k^2 t^{mr} y &= 0\end{aligned}$$

On multiplying by  $\frac{m^2}{t^{1-m}}$ , we get

$$t \frac{d^2y}{dt^2} + (1-m+cm) \frac{dy}{dt} + (km)^2 t^{mr+m-1} y = 0 \quad \dots (5)$$

$$\text{Let us put } a = 1-m+cm \text{ and } m = \frac{1}{r+1} \Rightarrow mr+m-1 = \frac{r}{r+1} + \frac{1}{r+1} - 1 = 0$$

$$\text{Thus (5) becomes } t \frac{d^2y}{dt^2} + a \frac{dy}{dt} + (km)^2 y = 0$$

Its solution is  $y = t^n [c_1 J_n(kmt) + c_2 J_{-n}(kmt)]$

Solution of (4) is  $y = x^{n/m} [c_1 J_n(km x^{1/m}) + c_2 J_{-n}(km x^{1/m})]$

**Ans.**

### 33.7 ORTHOGONALITY OF BESSLE FUNCTION

(AMIETE, June 2009)

$$\int_0^1 x J_n(\alpha x) J_n(\beta x) dx = 0$$

where  $\alpha$  and  $\beta$  are the roots of  $J_n(x) = 0$ .

**Proof.** We know that

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (\alpha^2 x^2 - n^2) y = 0 \quad \dots (1)$$

$$\Rightarrow x^2 \frac{d^2 z}{dx^2} + x \frac{dz}{dx} + (\beta^2 x^2 - n^2) z = 0 \quad \dots (2)$$

Solution of (1) and (2) are  $y = J_n(\alpha x)$ ,  $z = J_n(\beta x)$  respectively.

Multiplying (1) by  $\frac{z}{x}$  and (2) by  $-\frac{y}{x}$  and adding, we get

$$\begin{aligned} & x \left( z \frac{d^2 y}{dx^2} - y \frac{d^2 z}{dx^2} \right) + \left( z \frac{dy}{dx} - y \frac{dz}{dx} \right) + (\alpha^2 - \beta^2) xyz = 0. \\ \Rightarrow & \frac{d}{dx} \left[ x \left( z \frac{dy}{dx} - y \frac{dz}{dx} \right) \right] + (\alpha^2 - \beta^2) xyz = 0 \end{aligned} \quad \dots (3)$$

Integrating (3) w.r.t. 'x' between the limits 0 and 1, we get

$$\begin{aligned} & \left[ x \left( z \frac{dy}{dx} - y \frac{dz}{dx} \right) \right]_0^1 + (\alpha^2 - \beta^2) \int_0^1 xyz dx = 0 \\ \Rightarrow & (\beta^2 - \alpha^2) \int_0^1 xyz dx = \left[ x \left( z \frac{dy}{dx} - y \frac{dz}{dx} \right) \right]_0^1 = \left[ z \frac{dy}{dx} - y \frac{dz}{dx} \right]_{x=1} \end{aligned} \quad \dots (4)$$

Putting the values of  $y = J_n(\alpha x)$ ,  $\frac{dy}{dx} = \alpha J'_n(\alpha x)$ ,  $z = J_n(\beta x)$ ,  $\frac{dz}{dx} = \beta J'_n(\beta x)$  in (4), we get

$$\begin{aligned} & (\beta^2 - \alpha^2) \int_0^1 x J_n(\alpha x) J_n(\beta x) dx = [\alpha J'_n(\alpha x) J_n(\beta x) - \beta J'_n(\beta x) J_n(\alpha x)]_{x=1} \\ & = \alpha J'_n(\alpha) J_n(\beta) - \beta J'_n(\beta) J_n(\alpha) \end{aligned} \quad \dots (5)$$

Since  $\alpha, \beta$  are the roots of  $J_n(x) = 0$ , so  $J_n(\alpha) = J_n(\beta) = 0$ .

Putting the values of  $J_n(\alpha) = J_n(\beta) = 0$  in (5), we get

$$\begin{aligned} & (\beta^2 - \alpha^2) \int_0^1 x J_n(\alpha x) J_n(\beta x) dx = 0 \\ \Rightarrow & \boxed{\int_0^1 x J_n(\alpha x) J_n(\beta x) dx = 0} \end{aligned}$$

**Proved.**

**Example 27.** Prove that

$$\int_0^1 x [J_n(\alpha x)]^2 dx = \frac{1}{2} [J'_n(\alpha)]^2.$$

**Solution.** From (5) of article 33.7, we know that

$$(\beta^2 - \alpha^2) \int_0^1 x J_n(\alpha x) J_n(\beta x) dx = \alpha J'_n(\alpha) J_n(\beta) - \beta J'_n(\beta) J_n(\alpha)$$

when  $\beta = \alpha$

We also know that  $J_n(\alpha) = 0$ . Let  $\beta$  be a neighbouring value of  $\alpha$ , which tends to  $\alpha$ .

Then

$$\lim_{\beta \rightarrow \alpha} \int_0^1 x J_n(\alpha x) J_n(\beta x) dx = \lim_{\beta \rightarrow \alpha} \frac{0 + \alpha J'_n(\alpha) J_n(\beta)}{\beta^2 - \alpha^2}$$

As the limit is of the form  $\frac{0}{0}$ , we apply L' Hopital's rule

$$\int_0^1 x J_n^2(\alpha x) dx = \lim_{\beta \rightarrow \alpha} \frac{0 + \alpha J'_n(\alpha) J'_n(\beta)}{2\beta} = \frac{1}{2} [J'_n(\alpha)]^2 \quad [\because \alpha = \beta] \quad \text{Proved.}$$

### 33.8 A GENERATING FUNCTION FOR $J_n(x)$

Prove that  $J_n(x)$  is the coefficient of  $z^n$  in the expansion of  $e^{\frac{x}{2}(z-\frac{1}{z})}$ .

**Proof.** We know that  $e^t = 1 + t + \frac{t^2}{2!} + \frac{t^3}{3!} + \dots$

$$e^{\frac{xz}{2}} = 1 + \left( \frac{xz}{2} \right) + \frac{1}{2!} \left( \frac{xz}{2} \right)^2 + \frac{1}{3!} \left( \frac{xz}{2} \right)^3 + \dots \quad \dots (1)$$

$$e^{-\frac{x}{2z}} = 1 - \left( \frac{x}{2z} \right) + \frac{1}{2!} \left( \frac{x}{2z} \right)^2 - \frac{1}{3!} \left( \frac{x}{2z} \right)^3 + \dots \quad \dots (2)$$

On multiplying (1) and (2), we get

$$e^{\frac{x}{2}(z-\frac{1}{z})} = \left[ 1 + \left( \frac{xz}{2} \right) + \frac{1}{2!} \left( \frac{xz}{2} \right)^2 + \frac{1}{3!} \left( \frac{xz}{2} \right)^3 + \dots \right] \times \left[ 1 - \frac{x}{2z} + \frac{1}{2!} \left( \frac{x}{2z} \right)^2 - \frac{1}{3!} \left( \frac{x}{2z} \right)^3 + \dots \right] \quad \dots (3)$$

The coefficient of  $z^n$  in the product of (3), we get

$$= \frac{1}{n!} \left( \frac{x}{2} \right)^n - \frac{1}{(n+1)!} \left( \frac{x}{2} \right)^{n+2} + \frac{1}{2!(n+2)!} \left( \frac{x}{2} \right)^{n+4} - \dots = J_n(x)$$

Similarly, coefficient of  $z^{-n}$  in the product of (3) =  $J_{-n}(x)$

$$\therefore e^{\frac{x}{2}(z-\frac{1}{z})} = J_0 + z J_1 + z^2 J_2 + z^3 J_3 + \dots + z^{-1} J_{-1} + z^{-2} J_{-2} + z^{-3} J_{-3} + \dots$$

$$\boxed{e^{\frac{x}{2}(z-\frac{1}{z})} = \sum_{n=-\infty}^{\infty} z^n J_n(x)}$$

For this reason  $e^{\frac{x}{2}(z-\frac{1}{z})}$  is known as the generating function of Bessel's functions. **Proved.**

**Cor.** In the expansion of (3), coefficient of  $z^0$

$$= 1 - \frac{x^2}{2^2} + \frac{x^4}{2^2 \cdot 4^2} - \dots \text{ or } J_0 = 1 - \frac{x^2}{2^2} + \frac{x^4}{2^2 \cdot 4^2} - \dots$$

### 33.9 TRIGONOMETRIC EXPANSION INVOLVING BESSSEL FUNCTIONS

We know that

$$e^{\frac{x}{2}(z-\frac{1}{z})} = J_0 + z J_1 + z^2 J_2 + z^3 J_3 + \dots + z^{-1} J_{-1} + z^{-2} J_{-2} + z^{-3} J_{-3} + \dots \quad \dots (1)$$

Putting  $z = e^{i\theta}$  in (1), we get

$$e^{\frac{x}{2}(e^{i\theta}-e^{-i\theta})} = J_0 + J_1 e^{i\theta} + J_2 e^{2i\theta} + J_3 e^{3i\theta} + \dots + J_{-1} e^{-i\theta} + J_{-2} e^{-2i\theta} + J_{-3} e^{-3i\theta} + \dots$$

$\left( \text{since } \frac{e^{i\theta} - e^{-i\theta}}{2i} = \sin \theta \right)$

$$\begin{aligned}
 e^{ix\sin\theta} &= J_0 + J_1 e^{i\theta} + J_2 e^{2i\theta} + J_3 e^{3i\theta} + \dots - J_1 e^{-i\theta} + J_2 e^{-2i\theta} - J_3 e^{-3i\theta} - \dots \\
 &\quad (\text{since } J_{-n} = (-1)^n J_n) \\
 \Rightarrow \cos(x\sin\theta) + i\sin(x\sin\theta) &= J_0 + J_1 (e^{i\theta} - e^{-i\theta}) + J_2 (e^{2i\theta} + e^{-2i\theta}) + J_3 (e^{3i\theta} - e^{-3i\theta}) + \dots \\
 \Rightarrow \cos(x\sin\theta) + i\sin(x\sin\theta) &= J_0 + J_1 (2i\sin\theta) + J_2 (2\cos 2\theta) + J_3 (2i\sin 3\theta) + \dots
 \end{aligned}$$

Now equating real and imaginary parts, we get

$$\cos(x\sin\theta) = J_0 + 2J_2 \cos 2\theta + 2J_4 \cos 4\theta + \dots \quad \dots (2)$$

$$\sin(x\sin\theta) = 2J_1 \sin\theta + 2J_3 \sin 3\theta + 2J_5 \sin 5\theta + \dots \quad \dots (3)$$

On putting  $\theta = \frac{\pi}{2} - \alpha$  in (2) and (3), we get

$$\cos(x\cos\alpha) = J_0 - 2J_2 \cos 2\alpha + 2J_4 \cos 4\alpha - \dots$$

$$\sin(x\cos\alpha) = 2J_1 \cos\alpha + 2J_3 \cos 3\alpha + 2J_5 \cos 5\alpha - \dots$$

**Example 28.** Prove that

$$\cos x = J_0 - 2J_2 + 2J_4 - \dots$$

$$\sin x = 2J_1 - 2J_3 + 2J_5 + \dots$$

**Solution.** We know that

$$\cos(x\sin\theta) = J_0 + 2J_2 \cos 2\theta + 2J_4 \cos 4\theta + \dots \quad \dots (1)$$

$$\sin(x\sin\theta) = 2J_1 \sin\theta + 2J_3 \sin 3\theta + 2J_5 \sin 5\theta + \dots \quad \dots (2)$$

Putting  $\theta = \frac{\pi}{2}$  in (1) and (2), we get

$$\cos x = J_0 - 2J_2 + 2J_4 - \dots$$

$$\text{and } \sin x = 2J_1 - 2J_3 + 2J_5 - \dots$$

**Proved.**

**Example 29.** Prove that

$$x\sin x = 2[2^2 J_2 - 4^2 J_4 + 6^2 J_6 - \dots]$$

$$x\cos x = 2[1^2 J_1 - 3^2 J_3 + 5^2 J_5 + \dots]$$

**Solution.** We know that

$$\cos(x\sin\theta) = J_0 + 2J_2 \cos 2\theta + 2J_4 \cos 4\theta + \dots \quad \dots (1)$$

$$\text{and } \sin(x\sin\theta) = 2J_1 \sin\theta + 2J_3 \sin 3\theta + 2J_5 \sin 5\theta + \dots \quad \dots (2)$$

Differentiating (1) w.r.t. " $\theta$ ", we get

$$[-\sin(x\sin\theta)]x\cos\theta = 0 - 4J_2 \sin 2\theta - 8J_4 \sin 4\theta + \dots \quad \dots (3)$$

Again differentiating (3) w.r.t., " $\theta$ ", we get

$$\begin{aligned}
 [-\sin(x\sin\theta)][-\cos(x\sin\theta)]x\cos\theta \\
 = -8J_2 \cos 2\theta - 32J_4 \cos 4\theta + \dots \quad \dots (4)
 \end{aligned}$$

Now putting  $\theta = \frac{\pi}{2}$  in (4), we get

$$x\sin x = 8J_2 - 32J_4 + \dots = 2[2^2 J_2 - 4^2 J_4 + 6^2 J_6 - \dots]$$

Similarly differentiating (2) twice and putting  $\theta = \frac{\pi}{2}$ , we have

$$x\cos x = 2[1^2 J_1 - 3^2 J_3 + 5^2 J_5 - \dots] \quad \text{Proved.}$$

**Example 30.** Prove that  $J_0^2 + 2J_1^2 + 2J_2^2 + \dots = 1$

**Solution.** 
$$(J_0 + 2J_2 \cos 2\theta + 2J_4 \cos 4\theta + \dots) = \cos(x \sin \theta) \quad [\text{From (33.9)}] \quad \dots (1)$$

$$2J_1 \sin \theta + 2J_3 \sin 3\theta + 2J_5 \sin 5\theta + \dots = \sin(x \sin \theta) \quad \dots (2)$$

Now squaring (1) and integrating w.r.t. ' $\theta$ ' between the limits 0 and  $\pi$ , we get

$$J_0^2 \pi + 2J_2^2 \pi + 2J_4^2 \pi + \dots = \int_0^\pi \cos^2(x \sin \theta) d\theta \quad \dots (3)$$

Also squaring (2) and integrating w.r.t. " $\theta$ " between the limits 0 and  $\pi$ , we get

$$2J_1^2 \pi + 2J_3^2 \pi + 2J_5^2 \pi + \dots = \int_0^\pi \sin^2(x \sin \theta) d\theta \quad \dots (4)$$

Adding (3) and (4), we get

$$\pi[J_0^2 + 2J_1^2 + 2J_2^2 + 2J_3^2 + \dots] = \int_0^\pi \cos^2(x \sin \theta) d\theta + \int_0^\pi \sin^2(x \sin \theta) d\theta = \int_0^\pi d\theta = \pi$$

$$\Rightarrow J_0^2 + 2J_1^2 + 2J_2^2 + 2J_3^2 + \dots = 1 \quad \text{Proved.}$$

### 33.10 BESSEL'S INTEGRAL

To prove that

$$(a) J_0(x) = \frac{1}{\pi} \int_0^\pi \cos(x \sin \theta) d\theta \quad (b) J_n(x) = \frac{1}{\pi} \int_0^\pi \cos(n\theta - x \sin \theta) d\theta$$

**Proof.** We know that

$$\cos(x \sin \theta) = J_0 + 2J_2 \cos 2\theta + 2J_4 \cos 4\theta + \dots \quad \dots (1)$$

$$\sin(x \sin \theta) = 2J_1 \sin \theta + 2J_3 \sin 3\theta + 2J_5 \sin 5\theta + \dots \quad \dots (2)$$

(a) Integrating (1) between the limits 0 and  $\pi$ , we have

$$\begin{aligned} \int_0^\pi \cos(x \sin \theta) d\theta &= \int_0^\pi (J_0 + 2J_2 \cos 2\theta + 2J_4 \cos 4\theta + \dots) d\theta \\ &= J_0 \int_0^\pi d\theta + 2J_2 \int_0^\pi \cos 2\theta d\theta + 2J_4 \int_0^\pi \cos 4\theta d\theta + \dots \\ &= J_0 \pi + 0 + 0 \end{aligned}$$

$$\text{i.e. } J_0 = \frac{1}{\pi} \int_0^\pi \cos(x \sin \theta) d\theta \quad \text{Proved.}$$

(b) Multiplying (1) by  $\cos n\theta$  and integrating between the limits 0 and  $\pi$ , we have

$$\begin{aligned} \int_0^\pi \cos(x \sin \theta) \cos n\theta d\theta &= \int_0^\pi [J_0 \cos n\theta + 2J_2 \cos 2\theta \cos n\theta + 2J_4 \cos 4\theta \cos n\theta + \dots] d\theta \\ &= J_0 \int_0^\pi \cos n\theta d\theta + 2J_2 \int_0^\pi \cos 2\theta \cos n\theta d\theta + \dots \\ &= 0, \quad \text{if } n \text{ is odd} \quad \dots (3) \\ &= \pi J_n, \quad \text{if } n \text{ is even} \quad \dots (4) \end{aligned}$$

Again multiplying (2) by  $\sin n\theta$  and integrating between the limits 0 and  $\pi$ , we have

$$\begin{aligned} \int_0^\pi \sin(x \sin \theta) \sin n\theta d\theta &= \int_0^\pi (2J_1 \sin \theta \sin n\theta + 2J_3 \sin 3\theta \sin n\theta + \dots) d\theta \\ &= 2J_1 \int_0^\pi \sin \theta \sin n\theta d\theta + 2J_3 \int_0^\pi \sin 3\theta \sin n\theta d\theta + \dots \\ &= 0 \quad \text{if } n \text{ is even} \quad \dots (5) \\ &= \pi J_n \quad \text{if } n \text{ is odd} \quad \dots (6) \end{aligned}$$

Adding (3) and (6) or (4) and (5), we get

$$\int_0^{\pi} [\cos(x \sin \theta) \cos n\theta + \sin(x \sin \theta) \sin n\theta] d\theta = \pi J_n$$

$\Rightarrow \int_0^{\pi} \cos(n\theta - x \sin \theta) d\theta = \pi J_n \text{ or } J_n = \frac{1}{\pi} \int_0^{\pi} \cos(n\theta - x \sin \theta) d\theta \quad \text{Proved.}$

## **EXERCISE 33.1**

**Prove that**

1.  $J_1(x) = \frac{x}{2} - \frac{x^3}{2^3 \cdot 1! \cdot 2!} + \frac{x^5}{2^5 \cdot 2! \cdot 3!} - \frac{x^7}{2^7 \cdot 3! \cdot 4!} + \dots$
  2. (a)  $J_0(2) = 0.224$       (b)  $J_1 = 0.44.$
  3.  $J_2 = J_0'' - x^{-1}J_0'$
  4.  $\frac{d}{dx}[xJ_1(x)] = xJ_0(x)$
  5.  $\frac{d}{dx}[J_n^2(x) + J_{n+1}^2(x)] = 2\left(\frac{n}{x}J_n^2(x) - \frac{n+1}{x}J_{n+1}^2(x)\right)$
  6.  $\int_0^\pi x^{n+1}J_n(x)dx = x^{n+1}(x), \quad n > -1$
  7.  $x^2J_n''(x) = (n^2 - n - x^2)J_n(x) + xJ_{n+1}(x) \quad (A.M.I.E.T.E., \text{ Summer 2001})$
  8.  $\int x^2J_0J_1dx = \frac{1}{2}x^2J_0' + c$
  9.  $J_{3/2}(x)\sin x - J_{-3/2}(x)\cos(x) = \frac{\sqrt{2}\pi}{x^3}$
  10.  $J_1'' = \left(\frac{2}{x^2} - 1\right)J_1(x) - \frac{1}{x}J_0(x)$
  11.  $J_0^2 + 2(J_1^2 + J_2^2 + J_3^2 + \dots) = 1$
  12. If  $J_0(2) = a, J_1(2) = b$  find  $J_2(2), J_1'(2), J_2'(2)$   
in terms of  $a$  and  $b$  where  $J_n(x)$  is the Bessel function of first kind.

$$\text{Ans. } J_2(2) = b - a, J'_1(2) = a - \frac{b}{2}, J'_2(2) = a$$

13. Prove that  $J_n(x) = 0$  has no repeated root except  $x = 0$ .

14. Integrate  $\int x^3 J_0(x) dx$ , where  $J_n(x)$  is the Bessel's function of first kind, in terms of  $J_0(x)$ ,  $J_1(x)$  and  $J_n(x)$ .

### 33.11 FOURIER-BESSEL EXPANSION

If a function  $f(x)$  is continuous and has a finite number of oscillations in the interval  $0 \leq x \leq a$ , then  $f(x)$  can be expanded in a series.

$$f(x) \equiv C_1 J_{\nu}(\alpha_1 x) + C_2 J_{\nu}(\alpha_2 x) + C_3 J_{\nu}(\alpha_3 x) + \dots + C_n J_{\nu}(\alpha_n x) + \dots$$

$$\Rightarrow f(x) = \sum_{i=1}^{\infty} C_i J_n(\alpha_i x).$$

where  $\alpha_1, \alpha_2, \alpha_3$  are the roots of the equation  $J_{-}(x) = 0$ .

**Solution.** [The orthogonal property of Bessel's functions enables us to expand a function in terms of Bessel's function].

$$\text{Let } f(x) = \sum_{i=1}^{\infty} C_i J_n(\alpha_i x) \quad \dots (1)$$

Multiplying both sides of (1) by  $x J_n(\alpha_i x)$ , we get

$$x f(x) J_n(\alpha_j x) = \sum_{i=1}^{\infty} C_i x J_n(\alpha_j x) J_n(\alpha_i x) \quad \dots (2)$$

Integrating both sides of (2) from  $x = 0$  to  $x = a$ , we have

$$\int_0^a x f(x) J_n(\alpha_j x) dx = \sum_{i=1}^{\infty} C_i \int_0^a x J_n(\alpha_j x) J_n(\alpha_i x) dx \quad \dots (3)$$

By orthogonal property of Bessel's functions, we know that

$$\int_0^a x J_n(\alpha_i x) J_n(\alpha_j x) dx = \begin{cases} 0 & \text{if } i \neq j \\ \frac{a^2}{2} J_{(n+1)}^2(\alpha_i a) & \text{if } i = j \end{cases}$$

On applying this property on the right-hand side of (3), it reduces to

$$\begin{aligned} \int_0^a x f(x) J_n(\alpha_i x) dx &= C_i \cdot \frac{a^2}{2} J_{(n+1)}^2(\alpha_i a) \\ \Rightarrow C_i &= \frac{2 \int_0^a x f(x) J_n(\alpha_i x) dx}{a^2 J_{(n+1)}^2(\alpha_i a)} \end{aligned}$$

By putting the values of the coefficient  $C_i$ 's in (1), we get the Fourier-Bessel Expansions.

**Ans.**

**Example 31.** Show that  $\sum_{i=1}^{\infty} \frac{2J_0(a_i x)}{a_i J_1(a_i)} = 1$ , where  $a_1, a_2, a_3, \dots$  are the roots of  $J_0(x)$ .

**Solution.** Let  $f(x) = \sum_{i=1}^{\infty} C_i J_n(a_i x)$ , ... (1)

$$\text{then } C_n = \frac{2}{J_{(n+1)}^2(a_i)} \int_0^1 x J_n(a_i x) f(x) dx \quad \dots (2)$$

Putting  $f(x) = 1$  and  $n = 0$  in (1), we get

$$1 = \sum_{i=1}^{\infty} C_i J_0(a_i x) \quad \dots (3)$$

$$C_i = \frac{2}{J_1^2(a_i)} \int_0^1 x J_0(a_i x) dx = \frac{2}{J_1^2(a_i)} \left[ \frac{J_1(a_i)}{a_i} \right] = \frac{2}{a_i J_1(a_i)}$$

Substituting the values of  $C_i f(x)$  and  $n$  in (3), we obtain

$$\begin{aligned} 1 &= \sum_{i=1}^{\infty} \frac{2}{a_i J_1(a_i)} J_0(a_i x) \\ \Rightarrow \sum \frac{2J_0(a_i x)}{a_i J_1(a_i)} &= 1 \quad \text{Proved.} \end{aligned}$$

**Example 32.** Expand  $f(x) = x^2$  in the interval  $0 < x < 2$  in terms of  $J_2(\alpha_n x)$  where  $\alpha_n$  are the roots of  $J_2(2\alpha_n) = 0$ .

**Solution.**  $f(x) = x^2$

$$x^2 = \sum_{i=1}^{\infty} C_i J_2(\alpha_i x) \quad \dots (1)$$

Multiplying both sides of (1) by  $x J_2(\alpha_j x)$ , we get

$$x^3 J_2(\alpha_j x) = \sum_{i=1}^{\infty} C_i x J_2(\alpha_i x) J_2(\alpha_j x) \quad \dots (2)$$

Integrating (2) w.r.t.  $x$  from  $x = 0$  to  $x = 2$ , we get

$$\int_0^2 x^3 J_2(\alpha_j x) dx = \sum_{i=1}^{\infty} C_i \int_0^2 x J_2(\alpha_i x) J_2(\alpha_j x) dx$$

$$\left[ \frac{x^3 J_3(\alpha_i x)}{\alpha_i} \right]_0^2 = C_i \int_0^2 x J_2^2(\alpha_i x) dx \quad (i = j) \text{ (other integrals are zero)}$$

$$\frac{8J_3(2\alpha_i)}{\alpha_i} = C_i \frac{2^2}{2} J_3^2(2\alpha_i)$$

$$C_i = \frac{8J_3(2\alpha_i)}{\alpha_i} \frac{2}{4J_3^2(2\alpha_i)} = \frac{4}{\alpha_i J_3(2\alpha_i)}$$

On putting the values of coefficients  $C_i$  in (1), we get

$$x^2 = \sum_{i=1}^{\infty} \frac{4J_2(\alpha_i x)}{\alpha_i J_3(2\alpha_i)}$$
Ans.

### EXERCISE 33.2

1. Expand  $f(x) = x^3$  in the interval  $0 < x < 3$  in terms of Bessel's functions  $J_1(\alpha_n x)$  where  $\alpha_n$  are the roots of  $J_1(3\alpha) = 0$ .

$$\text{Ans. } x^3 = \sum_{i=1}^{\infty} \frac{6}{\alpha_i^2 J_2^2(3\alpha_i)} \{3\alpha_i J_2(3\alpha_i) - 2J_3(3\alpha_i)\}$$

2. Show that the Fourier-Bessel series in  $J_2(\alpha_i x)$  for  $f(x) = x^2$ , ( $0 < x < \alpha$ ) where  $\alpha_i$  are positive roots of  $J_2(x) = 0$  is

$$x^2 = 2a^2 \sum_{i=1}^{\infty} \frac{J_2(\alpha_i x)}{a\alpha_i J_3(\alpha_i a)}$$

### 33.12 BER AND BEI FUNCTIONS

The following differential equation is useful in certain problems in electrical engineering.

$$x \frac{d^2 y}{dx^2} + \frac{dy}{dx} - i x y = 0 \quad \dots (1)$$

This equation (1) is a particular case of the differential equation

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (k^2 x^2 - n^2) y = 0 \quad \dots (2)$$

On putting  $n = 0$ ,  $k^2 = -i$  in equation (2), we get

$$x \frac{d^2 y}{dx^2} + \frac{dy}{dx} - i x y = 0$$

Its solution is  $y = J_0(k x) = J_0[(-1)^{1/2} x] = J_0(i^{3/2} x)$

$$y = J_0(i^{3/2} x) = 1 - \frac{i^3 x^2}{2^2} + \frac{i^6 x^4}{(2!)^2 \cdot 2^4} - \frac{i^9 x^6}{(3!)^2 \cdot 2^6} + \frac{i^{12} x^8}{(4!)^2 \cdot 2^8} \dots$$

$$= \left[ 1 - \frac{x^4}{2^2 \cdot 4^2} + \frac{x^8}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2} \dots \right] + i \left[ \frac{x^2}{2^2} - \frac{x^6}{2^2 \cdot 4^2 \cdot 6^2} + \frac{x^{10}}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2 \cdot 10^2} \dots \right]$$

$$= 1 + \sum_{k=1}^{\infty} (-1)^k \frac{x^{4k}}{2^2 \cdot 4^2 \cdot 6^2 \dots (4k)^2} + i \left[ - \sum_{k=1}^{\infty} \frac{(-1)^k x^{4k-2}}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2 \dots (4k-2)^2} \right]$$

$$J_0(i^{3/2}x) = \text{Ber } (\text{Bessel real}) + \text{Bei } (\text{Bessel imaginary})$$

$$\begin{aligned}\text{Ber } x &= 1 + \sum_{k=1}^{\infty} (-1)^k \frac{x^{4k}}{2^2 \cdot 4^2 \cdot 6^2 \cdots (4k)^2} \\ \text{Bei } x &= -\sum_{k=1}^{\infty} \frac{(-1)^k x^{4k-2}}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2 \cdots (4k-2)^2}\end{aligned}$$

**Example 33.** Show that  $\frac{d}{dx}(x \text{Ber}' x) = -x \text{Bei } x$ .

**Solution.** We know that

$$\text{Ber } x = 1 - \frac{x^4}{2^2 \cdot 4^2} + \frac{x^8}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2} + \dots \infty$$

$$\text{On differentiating, } \text{Ber}' x = -\frac{4x^3}{2^2 \cdot 4^2} + \frac{8x^7}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2} + \dots \infty$$

$$(x \text{Ber}' x) = -\frac{x^4}{2^2 \cdot 4} + \frac{x^8}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8} + \dots$$

$$\begin{aligned}\frac{d}{dx}(x \text{Ber}' x) &= -\frac{x^3}{2^2} + \frac{x^7}{2^2 \cdot 4^2 \cdot 6} + \dots \\ &= -x \left[ \frac{x^2}{2^2} - \frac{x^6}{2^2 \cdot 4^2 \cdot 6^2} + \dots \infty \right] = -x \text{Bei } x\end{aligned}$$

**Proved.**

**Example 34.** Show that  $\frac{d}{dx}(x \text{Bei}' x) = x \text{Ber } x$ .

$$\text{Solution. We know that } \text{Bei } x = \frac{x^2}{2^2} - \frac{x^6}{2^2 \cdot 4^4 \cdot 6^2} + \frac{x^{10}}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2 \cdot 10^2} \dots \quad \dots (1)$$

On differentiating (1) w.r.t. 'x', we get

$$\text{Bei}' x = \frac{x}{2} - \frac{x^5}{2^2 \cdot 4^2 \cdot 6} + \frac{x^9}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2 \cdot 10} \dots \infty$$

$$(x \text{Bei}' x) = \frac{x^2}{2} - \frac{x^6}{2^2 \cdot 4^2 \cdot 6} + \frac{x^{10}}{2^2 \cdot 6^2 \cdot 8^2 \cdot 10} \dots \infty$$

$$\begin{aligned}\frac{d}{dx}(x \text{Bei}' x) &= x - \frac{x^5}{2^2 \cdot 4^2} + \frac{x^9}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2} \dots \infty \\ &= x \left[ 1 - \frac{x^4}{2^2 \cdot 4^2} + \frac{x^8}{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2} \dots \infty \right] = x \text{Ber } x\end{aligned}$$

**Proved.**

**Example 35.** Show that

$$\int_0^a x[\text{Ber}^2 x + \text{Bei}^2 x] dx = a[\text{Ber } a \text{Bei}' a - \text{Bei } a \text{Ber}' a]$$

$$\text{Solution. } \frac{d}{dx}(x \text{Bei}' x) = x \text{Ber } x \quad \dots (1) \text{ (See example 34)}$$

$$\text{and } \frac{d}{dx}(x \text{Ber}' x) = -x \text{Bei } x \quad \dots (2) \text{ (See example 33)}$$

Multiplying (1) by  $\text{Ber } x$  and (2) by  $\text{Bei } x$  and subtracting, we get

$$\text{Ber } x \frac{d}{dx}(x \text{Bei}' x) - \text{Bei } x \frac{d}{dx}(x \text{Ber}' x) = x \text{Ber}^2 x + x \text{Bei}^2 x \quad \dots (3)$$

Integrating both sides of (3) from 0 to  $a$ , we get

$$\int_0^a \left[ \text{Ber } x \frac{d}{dx} (\text{Bei}' x) - \text{Bei } x \frac{d}{dx} (\text{Ber}' x) \right] dx = \int_0^a (x \text{Ber}^2 x + x \text{Bei}^2 x) dx$$

$$\Rightarrow \int_0^a x(\text{Ber}^2 x + \text{Bei}^2 x) dx = \int_0^a \left[ \text{Ber } x \frac{d}{dx} (\text{Bei}' x) - \text{Bei } x \frac{d}{dx} (\text{Ber}' x) \right] dx$$

On adding and subtracting  $\text{Bei}' x \frac{d}{dx} (\text{Ber } x)$  on R.H.S.

$$= \int_0^a \left[ \text{Ber } x \frac{d}{dx} (\text{Ber}' x) + \text{Bei}' x \frac{d}{dx} (\text{Bei}' x) - \text{Bei}' x \frac{d}{dx} (\text{Ber}' x) - \text{Ber}' x \frac{d}{dx} (\text{Ber}' x) \right] dx$$

$$= \int_0^a \frac{d}{dx} [x(\text{Ber } x \text{Bei}' x - \text{Bei } x \text{Ber}' x)] dx$$

$$= [x(\text{Ber } x \text{Bei}' x - \text{Bei } x \text{Ber}' x)]_0^a$$

$$= a [\text{Ber } a \text{Bei}' a - \text{Bei } a \text{Ber}' a]$$

**Proved.**

### OBJECTIVE TYPE QUESTIONS

Choose the correct or the best of the answers/statements given in the following parts:

1.  $J_{\frac{1}{2}}$  is given by

(i)  $\sqrt{\frac{2\pi}{x}} \sin x$       (ii)  $\sqrt{\frac{2\pi}{x}} \cos x$       (iii)  $\sqrt{\frac{\pi}{2x}} \cos x$       (iv)  $\sqrt{\frac{2}{\pi x}} \sin x$

(UP., II Semester, 2010) **Ans. (iv)**

2. If  $J_{n+1}(x) = \frac{2}{x} J_n(x) - J_0(x)$ , then  $n$  is

(i) 0      (ii) 2      (iii) -1      (iv) None of these  
 3.  $J'_0 =$       (i)  $J_1$       (ii)  $-J_1$       (iii)  $J_2 - J_0$       (iv)  $J_2$

**Ans. (iv)**  
 (R.G.P.V. Bhopal, II Semester, Feb 2006)

4.  $J_{-\frac{1}{2}}(x) =$

(R.G.P.V. Bhopal, II Semester, June 2006)

(i)  $\sqrt{\frac{2}{\pi x}} \sin x$       (ii)  $\sqrt{\frac{2}{\pi}} \sin x$       (iii)  $\sqrt{\frac{2}{\pi x}} \cos x$       (iv)  $\sqrt{\frac{2\pi}{x}} \cos x$       **Ans. (iii)**

(R.G.P.V. Bhopal, II Semester, Feb. 2006)

5. Bessel's equation of order zero is:

(i)  $xy + y = 0$   
 (iii)  $xy_2 + y_1 + xy = 0$

(ii)  $xy_2 + xy_1 + y = 0$   
 (iv)  $xy_2 + y_1 + xy = 0$

**Ans. (iv)**

(R.G.P.V. Bhopal, II Semester, Dec. 2007, Feb. 2006)

6. The value of the integral  $\int x^2 J_1(x) dx$  is

(i)  $x^2 J_1(x) + c$   
 (iii)  $x^2 J_2(x) + c$

(ii)  $x^2 J_{-1}(x) + c$   
 (iv)  $x^2 J_{-2}(x) + c$

**Ans. (iii)**

(AMIETE, June 2010)

# 34

## LEGENDRE'S FUNCTIONS

---

---

### 34.1 LEGENDRE'S EQUATION

The differential equation  $(1-x^2) \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + n(n+1)y = 0$  ... (1)

is known as Legendre's equation. The above equation can also be written as

$$\frac{d}{dx} \left\{ (1-x^2) \frac{dy}{dx} \right\} + n(n+1)y = 0 \quad n \in I$$

This equation can be integrated in series of ascending or descending powers of  $x$ . i.e., series in ascending or descending powers of  $x$  can be found which satisfy the equation (1).

Let the series in descending powers of  $x$  be

$$y = x^m (a_0 + a_1 x^{-1} + a_2 x^{-2} + \dots) \quad \dots (2)$$

$$\Rightarrow y = \sum_{r=0}^{\infty} a_r x^{m-r}$$

so that  $\frac{dy}{dx} = \sum_{r=0}^{\infty} a_r (m-r)^{m-r-1}$

and  $\frac{d^2y}{dx^2} = \sum_{r=0}^{\infty} a_r (m-r)(m-r-1)x^{m-r-2}$

Substituting these values in (1), we have

$$(1-x^2) \sum_{r=0}^{\infty} a_r (m-r)(m-r-1)x^{m-r-2} - 2x \sum_{r=0}^{\infty} a_r (m-r)x^{m-r-1} + n(n+1) \sum_{r=0}^{\infty} a_r x^{m-r} = 0$$

$$\Rightarrow \sum_{r=0}^{\infty} [(m-r)(m-r-1)x^{m-r-2} + \{n(n+1) - 2(m-r) - (m-r)(m-r-1)\} x^{m-r}] a_r = 0$$

$$\Rightarrow \sum_{r=0}^{\infty} [(m-r)(m-r-1)x^{m-r-2} + \{n(n+1) - (m-r)(m-r+1)\} x^{m-r}] a_r \equiv 0 \quad \dots (3)$$

The equation (3) is an identity and therefore coefficients of various powers of  $x$  must vanish. Now equating to zero the coefficients of  $x^m$  i.e. by substituting  $r=0$  in the second summation, we get,

$$a_0 \{n(n+1) - m(m+1)\} = 0$$

But  $a_0 \neq 0$ , as it is the coefficient of the very first term in the series

$$\text{Hence } n(n+1) - m(m+1) = 0 \quad \dots (4)$$

$$\text{i.e., } n^2 + n - m^2 - m = 0 \Rightarrow (n^2 - m^2) + (n - m) = 0$$

$$\Rightarrow (n - m)(n + m + 1) = 0, \text{ This is the indicial equation.}$$

$$\text{which gives } m = n \quad \text{or} \quad m = -n - 1 \quad \dots (5)$$

Next equating to zero the coefficient of  $x^{m-1}$  by putting  $r = 1$ , in the second summation

$$\begin{aligned} a_1[n(n+1) - (m-1)m] &= 0 \\ \Rightarrow a_1(n^2 + n - m^2 + m) &= 0 \Rightarrow a_1[(n^2 - m^2) + n + m] = 0 \\ \Rightarrow a_1[(m+n)(m-n-1)] &= 0 \end{aligned}$$

$$\text{which gives } a_1 = 0 \quad \dots (6)$$

$$\text{Since } (m+n)(m-n-1) \neq 0, \text{ by (5)}$$

Again to find a relation in successive coefficients  $a_r$ , etc., equating the coefficient of  $x^{m-r-2}$  to zero, we get

$$(m-r)(m-r-1)a_r + [n(n+1) - (m-r-2)(m-r-1)]a_{r+2} = 0 \quad \dots (7)$$

$$\left. \begin{aligned} n(n+1) - (m-r-2)(m-r-1) &= n^2 + n - (m-r-1-1)(m-r-1) \\ &= -[(m-r-1)^2 - (m-r-1) - n^2 - n] \\ &= -[(m-r-1+n)(m-r-1-n)-(m-r-1+n)] \\ &= -[(m-r-1+n)(m-r-1-n-1)] \\ &= -(m-r+n-1)(m-r-n-2) \end{aligned} \right\}$$

On simplification (7) becomes

$$\Rightarrow (m-r)(m-r-1)a_r - (m-r+n-1)(m-r-n-2)a_{r+2} = 0$$

$$\Rightarrow a_{r+2} = \frac{(m-r)(m-r-1)}{(m-r+n-1)(m-r-n-2)}a_r \quad \dots (8)$$

$$\text{Now since } a_1 = a_3 = a_5 = a_7 = \dots = 0$$

For the two values given by (5) there arises following two cases.

**Case I :** When  $m = n$

$$a_{r+2} = -\frac{(n-r)(n-r-1)}{(2n-r-1)(r+2)}a_r \quad [\text{From (8)}]$$

$$\text{If } r = 0 \quad a_2 = -\frac{n(n-1)}{(2n-1)2}a_0$$

$$\text{If } r = 2, \quad a_4 = -\frac{(n-2)(n-3)}{(2n-3) \times 4}a_2 = \frac{n(n-1)(n-2)(n-3)}{(2n-1)(2n-3)2 \cdot 4}a_0$$

and so on and

$$a_1 = a_3 = a_5 = \dots = 0$$

Hence the series (2) becomes

$$y = a_0 \left[ x^n - \frac{n(n-1)}{(2n-1)2}x^{n-2} + \frac{n(n-1)(n-2)(n-3)}{(2n-1)(2n-3)2 \cdot 4}x^{n-4} - \dots \right]$$

Which is a solution of (1).

**Case II :** When  $m = -(n+1)$ , we have

$$a_{r+2} = \frac{(n+r+1)(n+r+2)}{(r+2)(2n+r+3)}a_r \quad [\text{From (8)}]$$

$$\text{If } r = 0, \quad a_2 = \frac{(n+1)(n+2)}{2(2n+3)}a_0;$$

$$\text{If } r = 2, \quad a_4 = \frac{(n+3)(n+4)}{4 \cdot (2n+5)} a_2 = \frac{(n+1)(n+2)(n+3)(n+4)}{2 \cdot 4 \cdot (2n+3) \cdot (2n+5)} a_0 \quad \text{and so on.}$$

Hence the series (2) in this case becomes

$$y = a_0 \left[ x^{-n-1} + \frac{(n+1)(n+2)}{2 \cdot (2n+3)} x^{-n-3} + \frac{(n+1)(n+2)(n+3)(n+4)}{2 \cdot 4 \cdot (2n+3) \cdot (2n+5)} x^{-n-5} + \dots \right] \quad \dots (9)$$

This gives another solution of (1) in a series of descending powers of  $x$ .

**Note.** If we want to integrate the Legendre's equation in a series of ascending powers of  $x$ , we may proceed by taking

$$y = a_0 x^k + a_1 x^{k+1} + a_2 x^{k+2} + \dots = \sum_{r=0}^{\infty} a_r x^{k+r}$$

But integration in descending powers of  $x$  is more important than that in ascending powers of  $x$ .

### 34.2 LEGENDRE'S POLYNOMIAL $P_n(x)$ .

**Definition :**

The Legendre's Equation is

$$(1-x^2) \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + n(n+1)y = 0 \quad \dots (1)$$

The solution of the above equation in the series of descending powers of  $x$  is

$$y = a_0 \left[ x^n - \frac{n(n-1)}{(2n-1) \cdot 2} x^{n-2} + \frac{n(n-1)(n-2)(n-3)}{(2n-1)(2n-3) \cdot 2 \cdot 4} x^{n-4} \dots \right]$$

where  $a_0$  is an arbitrary constant.

Now if  $n$  is a positive integer and  $a_0 = \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{n!}$  the above solution is  $P_n(x)$ , so that

$$P_n(x) = \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{n!} \left[ x^n - \frac{n(n-1)}{(2n-1) \cdot 2} x^{n-2} + \dots \right]$$

**Note 1.** This is a terminating series.

When  $n$  is even, it contains  $\frac{1}{2}n+1$  terms, the last term being

$$(-1)^{\frac{1}{2}} \frac{n(n-1)(n-2)\dots 1}{(2n-1)(2n-3)\dots(n+1)2\cdot 4 \dots (n-1)}$$

And when  $n$  is odd it contains  $\frac{1}{2}(n+1)$  terms and the last term in this case is

$$(-1)^{\frac{1}{2}(n-1)} \frac{n(n-1)(n-2)\dots 3 \cdot 2}{(2n-1)(2n-3)\dots(n+2)2\cdot 4\dots(n-1)} x$$

$P_n(x)$  is called the *Legendre's function of the first kind*.

**Note.**  $P_n(x)$  is that solution of Legendre's equation (1) which is equal to unity when  $x = 1$ .

### 34.3 LEGENDRE'S FUNCTION OF THE SECOND KIND i.e. $Q_n(x)$

Another solution of Legendre's equation

$$(1-x^2) \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + n(n+1)y = 0$$

when  $n$  is a positive integer

$$y = a_0 \left[ x^{-n-1} + \frac{(n+1)(n+2)}{2 \cdot (2n+3)} x^{-n-3} + \dots \right]$$

If we take  $a_0 = \frac{n!}{1 \cdot 3 \cdot 5 \dots (2n+1)}$

the above solution is called  $Q_n(x)$ , so that

$$Q_n(x) = \frac{n!}{1 \cdot 3 \cdot 5 \dots (2n+1)} \left[ x^{-n-1} + \frac{(n+1)(n+2)}{2 \cdot (2n+3)} x^{-n-3} + \dots \right]$$

The series for  $Q_n(x)$  is a non-terminating series.

### 34.4 GENERAL SOLUTION OF LEGENDRE'S EQUATION

Since  $P_n(x)$  and  $Q_n(x)$  are two independent solutions of Legendre's equation, therefore the most general solution of Legendre's equation is

$$y = AP_n(x) + B Q_n(x)$$

Where  $A$  and  $B$  are two arbitrary constants.

### 34.5 RODRIGUE'S FORMULA

(AMIEETE, June 2010, 2009, U.P., II Semester, 2010, 2007, 2004)

$$P_n(x) = \frac{1}{2^n \cdot n!} \frac{d^n}{dx^n} (x^2 - 1)^n$$

**Proof.** Let  $v = (x^2 - 1)^n$  ... (1)

Then  $\frac{dv}{dx} = n(x^2 - 1)^{n-1}(2x)$

Multiplying both sides by  $(x^2 - 1)$ , we get

$$(x^2 - 1) \frac{dv}{dx} = 2n(x^2 - 1)^n x.$$

$$\Rightarrow (x^2 - 1) \frac{d^2v}{dx^2} = 2n \frac{dv}{dx} x \quad [\text{Using (1)}] \quad \dots (2)$$

Now differentiating (2),  $(n+1)$  times by Leibnitz's theorem, we have

$$\begin{aligned} & (x^2 - 1) \frac{d^{n+2}v}{dx^{n+2}} + {}^{(n+1)}C_1(2x) \frac{d^{n+1}v}{dx^{n+1}} + {}^{(n+1)}C_2(2) \frac{d^n v}{dx^n} = 2n \left[ x \frac{d^{n+1}v}{dx^{n+1}} + {}^{(n+1)}C_1(1) \frac{d^n v}{dx^n} \right] \\ \Rightarrow & (x^2 - 1) \frac{d^{n+2}v}{dx^{n+2}} + 2x \left[ {}^{(n+1)}C_1 - n \right] \frac{d^{n+1}v}{dx^{n+1}} + 2 \left[ {}^{n+1}C_2 - n \cdot {}^{(n+1)}C_1 \right] \frac{d^n v}{dx^n} = 0 \\ \Rightarrow & (x^2 - 1) \frac{d^{n+2}v}{dx^{n+2}} + 2x \frac{d^{n+1}v}{dx^{n+1}} - n(n+1) \frac{d^n v}{dx^n} = 0 \end{aligned} \quad \dots (3)$$

If we put  $\frac{d^n v}{dx^n} = y$ , (3) becomes

$$\begin{aligned} & (x^2 - 1) \frac{d^2 y}{dx^2} + 2x \frac{dy}{dx} - n(n+1)y = 0 \\ \Rightarrow & (1 - x^2) \frac{d^2 y}{dx^2} - 2x \frac{dy}{dx} + n(n+1)y = 0 \end{aligned}$$

This shows that  $y = \frac{d^n v}{dx^n}$  is a solution of Legendre's equation.

$$\therefore C \frac{d^n v}{dx^n} = P_n(x) \quad \dots (4)$$

Where  $C$  is a constant.

But

$$v = (x^2 - 1)^n = (x + 1)^n (x - 1)^n$$

so that  $\frac{d^n v}{dx^n} = (x+1)^n \frac{d^n}{dx^n}(x-1)^n + {}^n C_1 \cdot n(x+1)^{n-1} \cdot \frac{d^{n-1}}{dx^{n-1}}(x-1)^n + \dots + (x-1)^n \frac{d^n}{dx^n}(x+1)^n = 0$

when

$$x = 1, \quad \text{then } \frac{d^n v}{dx^n} = 2^n \cdot n!$$

All the other terms disappear as  $(x - 1)$  is a factor in every term except first.

Therefore when  $x = 1$ , (4) gives

$$\begin{aligned} C \cdot 2^n \cdot n! &= P_n(1) = 1 & [P_n(1) = 1] \\ C &= \frac{1}{2^n \cdot n!}. & \dots(5) \end{aligned}$$

Substituting the value of  $C$  from (5) in (4), we have

$$\begin{aligned} P_n(x) &= \frac{1}{2^n \cdot n!} \frac{d^n v}{dx^n} \\ P_n(x) &= \frac{1}{2^n \cdot n!} \frac{d^n}{dx^n} (x^2 - 1)^n & [\because v = (x^2 - 1)^n] \end{aligned}$$

**Example 1.** Show that  $\int_{-1}^{+1} P_n(x) dx = 0, \quad n \neq 0$

and

$$\int_{-1}^{+1} P_n(x) dx = 2, \quad n = 0$$

**Solution.**

$$(i) \text{ We know that } P_n(x) = \frac{1}{2^n \cdot n!} \frac{d^n}{dx^n} (x^2 - 1)^n$$

$$\begin{aligned} \text{Integrating, we get } \int_{-1}^{+1} P_n(x) dx &= \frac{1}{2^n n!} \int_{-1}^{+1} \frac{d^n}{dx^n} (x^2 - 1)^n dx = \frac{1}{2^n n!} \left[ \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n \right]_{-1}^{+1} \\ &= \frac{1}{2^n n!} [0 - 0] = 0 \end{aligned}$$

(ii) When  $n = 0$

$$\int_{-1}^{+1} P_0(x) dx = \int_{-1}^{+1} 1 \cdot dx = [x]_{-1}^{+1} = 2 \quad \text{Proved.}$$

**Example 2.** Let  $P_n(x)$  be the Legendre polynomial of degree  $n$ . Show that for any function,  $f(x)$ , for which the  $n$ th derivative is continuous,

$$\int_{-1}^{+1} f(x) P_n(x) dx = \frac{(-1)^n}{2^n n!} \int_{-1}^{+1} (x^2 - 1)^n f^n(x) dx.$$

$$\begin{aligned} \text{Solution. } \int_{-1}^{+1} f(x) P_n(x) dx &= \int_{-1}^{+1} f(x) \cdot \frac{1}{2^n n!} \frac{d^n}{dx^n} (x^2 - 1)^n dx. & \left[ P_n(x) = \frac{1}{2^n n!} \frac{d^n}{dx^n} (x^2 - 1)^n \right] \\ &= \frac{1}{2^n n!} \int_{-1}^{+1} f(x) \cdot \frac{d^n}{dx^n} (x^2 - 1)^n dx \end{aligned}$$

Integrating by parts, we get

$$= \frac{1}{2^n n!} \left[ f(x) \cdot \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n - \int f'(x) \cdot \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n dx \right]_{-1}^{+1}$$

$$= \frac{1}{2^n n!} \left[ 0 - \int_{-1}^1 f'(x) \cdot \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n dx \right] = \frac{(-1)}{2^n n!} \int_{-1}^1 f'(x) \cdot \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n dx$$

Again integrating by parts, we have

$$\begin{aligned} &= \frac{(-1)}{2^n n!} \left[ f'(x) \cdot \frac{d^{n-2}}{dx^{n-2}} (x^2 - 1)^n - \int f''(x) \cdot \frac{d^{n-2}}{dx^{n-2}} (x^2 - 1)^n dx \right]_{-1}^1 \\ &= \frac{(-1)^2}{2^n n!} \int_{-1}^1 f''(x) \cdot \frac{d^{n-2}}{dx^{n-2}} (x^2 - 1)^n dx \end{aligned}$$

Similarly, integrating  $(n - 2)$  times by parts, we get

$$\int_{-1}^1 f(x) P_n(x) dx = \frac{(-1)^{n-2}}{2^n n!} \int_{-1}^1 f^n(x) (x^2 - 1)^n dx = \frac{(-1)^n}{2^n n!} \int_{-1}^{+1} f^n(x) (x^2 - 1)^n dx$$

**Proved.**

### 34.6 LEGENDRE'S POLYNOMIALS

$$P_n(x) = \frac{1}{2^n \cdot n!} \cdot \frac{d^n}{dx^n} (x^2 - 1)^n \quad (\text{Rodrigue's formula})$$

$$\text{If } n = 0, \quad P_0(x) = \frac{1}{2^0 \cdot 0!} = 1$$

$$\text{If } n = 1, \quad P_1(x) = \frac{1}{2^1 \cdot 1!} \frac{d}{dx} (x^2 - 1) = \frac{1}{2} (2x) = x$$

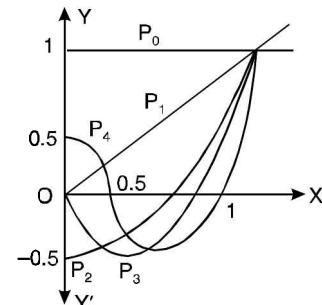

$$\begin{aligned} \text{If } n = 2, \quad P_2(x) &= \frac{1}{2^2 \cdot 2!} \frac{d^2}{dx^2} (x^2 - 1)^2 = \frac{1}{8} \frac{d}{dx} [2(x^2 - 1)(2x)] \\ &= \frac{1}{2} [(x^2 - 1) \cdot 1 + 2x \cdot x] = \frac{1}{2} (3x^2 - 1) \end{aligned}$$

$$\text{Similarly } P_3(x) = \frac{1}{2} (5x^3 - 3x)$$

$$P_4(x) = \frac{1}{8} (35x^4 - 30x^2 + 3)$$

$$P_5(x) = \frac{1}{8} (63x^5 - 70x^3 + 15x)$$

$$P_6(x) = \frac{1}{16} (231x^6 - 315x^4 + 105x^2 - 5)$$

$$P_n(x) = \sum_{r=0}^n \frac{(-1)^r (2n-2r)!}{2^n \cdot r! (n-r)! (n-2r)!} x^{n-2r}$$

$$\text{where } N = \frac{n}{2} \text{ if } n \text{ is even.}$$

$$N = \frac{1}{2}(n-1) \text{ if } n \text{ is odd.}$$

**Note.** We can evaluate  $P_n(x)$  by differentiating  $(x^2 - 1)^n$ ,  $n$  times.

$$\begin{aligned}\frac{d^n}{dx^n} (x^2 - 1)^n &= \sum_{r=0}^{r=n} {}^n C_r (x^2)^{n-r} (-1)^r = \sum_{r=0}^{r=n} (-1)^r \frac{n!}{r!(n-r)!} x^{2n-2r} \\ P_n(x) &= \frac{1}{2^n \cdot n!} \frac{d^n}{dx^n} (x^2 - 1)^n = \frac{1}{2^n \cdot n!} \sum_{r=0}^{r=n} (-1)^r \frac{n!}{r!(n-r)!} (x^{2n-2r}) \\ &= \sum_{r=0}^N \frac{(-1)^r (2n-2r)!}{2^n \cdot r!(n-r)!(n-2r)!} x^{n-2r}\end{aligned}$$

Either  $x^0$  or  $x^1$  is in the last term.

$$\therefore n - 2r = 0 \quad \text{or} \quad r = \frac{n}{2} \quad (n \text{ is even})$$

$$n - 2r = 1 \quad \text{or} \quad r = \frac{1}{2}(n-1) \quad (n \text{ is odd})$$

**Example 3.** Express  $f(x) = 4x^3 + 6x^2 + 7x + 2$  in terms of Legendre Polynomials.

**Solution.** Let  $4x^3 + 6x^2 + 7x + 2 \equiv a P_3(x) + b P_2(x) + c P_1(x) + d P_0(x)$  ... (1)

$$\begin{aligned}&\equiv a\left(\frac{5x^3}{2} - \frac{3x}{2}\right) + b\left(\frac{3x^2}{2} - \frac{1}{2}\right) + c(x) + d(1) \\ &\equiv \frac{5ax^3}{2} - \frac{3ax}{2} + \frac{3bx^2}{2} - \frac{b}{2} + cx + d \\ 4x^3 + 6x^2 + 7x + 2 &\equiv \frac{5ax^3}{2} + \frac{3bx^2}{2} + \left(\frac{-3a}{2} + c\right)x - \frac{b}{2} + d.\end{aligned}$$

Equating the coefficients of like powers of  $x$ , we have

$$4 = \frac{5a}{2}, \quad \Rightarrow \quad a = \frac{8}{5}$$

$$6 = \frac{3b}{2} \quad \Rightarrow \quad b = 4$$

$$7 = \frac{-3a}{2} + c \quad \Rightarrow \quad 7 = \frac{-3}{2}\left(\frac{8}{5}\right) + c \quad \Rightarrow \quad c = \frac{47}{5}$$

$$2 = \frac{b}{-2} + d \quad \Rightarrow \quad 2 = \frac{4}{-2} + d \quad \Rightarrow \quad d = 4$$

Putting the values of  $a, b, c, d$  in (1), we get

$$4x^3 + 6x^2 + 7x + 2 = \frac{8}{5}P_3(x) + 4P_2(x) + \frac{47}{5}P_1(x) + 4P_0(x) \quad \text{Ans.}$$

**Example 4.** Express the polynomial

$f(x) = 4x^3 - 2x^2 - 3x + 8$  in terms of Legendre Polynomials.  
(U.P., II Semester, 2009)

**Solution.** Let

$$4x^3 - 2x^2 - 3x + 8 \equiv a P_3(x) + b P_2(x) + c P_1(x) + d P_0(x) \quad \dots(1)$$

$$\begin{aligned}&\equiv a\left(\frac{5x^3}{2} - \frac{3x}{2}\right) + b\left(\frac{3x^2}{2} - \frac{1}{2}\right) + c(x) + d(1) \\ &\equiv \frac{5ax^3}{2} - \frac{3ax}{2} + \frac{3bx^2}{2} - \frac{b}{2} + cx + d\end{aligned}$$

$$\equiv \frac{5ax^3}{2} - \frac{3ax}{2} + \frac{3bx^2}{2} - \frac{b}{2} + cx + d$$

$$\Rightarrow 4x^3 - 2x^2 - 3x + 8 \equiv \frac{5ax^3}{2} + \frac{3bx^2}{2} + \left(\frac{-3a}{2} + c\right)x - \frac{b}{2} + d$$

Equating the coefficients of like powers of  $x$ , we have

$$\begin{aligned} 4 &= \frac{5a}{2} & \Rightarrow a &= \frac{8}{5} \\ -2 &= \frac{3b}{2} & \Rightarrow b &= -\frac{4}{3} \\ -3 &= -\frac{3a}{2} + c & \Rightarrow c &= -3 + \frac{3}{2}\left(\frac{8}{5}\right) = -3 + \frac{12}{5} = -\frac{3}{5} \\ 8 &= -\frac{b}{2} + d & \Rightarrow d &= 8 + \frac{b}{2} = 8 + \frac{1}{2}\left(-\frac{4}{3}\right) = 8 - \frac{2}{3} = \frac{22}{3} \end{aligned}$$

Putting these values in (1), we get

$$f(x) = \frac{8}{5}P_3(x) - \frac{4}{3}P_2(x) - \frac{3}{5}P_1(x) + \frac{22}{3}P_0(x) \quad \text{Ans.}$$

**Example 5.** Show that  $x^4 = \frac{1}{35}[8P_4(x) + 20P_2(x) + 7P_0(x)]$

**Solution.** We know that  $P_4(x) = \frac{1}{8}(35x^4 - 30x^2 + 3)$

$$P_2(x) = \frac{1}{2}(3x^2 - 1), P_0(x) = 1$$

$$\begin{aligned} \text{R.H.S.} &= \frac{1}{35}[8P_4(x) + 20P_2(x) + 7P_0(x)] \\ &= \frac{1}{35}[(35x^4 - 30x^2 + 3) + 10(3x^2 - 1) + 7] \\ &= x^4 = \text{L.H.S.} \end{aligned}$$

**Proved.**

### 34.7 A GENERATING FUNCTION OF LEGENDRE'S POLYNOMIAL

Prove that  $P_n(x)$  is the coefficient of  $z^n$  in the expansion of  $(1 - 2xz + z^2)^{-1/2}$  in ascending powers of  $x$ .  
(U.P. II Semester summer 2005)

**Proof.**  $(1 - 2xz + z^2)^{-1/2} = [1 - z(2x - z)]^{-1/2}$

Expanding R.H.S. by Binomial Theorem, we have

$$\begin{aligned} (1 - 2xz + z^2)^{-\frac{1}{2}} &= 1 + \frac{1}{2}z(2x - z) + \frac{-\frac{1}{2}\left(-\frac{3}{2}\right)}{2!}z^2(2x - z)^2 + \dots \\ &\quad + \frac{-\frac{1}{2}\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+1\right)}{n!}(-z)^n(2x - z)^n + \dots \quad \dots (1) \end{aligned}$$

Now coefficient of  $z^n$  in  $(n+1)$  th term i.e.  $\frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+1\right)}{n!}(-z)^n(2x - z)^n$

$$= \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+1\right)}{n!}(-1)^n(2x)^n$$

$$= \frac{1.3.5\dots(2n-1)}{2^n \cdot n!} (2)^n \cdot x^n = \frac{1.3.5\dots(2n-1)}{n!} x^n \quad \dots (2)$$

Coefficient of  $z^n$  in  $n$ th term i.e.  $\frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+2\right)}{(n-1)!} (-z)^{n-1} (2x-z)^{n-1}$

$$\begin{aligned} &= \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+2\right)}{(n-1)!} (-1)^{n-1} [-(n-1) (2x)^{n-2}] \\ &= \frac{1.3.5\dots(2n-3)}{2^{n-1} \cdot (n-1)!} (2)^{n-2} (n-1) x^{n-2} = \frac{1.3.5\dots(2n-3)}{2 \cdot (n-1)!} (n-1) x^{n-2} \\ &= \frac{1.3.5\dots(2n-3)}{2 \cdot (n-1)!} \times \frac{(2n-1)}{(2n-1)} (n-1) x^{n-2} = \frac{1.3.5\dots(2n-3)(2n-1)}{n!} \times \frac{n(n-1)}{2(2n-1)} x^{n-2} \end{aligned} \quad \dots (3)$$

Coefficient of  $x^n$  in

$$\begin{aligned} &\frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+3\right)}{(n-2)!} z^{n-2} (2x-z)^{n-2} \\ &= \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+3\right)}{(n-2)!} \times (-1)^{n-2} \times \frac{(n-2)(n-3)}{2!} (2x)^{n-4} \\ &= \frac{1.3.5\dots(2n-5)}{2^{n-2} (n-2)!} \times \frac{(n-2)(n-3)}{2!} (2x)^{n-4} \\ &= \frac{1.3.5\dots(2n-5)(2n-3)(2n-1)}{4(n-2)!} \times \frac{(n-2)(n-3)}{2(2n-3)(2n-1)} x^{n-4} \\ &= \frac{1.3.5\dots(2n-1)}{4n(n-1)(n-2)!} \times \frac{n(n-1)(n-2)(n-3)}{2(2n-3)(2n-1)} x^{n-4} \\ &= \frac{1.3.5\dots(2n-1)}{n!} \times \frac{n(n-1)(n-2)(n-3)}{2.4(2n-1)(2n-3)} x^{n-4} \end{aligned} \quad \dots (4)$$

and so on.

Thus coefficient of  $z^n$  in the expansion of (1) is sum of (2), (3) and (4) etc.

$$= \frac{1.3.5\dots(2n-1)}{n!} \left[ x^n - \frac{n(n-1)}{2(2n-1)} \cdot x^{n-2} + \frac{n(n-1)(n-2)(n-3)}{2.4(2n-1)(2n-3)} x^{n-4} - \dots \right] = P_n(x)$$

Thus coefficients of  $z, z^2, z^3 \dots$  etc. in (1) are  $P_1(x), P_2(x), P_3(x) \dots$

Hence

$$(1 - 2xz + z^2)^{-1/2} = P_0(x) + zP_1(x) + z^2P_2(x) + z^3P_3(x) + \dots + z^n P_n(x) + \dots$$

i.e., 
$$(1 - 2xz + z^2)^{-1/2} = \sum_{n=0}^{\infty} P_n(x) \cdot z^n.$$
 **Proved.**

**Example 6.** Prove that  $P_n(1) = 1$ .

**Solution.** We know that

$$(1 - 2xz + z^2)^{-1/2} = 1 + zP_1(x) + z^2P_2(x) + z^3P_3(x) + \dots + z^n P_n(x) + \dots$$

Substituting 1 for  $x$  in the above equation, we get

$$(1 - 2z + z^2)^{-1/2} = 1 + zP_1(1) + z^2P_2(1) + z^3P_3(1) + \dots + z^n P_n(1) + \dots$$

$$[(1-z)^2]^{-1/2} = \sum_{n=0}^{\infty} z^n P_n(1) \Rightarrow (1-z)^{-1} = \sum z^n P_n(1)$$

$$\Rightarrow \sum z^n P_n(1) = (1-z)^{-1} = 1 + z + z^2 + z^3 + \dots + z^n + \dots$$

Equating the coefficients of  $z^n$  on both sides, we get

$$P_n(1) = 1$$

**Proved.**

**Example 7.** Prove that  $\sum_{n=0}^{\infty} P_n(x) = \frac{1}{\sqrt{2-2x}}$ .

**Solution.** We know that  $(1 - 2xz + z^2)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^n P_n(x)$  ... (1)

Putting  $z = 1$  in (1), we get

$$(1 - 2x + 1)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} P_n(x)$$

$$\frac{1}{\sqrt{2-2x}} = \sum_{n=0}^{\infty} P_n(x)$$

**Proved.**

**Example 8.** Prove that :  $\sum_{n=0}^{\infty} \frac{x^{n+1}}{n+1} P_n(x) = \frac{1}{2} \log \left( \frac{1+x}{1-x} \right)$

**Solution.** We know that  $\sum_{n=0}^{\infty} h^n P_n(x) = (1 - 2xh + h^2)^{-1/2}$

Integrating both sides w.r.t.  $h$  from 0 to  $h$ , we get

$$\sum_{n=0}^{\infty} \frac{h^{n+1}}{n+1} P_n(x) = \int_0^h \frac{dh}{\sqrt{1-2hx+h^2}} = \int_0^h \frac{dh}{\sqrt{(h-x)^2 + (1-x^2)}}; \text{ if } |x| < 1 \quad \begin{array}{l} \text{Here } x \text{ is constant} \\ \text{h is variable.} \end{array}$$

$$= \log \frac{(h-x) + \sqrt{h^2 - 2hx + 1}}{1-x} \quad \left[ \int \frac{dh}{\sqrt{h^2 + a^2}} = \log \frac{h + \sqrt{h^2 + a^2}}{a} \right]$$

Putting  $h = x$  in the expression, we get

$$\sum_{n=0}^{\infty} \frac{x^{n+1}}{n+1} P_n(x) = \log \left( \frac{\sqrt{1-x^2}}{1-x} \right) = \frac{1}{2} \log \left( \frac{1+x}{1-x} \right)$$

**Proved.**

**Example 9.** Show that

$$P_n(-x) = (-1)^n P_n(x) \text{ and } P_n(-1) = (-1)^n. \quad (\text{AMIETE, June 2010})$$

**Solution.** We know that

$$(1 - 2xz + z^2)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^n P_n(x) \quad \dots (1)$$

Putting  $-x$  for  $x$  in both sides of (1), we get

$$(1 + 2xz + z^2)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^n P_n(-x) \quad \dots (2)$$

Again putting  $-z$  for  $z$  in (1), we obtain

$$(1+2xz+z^2)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} (-1)^n z^n P_n(x) \quad \dots (3)$$

$$\text{From (2) and (3), we have } \sum_{n=0}^{\infty} z^n P_n(-x) = \sum_{n=0}^{\infty} (-1)^n z^n P_n(x) \quad \dots (4)$$

Comparing the coefficients of  $z^n$  from both sides of (4), we obtain

$$P_n(-x) = (-1)^n P_n(x) \quad \dots (5)$$

Putting  $x = 1$  in (5), we get  $P_n(-1) = (-1)^n P_n(1) = (1)(-1)^n$   $[P_n(1) = 1]$

(1) If  $n$  is even, then from (5)

$$P_n(-x) = P_n(x),$$

So  $P_n(x)$ , is even function of  $x$ .

(ii) If  $n$  is odd, then from (5)

$P_n(-x) = -P_n(x)$ , so  $P_n(x)$  is an odd function. **Proved.**

**Example 10.** Prove that (i)  $P'_n(1) = \frac{1}{2}n(n+1)$

$$(ii) P'_n(-1) = (-1)^{n-1} \frac{n}{2}(n+1)$$

**Solution.** Legendre's equation is

$$(1-x^2) \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + n(n+1)y = 0 \quad \dots (1)$$

$$(1-x^2) P''_n(x) - 2x P'_n(x) + n(n+1) P_n(x) = 0 \quad \dots (2)$$

$[P_n(x)$  is the solution of (1)]

(i) Putting  $x = 1$  in (2), we get

$$0 - 2P'_n(1) + n(n+1)P_n(1) = 0 \Rightarrow 2P'_n(1) = n(n+1)(1) \quad [P_n(1) = 1]$$

$$\Rightarrow P'_n(1) = \frac{1}{2}n(n+1) \quad \text{Proved.}$$

(ii) On putting  $x = -1$  in (2), we get

$$0 + 2P'_n(-1) + n(n+1)P_n(-1) = 0$$

$$\Rightarrow 2P'_n(-1) + n(n+1)(-1)^n P_n(1) = 0$$

$$\Rightarrow 2P'_n(-1) + n(n+1)(-1)^n(1) = 0 \Rightarrow 2P'_n(-1) - n(n+1)(-1)^{n-1} = 0$$

$$\Rightarrow P'_n(-1) = (-1)^{n-1} \frac{1}{2}n(n+1) \quad \text{Proved.}$$

**Example 11.** Show that

$$(i) P_{2n}(0) = (-1)^n \frac{1.3.5\dots(2n-1)}{2.4.6\dots2n} \quad (ii) P_{2n+1}(0) = 0.$$

(U.P., II Semester, Summer 2008, 2005)

**Solution.** We know that  $\sum z^{2n} P_{2n}(x) = (1-2xz+z^2)^{-1/2}$

On putting  $x = 0$

$$\begin{aligned} \sum z^{2n} P_{2n}(0) &= (1+z^2)^{-1/2} \\ &= 1 + \left(-\frac{1}{2}\right) z^2 + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)}{2!} (z^2)^2 + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)}{3!} (z^2)^3 \\ &\quad + \dots + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+1\right)}{n!} (z^2)^n + \dots \end{aligned}$$

Equating the coefficient of  $z^{2n}$  both sides, we get

$$\begin{aligned} P_{2n}(0) &= \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)\dots\left(-\frac{1}{2}-n+1\right)}{n!} = (-1)^n \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{2^n \cdot n!} \\ &= (-1)^n \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{2 \cdot 4 \cdot 6 \cdot 8 \dots 2n} \end{aligned}$$

**Proved.**

Equating the coefficient of  $z^{2n+1}$  of both sides, we get  $P_{2n+1}(0) = 0$

**Example 12.** Show that

$$\frac{1-z^2}{(1-2xz+z^2)^{3/2}} = \sum_{n=0}^{\infty} (2n+1) P_n \cdot z^n$$

**Solution.** We know that

$$(1-2xz+z^2)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^n P_n(x) \quad \dots (1)$$

Differentiating both sides of (1) with respect to  $z$ , we get

$$\begin{aligned} -\frac{1}{2}(1-2xz+z^2)^{-\frac{3}{2}}(-2x+2z) &= \sum_{n=0}^{\infty} n z^{n-1} \cdot P_n(x) \\ \Rightarrow \frac{x-z}{(1-2xz+z^2)^{3/2}} &= \sum_{n=0}^{\infty} n z^{n-1} P_n(x) \end{aligned} \quad \dots (2)$$

Multiplying both sides of (2) by  $2z$ , we get

$$\frac{2xz-2z^2}{(1-2xz+z^2)^{3/2}} = \sum_{n=0}^{\infty} 2n z^n P_n(x) \quad \dots (3)$$

On adding (1) and (3), we get

$$\begin{aligned} (1-2xz+z^2)^{-\frac{1}{2}} + \frac{2xz-2z^2}{(1-2xz+z^2)^{3/2}} &= \sum_{n=0}^{\infty} z^n P_n(x) + \sum_{n=0}^{\infty} 2n z^n P_n(x) \\ \Rightarrow \frac{1-2xz+z^2+2xz-2z^2}{(1-2xz+z^2)^{3/2}} &= \sum_{n=0}^{\infty} (2n+1) z^n P_n(x) \\ \Rightarrow \frac{1-z^2}{(1-2xz+z^2)^{3/2}} &= \sum_{n=0}^{\infty} (2n+1) z^n P_n \end{aligned} \quad \text{Proved.}$$

**Example 13.** Prove that  $\frac{1+z}{z\sqrt{(1-2xz+z^2)}} - \frac{1}{z} = \sum_{n=0}^{\infty} (P_n + P_{n+1}) z^n$

(A.M.I.E.T.E., Summer 2001)

$$\begin{aligned} \text{Solution.} \quad \text{R.H.S.} &= \sum_{n=0}^{\infty} (P_n + P_{n+1}) z^n = \sum_{n=0}^{\infty} z^n P_n + \sum_{n=0}^{\infty} z^n P_{n+1} \\ &= \sum_{n=0}^{\infty} z^n P_n + \frac{1}{z} \sum_{n=0}^{\infty} z^{n+1} P_{n+1} \end{aligned} \quad \dots (1)$$

But

$$\sum_{n=0}^{\infty} z^n P_n = P_0 + z P_1 + z^2 P_2 + z^3 P_3 + \dots$$

And

$$\sum_{n=0}^{\infty} z^{n+1} P_{n+1} = z P_1 + z^2 P_2 + z^3 P_3 + \dots$$

$$= -P_0 + P_0 + z P_1 + z^2 P_2 + z^3 P_3 + \dots = -P_0 + \sum z^n P_n$$

Putting the value of  $\sum_{n=0}^{\infty} z^{n+1} P_{n+1}$  in (1), we get

$$\begin{aligned}\text{R.H.S.} &= \sum_{n=0}^{\infty} z^n P_n + \frac{1}{z} [\Sigma z^n P_n - P_0] = \left(1 + \frac{1}{z}\right) \sum_{n=0}^{\infty} z^n P_n - \frac{P_0}{z} \\ &= \left(1 + \frac{1}{z}\right) (1 - 2xz + z^2)^{-\frac{1}{2}} - \frac{1}{z} = \text{L.H.S.} \quad (P_0 = 1) \\ &= \frac{1+z}{z\sqrt{(1-2xz+z^2)}} - \frac{1}{z} = \text{L.H.S.} \quad \text{Proved.}\end{aligned}$$

**Example 14.** Prove that

$$P_n\left(-\frac{1}{2}\right) = P_0\left(-\frac{1}{2}\right) P_{2n}\left(\frac{1}{2}\right) + P_1\left(-\frac{1}{2}\right) P_{2n-1}\left(\frac{1}{2}\right) + \dots + P_{2n}\left(-\frac{1}{2}\right) P_0\left(\frac{1}{2}\right)$$

**Solution.** We know that

$$(1 - 2xz + z^2)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^n P_n(x) \quad \dots (1)$$

Substituting  $\frac{1}{2}$  for  $x$  in (1), we have

$$(1 - z + z^2)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^n P_n\left(\frac{1}{2}\right) \quad \dots (2)$$

Again putting  $-\frac{1}{2}$  for  $x$  in (1), we have

$$(1 + z + z^2)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^n P_n\left(-\frac{1}{2}\right) \quad \dots (3)$$

Replacing  $z$  by  $z^2$  in (3), we obtain

$$(1 + z^2 + z^4)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^{2n} P_n\left(-\frac{1}{2}\right) \quad \dots (4)$$

But

$$\begin{aligned}(1 + z^2 + z^4)^{-\frac{1}{2}} &= [(1 + z^2)^2 - z^2]^{-\frac{1}{2}} \\ &= [(1 + z^2 + z)(1 + z^2 - z)]^{-\frac{1}{2}} \\ &= (1 + z + z^2)^{-\frac{1}{2}} (1 - z + z^2)^{-\frac{1}{2}} \quad \dots (5)\end{aligned}$$

Putting the values of  $(1 + z + z^2)^{-\frac{1}{2}}$  and  $(1 - z + z^2)^{-\frac{1}{2}}$  from (3) and (2) in (5), we get

$$(1 + z^2 + z^4)^{-\frac{1}{2}} = \sum_{n=0}^{\infty} z^n P_n\left(-\frac{1}{2}\right) \cdot \sum_{n=0}^{\infty} z^n P_n\left(\frac{1}{2}\right) \quad \dots (6)$$

Now substituting the value of  $(1 + z^2 + z^4)^{-\frac{1}{2}}$  from (4) in (6), we get

$$\begin{aligned}\sum_{n=0}^{\infty} z^{2n} P_n\left(-\frac{1}{2}\right) &= \sum_{n=0}^{\infty} z^n P_n\left(-\frac{1}{2}\right) \cdot \sum_{n=0}^{\infty} z^n P_n\left(\frac{1}{2}\right) \\ &= \left[ P_0\left(-\frac{1}{2}\right) + z P_1\left(-\frac{1}{2}\right) + \dots + z^{2n-1} P_{2n-1}\left(-\frac{1}{2}\right) + z^{2n} P_{2n}\left(-\frac{1}{2}\right) + \dots \right] \\ &\quad \left[ P_0\left(\frac{1}{2}\right) + z P_1\left(\frac{1}{2}\right) + \dots + z^{2n-1} P_{2n-1}\left(\frac{1}{2}\right) + z^{2n} P_{2n}\left(\frac{1}{2}\right) + \dots \right]\end{aligned}$$

On equating the coefficients of  $z^{2n}$  on both sides, we have

$$\begin{aligned} P_n\left(-\frac{1}{2}\right) &= P_0\left(-\frac{1}{2}\right)P_{2n}\left(\frac{1}{2}\right) + P_1\left(-\frac{1}{2}\right)P_{2n-1}\left(\frac{1}{2}\right) \\ &\quad + \dots + P_{2n-1}\left(-\frac{1}{2}\right)P_1\left(\frac{1}{2}\right) + P_{2n}\left(-\frac{1}{2}\right)P_0\left(\frac{1}{2}\right) \end{aligned} \quad \text{Proved.}$$

**Example 15.** Prove that

$$1 + \frac{1}{2}P_1(\cos \theta) + \frac{1}{3}P_2(\cos \theta) + \frac{1}{4}P_3(\cos \theta) + \dots = \log \frac{1 + \sin \frac{\theta}{2}}{\sin \frac{\theta}{2}}$$

**Solution.** We know that

$$\begin{aligned} \sum_{n=0}^{\infty} z^n P_n(x) &= (1 - 2xz + z^2)^{-\frac{1}{2}} = [z^2 - 2xz + x^2 + 1 - x^2]^{-\frac{1}{2}} \\ &= [(z-x)^2 + (1-x^2)]^{-\frac{1}{2}} = \frac{1}{\sqrt{(z-x)^2 + (\sqrt{1-x^2})^2}} \end{aligned} \quad \dots (1)$$

On integrating both sides of (1) w.r.t., 'z' between the limits 0 to 1, we have

$$\begin{aligned} \sum_{n=0}^{\infty} P_n(x) \int_0^1 z^n dz &= \int_0^1 \frac{dz}{\sqrt{(z-x)^2 + (\sqrt{1-x^2})^2}} \\ \sum_{n=0}^{\infty} P_n(x) \cdot \left[ \frac{z^{n+1}}{n+1} \right]_0^1 &= \log \left[ (z-x) + \sqrt{(z-x)^2 + (1-x^2)} \right]_0^1 \\ &\quad \left[ \int \frac{dx}{\sqrt{(x^2 + a^2)}} = \log \left\{ x + \sqrt{(x^2 + a^2)} \right\} \right] \\ &= \log \left[ (1-x) + \sqrt{(1-2xz+z^2)} \right]_0^1 \\ \sum_{n=0}^{\infty} P_n(x) \left( \frac{1}{n+1} \right) &= \log [(1-x) + \sqrt{(1-2x+1)}] - \log(-x+1) \\ &= \log [1-x+\sqrt{2-2x}] - \log(-x+1) \end{aligned}$$

Replacing  $x$  by  $\cos \theta$ , we get

$$\begin{aligned} \sum_{n=0}^{\infty} \frac{P_n(\cos \theta)}{n+1} &= \log [1-\cos \theta + \sqrt{2-2\cos \theta}] - \log(-\cos \theta + 1) \quad \left[ \cos \theta = 1 - 2 \sin^2 \frac{\theta}{2} \right] \\ &= \log \left[ 1 - \left( 1 - 2 \sin^2 \frac{\theta}{2} \right) + \sqrt{2 - 2 \left( 1 - 2 \sin^2 \frac{\theta}{2} \right)} \right] - \log \left\{ 1 - \left( 1 - 2 \sin^2 \frac{\theta}{2} \right) \right\} \\ &= \log \left\{ 2 \sin^2 \frac{\theta}{2} + 2 \sin \frac{\theta}{2} \right\} - \log 2 \sin^2 \frac{\theta}{2} = \log \frac{\left\{ 2 \sin^2 \frac{\theta}{2} + 2 \sin \frac{\theta}{2} \right\}}{2 \sin^2 \frac{\theta}{2}} \\ \Rightarrow \sum_{n=0}^{\infty} \frac{P_n(\cos \theta)}{n+1} &= \log \frac{\sin \frac{\theta}{2} + 1}{\sin \frac{\theta}{2}} \\ \Rightarrow \log \frac{1 + \sin \frac{\theta}{2}}{\sin \frac{\theta}{2}} &= P_0(\cos \theta) + \frac{1}{2}P_1(\cos \theta) + \frac{1}{3}P_2(\cos \theta) + \frac{1}{4}P_3(\cos \theta) + \dots \end{aligned}$$

$$\Rightarrow \log \frac{1+\sin \frac{\theta}{2}}{\sin \frac{\theta}{2}} = 1 + \frac{1}{2} P_1(\cos \theta) + \frac{1}{3} P_2(\cos \theta) + \frac{1}{4} P_3(\cos \theta) + \dots \quad \text{Proved.}$$

## 34.8 ORTHOGONALITY OF LEGENDRE POLYNOMIALS

(AMIETE, June 2010)

$$\int_{-1}^{+1} P_m(x) \cdot P_n(x) dx = 0 \quad n \neq m$$

**Proof.**  $P_n(x)$  is a solution of

$$(1-x^2) \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + n(n+1)y = 0 \quad \dots (1)$$

 $P_m(x)$  is the solution of

$$(1-x^2) \frac{d^2z}{dx^2} - 2x \frac{dz}{dx} + m(m+1)z = 0 \quad \dots (2)$$

Multiplying (1) by  $z$  and (2) by  $y$  and subtracting, we get

$$\begin{aligned} & (1-x^2) \left[ z \frac{d^2y}{dx^2} - y \frac{d^2z}{dx^2} \right] - 2x \left[ z \frac{dy}{dx} - y \frac{dz}{dx} \right] + [n(n+1) - m(m+1)]yz = 0 \\ & (1-x^2) \left[ \left\{ z \frac{d^2y}{dx^2} + \frac{dz}{dx} \frac{dy}{dx} \right\} - \left\{ \frac{dy}{dx} \frac{dz}{dx} + y \frac{d^2z}{dx^2} \right\} \right] - 2x \left\{ z \frac{dy}{dx} - y \frac{dz}{dx} \right\} + (n-m)(n+m+1)yz = 0 \\ \Rightarrow & \frac{d}{dx} \left[ (1-x^2) \left( z \frac{dy}{dx} - y \frac{dz}{dx} \right) \right] + (n-m)(n+m+1)yz = 0 \end{aligned}$$

Now integrating from  $-1$  to  $1$ , we get

$$\begin{aligned} & \left[ (1-x^2) \left( z \frac{dy}{dx} - y \frac{dz}{dx} \right) \right]_{-1}^{+1} + (n-m)(n+m+1) \int_{-1}^{+1} y \cdot z dx = 0. \\ \Rightarrow & 0 + (n-m)(n+m+1) \int_{-1}^{+1} y \cdot z dx = 0 \quad \{y = P_n(x), z = P_m(x)\} \\ & \int_{-1}^{+1} P_n(x) \cdot P_m(x) dx = 0 \quad \text{if } n \neq m. \quad \text{Proved.} \end{aligned}$$

**Example 16.** Prove that

$$\int_{-1}^{+1} [P_n(x)]^2 dx = \frac{2}{2n+1} \quad (\text{U.P., II Semester, June 2008, 2004, 2002})$$

$$\text{and hence show that } \int_{-1}^{+1} P_3^2(x) dx = \frac{2}{7} \quad (\text{AMIETE, June 2010})$$

**Solution.** We know that  $(1 - 2xz + z^2)^{-1/2} = \sum z^n P_n(x)$ 

Squaring both sides, we get

$$(1 - 2xz + z^2)^{-1} = \sum z^{2n} P_n^2(x) + 2 \sum z^{m+n} P_m(x) \cdot P_n(x)$$

Integrating both sides between  $-1$  and  $+1$ , we have

$$\begin{aligned} & \int_{-1}^{+1} \sum z^{2n} P_n^2(x) dx + \int_{-1}^{+1} 2 \sum z^{m+n} P_m(x) \cdot P_n(x) dx = \int_{-1}^{+1} (1 - 2xz + z^2)^{-1} dx \\ & \int_{-1}^{+1} \sum z^{2n} P_n^2(x) dx + 0 = \int_{-1}^{+1} \frac{1}{1 - 2xz + z^2} dx \end{aligned}$$

$$\begin{aligned}
\Rightarrow \quad \Sigma z^{2n} \int_{-1}^{+1} P_n^2(x) dx &= -\frac{1}{2z} \{\log(1-2xz+z^2)\}_{-1}^{+1} \\
&= -\frac{1}{2z} \log \frac{1-2z+z^2}{1+2z+z^2} = -\frac{1}{2z} \log \left( \frac{1-z}{1+z} \right)^2 \\
&= \frac{1}{z} \log \frac{1+z}{1-z} = \frac{1}{z} [\log(1+z) - \log(1-z)] \\
&= \frac{1}{z} \left[ \left( z - \frac{z^2}{2} + \frac{z^3}{3} - \frac{z^4}{4} + \dots + \frac{z^{2n+1}}{2n+1} + \dots \right) - \left( -z - \frac{z^2}{2} - \frac{z^3}{3} - \frac{z^4}{4} - \dots - \frac{z^{2n+1}}{2n+1} - \dots \right) \right] \\
\Sigma z^{2n} \int_{-1}^{+1} P_n^2(x) dx &= \frac{2}{z} \left[ z + \frac{z^3}{3} + \frac{z^5}{5} + \dots + \frac{z^{2n+1}}{2n+1} + \dots \right] = 2 \left[ 1 + \frac{z^2}{3} + \frac{z^4}{5} + \dots + \frac{z^{2n}}{2n+1} + \dots \right]
\end{aligned}$$

Equating the coefficient of  $z^{2n}$  on both sides, we have

$$\int_{-1}^{+1} [P_n(x)]^2 dx = \frac{2}{2n+1}. \quad \text{Proved.}$$

$$\text{Hence} \quad \int_{-1}^{+1} P_3^2(x) dx = \frac{2}{2 \times 3 + 1} = \frac{2}{7}. \quad \text{Proved.}$$

**Example 17.** Prove that

$$\int_{-1}^{+1} P_n(x) (1-2xt+t^2)^{-1/2} dx = \frac{2t^n}{2n+1}$$

where  $n$  is a positive integer.

$$\begin{aligned}
\text{Solution.} \quad \text{L.H.S.} &= \int_{-1}^{+1} P_n(x) (1-2xt+t^2)^{-1/2} dx = \int_{-1}^{+1} P_n(x) \left\{ \sum t^n P_n(x) \right\} dx \\
&= \int_{-1}^{+1} P_n(x) [P_0(x) + t P_1(x) + t^2 P_2(x) + t^3 P_3(x) + \dots + t^n P_n(x) + \dots] dx \\
&= t^n \int_{-1}^{+1} P_n^2(x) dx \quad \left[ \begin{array}{l} \text{All other terms vanish since} \\ \int_{-1}^{+1} P_m(x) P_n(x) dx = 0; m \neq n \end{array} \right] \\
&= t^n \cdot \frac{2}{2n+1} = \text{R.H.S.} \quad [\text{By II orthogonal property}] \quad \text{Proved.}
\end{aligned}$$

**Example 18.** Show that

$$\int_{-1}^{+1} (1-x^2) P_m' P_n' dx = \begin{cases} 0, & \text{when } m \neq n \\ \frac{2n(n+1)}{2n+1}, & \text{when } m = n \end{cases}$$

where dashes denote differentiation w.r.t.  $x$ .

(U.P. II Semester summer 2006)

$$\begin{aligned}
\text{Solution.} \quad \text{We have,} \quad &\int_{-1}^{+1} (1-x^2) P_m' P_n' dx \\
&= \left[ (1-x^2) P_m' P_n \right]_{-1}^{+1} - \int_{-1}^{+1} P_n \left[ \frac{d}{dx} (1-x^2) P_m' \right] dx \quad [\text{Integrating by parts}] \\
&= 0 - \int_{-1}^{+1} P_n \frac{d}{dx} \{(1-x^2) P_m'\} dx \quad \left[ \begin{array}{l} \text{From Legendre's differential equation} \\ \frac{d}{dx} \{(1-x^2) P_m'\} + m(m+1) P_m = 0 \end{array} \right] \\
&= - \int_{-1}^{+1} P_n \{-m(m+1)P_m\} dx \quad (\text{Orthogonality})
\end{aligned}$$

$$= m(m+1) \int_{-1}^1 P_n P_m dx = m(m+1) \cdot 0 = 0 \quad \left[ \int_{-1}^{+1} P_n P_m dx = 0, \text{ when } m \neq n \right]$$

By putting  $m = n$  in example 18, we can also prove that

$$\int_{-1}^1 (1-x^2) (P_n')^2 dx = \frac{2n(n+1)}{2n+1}$$

(Orthogonality Property)

**Proved.**

**Example 19.** Assuming that a polynomial  $f(x)$  of degree  $n$  can be written as

$$f(x) = \sum_{m=0}^{\infty} C_m P_m(x),$$

show that

$$C_m = \frac{2m+1}{2} \int_{-1}^1 f(x) P_m(x) dx$$

**Solution.** We have,  $f(x) = \sum_{m=0}^{\infty} C_m P_m(x)$   
 $= C_0 P_0(x) + C_1 P_1(x) + C_2 P_2(x) + C_3 P_3(x) + C_4 P_4(x) + \dots + C_m P_m(x) + \dots$

Multiplying both sides by  $P_m(x)$ , we get

$$\begin{aligned} P_m(x) f(x) &= C_0 P_0(x) P_m(x) + C_1 P_1(x) P_m(x) + C_2 P_2(x) P_m(x) + \dots + C_m P_m^2(x) + \dots \\ \int_{-1}^{+1} f(x) P_m(x) dx &= \int_{-1}^{+1} [C_0 P_0(x) P_m(x) + C_1 P_1(x) P_m(x) + C_2 P_2(x) P_m(x) + \dots + C_m P_m^2(x) + \dots] dx \\ &= \left[ 0 + 0 + \dots + C_m \frac{2}{2m+1} + \dots \right] = \frac{2C_m}{2m+1} \\ C_m &= \frac{2m+1}{2} \int_{-1}^{+1} f(x) P_m(x) dx \end{aligned}$$

**Proved.**

**Example 20.** Using the Rodrigue's formula for Legendre function, prove that

$$\int_{-1}^{+1} x^m P_n(x) dx = 0, \text{ where } m, n \text{ are positive integers and } m < n.$$

**Solution.**  $\int_{-1}^{+1} x^m P_n(x) dx = \int_{-1}^{+1} x^m \frac{1}{2^n n!} \frac{d^n}{dx^n} (x^2 - 1)^n dx = \frac{1}{2^n n!} \int_{-1}^{+1} x^m \frac{d^n}{dx^n} (x^2 - 1)^n dx$

On integrating by parts, we get

$$\begin{aligned} &= \frac{1}{2^n n!} \left[ \left\{ x^m \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n \right\}_{-1}^{+1} - \int_{-1}^{+1} m x^{m-1} \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n dx \right] \\ &= 0 - \frac{m}{2^n n!} \int_{-1}^{+1} x^{m-1} \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n dx \end{aligned}$$

Similarly,  $\frac{m}{2^n n!} \int_{-1}^{+1} x^{m-1} \frac{d^{n-1}}{dx^{n-1}} (x^2 - 1)^n dx = -(-1)^2 \frac{m(m-1)}{2^2 n!} \int_{-1}^{+1} x^{m-2} \frac{d^{n-2}}{dx^{n-2}} (x^2 - 1)^n dx$

Integrating R.H.S.,  $m-2$  times, we get

$$\begin{aligned} \int_{-1}^{+1} x^m P_n(x) dx &= (-1)^m \frac{m(m-1)\dots 1}{2^n n!} \int_{-1}^{+1} \frac{d^{n-m}}{dx^{n-m}} (x^2 - 1)^n dx \\ &= \frac{(-1)^m m!}{2^n n!} \int_{-1}^{+1} \frac{d^{n-m}}{dx^{n-m}} (x^2 - 1)^n dx \\ &= \frac{(-1)^m m!}{2^n n!} \left[ \frac{d^{n-m-1}}{dx^{n-m-1}} (x^2 - 1)^n \right]_{-1}^{+1} = 0 \end{aligned}$$

**Proved.**

### 34.9 RECURRENCE FORMULAE

The following recurrence formulae are derived from the generating function. These formulae are very useful in solving the questions. So they are to be committed to memory.

1.	$(n+1)P_{n+1}(x)$	$= (2n+1)x P_n(x) - n P_{n-1}(x)$
2.	$n P_n(x)$	$= x P'_n(x) - P'_{n-1}(x)$
3.	$(2n+1) P_n(x)$	$= P'_{n+1}(x) - P'_{n-1}(x)$
4.	$P'_n(x)$	$= x P'_{n-1} + n P_{n-1}(x)$
5.	$(x^2 - 1) P'_n(x)$	$= n[x P_n - P_{n-1}]$
6.	$(x^2 - 1) P'_n(x)$	$= (n+1)[P_{n+1}(x) - x P_n(x)]$

**Formula I.** 
$$(n+1)P_{n+1} = (2n+1)x P_n - n P_{n-1}$$

**Solution.** We know that,  $(1 - 2xz + z^2)^{-1/2} = \sum z^n P_n(x)$

Differentiating w.r.t, 'z', we get

$$-\frac{1}{2}(1 - 2xz + z^2)^{-3/2}(-2x + 2z) = \sum nz^{n-1} P_n(x)$$

Multiplying both sides by  $(1 - 2xz + z^2)$ , we get

$$\begin{aligned} (1 - 2xz + z^2)^{-1/2}(x - z) &= (1 - 2xz + z^2)\sum nz^{n-1} P_n(x) \\ (x - z)\sum z^n P_n(x) &= (1 - 2xz + z^2)\sum nz^{n-1} P_n(x) \end{aligned} \quad \dots (1)$$

Equating the coefficients of  $z^n$  on both sides of (1), we get

$$\begin{aligned} xP_n(x) - P_{n-1}(x) &= (n+1)P_{n+1}(x) - 2x(n)P_n(x) + (n-1)P_{n-1}(x) \\ (n+1)P_{n+1}(x) &= (2n+1)x P_n - n P_{n-1} \end{aligned} \quad \text{Proved.}$$

**Formula II.** 
$$nP_n = x P'_n - P'_{n-1} \quad (\text{U.P., II Semester, summer, 2009, 2006})$$

**Solution.** We know that,  $(1 - 2xz + z^2)^{-1/2} = \sum z^n P_n(x)$  ... (1)

Differentiating (1) with respect to  $z$ , we get

$$-\frac{1}{2}(1 - 2xz + z^2)^{-3/2}(-2x + 2z) = \sum nz^{n-1} P_n(x)$$

$$\Rightarrow (x - z)(1 - 2xz + z^2)^{-3/2} = \sum nz^{n-1} P_n(x) \quad \dots (2)$$

Differentiating (1) with respect to  $x$ , we get

$$-\frac{1}{2}(1 - 2xz + z^2)^{-3/2}(-2z) = \sum z^n P'_n(x)$$

$$\Rightarrow z(1 - 2xz + z^2)^{-3/2} = \sum z^n P'_n(x) \quad \dots (3)$$

Dividing (2) by (3), we get

$$\frac{x - z}{z} = \frac{\sum nz^{n-1} P_n(x)}{\sum z^n P'_n(x)}$$

$$\Rightarrow (x - z)\sum z^n P'_n(x) = \sum nz^n P_n(x)$$

Equating coefficients of  $z^n$  on both sides, we get

$$x P'_n(x) - P'_{n-1}(x) = n P_n(x) \quad \text{Proved.}$$

**Formula III.**

$$\boxed{P'_{n+1} - P'_{n-1} = (2n+1)P_n}$$

**Solution.** We know that,  $(n+1)P_{n+1} = (2n+1)xP_n - nP_{n-1}$  (Recurrence Formula I) ... (1)

Differentiating (1) w.r.t. 'x', we get

$$(n+1)P'_{n+1} = (2n+1)P_n + (2n+1)xP'_n - nP'_{n-1} \quad \dots (2)$$

$$xP'_n - P'_{n-1} = nP_n \quad (\text{Recurrence formula II}) \dots (3)$$

Substituting the value of  $xP'_n$  from (3) into (2), we get

$$(n+1)P'_{n+1} = (2n+1)P_n + (2n+1)[nP_n + P'_{n-1}] - nP'_{n-1}$$

$$\Rightarrow (n+1)P'_{n+1} - (n+1)P'_{n-1} = (2n+1)(1+n)P_n$$

$$\Rightarrow (2n+1)P_n = P'_{n+1} - P'_{n-1} \quad \text{Proved.}$$

**Formula IV.**

$$\boxed{P'_n - xP'_{n-1} = nP_{n-1}} \quad (\text{U.P. II Semester, 2010})$$

**Solution.** We know that,  $(n+1)P_{n+1} = (2n+1)xP_n - nP_{n-1}$  (Formula I)

Replacing  $n$  by  $n - 1$ , we get

$$nP_n = (2n-1)xP_{n-1} - (n-1)P_{n-2}$$

Differentiating the above formula w.r.t. 'x', we get

$$nP'_n = (2n-1)P_{n-1} + (2n-1)xP'_{n-1} - (n-1)P'_{n-2}$$

$$\Rightarrow n[P'_n - xP'_{n-1}] - (n-1)[xP'_{n-1} - P'_{n-2}] = (2n-1)P_{n-1}$$

$$n[P'_n - xP'_{n-1}] - (n-1)[(n-1)P_{n-1}] = (2n-1)P_{n-1} \quad (\text{Form formula II})$$

$$\Rightarrow n[P'_n - xP'_{n-1}] = [(n-1)^2 + (2n-1)]P_{n-1} = n^2 P_{n-1}$$

$$\Rightarrow P'_n - xP'_{n-1} = nP_{n-1}. \quad \text{Proved.}$$

**Formula V.**

$$\boxed{(x^2 - 1)P'_n = n[xP_n - P_{n-1}]}$$

**Solution.** We know that,  $P'_n - xP'_{n-1} = nP_{n-1}$  ... (1) (Recurrence Formula III)

$$xP'_n - P'_{n-1} = nP_n \quad \dots (2) \quad (\text{Recurrence Formula II})$$

Multiplying (2) by  $x$  and subtracting from (1), we get

$$(1-x^2)P'_n = n(P_{n-1} - xP_n). \quad \text{Proved.}$$

**Formula VI.**

$$\boxed{(x^2 - 1)P'_n = (n+1)(P_{n+1} - xP_n).} \quad (\text{U.P. II Semester, June 2007})$$

**Solution.** We know that,  $(n+1)P_{n+1} = (2n+1)xP_n - nP_{n-1}$  (Recurrence formula I)

Which can be written as

$$(n+1)(P_{n+1} - xP_n) = n(xP_n - P_{n-1}) \quad \dots (1)$$

$$\text{But } (x^2 - 1)P'_n = n(xP_n - P_{n-1}) \quad \dots (2) \quad (\text{Recurrence formula V})$$

From (1) and (2), we get

$$\Rightarrow (x^2 - 1)P'_n = (n+1)(P_{n+1} - xP_n). \quad \text{Proved.}$$

**Example 21.** If  $P_n(x)$  is a Legendre polynomial of degree  $n$  and  $\alpha$  is such that  $P_n(\alpha) = 0$ . Show that  $P_{n-1}(\alpha)$  and  $P_{n+1}(\alpha)$  are of opposite signs.

**Solution.** From Recurrence relation (1), we have

$$(2n+1)xP_n(x) = (n+1)P_{n+1}(x) + nP_{n-1}(x) \quad \dots (1)$$

Putting

$x = \alpha$  in (1), we get

$$(2n+1) \alpha \cdot P_n(\alpha) = (n+1) P_{n+1}(\alpha) + n P_{n-1}(\alpha) \quad \dots(2)$$

Putting

$P_n(\alpha) = 0$  (given) in (2), we get

$$(2n+1) \alpha \cdot 0 = (n+1) P_{n+1}(\alpha) + n P_{n-1}(\alpha)$$

$$\Rightarrow$$

$$\frac{P_{n+1}(\alpha)}{P_{n-1}(\alpha)} = \frac{n}{n+1} \quad \dots(3)$$

As  $n$  is a positive integer so R.H.S. of (3) is negative. Hence (3) shows that  $P_{n+1}(\alpha)$  and  $P_{n-1}(\alpha)$  are of opposite signs. **Proved.**

**Example 22.** Prove that  $\int P_n dx = \frac{1}{2n+1} [P_{n+1} - P_{n-1}] + C$

**Solution.** We know that  $(2n+1) P_n = P'_{n+1} - P'_{n-1}$  (Recurrence relation III)

Integrating

$$(2n+1) \int P_n dx = P_{n+1} - P_{n-1} + A$$

$$\int P_n dx = \frac{P_{n+1} - P_{n-1}}{2n+1} + C \quad \text{Proved.}$$

**Example 23.** Show that  $P'_{n+1} + P'_n = P_0 + 3P_1 + 5P_2 + \dots + (2n+1)P_n$

**Solution.** We know that

$$(2n+1) P_n = P'_{n+1} - P'_{n-1} \quad (\text{Recurrence formula III})$$

Putting

$n = 1, 2, 3, \dots n$  in succession, we get

$$3P_1 = P'_2 - P'_0 \quad \dots(1)$$

$$5P_2 = P'_3 - P'_1 \quad \dots(2)$$

$$7P_3 = P'_4 - P'_2 \quad \dots(3)$$

.....

.....

$$(2n-1) P_{n-1} = P'_n - P'_{n-2}$$

$$(2n+1) P_n = P'_{n+1} - P'_{n-1}$$

Adding (1), (2), (3) etc., we get

$$3P_1 + 5P_2 + 7P_3 + \dots + (2n-1) P_{n-1} + (2n+1) P_n = P'_{n+1} + P'_n - P'_0 - P'_1 = P'_{n+1} + P'_n - P_0$$

$$\Rightarrow P'_{n+1} + P'_n = P_0 + 3P_1 + 5P_2 + 7P_3 + \dots + (2n+1)P_n \quad [P'_1 = P_0 \text{ and } P'_0 = 0] \quad \text{Proved.}$$

**Example 24.** Prove that

$$(2n+1)(x^2 - 1) P'_n(x) = n(n+1) \{P_{n+1}(x) - P_{n-1}(x)\}$$

**Solution.** We know that

$$(x^2 - 1) P'_n(x) = (n+1) [P_{n+1}(x) - x P_n(x)] \quad \dots(1)$$

(Recurrence Formula VI)

$$(x^2 - 1) P'_n(x) = n[x P_n(x) - P_{n-1}(x)] \quad \dots(2)$$

(Recurrence Formula V)

$P_n(x)$  does not occur in the required result so we have to eliminate  $P_n(x)$ .

Multiplying (1) by  $n$  and (2) by  $(n+1)$  and then adding, we get

$$[n + (n+1)] (x^2 - 1) P'_n(x) = n(n+1) P_{n+1}(x) - n(n+1) P_{n-1}(x)$$

$$\Rightarrow (2n+1)(x^2 - 1) P'_n(x) = n(n+1) [P_{n+1}(x) - P_{n-1}(x)] \quad \text{Proved.}$$

**Example 25.** Prove that:

$$\int_{-1}^1 (x^2 - 1) P_{n+1} P_n' dx = \frac{2n(n+1)}{(2n+1)(2n+3)}$$

**Solution.** L.H.S. =  $\int_{-1}^1 (x^2 - 1) P_{n+1} P_n' dx \dots(1)$

From Recurrence relation (5),

$$\begin{aligned} n(P_{n-1} - xP_n) &= (1 - x^2)P_n' \\ \Rightarrow (x^2 - 1)P_n' &= n(xP_n - P_{n-1}) \end{aligned} \dots(2)$$

Now,  $\int_{-1}^1 (x^2 - 1) P_{n+1} P_n' dx = \int_{-1}^1 \{(x^2 - 1) P_n'\} P_{n+1} dx$

Putting the value of  $(x^2 - 1) P_n'$  from (2) in (1), we get

$$\begin{aligned} &= \int_{-1}^1 n(xP_n - P_{n-1}) P_{n+1} dx \\ &= n \int_{-1}^1 xP_n P_{n+1} dx - n \int_{-1}^1 P_{n-1} P_{n+1} dx \\ &= n \int_{-1}^1 xP_n P_{n+1} dx + 0 \quad \dots(3) \left[ \because \int_{-1}^1 P_{n-1} P_{n+1} dx = 0 \right] \end{aligned}$$

From Recurrence relation (1), we have

$$\begin{aligned} (2n+1)xP_n &= (n+1)P_{n+1} + nP_{n-1} \\ xP_n &= \frac{(n+1)P_{n+1} + nP_{n-1}}{(2n+1)} \end{aligned} \dots(4)$$

Putting the value of  $xP_n$  from (4) in (3), we get

$$\begin{aligned} \int_{-1}^1 (x^2 - 1) P_{n+1} P_n' dx &= n \int_{-1}^1 \left[ \frac{(n+1)P_{n+1} + nP_{n-1}}{2n+1} \right] P_{n+1} dx \quad [\text{From (2)}] \\ &= \frac{n(n+1)}{2n+1} \int_{-1}^1 P_{n+1}' dx + \frac{n^2}{2n+1} \int_{-1}^1 P_{n-1} P_{n+1} dx \\ &= \frac{n(n+1)}{2n+1} \cdot \frac{2}{2(n+1)+1} + 0 = \frac{2n(n+1)}{(2n+1)(2n+3)} \end{aligned}$$

**Proved.**

### 34.10 LAPLACE'S FIRST DEFINITE INTEGRAL FOR $P_n(x)$

$$P_n(x) = \frac{1}{\pi} \int_0^\pi [x \pm \sqrt{(x^2 - 1)} \cos \phi]^n d\phi$$

where  $n$  is a positive integer.

**Solution.** We know that

$$\int_0^\pi \frac{d\phi}{a \pm b \cos \phi} = \frac{\pi}{\sqrt{(a^2 - b^2)}} \quad (\text{If } a > b) \dots(1)$$

Put

$$a = 1 - xz \text{ and } b = z^2 \sqrt{(x-1)}, \text{ so that}$$

$$a^2 - b^2 = (1 - xz)^2 - z^2(x^2 - 1) = 1 - 2xz + z^2$$

Substituting the values of  $a$ ,  $b$  and  $a^2 - b^2$  in (1), we get

$$\int_0^\pi \frac{d\phi}{(1 - xz) \pm z \sqrt{(x^2 - 1)} \cos \phi} = \frac{\pi}{\sqrt{(1 - 2xz + z^2)}}$$

$$\Rightarrow \pi(1-2xz+z^2)^{-\frac{1}{2}} = \int_0^\pi \frac{d\phi}{1-z\{x \pm \sqrt{(x^2-1)} \cos \phi\}}$$

$$= \int_0^\pi [1-z\{x \pm \sqrt{(x^2-1)} \cos \phi\}]^{-1} d\phi$$

$$\pi \sum_{n=0}^{\infty} z^n P_n(x) = \int_0^\pi [1-t]^{-1} d\phi$$

where  $t = z \{x \mp \sqrt{(x^2-1)} \cos \phi\}$  and  $|z \{x \pm \sqrt{(x^2-1)} \cos \phi\}| < 1$  and  $z$  is small quantity.

$$= \int_0^\pi [1+t+t^2+\dots] d\phi = \int_0^\pi \sum_{n=0}^{\infty} t^n d\phi$$

$$= \int_0^\pi \sum_{n=0}^{\infty} z^n [x \pm \sqrt{(x^2-1)} \cos \phi]^n d\phi$$

$$\pi \sum_{n=0}^{\infty} z^n P_n(x) = \int_0^\pi z^n \{x \pm \sqrt{(x^2-1)} \cos \phi\}^n d\phi$$

Equating the coefficients of  $z^n$  from both the sides, we obtain

$$\pi P_n(x) = \int_0^\pi \left\{x \mp \sqrt{(x^2-1)} \cos \phi\right\}^n d\phi$$

$$\Rightarrow P_n(x) = \frac{1}{\pi} \int_0^\pi \left\{x \mp \sqrt{(x^2-1)} \cos \phi\right\}^n d\phi \quad \text{Proved.}$$

### 34.11 LAPLACE'S SECOND DEFINITE INTEGRAL FOR $P_n(x)$

$$P_n(x) = \frac{1}{\pi} \int_0^\pi \frac{d\phi}{\left\{x \pm \sqrt{(x^2-1)} \cos \phi\right\}^{n+1}}$$

where  $n$  is a positive integer.

**Solution.** We know that

$$\int_0^\pi \frac{d\pi}{a \pm b \cos \phi} = \frac{\pi}{\sqrt{(a^2-b^2)}} \quad (\text{If } a > b) \dots (1)$$

Putting  $a = xz - 1$  and  $b = z\sqrt{(x^2-1)}$ , we get

$$a^2 - b^2 = (xz - 1)^2 - z^2(x^2 - 1) = x^2z^2 - 2xz + 1 - z^2x^2 + z^2 = 1 - 2xz + z^2$$

On substituting the values of  $a$ ,  $b$  and  $a^2 - b^2$  in (1), we get

$$\int_0^\pi \frac{d\pi}{z\{x \pm \sqrt{(x^2-1)} \cos \phi\} - 1} = \pi(1-2xz+z^2)^{-\frac{1}{2}}$$

Put  $z\{x \pm \sqrt{(x^2-1)} \cos \phi\} = t$  and  $|t| > 1$

$$\int_0^\pi \frac{d\phi}{t-1} = \frac{\pi}{z} \left\{1 - \frac{2x}{z} + \frac{1}{z^2}\right\}^{-\frac{1}{2}}$$

$$\Rightarrow \int_0^\pi \frac{1}{t} \frac{d\phi}{1-\frac{1}{t}} = \frac{\pi}{z} \sum_{n=0}^{\infty} \frac{1}{z^n} P_n(x)$$

$$\Rightarrow \int_0^\pi \frac{1}{t} \left(1 + \frac{1}{t} + \frac{1}{t^2} + \dots\right) d\phi = \pi \sum_{n=0}^{\infty} \frac{1}{z^{n+1}} P_n(x)$$

$$\Rightarrow \int_0^\pi \sum_{n=0}^{\infty} \frac{1}{t^{n+1}} d\phi = \pi \sum_{n=0}^{\infty} \frac{1}{z^{n+1}} P_n(x)$$

On putting the value of  $t$ , we get

$$\Rightarrow \int_0^\pi \sum_{n=0}^{\infty} \frac{d\phi}{z^{n+1} \{x \pm \sqrt{(x^2 - 1)} \cos \phi\}^{n+1}} = \pi \sum_{n=0}^{\infty} \frac{1}{z^{n+1}} P_n(x) \quad \dots (2)$$

Equating the coefficient of  $\frac{1}{z^{n+1}}$  on both sides of (2), we get

$$\begin{aligned} & \int_0^\pi \frac{d\phi}{[x \pm \sqrt{(x^2 - 1)} \cos \phi]^{n+1}} = \pi P_n(x) \\ \Rightarrow & \qquad \qquad \qquad P_n(x) = \frac{1}{\pi} \int_0^\pi \frac{d\phi}{[x \pm \sqrt{(x^2 - 1)} \cos \phi]^{n+1}} \end{aligned} \quad \text{Proved.}$$

**Example 26.** Prove that

$$\int_{-1}^{+1} x^2 P_{n+1}(x) \cdot P_{n-1}(x) dx = \frac{2n(n+1)}{(2n-1)(2n+1)(2n+3)}$$

Deduce the value of  $\int_0^1 x^2 P_{n+1} \cdot P_{n-1} dx$ .

**Solution.** The recurrence formula 1 is

$$\begin{aligned} (n+1) P_{n+1} &= (2n+1) x P_n - n P_{n-1} \\ \Rightarrow (2n+1) x P_n &= (n+1) P_{n+1} + n P_{n-1} \end{aligned}$$

Replacing  $n$  by  $(n+1)$  and  $(n-1)$ , we have

$$(2n+3) x P_{n+1} = (n+2) P_{n+2} + (n+1) P_n \quad \dots (1)$$

$$(2n-1) x P_{n-1} = n P_n + (n-1) P_{n-2} \quad [\text{Replacing } n \text{ by } (n-2)] \quad \dots (2)$$

Multiplying (1) and (2) and integrating in the limits  $-1$  to  $+1$ , we have

$$\begin{aligned} (2n+3)(2n-1) \int_{-1}^{+1} x^2 P_{n+1} \cdot P_{n-1} dx &= n(n+1) \int_{-1}^1 P_n^2 dx + n(n+2) \int_{-1}^{+1} P_n \cdot P_{n+2} dx \\ &\quad + (n^2 - 1) \int_{-1}^{+1} P_n P_{n-2} dx + (n-1)(n+2) \int_{-1}^{+1} P_{n+2} \cdot P_{n-2} dx \\ &= n(n+1) \int_{-1}^1 P_n^2 dx + 0 + 0 + 0 \quad (\text{Orthogonality property}) \\ &= n(n+1) \cdot \frac{2}{(2n+1)} \end{aligned}$$

$$\int_{-1}^{+1} x^2 \cdot P_{n+1} \cdot P_{n-1} dx = \frac{2n(n+1)}{(2n-1)(2n+1)(2n+3)} \quad \text{as R.H.S. is even function.}$$

$$\text{and } \int_0^1 x^2 \cdot P_{n+1} \cdot P_{n-1} dx = \frac{n(n+1)}{(2n-1)(2n+1)(2n+3)} \quad \text{Proved.}$$

**Example 27.** Prove that

$$P_{-(n+1)}(x) = P_n(x)$$

**Solution.** From Laplace's first integral

$$P_n(x) = \frac{1}{\pi} \int_0^\pi [x \pm \sqrt{(x^2 - 1)} \cos \phi]^n d\phi \quad \dots (1)$$

On putting  $-(n+1)$  for  $n$  in (1), we get

$$\begin{aligned} P_{-(n+1)}(x) &= \frac{1}{\pi} \int_0^\pi \frac{d\phi}{[x \pm \sqrt{(x^2 - 1)} \cos \phi]^{n+1}} \\ &= P_n(x) \quad (\text{from Laplace's second integral}) \end{aligned} \quad \text{Proved.}$$

**EXERCISE 34.1**

1. Express in terms of Legendre Polynomials.

(a)  $1 + x - x^2$

**Ans.**  $-\frac{2}{3}P_2(x) + P_1(x) + \frac{2}{3}P_0(x)$

(b)  $x^3 + 1$

**Ans.**  $\frac{2}{5}P_3(x) + \frac{3}{5}P_1(x) + P_0(x)$

(c)  $1 + 2x - 3x^2 + 4x^3$

**Ans.**  $\frac{8}{5}P_3(x) - 2P_2(x) + \frac{22}{5}P_1(x)$

(d)  $x^4 + 2x^3 - 6x^2 + 5x - 3$

(AMIEETE, Dec. 2009)

**Ans.**  $\frac{8}{35}P_4(x) + \frac{4}{5}P_3(x) - \frac{24}{7}P_2(x) + \frac{31}{5}P_1(x) - \frac{24}{5}P_0(x)$

(e)  $x^4 + 3x^3 - x^2 + 5x - 2$

(AMIEETE, June 2010)

**Ans.**  $\frac{8}{35}P_4(x) + \frac{6}{5}P_3(x) - \frac{2}{21}P_2(x) + \frac{34}{5}P_1(x) - \frac{32}{15}$

2. Show that

(a)  $x^5 = \frac{8}{63} \left[ P_5(x) + \frac{7}{2}P_3(x) + \frac{27}{8}P_1(x) \right]$

(b)  $x^3 = \frac{2}{5}P_3(x) + \frac{3}{5}P_1(x)$

Evaluate the following :

3.  $\int_{-1}^{+1} x^3 P_4(x) dx$

**Ans.** 0

4.  $\int_{-1}^{+1} x^3 P_3(x) dx$

(A.M.I.E.T.E., Summer 2001) **Ans.**  $\frac{4}{35}$

Prove that

5.  $\int_{-1}^{+1} x^n P_n(x) dx = \frac{\frac{1}{2}(n+1)}{2^n \left( \frac{2n+3}{2} \right)} - \frac{2^{n+1} (n!)^2}{(2n+1)}$

6.  $\int_{-1}^{+1} x P_n(x) P_{n-1}(x) dx = \frac{2n}{4n^2 - 1}$

7.  $\int_0^1 P_{2n}(x) \cdot P_{2n+1}(x) dx = \int_0^1 P_{2n}(x) \cdot P_{2n-1}(x) dx$

8.  $\int_{\infty}^1 P_n(x) dx = \frac{1}{2n+1} [P_{n-1}(x) - P_{n+1}(x)]$

9.  $P_n(x) = P'_{n+1}(x)$

10.  $\frac{d}{dx} \left[ (1-x) \frac{d}{dx} P_n(x) \right] + n(n+1) P_n(x) = 0$

11.  $\int_{-1}^{+1} x \cdot P_n \cdot \frac{d}{dx} P_m dx$  is either 0, 2 or  $\frac{2n}{2n+1}$

12.  $P_n(x) = P'_{n+1}(x) - 2xP'_n(x) + P'_{n-1}(x)$

13.  $P'_{2n+1} = (2n+1)P_{2n} + 2nP_{2n-1} + (2n-1)x^2 P_{n-2} + \dots + 2x^{2n-1} P_1 + x^{2n} P_0$

14.  $(n+1)\{P_n P'_{n+1} - P_{n+1} P'_n\} = P_0^2 + 3P_1^2 + 5P_2^2 + \dots + (2n+1)P_n^2$

15.  $(n+1)^2 P_n^2 - (x^2 - 1)P_n^2 = P_0^2 + 3P_1^2 + 5P_2^2 + \dots + (2n+1)P_n^2$

16.  $\int_0^{\pi} P_n(\cos \theta) (\cos n\theta) d\theta = \beta \left( n + \frac{1}{2}, \frac{1}{2} \right)$  if  $n$  is a positive integer.

17.  $u = (1 - 2xz + z^2)^{-\frac{1}{2}}$  is a solution of the equation  $z \frac{\partial^2 v}{\partial x^2} \left\{ (1 - x^2) \frac{\partial v}{\partial x} \right\} = 0$  ?

### 34.12 FOURIER-LEGENDRE EXPANSION

Let  $f(x)$  be a function defined from  $x = -1$  to  $x = 1$ .

The Fourier-Legendre expansion of  $f(x)$

$$f(x) = C_1 P_1(x) + C_2 P_2(x) + C_3 P_3(x) + \dots \quad \dots (1)$$

$$\Rightarrow C_n = \frac{2n+1}{2} \int_{-1}^{+1} f(x) P_n(x) dx$$

Multiplying both sides of (1) by  $P_n(x)$ , we have

$$f(x) \cdot P_n(x) = C_1 P_1(x) \cdot P_n(x) + C_2 P_2(x) \cdot P_n(x) + \dots + C_n P_n^2(x) + \dots \quad \dots (2)$$

Integrating both sides of (2), we get

$$\int_{-1}^{+1} f(x) \cdot P_n(x) dx = C_1 \int_{-1}^{+1} P_1(x) \cdot P_n(x) dx + C_2 \int_{-1}^{+1} P_2(x) \cdot P_n(x) dx + \dots + C_n \int_{-1}^{+1} P_n^2(x) dx + \dots$$

$$\int_{-1}^{+1} f(x) \cdot P_n(x) dx = C_n \int_{-1}^{+1} P_n^2(x) dx \quad (\text{Other integrals are equal to zero})$$

$$= C_n \frac{2}{2n+1}$$

$$\Rightarrow C_n = \frac{2n+1}{2} \int_{-1}^{+1} f(x) \cdot P_n(x) dx \text{ or } C_n = \left( n + \frac{1}{2} \right) \int_{-1}^{+1} f(x) \cdot P_n(x) dx.$$

**Example 28.** Evaluate

$$\int_{-1}^{+1} x^2 P_n^2(x) dx \quad (\text{U.P. II Semester 2010})$$

**Solution.** We know that

$$(n+1) P_{n+1} = (2n+1)x P_n(x) - n P_{n-1}(x) \quad (\text{Recurrence formula I})$$

$$(2n+1)x P_n(x) = (n+1) P_{n+1}(x) + n P_{n-1}(x)$$

Squaring both sides, we get

$$(2n+1)^2 x^2 P_n^2(x) = (n+1)^2 P_{n+1}^2(x) + n^2 P_{n-1}^2(x) + 2n(n+1) P_{n+1}(x) P_{n-1}(x)$$

Integrating both sides w.r.t.  $x$  between  $-1$  and  $+1$ , we get

$$(2n+1)^2 \int_{-1}^{+1} x^2 P_n^2(x) dx = (n+1)^2 \int_{-1}^{+1} P_{n+1}^2(x) dx + n^2 \int_{-1}^{+1} P_{n-1}^2(x) dx + 2n(n+1) \int_{-1}^{+1} P_{n+1}(x) P_{n-1}(x) dx$$

$$= (n+1)^2 \frac{2}{2(n+1)+1} + n^2 \frac{2}{2(n-1)+1} + 0 = \frac{2(n+1)^2}{2n+3} + \frac{2n^2}{2n-1}$$

$$\int_{-1}^{+1} x^2 P_n^2(x) dx = \frac{2(n+1)^2}{(2n+1)^2(2n+3)} + \frac{2n^2}{(2n+1)^2(2n-1)} \quad \text{Ans.}$$

**Example 29.** Find the sum of the first  $(n+1)$  terms of the series  $\sum_{m=0}^{\infty} (2m+1) P_m(x) P_m(y)$   
**[Christoffel's Summation Formula]**

**Solution.** We know that

$$(2m+1) x P_m(x) = (m+1) P_{m+1}(x) + m P_{m-1}(x) \quad \dots (1)$$

$$\text{and} \quad (2m+1) y P_m(y) = (m+1) P_{m+1}(y) + m P_{m-1}(y) \quad \dots (2)$$

Multiplying (1) by  $P_m(y)$  and (2) by  $P_m(x)$  and subtracting, we get

$$(2m+1)(x-y) P_m(x) P_m(y) = (m+1) \{ P_{m+1}(x) P_m(y) - P_m(x) P_{m+1}(y) \} \\ - m \{ P_m(x) P_{m-1}(y) - P_{m-1}(x) P_m(y) \}$$

Now putting  $m = 1, 2, 3, \dots, n$  in succession, we have

$$3(x-y)P_1(x)P_1(y) = 2\{P_2(x)P_1(y) - P_1(x)P_2(y)\} - 1\{P_1(x)P_0(y) - P_0(x)P_1(y)\}$$

$$5(x-y)P_2(x)P_2(y) = \{P_3(x)P_2(y) - P_2(x)P_3(y)\} - 2\{P_2(x)P_1(y) - P_1(x)P_2(y)\}$$

.....

And again

$$(2n+1)(x-y)P_n(x)P_n(y) = (n+1)\{P_{n+1}(x)P_n(y) - P_n(x)P_{n+1}(y)\} \\ - n\{P_n(x)P_{n-1}(y) - P_{n-1}(x)P_n(y)\}$$

Adding these equations, we get

$$(x-y)[3P_1(x)P_1(y) + 5P_2(x)P_2(y) + \dots + (2n+1)P_n(x)P_n(y)] \\ = (n+1)[P_{n+1}(x)P_n(y) - P_n(x)P_{n+1}(y)] - [P_1(x)P_0(y) - P_0(x)P_1(y)]$$

But  $P_0(x) = P_0(y) = 1$  and  $P_1(x) = x, P_1(y) = y$

Therefore  $P_1(x)P_2(y) - P_0(x)P_1(y) = x - y = (x-y)P_0(x)P_0(y)$

$$(x-y)[P_0(x)P_0(y) + 3P_1(x)P_1(y) + 5P_2(x)P_2(y) + \dots + (2n+1)P_n(x)P_n(y)] \\ = (n+1)[P_{n+1}(x)P_n(y) - P_n(x)P_{n+1}(y)]$$

$$\sum_{n=0}^{+\infty} (2m+1)P_m(x)P_m(y) = (n+1) \frac{P_{n+1}(x)P_n(y) - P_n(x)P_{n+1}(y)}{x-y} \quad \text{Ans.}$$

**Example 30.** Prove that

$$\int_{-1}^{+1} \left( \frac{dP_n(x)}{dx} \right)^2 dx = n(n+1)$$

**Solution.** We know that (Christoffel's series)

$$\frac{d}{dx}P_n(x) = (2n-1)P_{n-1}(x) + (2n-5)P_{n-3}(x) + (2n-9)P_{n-5}(x) + \dots$$

the last term being  $3P_1$  if  $n$  is even and  $P_0$  if  $n$  is odd.

Squaring both sides and then integrating, we have

$$\begin{aligned} \int_{-1}^{+1} \left( \frac{dP_n(x)}{dx} \right)^2 dx &= (2n-1)^2 \int_{-1}^{+1} P_{n-1}^2(x) dx + (2n-5)^2 \int_{-1}^{+1} P_{n-3}^2(x) dx + \dots \\ &\quad + 2(2n-1)(2n-5) \int_{-1}^{+1} P_{n-1}(x)P_{n-3}(x) dx + \dots \\ &= (2n-1)^2 \frac{2}{2(n-1)+1} + (2n-5)^2 \frac{2}{2(n-3)+1} + \dots \\ &= \frac{2(2n-1)^2}{(2n-1)} + \frac{2(2n-5)^2}{2n-5} + \dots \\ &= 2(2n-1) + 2(2n-5) + \dots \\ &= 2[(2n-1) + (2n-5) + \dots] \end{aligned} \quad \dots (1)$$

(i) If  $n$  is even, then the last term is  $3P_1$

$$(3)^2 \int P_1^2(x) dx = 9 \frac{2}{2 \cdot 1 + 1} = 2 \times 3 = 6$$

Equation (1) becomes

$$\int_{-1}^{+1} \left[ \frac{dP_n(x)}{dx} \right]^2 dx = 2[(2n-1) + (2n-5) + \dots + 3] \quad (\text{This is an A.P., Number of terms} = \frac{n}{2})$$

$$= 2 \frac{n}{2 \times 2} \left[ 2 \times 3 + \left( \frac{n}{2} - 1 \right) 4 \right] = \frac{n}{2} (6 + 2n - 4) = n(n+1)$$

(ii) If  $n$  is odd, then the last term is  $P_0(x)$ .

$$\int_{-1}^{+1} P_0^2(x) dx = \int_{-1}^{+1} dx = 2$$

$$\int_{-1}^{+1} \left( \frac{dP_n(x)}{dx} \right)^2 dx = 2[(2n-1) + (2n-5) + \dots + 1]$$

$$[ \text{This is an A.P. Here number of terms} = \frac{n+1}{2} ]$$

$$= 2 \frac{n+1}{2 \times 2} \left[ 2 \times 1 + \left( \frac{n+1}{2} - 1 \right) 4 \right] = \frac{n+1}{2} (2 + 2n + 2 - 4) = n(n+1) \quad \text{Ans.}$$

**Example 31.** Show that

$$xP'_n(x) = nP_n(x) + (2n-3)P_{n-2}(x) + (2n-7)P_{n-4}(x) + \dots$$

**Solution.** We know that

$$nP_n(x) = xP'_n(x) - P'_{n-1}(x) \quad (\text{Recurrence formula II})$$

$$\Rightarrow xP'_n(x) = nP_n(x) + P'_{n-1}(x) \quad \dots (1)$$

$$P'_{n+1}(x) = (2n+1)P_n(x) + P'_{n-1}(x) \quad (\text{Recurrence formula III}) \quad \dots (2)$$

Putting  $n-2$  for  $n$  in (2), we get

$$P'_{n-1}(x) = (2n-3)P_{n-2}(x) + P'_{n-3}(x) \quad \dots (3)$$

Putting  $n-4$  for  $n$  in (2), we get

$$P'_{n-3}(x) = (2n-7)P_{n-4}(x) + P'_{n-5}(x) \quad \dots (4)$$

Putting  $n-6$  for  $n$  in (2), we have

$$P'_{n-5}(x) = (2n-11)P_{n-6}(x) + P'_{n-7}(x) \quad \dots (5)$$

and so on.

Adding (1), (3), (4), (5) etc., we get

$$xP'_n(x) = nP_n(x) + (2n-3)P_{n-2}(x) + (2n-7)P_{n-4}(x) + (2n-11)P_{n-6}(x) + \dots \quad \text{Proved.}$$

**Example 32.** Prove that  $\int_{-1}^{+1} xP_n P'_n dx = \frac{2n}{2n+1}$

**Solution.** In the last example we have proved that

$$xP'_n(x) = nP_n(x) + (2n-3)P_{n-2}(x) + (2n-7)P_{n-4}(x) + (2n-11)P_{n-6}(x) + \dots$$

Multiplying the above expansion by  $P_n$  and integrating between  $-1$  and  $+1$ , we get

$$\int_{-1}^{+1} x \cdot P_n(x) P'_n(x) dx = n \int_{-1}^{+1} P_n^2(x) dx + (2n-3) \int_{-1}^{+1} P_n(x) \cdot P_{n-2}(x) dx + (2n-7) \int_{-1}^{+1} P_n(x) \cdot P_{n-4}(x) dx$$

$$+ (2n-11) \int_{-1}^{+1} P_n(x) \cdot P_{n-6}(x) dx + \dots$$

$$= n \cdot \frac{2}{2n+1} + 0 + 0 + \dots = \frac{2n}{2n+1} \quad \text{Proved.}$$

**Example 33.** Expand the function

$$f(x) = \begin{cases} 0, & -1 < x < 0 \\ 1, & 0 < x < 1 \end{cases}$$

in terms of Legendre polynomials.

**Solution.** Let  $f(x) = \sum_{n=0}^{\infty} C_n P_n(x) dx$ , then

$$\begin{aligned} C_n &= \left(n + \frac{1}{2}\right) \int_{-1}^{+1} f(x) P_n(x) dx \\ &= \left(n + \frac{1}{2}\right) \left[ \int_{-1}^0 0 \cdot P_n(x) dx + \int_0^1 1 \cdot P_n(x) dx \right] = \left(n + \frac{1}{2}\right) \int_0^1 P_n(x) dx \\ &= \left(n + \frac{1}{2}\right) \left[ \int_0^1 P_0(x) dx + \int_0^1 P_1(x) dx + \int_0^1 P_2(x) dx + \int_0^1 P_3(x) dx + \dots \right] \end{aligned}$$

$$C_0 = \frac{1}{2} \int_0^1 P_0(x) dx = \frac{1}{2} \int_0^1 1 dx = \frac{1}{2} [x]_0^1 = \frac{1}{2}$$

$$C_1 = \frac{3}{2} \int_0^1 P_1(x) dx = \frac{3}{2} \int_0^1 x dx = \frac{3}{2} \left[ \frac{x^2}{2} \right]_0^1 = \frac{3}{4}$$

$$C_2 = \frac{5}{2} \int_0^1 P_2(x) dx = \frac{5}{2} \int_0^1 \frac{1}{2}(3x^2 - 1) dx = \frac{5}{4} (x^3 - x)_0^1 = 0$$

$$C_3 = \frac{7}{2} \int_0^1 P_3(x) dx = \frac{7}{2} \int_0^1 \frac{1}{2}(5x^3 - 3x) dx = \frac{7}{4} \left[ \frac{5x^4}{4} - \frac{3x^2}{2} \right]_0^1 = \frac{-7}{16}$$

$$\begin{aligned} C_4 &= \frac{9}{2} \int_0^1 P_4(x) dx = \frac{9}{2} \int_0^1 \frac{1}{8}(35x^4 - 30x^2 + 3) dx \\ &= \frac{9}{16} \left[ 7x^5 - 10x^3 + 3x \right]_0^1 = 0 \end{aligned}$$

$$\begin{aligned} C_5 &= \frac{11}{2} \int_0^1 P_5(x) dx = \frac{11}{2} \int_0^1 \frac{1}{8}(63x^5 - 70x^3 + 15x) dx \\ &= \frac{11}{16} \left[ \frac{21}{2}x^6 - \frac{35}{2}x^4 + \frac{15}{2}x^2 \right]_0^1 = \frac{11}{32} \end{aligned}$$

Hence  $f(x) = \frac{1}{2}P_0(x) + \frac{3}{4}P_1(x) - \frac{7}{16}P_3(x) + \frac{11}{32}P_5(x) + \dots$

**Ans.**

**Example 34.** Express the function

$$f(x) = \begin{cases} 0, & -1 < x \leq 0 \\ x, & 0 < x < 1 \end{cases}$$

in Fourier-Legendre expansion.

**Solution.** Let  $f(x) = \sum_{n=0}^{\infty} C_n P_n(x)$ , then

$$C_n = \left(n + \frac{1}{2}\right) \int_{-1}^{+1} f(x) P_n(x) dx$$

$$C_n = \left(n + \frac{1}{2}\right) \int_{-1}^0 0 \cdot P_n(x) dx + \left(n + \frac{1}{2}\right) \int_0^1 x \cdot P_n(x) dx = \left(n + \frac{1}{2}\right) \int_0^1 x \cdot P_n(x) dx$$

$$\begin{aligned}
C_0 &= \frac{1}{2} \int_0^1 x \cdot P_0(x) dx = \frac{1}{2} \int_0^1 x \cdot 1 dx = \frac{1}{2} \int_0^1 x dx = \frac{1}{2} \left[ \frac{x^2}{2} \right]_0^1 = \frac{1}{4} \\
C_1 &= \frac{3}{2} \int_0^1 x \cdot P_1(x) dx = \frac{3}{2} \int_0^1 x \cdot x dx = \frac{3}{2} \int_0^1 x^2 dx = \frac{3}{2} \left[ \frac{x^3}{3} \right]_0^1 = \frac{1}{2} \\
C_2 &= \frac{5}{2} \int_0^1 x \cdot P_2(x) dx = \frac{5}{2} \int_0^1 x \cdot \frac{3x^2 - 1}{2} dx = \frac{5}{4} \int_0^1 (3x^3 - x) dx = \frac{5}{4} \left( \frac{3x^4}{4} - \frac{x^2}{2} \right)_0^1 = \frac{5}{16} \\
C_3 &= \frac{7}{2} \int_0^1 x \cdot P_3(x) dx = \frac{7}{2} \int_0^1 x \cdot \frac{5x^3 - 3x}{2} dx = \frac{7}{4} \int_0^1 (5x^4 - 3x^2) dx = \frac{7}{4} (x^5 - x^3)_0^1 = 0 \\
C_4 &= \frac{9}{2} \int_0^1 x \cdot P_4(x) dx = \frac{9}{2} \int_0^1 x \cdot \frac{35x^4 - 30x^2 + 3}{8} dx \\
&= \frac{9}{16} \int_0^1 (35x^5 - 30x^3 + 3x) dx = \frac{9}{16} \left[ \frac{35x^6}{6} - \frac{15x^4}{2} + \frac{3x^2}{2} \right]_0^1 = \frac{-3}{32} \\
C_5 &= \frac{11}{2} \int_0^1 x \cdot P_5(x) dx = \frac{11}{2} \int_0^1 x \cdot \frac{63x^5 - 70x^3 + 15x}{8} dx \\
&= \frac{11}{16} \int_0^1 (63x^6 - 70x^4 + 15x^2) dx = \frac{11}{16} \left[ 9x^7 - 14x^5 + 5x^3 \right]_0^1 = 0
\end{aligned}$$

Hence  $f(x) = \frac{1}{4}P_0(x) + \frac{1}{2}P_1(x) + \frac{5}{16}P_2(x) - \frac{3}{32}P_4(x) + \dots$

**Ans.**

**Example 35.** Expand the function

$$f(x) = \begin{cases} 0 & , -1 < x \leq 0 \\ x^2 & , 0 < x < 1 \end{cases}$$

in terms of Legendre Polynomials.

**Ans.**  $f(x) = \frac{1}{6}P_0(x) + \frac{3}{8}P_1(x) + \frac{1}{3}P_2(x) + \frac{7}{48}P_3(x) - \frac{11}{384}P_5(x) + \dots$

### 34.13 STRUM-LIOUVILLE EQUATION

$$\frac{d}{dx} \left[ P(x) \cdot \frac{dy}{dx} \right] + [\lambda q(x) + r(x)]y = 0$$

**Solution.** We know that Bessel's equation is

$$X^2 \frac{d^2 y}{dX^2} + X \frac{dy}{dX} + (X^2 - n^2)y = 0 \quad \dots (1)$$

Substituting

$X = kx$  in (1), we get

$$\frac{dy}{dX} = \frac{dy}{dx} \frac{dx}{dX} = \frac{dy}{dx} \frac{1}{k}$$

$$k^2 x^2 \left( \frac{d^2 y}{dx^2} \frac{1}{k^2} \right) + (kx) \left( \frac{dy}{dx} \frac{1}{k} \right) + (k^2 x^2 - n^2)y = 0$$

$$\Rightarrow x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (k^2 x^2 - n^2)y = 0$$

$$\begin{aligned} x \frac{d^2y}{dx^2} + \frac{dy}{dx} + \left( k^2 x - \frac{n^2}{x} \right) y &= 0 \\ \left( x \frac{d^2y}{dx^2} + \frac{dy}{dx} \right) + \left( \lambda x - \frac{n^2}{x} \right) y &= 0 \quad (\text{Put } k^2 = \lambda) \\ \frac{d}{dx} \left( x \frac{dy}{dx} \right) + \left( \lambda x - \frac{n^2}{x} \right) y &= 0 \end{aligned} \quad \dots (2)$$

Equations (1) and (2) are of the form.

$$\frac{d}{dx} \left[ P(x) \cdot \frac{dy}{dx} \right] + [\lambda q(x) + r(x)] y = 0 \quad \dots (3)$$

Equation (3) is known as the Strum-Liouville equation.

Equation (3) with the following conditions is known as Strum-Liouville problem.

$$\alpha_1 y(a) + \alpha_2 y'(a) = 0$$

$$\beta_1 y(b) + \beta_2 y'(b) = 0$$

Solution of Strum-Liouville problem is called an eigen function where  $\lambda$  is an eigen value.

**Particular Case.** Putting  $p = 1$ ,  $q = 1$ ,  $r = 0$  in (3), we have

$$\frac{d^2y}{dx^2} + \lambda y = 0$$

Now taking conditions as  $\alpha_1 = \beta_1 = 1$  and  $\alpha_2 = \beta_2 = 0$

$$y(a) = 0 \quad \text{and} \quad y(b) = 0$$

Hence  $y'' + \lambda y = 0$        $y(a) = 0, y(b) = 0$       simplest form of Strum-Liouville problem.

### 34.14 ORTHOGONALITY

$$\int_a^b P(x) y_m(x) \cdot y_n(x) dx = 0, \quad m \neq n$$

$$\int_a^b P(x) [y_m(x)]^2 dx = \| y_m \|, \quad m = n$$

where  $\| y_m \|$  is the norm of  $y_m$ .

**Orthonormal :** If the function is orthogonal and have norm equal to 1, then the function is known as orthonormal.

### 34.15 ORTHOGONALITY OF EIGEN FUNCTIONS

If  $P$ ,  $q$ ,  $r$  and  $r'$  are the functions in Strum-Liouville equation and  $\lambda_m(x)$ ,  $\lambda_n(x)$  be the eigen functions of Strum-Liouville problem, then

$$\begin{aligned} (\lambda_m - \lambda_n) \int_a^b q y_m y_n dx &= y_m(P y'n) - y_n(P y'm) \\ &= \frac{d}{dx} [(P y'_n) y_m - (P y'_m) y_n]_a^b \\ &= P(b) [y'_n(b) y_m(b) - y'_m(b) y_n(b)] - P(a) [y'_n(a) y_m(a) - y'_m(a) y_n(a)] \\ &= 0 \quad \text{if} \end{aligned} \quad \dots (1)$$

$$(i) \quad y(a) = y(b) \quad (ii) \quad y'(a) = y'(b)$$

$$(iii) \quad \alpha_1 y(a) + \alpha_2 y'(a) = 0 \quad (iv) \quad \beta_1 y(b) + \beta_2 y'(b) = 0$$

Equation (1) becomes  $\int_a^b q y_m y_n dx = 0$   $(m \neq n)$

It means that eigen functions  $y_m, y_n$  are orthogonal with the weight  $q(x)$ .

## **OBJECTIVE TYPE QUESTIONS**

**Choose the correct or the best of the answer given in the following parts :**

1. Let  $P_n(x)$  be Legendre polynomial of degree  $n > 1$ , then

$\int_{-1}^{+1} (1+x)P_n(x)dx$  is equal to

2. The Rodrigue formula for Legendre Polynomial  $P_n(x)$  is given by:

$$(i) \quad P_n(x) = \frac{1}{n!2^n} \frac{d^n}{dx^n} (x^2 - 1)^n$$

$$(ii) \quad P_n(x) = \frac{n!}{2^n} \frac{d^n}{dx^n} (x^2 - 1)^{n-1}$$

$$(iii) P_n(x) = \frac{n!}{2^{n-1}} \frac{d^n}{dx^n} (x^2 - 1)^{n-1}$$

$$(iv) \quad P_n(x) = \frac{1}{n!2^n} (x^2 - 1)^n \quad \text{Ans. (i)}$$

(U.P., II Semester, 2009)

3. The integral  $\int_0^\pi P_n(\cos \theta) \sin 2\theta d\theta$ , where  $P_n(x)$  is the Legendre polynomial of degree  $n$  equals to

- (i) 1              (ii)  $\frac{1}{2}$               (iii) 0              (iv) 2              (AMIETE, Dec. 2004)    Ans. (iii)

## HERMITE FUNCTION

---

---

### 35.1 INTRODUCTION

In this chapter we will learn Hermite function in detail.

### 35.2 HERMITE'S EQUATION

$$\frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + 2ny = 0 \quad \dots\dots\dots(1)$$

The solution of (1) is known as Hermite's polynomial.

**Solution** Here, we have

$$\frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + 2ny = 0 \quad \dots\dots\dots(1)$$

Suppose its series solution is

$$y = a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots\dots\dots + a_k x^{m+k}$$

$$\text{or} \quad y = \sum_{k=0}^{\infty} a_k x^{m+k} \quad \dots\dots\dots(2)$$

$$\frac{dy}{dx} = \sum a_k (m+k) x^{m+k-1}$$

$$\frac{d^2y}{dx^2} = \sum_{k=0}^{\infty} a_k (m+k)(m+k-1) x^{m+k-2}$$

Putting the values of  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in (1), we get

$$\Rightarrow \sum a_k (m+k)(m+k-1) x^{m+k-2} - 2x \sum a_k (m+k) x^{m+k-1} + 2n \sum a_k x^{m+k} = 0$$

$$\Rightarrow \sum a_k (m+k)(m+k-1) x^{m+k-2} - 2 \sum a_k (m+k) x^{m+k} + 2n \sum a_k x^{m+k} = 0$$

$$\Rightarrow \sum a_k (m+k)(m+k-1) x^{m+k-2} - 2 \sum a_k [(m+k)-n] x^{m+k} = 0 \quad \dots\dots\dots(3)$$

This equation holds good for  $k = 0$  and all positive integer. By our assumption  $k$  cannot be negative.

To get the lowest degree term  $x^{m-2}$ , we put  $k = 0$  in the first summation of (3) and we cannot have  $x^{m-2}$  from the second summation. Since  $k \neq -2$ .

The coefficient of  $x^{m-2}$  is

$$a_0 m(m-1) = 0 \Rightarrow m = 0, m = 1, \text{ since } a_0 \neq 0 \quad \dots\dots\dots(4)$$

This is the **indicial equation**.

Now equating the coefficient of next lowest degree term  $x^{m-1}$  to zero in (3), we get (by putting  $k = 1$  in the first summation and we cannot have  $x^{m-1}$  from the second summation since  $k \neq -1$ .)

$$a_1 m(m+1) = 0 \Rightarrow \begin{cases} a_1 \text{ may or may not be zero when } m = 0 \\ a_1 = 0, \text{ when } m = 1 \end{cases} \quad \begin{array}{l} (m+1 \neq 0 \text{ as } m \text{ is} \\ \text{already equal to zero.} \end{array}$$

Again equating the coefficient of the general term  $x^{m+k}$  to zero, we get

$$a_{k+2}(m+k+2)(m+k+1) - 2a_k(m+k-n) = 0$$

$$a_{k+2} = \frac{2(m+k-n)}{(m+k+2)(m+k+1)} a_k \quad \dots\dots\dots(5)$$

$$\text{If } m = 0, \text{ then, } a_{k+2} = \frac{2(k-n)}{(k+2)(k+1)} a_k \quad \dots\dots\dots(6)$$

$$\text{If } m = 1, \text{ then, } a_{k+2} = \frac{2(k+1-n)}{(k+3)(k+2)} a_k \quad \dots\dots\dots(7)$$

$$\text{Case I. When } m = 0, a_{k+2} = \frac{2(k-n)}{(k+2)(k+1)} a_k$$

$$\text{If } k = 0, \text{ then, } a_2 = \frac{-2n}{2} a_0 = -na_0$$

$$\text{If } k = 1, \text{ then, } a_3 = \frac{2(1-n)}{6} a_1 = -2 \frac{(n-1)}{3!} a_1$$

$$\text{If } k = 2, \text{ then, } a_4 = \frac{2(2-n)}{12} a_2 = 2 \frac{(2-n)}{12} (-na_0) = (2)^2 \frac{n(n-2)}{4!} a_0$$

$$\text{If } k = 3, \text{ then, } a_5 = \frac{2(3-n)}{20} a_3 = \frac{2(3-n)}{20} \left( -\frac{2(n-1)}{3!} a_1 \right) = (2)^2 \frac{(n-1)(n-3)}{5!} a_1$$

$$a_{2r} = \frac{(-2)^r n(n-2)(n-4)\dots(n-2r+2)}{(2r)!} a_0$$

$$a_{2r+1} = \frac{(-2)^r (n-1)(n-3)\dots(n-2r+1)}{(2r+1)!} a_1 = 0$$

When  $m = 0$ , then there are two possibilities

**Possibility I.** When,  $a_1 = 0$ , then  $a_3 = a_5 = a_7 = a_{2r+1} = \dots = 0$ .

**Possibility II.** When  $a_1 \neq 0$

$$y = \sum_{k=0}^{\infty} a_k x^k$$

$$\text{i.e. } y = a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + \dots \dots \dots \\ = a_0 + a_2 x^2 + a_4 x^4 + \dots + a_1 x + a_3 x^3 + a_5 x^5 \quad \dots\dots\dots(8)$$

Putting the values of  $a_0, a_1, a_2, a_3, a_4$  and  $a_5$  in (8), we get

$$\begin{aligned} &= a_0 \left[ 1 - \frac{2n}{2!} x^2 + \frac{2^2 n(n-2)}{4!} x^4 - \dots + (-1)^r \frac{2^r}{(2r)!} n(n-2) \dots (n-2r+2) x^{2r} + \dots \right] \\ &\quad + a_1 x \left[ 1 - \frac{2(n-1)}{3!} x^2 + \frac{2^2 (n-1)(n-3)}{5!} x^4 - \dots \right. \\ &\quad \left. + (-1)^r \frac{2^r}{(2r+1)!} (n-1)(n-3) \dots (n-2r+1) x^{2r} + \dots \right] \dots\dots\dots(9) \end{aligned}$$

$$\begin{aligned} &= a_0 \left[ 1 + \sum_{r=1}^{\infty} \frac{(-1)^r 2^r}{(2r)!} n(n-2) \dots (n-2r+2) x^{2r} \right] \\ &\quad + a_0 \left[ x + \sum_{r=1}^{\infty} \frac{(-1)^r 2^r}{(2r+1)!} (n-1)(n-3) \dots (n-2r+2) x^{2r+1} \right] \quad (\text{If } a_1 = a_0) \dots\dots\dots(10) \end{aligned}$$

**Case II.** When  $m = 1$ , then  $a_1 = 0$  and so by putting  $k = 0, 1, 2, 3, \dots$  in (7), we get

$$\begin{aligned} a_{k+2} &= \frac{2(k+1-n)}{(k+3)(k+2)} a_k \\ a_2 &= -\frac{2(n-1)}{3!} a_0 \\ a_4 &= \frac{2^2 (n-1)(n-3)}{5!} a_0 \\ &\dots\dots\dots \\ a_{2r} &= (-1)^r \frac{2^r (n-1)(n-3) \dots (n-2r+1)}{(2r+1)!} a_0 \end{aligned}$$

Hence, the solution is

$$= a_0 x \left[ 1 - \frac{2(n-1)}{3!} x^2 + \frac{2^2 (n-1)(n-3)}{5!} x^4 \dots + \frac{(-1)^r 2^r (n-1)(n-3) \dots (n-2r+1)}{(2r+1)!} x^{2r} + \dots \right] \dots\dots\dots(11)$$

It is clear that the solution (11) is included in the second part of (9) except that  $a_0$  is replaced by  $a_1$  and hence in order that the Hermite equation may have two independent solutions,  $a_1$  must be zero, even if  $m = 0$  and then (9) reduces to

$$y = a_0 \left[ 1 - \frac{2n}{2!} x^2 + \frac{2^2 n(n-2)}{4!} x^4 - \dots + (-1)^r \frac{2^r}{(2r)!} n(n-2) \dots (n-2r+2) x^{2r} + \dots \right] \dots\dots\dots(12)$$

The complete integral of (1) is then given by

$$y = A \left[ 1 - \frac{2n}{2!} x^2 + \frac{2^2 n(n-2)}{4!} x^4 - \dots \right] + B \left[ 1 - \frac{2(n-1)}{3!} x^2 + \frac{2^2 (n-1)(n-3)}{5!} x^4 \dots \right] \dots\dots\dots(13)$$

where A and B are arbitrary constants.

### 35.3 GENERATING FUNCTION OF HERMITE POLYNOMIALS (RODRIGUE FORMULA)

We know that

$$e^{x^2} \frac{\partial^n}{\partial t^n} e^{\{-(t-x)^2\}} = H_n(x) + H_{n+1}(x)t + H_{n+2}(x)t^2 + \dots \dots \dots \quad (1)$$

Now differentiating  $e^{\{-(t-x)^2\}}$  w.r.t.,  $t$ , we get

$$\frac{\partial}{\partial t} e^{\{-(t-x)^2\}} = -2(t-x) e^{\{-(t-x)^2\}}$$

Taking limit when  $t \rightarrow 0$ , we get

$$\lim_{t \rightarrow 0} \frac{\partial}{\partial t} e^{\{-(t-x)^2\}} = 2xe^{-x^2} \quad (2)$$

Again differentiating  $e^{\{-(t-x)^2\}}$  w.r.t. 'x', we get

$$\frac{\partial}{\partial x} e^{\{-(t-x)^2\}} = (-1)^2 (t-x) e^{\{-(t-x)^2\}}$$

Taking limit when  $t \rightarrow 0$ , we get

$$\lim_{t \rightarrow 0} \frac{\partial}{\partial x} e^{\{-(t-x)^2\}} = -2xe^{-x^2} \quad (3)$$

From (2) and (3), we have

$$\lim_{t \rightarrow 0} \frac{\partial}{\partial t} e^{\{-(t-x)^2\}} = (-1)^1 \lim_{t \rightarrow 0} \frac{\partial}{\partial x} e^{\{-(t-x)^2\}}$$

Similarly,

$$\lim_{t \rightarrow 0} \frac{\partial^2}{\partial t^2} e^{\{-(t-x)^2\}} = (-1)^2 \lim_{t \rightarrow 0} \frac{\partial^2}{\partial x^2} e^{\{-(t-x)^2\}}$$

-----

$$\lim_{t \rightarrow 0} \frac{\partial^n}{\partial t^n} e^{\{-(t-x)^2\}} = (-1)^n \lim_{t \rightarrow 0} \frac{\partial^n}{\partial x^n} e^{\{-(t-x)^2\}} = (-1)^n \frac{d^n}{dx^n} e^{-x^2}$$

[differentiating  $n$  times] (4)

Putting  $t = 0$  in (1), we get

$$\lim_{t \rightarrow 0} e^{x^2} \frac{\partial^n}{\partial t^n} e^{\{-(t-x)^2\}} = H_n(x) \quad (5)$$

Putting the value of  $\lim_{t \rightarrow 0} \frac{\partial^n}{\partial t^n} e^{\{-(t-x)^2\}}$  from (4) in (5), we get

$$(-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2} = H_n(x)$$

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2} \quad (6)$$

**$n = 0$**

On putting  $n = 0$  in (6), we get

$$H_0(x) = (-1)^0 e^{x^2} e^{-x^2} = 1$$

$$H_0(x) = 1$$

**n = 1**

On putting  $n = 1$  in (6), we get

$$H_1(x) = (-1)^1 e^{x^2} \frac{d}{dx} e^{-x^2} = -e^{x^2} (-2x) e^{-x^2} = 2x$$

$$H_1(x) = 2x$$

**n = 2**

On putting  $n = 2$  in (6), we get

$$\begin{aligned} H_2(x) &= (-1)^2 e^{x^2} \frac{d^2}{dx^2} e^{-x^2} = e^{x^2} \frac{d}{dx} (-2xe^{-x^2}) \\ &= e^{x^2} \left[ -2e^{x^2} - 2x(-2x)e^{-x^2} \right] \\ &= -2 + 4x^2 \\ H_2(x) &= 4x^2 - 2 \end{aligned}$$

**n = 3**

On putting  $n = 3$  in (6), we get

$$\begin{aligned} H_3(x) &= (-1)^3 e^{x^2} \frac{d^3}{dx^3} (e^{-x^2}) = -e^{x^2} \frac{d^2}{dx^2} (-2xe^{-x^2}) \\ &= -e^{x^2} \frac{d}{dx} (-2e^{-x^2} + (-2x)(-2x)e^{-x^2}) \\ &= -e^{x^2} \frac{d}{dx} (-2 + 4x^2) e^{-x^2} = -e^{x^2} \left[ 8xe^{-x^2} + (4x^2 - 2)(-2x)e^{-x^2} \right] \\ &= -\left[ 8x + (4x^2 - 2)(-2x) \right] = -8x + 8x^3 - 4x = 8x^3 - 12x \\ H_3(x) &= 8x^3 - 12x \end{aligned}$$

Similarly

$$H_4(x) = 16x^4 - 48x^2 + 12$$

$$H_5(x) = 32x^5 - 160x^3 + 120x$$

$$H_6(x) = 64x^6 - 480x^4 + 720x^2 - 120$$

$$H_7(x) = 128x^7 - 1344x^5 + 3360x^3 - 1680x$$

**Example 1.** Convert Hermite polynomial

$2H_4(x) + 3H_3(x) - H_2(x) + 5H_1(x) + 6H_0$   
into ordinary polynomial.

**Solution.** Here, we have

$$\begin{aligned} 2H_4(x) + 3H_3(x) - H_2(x) + 5H_1(x) + 6H_0 \\ &= 2[16x^4 - 48x^2 + 12] + 3\{8x^3 - 12x\} - (4x^2 - 2) + 5(2x) + 6(1) \\ &= 32x^4 - 96x^2 + 24 + 24x^3 - 36x - 4x^2 + 2 + 10x + 6 \\ &= 32x^4 + 24x^3 - 100x^2 - 26x + 32 \end{aligned}$$

**Ans.**

**Example 2.** Convert ordinary polynomial

$$64x^4 + 8x^3 - 32x^2 + 40x + 10$$

into Hermite polynomial.

**Solution.** Here, we have

$$\begin{aligned} \text{Let } 64x^4 + 8x^3 - 32x^2 + 40x + 10 &= AH_4(x) + BH_3(x) + CH_2(x) + DH_1(x) + EH_0(x) \\ &= A(16x^4 - 48x^2 + 12) + B(8x^3 - 12x) + C(4x^2 - 2) + D(2x) + E(1) \\ &= 16Ax^4 + 8Bx^3(-48A + 4C)x^2 + (-12B + 2D)x + 12A - 2C + E \end{aligned}$$

Equating the coefficients of like powers of  $x$ , we get

$$16A = 64 \Rightarrow A = 4$$

$$8B = 8 \Rightarrow B = 1$$

$$-48A + 4C = -32 \Rightarrow 4C = -32 + 192 \Rightarrow C = 40$$

$$-12B + 2D = 40 \Rightarrow -12 + 2D = 40 \Rightarrow 2D = 52 \Rightarrow D = 26$$

$$12A - 2C + E = 10 \Rightarrow 12 \times 4 - 2(40) + E = 10 \Rightarrow E = 42$$

The required Hermite polynomial is

$$4 H_4(x) + H_3(x) + 40 H_2(x) + 26 H_1(x) + 42 H_0(x)$$

**Ans.**

### 35.4 ORTHOGONAL PROPERTY

The *orthogonal property* of Hermite's polynomials is

$$\int_{-\infty}^{\infty} e^{-x^2} H_m(x) H_n(x) dx = \begin{cases} 0, & m \neq n \\ 2^n n! \sqrt{\pi}, & m = n \end{cases}$$

**Solution.** We know that,

$$e^{\left\{x^2 - (t_1 - x)^2\right\}} = \sum \frac{H_n(x)}{n!} t_1^n \quad (\text{generating function}) \quad \dots\dots(1)$$

$$\text{and} \quad e^{\left\{x^2 - (t_2 - x)^2\right\}} = \sum \frac{H_m(x)}{m!} t_2^m \quad \dots\dots(2)$$

Multiplying (1) and (2), we get

$$\begin{aligned} e^{\left\{x^2 - (t_1 - x)^2\right\}} \cdot e^{\left\{x^2 - (t_2 - x)^2\right\}} &= \left[ \sum_{n=0}^{\infty} \frac{H_n(x)}{n!} t_1^n \right] \left[ \sum_{m=0}^{\infty} \frac{H_m(x)}{m!} t_2^m \right] \\ &= \sum_{n=0}^{\infty} \sum_{m=0}^{\infty} [H_n(x)|H_m(x)|] \frac{t_1^n t_2^m}{n! m!} \end{aligned}$$

Multiplying both the sides of this equation by  $e^{-x^2}$  and then integrating with the limits from  $-\infty$  to  $\infty$ , we have

$$\begin{aligned} \sum_{nm} \left[ \int_{-\infty}^{\infty} e^{-x^2} H_n(x) H_m(x) dx \right] \frac{t_1^n t_2^m}{n! m!} &= e^{-x^2} \int_{-\infty}^{\infty} e^{\left\{x^2 - (t_1 - x)^2\right\}} \cdot e^{\left\{x^2 - (t_2 - x)^2\right\}} dx \\ &= \int_{-\infty}^{\infty} e^{\left\{x^2 - (t_1 - x)^2\right\} - (t_2 - x)^2} dx \\ &= e^{\left\{-\left(t_1^2 + t_2^2\right)\right\}} \int_{-\infty}^{\infty} e^{\left\{-x^2 + 2x(t_1 + t_2)\right\}} dx \quad \dots\dots(3) \end{aligned}$$

We have already learnt that  $\int_{-\infty}^{\infty} e^{\left\{-ax^2 + 2bx\right\}} dx = \sqrt{\frac{\pi}{2}} e^{\frac{b^2}{a}}$  [standard formula].....(4)

Replacing  $2b$  by  $(t_1 + t_2)$  and  $a$  by 1 in (4), we get

$$\int_{-\infty}^{\infty} e^{\left\{-x^2 + 2x(t_1 + t_2)\right\}} dx = \sqrt{\pi} e^{(t_1 + t_2)^2} \quad \dots\dots(5)$$

Putting the value of  $\int_{-\infty}^{\infty} e^{\{-x^2+2x(t_1+t_2)\}} dx$  from (5) in R.H.S. of (3), we get

$$\begin{aligned} e^{\{-(t_1+t_2)^2\}} \cdot \sqrt{\pi} e^{(t_1+t_2)^2} &= \sqrt{\pi} e^{-t_1^2-t_2^2+t_1^2+t_2^2+2t_1t_2} = \sqrt{\pi} e^{2t_1t_2} \\ &= \sqrt{\pi} \left[ 1 + 2t_1t_2 + \frac{(2t_1t_2)^2}{2!} + \frac{(2t_1t_2)^3}{3!} + \dots \right] = \sqrt{\pi} \sum \frac{(2t_1t_2)^n}{n!} \\ &= \sqrt{\pi} \sum \frac{2^n t_1^n t_2^n}{n!} = \sqrt{\pi} \sum_{m=0}^{\infty} 2^n t_1^n t_2^m \delta_{m,n} \quad \left[ t_2^n = t_2^m \delta_{n,m} \right] \end{aligned}$$

From (3), we have

$$\sum_{nm} \left[ \int_{-\infty}^{\infty} e^{-x^2} H_n(x) H_m(x) dx \right] \frac{t_1^n t_2^m}{n! m!} = \sqrt{\pi} \sum_{nm} \frac{2^n}{n!} t_1^n t_2^m \delta_{n,m}$$

On equating the coefficients of  $t_1^n, t_2^m$  on both sides., we get

$$\begin{aligned} \int_{-\infty}^{\infty} e^{-x^2} \frac{H_n(x) H_m(x)}{n! m!} dx &= \frac{\sqrt{\pi} 2^n}{n!} \delta_{n,m} \\ \Rightarrow \int_{-\infty}^{\infty} e^{-x^2} H_n(x) H_m(x) dx &= \sqrt{\pi} 2^n m! \delta_{n,m} \\ \Rightarrow \int_{-\infty}^{\infty} e^{-x^2} H_m(x) H_n(x) dx &= \begin{cases} 0 & m \neq n \\ 2^n n! \sqrt{\pi}, & m = n \end{cases} \begin{matrix} \delta_{n,m} = 0, \text{if } m \neq n \\ = 1, \text{if } m = n \end{matrix} \end{aligned}$$

**Proved.**

**Example 3.** Find the value of  $\int_{-\infty}^{\infty} e^{-x^2} H_2(x) H_3(x) dx$ .

**Solution.** We know that

$$\int_{-\infty}^{\infty} e^{-x^2} H_m(x) H_n(x) dx = 0 \text{ if } m \neq n$$

Here  $m = 2$  and  $n = 3$ ,  $m \neq n$

$$\text{Hence, } \int_{-\infty}^{\infty} e^{-x^2} H_2(x) H_3(x) dx = 0 \quad \text{Ans.}$$

**Example 4.** Find the value of  $\int_{-\infty}^{\infty} e^{-x^2} [H_2(x)]^2 dx$

**Solution.** We know that

$$\int_{-\infty}^{\infty} e^{-x^2} [H_n(x)]^2 dx = 2^n (n)! \sqrt{\pi}$$

$$\int_{-\infty}^{\infty} e^{-x^2} [H_2(x)]^2 dx = 2^2 (2!) \sqrt{\pi} = 8\sqrt{\pi} \quad \text{Ans.}$$

### 35.5 RECURRENCE FORMULAE FOR $H_n(x)$ OF HERMITE EQUATION.

Four recurrence Relations

1.  $2n H_{n-1}(x) = H'_n(x)$
2.  $2x H_n(x) = 2n H_{n-1}(x) + H_{n+1}(x)$
3.  $H'_n(x) = 2x H_n(x) - H_{n+1}(x)$
4.  $H'_n(x) = x H'_n(x) + 2n H_n(x) = 0$

**Recurrence Relation I**

Hermite equation is  $y'' - 2xy' + 2ny = 0$  for integral values taking  $v = n$ .

$$\text{Also, } e^{2tx-t^2} = \sum_{n=0}^{\infty} \frac{H_n(x)t^n}{n!} \quad \dots\dots\dots(1)$$

**I.** Differentiating partially w.r.t.  $x$ , we have

$$2t e^{2tx-t^2} = \sum_{n=0}^{\infty} H'_n(x) \frac{t^n}{n!} \quad \dots\dots\dots(2)$$

Substituting the value of  $2te^{2tx-t^2}$  from (1) in (2), we get

$$\begin{aligned} \text{i.e.} \quad & 2t \sum_{n=0}^{\infty} \frac{H_n(x)t^n}{n!} = \sum_{n=0}^{\infty} H'_n(x) \frac{t^n}{n!} \\ \Rightarrow \quad & 2 \sum_{n=0}^{\infty} \frac{H_n(x)t^{n+1}}{n!} = \sum_{n=0}^{\infty} H'_n(x) \frac{t^n}{n!} \end{aligned}$$

On replacing  $n$  by  $n - 1$  on L.H.S, we get

$$\begin{aligned} & 2 \frac{H_{n-1}(x)t^n}{(n-1)!} = H'_n(x) \frac{t^n}{n!} \\ \Rightarrow \quad & \frac{2nH_{n-1}(x)t^n}{n!} = H'_n(x) \frac{t^n}{n!} \end{aligned}$$

On equating the coefficients of  $\frac{t^n}{n!}$  on both sides, we get

$$\begin{aligned} \text{i.e.} \quad & 2 \frac{n!}{(n-1)!} H_{n-1}(x) = H'_n(x) \\ & 2nH_{n-1}(x) = H'_n(x) \quad \dots\dots\dots(3) \end{aligned}$$

$$2nH_{n-1}(x) = H'_n(x)$$

**II.** Differentiating partially w.r.t. ' $t$ ', both sides of (1), we get

$$\begin{aligned} 2(x-t)e^{2tx-t^2} &= \sum_{n=0}^{\infty} H_n(x) \frac{nt^{n-1}}{(n-1)!} \\ 2(x-t)e^{2tx-t^2} &= \sum_{n=1}^{\infty} H_n(x) \frac{t^{n-1}}{(n-1)!} \quad (n=0 \text{ vanishes on R.H.S}) \quad \dots\dots\dots(4) \end{aligned}$$

On putting  $n = 0$  R.H.S becomes zero.

Putting the value of  $e^{2tx-t^2}$  from (1) in (4), we get

$$2(x-t) \sum_{n=0}^{\infty} H_n(x) \frac{t^n}{n!} = \sum_{n=1}^{\infty} H_n(x) \frac{t^{n-1}}{(n-1)!}$$

$$\text{or} \quad 2x \sum_{n=0}^{\infty} H_n(x) \frac{t^n}{n!} - 2 \sum_{n=0}^{\infty} H_n(x) \frac{t^{n+1}}{n!} = \sum_{n=1}^{\infty} H_n(x) \frac{t^{n-1}}{(n-1)!}$$

Equating the coefficients of  $t^n$  on either side, we get

$$2x \frac{H_n(x)}{n!} - 2 \frac{H_{n-1}(x)}{(n-1)!} = \frac{H_{n+1}(x)}{n!} \quad (\text{Replacing } n \text{ by } n+1 \text{ on R.H.S})$$

i.e.  $2xH_n(x) = 2nH_{n-1}(x) + H_{n+1}(x)$   
 $2xH_n(x) = 2nH_{n-1}(x) + H_{n+1}(x) \quad \dots\dots(5)$

**III.** Eliminating  $H_{n-1}(x)$  from recurrence relation (1) and (2), we get

$$2xH_n(x) = H'_n(x) + H_{n+1}(x)$$

$$H'_n(x) = 2xH_n(x) - H_{n+1}(x)$$

$$H'_n(x) = 2xH_n(x) - H_{n+1}(x)$$

**IV.** Differentiating recurrence relation (3), w.r.t.  $x$ , we get

$$H''_n(x) = 2xH'_n(x) + 2H_n(x) - H'_{n+1}(x)$$

Putting  $H'_{n+1}(x) = 2(n+1)H_n(x)$  obtained from recurrence relation (1) on replacing  $n$  by  $n+1$ , we get

$$H''_n(x) = 2xH'_n(x) + 2H_n(x) - 2(n+1)H_n(x)$$

$$\Rightarrow H''_n(x) - 2xH'_n(x) + 2nH_n(x) = 0$$

which clearly follows that  $y = H_n(x)$  is a solution of Hermite equation.

$$H''_n(x) - 2xH'_n(x) + 2nH_n(x) = 0$$

**Example 5.** Prove that

$$H_{2n}(0) = (-1)^n \cdot 2^{2n} \left(\frac{1}{2}\right)^n$$

**Solution.** We know that

$$H_{2n}(x) = \sum \frac{(-1)^n (2m)!(2x)^{2n+2x}}{x!(2n-2x)!} \quad \dots (1) \quad \begin{bmatrix} \text{Even Hermite} \\ \text{polynomial} \end{bmatrix}$$

Putting  $x = 0$  in (1), we get

$$\begin{aligned} H_{2n}(0) &= \frac{(-1)^n (2n)!}{(n)!} = (-1)^n \frac{(2n)(2n-1)(2n-2)\dots1}{n(n-1)(n-2)\dots1} \\ &= (-1)^n \frac{2(2n-1)2(2n-3)2(2n-5)2\dots2.1}{n!} n! \\ &= (-1)^n 2^n 2^n \frac{(2n-1)(2n-3)(2n-5)}{2^2 2^2 2^2} \dots \frac{3}{2} \cdot \frac{1}{2} \\ &= (-1)^n 2^{2n} \left(\frac{1}{2}\right) \left(\frac{3}{2}\right) \left(\frac{5}{2}\right) \left(\frac{7}{2}\right) \dots \left(\frac{2n-3}{2}\right) \left(\frac{2n-1}{2}\right) \\ &= (-1)^n 2^{2n} \left(\frac{1}{2}\right)^n \end{aligned}$$

**Proved.**

**Exmaple 6.** Prove that

$$H'_{2n+1}(0) = (-1)^n 2^{2n+1} \left(\frac{3}{2}\right)^n$$

**Solution.** We know that by Recurrence Relation I

$$H'_n(x) = 2n H_{n-1}(x) \quad \dots \dots \dots (1)$$

Replacing  $n$  by  $2n+1$  in (1), we get

$$H'_{2n+1}(x) = 2(2n+1) H_{2n}(x) \quad \dots \dots \dots (2)$$

Putting  $x = 0$  in (2), we get

$$H'_{2n+1}(0) = 2(2n+1) H_{2n}(0)$$

$$= 2(2n+1)(-1)^n 2^{2n} \left(\frac{1}{2}\right)^n$$

$$= (2n+1)(-1)^n 2^{2n+1} \left[ \frac{(2n-1)(2n-3)\dots\cdot 3 \cdot 1}{2^n} \right]$$

[Using previous exp]

$$= (-1)^n 2^{2n+1} \left[ \frac{3}{2} \left( \frac{3}{2} + 1 \right) \dots \left( \frac{3}{2} + n - 1 \right) \right]$$

$$= (-1)^n \cdot 2^{2n+1} \left( \frac{3}{2} \right)^n$$

**Proved.**

**Example 7.** Prove that

$$H_{2n+1}(0) = 0$$

**Solution.** We know that

$$H_{2n+1}(x) = \sum_{k=0}^{2n+1/2} \frac{(-1)^k (2n+1)!(2x)^{2n+1-2k}}{k!(2n+1-2k)!} \quad \begin{bmatrix} \text{Odd Hermite} \\ \text{Polynomial} \end{bmatrix}$$

Putting  $x = 0$  in above, we get

$$\therefore H_{2n+1}(0) = 0$$

**Proved.**

**Example 8.** Prove that

$$H'_{2n}(0) = 0$$

**Solution.** From recurrence relation I, we know that

$$H'_n(x) = 2n H_{n-1}(x)$$

Replacing  $n$  by  $2n$ , we get

$$H'_{2n}(x) = 2(2n) H_{2n-1}(x) \quad \dots \dots \dots (1)$$

Putting  $x = 0$  in (1), we get

$$H'_{2n}(0) = 4n H_{2n-1}(0)$$

$$\begin{aligned} &= 4n(0) \\ &= 0 \end{aligned}$$

**From example 7**  
 $H_{2n-1}(0) = 0$

**Example 9.** Prove that

$$\frac{d^m}{dx^m} \{H_n(x)\} = \frac{2^n (n)!}{(n-m)!} H_{n-m} \quad m < n$$

**Solution.** From recurrence relation I, we know that

$$\begin{aligned} H'_n(x) &= 2n H_{n-1}(x) \\ \Rightarrow \frac{d}{dx}\{H_n(x)\} &= 2n H_{n-1}(x) \\ \Rightarrow \frac{d^2}{dx^2}\{H_n(x)\} &= 2n \frac{d}{dx}[H_{n-1}(x)] \\ &= 2n H'_{n-1}(x) \\ &= 2n [2(n-1) H_{n-2}(x)] \\ &= 2^2 n (n-1) H_{n-2}(x) \end{aligned} \quad [\text{From (1)}]$$

$$\text{Similarly } \frac{d^3}{dx^3}\{H_n(x)\} = 2^3 n(n-1)(n-2) H_{n-3}(x)$$

Proceeding similarly  $m$  times, we get

$$\begin{aligned} \frac{d^m}{dx^m}\{H_n(x)\} &= 2^m n(n-1)\dots(n-m+1) H_{n-m}(x), \cdot m < n \\ &= \frac{2^m}{(n-m)!} H_{n-m}(x) \end{aligned} \quad \text{Proved.}$$

**Example 10.** Prove that  $H_n(-x) = (-1)^n H_n(x)$ .

$$\begin{aligned} \text{Solution. Here, we have } \sum_{n=0}^{\infty} \frac{H_n(x)t^n}{n!} &= e^{2tx-t^2} = e^{2tx}e^{-t^2} = \sum_{n=0}^{\infty} \frac{(2x)^n t^n}{n!} \times \sum_{n=0}^{\infty} \frac{(-1)^{2n}}{n!} \\ &= \sum_{n=0}^{\infty} \sum_{k=0}^{n/2} \frac{(-1)^k (2x)^{n-2k}}{k!(n-2k)!} \end{aligned}$$

Equating coefficient of  $\frac{t^n}{n!}$  on either side, we get

$$H_n(x) = \sum_{k=0}^{n/2} \frac{(-1)^k n!(2x)^{n-2k}}{k!(n-2k)!}$$

Replacing  $x$  by  $-x$ , we get

$$\begin{aligned} H_n(-x) &= \sum_{k=0}^{n/2} \frac{(-1)^k n!(-2x)^{n-2k}}{k!(n-2k)!} \\ &= \sum_{k=0}^{n/2} \frac{(-1)^k (-1)^{n-2k} n!(2x)^{n-2k}}{k!(n-2k)!} \\ &= (-1)^n \sum_{k=0}^{n/2} \frac{(-1)^k n!(2x)^{n-2k}}{k!(n-2k)!} = (-1)^n H_n(x) \end{aligned}$$

**Example 11.** Prove that

$$\int_{-\infty}^{\infty} xe^{-x^2} H_n(x) H_m(x) dx = \sqrt{\pi} \left[ 2^{n-1} n! \delta_{m,n-1} + 2^n (n+1) \delta_{n+1,m} \right].$$

**Solution.** Integrating by parts, we have

$$\begin{aligned} \int_{-\infty}^{\infty} xe^{-x^2} H_n(x) H_m(x) dx &= \left[ -\frac{1}{2} e^{-x^2} H_n(x) H_m(x) \right]_{-\infty}^{\infty} \\ &\quad + \frac{1}{2} \int_{-\infty}^{\infty} e^{-x^2} \frac{d}{dx} \{H_n(x) H_m(x)\} dx \\ &= 0 + \frac{1}{2} \int_{-\infty}^{\infty} e^{-x^2} \frac{d}{dx} \{H_n(x) H_m(x)\} dx \quad (\text{Orthogonality property}) \end{aligned}$$

Differentiating by product rule w.r.t. 'x' under the sign of integration, we get

$$= \frac{1}{2} \int_{-\infty}^{\infty} e^{-x^2} \{H'_n(x) H_m(x) + H_n(x) H'_m(x)\} dx$$

By putting the values of  $H'_n(x) = 2n H_{n-1}(x)$  and  $H'_m(x) = 2m H_{m-1}(x)$  by recurrence relation (1), we get

$$\begin{aligned} &= \frac{1}{2} \int_{-\infty}^{\infty} e^{-x^2} [2n H_{n-1}(x) H_m(x) + 2m H_n(x) H_{m-1}(x)] dx \\ &= n \int_{-\infty}^{\infty} e^{-x^2} H_{n-1}(x) H_m(x) dx + m \int_{-\infty}^{\infty} e^{-x^2} H_n(x) H_{m-1}(x) dx \\ &= n\sqrt{\pi} 2^{n-1} (n-1)! \delta_{m,n-1} + m\sqrt{\pi} 2^n n! \delta_{n,m-1} \quad (\text{by orthogonal properties}) \end{aligned}$$

By putting the value of  $\delta_{n,m-1} = \delta_{n+1,m}$ , we get

$$= \sqrt{\pi} [2^{n-1} n! \delta_{m,n-1} + 2^n (n+1)! \delta_{n+1,m}] \quad \text{Proved.}$$

### EXERCISE 35.1

1. Find the value of  $\int_{-\infty}^{\infty} e^{-x^2} H_{20}(x) H_{10}(x) dx$  **Ans. 0**
2. Find the value of  $\int_{-\infty}^{\infty} e^{-x^2} [H_9(x)]^2 dx$  **Ans.  $2^9 (9)! \sqrt{\pi}$**
3. Find the value of  $H_2(x)$  in terms of  $x$ . **Ans.  $4x^2 - 2$**
4. Convert the Hermite polynomial  $2H_3 - 4H_2 + H_1 + H_0$  into ordinary polynomial. **Ans.  $16x^3 - 16x^2 - 22x + 9$**
5. Convert  $8x^3 + 8x^2 - 6x + 2$  into Hermite polynomial **Ans.  $H_3 + 2H_2 + 3H_1 + 6H_0$**
6. Verify,  $P_n(x) = \frac{2}{\sqrt{\pi n!}} \int_0^{\infty} t^n e^{-t^2} H_n(xt) dt$ .
7. Show that if  $m$  is an integer,  $\int_{-\infty}^{\infty} x^m e^{-x^2} H_n(x) dx = 0$ .

## LAGUERRE'S FUNCTION

---

---

### 36.1 LAGUERRE'S FUNCTION

The Laguerre's differential equation is  $x \frac{d^2y}{dx^2} + (1-x) \frac{dy}{dx} + ny = 0$

**Solution.** Here, we have

$$\begin{aligned} & x \frac{d^2y}{dx^2} + (1-x) \frac{dy}{dx} + ny = 0 & \dots\dots\dots(1) \\ \Rightarrow & \frac{d^2y}{dx^2} + \left(\frac{1-x}{x}\right) \frac{dy}{dx} + \frac{n}{x} y = 0 \end{aligned}$$

Here  $x = 0$  is a regular singularity of (1). So we will solve it by series solution method. :

$$\begin{aligned} \text{Let } & y = \sum_{k=0}^{\infty} a_k x^{m+k} \\ & \left[ y = a_0 x^m + a_1 x^{m+1} + a_2 x^{m+2} + a_3 x^{m+3} + \dots\dots + a_k x^{m+k} + \dots\dots \right] & \dots\dots\dots(2) \\ \Rightarrow & \frac{dy}{dx} = \sum_{k=0}^{\infty} (m+k) a_k x^{m+k-1} \\ \Rightarrow & \frac{d^2y}{dx^2} = \sum_{k=0}^{\infty} (m+k)(m+k-1) a_k x^{m+k-2} \end{aligned}$$

Putting the values of  $y$ ,  $\frac{dy}{dx}$  and  $\frac{d^2y}{dx^2}$  in (1), we get

$$\begin{aligned} & x \sum_{k=0}^{\infty} (m+k)(m+k-1) a_k x^{m+k-2} + (1-x) \sum_{k=0}^{\infty} (m+k) a_k x^{m+k-1} + n \sum_{k=0}^{\infty} a_k x^{m+k} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} (m+k)(m+k-1) a_k x^{m+k-1} + \sum_{k=0}^{\infty} (m+k) a_k x^{m+k-1} - \sum_{k=0}^{\infty} (m+k) a_k x^{m+k} \\ & + n \sum_{k=0}^{\infty} a_k x^{m+k} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} a_k \{(m+k)(m+k-1) + (m+k)\} x^{m+k-1} - \sum_{k=0}^{\infty} a_k \{m+k-n\} x^{m+k} = 0 \end{aligned}$$

$$\begin{aligned} \Rightarrow & \sum_{k=0}^{\infty} a_k \left\{ (m+k)^2 - (m+k) + (m+k) \right\} x^{m+k-1} - \sum_{k=0}^{\infty} a_k \{ m+k-n \} x^{m+k} = 0 \\ \Rightarrow & \sum_{k=0}^{\infty} a_k (m+k)^2 x^{m+k-1} - \sum_{k=0}^{\infty} a_k (m+k-n) x^{m+k} = 0 \end{aligned} \quad \dots\dots\dots(3)$$

Equating to zero the coefficient of lowest degree term  $x^{m-1}$

( $x^{m-1}$  is obtained by putting  $k=0$  in the first summation of (3), but we cannot put  $k=-1$  in second summation to get  $x^{m-1}$  since  $k$  is always positive.)

$$\begin{aligned} a_0 m^2 &= 0 && \text{(Indicial equation)} \\ \Rightarrow m &= 0, m = 0, a_0 \neq 0 \end{aligned}$$

Again equating to zero, the coefficient of  $x^{m+k}$  in (2), we get

(To get  $x^{m+k}$  we put  $k \Rightarrow k+1$  in first summation and  $k \Rightarrow k$  in second summation of (2).

$$\begin{aligned} (m+k+1)^2 a_{k+1} - (m+k-n) a_k &= 0 \\ \Rightarrow a_{k+1} &= \frac{(m+k-n)}{(m+k+1)^2} a_k \end{aligned} \quad \dots\dots\dots(4)$$

For  $m=0$  in (4), we have

$$a_{k+1} = \frac{k-n}{(k+1)^2} a_k$$

If  $k=0$ , then  $a_1 = -n a_0$

$$\text{If } k=1, \text{ then } a_2 = \frac{1-n}{4} a_1 = \frac{(n-1)}{4} n a_0$$

$$\text{If } k=2, \text{ then } a_3 = \frac{2-n}{9} a_2 = \left( \frac{(2-n)}{9} \right) \left( \frac{(n-1)n}{4} \right) a_0 = (-1)^3 \frac{n(n-1)(n-2)}{(3!)^2} a_0$$

-----  
-----

$$a_k = (-1)^k \frac{n(n-1)(n-2)\dots(n-k+1)}{(k!)^2} a_0$$

On putting these values of the coefficients  $a_1, a_2, a_3 \dots\dots\dots a_k$  and  $m=0$  in (2), we get

$$y = a_0 + a_1 x + a_2 x^2 + a_3 x^3 \dots\dots\dots + a_k x^k + \dots\dots\dots$$

$$\begin{aligned} y &= a_0 - n a_0 x + \frac{n(n-1)}{(2!)^2} a_0 x^2 - \frac{n(n-1)(n-2)}{(3!)^2} a_0 x^3 + \dots\dots\dots \\ &\quad + (-1)^k \frac{n(n-1)(n-2)\dots(n-k+1)}{(k!)^2} a_0 x^k + \dots\dots\dots \end{aligned}$$

$$\begin{aligned}
&= a_0 \left[ 1 - nx + \frac{n(n-1)}{(2!)^2} x^2 - \frac{n(n-1)(n-2)}{(3!)^2} x^3 + \dots \right. \\
&\quad \left. + (-1)^k \frac{n(n-1)(n-2) \dots (n-k+1)}{(k!)^2} x^k + \dots \right] \\
&= a_0 \sum_{k=0}^{\infty} (-1)^k \frac{(n!)^2}{(k!)^2 (n-k)!} x^k, \text{ where } n \text{ is positive.}
\end{aligned}$$

If we take  $a_0 = n!$ , then solution of (1) becomes Laguerre's polynomial

$$\begin{aligned}
y &= n! \left[ 1 - nx + \frac{n(n-1)}{(2!)^2} x^2 - \frac{n(n-1)(n-2)}{(3!)^2} x^3 + \dots \right. \\
&\quad \left. + \frac{(-1)^k n(n-1)(n-2) \dots (n-k+1)}{(k!)^2} x^k + \dots \right] \\
\Rightarrow L_n(x) &= (-1)^n \left[ x^n - \frac{n^2}{1!} x^{n-1} + \frac{n^2(n-1)^2}{2!} x^{n-2} + \dots + (-1)^n n! \right]
\end{aligned}$$

This is the expression for Laguerre's polynomial.

### 36.2 LAGUERRE'S FUNCTION FOR DIFFERENT VALUES OF $n$ .

$L_n(0) = n!$
$L_0(x) = 1$
$L_1(x) = 1 - x$
$L_2(x) = x^2 - 4x + 2$
$L_3(x) = -x^3 + 9x^2 - 18x + 6$
$L_4(x) = x^4 - 16x^3 + 72x^2 - 96x + 48$
and so on.

### 36.3 GENERATING FUNCTION OF LAGUERRE POLYNOMIAL

$$(1-t) \sum_{n=0}^{\infty} \frac{L_n(x)}{n!} t^n = e^{\frac{-xt}{1-t}}$$

**Solution :** Here, we have

$$\begin{aligned}
(1-t) \sum_{n=0}^{\infty} \frac{L_n(x)}{n!} t^n &= e^{\frac{-xt}{1-t}} \\
\sum_{n=0}^{\infty} \frac{L_n(x)t^n}{n!} &= \frac{1}{1-t} e^{\frac{-xt}{1-t}} \\
&= \frac{1}{1-t} \left[ 1 - \frac{xt}{(1-t)} + \frac{x^2 t^2}{2!(1-t)^2} - \dots + \frac{(-1)^k x^k t^k}{k!(1-t)^k} + \dots \right] = \sum_{k=0}^{\infty} -\frac{(-1)^k x^k t^k}{k!(1-t)^{k+1}} \\
&= \sum_{k=0}^{\infty} -\frac{(-1)^k x^k t^k}{k!} (1-t)^{-(k+1)}
\end{aligned}$$

$$\begin{aligned}
&= \sum_{k=0}^{\infty} -\frac{(-1)^k x^k}{k!} t^k \left[ 1 + (k+1)t + \frac{(k+1)(k+2)}{2!} t^2 + \dots + \frac{(k+1)(k+2)\dots(k+1)}{l!} t^l + \dots \right] \\
&= \sum_{k=0}^{\infty} \sum_{l=0}^{\infty} \frac{(-1)^k (k+1)_l}{k! l!} x^k t^{k+l}, \text{ where } (k+1)_l = \frac{\Gamma(k+1+l)}{\Gamma(k+1)}
\end{aligned}$$

Equating the coefficients of  $t^n$  on both sides, we get

On putting  $l = n - k$ , we get the coefficient of  $x^k$ .

$$\frac{L_n(x)}{n!} = \sum_{k=0}^{\infty} \frac{(-1)^k (k+1)_{n-k}}{r!(n-k)!} x^k$$

$$\text{Here } (k+1)_{n-k} = \frac{\Gamma(k+1+n-k)}{\Gamma(k+1)} + \frac{\Gamma(n+1)}{\Gamma(k+1)} = \frac{n!}{k!}$$

$$\begin{aligned}
\frac{(-1)^k}{(n-k)!} &= \frac{(-1)^k n(n-1)\dots(n-k+1)}{n!} \\
&= \frac{(-n)(-n+1)(-n+2)\dots(-n+k-1)}{n!} = \frac{(-n)_k}{n!}
\end{aligned}$$

$$\begin{aligned}
L_n(x) &= n! \sum_{k=0}^{\infty} \frac{(-n)_k}{n!} \frac{n!}{(k!)^2} x^k = n! \sum_{k=0}^{\infty} \frac{(-n)_k}{(k!)^2} x^k \\
&= n! \left[ 1 + \frac{(-n)}{1! 1!} x + \frac{(-n)(-n+1)}{2! 2!} x^2 + \frac{(-n)(-n+1)(-n+2)}{3! 3!} x^3 + \dots \right] \\
&= n! F(-n, 1; x)
\end{aligned}$$

From which it follows that  $L_n(x)$  is a polynomial of degree  $n$  in  $x$  and that the coefficient of  $x^n$  is  $(-1)^n$ .

### 36.4 RECURRENCE RELATION

**Relation I :** We know that

$$e^{\frac{-xt}{1-t}} = (1-t) \sum_{n=0}^{\infty} \frac{L_n(x)}{n!} t^n \quad \dots\dots(1)$$

Differentiating (1) w.r.t 't', we get

$$\begin{aligned}
-\frac{x}{(1-t)^2} e^{\frac{-xt}{1-t}} &= (1-t) \sum_{n=0}^{\infty} \frac{L_n(x) t^{n-1}}{(n-1)!} - \sum_{n=0}^{\infty} \frac{L_n(x) t^n}{n!} \\
\Rightarrow -\frac{x}{(1-t)^2} (1-t) \sum_{n=0}^{\infty} \frac{L_n(x) t^n}{n!} &= (1-t) \sum_{n=0}^{\infty} \frac{L_n(x) t^{n-1}}{(n-1)!} - \sum_{n=0}^{\infty} \frac{L_n(x) t^n}{n!} \\
\Rightarrow x \sum_{n=0}^{\infty} \frac{L_n(x) t^n}{n!} + (1-t)^2 \sum_{n=0}^{\infty} \frac{L_n(x) t^{n-1}}{(n-1)!} - (1-t) \sum_{n=0}^{\infty} \frac{L_n(x) t^n}{n!} &= 0
\end{aligned}$$

Equating to zero the coefficient of  $t^n$ , we get

$$\begin{aligned} & x \frac{L_n(x)}{n!} + \frac{L_{n+1}(x)}{n!} - 2 \frac{L_n(x)}{(n-1)!} + \frac{L_{n-1}(x)}{(n-2)!} - \frac{L_n(x)}{n!} + \frac{L_{n-1}(x)}{(n-1)!} = 0 \\ \Rightarrow & L_{n-1}(x) + (x - 2n - 1) L_n(x) + n^2 L_{n-1}(x) = 0 \end{aligned}$$

**Relation II :** We know that

$$e^{\frac{-xt}{1-t}} = (1-t) \sum_{n=0}^{\infty} \frac{L_n(x)}{n!} t^n \quad \dots\dots(1)$$

On differentiating (1) w.r.t.  $x$ , we get

$$\begin{aligned} & -\left(\frac{t}{1-t}\right) e^{\frac{-xt}{1-t}} = (1-t) \sum_{n=0}^{\infty} \frac{L'_n(x)t^n}{n!} \\ \Rightarrow & -\left(\frac{t}{1-t}\right)(1-t) \sum_{n=0}^{\infty} \frac{L_n(x)}{n!} t^n = (1-t) \sum_{n=0}^{\infty} \frac{L'_n(x)}{n!} t^n \\ \Rightarrow & t \sum_{n=0}^{\infty} \frac{L_n(x)t^n}{n!} + (1-t) \sum_{n=0}^{\infty} \frac{L'_n(x)t^n}{n!} = 0 \end{aligned}$$

Equating to zero the coefficient of  $t^n$ , we get

$$\frac{L'_n(x)}{n!} - \frac{L'_{n-1}(x)}{(n-1)!} + \frac{L_n(x)}{(n-1)!} = 0$$

$$i.e. \quad L'_n(x) - n L'_{n-1}(x) + n L_{n-1}(x) = 0$$

**Relation III :** By recurrence relation (1), we have

$$L_{n+1}(x) + (x - 2n - 1) L_n(x) + x^2 L_{n-1}(x) = 0 \quad \dots\dots(1)$$

On differentiating (1) w.r.t 'x', we get

$$L'_{n+1}(x) - (x - 2n - 1) L'_n(x) + L_n(x) + n^2 L'_{n-1}(x) = 0. \quad \dots\dots(2)$$

Differentiating (2) w.r.t 'x', we get

$$L''_{n+1}(x) + (x - 2n - 1) L''_n(x) + 2L'_n(x) + n^2 L''_{n-1}(x) = 0.$$

Let us replace  $n$  by  $(n + 1)$ , we get

$$L''_{n+2}(x) + (x - 2n - 3) L''_{n-1}(x) + (n + 1)^2 L_n''(x) + 2L'_{n+1}(x) = 0. \quad \dots\dots(3)$$

From recurrence relation (2), we have

$$L_n'(x) = n \{L'_{n-1}(x) - L_{n-1}(x)\}$$

On replacing  $n$  by  $(n + 1)$ , we get

$$L'_{n+1}(x) + (n + 1) \{L'_n(x) - L_n(x)\} \quad \dots\dots(4)$$

On differentiating (4), we get

$$L''_{n+1}(x) = (n + 1) \{L_n''(x) - L_n'(x)\}. \quad \dots\dots(5)$$

Again replacing  $n$  by  $(n + 1)$ , we get

$$L'_{n+2}(x) = (n + 2) \{L''_{n+1}(x) - L'_{n+1}(x)\} \quad \dots\dots(6)$$

From (3),

$$(n+2) \{L''_{n+1}(x) - L'_{n+1}(x)\} + (x-2n-3)L''_{n+1}(x) + (n+1)^2 L_n''(x) + 2L'_{n+1}(x) = 0$$

$$(x-n-1)L''_{n+1}(x) - nL'_{n+1}(x) + (n+1)^2 L_n''(x) = 0$$

Eliminating  $L''_{n+1}(x)$  and  $L'_{n+1}(x)$  by (4) and (5), we get

$$xL''_n(x) + (1-x)L'_n(x) + nL_n(x) = 0$$

So,  $t y = A L_n(x)$  is a solution of Laguerre equation.

**Relation IV :** We know that

$$(1-t)^{-1} e^{\left(\frac{1}{1-t}\right)x} = \sum_{n=0}^{\infty} \frac{L_n(x)t^n}{n!} \quad \dots\dots\dots(1)$$

Differentiating (1) w.r.t 't'  $n$  times by Leibnitz theorem, we have

$$e^x \frac{d^n}{dt^n} \left[ (1-t)^{-1} e^{\frac{x}{1-t}} \right] = L_n(x) + L_{n+1}(x) + \dots$$

$$\text{Now, } \frac{d}{dt} \left[ (1-t)^{-1} e^{\frac{x}{1-t}} \right] = \frac{1-x-t}{(1-t)^3} e^{\frac{x}{1-t}}$$

Taking limit when  $t \rightarrow 0$ , we get

$$\lim_{t \rightarrow 0} \frac{d}{dt} \left[ (1-t)^{-1} e^{\frac{x}{1-t}} \right] = (1-x)e^{-x} \frac{d}{dx} (xe^{-x})$$

Similarly

$$\lim_{t \rightarrow 0} \frac{d^2}{dt^2} \left[ (1-t)^{-1} e^{\frac{x}{1-t}} \right] = \frac{d^2}{dx^2} (x^2 e^{-x})$$

$$\Rightarrow \lim_{t \rightarrow 0} \frac{d^n}{dt^n} \left[ (1-t)^{-1} e^{\frac{x}{1-t}} \right] = \frac{d^n}{dx^n} (x^n e^{-x})$$

Hence, proceeding to the limit as  $t \rightarrow 0$ , we get

$$e^x \frac{d^n}{dx^n} (x^n e^{-x}) = L_n(x)$$

### 36.5 ORTHOGONAL PROPERTY

$$\text{Let } f_n(x) = \frac{1}{n!} e^{-x/2} L_n(x) \quad \dots\dots\dots(1)$$

$$\int_0^\infty f_m(x) f_n(x) dx = \int_0^\infty e^{-x} \frac{L_m(x)}{m!} \frac{L_n(x)}{n!} dx = \delta_{m,n}$$

Over the interval  $0 \leq x \leq \infty$  1 when  $\delta_{m,n} = \begin{cases} 0 & \text{for } m \neq n \\ 1 & \text{for } m = n \end{cases}$

From recurrence relation (4), we know that

$$L_n(x) = e^x \frac{d^n}{dx^n} (x^n e^{-x})$$

So, we get

$$\int_0^\infty e^{-x} x^m L_n(x) dx = \int_0^\infty e^{-x} x^m e^x \frac{d^n}{dx^n} (x^n e^{-x}) dx = \int_0^\infty x^m \frac{d^n}{dx^n} (x^n e^{-x}) dx$$

Integrating the R.H.S. by parts, we get

$$\begin{aligned} \int_0^\infty e^{-x} x^m L_n(x) dx &= \left[ x^m \frac{d^{n-1}}{dx^{n-1}} x^n e^{-x} \right]_0^\infty - \int_0^\infty mx^{m-1} \frac{d^{n-1}}{dx^{n-1}} (x^n e^{-x}) dx \\ &= (-1)m \int_0^\infty e^{m-1} \frac{d^{n-1}}{dx^{n-1}} (x^n e^{-x}) dx \\ &= (-1)^2 m(m-1) \int_0^\infty e^{m-2} \frac{d^{n-2}}{dx^{n-2}} (x^n e^{-x}) dx \\ &= \dots \dots \dots \\ &= (-1)^n m! \int_0^\infty \frac{d^{n-m}}{dx^{n-m}} (x^n e^{-x}) dx \\ &= 0 \text{ if } n > m. \end{aligned}$$

Replacing  $n$  by  $m$ , we get ( $m < n$ )

$$\begin{aligned} &\int_0^\infty e^{-x} x^n L_m(x) dx = 0 \text{ for } m < n \\ \Rightarrow &\int_0^\infty e^{-x} L_m(x) L_n(x) dx = 0, \text{ if } m \neq n \\ \Rightarrow &\int_0^\infty e^{-x} \frac{L_m(x)}{m!} \frac{L_n(x)}{n!} dx = 0, \text{ if } m \neq n \end{aligned}$$

Taking  $m = n$ , then  $L_n(x)$  is  $(-1)^n x^n$ ,

$$\begin{aligned} \therefore \int_0^\infty e^{-x} \{L_n(x)\}^2 dx &= (-1)^n \int_0^\infty e^{-x} x^n L_n(x) dx = (-1)^n \int_0^\infty e^{-x} x^n e^x \frac{d^n}{dx^n} (x^n e^{-x}) dx \\ &= (-1)^n \int_0^\infty x^n \frac{d^n}{dx^n} (x^n e^{-x}) dx = (-1)^{2n} n! \int_0^\infty x^n e^{-x} dx = (n!)^2 \\ \Rightarrow \int_0^\infty e^{-x/2} \frac{L_n(x)}{n!} e^{-x/2} \frac{L_n(x)}{n!} dx &= 1 \quad \dots \dots \dots (3) \end{aligned}$$

Combining (2) and (3), we get

$$\int_0^\infty f_m(x) f_n(x) dx = \int_0^\infty e^{-x/2} \frac{L_m(x)}{m!} e^{-x/2} \frac{L_n(x)}{n!} dx = \delta_{m,n}$$

### EXERCISE 36.1

**Prove the following :**

1.  $L_3^1(x) = -18 + 18x - 3x^2$

2.  $L_4^2(x) = 144 - 96x + 12x^2$

3.  $L_4^4(x) = 24.$

4. Find a series solution of

$xy'' + (1+x)y' + y = 0.$

**Ans.**  $y = e^{-x} L_0(x) = e^{-x}$

## CHEBYSHEV POLYNOMIALS

---

---

### 37.1 INTRODUCTION

In numerical analysis, main problem is approximating a function. For better approximation of a function the error should be minimum. To make the error minimum we use the least squares method. On the other hand, we may choose the approximation such that maximum component of error is minimised. This introduces Chebyshev polynomial. We apply Chebyshev polynomial in the economization of power series.

### 37.2 CHEBYSHEV POLYNOMIALS (Tchebcheff or Tschebyscheff polynomials)

The Chebyshev polynomials of first kind

$$T_n(x) = \cos(n \cos^{-1} x)$$

and the second kind

$$U_n(x) = \sin(n \cos^{-1} x)$$

where  $n$  is non-negative integer

### 37.3 Chebyshev Equation

$$(1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + n^2 y = 0 \quad \dots (1)$$

Prove that  $T_n(x)$  and  $U_n(x)$  are the independent solutions of the Chebyshev equation.

**Proof.**

Let

$$y = T_n(x) = \cos(n \cos^{-1} x) = \cos n\theta$$

$$\frac{dy}{dx} = \frac{dy}{d\theta} \frac{d\theta}{dx} = -\frac{n \sin n\theta}{-\sin \theta}$$

$$\left\{ \cos \theta = x \Rightarrow -\sin \theta \frac{d\theta}{dx} = 1 \text{ or } \frac{d\theta}{dx} = -\frac{1}{\sin \theta} \right\}$$

or

$$\frac{dy}{dx} = \frac{n \sin n\theta}{\sin \theta}$$

$$\frac{d^2y}{dx^2} = \frac{\sin \theta (n^2 \cos n\theta) - n \sin n\theta \cdot \cos \theta}{\sin^2 \theta} \frac{d\theta}{dx}$$

$$= \frac{n^2 \sin \theta \cos n\theta - n \sin n\theta \cdot \cos \theta}{\sin^2 \theta} \left( -\frac{1}{\sin \theta} \right)$$

$$\Rightarrow \frac{-n^2 \cos n\theta + \left( \frac{n \sin n\theta}{\sin \theta} \right) (\cos \theta)}{\sin^2 \theta}$$

$$\Rightarrow \frac{d^2y}{dx^2} = \frac{-n^2y + x \frac{dy}{dx}}{1-x^2}$$

$$\Rightarrow (1-x^2) \frac{d^2y}{dx^2} - x \frac{dy}{dx} + n^2y = 0$$

Which is satisfied by  $T_n(x)$ .

Similarly we can prove that  $U_n = \sin(n \cos^{-1} x)$  is a solution of Chebyshev equation.

Hence  $T_n(x)$  and  $U_n(x)$  both are the solutions of (1). But  $U_n(x)$  can not be expressed as a constant multiple of  $T_n(x)$  as shown below :

$$T_n(1) = \cos(n \cos^{-1} 1) = \cos n(0) = \cos 0 = 1$$

$$U_n(1) = \sin(n \cos^{-1} 1) = \sin n(0) = 0$$

Thus  $T_n(x)$  and  $U_n(x)$  are independent solutions of Chebyhev's equation.

### 37.4 ORTHOGONAL PROPERTIES OF CHEBYSHEV POLYNOMIALS.

$$\int_{-1}^1 \frac{T_m(x)T_n(x)}{\sqrt{1-x^2}} dx = \begin{cases} 0, & m \neq n \neq 0 \\ \frac{\pi}{2}, & m = n \neq 0 \\ \pi, & m = n = 0 \end{cases}$$

**Proof.** We know that

$$T_m(x) = \cos(m \cos^{-1} x) = \cos m\theta \quad \left\{ \begin{array}{l} \theta = \cos^{-1} x \\ x = \cos \theta \\ dx = -\sin \theta d\theta \end{array} \right.$$

$$T_n(x) = \cos(n \cos^{-1} x) = \cos n\theta$$

$$\therefore (a) \text{ If } m \neq n \neq 0 \quad \int_{-1}^1 \frac{T_m(x)T_n(x)}{\sqrt{1-x^2}} dx = \int_{\pi}^0 \frac{\cos m\theta \cos n\theta}{\sin \theta} (-\sin \theta d\theta)$$

$$= \int_0^{\pi} \cos m\theta \cos n\theta d\theta$$

$$= \frac{1}{2} \int_0^{\pi} [(\cos(m+n)\theta + \cos(m-n)\theta)] d\theta$$

$$= \frac{1}{2} \left[ \frac{\sin(m+n)\theta}{m+n} + \frac{\sin(m-n)\theta}{m-n} \right]_0^{\pi}$$

$$= 0 \quad m \neq n$$

(b) If  $m = n \neq 0$

$$\int_{-1}^{+1} \frac{T_n(x)T_n(x)dx}{\sqrt{1-x^2}} = \int_{\pi}^0 \frac{\cos n\theta \cos n\theta}{\sin \theta} (-\sin \theta d\theta)$$

$$= \int_0^{\pi} \cos^2 n\theta d\theta = \frac{1}{2} \int_0^{\pi} (\cos 2\theta + 1) d\theta$$

$$= \frac{1}{2} \left[ \frac{\sin 2\theta}{2} + \theta \right]_0^\pi = \frac{\pi}{2}$$

(c) If  $m = n = 0$

$$\int_{-1}^{+1} \frac{T_0(x)T_0(x)}{\sqrt{1-x^2}} dx = \int_{-\pi}^0 \frac{(1)(1)}{\sin \theta} (-\sin \theta d\theta) = \int_0^\pi d\theta = (\theta)_0^\pi = \pi$$

**Note:** (1) Similarly we can prove that  $\int_{-1}^{+1} \frac{U_m(x)U_n(x)}{\sqrt{1-x^2}} dx = \begin{cases} 0, & m \neq n \\ \frac{\pi}{2}, & m = n \neq 0 \\ \pi, & m = n = 0 \end{cases}$

(2) The polynomials  $T_n(x)$  are orthogonal with the function  $\frac{1}{\sqrt{1-x^2}}$ .

**Example 1.** Prove that (a)  $T_{-n}(x) = T_n(x)$

$$(b) T_0(x) = 1 \quad (c) T_1(x) = x$$

**Solution.** The Chebyshev polynomial of degree  $n$  over the integral  $[-1, 1]$  is defined as

$$T_n(x) = \cos(n \cos^{-1} x) \quad \dots (1)$$

On putting  $-n$  for  $n$  in (1) we get

$$\begin{aligned} T_{-n} &= \cos(-n \cos^{-1} x) \\ &= \cos(n \cos^{-1} x) \\ &= T_n \\ \Rightarrow T_n &= T_{-n} \end{aligned}$$

(b) Let

$$\cos^{-1} x = \theta \text{ so that } x = \cos \theta$$

On putting  $\cos^{-1} x = \theta$  in (1), it becomes

$$T_n(x) = \cos n \theta \quad \dots (2)$$

$$T_0(x) = \cos 0 = 1$$

On putting  $n = 0$  in (1), we get  $T(0) = \cos 0 = 1$

(c) If  $n = 1$  On putting  $n = 1$  in (1) we get,  $T_1(x) = \cos \theta = x$

### 37.5 RECURRENCE RELATION OF CHEBYSHEV POLYNOMIALS

(I) **Formula I**

$$T_{n+1}(x) = 2x T_n(x) - T_{n-1}(x)$$

$$\cos(n-1)\theta + \cos(n+1)\theta = 2 \cos n\theta \cdot \cos \theta \quad \dots (1) \text{ (Trigonometric identity)}$$

On putting the values of  $\cos(n-1)\theta, \cos(n+1)\theta, \cos n\theta, \cos \theta$  in (1) we get

$$T_{n-1}(x) + T_{n+1}(x) = 2x T_n(x)$$

$$\Rightarrow T_{n+1}(x) = 2x T_n(x) - T_{n-1}(x) \quad \dots (2)$$

This is the required recurrence relation of Chebyshev polynomials

Similarly we can prove that  $U_{n+1}(x) = 2x U_n(x) - U_{n-1}(x)$

On substituting  $n = 1$ , in (2) we have

$$\begin{aligned} T_2(x) &= 2x T_1(x) - T_0(x) \\ &= 2x(x) - 1 = 2x^2 - 1 \end{aligned}$$

If  $n = 2$ ,

$$\begin{aligned} T_3(x) &= 2x T_2(x) - T_1(x) = 2x(2x^2 - 1) - x \\ &= 4x^3 - 3x \end{aligned}$$

If  $n = 3$ ,

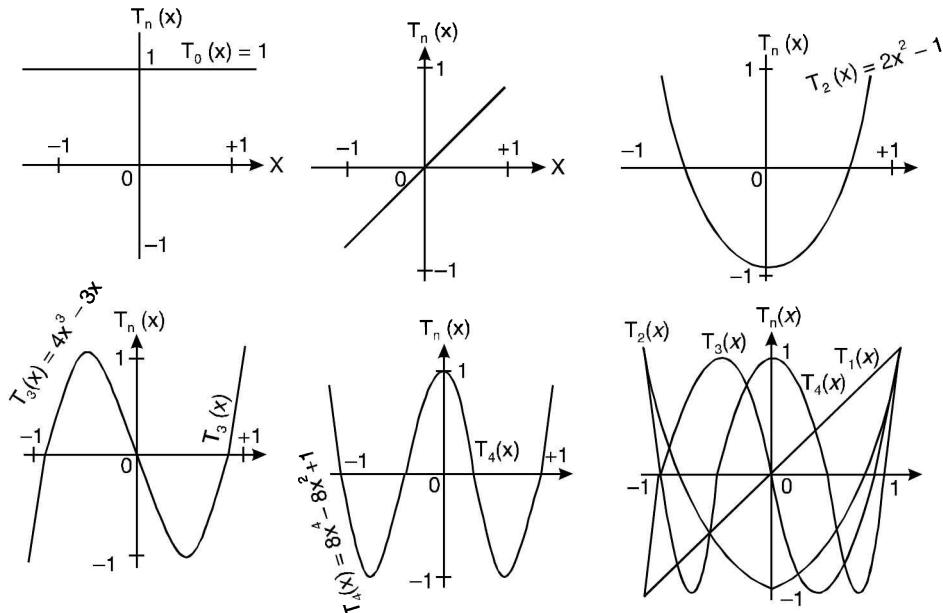

$$\begin{aligned}T_4(x) &= 2x T_3(x) - T_2(x) \\&= 2x(4x^3 - 3x) - (2x^2 - 1) \\&= 8x^4 - 8x^2 + 1\end{aligned}$$

In this way

$$\begin{aligned}T_0(x) &= 1 \\T_1(x) &= x \\T_2(x) &= 2x^2 - 1 \\T_3(x) &= 4x^3 - 3x \\T_4(x) &= 8x^4 - 8x^2 + 1 \\T_5(x) &= 16x^5 - 20x^3 + 5x \\T_6(x) &= 32x^6 - 48x^4 + 18x^2 - 1\end{aligned}$$

Here the coefficient of  $x^n$  in  $T_n(x)$  is always  $2^{n-1}$ .

#### Graph of Chebyshev polynomials.

#### 37.6 POWERS OF X IN TERMS OF $T_n(x)$

$$1 = T_0(x)$$

$$x = T_1(x)$$

$$x^2 = \frac{1}{2}[T_0(x) + T_2(x)]$$

$$x^3 = \frac{1}{4}[3T_1(x) + T_3(x)]$$

$$x^4 = \frac{1}{8}[3T_0(x) + 4T_2(x) + T_4(x)]$$

$$x^5 = \frac{1}{16}[10T_1(x) + 5T_3(x) + T_5(x)]$$

$$x^6 = \frac{1}{32}[10T_0(x) + 15T_2(x) + 6T_4(x) + T_6(x)]$$

and so on.

### Recurrence Formula II

$$(1-x^2)T'_n(x) = -nxT_n(x) + nT_{n-1}(x)$$

**Solution.** We know that

$$\begin{aligned} T_n(x) &= \cos(n\cos^{-1}x) = \cos n\theta & \theta = \cos^{-1}x = x = \cos\theta \\ T'_n(x) &= -\sin n\theta \left( n \frac{d\theta}{dx} \right) = \frac{-\sin n\theta}{1} \left( -\frac{n}{\sin\theta} \right) = \frac{n \sin n\theta}{\sin\theta} & 1 = -\sin\theta \frac{d\theta}{dx} \\ & \frac{d\theta}{dx} = -\frac{1}{\sin\theta} \end{aligned}$$

Multiplying both sides by  $(1-x^2)$  we get

$$(1-x^2)T'_n(x) = (1-x^2) \frac{n \sin n\theta}{\sin\theta} = \frac{(1-\cos^2\theta)n \sin n\theta}{\sin\theta} = \frac{(\sin^2\theta)(n \sin n\theta)}{\sin\theta} = n \sin n\theta \sin\theta \quad \dots (1)$$

$$\begin{aligned} -nxT_n(x) + nT_{n-1}(x) &= -n \cos\theta \cos n\theta + n \cos(n-1)\theta \\ &= n[-\cos\theta \cos n\theta + \cos(n\theta - \theta)] \\ &= n[-\cos\theta \cos n\theta + \cos n\theta \cos\theta + \sin n\theta \sin\theta] \\ &= n \sin n\theta \sin\theta \quad \dots (2) \end{aligned}$$

From (1) and (2)

$$(1-x^2)T'_n(x) = -nxT_n(x) + nT_{n-1}(x)$$

**Proved.**

**Example 2.** Prove that

$$[T_n(x)]^2 - T_{n+1}(x)T_{n-1}(x) = 1 - x^2$$

**Solution.** Let  $\cos^{-1}x = \theta \Rightarrow x = \cos\theta$

$$\begin{aligned} [T_n(x)]^2 - T_{n+1}(x)T_{n-1}(x) &= [\cos(n\cos^{-1}x)]^2 - [\cos((n+1)\cos^{-1}x)][\cos((n-1)\cos^{-1}x)] \\ &= \cos^2 n\theta - \cos(n+1)\theta \cos(n-1)\theta \\ &= \cos^2 n\theta - \frac{1}{2}[\cos 2n\theta + \cos 2\theta] \\ &= \cos^2 n\theta - \frac{1}{2}[2\cos^2 n\theta - 1 + 2\cos^2 - 1] \\ &= \cos^2 n\theta - \cos^2 n\theta + \frac{1}{2} - \cos^2 \theta + \frac{1}{2} \\ &= 1 - \cos^2 \theta = 1 - x^2 \end{aligned}$$

**Proved**

**Example 3.** Prove that

$$T_n(x) = \frac{1}{2} \left[ \left\{ x + i\sqrt{(1-x^2)} \right\}^n + \left\{ x - i\sqrt{(1-x^2)} \right\}^n \right]$$

**Solution.** We know that

$$T_n(x) = \cos(n\cos^{-1}x) = \cos n\theta \quad \dots (1)$$

$$\theta = \cos^{-1} x \Rightarrow x = \cos \theta$$

$$\begin{aligned}
\text{R.H.S.} &= \frac{1}{2} [\{x + i\sqrt{(1-x^2)}\}^n + \{x - i\sqrt{(1-x^2)}\}^n] \\
&= \frac{1}{2} [\{\cos \theta + i\sqrt{(1-\cos^2 \theta)}\}^n + \{\cos \theta - i\sqrt{(1-\cos^2 \theta)}\}^n] \\
&= \frac{1}{2} [\{\cos \theta + i \sin \theta\}^n + \{\cos \theta - i \sin \theta\}^n] \\
&= \frac{1}{2} [\cos n\theta + i \sin n\theta + \cos n\theta - i \sin n\theta] \quad (\text{De Moivre's theorem}) \\
&= \cos n\theta
\end{aligned} \tag{2}$$

From (1) and (2) we have

$$T_n(x) = \frac{1}{2} [\{x + i\sqrt{(1-x^2)}\}^n + \{x - i\sqrt{(1-x^2)}\}^n] \quad \text{Proved.}$$

**Example 4.** Prove that

$$U_n(x) = -\frac{1}{2}i \left[ \left\{ x + i\sqrt{(1-x^2)} \right\}^n - \left\{ x - i\sqrt{(1-x^2)} \right\}^n \right]$$

**Solution.** We know that

$$\begin{aligned}
U_n(x) &= \sin(n \cos^{-1} x) = \sin n\theta \quad \dots (1) \quad \cos^{-1} x = \theta \Rightarrow x = \cos \theta \\
\text{R.H.S.} &= -\frac{1}{2}i [\{x + i\sqrt{(1-x^2)}\}^n - \{x - i\sqrt{(1-x^2)}\}^n] \\
&= \frac{-i}{2} [\{\cos \theta + i\sqrt{(1-\cos^2 \theta)}\}^n - \{\cos \theta - i\sqrt{(1-\cos^2 \theta)}\}^n] \\
&= \frac{-i}{2} [\{\cos \theta + i \sin \theta\}^n - \{\cos(-\theta) + i \sin(-\theta)\}^n] \\
&= \frac{-i}{2} [\{\cos n\theta + i \sin n\theta\} - \{\cos(-n\theta) + i \sin(-n\theta)\}] \quad (\text{De Moivre's Theorem}) \\
&= \frac{-i}{2} [\cos n\theta + i \sin n\theta - \cos n\theta + i \sin n\theta] \\
&= \frac{-i}{2} (2i \sin n\theta) = \sin n\theta
\end{aligned} \tag{2}$$

From (1) and (2) we have

$$U_n(x) = -\frac{1}{2}i [\{x + i\sqrt{(1-x^2)}\}^n - \{x - i\sqrt{(1-x^2)}\}^n] \quad \text{Proved.}$$

### 37.7 RECURRENCE FORMULAE FOR $U_n(x)$

$$(I) U_{n+1}(x) - 2x U_n(x) + U_{n-1}(x) = 0$$

**Proof**  $U_n(x) = \sin(n \cos^{-1} x) = \sin n\theta \quad (x = \cos \theta)$

$$\begin{aligned}
\text{Now } U_{n+1}(x) - 2x U_n(x) + U_{n-1}(x) &= \sin(n+1)\theta - 2 \cos \theta \sin n\theta + \sin(n-1)\theta, \\
&= \sin(n+1)\theta - [\sin(n+1)\theta + \sin(n-1)\theta] + \sin(n-1)\theta \\
&= 0
\end{aligned} \quad \text{Proved.}$$

$$(ii) (1-x^2)U'_n(x) = -nxU_n(x) + nU_{n-1}(x) \quad (U.P., III \text{ semester 2002})$$

**Proof.** We know that

$$\begin{aligned} U_n(x) &= \sin(n \cos^{-1} x) = \sin n\theta \\ U'_n(x) &= \cos n\theta \left( n \frac{d\theta}{dx} \right) = \cos n\theta \left( \frac{-n}{\sin \theta} \right) = -n \frac{\cos n\theta}{\sin \theta} \end{aligned}$$

Multiplying both sides by  $\sqrt{(1-x^2)}$  we get

$$\begin{aligned} \sqrt{(1-x^2)} U'_n(x) &= -n \sqrt{(1-x^2)} \frac{\cos n\theta}{\sin \theta} = -n \sqrt{(1-\cos^2 \theta)} \frac{\cos n\theta}{\sin \theta} \\ &= \frac{n \sin^2 \theta \cos n\theta}{\sin \theta} = -n \cos n\theta \sin \theta \end{aligned} \quad \dots (1)$$

$$\begin{aligned} \text{R.H.S.} &= -nxU_n(x) + nU_{n-1}(x) \\ &= -n \cos \theta \sin n\theta + n \sin(n-1)\theta \\ &= -n [\cos \theta \sin n\theta - \sin(n\theta - \theta)] \\ &= -n [\cos \theta \sin n\theta - \sin n\theta \cos \theta + \cos n\theta \sin \theta] \\ &= -n (\cos n\theta \sin \theta) = -n \cos n\theta \sin \theta \end{aligned} \quad \dots (2)$$

From (1) and (2) we get

$$(1-x^2)U'_n(x) = -nxU_n(x) + nU_{n-1}(x) \quad \text{Proved.}$$

**Example 5.** Show that  $\frac{1}{\sqrt{(1-x^2)}} U_n(x)$  satisfies the differential equation

$$(1-x^2) \frac{d^2y}{dx^2} - 3x \frac{dy}{dx} + (n^2 - 1)y = 0$$

**Solution.** Let  $y = \frac{1}{\sqrt{(1-x^2)}} U_n(x)$

$$= \frac{\sin(n \cos^{-1} x)}{\sqrt{1-x^2}} = \frac{\sin n\theta}{\sqrt{1-x^2}} \quad \left[ \begin{array}{l} \cos^{-1} x = \theta \\ \frac{-1}{\sqrt{1-x^2}} = \frac{d\theta}{dx} \end{array} \right]$$

Differentiating both sides we get

$$\frac{dy}{dx} = \frac{\sqrt{1-x^2} \cdot \cos n\theta \left( n \frac{d\theta}{dx} \right) - \frac{1}{2} (1-x^2)^{-\frac{1}{2}} (-2x) \cdot \sin n\theta}{(1-x^2)}$$

$$\Rightarrow \frac{n\sqrt{1-x^2} \cos n\theta \left( \frac{-1}{\sqrt{1-x^2}} \right) + \frac{x}{\sqrt{1-x^2}} \sin n\theta}{(1-x^2)}$$

$$\Rightarrow (1-x^2) \frac{dy}{dx} = -n \cos n\theta + \frac{x \sin n\theta}{\sqrt{1-x^2}}$$

$$\Rightarrow (1-x^2) \frac{dy}{dx} = -n \cos n\theta + xy$$

Again differentiating we get

$$\begin{aligned}
 & (1-x^2) \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} = n^2 \sin n\theta \frac{d\theta}{dx} + x \frac{dy}{dx} + 1.y \\
 \Rightarrow & (1-x^2) \frac{d^2y}{dx^2} - 3x \frac{dy}{dx} = -n^2 \frac{\sin n\theta}{\sqrt{1-x^2}} + y \\
 & (1-x^2) \frac{d^2y}{dx^2} - 3x \frac{dy}{dx} = -n^2 y + y \\
 \Rightarrow & (1-x^2) \frac{d^2y}{dx^2} - 3 \times \frac{dy}{dx} + (n^2 - 1)y = 0
 \end{aligned}
 \tag{Proved.}$$

**Example 6.** Show that

$$\sqrt{(1-x^2)} T_n(x) = U_{n+1}(x) - xU_n(x)$$

**Solution.** Let  $\cos^{-1} x = \theta \Rightarrow x = \cos \theta$

$$\begin{aligned}
 \text{L.H.S.} &= \sqrt{(1-x^2)} T_n(x) = \sqrt{(1-\cos^2 \theta)} \cos(n \cos^{-1} x) = \sin \theta \cos n\theta \\
 \text{R.H.S.} &= U_{n+1}(x) - xU_n(x) \\
 &= \sin(n+1)\theta - \cos \theta \sin n\theta \\
 &= \sin(n\theta + \theta) - \cos \theta \sin n\theta \\
 &= \sin n\theta \cos \theta + \cos n\theta \sin \theta - \cos \theta \sin n\theta \\
 &= \cos n\theta \cdot \sin \theta \\
 &= \text{L.H.S.}
 \end{aligned}
 \tag{Proved.}$$

**Example 7.** Show that

$$\sum_{r=0}^n T_{2r}(x) = \frac{1}{2} \left\{ I + \frac{1}{\sqrt{(1-x^2)}} U_{2n+1}(x) \right\}$$

**Solution.** Let  $\cos^{-1} x = \theta \Rightarrow x = \cos \theta$

$$\begin{aligned}
 \sum_{r=0}^n T_{2r}(x) &= \sum_{r=0}^n \cos(2r \cos^{-1} x) = \sum_{r=0}^n \cos(2r\theta) \\
 &= \text{Real part of } \sum_{r=0}^n [(\cos(2r\theta) + i \sin(2r\theta))] = \text{Real part of } \sum_{r=0}^n e^{i2r\theta} \\
 &= \text{Real part of } [1 + e^{i2\theta} + e^{i4\theta} + e^{i6\theta} + \dots + e^{i2n\theta}] \\
 &\quad (\text{This is G.P. of } (n+1) \text{ terms with common ratio } e^{i2\theta}) \\
 &= \text{Real part of } \frac{1 - e^{i(2\theta)(n+1)}}{1 - e^{i2\theta}} \quad \left( \text{sum} = \frac{1 - r^{n+1}}{1 - r} \right) \\
 &= \text{Real part of } \frac{[1 - e^{i(2n+2)\theta}][1 - e^{-i2\theta}]}{(1 - e^{i2\theta})(1 - e^{-i2\theta})} \\
 &= \text{Real part of } \frac{1 - e^{i(2n+2)\theta} - e^{-i2\theta} + e^{i2n\theta}}{1 + 1 - e^{i2\theta} - e^{-i2\theta}}
 \end{aligned}$$

$$\begin{aligned}
&= \text{Real part of } \frac{1 - \{\cos(2n+2)\theta - i \sin(2n+2)\theta\} - \{\cos 2\theta - i \sin 2\theta\} + \{\cos 2n\theta - i \sin 2n\theta\}}{2 - 2 \cos 2\theta} \\
&= \frac{1 - \cos(2n+2)\theta - \cos 2\theta + \cos 2n\theta}{2(1 - \cos 2\theta)} = \frac{1}{2} \left[ \frac{1 - \cos 2\theta}{1 - \cos 2\theta} - \frac{\cos(2n+2)}{1 - \cos 2\theta} \cos 2n\theta \right] \\
&= \frac{1}{2} \left[ 1 - \frac{\cos(2n+2)\theta - \cos 2n\theta}{1 - \cos 2\theta} \right] = \frac{1}{2} \left[ 1 + \frac{2 \sin(2n+1)\theta \sin \theta}{2 \sin^2 \theta} \right] \\
&= \frac{1}{2} \left[ 1 + \frac{\sin(2n+1)\theta}{\sin \theta} \right] = \frac{1}{2} \left[ 1 + \frac{U_{(2n+1)}(x)}{\sqrt{1-x^2}} \right]
\end{aligned}$$

**Proved.****Example 8.** Prove that

$$T_n(x) = \sum_{r=0}^N (-1)^r \frac{\binom{n}{2r} n!}{n-2r} (1-x^2)^r x^{n-2r} \quad N = \frac{n}{2} \text{ if } n \text{ is even}$$

$$N = \frac{n-1}{2} \text{ if } n \text{ is odd}$$

**Solution.** We know that  $T_n(x) = x^n - {}^n C_2 x^{n-2} (1-x^2) + {}^n C_4 x^{n-4} (1-x^2)^2 + \dots$ 

$$T_n(x) = \frac{1}{2} \left[ \left\{ x + i\sqrt{(1-x^2)} \right\}^n + \left\{ x - i\sqrt{(1-x^2)} \right\}^n \right] \quad \dots (1)$$

On applying Binomial theorem on (1) we get

$$\begin{aligned}
T_n &= \frac{1}{2} \left[ x^n + {}^n C_1 x^{n-1} (i\sqrt{1-x^2}) + \dots + {}^n C_r x^{n-r} (-i\sqrt{1-x^2})^r + \dots \right. \\
&\quad \left. + \{x^n + {}^n C_1 x^{n-1} (-i\sqrt{1-x^2}) + \dots + {}^n C_r x^{n-r} (-i\sqrt{1-x^2})^r + \dots\} \right] \\
&= \frac{1}{2} \left[ \left\{ \sum_{r=0}^n {}^n C_r x^{n-r} (i\sqrt{1-x^2})^r \right\} + \left\{ \sum_{r=0}^n {}^n C_r x^{n-r} (-i\sqrt{1-x^2})^r \right\} \right] \\
&= \frac{1}{2} \sum_{r=0}^n {}^n C_r x^{n-r} (1-x^2)^{\frac{r}{2}} (i)^r \{1 + (-1)^r\} \quad \dots (2)
\end{aligned}$$

(a) If  $r$  is odd or  $r = 2s + 1$ 

$$r \leq n$$

$$T_n = \sum_{s=0}^{\frac{n-1}{2}} {}^n C_{2s+1} x^{n-2s-1} (i)^{2s+1} [1 + (-1)^{2s+1}] \quad 2s+1 \leq n$$

$$T_n = \sum_{s=0}^{\frac{n-1}{2}} {}^n C_{2s+1} x^{n-2s-1} (i)^{2s+1} (1-1) = 0 \quad s \leq \frac{n-1}{2}$$

(b) If  $r$  is even or  $r = 2s$ 

$$T_n = \frac{1}{2} \sum_{s=0}^{\frac{n}{2}} {}^n C_{2s} x^{n-2s} (1-x^2)^s (i)^{2s} \{1 + (-1)^{2s}\}$$

$\begin{cases} r \leq n \\ 2s \leq n \\ s \leq \frac{n}{2} \\ \text{if } n \text{ is even} \end{cases}$

$$\begin{aligned}
 &= \frac{1}{2} \sum_{s=0}^{\frac{n}{2}} {}^n C_{2s} x^{n-2s} (1-x^2)^s (-1)^s \{1+1\} \\
 &= \sum_{s=0}^{\frac{n}{2}} (-1)^s {}^n C_{2s} x^{n-2s} (1-x^2)^s \\
 &= \sum_{s=0}^{\frac{n}{2}} (-1)^s \frac{n!}{(n-2s)! (2s)!} (1-x^2)^s x^{n-2s}
 \end{aligned}$$

$$(ii) \text{ If } n \text{ is odd or } n \equiv 2s + 1 \quad s = \frac{n-1}{2}$$

$$T_n = \sum_{s=0}^{\frac{n-1}{2}} (-1)^s \frac{n!}{(n-2s)! (2s)!} (1-x^2)^s x^{n-2s}$$

$$\text{Hence } T_n = x^n - {}^n C_2 x^{n-2} (1-x^2) + {}^n C_4 x^{n-4} (1-x^2)^2 + \dots$$

**Proved.**

**Example 9.** Find the value of the following:

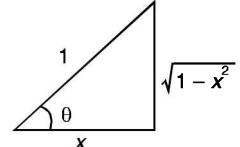

$$(i) U_0(x) \quad (ii) U_1(x) \quad (iii) U_2(x) \quad (iv) U_3(x)$$

**Solution.** We know that

$$U_n(x) = \sin(n \cos^{-1} x)$$

$$\text{If } n = 0, \quad U_0(x) = \sin(0) = 0$$

$$\text{If } n = 1, \quad U_1(x) = \sin(\cos^{-1} x) = \sin \sin^{-1} \sqrt{1-x^2} = \sqrt{1-x^2}$$

$$\text{If } n = 2, \quad U_2(x) = \sin(2 \cos^{-1} x) = \sin 2\theta = 2 \sin \theta \cos \theta = 2x \sqrt{1-x^2}$$

$$\left[ \begin{array}{l} \theta = \cos^{-1} x \\ \cos \theta = x \end{array} \right]$$

$$\begin{aligned}
 \text{If } n = 3, \quad U_3(x) &= \sin(3 \cos^{-1} x) = \sin 3\theta = 3 \sin \theta - 4 \sin^3 \theta \\
 &= 3\sqrt{1-x^2} - 4(\sqrt{1-x^2})^3 = \sqrt{1-x^2} [3 - 4(1-x^2)] = \sqrt{1-x^2} [4x^2 - 1]
 \end{aligned}$$

Here we see that  $U_n(x)$  is not polynomial.

But if we define

$$U_n(x) = \frac{\sin\{(n+1)\cos^{-1} x\}}{\sin(\cos^{-1} x)} = \frac{U_{n+1}}{\sqrt{1-x^2}}$$

Then  $U_n(x)$  is a polynomial in  $x$  of degree  $n$ .

### 37.8 GENERATING FUNCTION FOR $T_n(x)$

$$\frac{1-t^2}{1-2tx+t^2} = T_0(x) + 2 \sum_{n=1}^{\infty} T_n(x) \cdot t^n$$

$$\text{Proof L.H.S.} = \frac{1-t^2}{1-2tx+t^2} \quad \text{Put} \quad x = \cos \theta = \frac{e^{i\theta} + e^{-i\theta}}{2}$$

$$= \frac{1-t^2}{1-t(e^{i\theta} + e^{-i\theta}) + t^2} = \frac{1-t^2}{(1-te^{i\theta}) - te^{-i\theta} + t^2} = \frac{1-t^2}{(1-te^{i\theta}) - te^{-i\theta}(1-te^{i\theta})}$$

$$\begin{aligned}
&= \frac{1-t^2}{(1-te^{i\theta})(1-te^{-i\theta})} = (1-t^2)(1-te^{i\theta})^{-1}(1-te^{-i\theta})^{-1} \\
&= (1-t^2)(1+te^{i\theta}+t^2e^{2i\theta}+\dots+t^re^{ri\theta}+\dots)[1+te^{-i\theta}+t^2e^{-2i\theta}+\dots+t^se^{-si\theta}+\dots] \\
&= (1-t^2) \sum_{r=0}^{\infty} t^r e^{ri\theta} \sum_{s=0}^{\infty} t^s e^{-si\theta} = (1-t^2) \sum_{r=0}^{\infty} t^{r+s} e^{(r-s)i\theta} \\
&= \sum_{r=0}^{\infty} i^{r-s} t^{r+s} - \sum_{r=0}^{\infty} i^{r-s} t^{r+s+2} \quad \dots (1)
\end{aligned}$$

On putting  $r = s = 0$  in the first summation of (1) we get coefficient of  $t_0 = e^{i(0-0)\theta} = e^0 = 1 = T_0(x)$ .

On putting  $r + s = n$  or  $s = n - r$  in the first summation and  $r + s + 2 = n$  or  $s = n - r - 2$  in the second summation, we get

$$\begin{aligned}
\text{Coefficient of } t^n &= \sum_{r=0}^n e^{i[r-(n-r)]\theta} - \sum_{r=0}^{n-2} e^{i[r-(n-r-2)]\theta} \\
&= \sum_{r=0}^n e^{i(-n+2r)\theta} - \sum_{r=0}^{n-2} e^{i[-n+2r+2]\theta} \\
&= e^{-in\theta} \sum_{r=0}^n e^{i(2r)\theta} - e^{-i(n-2)\theta} \sum_{r=0}^{n-2} e^{i(2r)\theta} \\
&= e^{-in\theta} [1 + e^{2i\theta} + e^{4i\theta} + \dots \text{to } (n+1) \text{ terms}] - e^{-i(n-2)\theta} [1 + e^{2i\theta} + e^{4i\theta} + \dots \text{to } (n-1) \text{ terms}] \\
&= e^{-in\theta} \frac{1 - (e^{2i\theta})^{n+1}}{1 - e^{2i\theta}} - e^{-i(n-2)\theta} \frac{1 - (e^{2i\theta})^{n-1}}{1 - e^{2i\theta}} \quad [\text{Sum of G.P.}] \\
&= \frac{e^{-in\theta} - e^{i(n+2)\theta}}{1 - e^{2i\theta}} - \frac{e^{-i(n-2)\theta} - e^{in\theta}}{1 - e^{2i\theta}} \\
&= \frac{e^{-in\theta} - e^{i(n+2)\theta} - e^{-i(n-2)\theta} + e^{in\theta}}{1 - e^{2i\theta}} = \frac{e^{-in\theta}(1 - e^{2i\theta}) + e^{in\theta}(1 - e^{2i\theta})}{1 - e^{2i\theta}} \\
&= \frac{(1 - e^{2i\theta})(e^{in\theta} + e^{-in\theta})}{1 - e^{2i\theta}} = (e^{in\theta} + e^{-in\theta}) = 2 \cos n\theta = 2T_n(x)
\end{aligned}$$

$$\text{or } \frac{1-t^2}{1-2tx+t^2} = T_0(x) + 2 \sum_{n=0}^{\infty} T_n(x) t^n$$

**Proved.**

**Example 10.** Show that

$$(i) T_n(-1) = (-1)^n \quad (ii) T_{2n}(0) = (-1)^n \quad (iii) T_{2n+1}(0) = 0$$

**Solution.** We know that

$$T_n(x) = \cos(n \cos^{-1} x) \quad \dots (1)$$

(i) Replacing  $x$  by  $-1$  in (1) we get

$$T_n(-1) = \cos[n \cos^{-1}(-1)] = \cos[n\pi] = (-1)^n$$

(ii) Replacing  $x$  by 0 and  $n$  by  $2n$  in (1) we get

$$T_{2n}(0) = \cos[2n\cos^{-1}(0)] = \cos\left(2n\frac{\pi}{2}\right) = \cos n\pi = (-1)^n$$

(iii) Replacing  $x$  by 0 and  $n$  by  $2n + 1$ , we get

$$T_{2n+1}(0) = \cos[(2n+1)\cos^{-1}(0)] = \cos[(2n+1)\frac{\pi}{2}] = 0 \quad \text{Proved.}$$

**Example 11.** Show that

$$(i) U_n(1) = 0 \quad (ii) U_n(-1) = 0, \quad (iii) U_{2n}(0) = 0, \quad (iv) U_{2n+1}(0) = (-1)^n$$

**Solution.** We know that

$$U_n(x) = \sin(n\cos^{-1}x) \quad \dots (1)$$

(i) Replacing  $x$  by 1 in (1), we get

$$U_n(1) = \sin(n\cos^{-1}1) = \sin(n \times 0) = 0$$

(ii) Replacing  $x$  by  $-1$  in (1) we get

$$U_n(-1) = \sin(n\cos^{-1}(-1)) = \sin(n\pi) = 0$$

(iii) Replacing  $x$  by 0 and  $n$  by  $2n$  in (1) we get

$$U_{2n}(0) = \sin(2n\cos^{-1}0) = \sin\left(2n\frac{\pi}{2}\right) = \sin(n\pi) = 0$$

(iv) Replacing  $x$  by 0 and  $n$  by  $2n + 1$ , in (1) we get

$$U_{2n+1}(0) = \sin[(2n+1)\cos^{-1}0] = \sin(2n+1)\frac{\pi}{2} = \sin\left(n\pi + \frac{\pi}{2}\right) = (-1)^n \quad \text{Proved.}$$

**Example 12.** Show that

$$2[T_n(x)]^2 = I + T_{2n}(x)$$

$$\begin{aligned} \text{Solution.} \quad 2[T_n(x)]^2 &= 2[\cos(n\cos^{-1}x)]^2 \\ &\quad \left[ \begin{array}{l} \cos^{-1}x = 0 \\ \Rightarrow x = \cos\theta \end{array} \right] \end{aligned}$$

$$\begin{aligned} &= 2[\cos n\theta]^2 \\ &= \cos 2n\theta + 1 \\ &= \cos[2n\cos^{-1}x] + 1 \\ &= T_{2n}(x) + 1 \end{aligned} \quad \text{Proved.}$$

**Example 13.** Show that

$$T_{m+n}(x) + T_{m-n}(x) = 2T_m(x)T_n(x)$$

$$\begin{aligned} \text{Solution.} \quad T_{m+n}(x) + T_{m-n}(x) &= \cos[(m+n)\cos^{-1}x] + \cos[(m-n)\cos^{-1}x] \\ &= \cos[m+n]\theta + \cos(m-n)\theta \quad (\cos^{-1}x = \theta) \\ &= 2\cos m\theta \cos n\theta \\ &= 2\cos[m\cos^{-1}x]\cos[n\cos^{-1}x] \\ &= 2T_m(x)T_n(x) \end{aligned} \quad \text{Proved.}$$

$$\text{Example 14. Show that } T_n'(x) = \frac{n}{\sqrt{1-x^2}} u_n(x)$$

$$\begin{aligned}
 \textbf{Solution. } T_n(x) &= \cos(n \cos^{-1} x) = \cos n\theta \\
 T_n'(x) &= -\sin n\theta \cdot n \frac{d\theta}{dx} & \cos^{-1} x = \theta \\
 &= -\sin n\theta \left( -\frac{n}{\sqrt{1-x^2}} \right) & \frac{-1}{\sqrt{1-x^2}} = \frac{d\theta}{dx} \\
 &= \frac{n \sin n\theta}{\sqrt{1-x^2}} = \frac{n \sin[n \cos^{-1} x]}{\sqrt{1-x^2}} \\
 &= \frac{n u_n(x)}{\sqrt{1-x^2}} & \textbf{Ans.}
 \end{aligned}$$

### EXERCISE 37.1

1. Express the following Chebyshev functions :

$$T_2(x) + 2T_1(x) + 2T_0(x) \text{ into ordinary polynomials.} \quad \text{Ans. } 2x^2 + 2x + 1$$

2. Express the polynomial

$$12x^3 + 6x^2 + 4x + 1$$

in Chebyshev polynomical (a) first kind  $T_n(x)$ .

$$(b) \text{ second kind } U_n(x) = \frac{\sin\{(n+1)\cos^{-1}x\}}{\sin(\cos^{-1}x)}$$

$$\text{Ans. (a) } 3T_3(x) + 3T_2(x) + 13T_1(x) + 4T_0(x) \quad (b) \frac{3}{2}U_3(x) + \frac{3}{2}U_2(x) + 5U_1(x) + \frac{5}{2}U_0(x)$$

3. Express the polynomial

$$16x^4 + 4x^3 + 2x^2 + 4x + 5 \text{ into the Chebyshev polynomial of first kind.}$$

$$\text{Ans. } 2T_4(x) + T_3(x) + 9T_2(x) + 7T_1(x) + 12T_0(x)$$

4. If  $U_n(x) = \frac{\sin\{(n+1)\cos^{-1}x\}}{\sin(\cos^{-1}x)}$ , show that

$$(a) U_n(-x) = (-1)^n U_n(x) \quad (b) U_n(1) = n+1$$

$$(c) U_n(-1) = (-1)^n (n+1)$$

5. Prove that

$$U_{n+1}(x) - 2xU_n(x) + U_{n-1}(x) = 0$$

6. Prove that

$$(a) \int_{-1}^{+1} \sqrt{1-x^2} U_m(x) U_n(x) dx = 0, \quad m \neq n \quad (b) \int_{-1}^{+1} \sqrt{1-x^2} (U_n(x))^2 dx = \frac{\pi}{2}$$

8. Prove that

$$\begin{aligned}
 U_n(x) &= \sum_{r=0}^{\frac{1}{2}(n-1)} (-1)^r \frac{n!}{(2r+1)! (n-2r-1)!} (1-x^2)^{r+\frac{1}{2}} x^{n-2r-1} \\
 &= {}^{n+1}C_1 x^n - {}^{n+1}C_3 x^{n-2} (1-x^2) + {}^{n+1}C_5 x^{n-4} (1-x^2)^2 \dots
 \end{aligned}$$

7. Prove that  $T_n(x) = U_n(x) - xU_{n-1}(x)$

# CHAPTER

# 38

## GAMMA, BETA FUNCTION

---

### 38.1 GAMMA FUNCTION

*(U.P. I Semester Dec. 2007)*

$$\int_0^\infty e^{-x} x^{n-1} dx \quad (n > 0)$$

is called gamma function of  $n$ . It is also written as  $\Gamma(n) = \int_0^\infty e^{-x} x^{n-1} dx$

$$\boxed{\int_0^\infty e^{-x} x^{n-1} dx = \Gamma(n)}$$

**Example 1.** Prove that  $\Gamma(1) = 1$

**Solution.** We know that,  $\Gamma(n) = \int_0^\infty e^{-x} x^{n-1} dx$

$$\text{Put } n=1, \quad \Gamma(1) = \int_0^\infty e^{-x} x^{1-1} dx = \int_0^\infty e^{-x} dx = \left[ \frac{e^{-x}}{-1} \right]_0^\infty = 1 \quad \text{Proved.}$$

**Example 2.** Prove that

$$(i) \quad \Gamma(n+1) = n \Gamma(n) \quad (ii) \quad \Gamma(n+1) = n! \quad (\text{Reduction formula})$$

**Solution.**

$$(i) \quad \text{We know that, } \Gamma(n) = \int_0^\infty x^{n-1} e^{-x} dx \quad \dots(1)$$

Integrating by parts, we have

$$\begin{aligned} \Gamma(n) &= \left[ x^{n-1} \frac{e^{-x}}{-1} \right]_0^\infty - (n-1) \int_0^\infty x^{n-2} \frac{e^{-x}}{-1} dx \\ &= \lim_{x \rightarrow 0} \left\{ \left( 1 - \frac{x}{1!} + \frac{x^2}{2!} - \dots + (-1)^n \frac{x^n}{n!} + \dots + \infty \right) x^{n-1} \right\} + (n-1) \int_0^\infty x^{n-2} e^{-x} dx \\ &= 0 + (n-1) \int_0^\infty x^{n-2} e^{-x} dx \\ \therefore \Gamma(n) &= (n-1) \Gamma(n-1) \quad \dots(2) \end{aligned}$$

$$\boxed{\Gamma(n+1) = n \Gamma(n)} \quad \text{Replacing } n \text{ by } (n+1) \quad \text{Proved.}$$

(ii) Replacing  $n$  by  $n-1$  in (2), we get

$$\Gamma(n-1) = (n-2) \Gamma(n-2)$$

Putting the value  $\lceil n-1 \rceil$  in (2), we get

$$\lceil n \rceil = (n-1)(n-2)\lceil n-2 \rceil$$

Similarly,

$$\lceil n \rceil = (n-1)(n-2) \dots 3.2.1 \lceil 1 \rceil$$

... (3)

Putting the value of  $\lceil 1 \rceil$  in (3), we have

$$\lceil n \rceil = (n-1)(n-2) \dots 3.2.1.1$$

$$\lceil n \rceil = (n-1)!$$

Replacing  $n$  by  $n+1$ , we have  $\lceil n+1 \rceil = n!$

**Proved.**

**Example 3.** Evaluate  $\lceil -\frac{1}{2} \rceil$ .

**Solution.**  $\lceil n+1 \rceil = n \lceil n \rceil$

$$\lceil -\frac{1}{2} + 1 \rceil = -\frac{1}{2} \lceil -\frac{1}{2} \rceil \Rightarrow \lceil \frac{1}{2} \rceil = -\frac{1}{2} \lceil -\frac{1}{2} \rceil \Rightarrow \sqrt{\pi} = -\frac{1}{2} \lceil -\frac{1}{2} \rceil \Rightarrow \lceil -\frac{1}{2} \rceil = -2\sqrt{\pi} \text{ Ans.}$$

**Example 4.** Evaluate  $\int_0^\infty \sqrt[4]{x} e^{-\sqrt{x}} dx$

**Solution.** Let  $I = \int_0^\infty x^{1/4} e^{-\sqrt{x}} dx$  ... (1)

Putting  $\sqrt{x} = t \Rightarrow x = t^2$  so that  $dx = 2t dt$  in (1), we get

$$\begin{aligned} I &= \int_0^\infty t^{1/2} e^{-t} 2t dt = 2 \int_0^\infty t^{3/2} e^{-t} dt = 2 \int_0^\infty t^{5/2-1} e^{-t} dt \\ &= 2 \left[ \frac{5}{2} \right] \quad [\text{By definition}] \\ &= 2 \cdot \frac{3}{2} \left[ \frac{3}{2} \right] = 2 \cdot \frac{3}{2} \cdot \frac{1}{2} \left[ \frac{1}{2} \right] = \frac{3}{2} \sqrt{\pi} \end{aligned} \text{ Ans.}$$

**Example 5.** Evaluate  $\int_0^\infty \sqrt{x} e^{-\sqrt[3]{x}} dx$ .

**Solution.** Let  $I = \int_0^\infty \sqrt{x} e^{-\sqrt[3]{x}} dx$  ... (1)

Putting  $\sqrt[3]{x} = t \Rightarrow x = t^3$  so that  $dx = 3t^2 dt$  in (1), we get

$$I = \int_0^\infty t^{3/2} e^{-t} 3t^2 dt = 3 \int_0^\infty t^{7/2} e^{-t} dt = 3 \int_0^\infty t^{9/2-1} e^{-t} dt = 3 \left[ \frac{9}{2} \right] = 3 \cdot \frac{7}{2} \cdot \frac{5}{2} \cdot \frac{3}{2} \cdot \frac{1}{2} \left[ \frac{1}{2} \right] = \frac{315}{16} \sqrt{\pi} \text{ Ans.}$$

**Example 6.** Evaluate  $\int_0^\infty x^{n-1} e^{-h^2 x^2} dx$ .

**Solution.** Let  $I = \int_0^\infty x^{n-1} e^{-h^2 x^2} dx$  ... (1)

Putting  $t = h^2 x^2 \Rightarrow x = \frac{\sqrt{t}}{h}$  so that  $dx = \frac{dt}{2h\sqrt{t}}$ , we get

$$\begin{aligned} I &= \int_0^\infty \left( \frac{\sqrt{t}}{h} \right)^{n-1} e^{-t} \frac{dt}{2h\sqrt{t}} \\ &= \frac{1}{2h^n} \int_0^\infty t^{\frac{n-1}{2}} e^{-t} \frac{dt}{\sqrt{t}} = \frac{1}{2h^n} \int_0^\infty t^{\frac{n-2}{2}} e^{-t} dt = \frac{1}{2h^n} \left[ \frac{n}{2} \right] \end{aligned} \text{ Ans.}$$

**Example 7.** Evaluate  $\int_0^\infty \frac{x^a}{a^x} dx$ , hence show that  $\int_0^\infty \frac{x^7}{7^x} dx = \frac{7!}{(\log 7)^8}$  ( $a > 1$ )

**Solution.** Here, we have  $\int_0^\infty \frac{x^a}{a^x} dx$  ... (1)

Putting  $a^x = e^t \Rightarrow x \log a = t \Rightarrow x = \frac{t}{\log a}, \Rightarrow dx = \frac{dt}{\log a}$  in (1), we have

$$\begin{aligned}\int_0^\infty \frac{x^a}{a^x} dx &= \int_0^\infty \left( \frac{t}{\log a} \right)^a e^{-t} \frac{dt}{\log a} = \frac{1}{(\log a)^{a+1}} \int_0^\infty e^{-t} t^a dt = \frac{1}{(\log a)^{a+1}} \int_0^\infty t^{(a+1)-1} e^{-t} dt \\ &= \frac{1}{(\log a)^{a+1}} [a+1]\end{aligned}$$

On putting  $a = 7$ , we get  $\int_0^\infty \frac{x^7}{7^x} dx = \frac{7!}{(\log 7)^8}$  **Ans.**

### 38.2 PROVE THAT

$$\int_0^1 x^m (\log x)^n dx = \frac{(-1)^n}{(m+1)^{n+1}} [n+1]$$

**Proof :** Put  $\log x = -t$  so that  $x = e^{-t} \Rightarrow dx = -e^{-t} dt$

$$\begin{aligned}\therefore x^m &= e^{-mt} \\ (\log x)^n &= (-t)^n\end{aligned}$$

$$\text{Now, } \int_0^1 x^m (\log x)^n dx = \int_{-\infty}^0 e^{-mt} (-t)^n (-e^{-t}) dt = \int_0^\infty (-1)^n e^{-mt-t} t^n dt$$

Putting  $(m+1)t = u$  so that  $(m+1)dt = du$ , we get

$$\begin{aligned}\therefore I &= \int_0^\infty (-1)^n e^{-u} \cdot \frac{u^n}{(m+1)^n} \frac{du}{(m+1)} \\ &= \frac{(-1)^n}{(m+1)^{n+1}} \int_0^\infty e^{-u} u^n du = \frac{(-1)^n}{(m+1)^{n+1}} \int_0^\infty e^{-u} u^{(n+1)-1} du = \frac{(-1)^n}{(m+1)^{n+1}} [n+1] \text{ Proved.}\end{aligned}$$

**Example 8.** Prove that  $\int_0^1 (x \log x)^4 dx = \frac{4!}{5^5}$  **(M.U. II Semester, 2009)**

**Solution.** We know that

$$\int_0^1 x^m (\log x)^n dx = \frac{(-1)^n}{(m+1)^{n+1}} [n+1] \quad \dots (1) \text{ [From Art 38.2]}$$

$$\text{Now, } \int_0^1 (x \log x)^4 dx = \int_0^1 x^4 (\log x)^4 dx$$

Putting  $m = n = 4$  in (1), we get

$$\int_0^1 x^4 (\log x)^4 dx = \frac{(-1)^4}{(4+1)^{4+1}} [4+1] = \frac{[5]}{5^5} = \frac{4!}{5^5} \text{ Proved.}$$

**Example 9.** Evaluate  $\int_0^1 \frac{dx}{\sqrt{-\log x}}$

**Solution.** Let  $-\log x = y \Rightarrow \log x = -y \Rightarrow e^{-y} = x$  so that  $dx = -e^{-y} dy$

$$\int_0^1 \frac{dx}{\sqrt{-\log x}} = \int_0^1 \frac{-e^{-y} dy}{\sqrt{y}} = \int_0^\infty y^{-\frac{1}{2}} e^{-y} dy = \left[ \frac{1}{2} \right] = \sqrt{\pi} \quad \text{Ans.}$$

**Example 10.** Evaluate  $\int_0^1 x^{n-1} \left[ \log_e \left( \frac{1}{x} \right) \right]^{m-1} dx$

**Solution:** Put  $\log_e \frac{1}{x} = t$  or  $x = e^{-t}$   $\therefore dx = -e^{-t} dt$

$$\int_0^1 x^{n-1} \left[ \log_e \left( \frac{1}{x} \right) \right]^{m-1} dx = \int_0^\infty (e^{-t})^{n-1} [t]^{m-1} (-e^{-t} dt) = \int_0^\infty e^{-nt} t^{m-1} dt$$

Putting

$$nt = u \Rightarrow t = \frac{u}{n} \quad \text{so that } dt = \frac{du}{n}$$

$$= \int_0^\infty e^{-u} \left( \frac{u}{n} \right)^{m-1} \frac{du}{n} = \frac{1}{n^m} \int_0^\infty e^{-u} u^{m-1} du = \frac{1}{n^m} \boxed{m}$$

Ans.

### 38.3 TRANSFORMATION OF GAMMA FUNCTION

Prove that (i)  $\int_0^\infty e^{-ky} y^{n-1} dy = \boxed{\frac{n}{k^n}}$  (AMIETE, Dec. 2010) (ii)  $\boxed{\frac{1}{2}} = \sqrt{\pi}$

$$(iii) \int_0^1 \left( \log \frac{1}{y} \right)^{n-1} dy = \boxed{n} \quad (iv) \Gamma n = \frac{1}{n} \int_0^\infty e^{-x^n} dx$$

**Solution:** We know that  $\boxed{n} = \int_0^\infty x^{n-1} e^{-x} dx$  ... (1)

(i) Replace  $x$  by  $ky$ , so that  $dx = k dy$ ; then (1) becomes

$$\boxed{n} = \int_0^\infty (ky)^{n-1} e^{-ky} k dy.$$

$$\boxed{n} = k^n \int_0^\infty e^{-ky} y^{n-1} dy$$

$$\therefore \boxed{\int_0^\infty e^{-ky} y^{n-1} dy = \frac{\boxed{n}}{k^n}} \quad \text{... (2) Proved.}$$

(ii) Replace  $x^n$  by  $y$ , so that  $n x^{n-1} dx = dy$  in (1), then

$$\boxed{n} = \int_0^\infty y^{\frac{n-1}{n}} e^{-y^{\frac{1}{n}}} \frac{dy}{n x^{n-1}} = \int_0^\infty y^{\frac{n-1}{n}} e^{-y^{\frac{1}{n}}} \frac{dy}{\frac{n-1}{n} y^{\frac{n-1}{n}}} = \frac{1}{n} \int_0^\infty e^{-y^{\frac{1}{n}}} dy$$

When  $n = \frac{1}{2}$ ,

$$\boxed{\frac{1}{2}} = \frac{1}{\frac{1}{2}} \int_0^\infty e^{-y^{\frac{1}{2}}} dy = 2 \left[ \frac{1}{2} \sqrt{\pi} \right]$$

$$\boxed{\frac{1}{2}} = \sqrt{\pi}$$

Proved.

(iii) Putting  $e^{-x} = y$ , so that  $-e^{-x} dx = dy$  and  $-x = \log y$ ,  $x = \log \frac{1}{y}$ , (1) becomes

$$\boxed{n} = - \int_1^0 \left( \log \frac{1}{y} \right)^{n-1} y \cdot \frac{dy}{e^{-x}} = \int_0^1 \left( \log \frac{1}{y} \right)^{n-1} y \cdot \frac{dy}{y} = \int_0^1 \left( \log \frac{1}{y} \right)^{n-1} dy \quad \text{Proved.}$$

(iv) We know that,  $\Gamma(n) = \int_0^\infty e^{-x} \cdot x^{n-1} dx$  ... (1)

Putting  $x^n = y \Rightarrow x = y^{1/n}$  so that  $dx = \frac{1}{n} y^{\frac{1}{n}-1} dy$  in (1), we get

$$\Gamma n = \int_0^\infty e^{-y^{1/n}} y^{\frac{n-1}{n}} \cdot \frac{1}{n} y^{\frac{1}{n}-1} dy = \frac{1}{n} \int_0^\infty e^{-y^{\frac{1}{n}}} dy$$

$$\Gamma n = \frac{1}{n} \int_0^\infty e^{-x^n} dx.$$

**Proved.****EXERCISE 38.1****Evaluate:**

1. (i)  $\left| -\frac{3}{2} \right|$

(ii)  $\left| -\frac{15}{2} \right|$

(iii)  $\left| \frac{7}{2} \right|$

(iv)  $\left| 0 \right|$

**Ans.** (i)  $\frac{4}{3}\sqrt{\pi}$

(ii)  $\frac{2^8\sqrt{\pi}}{15 \times 13 \times 11 \times 9 \times 7 \times 5 \times 3}$

(iii)  $\frac{15\sqrt{\pi}}{8}$  (iv)  $\infty$

2.  $\int_0^\infty \sqrt{x} e^{-x} dx$

**Ans.**  $\left| \frac{3}{2} \right|$

3.  $\int_0^\infty x^4 e^{-x^2} dx$

**Ans.**  $\frac{3\sqrt{\pi}}{8}$

4.  $\int_0^\infty e^{-h^2 x^2} dx$

**Ans.**  $\frac{\sqrt{\pi}}{2h}$

5.  $\int_0^\infty \int_0^\infty e^{-(ax^2+by^2)} x^{2m-1} y^{2n-1} dx dy, \quad a, b, m, n > 0$

**Ans.**  $\frac{\left| m \right| \left| n \right|}{4 a^m b^n}$

6.  $\int_0^1 (x \log x)^3 dx$

**Ans.**  $-\frac{3}{128}$

7.  $\int_0^1 \frac{dx}{\sqrt{x \log \frac{1}{x}}}$

**Ans.**  $\sqrt{2\pi}$

8. Prove that  $1.3.5....(2n-1) = \frac{2^n \left| n + \frac{1}{2} \right|}{\sqrt{\pi}}$

9.  $\int_0^\infty e^{-y^{1/m}} dy = m \left| m \right|$

10.  $\int_0^\infty \int_0^\infty e^{-(ax^2+by^2)} x^{2m-1} y^{2n-1} dx dy = \frac{\Gamma(m)\Gamma(n)}{4a^m b^n}, \text{ where } a, b, m, n \text{ are positive.}$

11.  $\int_0^{\pi/2} \frac{d\theta}{(a \cos^4 \theta + b \sin^4 \theta)} = \frac{(\Gamma(1/4))^2}{4(ab)^{1/4} \sqrt{\pi}}$

[Hint. Put  $\tan \theta = t$  then  $bt^4 = az$ ]

**38.4 BETA FUNCTION**

(U.P. I Semester Dec. 2007)

$$\int_0^1 x^{l-1} (1-x)^{m-1} dx$$

( $l > 0, m > 0$ )

is called the Beta function of  $l, m$ . It is also written as

$$\beta(l, m) = \int_0^1 x^{l-1} (1-x)^{m-1} dx$$

**38.5 EVALUATION OF BETA FUNCTION**

$$\beta(l, m) = \frac{\left| l \right| \left| m \right|}{\left| l+m \right|}$$

**Solution.** We have,  $\beta(l, m) = \int_0^1 x^{l-1} (1-x)^{m-1} dx = \int_0^1 (1-x)^{m-1} x^{l-1} dx$

Integrating by parts, we have

$$\begin{aligned} &= \left[ (1-x)^{m-1} \frac{x^l}{l} \right]_0^1 + (m-1) \int_0^1 (1-x)^{m-2} \left( \frac{x^l}{l} \right) dx \\ &= \frac{(m-1)}{l} \int_0^1 (1-x)^{m-2} x^l dx \end{aligned}$$

Again integrating by parts, we get

$$\begin{aligned}
 &= \frac{(m-1)(m-2)}{l(l+1)} \int_0^1 (1-x)^{m-3} x^{l+1} dx = \frac{(m-1)(m-2) \dots 2 \cdot 1}{l(l+1) \dots (l+m-2)} \int_0^1 x^{l+m-2} dx \\
 &= \frac{(m-1)(m-2) \dots 2 \cdot 1}{l(l+1) \dots (l+m-2)} \left[ \frac{x^{l+m-1}}{l+m-1} \right]_0^1 = \frac{(m-1)(m-2) \dots 2 \cdot 1}{l(l+1) \dots (l+m-2)(l+m-1)} \\
 &= \frac{(m-1)!}{l(l+1) \dots (l+m-2)(l+m-1)} \times \frac{(l-1)(l-2) \dots 1}{(l-1)(l-2) \dots 1} \\
 &= \frac{(m-1)! (l-1)!}{1 \cdot 2 \dots (l-2)(l-1) l(l+1) \dots (l+m-2)(l+m-1)} = \frac{(l-1)! (m-1)!}{(l+m-1)!} = \frac{\lceil l \rceil \lceil m \rceil}{\lceil l+m \rceil}
 \end{aligned}$$

And if only  $l$  is positive integer and not  $m$  then

$$\boxed{\beta(l, m) = \frac{(l-1)!}{m(m+1) \dots (m+l-1)}}$$

Ans.

### 38.6 A PROPERTY OF BETA FUNCTION

$$\beta(l, m) = \beta(m, l)$$

**Solution.** We have

$$\begin{aligned}
 \beta(l, m) &= \int_0^1 x^{l-1} (1-x)^{m-1} dx \quad \left[ \int_0^a f(x) dx = \int_0^a f(a-x) dx \right] \\
 &= \int_0^1 (1-x)^{l-1} [1-(1-x)]^{m-1} dx = \int_0^1 (1-x)^{l-1} x^{m-1} dx \\
 &= \int_0^1 x^{m-1} (1-x)^{l-1} dx
 \end{aligned}$$

$l$  and  $m$  are interchanged.

$$\boxed{\beta(l, m) = \beta(m, l)}$$

Proved.

**Example 11.** Evaluate  $\int_0^1 x^4 (1-\sqrt{x})^5 dx$

**Solution.** Let  $\sqrt{x} = t \Rightarrow x = t^2$  so that  $dx = 2t dt$

$$\begin{aligned}
 \int_0^1 x^4 (1-\sqrt{x})^5 dx &= \int_0^1 (t^2)^4 (1-t)^5 (2t dt) \\
 &= 2 \int_0^1 t^9 (1-t)^5 dt = 2 \beta(10, 6) = 2 \frac{\lceil 10 \rceil \lceil 6 \rceil}{\lceil 16 \rceil} = 2 \cdot \frac{9! 5!}{(15)!} \\
 &= 2 \cdot \frac{5!}{10 \times 11 \times 12 \times 13 \times 14 \times 15} = \frac{2 \times 1 \times 2 \times 3 \times 4 \times 5}{10 \times 11 \times 12 \times 13 \times 14 \times 15} = \frac{1}{11 \times 13 \times 7 \times 15} = \frac{1}{15015} \quad \text{Ans.}
 \end{aligned}$$

**Example 12.** Evaluate  $\int_0^1 (1-x^3)^{-\frac{1}{2}} dx$

$$\begin{aligned}
 \text{Solution.} \quad \text{Let } x^3 = y \Rightarrow x = y^{1/3} \text{ so that } dx = \frac{1}{3} y^{-\frac{2}{3}} dy \\
 \int_0^1 (1-x^3)^{-\frac{1}{2}} dx = \int_0^1 (1-y)^{-\frac{1}{2}} \left( \frac{1}{3} y^{-\frac{2}{3}} dy \right) \\
 = \frac{1}{3} \int_0^1 y^{-\frac{2}{3}} (1-y)^{-\frac{1}{2}} dy = \frac{1}{3} \beta\left(\frac{1}{3}, \frac{1}{2}\right) = \frac{1}{3} \frac{\lceil \frac{1}{3} \rceil \lceil \frac{1}{2} \rceil}{\lceil \frac{5}{6} \rceil} \quad \text{Ans.}
 \end{aligned}$$

### 38.7 TRANSFORMATION OF BETA FUNCTION

We know that

$$\beta(l, m) = \int_0^1 x^{l-1} (1-x)^{m-1} dx,$$

Putting  $x = \frac{1}{1+y}$  so that  $d x = -\frac{1}{(1+y)^2} dy$  and  $1-x = \frac{y}{1+y}$  in (1), we get

$$\beta(l, m) = \int_{\infty}^0 \left(\frac{1}{1+y}\right)^{l-1} \left(\frac{y}{1+y}\right)^{m-1} \left[ -\frac{1}{(1+y)^2} dy \right] = \int_0^{\infty} \frac{y^{m-1}}{(1+y)^{l+m}} dy$$

Since  $l, m$  can be interchanged in  $\beta(l, m)$ ,

$$\beta(l, m) = \int_0^{\infty} \frac{y^{l-1}}{(1+y)^{m+l}} dy \Rightarrow \beta(l, m) = \int_0^{\infty} \frac{x^{l-1}}{(1+x)^{m+l}} dx \quad \dots(1)$$

**Example 13.** Evaluate  $\int_0^1 \frac{x^{m-1} + x^{n-1}}{(1+x)^{m+n}} dx$

**Solution.** We know that

$$\begin{aligned} \beta(m, n) &= \int_0^{\infty} \frac{x^{m-1}}{(1+x)^{m+n}} dx \Rightarrow \int_0^{\infty} \frac{x^{m-1}}{(1+x)^{m+n}} dx = \beta(m, n) \\ &\Rightarrow \int_0^1 \frac{x^{m-1}}{(1+x)^{m+n}} dx + \int_1^{\infty} \frac{x^{m-1}}{(1+x)^{m+n}} dx = \beta(m, n) \end{aligned} \quad \dots(1)$$

$$\begin{aligned} \text{Consider } \int_1^{\infty} \frac{x^{m-1}}{(1+x)^{m+n}} dx &= \int_1^0 \frac{\left(\frac{1}{t}\right)^{m-1}}{\left(1+\frac{1}{t}\right)^{m+n}} \left(-\frac{1}{t^2} dt\right) = \int_0^1 \frac{\left(\frac{1}{t}\right)^{m-1} \frac{1}{t^2}}{\left(\frac{1}{t}\right)^{m+n} (t+1)^{m+n}} dt \quad \left(\text{Put } x = \frac{1}{t}\right) \\ &= \int_0^1 \frac{t^{n-1}}{(1+t)^{m+n}} dt = \int_0^1 \frac{x^{n-1}}{(1+x)^{m+n}} dx \end{aligned}$$

Putting the value of  $\int_1^{\infty} \frac{x^{m-1}}{(1+x)^{m+n}} dx$  in (1), we get

$$\begin{aligned} \int_0^1 \frac{x^{m-1}}{(1+x)^{m+n}} dx + \int_0^1 \frac{x^{n-1}}{(1+x)^{m+n}} dx &= \beta(m, n) \\ \Rightarrow \int_0^1 \frac{x^{m-1} + x^{n-1}}{(1+x)^{m+n}} dx &= \beta(m, n) \end{aligned} \quad \text{Ans.}$$

### 38.8 RELATION BETWEEN BETA AND GAMMA FUNCTIONS

We know that,  $\Gamma(l) = \int_0^{\infty} e^{-x} x^{l-1} dx$ , [Put  $zx = y$ ]

$$\frac{\Gamma(l)}{z^l} = \int_0^{\infty} e^{-zx} x^{l-1} dx$$

$$\Gamma(l) = \int_0^{\infty} z^l e^{-zx} x^{l-1} dx$$

Multiplying both sides by  $e^{-z} z^{m-1}$ , we have

$$\Gamma(l) \cdot e^{-z} \cdot z^{m-1} = \int_0^{\infty} e^{-z} \cdot z^{m-1} \cdot z^l \cdot e^{-zx} \cdot x^{l-1} dx$$

$$\int l \cdot e^{-z} \cdot z^{m-1} dz = \int_0^\infty e^{-(1+x)z} \cdot z^{l+m-1} \cdot x^{l-1} dx$$

Integrating both sides w.r.t. 'z', we get

$$\int_0^\infty \int l \cdot e^{-z} \cdot z^{m-1} dz = \int_0^\infty \int_0^\infty e^{-(1+x)z} z^{l+m-1} x^{l-1} dx dz$$

$$\int l \int m = \int_0^\infty x^{l-1} dx \int_0^\infty e^{-(1+x)z} z^{l+m-1} dz$$

$$= \int_0^\infty x^{l-1} dx \cdot \frac{\overline{l+m}}{(1+x)^{l+m}} \quad [\text{From (1), Art 38.7}]$$

$$\int l \int m = \int l+m \int_0^\infty \frac{x^{l-1}}{(1+x)^{l+m}} dx = \int l+m \cdot \beta(l, m)$$

$$\therefore \boxed{\beta(l, m) = \frac{\int l \int m}{\int l+m}}$$

This is the required relation.

### 38.9. SHOW THAT

$$\int_0^{\frac{\pi}{2}} \sin^p \theta \cos^q \theta d\theta = \frac{\left(\frac{p+1}{2}\right) \left(\frac{q+1}{2}\right)}{2 \left(\frac{p+q+2}{2}\right)}$$

**Solution.** We know that

$$\beta(m, n) = \int_0^1 x^{m-1} (1-x)^{n-1} dx \quad \dots(1)$$

$$\begin{aligned} \text{Putting } & x = \sin^2 \theta, dx = 2 \sin \theta \cos \theta d\theta \\ \text{and } & 1-x = 1-\sin^2 \theta = \cos^2 \theta \end{aligned}$$

Then (1) becomes

$$\beta(m, n) = \int_0^{\frac{\pi}{2}} \sin^{2m-2} \theta \cos^{2n-2} \theta \cdot 2 \sin \theta \cos \theta d\theta$$

$$\text{or } \int m \int n = 2 \int_0^{\frac{\pi}{2}} \sin^{2m-1} \theta \cos^{2n-1} \theta d\theta$$

$$\text{Putting } 2m-1 = p, \text{ i.e., } m = \frac{p+1}{2}$$

$$\text{and } 2n-1 = q, \text{ i.e., } n = \frac{q+1}{2}$$

$$\frac{\left(\frac{p+1}{2}\right) \left(\frac{q+1}{2}\right)}{\left(\frac{p+q+2}{2}\right)} = 2 \int_0^{\frac{\pi}{2}} \sin^p \theta \cos^q \theta d\theta$$

$$\boxed{\int_0^{\frac{\pi}{2}} \sin^p \theta \cos^q \theta d\theta = \frac{\left(\frac{p+1}{2}\right) \left(\frac{q+1}{2}\right)}{2 \left(\frac{p+q+2}{2}\right)}}$$

**Proved.**

**Example 14.** Prove that  $\int_0^{\frac{\pi}{2}} \sqrt{\sin \theta} d\theta \times \int_0^{\frac{\pi}{2}} \frac{1}{\sqrt{\sin \theta}} d\theta = \pi$  (AMIETE, June 2009)

**Solution.** L.H.S. =  $\int_0^{\frac{\pi}{2}} \sqrt{\sin \theta} d\theta \times \int_0^{\frac{\pi}{2}} \frac{1}{\sqrt{\sin \theta}} d\theta$

$$= \int_0^{\frac{\pi}{2}} \sin^{\frac{1}{2}} \theta \cos^0 \theta d\theta \times \int_0^{\frac{\pi}{2}} \sin^{-\frac{1}{2}} \theta \cos^0 \theta d\theta$$

$$= \frac{1}{2} \begin{Bmatrix} \frac{1}{2}+1 \\ 2 \end{Bmatrix} \begin{Bmatrix} 0+1 \\ 2 \end{Bmatrix} \times \frac{-\frac{1}{2}+1}{2} \begin{Bmatrix} 0+1 \\ 2 \end{Bmatrix} = \frac{3}{4} \begin{Bmatrix} 1 \\ 2 \end{Bmatrix} \times \frac{1}{4} \begin{Bmatrix} 1 \\ 2 \end{Bmatrix}$$

$$2 \begin{Bmatrix} 3 \\ 4 \end{Bmatrix} + \frac{1}{2} \quad 2 \begin{Bmatrix} 1 \\ 4 \end{Bmatrix} + \frac{1}{2} \quad 2 \begin{Bmatrix} 5 \\ 4 \end{Bmatrix} \quad 2 \begin{Bmatrix} 3 \\ 4 \end{Bmatrix}$$

$$= \frac{1}{2} \begin{Bmatrix} 1 \\ 2 \end{Bmatrix} \begin{Bmatrix} 1 \\ 4 \end{Bmatrix} = \frac{(\sqrt{\pi}) (\sqrt{\pi})}{4} \begin{Bmatrix} 1 \\ 4 \end{Bmatrix} = \pi = \text{R.H.S.}$$

Proved.

**Example 15.** Prove that  $\int_0^1 \frac{x^2}{\sqrt{1-x^4}} dx \times \int_0^1 \frac{dx}{\sqrt{1+x^4}} = \frac{\pi}{4\sqrt{2}}$  (AMIETE, Dec. 2009)

**Solution.** Here, we have  $\int_0^1 \frac{x^2}{\sqrt{1-x^4}} dx \times \int_0^1 \frac{dx}{\sqrt{1+x^4}}$  ... (1)

Let  $I_1 = \int_0^1 \frac{x^2}{\sqrt{1-x^4}} dx$  Put  $x^2 = \sin \theta \Rightarrow 2x dx = \cos \theta d\theta$

$$x = \sqrt{\sin \theta} \Rightarrow dx = \frac{1}{2} (\sin \theta)^{-\frac{1}{2}} \cos \theta d\theta$$

$$= \int_0^{\frac{\pi}{2}} \frac{\sin \theta}{\sqrt{1-\sin^2 \theta}} \frac{1}{2} (\sin \theta)^{-\frac{1}{2}} \cos \theta d\theta.$$

$$= \frac{1}{2} \int_0^{\frac{\pi}{2}} \frac{(\sin \theta)^{\frac{1}{2}-1}}{\cos \theta} \cdot \cos \theta d\theta = \frac{1}{2} \int_0^{\frac{\pi}{2}} (\sin \theta)^{\frac{1}{2}} (\cos \theta)^0 d\theta$$

$$= \frac{1}{2} \left( \begin{Bmatrix} \frac{1}{2}+1 \\ 2 \end{Bmatrix} \begin{Bmatrix} 0+1 \\ 2 \end{Bmatrix} \right) = \frac{1}{4} \begin{Bmatrix} 3 \\ 5 \end{Bmatrix} \begin{Bmatrix} 1 \\ 2 \end{Bmatrix}$$

... (2)

Let  $I_2 = \int_0^1 \frac{dx}{\sqrt{1+x^4}}$

[ Put  $x^2 = \tan \theta \Rightarrow x = \sqrt{\tan \theta}$  ]

$$\Rightarrow dx = \frac{1}{2} (\tan \theta)^{-\frac{1}{2}} \sec^2 \theta d\theta$$

$$= \frac{1}{2} \int_0^{\frac{\pi}{4}} \frac{(\tan \theta)^{-\frac{1}{2}} \sec^2 \theta}{\sqrt{1+\tan^2 \theta}} d\theta = \frac{1}{2} \int_0^{\frac{\pi}{4}} (\tan \theta)^{-\frac{1}{2}} \sec \theta d\theta$$

$$= \frac{1}{2} \int_0^{\frac{\pi}{4}} (\sin \theta)^{-\frac{1}{2}} \cdot (\cos \theta)^{-\frac{1}{2}} d\theta = \frac{1}{2} \int_0^{\frac{\pi}{4}} \sqrt{\frac{2}{2 \sin \theta \cos \theta}} d\theta$$

$$\begin{aligned}
&= \frac{1}{\sqrt{2}} \int_0^{\frac{\pi}{2}} \frac{d\theta}{\sqrt{\sin 2\theta}} && \text{Put } 2\theta = t \Rightarrow d\theta = \frac{dt}{2} \\
&= \frac{1}{2\sqrt{2}} \int_0^{\frac{\pi}{2}} \frac{dt}{\sqrt{\sin t}} = \frac{1}{2\sqrt{2}} \int_0^{\frac{\pi}{2}} (\sin t)^{-\frac{1}{2}} (\cos t)^0 dt \\
&= \frac{1}{2\sqrt{2}} \begin{pmatrix} 1 - \frac{1}{2} \\ \frac{2}{2} \\ 2 \left| \frac{1}{4} + \frac{1}{2} \right. \end{pmatrix} = \frac{1}{4\sqrt{2}} \begin{pmatrix} 1 \\ 4 \\ 2 \\ 3 \\ 4 \end{pmatrix} && \dots (3)
\end{aligned}$$

Putting the value in (1) from equation (1) and (2), we get

$$\int_0^1 \frac{x^2 dx}{\sqrt{1-x^4}} \times \int_0^1 \frac{dx}{\sqrt{1-x^4}} = \frac{1}{4} \begin{pmatrix} 3 \\ 4 \\ 5 \\ 4 \end{pmatrix} \times \frac{1}{4\sqrt{2}} \begin{pmatrix} 1 \\ 4 \\ 2 \\ 3 \\ 4 \end{pmatrix} = \frac{1}{16\sqrt{2}} \begin{pmatrix} 1 \\ 2 \\ 2 \\ 2 \\ 4 \end{pmatrix} = \frac{1}{16\sqrt{2}} = \frac{\pi}{4\sqrt{2}} = \frac{\pi}{4\sqrt{2}} \text{ Proved.}$$

**Example 16.** Prove that  $\int_0^1 \frac{dx}{\sqrt{1-x^4}} = \frac{\sqrt{\pi}}{4} \begin{pmatrix} 1 \\ 4 \\ 3 \\ 4 \end{pmatrix}$  (AMIETE, June 2010)

**Solution.** Here, we have  $\int_0^1 \frac{dx}{\sqrt{1-x^4}}$ , Put  $x^2 = \sin \theta \Rightarrow x = \sqrt{\sin \theta}$

$$\begin{aligned}
&\Rightarrow dx = \frac{1}{2} (\sin \theta)^{-\frac{1}{2}} \cos \theta . d\theta \\
&= \frac{1}{2} \int_0^{\frac{\pi}{2}} \frac{(\sin \theta)^{-\frac{1}{2}} \cos \theta}{\sqrt{1-\sin^2 \theta}} = \frac{1}{2} \int_0^{\frac{\pi}{2}} \frac{(\sin \theta)^{-\frac{1}{2}} \cos \theta}{\cos \theta} d\theta \\
&= \frac{1}{2} \int_0^{\frac{\pi}{2}} (\sin \theta)^{-\frac{1}{2}} (\cos \theta)^0 d\theta = \frac{1}{2} \begin{pmatrix} -\frac{1}{2} + 1 \\ 2 \\ 2 \left| \frac{1}{4} + \frac{1}{2} \right. \end{pmatrix} = \frac{1}{4} \begin{pmatrix} 2 \\ 4 \\ 2 \\ 3 \\ 4 \end{pmatrix} = \frac{\sqrt{\pi}}{4} \begin{pmatrix} 1 \\ 4 \\ 3 \\ 4 \end{pmatrix} && \text{Proved.}
\end{aligned}$$

**Example 17.** Find the value of  $\frac{1}{2}$ .

**Solution.** We have already solved this problem in Art. 38.3 (ii) Transformation of the Gamma Function.

Now, by **Second method:** We know that,

$$\int_0^{\frac{\pi}{2}} \sin^p \theta \cdot \cos^q \theta d\theta = \frac{\begin{pmatrix} p+1 \\ 2 \\ p+q+2 \end{pmatrix}}{2^{\frac{p+q+2}{2}}}$$

$$\text{Putting } p = q = 0, \text{ we get } \int_0^{\frac{\pi}{2}} d\theta = \frac{1}{2} \begin{pmatrix} 1 \\ 2 \\ 1 \end{pmatrix} \Rightarrow [\theta]_0^{\pi/2} = \frac{1}{2} \left( \frac{1}{2} \right)^2 \Rightarrow \frac{\pi}{2} = \frac{1}{2} \left( \frac{1}{2} \right)^2$$

$$\Rightarrow \left( \frac{1}{2} \right)^2 = \pi \Rightarrow \frac{1}{2} = \sqrt{\pi} \quad \text{Ans.}$$

**Example 18.** Show that

$$\int_0^{\frac{\pi}{2}} \sqrt{\cot \theta} d\theta = \frac{1}{2} \left[ \frac{1}{4} \right] \left[ \frac{3}{4} \right]$$

**Solution.** We know that

$$\int_0^{\frac{\pi}{2}} \sin^p \theta \cdot \cos^q \theta d\theta = \frac{\frac{p+1}{2} \left[ \frac{q+1}{2} \right]}{2 \left[ \frac{p+q+2}{2} \right]} \quad \dots(1)$$

$$\int_0^{\frac{\pi}{2}} \sqrt{\cot \theta} d\theta = \int_0^{\frac{\pi}{2}} \frac{\cos^{1/2} \theta}{\sin^{1/2} \theta} d\theta = \int_0^{\frac{\pi}{2}} \sin^{-1/2} \theta \cos^{1/2} \theta d\theta$$

On applying formula (1), we have

$$\int_0^{\frac{\pi}{2}} \sqrt{\cot \theta} d\theta = \frac{\frac{-1}{2} + 1 \left[ \frac{1}{2} + 1 \right]}{2 \left[ \frac{-1 + 1 + 2}{2} \right]} = \frac{\left[ \frac{1}{4} \right] \left[ \frac{3}{4} \right]}{2 \left[ \frac{1}{2} \right]} = \frac{1}{2} \left[ \frac{1}{4} \right] \left[ \frac{3}{4} \right]$$

**Proved.**

**Example 19.** Using Beta and Gamma functions, evaluate

$$\int_0^1 \left( \frac{x^3}{1-x^3} \right)^{\frac{1}{2}} dx$$

**Solution.**  $\int_0^1 \left( \frac{x^3}{1-x^3} \right)^{\frac{1}{2}} dx \quad \dots(1)$

Putting  $x^3 = \sin^2 \theta$ , so that  $x = \sin^{\frac{2}{3}} \theta$ ,  $dx = \frac{2}{3} \sin^{-\frac{1}{3}} \theta \cos \theta d\theta$  in (1), we get

$$\begin{aligned} \int_0^1 \left( \frac{x^3}{1-x^3} \right)^{\frac{1}{2}} dx &= \int_0^{\pi/2} \left( \frac{\sin^2 \theta}{1-\sin^2 \theta} \right)^{\frac{1}{2}} \frac{2}{3} \sin^{-\frac{1}{3}} \theta \cos \theta d\theta \\ &= \frac{2}{3} \int_0^{\pi/2} \left( \frac{\sin \theta}{\cos \theta} \right) \sin^{-\frac{1}{3}} \theta \cos \theta d\theta = \frac{2}{3} \int_0^{\pi/2} \sin^{\frac{2}{3}} \theta d\theta \end{aligned}$$

$$= \frac{2}{3} \frac{\left[ \frac{2}{3} + 1 \right] \left[ \frac{0+1}{2} \right]}{\left[ \frac{2}{3} + 1 + 1 \right] \left[ \frac{2}{2} \right]} = \frac{2}{3} \frac{\left[ \frac{5}{6} \right] \left[ \frac{1}{2} \right]}{\left[ \frac{4}{3} \right]} = \frac{2}{3} \frac{\sqrt{\pi}}{\left[ \frac{4}{3} \right]} \left[ \frac{5}{6} \right]$$

**Ans.**

**Example 20.** Evaluate  $\int_{-1}^{+1} (1+x)^{p-1} (1-x)^{q-1} dx$ .

**Solution.** Put  $x = \cos 2\theta$ , then  $dx = -2 \sin 2\theta d\theta$

$$\begin{aligned} \int_{-1}^{+1} (1+x)^{p-1} (1-x)^{q-1} dx &= \int_{\frac{\pi}{2}}^0 (1+\cos 2\theta)^{p-1} (1-\cos 2\theta)^{q-1} (-2 \sin 2\theta d\theta) \\ &= \int_{\frac{\pi}{2}}^0 (1+2\cos^2 \theta - 1)^{p-1} (1-1+2\sin^2 \theta)^{q-1} (-4 \sin \theta \cos \theta d\theta) \end{aligned}$$

$$\begin{aligned}
&= 4 \int_0^{\frac{\pi}{2}} 2^{p-1} \cos^{2p-2} \theta \cdot 2^{q-1} \sin^{2q-2} \theta \cdot \sin \theta \cos \theta d\theta = 2^{p+q} \int_0^{\infty} \sin^{2q-1} \theta \cos^{2p-1} \theta d\theta \\
&= 2^{p+q} \frac{\left[ \frac{2q}{2} \right] \left[ \frac{2p}{2} \right]}{2 \left[ \frac{2p+2q}{2} \right]} = 2^{p+q-1} \frac{\left[ p \right] \left[ q \right]}{\left[ p+q \right]} \quad \text{Ans.}
\end{aligned}$$

**Example 21.** Show that  $\lceil n \rceil \lceil 1-n \rceil = \frac{\pi}{\sin n \pi}$  ( $0 < n < 1$ )

**Solution.** We know that

$$\beta(m, n) = \int_0^{\infty} \frac{x^{n-1}}{(1+x)^{m+n}} dx \quad [\text{From (1), Art 38.7}]$$

$$\frac{\lceil m \rceil \lceil n \rceil}{\lceil m+n \rceil} = \int_0^{\infty} \frac{x^{n-1}}{(1+x)^{m+n}} dx$$

Putting  $m + n = 1$  or  $m = 1 - n$ , we get

$$\frac{\lceil 1-n \rceil \lceil n \rceil}{\lceil 1 \rceil} = \int_0^{\infty} \frac{x^{n-1}}{(1+x)^1} dx$$

$$\lceil 1-n \rceil \lceil n \rceil = \int_0^{\infty} \frac{x^{n-1}}{1+x} dx \quad \left[ \int_0^{\infty} \frac{x^{n-1}}{1+x} dx = \frac{\pi}{\sin n \pi} \right]$$

$$\Rightarrow \lceil n \rceil \lceil 1-n \rceil = \frac{\pi}{\sin n \pi} \quad \text{Proved.}$$

**Example 22.** Assuming  $\lceil n \rceil \lceil 1-n \rceil = \pi \operatorname{cosec} n \pi$ .  $0 < n < 1$ , show that

$$\int_0^{\infty} \frac{x^{p-1}}{1+x} dx = \left( \frac{\pi}{\sin p \pi} \right). \quad 0 < p < 1 \quad (\text{U.P., I Semester, Dec 2009})$$

**Solution:** Here, we have  $\pi \operatorname{cosec} n \pi = \lceil n \rceil \lceil 1-n \rceil$

$$\Rightarrow \frac{\pi}{\sin n \pi} = \lceil n \rceil \lceil 1-n \rceil$$

$$\text{We know that } \int_0^{\infty} \frac{x^{n-1}}{1+x} dx = \frac{\lceil 1-n \rceil \lceil n \rceil}{\lceil 1 \rceil} \quad \dots(1)$$

Setting  $m + n = 1$  so that  $m = 1 - n$  in (1), we get

$$\int_0^{\infty} \frac{x^{n-1}}{(1+x)^{m+n}} dx = \frac{\lceil m \rceil \lceil n \rceil}{\lceil m+n \rceil} = \beta(m, n) \quad \text{Proved.}$$

**Example 23.** Prove that  $\left| \left( \frac{1}{4} \right) \left( \frac{3}{4} \right) \right| = \pi \sqrt{2}$

**Solution.** Putting  $n = \frac{1}{4}$  in result of example 22, we obtain

$$\left| \left( \frac{1}{4} \right) \left( \frac{3}{4} \right) \right| = \frac{\pi}{\sin \frac{\pi}{4}}$$

$$\Rightarrow \left| \left( \frac{1}{4} \right) \left( \frac{3}{4} \right) \right| = \frac{\pi}{\left( \frac{1}{\sqrt{2}} \right)} \Rightarrow \left| \left( \frac{1}{4} \right) \left( \frac{3}{4} \right) \right| = \pi \sqrt{2} \quad \text{Proved.}$$

**Example 24.** Evaluate  $\int_0^1 \frac{dx}{(1-x^n)^n}$

**Solution.** Let  $x^n = \sin^2 \theta$  or  $x = \sin^{2/n} \theta$

$$\text{So that } dx = \frac{2}{n} \sin^{2/n-1} \theta \cos \theta d\theta$$

$$\begin{aligned} \int_0^1 \frac{dx}{(1-x^n)^n} &= \int_0^{\frac{\pi}{2}} \frac{\frac{2}{n} \sin^{2/n-1} \theta \cos \theta}{(1-\sin^2 \theta)^{1/n}} d\theta = \frac{2}{n} \int_0^{\frac{\pi}{2}} \frac{\sin^{2/n-1} \theta \cos \theta}{(\cos^2 \theta)^{1/n}} d\theta \\ &= \frac{2}{n} \int_0^{\frac{\pi}{2}} \sin^{2/n-1} \theta \cos^{1-2/n} \theta d\theta \\ &= \frac{2}{n} \frac{\left[ \frac{2}{n}-1+1 \right] \left[ 1-\frac{2}{n}+1 \right]}{2 \left[ \frac{2}{n}-1+1+2-\frac{2}{n} \right]} = \frac{1}{n} \left[ \frac{1}{n} \right] \left[ \frac{n-1}{n} \right] \quad \left( \because \left[ \frac{1}{n} \right] \left[ 1-\frac{1}{n} \right] = \frac{\pi}{\sin \frac{\pi}{n}} \right) \\ &= \frac{\pi}{n \sin \frac{\pi}{n}} \end{aligned}$$

**Ans.**

**Example 25.** Show that  $\int_0^a \frac{dx}{\sqrt[n]{(a^n - x^n)}} = \frac{\pi}{n} \operatorname{cosec} \left( \frac{\pi}{n} \right)$ , where  $n > 1$ . (M.U. II Semester 2009)

**Solution.** Let  $x^n = a^n \sin^2 \theta \Rightarrow x = a \sin^{\frac{2}{n}} \theta$

$$\text{So that } dx = \frac{2a}{n} \sin^{\frac{2}{n}-1} \theta \cos \theta d\theta$$

$$\therefore \int_0^a \frac{dx}{\sqrt[n]{a^n - x^n}} = \int_0^{\frac{\pi}{2}} \frac{a \times \frac{2}{n} \sin^{\frac{2}{n}-1} \theta \cos \theta}{(a^n - a^n \sin^2 \theta)^{\frac{1}{n}}} d\theta = \frac{2}{n} \int_0^{\frac{\pi}{2}} \frac{\sin^{\frac{2}{n}-1} \theta \cos \theta}{\cos^{\frac{2}{n}} \theta} d\theta$$

$$\begin{aligned} &= \frac{2}{n} \int_0^{\frac{\pi}{2}} \sin^{\frac{2}{n}-1} \theta \cos^{1-\frac{2}{n}} \theta d\theta = \frac{2}{n} \frac{\left[ \frac{2}{n}-1+1 \right] \left[ 1-\frac{2}{n}+1 \right]}{2 \left[ \frac{2}{n}-1+1+2-\frac{2}{n} \right]} \\ &= \frac{1}{n} \left[ \frac{1}{n} \right] \left[ \frac{n-1}{n} \right] \end{aligned}$$

$$\begin{aligned} &= \frac{\pi}{n \sin \frac{\pi}{n}} = \frac{\pi}{n} \operatorname{cosec} \left( \frac{\pi}{n} \right) \quad \left[ \left[ \frac{1}{n} \right] \left[ 1-\frac{1}{n} \right] = \frac{\pi}{\sin \frac{\pi}{n}} \right] \end{aligned}$$

**Proved.**

**Example 26.** Show that  $\int_0^{\frac{\pi}{2}} \tan^P \theta d\theta = \frac{\pi}{2} \sec \frac{P\pi}{2}$  and indicate the restriction on the values of  $P$ .

**Solution.**

$$\begin{aligned} \int_0^{\frac{\pi}{2}} \tan^P \theta d\theta &= \int_0^{\frac{\pi}{2}} \sin^P \theta \cos^{-P} \theta d\theta \\ &= \frac{\boxed{P+1}}{2} \boxed{\frac{-P+1}{2}} \quad \left[ \begin{array}{l} 1-P > 0 \\ 1 > P \end{array} \right] \quad = \frac{\boxed{P+1}}{2} \boxed{\frac{-P+1}{2}} \quad \left[ \begin{array}{l} 1+P > 0 \\ P > -1 \end{array} \right] \\ &= \frac{1}{2} \boxed{\frac{P+1}{2}} \boxed{\frac{-P+1}{2}} : 1 > P > -1 = \frac{1}{2} \frac{\pi}{\sin \frac{P+1}{2} \pi} = \frac{1}{2} \frac{\pi}{\cos \frac{P\pi}{2}} = \frac{\pi}{2} \sec \frac{P\pi}{2} \quad \text{Proved.} \end{aligned}$$

### 38.10 DUPLICATION FORMULA

$$\sqrt{m} \sqrt{m + \frac{1}{2}} = \frac{\sqrt{\pi}}{2^{2m-1}} \sqrt{2m}, \text{ where } m \text{ is positive.}$$

Hence show that  $\beta(m, m) = 2^{1-2m} \beta \left( m, \frac{1}{2} \right)$

(AMIEETE, Dec. 2010, U.P., II Semester; Summer 2001)

**Proof.** We know that  $\frac{\boxed{p+1}}{2} \boxed{\frac{q+1}{2}} = \int_0^{\frac{\pi}{2}} \sin^p \theta \cdot \cos^q \theta d\theta$

Putting  $q = p$ , we get  $\frac{\boxed{p+1}}{2} \boxed{\frac{p+1}{2}}$

$$\begin{aligned} &= \int_0^{\frac{\pi}{2}} \sin^p \theta \cdot \cos^p \theta d\theta = \int_0^{\frac{\pi}{2}} (\sin \theta \cos \theta)^p d\theta \\ &= \int_0^{\frac{\pi}{2}} \frac{1}{2^p} (2 \sin \theta \cos \theta)^p d\theta = \frac{1}{2^p} \int_0^{\frac{\pi}{2}} (\sin 2\theta)^p d\theta \quad [\text{Putting } 2\theta = t \Rightarrow d\theta = \frac{dt}{2}] \end{aligned}$$

$$= \frac{1}{2^p} \int_0^{\pi} \sin^p t \frac{dt}{2} = \frac{1}{2^p} \cdot \frac{1}{2} \cdot 2 \int_0^{\frac{\pi}{2}} \sin^p t dt = \frac{1}{2^p} \int_0^{\frac{\pi}{2}} \sin^p t \cos^0 t dt$$

$$= \frac{1}{2^p} \boxed{\frac{p+1}{2}} \boxed{\frac{0+1}{2}} \quad \Rightarrow \quad \boxed{\frac{p+1}{2}} \boxed{\frac{p+1}{2}} = \frac{1}{2^p} \boxed{\frac{p+1}{2}} \boxed{\frac{1}{2}} \\ \Rightarrow \quad \boxed{\frac{p+1}{2}} \boxed{\frac{1}{2}} \quad \Rightarrow \quad \boxed{\frac{p+1}{2}} \boxed{\frac{\sqrt{\pi}}{2}}$$

$$\Rightarrow \quad \boxed{\frac{p+1}{2}} = \frac{1}{2^p} \boxed{\frac{1}{2}} \quad \Rightarrow \quad \boxed{\frac{p+1}{2}} = \frac{1}{2^p} \frac{\sqrt{\pi}}{\boxed{\frac{p+2}{2}}} \\ \text{Take } \frac{p+1}{2} = m \quad \Rightarrow \quad p = 2m - 1$$

$$\Rightarrow \frac{\sqrt{m}}{\sqrt{2m}} = \frac{1}{2^{2m-1}} \frac{\sqrt{\pi}}{\sqrt{\frac{2m+1}{2}}} \quad \dots(1)$$

$$\sqrt{m} \sqrt{m + \frac{1}{2}} = \frac{\sqrt{\pi}}{2^{2m-1}} \sqrt{2m}$$

**Proved.**

Multiplying both sides of (1) by  $\sqrt{m}$ , we have

$$\frac{\sqrt{m} \sqrt{m}}{\sqrt{2m}} = 2^{1-2m} \frac{\frac{1}{2} \sqrt{m}}{\sqrt{m + \frac{1}{2}}}$$

$\beta(m, m) = 2^{1-2m} \beta\left(m, \frac{1}{2}\right)$

**Proved.**

**Example 27.** For a  $\beta$  function, show that

$$\beta(p, q) = \beta(p+1, q) + \beta(p, q+1) \quad (\text{U.P., Ist Semester, Dec 2008})$$

**Solution.**  $\beta(p+1, q) + \beta(p, q+1)$

$$\begin{aligned} &= \int_0^1 x^p (1-x)^{q-1} dx + \int_0^1 x^{p-1} (1-x)^q dx \\ &= \int_0^1 x^{p-1} (1-x)^{q-1} [x+1-x] dx \quad (\text{Taking common}) \\ &= \int_0^1 x^{p-1} (1-x)^{q-1} dx = \beta(p, q) \end{aligned}$$

**Proved.**

**Example 28.** Prove that  $\beta(m, m) \times \beta\left(m + \frac{1}{2}, m + \frac{1}{2}\right) = \frac{\pi}{m} 2^{1-4m}$  (M.U. II, Semester, 2008)

$$\begin{aligned} \text{Solution. L.H.S.} &= \beta(m, m) \times \beta\left(m + \frac{1}{2}, m + \frac{1}{2}\right) = \frac{\sqrt{m} \sqrt{m}}{\sqrt{2m}} \times \frac{\sqrt{m + \frac{1}{2}} \sqrt{m + \frac{1}{2}}}{\sqrt{2m+1}} \\ &= \frac{\left(\frac{\sqrt{m}}{\sqrt{2m}}\right)^2 \left(\frac{\sqrt{m + \frac{1}{2}}}{\sqrt{2m+1}}\right)^2}{2m} \quad [\because \sqrt{2m+1} = 2m \sqrt{2m}] \\ &= \left(\frac{\sqrt{m} \sqrt{m + \frac{1}{2}}}{\sqrt{2m}}\right)^2 \cdot \frac{1}{2m} = \left(\frac{\sqrt{\pi}}{2^{2m-1}}\right)^2 \frac{1}{2m} \\ &= \frac{\pi}{2^{4m-2}} \cdot \frac{1}{2m} \quad \left[ \begin{array}{l} \text{By duplication formula} \\ 2^{2m-1} \cdot \sqrt{m} \cdot \sqrt{m + \frac{1}{2}} = \sqrt{\pi} \cdot \sqrt{2m} \end{array} \right] \\ &= \frac{\pi}{m} \cdot 2^{1-4m} \\ &= \text{R.H.S.} \quad \left[ \frac{\sqrt{m} \sqrt{m + \frac{1}{2}}}{\sqrt{2m}} = \frac{\sqrt{\pi}}{2^{2m-1}} \right] \end{aligned}$$

**Proved.**

### 38.11 TO SHOW THAT

$$\left| \left( \frac{1}{n} \right) \left( \frac{2}{n} \right) \left( \frac{3}{n} \right) \cdots \left( \frac{n-1}{n} \right) \right| = \frac{(2\pi) \left( \frac{n-1}{2} \right)}{n^{1/2}}$$

where  $n$  is a positive integer than one.

**Proof.** Let  $P = \left[ \begin{array}{c} \left( \frac{1}{n} \right) \\ \left( \frac{2}{n} \right) \\ \left( \frac{3}{n} \right) \\ \dots \\ \left( \frac{n-2}{n} \right) \\ \left( \frac{n-1}{n} \right) \end{array} \right]$

$$= \left[ \begin{array}{c} \left( \frac{1}{n} \right) \\ \left( \frac{2}{n} \right) \\ \left( \frac{3}{n} \right) \\ \dots \\ \left( 1 - \frac{2}{n} \right) \\ \left( 1 - \frac{1}{n} \right) \end{array} \right] \quad \dots(1)$$

Writing the value of  $P$  in the reverse order, we have

$$P = \left[ \begin{array}{c} \left( 1 - \frac{1}{n} \right) \\ \left( 1 - \frac{2}{n} \right) \\ \dots \\ \left( \frac{3}{n} \right) \\ \left( \frac{2}{n} \right) \\ \left( \frac{1}{n} \right) \end{array} \right] \quad \dots(2)$$

Multiplying (1) and (2), we get

$$\begin{aligned} P^2 &= \left( \left[ \begin{array}{c} \left( \frac{1}{n} \right) \\ \left( 1 - \frac{1}{n} \right) \end{array} \right] \left[ \begin{array}{c} \left( \frac{2}{n} \right) \\ \left( 1 - \frac{2}{n} \right) \end{array} \right] \dots \right. \\ &\quad \left. \left[ \begin{array}{c} \left( \frac{2}{n} \right) \\ \left( 1 - \frac{2}{n} \right) \end{array} \right] \left[ \begin{array}{c} \left( \frac{3}{n} \right) \\ \left( 1 - \frac{1}{n} \right) \end{array} \right] \dots \right. \\ &\quad \left. \left[ \begin{array}{c} \left( \frac{3}{n} \right) \\ \left( 1 - \frac{1}{n} \right) \end{array} \right] \left[ \begin{array}{c} \left( \frac{2}{n} \right) \\ \left( 1 - \frac{1}{n} \right) \end{array} \right] \dots \right. \\ P^2 &= \frac{\pi}{\sin\left(\frac{\pi}{n}\right)} \cdot \frac{\pi}{\sin\left(\frac{2\pi}{n}\right)} \cdot \frac{\pi}{\sin\left(\frac{3\pi}{n}\right)} \dots \frac{\pi}{\sin\left(\frac{(n-1)\pi}{n}\right)} \left[ \because \Gamma(n) \Gamma(1-n) = \frac{\pi}{\sin n\pi} \right] \\ \Rightarrow P^2 &= \frac{\pi^{n-1}}{\sin\left(\frac{\pi}{n}\right) \sin\left(\frac{2\pi}{n}\right) \sin\left(\frac{3\pi}{n}\right) \dots \sin\left(\frac{(n-1)\pi}{n}\right)} \end{aligned} \quad \dots(3)$$

But from Trigonometry, we know that

$$\frac{\sin n\theta}{\sin \theta} = 2^{n-1} \sin\left(\theta + \frac{\pi}{n}\right) \sin\left(\theta + \frac{2\pi}{n}\right) \dots \sin\left(\theta + \frac{(n-1)\pi}{n}\right) \quad \dots(4)$$

Take Limit as  $\theta \rightarrow 0$ ,

$$\text{Lt}_{\theta \rightarrow 0} \frac{\sin n\theta}{\sin \theta} = \text{Lt}_{\theta \rightarrow 0} \left( n \cdot \frac{\sin n\theta}{n\theta} \cdot \frac{\theta}{\sin \theta} \right) = n$$

On putting this limit in (4), we get

$$\begin{aligned} n &= 2^{n-1} \sin \frac{\pi}{n} \sin \frac{2\pi}{n} \sin \frac{3\pi}{n} \dots \sin \frac{(n-1)\pi}{n} \quad [\text{From (4)}] \\ \Rightarrow \quad \frac{\sin \frac{\pi}{n} \cdot \sin \frac{2\pi}{n} \cdot \sin \frac{3\pi}{n} \dots \sin \frac{(n-1)\pi}{n}}{n} &= \frac{n}{2^{n-1}} \end{aligned}$$

Substituting this in equation (3), we obtain

$$\begin{aligned} P^2 &= \frac{\pi^{n-1}}{\left( \frac{n}{2^{n-1}} \right)} = \frac{(2\pi)^{n-1}}{n} \quad \therefore \quad P = \frac{(2\pi)^{(n-1)/2}}{n^{1/2}} \\ \Rightarrow \quad \left[ \begin{array}{c} \left( \frac{1}{n} \right) \\ \left( \frac{2}{n} \right) \\ \left( \frac{3}{n} \right) \\ \dots \\ \left( \frac{n-1}{n} \right) \end{array} \right] &= \frac{(2\pi)^{(n-1)/2}}{n^{1/2}} \end{aligned}$$

### 38.12 TO SHOW THAT

$$(i) \int_0^\infty e^{-ax} x^{n-1} \cos bx dx = \frac{\Gamma(n) \cos n\theta}{(a^2 + b^2)^{n/2}} \quad [U.P., I Semester, (C.O.) 2004]$$

$$(ii) \int_0^\infty e^{-ax} x^{n-1} \sin bx dx = \frac{\Gamma(n) \sin n\theta}{(a^2 + b^2)^{n/2}} \quad \text{where } \theta = \tan^{-1}\left(\frac{b}{a}\right) \quad [U.P., I Semester, 2003]$$

**Proof.** We know that  $\int_0^\infty e^{-ax} \cdot x^{n-1} dx = \frac{\Gamma(n)}{a^n}$ , where  $a, n$  are positive.

Put  $ax = z$  so that  $dx = \frac{dz}{a}$

$$\therefore \int_0^\infty e^{-ax} x^{n-1} dx = \int_0^\infty e^{-z} \left(\frac{z}{a}\right)^{n-1} \cdot \frac{dz}{a} = \frac{1}{a^n} \int_0^\infty e^{-z} z^{n-1} dz = \frac{\Gamma(n)}{a^n}$$

Replacing  $a$  by  $(a + ib)$ , we have

$$\int_0^\infty e^{-(a+ib)x} x^{n-1} dx = \frac{\Gamma(n)}{(a+ib)^n} \quad \dots(1)$$

Now  $e^{-(a+ib)x} = e^{-ax} \cdot e^{-ibx} = e^{-ax} (\cos bx - i \sin bx)$   
Putting the value of  $e^{-(a+ib)x}$  in (1), we get

$$\int_0^\infty e^{-ax} (\cos bx - i \sin bx) x^{n-1} dx = \frac{\sqrt{n}}{(a+ib)^n} \quad \dots(2)$$

Putting  $a = r \cos \theta$  and  $b = r \sin \theta$  so that  $r^2 = a^2 + b^2$  and  $\theta = \tan^{-1} \frac{b}{a}$

$$(a+ib)^n = (r \cos \theta + ir \sin \theta)^n = r^n (\cos \theta + i \sin \theta)^n$$

$(a+ib)^n = r^n (\cos n\theta + i \sin n\theta) \quad [\text{De Moivre's Theorem}]$

Putting the value of  $(a+ib)^n$  in (2), we have

$$\begin{aligned} \int_0^\infty e^{-ax} (\cos bx - i \sin bx) x^{n-1} dx &= \frac{\sqrt{n}}{r^n (\cos n\theta + i \sin n\theta)} \\ &= \frac{\sqrt{n}}{r^n} (\cos n\theta + i \sin n\theta)^{-1} \\ &= \frac{\sqrt{n}}{r^n} (\cos n\theta - i \sin n\theta) \end{aligned}$$

Now, equating real and imaginary parts on the two sides, we get

$$(i) \int_0^\infty e^{-ax} x^{n-1} \cos bx dx = \frac{\sqrt{n}}{r^n} \cos n\theta \quad \text{and}$$

$$(ii) \int_0^\infty e^{-ax} x^{n-1} \sin bx dx = \frac{\sqrt{n}}{r^n} \sin n\theta$$

where  $r^2 = a^2 + b^2$  and  $\theta = \tan^{-1} \frac{b}{a}$ .

**Proved.**

**Example 29.** Evaluate:

$$(i) \int_0^\infty \cos x^2 dx \quad (ii) \int_{-\infty}^\infty \cos \frac{\pi x^2}{2} dx.$$

**Solution.** (i) We know that

$$\int_0^\infty e^{-ax} x^{n-1} \cos bx dx = \frac{\Gamma(n) \cos n\theta}{(a^2 + b^2)^{n/2}}, \text{ where } \theta = \tan^{-1} \left( \frac{b}{a} \right)$$

$$\text{Put } a = 0, \quad \int_0^\infty x^{n-1} \cos bx dx = \frac{\Gamma(n)}{b^n} \cos \frac{n\pi}{2} \quad \left[ \begin{aligned} \theta &= \tan^{-1} \left( \frac{b}{0} \right) \\ &= \tan^{-1} (\infty) = \frac{\pi}{2} \end{aligned} \right]$$

Put  $x^n = z$  so that  $x^{n-1} dx = \frac{dz}{n}$  and  $x = z^{1/n}$

then,  $\int_0^\infty \cos bz^{1/n} dz = \frac{n \Gamma(n)}{b^n} \cos \frac{n\pi}{2}$

$$\Rightarrow \int_0^\infty \cos(bx^{1/n}) dx = \frac{\Gamma(n+1)}{b^n} \cos \frac{n\pi}{2} \quad \dots(1)$$

Here  $b = 1, n = \frac{1}{2}$

$$\therefore \int_0^\infty \cos x^2 dx = \Gamma\left(\frac{3}{2}\right) \cos \frac{\pi}{4} = \frac{\sqrt{\pi}}{2} \cdot \frac{1}{\sqrt{2}} = \frac{\sqrt{\pi}}{2\sqrt{2}} \quad \text{Ans.}$$

$$(ii) I = \int_{-\infty}^\infty \cos \frac{\pi x^2}{2} dx = 2 \int_0^\infty \cos \frac{\pi x^2}{2} dx \quad [f(-x) = f(x)] \quad \dots(2)$$

Putting  $b = \frac{\pi}{2}$  and  $n = \frac{1}{2}$  in equation (1), we get

$$\int_0^\infty \cos\left(\frac{\pi}{2} x^2\right) dx = \frac{\Gamma\left(\frac{3}{2}\right)}{\left(\frac{\pi}{2}\right)^{1/2}} \cos \frac{\pi}{4}$$

$\therefore$  From (2),  $I = 2 \frac{\Gamma\left(\frac{3}{2}\right)}{\left(\frac{\pi}{2}\right)^{1/2}} \cos \frac{\pi}{4} = 2 \cdot \frac{1}{2} \sqrt{\pi} \cdot \frac{\sqrt{2}}{\sqrt{\pi}} \cdot \frac{1}{\sqrt{2}} = 1.$  Ans.

**Example 30.** Evaluate:  $\int_0^1 \log \Gamma(x) dx$

**Solution.** Let  $I = \int_0^1 \log \Gamma(x) dx$

$$= \int_0^1 \log \Gamma(1-x) dx \quad \left[ \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$$

Adding (1) and (2), we get

$$\begin{aligned} 2I &= \int_0^1 (\log \Gamma(x) + \log \Gamma(1-x)) dx \\ &= \int_0^1 \log (\Gamma(x) \Gamma(1-x)) dx = \int_0^1 \log \left( \frac{\pi}{\sin \pi x} \right) dx \quad \left[ \Gamma(x) \Gamma(1-x) = \frac{\pi}{\sin \pi x} \right] \\ &= \int_0^1 (\log \pi - \log \sin \pi x) dx = \int_0^1 \log \pi dx - \int_0^1 \log \sin \pi x dx \\ &= I_1 - I_2 \end{aligned} \quad \dots(3)$$

where  $I_1 = \int_0^1 \log \pi dx = \log \pi$

$$\begin{aligned} I_2 &= \int_0^1 \log \sin \pi x dx \quad \left[ \text{Put } \pi x = t \Rightarrow dx = \frac{1}{\pi} dt \right] \\ &= \int_0^{\pi} \log \sin t \left( \frac{dt}{\pi} \right) = \frac{1}{\pi} \cdot 2 \int_0^{\pi/2} \log \sin t dt = \frac{2}{\pi} \left( -\frac{\pi}{2} \log 2 \right) = -\log 2 \end{aligned}$$

From (3),  $2I = \log \pi + \log 2 = \log 2\pi$

$$I = \frac{1}{2} \log 2\pi. \quad \text{Ans.}$$

**Example 31.** Prove that  $\int_0^\infty x^2 e^{-x^4} dx \times \int_0^\infty \frac{e^{-x^2}}{\sqrt{x}} dx = \frac{\pi}{4\sqrt{2}}$  (M.U., II Semester, 2008)

**Solution.** Here, we have

$$\int_0^\infty x^2 e^{-x^4} dx \quad \dots(1)$$

Putting  $x^4 = t \Rightarrow x = t^{\frac{1}{4}}$ ,  $dx = \frac{1}{4}t^{-\frac{3}{4}} dt$  in (1), we get

$$\int_0^\infty t^{\frac{1}{2}} e^{-t} \left( \frac{1}{4}t^{-\frac{3}{4}} dt \right) = \frac{1}{4} \int_0^\infty e^{-t} t^{-\frac{1}{4}} dt = \frac{1}{4} \int_0^\infty e^{-t} t^{\frac{3}{4}-1} dt = \frac{1}{4} \left[ \frac{3}{4} \right] \quad \dots(2)$$

Now, we calculate the value of  $\int_0^\infty \frac{e^{-x^2}}{\sqrt{x}} dx$  ... (3)

Putting  $x^2 = t$ ,  $x = t^{\frac{1}{2}}$   $\Rightarrow dx = \frac{1}{2}t^{-\frac{1}{2}} dt$  in (2), we get

$$\int_0^\infty e^{-t} t^{-\frac{1}{4}} \left( \frac{1}{2}t^{\frac{-1}{2}} dt \right) = \frac{1}{2} \int_0^\infty e^{-t} t^{-\frac{3}{4}} dt = \frac{1}{2} \int_0^\infty e^{-t} t^{\frac{1}{4}-1} dt = \frac{1}{2} \left[ \frac{1}{4} \right] \quad \dots(4)$$

From (3) and (4), we get

$$\begin{aligned} \int_0^\infty x^2 e^{-x^4} dx \cdot \int_0^\infty \frac{e^{-x^2}}{\sqrt{x}} dx &= \left( \frac{1}{4} \left[ \frac{3}{4} \right] \right) \left( \frac{1}{2} \left[ \frac{1}{4} \right] \right) = \frac{1}{8} \left[ \frac{3}{4} + \frac{1}{4} \right] \left[ \frac{1}{4} \right] \\ &\quad \left. \begin{array}{l} \text{Duplication formula} \\ 2^{2m-1} \sqrt{m} \sqrt{m + \frac{1}{2}} = \sqrt{\pi} \sqrt{2m} \\ \text{Putting } m = \frac{1}{4}, \text{ we get} \\ 2^{-\frac{1}{2}} \left[ \frac{1}{4} \right] \left[ \frac{3}{4} \right] = \sqrt{\pi} \left[ \frac{1}{2} \right] \\ \left[ \frac{1}{4} \right] \left[ \frac{3}{4} \right] = \sqrt{\pi} \sqrt{\pi} (2)^{\frac{1}{2}} \\ = \pi \sqrt{2} \end{array} \right] \\ &= \frac{1}{8} (\pi \sqrt{2}) = \frac{\pi}{4 \sqrt{2}} \end{aligned}$$

**Proved.**

**Example 32.** Show that

$$\int_0^1 \frac{x^{m-1} (1-x)^{n-1}}{(a+x)^{m+n}} dx = \frac{\beta(m, n)}{a^n (1+a)^m}$$

**Solution.** Put  $\frac{x}{a+x} = \frac{t}{a+1}$

$$(a+1)x = t(a+x) \Rightarrow x = \frac{at}{a+1-t}$$

$$dx = \frac{(a+1-t)a dt - a t(-dt)}{(a+1-t)^2} = \frac{(a^2 + a - at + at)}{(a+1-t)^2} dt = \frac{a(a+1)}{(a+1-t)^2} dt$$

$$\begin{aligned} \int_0^1 \frac{x^{m-1} (1-x)^{n-1}}{(a+x)^{m+n}} dx &= \int_0^1 \frac{\left(\frac{at}{a+1-t}\right)^{m-1} \cdot \left(1 - \frac{at}{a+1-t}\right)^{n-1}}{\left(a + \frac{at}{a+1-t}\right)^{m+n}} \frac{a(a+1)}{(a+1-t)^2} dt \\ &= \int_0^1 \frac{(at)^{m-1} (a+1-t-at)^{n-1}}{(a^2 + a - at + at)^{m+n}} a(a+1) dt \end{aligned}$$

$$\begin{aligned}
 &= \int_0^1 \frac{a^{m-1} t^{m-1} (a+1)^{n-1} (1-t)^{n-1}}{a^{m+n} (a+1)^{m+n}} a (a+1) dt \\
 &= \frac{1}{a^n (a+1)^m} \int_0^1 t^{m-1} (1-t)^{n-1} dt = \frac{1}{a^n (a+1)^m} \beta(m, n)
 \end{aligned}
 \quad \text{Proved.}$$

**Example 33.** Prove that  $\int_0^\infty \frac{x^4(1+x^5)}{(1+x)^{15}} dx = \frac{1}{5005}$ . (M.U. II Semester, 2008)

**Solution.** Let  $I = \int_0^\infty \frac{x^4(1+x^5)}{(1+x)^{15}} dx$

$$\Rightarrow I = \int_0^\infty \frac{x^4}{(1+x)^{15}} dx + \int_0^\infty \frac{x^9}{(1+x)^{15}} dx = I_1 + I_2 \quad \dots(1)$$

Now, put  $x = \frac{t}{1-t}$ , when  $x = 0, t = 0$ ; when  $x = \infty, t = 1$

$$1+x = 1 + \frac{t}{1-t} = \frac{1}{1-t} \Rightarrow dx = \frac{dt}{(1-t)^2}$$

$$\therefore I_1 = \int_0^1 \left( \frac{t}{1-t} \right)^4 \cdot (1-t)^{15} \cdot \frac{1}{(1-t)^2} dt = \int_0^1 t^4 (1+t)^9 dt = \beta(5, 10) \quad \dots(2)$$

$$\text{and } I_2 = \int_0^1 \left( \frac{t}{1-t} \right)^9 \cdot (1-t)^{15} \cdot \frac{dt}{(1-t)^2} = \int_0^1 t^9 (1-t)^4 dt = \beta(10, 5) \quad \dots(3)$$

$$\begin{aligned}
 \therefore I &= I_1 + I_2 \\
 &= \beta(5, 10) + \beta(10, 5) \quad [\text{Using (2) and (3)}] \\
 &= \beta(5, 10) + \beta(5, 10) \quad [\because \beta(m, n) = \beta(n, m)]
 \end{aligned}$$

$$= 2 \beta(5, 10) = \frac{2 \left[ \overline{5} \right] \left[ \overline{10} \right]}{\left[ \overline{15} \right]} = \frac{2 \cdot 4! \cdot 9!}{14!}$$

$$= \frac{2 \times 4 \times 3 \times 2 \times 1 \times 9!}{14 \times 13 \times 12 \times 11 \times 10 \times 9!} = \frac{1}{7 \times 13 \times 11 \times 5} = \frac{1}{5005}$$

**Proved.**

**Example 34.** Prove that

$$\int_0^1 \frac{x^3 - 2x^4 + x^5}{(1+x)^7} dx = \frac{1}{960}. \quad (\text{M.U., II Semester, 2008})$$

**Solution.** Let

$$I = \int_0^1 \frac{x^3 - 2x^4 + x^5}{(1+x)^7} dx$$

$$\Rightarrow I = \int_0^1 \frac{x^3}{(1+x)^7} dx - 2 \int_0^1 \frac{x^4}{(1+x)^7} dx + \int_0^1 \frac{x^5}{(1+x)^7} dx$$

$$\Rightarrow I = I_1 - 2 I_2 + I_3 \quad \dots(1)$$

Now put  $x = \frac{t}{1-t}$  so that  $1+x = 1 + \frac{t}{1-t} \Rightarrow 1+x = \frac{1}{1-t} \Rightarrow dx = \frac{dt}{(1-t)^2}$

$$\therefore I_1 = \int_0^1 \left( \frac{t}{1-t} \right)^3 \cdot (1-t)^7 \cdot \frac{1}{(1-t)^2} dt$$

$$= \int_0^1 t^3 (1-t)^2 dt = \int_0^1 t^{4-1} (1-t)^{3-1} dt = \beta(4, 3) \quad \dots(2)$$

$$\text{and } I_2 = \int_0^1 \left( \frac{t}{1-t} \right)^4 (1-t)^7 \cdot \frac{1}{(1-t)^2} dt \\ = \int_0^1 t^4 (1-t) dt = \int_0^1 t^{5-1} (1-t)^{2-1} dt = \beta(5, 2) \quad \dots(3)$$

$$\text{Also, } I_3 = \int_0^1 \left( \frac{t}{1-t} \right)^5 (1-t)^7 \frac{dt}{(1-t)^2} = \int_0^1 t^5 (1-t)^0 dt = \int_0^1 t^{6-1} (1-t)^{1-1} dt = \beta(6, 1) \dots(4)$$

Putting the values of  $I_1$ ,  $I_2$  and  $I_3$  in (1), we get

$$I = \beta(4, 3) - 2\beta(5, 2) + \beta(6, 1) = \frac{\sqrt[4]{3}}{4+3} - 2\frac{\sqrt[5]{2}}{5+2} + \frac{\sqrt[6]{1}}{6+1} \\ = \frac{\sqrt[4]{3}}{7} - 2\frac{\sqrt[5]{2}}{7} + \frac{\sqrt[6]{1}}{7} = \frac{\sqrt[3]{3}}{4 \times 5 \times 6} - 2\frac{1}{5 \times 6} + \frac{1}{6} \\ = \frac{1}{60} - \frac{1}{15} + \frac{1}{6} = \frac{1-4+10}{60} = \frac{7}{60} \quad \text{Ans.}$$

### EXERCISE 38.2

**Prove that**

1.  $\int_0^{\frac{\pi}{2}} \sin^2 \theta \cos^4 \theta d\theta = \frac{\pi}{32}$
2.  $\int_0^{\frac{\pi}{2}} \sin^6 \theta d\theta = \frac{5\pi}{32}$
3.  $\int_0^{\frac{\pi}{2}} \sin^{m-1}(2\theta) d\theta = \frac{2^{m-1}}{m!} \left( \frac{m}{2} \right)^2 \quad (\text{Nagpur University, Winter 2003})$
4.  $\int_0^{\pi} \sin^5 x (1 - \cos x)^3 dx = \frac{32}{21} \quad (\text{Nagpur University, Winter 2001})$
5.  $\int_0^2 x (8 - x^3)^{\frac{1}{3}} dx = \frac{1}{9} \left[ \frac{1}{3} \right] \left[ \frac{2}{3} \right] \quad (\text{Nagpur University, Summer 2005})$
6.  $\int_0^{2\pi} x \sqrt{2ax - x^2} dx = \frac{\pi a^3}{2} \quad (\text{Nagpur University, Summer 2002})$
7.  $\beta(m+1, n) = \frac{m}{m+n} \beta(m, n) \quad 8. \beta(m, n+1) = \frac{n}{m+n} \beta(m, n)$
9.  $\int_0^1 \sqrt{x} \sqrt[3]{1-x^2} dx = \frac{\sqrt[3]{4}}{2} \left[ \frac{1}{7} \right] \left[ \frac{3}{12} \right]$
10.  $\int_0^1 (1-x^n)^{-\frac{1}{2}} dx = \frac{\sqrt[2]{1}}{n} \left[ \frac{1}{2} \right] \left[ \frac{n+2}{2n} \right]$
11.  $\int_0^1 (1-x^{1/n})^m dx = \frac{\left[ \frac{m}{n} \right]}{\left[ \frac{m}{n} + n \right]}$
12.  $\int_1^\infty \frac{dx}{x^{P+1}(x-1)^q} = \beta(P+q, 1-q) \text{ if } -P < q < 1$
13.  $\int_0^1 x^m (1-x^n)^p dx = \frac{1}{n} \left[ \frac{m+1}{2} \right] \left[ \frac{P+1}{\frac{m+1}{n} + P + 1} \right]$
14.  $\int_0^b (x-a)^m (b-x)^n dx = (b-a)^{m+n+1} \cdot \beta(m+1, n+1)$
15.  $\int_a^b (x-a)^{m-1} (b-x)^{n-1} dx = (b-a)^{m+n-1} \cdot \beta(m, n)$

16.  $\int_3^7 \frac{4\sqrt{(x-3)(7-x)}}{\sqrt{x}} dx = \frac{2\left(\left[\frac{1}{4}\right]^2\right)}{3\sqrt{\pi}}$  [Hint. Put  $x = 4t + 3$ ]

17.  $\int_0^{\frac{\pi}{2}} \frac{d\theta}{\sqrt{1 - \frac{1}{2}\sin^2 \theta}} = \frac{\left(\left[\frac{1}{4}\right]^2\right)}{4\sqrt{\pi}}$

18. If  $\int_0^\infty e^{-x} x^{n-1} dx = I_n$  for  $n > 0$  find  $\frac{I_{n+1}}{I_n}$  (A.M.I.E., Summer 2000) Ans.  $n$

Show that :

19.  $\int_0^\infty \sqrt{x} e^{-x^2} dx \times \int_0^\infty \frac{e^{-x^2}}{\sqrt{x}} dx = \frac{\pi}{2\sqrt{2}}$

20.  $\int_0^1 \frac{x^2 dx}{\sqrt{1-x^4}} \int_0^1 \frac{dx}{\sqrt{1+x^4}} = \frac{\pi}{4\sqrt{2}}$

21.  $\int_0^\infty x^2 e^{-x^4} dx \times \int_0^\infty e^{-x^4} dx = \frac{\pi}{8\sqrt{2}}$

22.  $\int_0^{\pi/2} \sin^3 x \cos^{5/2} x dx = \frac{8}{77}$

23.  $\int_0^1 \frac{x^{m-1} (1-x)^{n-1}}{(a+bx)^{m+n}} dx = \frac{\beta(m, n)}{a^n (a+b)^m}$

24.  $\frac{\beta(p, q+1)}{q} = \frac{\beta(p+1, q)}{p} = \frac{\beta(p, q)}{p+q}$

### 38.13 DOUBLE INTEGRATION

**Example 35.** Evaluate  $\iint_A \frac{dx dy}{\sqrt{xy}}$  using the substitutions

$$x = \frac{u}{1+v^2}, \quad y = \frac{uv}{1+v^2}$$

where  $A$  is bounded by  $x^2 + y^2 - x = 0$ ,  $y = 0$ ,  $y > 0$ .

**Solution.** Here  $\sqrt{xy} = \sqrt{\left(\frac{u}{1+v^2}\right)\left(\frac{uv}{1+v^2}\right)} = \frac{u\sqrt{v}}{1+v^2}$

$$\begin{aligned} dx dy &= \left| \frac{\partial(x, y)}{\partial(u, v)} \right| du dv \\ &= \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} du dv = \begin{vmatrix} \frac{1}{1+v^2} & -\frac{2uv}{(1+v^2)^2} \\ \frac{v}{1+v^2} & \frac{u(1-v^2)}{(1+v^2)^2} \end{vmatrix} du dv \\ &= \left[ \frac{u(1-v^2)}{(1+v^2)^3} + \frac{2uv^2}{(1+v^2)^3} \right] du dv = \left[ \frac{u-uv^2+2uv^2}{(1+v^2)^3} \right] du dv \\ &= \frac{u(1+v^2)}{(1+v^2)^3} du dv = \frac{u}{(1+v^2)^2} du dv \end{aligned}$$

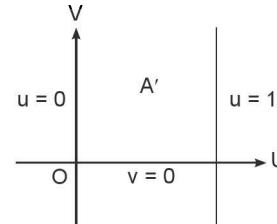

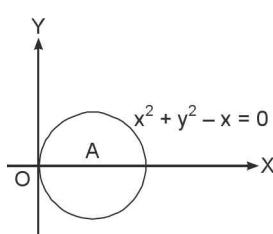

Also the circle  $x^2 + y^2 - x = 0$  is transformed into

$$\frac{u^2}{(1+v^2)^2} + \frac{u^2 v^2}{(1+v^2)^2} - \frac{u}{1+v^2} = 0 \Rightarrow \frac{u^2(1+v^2)}{(1+v^2)^2} - \frac{u}{1+v^2} = 0$$

$$\Rightarrow \frac{u^2}{1+v^2} - \frac{u}{1+v^2} = 0 \Rightarrow u^2 - u = 0 \Rightarrow u(u-1) = 0 \Rightarrow u = 0, u = 1$$

$$\text{Further } y = 0 \Rightarrow \frac{uv}{1+v^2} = 0 \Rightarrow u = 0, v = 0$$

and  $y > 0 \Rightarrow uv > 0$  either both  $u$  and  $v$  are positive or both negative.

The area  $A$ , i.e.,  $x^2 + y^2 - x = 0$  is transformed into  $A'$  bounded by  $u = 0, v = 0$  and  $u = 1$  and  $v = \infty$ .

$$\iint \frac{dx dy}{\sqrt{x}} = \int_0^1 \int_0^\infty \frac{(1+v^2)^2}{u\sqrt{v}} du dv = \int_0^1 \int_0^\infty \frac{1}{\sqrt{v}(1+v^2)} dv du$$

On putting  $v = \tan \theta, dv = \sec^2 \theta d\theta$

$$= \int_0^1 \int_0^{\frac{\pi}{2}} \frac{\sec^2 \theta}{\sqrt{\tan \theta} (1+\tan^2 \theta)} d\theta du = \int_0^1 du \int_0^{\frac{\pi}{2}} \sqrt{\frac{\cos \theta}{\sin \theta}} d\theta = \int_0^1 du \int_0^{\frac{\pi}{2}} \sin^{-\frac{1}{2}} \theta \cos^{\frac{1}{2}} \theta d\theta$$

$$\text{Duplication formula } \left[ m \right] \left[ m + \frac{1}{2} \right] = \frac{\sqrt{\pi}}{2^{2m-1}} \left[ 2m \right]$$

$$= \int_0^1 du \frac{\left[ -\frac{1}{2} + 1 \right]}{\left[ \frac{1}{2} \right]} \frac{\left[ \frac{1}{2} + 1 \right]}{\left[ \frac{1}{2} \right]} = \frac{1}{2} \int_0^1 du \left[ \frac{1}{4} \right] \left[ \frac{3}{4} \right] = \frac{1}{2} \int_0^1 du \left[ \frac{\sqrt{\pi}}{2^{\frac{-1}{2}}} \right] \left[ \frac{1}{2} \right]$$

$$= \frac{1}{2} \int_0^1 du \sqrt{2} \sqrt{\pi} \cdot \sqrt{\pi} = \frac{\pi}{\sqrt{2}} [u]_0^1 = \frac{\pi}{\sqrt{2}}$$

Ans.

**Example 36.** Prove that

$$\iint_D x^{l-1} y^{m-1} dx dy = \frac{\left[ l \right] \left[ m \right]}{\left[ l+m+1 \right]} h^{l+m}$$

where  $D$  is the domain  $x \geq 0, y \geq 0$  and  $x + y \leq h$ . (U.P., I Semester, Dec. 2004)

**Solution.** Putting  $x = Xh$  and  $y = Yh$ ,  $dx dy = h^2 dX dY$

$$\iint_D x^{l-1} y^{m-1} dx dy = \iint_{D'} (Xh)^{l-1} (Yh)^{m-1} h^2 dX dY$$

where  $D'$  is the domain

$$X \geq 0, \quad Y \geq 0, \quad X + Y \leq 1$$

$$= h^{l+m} \int_0^1 \int_0^{1-X} X^{l-1} Y^{m-1} dX dY = h^{l+m} \int_0^1 X^{l-1} dX \int_0^{1-X} Y^{m-1} dY$$

$$= h^{l+m} \int_0^1 X^{l-1} dX \left[ \frac{Y^m}{m} \right]_0^{1-X} = \frac{h^{l+m}}{m} \int_0^1 X^{l-1} (1-X)^m dX$$

$$= \frac{h^{l+m}}{m} \beta(l, m+1) = \frac{h^{l+m}}{m} \frac{\left[ l \right] \left[ m+1 \right]}{\left[ l+m+1 \right]} = \frac{h^{l+m}}{m} \frac{m \left[ l \right] \left[ m \right]}{\left[ l+m+1 \right]} = h^{l+m} \frac{\left[ l \right] \left[ m \right]}{\left[ l+m+1 \right]}$$

Proved.

### 38.14 DIRICHLET'S INTEGRAL (Triple Integration)

If  $l, m, n$  are all positive, then the triple integral

$$\iiint_V x^{l-1} y^{m-1} z^{n-1} dx dy dz = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n+1 \rceil}$$

where  $V$  is the region  $x \geq 0, y \geq 0, z \geq 0$  and  $x + y + z \leq 1$ .

**Proof.** Putting  $y + z \leq 1 - x = h$ . Then  $z \leq h - y$

$$\begin{aligned} \iiint_V x^{l-1} y^{m-1} z^{n-1} dx dy dz &= \int_0^1 x^{l-1} dx \int_0^{1-x} y^{m-1} dy \int_0^{1-x-y} z^{n-1} dz \\ &= \int_0^1 x^{l-1} dx \left[ \int_0^h \int_0^{h-y} y^{m-1} z^{n-1} dy dz \right] \\ &= \int_0^1 x^{l-1} dx \left[ \frac{\lceil m \rceil \lceil n \rceil}{\lceil m+n+1 \rceil} h^{m+n} \right] = \int_0^1 x^{l-1} dx \left[ \frac{\lceil m \rceil \lceil n \rceil}{\lceil m+n+1 \rceil} h^{m+n} \right] \\ &= \frac{\lceil m \rceil \lceil n \rceil}{\lceil m+n+1 \rceil} \int_0^1 x^{l-1} (1-x)^{m+n} dx = \frac{\lceil m \rceil \lceil n \rceil}{\lceil m+n+1 \rceil} \beta(l, m+n+1) \\ &= \frac{\lceil m \rceil \lceil n \rceil}{\lceil m+n+1 \rceil} \frac{\lceil l \rceil \lceil m+n+1 \rceil}{\lceil l+m+n+1 \rceil} \end{aligned}$$

$$\boxed{\iiint_V x^{l-1} y^{m-1} z^{n-1} dx dy dz = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n+1 \rceil}}$$

Note.  $\iiint_V x^{l-1} y^{m-1} z^{n-1} dx dy dz = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n+1 \rceil} h^{l+m+n}$

where  $V$  is the domain,  $x \geq 0, y \geq 0, z \geq 0$  and  $x + y + z \leq h$ .

**Corollary:** Dirichlet's theorem for  $n$  variables, the theorem states that

$$\iiint \dots \int x_1^{l_1-1} x_2^{l_2-1} \dots x_n^{l_n-1} dx_1 dx_2 dx_3 \dots dx_n = \frac{\lceil l_1 \rceil \lceil l_2 \rceil \lceil l_3 \rceil \dots \lceil l_n \rceil}{\lceil 1+l_1+l_2+\dots+l_n \rceil} h^{l_1+l_2+\dots+l_n}$$

### 38.15 LIOUVILLE'S EXTENSION OF DIRICHLET THEOREM

If the variables  $x, y, z$  are all positive such that  $h_1 < x + y + z < h_2$ , then

$$\iiint f(x+y+z) x^{l-1} y^{m-1} z^{n-1} dx dy dz = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} \int_{h_1}^{h_2} f(u) u^{l+m+n-1} du$$

**Proof.** By Dirichlet Theorem, we have

$$I = \iiint X^{l-1} Y^{m-1} Z^{n-1} dX dY dZ = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil 1+l+m+n \rceil} \quad \dots(1)$$

Under the condition  $x + y + z \leq u \Rightarrow \frac{x}{u} + \frac{y}{u} + \frac{z}{u} \leq 1$

Putting  $X = \frac{x}{u}, \quad Y = \frac{y}{u}, \quad Z = \frac{z}{u}$  so that

$dX = \frac{dx}{u}, \quad dY = \frac{dy}{u}, \quad dZ = \frac{dz}{u}$  in (1), we get

$$\iiint \left(\frac{x}{u}\right)^{l-1} \left(\frac{y}{u}\right)^{m-1} \left(\frac{z}{u}\right)^{n-1} \frac{dx}{u} \frac{dy}{u} \frac{dz}{u} = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil 1+l+m+n \rceil}$$

$$\iiint x^{l-1} y^{m-1} z^{n-1} dx dy dz = u^{l+m+n} \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil}$$

Similarly, if  $x + y + z \leq u + \delta u$  then

$$\iiint x^{l-1} y^{m-1} z^{n-1} dx dy dz = (u + \delta u)^{l+m+n} \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil}$$

Hence, value of the integral I extended to all such values of the variables as make the sum of the variables lie between  $u$  and  $u + \delta u$  is given by

$$\begin{aligned} I &= (u + \delta u)^{l+m+n} \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} - u^{l+m+n} \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} \\ \iiint x^{l-1} y^{m-1} z^{n-1} dx dy dz &= \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} [(u + \delta u)^{l+m+n} - u^{l+m+n}] \\ &= \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} u^{l+m+n} \left[ \left( 1 + \frac{\delta u}{u} \right)^{l+m+n} - 1 \right] \\ &= \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} u^{l+m+n} \left[ 1 + (l+m+n) \frac{\delta u}{u} + \dots - 1 \right] \\ &= \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} u^{l+m+n} (l+m+n) \frac{\delta u}{u} = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} u^{l+m+n-1} \delta u \end{aligned}$$

Let us consider  $\iiint f(x+y+z) x^{l-1} y^{m-1} z^{n-1} dx dy dz$

Under the condition  $h_1 \leq x + y + z \leq h_2$

When  $x + y + z$  lies between  $u$  and  $u + \delta u$ , the value of  $f(x+y+z)$  can only differ from  $f(u)$  by a small quantity of the same order as  $\delta u$ . Hence, neglecting square of  $\delta u$ , the part of the integral

$$\iiint f(x+y+z) x^{l-1} y^{m-1} z^{n-1} dx dy dz = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} f(u) u^{l+m+n-1} \delta u$$

(supposing the sum of variables to be between  $u$  and  $u + \delta u$ )

So  $\boxed{\iiint f(x+y+z) x^{l-1} y^{m-1} z^{n-1} dx dy dz = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil} \int_{h_1}^{h_2} f(u) u^{l+m+n-1} du}$

**Example 37.** Show that  $\iiint \frac{dx dy dz}{(x+y+z+1)^3} = \frac{1}{2} \log 2 - \frac{5}{16}$ , the integral being taken

throughout the volume bounded by planes  $x = 0, y = 0, z = 0, x + y + z = 1$ .

**Solution.** By Liouville's theorem when  $0 < x + y + z < 1$

$$\begin{aligned} \iiint \frac{dx dy dz}{(x+y+z+1)^3} &= \iiint \frac{x^{l-1} y^{m-1} z^{n-1} dx dy dz}{(x+y+z+1)^3} \quad (0 \leq x + y + z \leq 1) \\ &= \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+1+m+n \rceil} \int_0^1 \frac{1}{(u+1)^3} u^{l+m+n-1} du = \frac{1}{2} \int_0^1 \frac{u^2}{(u+1)^3} du \\ &= \frac{1}{2} \int_0^1 \left[ \frac{1}{u+1} - \frac{2}{(u+1)^2} + \frac{1}{(u+1)^3} \right] du \quad (\text{Partial fractions}) \end{aligned}$$

$$\begin{aligned}
 &= \frac{1}{2} \left[ \log(u+1) + \frac{2}{u+1} - \frac{1}{2(u+1)^2} \right]_0^1 \\
 &= \frac{1}{2} \left[ \log 2 + 2 \left( \frac{1}{2} - 1 \right) - \left( \frac{1}{8} - \frac{1}{2} \right) \right] = \frac{1}{2} \log 2 - \frac{5}{16} \quad \text{Proved.}
 \end{aligned}$$

**Example 38.** Find the value of  $\iiint \log(x+y+z) dx dy dz$  the integral extending over all positive and zero values of  $x, y, z$  subject to the condition  $x+y+z < 1$ .  
(U.P., I Sem. 2001)

**Solution.** By Liouville's theorem when  $0 < x+y+z < 1$

$$\begin{aligned}
 &\iiint \log(x+y+z) dx dy dz \\
 &= \iiint \log(x+y+z) x^{1-1} y^{1-1} z^{1-1} dx dy dz = \frac{\Gamma_1 \Gamma_1 \Gamma_1}{\Gamma_{1+1+1}} \int_0^1 (\log u) u^{1+1+1-1} du \\
 &= \frac{1}{\Gamma_3} \int_0^1 u^2 \log u du = \frac{1}{2} \left[ \log u \left( \frac{u^3}{3} \right) - \frac{1}{3} \frac{u^3}{3} \right]_0^1 = \frac{1}{2} \left( -\frac{1}{9} \right) = -\frac{1}{18} \quad \text{Ans.}
 \end{aligned}$$

**Example 39.** Evaluate  $\iiint \frac{dx_1 dx_2 \dots dx_n}{\sqrt{1-x_1^2-x_2^2-\dots-x_n^2}}$ , integral being extended to all positive values of the variables for which the expression is real. (U.P., II Semester, Summer 2001)

**Solution.**  $\sqrt{1-x_1^2-x_2^2-\dots-x_n^2}$  is real only when  $x_1^2+x_2^2+\dots+x_n^2 < 1$

Hence, the given integral is extended for all positive values of the variables

$x_1, x_2 \dots$  and  $x_n$  such that  $0 < x_1^2+x_2^2+\dots+x_n^2 < 1$

Let us now put  $x_1^2 = u_1$  i.e.  $x_1 = u_1^{\frac{1}{2}}$  so that  $dx_1 = \frac{1}{2} u_1^{-\frac{1}{2}} du_1$

$x_2^2 = u_2$  i.e.  $x_2 = u_2^{\frac{1}{2}}$  so that  $dx_2 = \frac{1}{2} u_2^{-\frac{1}{2}} du_2$

$x_n^2 = u_n$  i.e.  $x_n = u_n^{\frac{1}{2}}$  so that  $dx_n = \frac{1}{2} u_n^{-\frac{1}{2}} du_n$

Making these substitutions, the given condition becomes  $0 < u_1 + u_2 + \dots + u_n < 1$ .

Hence, the required integral becomes

$$\begin{aligned}
 &= \frac{1}{2^n} \iiint \frac{u_1^{-\frac{1}{2}} \cdot u_2^{-\frac{1}{2}} \dots u_n^{-\frac{1}{2}} \cdot du_1 \cdot du_2 \dots du_n}{\sqrt{1-u_1-u_2-\dots-u_n}} \\
 &= \frac{1}{2^n} \iiint \frac{u_1^{\frac{1}{2}-1} \cdot u_2^{\frac{1}{2}-1} \dots u_n^{\frac{1}{2}-1} \cdot du_1 \cdot du_2 \dots du_n}{\sqrt{1-u_1-u_2-\dots-u_n}} \\
 &= \frac{1}{2^n} \frac{\left[ \frac{1}{2} \cdot \left[ \frac{1}{2} \dots \left[ \frac{1}{2} \right] \right] \right]}{\left| \frac{1}{2} + \frac{1}{2} + \dots + \frac{1}{2} \right|} \int_0^1 \frac{1}{\sqrt{1-u}} \cdot u^{\left( \frac{1}{2} + \frac{1}{2} + \dots + \frac{1}{2} \right)-1} du
 \end{aligned}$$

By Liouville's Extension of Dirichlet's Therorem

$$\begin{aligned}
 &= \frac{1}{2^n} \frac{\left(\frac{1}{2}\right)^n}{\sqrt[n]{\frac{n}{2}}} \int_0^1 \frac{1}{\sqrt{1-u}} \cdot u^{\frac{n}{2}-1} du \\
 &= \frac{1}{2^n} \frac{(\sqrt{\pi})^n}{\sqrt[n]{\frac{n}{2}}} \int_0^{\frac{\pi}{2}} \frac{1}{\sqrt{1-\sin^2 \theta}} \cdot (\sin^2 \theta)^{\frac{n}{2}-1} 2 \sin \theta \cos \theta d\theta \quad (\text{Put } u = \sin^2 \theta) \\
 &= \frac{1}{2^{n-1}} \frac{(\sqrt{\pi})^n}{\sqrt[n]{\frac{n}{2}}} \int_0^{\frac{\pi}{2}} \sin^{n-1} \theta (\cos \theta)^n d\theta = \frac{1}{2^{n-1}} \frac{\pi^{\frac{n}{2}}}{\sqrt[n]{\frac{n}{2}}} \frac{\left[\frac{n}{2}\right]_1^{\frac{1}{2}}}{2 \left[\frac{n+1}{2}\right]} = \frac{1}{2^n} \frac{\pi^{\frac{n+1}{2}}}{\sqrt[n+1]{2}} \quad \text{Ans.}
 \end{aligned}$$

**Example 40.** Evaluate  $\iiint \frac{\sqrt{1-x^2-y^2-z^2}}{1+x^2+y^2+z^2} dx dy dz$ , integral being taken over all positive values of  $x, y, z$  such that  $x^2 + y^2 + z^2 \leq 1$ .

**Solution.** Putting  $x^2 = u, y^2 = v, z^2 = w$  so that  $u + v + w \leq 1$

$$\begin{aligned}
 \text{Also, } x = \sqrt{u} \quad &\Rightarrow \quad dx = \frac{1}{2\sqrt{u}} du \\
 y = \sqrt{v} \quad &\Rightarrow \quad dy = \frac{1}{2\sqrt{v}} dv \\
 z = \sqrt{w} \quad &\Rightarrow \quad dz = \frac{1}{2\sqrt{w}} dw
 \end{aligned}$$

$\therefore$  The given integral

$$\begin{aligned}
 &= \iiint \frac{\sqrt{1-(u+v+w)}}{\sqrt{1+(u+v+w)}} \frac{du dv dw}{8\sqrt{uvw}} \\
 &= \frac{1}{8} \iiint u^{1/2-1} v^{1/2-1} w^{1/2-1} \frac{\sqrt{1-(u+v+w)}}{\sqrt{1+(u+v+w)}} du dv dw \\
 &= \frac{1}{8} \frac{\left(\frac{1}{2}\right) \left(\frac{1}{2}\right) \left(\frac{1}{2}\right)}{\left|\left(\frac{1}{2} + \frac{1}{2} + \frac{1}{2}\right)\right|} \int_0^1 \sqrt{\frac{1-u}{1+u}} u^{\frac{1}{2} + \frac{1}{2} + \frac{1}{2} - 1} du \quad [\text{Using Liouville's extension}] \\
 &= \frac{1}{8} \frac{\left(\frac{1}{2}\right)^3}{\frac{1}{2} \left|\left(\frac{1}{2}\right)\right|} \int_0^1 \frac{(1-u)}{\sqrt{1-u^2}} u^{1/2} du = \frac{\pi}{4} \int_0^1 \frac{(1-\sqrt{t})}{\sqrt{1-t}} t^{1/4} \frac{dt}{2\sqrt{t}} \quad \text{where } u^2 = t \\
 &= \frac{\pi}{8} \int_0^1 \frac{(1-\sqrt{t}) t^{-1/4}}{\sqrt{1-t}} dt = \frac{\pi}{8} \left[ \int_0^1 t^{\frac{3}{4}-1} (1-t)^{1/2-1} dt - \int_0^1 t^{5/4-1} (1-t)^{1/2-1} dt \right] \\
 &= \frac{\pi}{8} \left[ \beta\left(\frac{3}{4}, \frac{1}{2}\right) - \beta\left(\frac{5}{4}, \frac{1}{2}\right) \right] \quad \text{Ans.}
 \end{aligned}$$

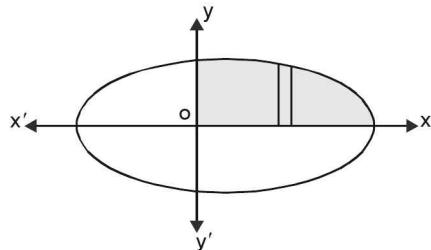

**Example 41.** Find the area and the mass contained in the first quadrant enclosed by the curve

$$\left(\frac{x}{a}\right)^\alpha + \left(\frac{y}{b}\right)^\beta = 1 \text{ where } \alpha > 0, \beta > 0 \text{ given that density at any point } p(xy) \text{ is } k\sqrt{xy}.$$

**Solution.** Here, we have  $\left(\frac{x}{a}\right)^\alpha + \left(\frac{y}{b}\right)^\beta = 1$

(U.P. 1 Semester 2008)

$$\begin{array}{l|l} \text{Put } \left(\frac{x}{a}\right)^\alpha = \cos^2 t & \text{and } \left(\frac{y}{b}\right)^\beta = \sin^2 t \\ \Rightarrow x = a \cos^{\frac{2}{\alpha}} t & \Rightarrow y = b \sin^{\frac{2}{\beta}} t \\ dx = \frac{2}{\alpha} a \cos^{\frac{2}{\alpha}-1} t (-\sin t) dt & \end{array}$$

$$\begin{aligned} \text{Area} &= \int y dx = \int_0^{\frac{\pi}{2}} (b \sin^{\frac{2}{\beta}} t) \left( -\frac{2a}{\alpha} \cos^{\frac{2}{\alpha}-1} t \sin t \right) dt \\ &= \frac{-2ab}{\alpha} \int_0^{\frac{\pi}{2}} \sin^{\frac{2}{\beta}+1} t \cos^{\frac{2}{\alpha}-1} t dt = \frac{-2ab}{\alpha} \frac{\binom{\frac{2}{\beta}+1+1}{2} \binom{\frac{2}{\alpha}-1+1}{2}}{2 \binom{\frac{2}{\beta}+1}{\frac{2}{\beta}}} \\ &= \frac{-ab}{\alpha} \frac{\binom{1+\frac{1}{\beta}}{\alpha} \binom{1}{\alpha}}{\binom{\alpha+\beta+\alpha\beta}{\alpha\beta}} = -ab \frac{\frac{1}{\alpha} \binom{1}{\alpha} \binom{1+\frac{1}{\beta}}{\alpha+\beta+\alpha\beta}}{\binom{\alpha+\beta+\alpha\beta}{\alpha\beta}} = -ab \frac{\binom{\frac{1}{\alpha}+1}{\alpha} \binom{1+\frac{1}{\beta}}{\alpha+\beta+\alpha\beta}}{\binom{\alpha+\beta+\alpha\beta}{\alpha\beta}} \end{aligned}$$

$$\text{Required area} = ab \frac{\binom{\alpha+1}{\alpha} \binom{\beta+1}{\beta}}{\binom{\alpha+\beta+\alpha\beta}{\alpha\beta}}$$

Ans.

$$\text{Density} = k\sqrt{xy}$$

$$\begin{aligned} \text{Mass} &= \text{Area} \times \text{Density} = \int [y dx k\sqrt{xy}] = 4k \int_0^{\frac{\pi}{2}} x^{\frac{1}{2}} y^{\frac{3}{2}} dx \\ &= 4k \int_0^{\frac{\pi}{2}} (a \cos^{\frac{2}{\alpha}} t)^{\frac{1}{2}} (b \sin^{\frac{2}{\beta}} t)^{\frac{3}{2}} \frac{2}{\alpha} a \cos^{\frac{2}{\alpha}-1} t (-\sin t) dt \\ &= 4k \int_0^{\frac{\pi}{2}} a^{\frac{1}{2}} b^{\frac{3}{2}} \cos^{\frac{1}{\alpha}} t b^{\frac{3}{2}} \sin^{\frac{3}{\beta}} t \frac{2}{\alpha} a \cos^{\frac{2}{\alpha}-1} t (-\sin t) dt \\ &= 4k a^{\frac{1}{2}+1} b^{\frac{3}{2}} \cdot \frac{2}{\alpha} \int_0^{\frac{\pi}{2}} \sin^{\frac{3}{\beta}+1} t \cos^{\frac{1}{\alpha}+\frac{2}{\alpha}-1} t dt \\ &= \frac{8k}{\alpha} a^{\frac{3}{2}} b^{\frac{3}{2}} \int_0^{\frac{\pi}{2}} \sin^{\frac{3}{\beta}+1} t \cos^{\frac{3}{\alpha}-1} t dt \quad (\text{neglecting the negative sign}) \end{aligned}$$

$$= \frac{8k}{\alpha} a^{\frac{3}{2}} b^{\frac{3}{2}} \frac{\sqrt{\frac{3+1+1}{2}} \sqrt{\frac{3-1+1}{2}}}{2 \sqrt{\frac{\frac{3}{\beta}+1+1+\frac{3}{\alpha}-1+1}{2}}} = \frac{8k}{\alpha} a^{\frac{3}{2}} b^{\frac{3}{2}} \frac{\sqrt{\frac{3+2\beta}{2\beta}} \sqrt{\frac{3}{2\alpha}}}{2 \sqrt{\frac{3}{2\alpha} + \frac{3}{2\beta} + 1}} \quad \text{Ans.}$$

**Example 42.** Find the mass of an octant of the ellipsoid  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ , the density at any point being  $\rho = kxyz$ . (U.P., I Semester, 2009)

**Solution.** Mass =  $\iiint \rho dv = \iiint (kxyz) dx dy dz$   
 $= k \iiint (x dx)(y dy)(z dz)$  ... (1)

Putting  $\frac{x^2}{a^2} = u, \frac{y^2}{b^2} = v, \frac{z^2}{c^2} = w$  and  $u + v + w = 1$

so that  $\frac{2x dx}{a^2} = du, \frac{2y dy}{b^2} = dv, \frac{2z dz}{c^2} = dw$

$$\begin{aligned} \text{Mass} &= k \iiint \left( \frac{a^2 du}{2} \right) \left( \frac{b^2 dv}{2} \right) \left( \frac{c^2 dw}{2} \right) \\ &= \frac{ka^2 b^2 c^2}{8} \iiint du dv dw, \quad \text{where } u + v + w \leq 1. \\ &= \frac{ka^2 b^2 c^2}{8} \iiint u^{l-1} v^{m-1} w^{n-1} du dv dw \\ &= \frac{ka^2 b^2 c^2}{8} \frac{\bar{l} \bar{m} \bar{n}}{\bar{l+m+n+1}} = \frac{ka^2 b^2 c^2}{8 \times 6} = \frac{ka^2 b^2 c^2}{48} \quad \text{Ans.} \end{aligned}$$

**Example 43.** Find the mass of a solid  $\left(\frac{x}{a}\right)^p + \left(\frac{y}{b}\right)^q + \left(\frac{z}{c}\right)^r = 1$ , the density at any point being  $\rho = kx^{l-1}y^{m-1}z^{n-1}$ , where  $x, y, z$  are all positive.

**Solution.** Here, we have

$$\begin{aligned} \left(\frac{x}{a}\right)^p + \left(\frac{y}{b}\right)^q + \left(\frac{z}{c}\right)^r &= 1 \\ \text{Density} &= k x^{l-1} y^{m-1} z^{n-1} \\ \text{Mass} &= \text{Volume} \times \text{Density} \\ &= \iiint dx dy dz \cdot k x^{l-1} y^{m-1} z^{n-1} \\ &= k \iiint (au)^{l-1} (bv)^{m-1} (cw)^{n-1} adu.bdv.cdw \\ &= k a^l b^m c^n \iiint u^{l-1} v^{m-1} w^{n-1} du dv dw \\ &= k \cdot a^l \cdot b^m \cdot c^n \frac{\bar{l} \bar{m} \bar{n}}{\sqrt{\bar{l+m+n+1}}} \quad \text{Ans.} \end{aligned}$$

**Example 44.** Evaluate  $I = \iiint_V x^{\alpha-1} y^{\beta-1} z^{\gamma-1} dx dy dz$ , where  $V$  is the region in the first octant bounded by sphere  $x^2 + y^2 + z^2 = 1$  and the coordinate planes.

[U.P., I Semester (C.O.) 2003]

**Solution.** Let  $x^2 = u \Rightarrow x = \sqrt{u} \therefore dx = \frac{1}{2\sqrt{u}} du$

$$y^2 = v \Rightarrow y = \sqrt{v} \therefore dy = \frac{1}{2\sqrt{v}} dv$$

$$z^2 = w \Rightarrow z = \sqrt{w} \therefore dz = \frac{1}{2\sqrt{w}} dw$$

Then,  $u + v + w = 1$ . Also,  $u \geq 0, v \geq 0, w \geq 0$ .

$$\begin{aligned} I &= \iiint_V (\sqrt{u})^{\alpha-1} (\sqrt{v})^{\beta-1} (\sqrt{w})^{\gamma-1} \frac{du}{2\sqrt{u}} \cdot \frac{dv}{2\sqrt{v}} \cdot \frac{dw}{2\sqrt{w}} \\ &= \frac{1}{8} \iiint u^{(\alpha/2)-1} v^{(\beta/2)-1} w^{(\gamma/2)-1} du \, dv \, dw \\ &= \frac{1}{8} \frac{\Gamma(\alpha/2) \Gamma(\beta/2) \Gamma(\gamma/2)}{[(\alpha/2) + (\beta/2) + (\gamma/2) + 1]} \end{aligned}$$

**Ans.**

### EXERCISE 38.3

**Evaluate:**

1.  $\iiint e^{x+y+z} dx \, dy \, dz$  taken over the positive octant such that  $x+y+z \leq 1$ . **Ans.**  $\frac{e-2}{2}$

2.  $\iiint \frac{dx \, dy \, dz}{(a^2 - x^2 - y^2 - z^2)}$  for all positive values of the variables for which the expression is real.

[Hint.  $a^2 - x^2 - y^2 - z^2 > 0 \Rightarrow 0 < x^2 + y^2 + z^2 < a^2$ ] **Ans.**  $\frac{\pi^2 a^2}{8}$

3.  $\iiint_R (x+y+z+1)^2 dx \, dy \, dz$  where  $R$  is defined by  $x \geq 0, y \geq 0, z \geq 0, x+y+z \leq 1$ .

**Ans.**  $\frac{31}{60}$

4.  $\iiint x^{-\frac{1}{2}} y^{-\frac{1}{2}} z^{-\frac{1}{2}} (1-x-y-z)^{\frac{1}{2}} dx \, dy \, dz$ ,  $x+y+z \leq 1, x>0, y>0, z>0$  **Ans.**  $\frac{\pi^2}{4}$

5. Show that  $\iiint \frac{dx \, dy \, dz}{(x+y+z+1)^2} = \frac{3}{4} - \log 2$ , the integral being taken throughout the volume bounded by the planes  $x=0, y=0, z=0$  and  $x+y+z=1$ .

**Choose the correct alternative:**

6.  $\left| \frac{1}{2} \right|$  is equal to  
*(i)*  $\pi$    *(ii)*  $\frac{1}{2!}$    *(iii)*  $\sqrt{\pi}$    *(iv)*  $\frac{\pi}{2}$    **Ans.** (iii)  
(R.G.P.V. Bhopal, I Semester, June 2006)

7.  $\beta(m, n) =$   
*(i)*  $\int_0^\pi \sin^{2m-1} \theta \cos^{2n-1} \theta d\theta$    *(ii)*  $\int_0^{\frac{\pi}{2}} \sin^{2m-1} \theta \cos^{2n-1} \theta d\theta$   
*(iii)*  $2 \int_0^{\frac{\pi}{2}} \sin^{2m-1} \theta \cos^{2n-1} \theta d\theta$    *(iv)*  $\int_0^{\frac{\pi}{2}} \sin^m \theta \cos^n \theta d\theta$    **Ans.** (iii)  
(R.G.P.V. Bhopal, I Semester Dec. 2006)

8. What is the relation between Beta and Gamma functions?

*(i)*  $\beta(m, l) = \frac{\Gamma(m) \Gamma(l)}{\Gamma(m+l)}$    *(ii)*  $\beta(l, m) = \frac{\Gamma(l) \Gamma(m)}{\Gamma(l+m)}$

$$(iii) \quad \beta(l, m) = \frac{\lceil l \rceil \lceil m \rceil}{\lceil m + l \rceil}$$

$$(iv) \quad \beta(l, m) = \frac{\lceil l \rceil \lceil m \rceil}{\lceil m \rceil \lceil l \rceil}$$

Ans. (ii)

(R.G.P.V. Bhopal, I Semester Dec. 2006)

9. The value of  $\lceil 3.5 \rceil$ 

$$(i) \quad \frac{15}{4}\sqrt{\pi} \quad (ii) \quad \frac{15}{8}\sqrt{\pi} \quad (iii) \quad \frac{15}{2}\sqrt{\pi} \quad (iv) \quad \frac{15}{16}\sqrt{\pi} \quad (AMIETE, June 2010) \quad \text{Ans. (ii)}$$

10. The value of  $\int_{-\infty}^{\infty} e^{-x^2} dx$  is

$$(i) \quad \frac{\sqrt{\pi}}{2} \quad (ii) \quad \left\lceil \frac{\pi}{2} \right\rceil \quad (iii) \quad \sqrt{\pi} \quad (iv) \quad \frac{\pi}{\sqrt{2}}$$

(AMIETE, June 2010) Ans. (iii)

11. In terms of Beta function  $\int_0^{\frac{\pi}{2}} \sin^7 \theta \sqrt{\cos \theta} d\theta$  is

$$(i) \quad \frac{1}{2} \beta\left(4, \frac{3}{4}\right) \quad (ii) \quad \frac{1}{2} \beta\left(2, \frac{1}{4}\right) \quad (iii) \quad \frac{1}{2} \beta\left(3, \frac{3}{4}\right) \quad (iv) \quad \text{None of these}$$

(AMIETE, June 2010) Ans. (i)

12. If  $l, m, n$  are all positive, then the triple integral

$$\iiint_V x^{l-1} y^{m-1} z^{n-1} dx dy dz = \frac{\lceil l \rceil \lceil m \rceil \lceil n \rceil}{\lceil l+m+n \rceil}$$

where  $V$  is the region  $x \geq 0, y \geq 0, z \geq 0$  and  $x + y + z \leq 1$ . (U.P., Ist Semester, 2005) Ans. True

### 38.16 ELLIPTIC INTEGRALS

Draw a circle with  $AA'$  (diameter) the major axis of the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ . This circle is called

the auxiliary circle  $x^2 + y^2 = a^2$ . The co-ordinates of a point  $P$  on the ellipse are  $(a \sin \phi, b \cos \phi)$ .

$x = a \sin \phi, y = b \cos \phi$  is the parametric equation of the ellipse.

Now the length of the arc BP of the ellipse

$$\begin{aligned} &= \int_0^\phi \sqrt{\left(\frac{dx}{d\phi}\right)^2 + \left(\frac{dy}{d\phi}\right)^2} d\phi = \int_0^\phi \sqrt{(a^2 \cos^2 \phi + b^2 \sin^2 \phi)} d\phi \quad \{b^2 = a^2 (1 - e^2)\} \\ &= \int_0^\phi \sqrt{a^2 \cos^2 \phi + (a^2 - a^2 e^2) \sin^2 \phi} d\phi = a \int_0^\phi \sqrt{1 - e^2 \sin^2 \phi} d\phi \end{aligned}$$

where  $e$  is the eccentricity of the ellipse.

This integral cannot be evaluated in the form of the elementary function. It defines a new function, called *elliptic function*. This integral is called the elliptic integrals as it is derived from the determination of the Perimeter of the ellipse. This integral cannot be evaluated by standard methods of integration. First the integrand  $\sqrt{1 - e^2 \sin^2 \phi}$  is expanded as power series and then is integrated term by term.

### 38.17 DEFINITION AND PROPERTY

$$\text{Elliptic integral of first kind} = F(k, \phi) = \int_0^\phi \frac{1}{\sqrt{1 - k^2 \sin^2 \phi}} d\phi \quad k^2 < 1$$

$$\text{Elliptic integral of second kind} = E(k, \phi) = \int_0^\phi \sqrt{(1-k^2 \sin^2 \phi)} d\phi \quad k^2 < 1$$

Here  $k$  is known as modulus and  $\phi$  amplitude.

The following results are easy to prove

$$F(0, \phi) = E(0, \phi) = \phi$$

$$F(1, \phi) = \log(\tan \phi + \sec \phi)$$

$$E(1, \phi) = \sin \phi$$

If  $\phi = \frac{\pi}{2}$  is the upper limit of the integral then the integral is called *complete elliptic integral* as under:

$$F(k) = \int_0^{\frac{\pi}{2}} \frac{d\phi}{\sqrt{1-k^2 \sin^2 \phi}} \quad \dots (1)$$

$$\text{and} \quad E(k) = \int_0^{\frac{\pi}{2}} \sqrt{1-k^2 \sin^2 \phi} d\phi \quad \dots (2)$$

These integrals can be evaluated by expanding the integrand in binomial series and integrating term by term.

$$(1 - k^2 \sin^2 \phi)^{-1/2} = 1 + \frac{k^2}{2} \sin^2 \phi + \frac{1.3}{2.4} k^4 \sin^4 \phi + \dots$$

$$F(k, \phi) = \int_0^\phi \frac{d\phi}{\sqrt{(1-k^2 \sin^2 \phi)}} = \phi + \frac{k^2}{2} \int_0^\phi \sin^2 \phi d\phi + \frac{1.3}{2.4} k^4 \int_0^\phi \sin^4 \phi d\phi + \dots \quad \dots (3)$$

which can be evaluated by the *Reduction Formula*

$$\int_0^\phi \sin^n \phi d\phi = -\frac{\sin^{n-1} \phi \cos \phi}{n} + \frac{n-1}{n} \int_0^\phi \frac{\sin^{n-2}}{\phi} d\phi$$

From (3), we get

$$K(k) = \int_0^{\frac{\pi}{2}} \frac{d\phi}{\sqrt{(1-k^2 \sin^2 \phi)}} = \frac{\pi}{2} + \frac{k^2}{2} \left( \frac{1}{2} \frac{\pi}{2} \right) + \frac{1.3}{2.4} k^4 \left( \frac{3.1}{4.2} \frac{\pi}{2} \right) + \dots$$

$$\text{or} \quad K(k) = \frac{\pi}{2} \left[ 1 + \frac{k^2}{4} + \frac{9k^4}{64} + \dots \right]$$

If  $k = \sin 10'$

$$K = \frac{\pi}{2} [1 + 0.00754 + 0.00012 + \dots] = 1.5828$$

The elliptic integrals are periodic functions with a period  $\pi$ .

$$F(k, \phi + P\pi) = PF(k, \pi) + F(k, \phi), P = 0, 1, 2, \dots$$

$$E(k, \phi + P\pi) = PE(k, \pi) + E(k, \phi), P = 0, 1, 2, \dots$$

$$F(k, \phi + P\pi) = 2PF(k) + F(k, \phi)$$

$$E(k, \phi + P\pi) = 2PE(k) + E(k, \phi)$$

If we substitute  $\sin \phi = x$ ,  $d\phi = \frac{dx}{\sqrt{1-x^2}}$  in (1) and (2), we have

$$F_1(k, x) = \int_0^x \frac{dx}{\sqrt{(1-x^2)(1-k^2x^2)}}$$

$$E_1(k, x) = \int_0^x \sqrt{\left(\frac{1-k^2x^2}{1-x^2}\right)} dx$$

These are known as Jacobi's form of elliptic integrals.

**Example 45.** Express  $\int_0^{\frac{\pi}{2}} \sqrt{\cos x} dx$  in terms of elliptic integrals.

**Solution.** Substitute  $\cos x = \cos^2 \phi$

$$\text{so that } x = \cos^{-1} \cos^2 \phi, dx = \frac{2 \cos \phi \sin \phi d\phi}{\sqrt{1 - \cos^4 \phi}} = \frac{2 \cos \phi d\phi}{\sqrt{1 + \cos^2 \phi}}$$

$$\begin{aligned} \int_0^{\frac{\pi}{2}} \sqrt{\cos x} dx &= \int_0^{\frac{\pi}{2}} \frac{2 \cos^2 \phi d\phi}{\sqrt{1 + \cos^2 \phi}} = 2 \int_0^{\frac{\pi}{2}} \frac{(1 + \cos^2 \phi) - 1}{\sqrt{1 + \cos^2 \phi}} d\phi \\ &= 2 \left\{ \int_0^{\frac{\pi}{2}} \sqrt{1 + \cos^2 \phi} d\phi - \int_0^{\frac{\pi}{2}} \frac{1}{\sqrt{1 + \cos^2 \phi}} d\phi \right\} \\ &= 2 \left\{ \int_0^{\frac{\pi}{2}} \sqrt{(2 - \sin^2 \phi)} d\phi - \int_0^{\frac{\pi}{2}} \frac{1}{\sqrt{(2 - \sin^2 \phi)}} d\phi \right\} \\ &= 2\sqrt{2} \int_0^{\frac{\pi}{2}} \sqrt{\left(1 - \frac{1}{2} \sin^2 \phi\right)} d\phi - \frac{2}{\sqrt{2}} \int_0^{\frac{\pi}{2}} \frac{1}{\sqrt{\left(1 - \frac{1}{2} \sin^2 \phi\right)}} d\phi \\ &= 2\sqrt{2} E\left(\frac{1}{\sqrt{2}}\right) - \sqrt{2} K\left(\frac{1}{\sqrt{2}}\right) \end{aligned}$$

**Ans.**

**Example 46.** Express  $\int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{(2 - \cos x)}}$  in terms of elliptic integrals.

$$\begin{aligned} \text{Solution. } \int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{(2 - \cos x)}} &= \int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{\left\{2 - \left(2 \cos^2 \frac{x}{2} - 1\right)\right\}}} \\ &= \int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{\left(3 - 2 \cos^2 \frac{x}{2}\right)}} = \frac{1}{\sqrt{3}} \int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{\left(1 - \frac{2}{3} \cos^2 \frac{x}{2}\right)}} \end{aligned}$$

On Putting  $x = \pi - 2\phi$ , so that  $dx = -2 d\phi$

$$\begin{aligned} &= \frac{1}{\sqrt{3}} \int_{\frac{\pi}{2}}^{\frac{\pi}{4}} \frac{-2 d\phi}{\sqrt{1 - \frac{2}{3} \cos^2\left(\frac{\pi}{2} - \phi\right)}} = \frac{-2}{\sqrt{3}} \int_{\frac{\pi}{2}}^{\frac{\pi}{4}} \frac{d\phi}{\sqrt{\left(1 - \frac{2}{3} \sin^2 \phi\right)}} \\ &= \frac{2}{\sqrt{3}} \left[ \int_0^{\frac{\pi}{2}} \frac{d\phi}{\sqrt{\left(1 - \frac{2}{3} \sin^2 \phi\right)}} - \int_0^{\frac{\pi}{4}} \frac{d\phi}{\sqrt{\left(1 - \frac{2}{3} \sin^2 \phi\right)}} \right] = \frac{2}{\sqrt{3}} \left[ K\left(\frac{\sqrt{2}}{3}\right) - F\left(\frac{\sqrt{2}}{3}, \frac{\pi}{4}\right) \right] \quad \text{Ans.} \end{aligned}$$

**Example 47.** Show that  $\int_0^{\frac{a}{2}} \frac{dx}{\sqrt{(2ax-x^2)(a^2-x^2)}} = \frac{2}{3a} K\left(\frac{1}{3}\right)$

**Solution.** On substituting  $x = \frac{a}{2}(1-\sin\theta)$  so that  $dx = -\frac{a}{2} 2\cos\theta d\theta$

$$\text{Upper limit, } x = \frac{a}{2}, \quad \frac{a}{2} = \frac{a}{2}(1-\sin\theta) \Rightarrow \theta = 0$$

$$\text{Lower limit, } x = 0, 0 = \frac{a}{2}(1-\sin\theta) \Rightarrow \theta = \frac{\pi}{2}$$

$$2ax - x^2 = (2a)\frac{a}{2}(1-\sin\theta) - \frac{a^2}{4}(1-\sin\theta)^2 = \frac{a^2}{4}[4 - 4\sin\theta - 1 + 2\sin\theta - \sin^2\theta]$$

$$= \frac{a^2}{4}(3 - 2\sin\theta - \sin^2\theta) = \frac{a^2}{4}(1-\sin\theta)(3+\sin\theta)$$

$$a^2 - x^2 = a^2 - \frac{a^2}{4}(1-\sin\theta)^2 = \frac{a^2}{4}[4 - 1 - \sin^2\theta + 2\sin\theta] = \frac{a^2}{4}[3 + 2\sin\theta - \sin^2\theta]$$

$$= \frac{a^2}{4}(1+\sin\theta)(3-\sin\theta)$$

$$\begin{aligned} \int_0^{\frac{a}{2}} \frac{dx}{\sqrt{(2ax-x^2)(a^2-x^2)}} &= \int_{\frac{\pi}{2}}^0 \frac{-\frac{a}{2}\cos\theta d\theta}{\sqrt{\frac{a^2}{4}(1-\sin\theta)(3+\sin\theta)} \frac{a^2}{4}(1+\sin\theta)(3-\sin\theta)}} \\ &= \int_0^{\frac{\pi}{2}} \frac{\cos\theta d\theta}{\frac{a}{2}\sqrt{(1-\sin^2\theta)(9-\sin^2\theta)}} = \frac{2}{a} \int_0^{\frac{\pi}{2}} \frac{d\theta}{(9-\sin^2\theta)} \\ &= \frac{2}{3a} \int_0^{\frac{\pi}{2}} \frac{d\theta}{\sqrt{1-\left(\frac{1}{3}\right)^2 \sin^2\theta}} = \frac{2}{3a} K\left(\frac{1}{3}\right) \end{aligned}$$

**Proved.**

#### EXERCISE 38.4

Show that

$$1. \quad \int_0^\pi \frac{dx}{\sqrt{(1-k^2 \sin^2\phi)}} = \frac{1}{k} F\left(\frac{1}{k}, x\right)$$

$$2. \quad \int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{(1+3\sin^2x)}} = \frac{1}{2} K\left(\frac{\sqrt{3}}{2}\right)$$

$$3. \quad \int_0^{\frac{\pi}{6}} \frac{dx}{\sqrt{\sin x}} = \sqrt{2} \left[ K\left(\frac{1}{\sqrt{2}}\right) - F\left(\frac{1}{\sqrt{2}}, \frac{\pi}{4}\right) \right]$$

$$4. \quad \int_0^\phi \frac{\sin\phi}{\sqrt{(1-k^2 \sin^2\phi)}} d\phi = \frac{1}{k^2} [F(k, \phi) - E(k, \phi)]$$

$$5. \quad \int_0^1 \frac{dx}{\sqrt{(1-x^4)}} = \frac{1}{\sqrt{2}} K\left(\frac{1}{\sqrt{2}}\right)$$

$$6. \quad \int_0^\phi \sqrt{(1-k^2 \sin^2\phi)} d\phi = \left(\frac{1}{k} - k\right) F\left(\frac{1}{k}, x\right) + KE\left(\frac{1}{k}, x\right) \text{ and } k \sin\phi < 1 \quad [\text{Hint. Put } \sin x = k \sin\phi]$$

### 38.18 ERROR FUNCTION

1.  $\frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$  is called error function of  $x$  and is also written as  $\text{erf}(x)$ .
2.  $\frac{2}{\sqrt{\pi}} \int_x^\infty e^{-t^2} dt$  is called complementary error function of  $x$  and is also written as  $\text{erf}_c(x)$ .
3. Important formula.

$$\int_0^\infty e^{-t^2} dt = \frac{\sqrt{\pi}}{2}$$

**Example 48.** Prove that  $\text{erf}(0) = 0$

$$\begin{aligned}\text{Solution. } \text{erf}(x) &= \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt \\ \text{erf}(0) &= \frac{2}{\sqrt{\pi}} \int_0^0 e^{-t^2} dt = 0\end{aligned}$$

**Proved.**

**Example 49.** Prove that  $\text{erf}(\infty) = 1$

$$\begin{aligned}\text{Solution. } \text{erf}(x) &= \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt \\ \text{erf}(\infty) &= \frac{2}{\sqrt{\pi}} \int_0^\infty e^{-t^2} dt = \frac{2}{\sqrt{\pi}} \frac{\sqrt{\pi}}{2} = 1\end{aligned}$$

**Proved.**

**Example 50.** Prove that  $\text{erf}(x) + \text{erf}_c(x) = 1$

$$\begin{aligned}\text{Solution. } \text{erf}(x) + \text{erf}_c(x) &= \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt + \frac{2}{\sqrt{\pi}} \int_x^\infty e^{-t^2} dt = \frac{2}{\sqrt{\pi}} \left[ \int_0^x e^{-t^2} dt + \int_x^\infty e^{-t^2} dt \right] \\ &= \frac{2}{\sqrt{\pi}} \int_0^\infty e^{-t^2} dt = \frac{2}{\sqrt{\pi}} \frac{\sqrt{\pi}}{2} = 1\end{aligned}$$

**Proved.**

**Example 51.** Prove that  $\text{erf}(-x) = -\text{erf}(x)$

$$\begin{aligned}\text{Solution. } \text{erf}(x) &= \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt \\ \text{erf}(-x) &= \frac{2}{\sqrt{\pi}} \int_0^{-x} e^{-t^2} dt \quad [\text{Put } t = -\mu] \\ &= \frac{2}{\sqrt{\pi}} \int_0^x e^{-u^2} (-du) = -\frac{2}{\sqrt{\pi}} \int_0^x e^{-u^2} (du) = -\text{erf}(x)\end{aligned}$$

**Proved.**

**Example 52.** Show that  $\int_a^b e^{-x^2} dx = \frac{\sqrt{\pi}}{2} [\text{erf}(b) - \text{erf}(a)]$

$$\begin{aligned}\text{Solution. } \frac{\sqrt{\pi}}{2} [\text{erf}(b) - \text{erf}(a)] &= \frac{\sqrt{\pi}}{2} \left[ \frac{2}{\sqrt{\pi}} \int_0^b e^{-t^2} dt - \frac{2}{\sqrt{\pi}} \int_0^a e^{-t^2} dt \right] = \int_0^b e^{-t^2} dt - \int_0^a e^{-t^2} dt \\ &= \int_0^b e^{-t^2} dt + \int_a^0 e^{-t^2} dt = \int_a^b e^{-t^2} dt = \int_a^b e^{-x^2} dx\end{aligned}$$

**Proved.**

**Example 53.** Show that

$$\int_0^\infty e^{-x^2 - 2bx} dx = \frac{\sqrt{\pi}}{2} e^{b^2} [1 - \operatorname{erf}(b)]$$

**Solution.**

$$\begin{aligned} \int_0^\infty e^{-x^2 - 2bx} dx &= \int_0^\infty e^{-x^2 - 2bx - b^2 + b^2} dx = \int_0^\infty e^{-(x+b)^2} e^{b^2} dx \\ &= e^{b^2} \left[ \int_b^\infty e^{-t^2} dt + \int_0^b e^{-t^2} dt \right] && [\text{Put } x+b=t] \\ &= e^{b^2} \left[ -\int_b^0 e^{-t^2} dt + \operatorname{erf}(\infty) \right] \\ &= e^{b^2} \left[ \frac{\sqrt{\pi}}{2} - \frac{\sqrt{\pi}}{2} \operatorname{erf}(b) \right] = e^{b^2} \frac{\sqrt{\pi}}{2} [1 - \operatorname{erf}(b)] && \text{Proved.} \end{aligned}$$

**Example 54.** Prove that

$$\frac{d}{dx} [\operatorname{erfc}(\alpha x)] = \frac{-2\alpha}{\sqrt{\pi}} e^{-\alpha^2 x^2}$$

**Solution.**

$$\frac{d}{dx} [\operatorname{erfc}(\alpha x)] = \frac{d}{dx} \left[ \frac{2}{\sqrt{\pi}} \int_{\alpha x}^\infty e^{-t^2} dt \right]$$

On applying the rule of differentiation under integral sign, we get

$$\begin{aligned} &= \frac{2}{\sqrt{\pi}} \left[ \int_{\alpha x}^\infty \left( \frac{\partial}{\partial x} e^{-t^2} \right) dt + \frac{d}{dx} (\infty) e^{-\infty} - \frac{d}{dx} (\alpha x) e^{-\alpha^2 x^2} \right] \\ &= \frac{2}{\sqrt{\pi}} \left[ 0 + 0 - \alpha \cdot e^{-\alpha^2 x^2} \right] = -\frac{2\alpha}{\sqrt{\pi}} e^{-\alpha^2 x^2} && \text{Proved.} \end{aligned}$$

### EXERCISE 38.5

**Prove that**

1.  $\operatorname{erfc}(x) + \operatorname{erfc}(-x) = 2$

2.  $\operatorname{erfc}(-x) = 1 + \operatorname{erfc}(x)$

3.  $\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \left[ x - \frac{x^3}{3} + \frac{1}{2!} \frac{x^5}{5} - \frac{1}{3!} \frac{x^7}{7} + \dots \right]$

4.  $\int_0^\infty e^{-(x+a)^2} dx = \frac{\sqrt{\pi}}{2} [1 - \operatorname{erf}(a)]$

5.  $\int_0^t \operatorname{erfc}(ax) dx = t \operatorname{erfc}(at) - \frac{e^{-a^2 t^2}}{a\sqrt{\pi}} + \frac{1}{a\sqrt{\pi}}$

6.  $\frac{d}{dx} [\operatorname{erf}(ax)] = \frac{2a}{\sqrt{\pi}} e^{-a^2 x^2}$

7.  $\frac{d}{dx} [\operatorname{erf}(\sqrt{x})] = \frac{e^{-x}}{\sqrt{\pi x}}$

8.  $\frac{d}{dx} [\operatorname{erf}(\sqrt{x})] = \frac{2}{\sqrt{\pi}} e^{-x^2}$

### 38.19 DIFFERENTIATION UNDER THE INTEGRAL SIGN

The value of a definite integral  $\int_a^b f(x, \alpha) dx$  is a function of  $\alpha$  (parameter),  $F(\alpha)$  say. To find  $F'(\alpha)$ , first we have to evaluate the integral  $\int_a^b f(x, \alpha) dx$  and then differentiate  $F(\alpha)$  w.r.t.  $\alpha$ . However, it is not always possible to evaluate the integral and then to find its derivative. Such problems are solved by reversing the order of the integration and differentiation i.e., first differentiate  $f(x, \alpha)$  partially w.r.t. " $\alpha$ " and then integrate it.

### 38.20 LEIBNITZ'S RULE

If  $f(x, \alpha)$  and  $\frac{\partial f(x, \alpha)}{\partial \alpha}$  be continuous functions of  $x$  and  $\alpha$ , then

$$\frac{d}{d\alpha} \left[ \int_a^b f(x, \alpha) dx \right] = \int_a^b \frac{\partial f(x, \alpha)}{\partial \alpha} dx.$$

**Proof.** Let

$$\int_a^b f(x, \alpha) dx = F(\alpha)$$

then

$$F(\alpha + \delta \alpha) = \int_a^b f(x, \alpha + \delta \alpha) dx$$

Hence

$$\begin{aligned} F(\alpha + \delta) - F(\alpha) &= \int_a^b f(x, \alpha + \delta \alpha) dx - \int_a^b f(x, \alpha) dx \\ &= \int_a^b [f(x, \alpha + \delta \alpha) - f(x, \alpha)] dx \\ \frac{F(\alpha + \delta \alpha) - F(\alpha)}{\delta \alpha} &= \int_a^b \frac{f(x, \alpha + \delta \alpha) - f(x, \alpha)}{\delta \alpha} dx \end{aligned}$$

Taking limits of both sides as  $\delta \alpha \rightarrow 0$ , we have

$$\frac{\partial F}{\partial \alpha} = \int_a^b \frac{\partial f(x, \alpha)}{\partial \alpha} dx$$

The above formula is useful for evaluating definite integrals which are otherwise impossible to evaluate.

**Example 55.** Evaluate

$$\int_0^\infty \frac{\tan^{-1}(ax)}{x(1+x^2)} dx$$

**Solution.** Let

$$I = \int_0^\infty \frac{\tan^{-1}(ax)}{x(1+x^2)} dx$$

∴

$$\begin{aligned} \frac{dl}{da} &= \int_0^\infty \frac{\partial}{\partial a} \frac{\tan^{-1}(ax)}{x(1+x^2)} dx \\ &= \int_0^\infty \frac{1}{x(1+x^2)} \cdot \frac{x}{1+a^2 x^2} dx = \int_0^\infty \frac{1}{(1+x^2)(1+a^2 x^2)} dx \end{aligned} \quad \dots(1)$$

Breaking the integrand into partial fractions,

$$\begin{aligned} &= \int_0^\infty \frac{1}{1-a^2} \left[ \frac{1}{1+x^2} - \frac{a^2}{1+a^2 x^2} \right] dx = \frac{1}{1-a^2} \left[ \tan^{-1} x - a \tan^{-1} ax \right]_0^\infty \\ &= \frac{1}{1-a^2} \left[ \frac{\pi}{2} - a \frac{\pi}{2} \right] = \frac{\pi}{2} \frac{1-a}{1-a^2} = \frac{\pi}{2} \frac{1}{1+a} \end{aligned}$$

Now, integrating with respect to "a", we get  $I = \frac{\pi}{2} \log(1+a) + c$

....(2)

From (1), when  $a = 0$ , then  $I = 0$

Putting  $a = 0$  and  $I = 0$  in (2), we get  $c = 0$

Hence (2) gives  $I = \frac{\pi}{2} \log(1+a)$

**Ans.**

**Example 56.** Evaluate  $\int_0^\infty \frac{e^{-x}}{x} \left( a - \frac{1}{x} + \frac{1}{x} e^{-ax} \right) dx$   
using the rule of differentiation under the sign of integration.

**Solution.** Let  $I = \int_0^\infty \frac{e^{-x}}{x} \left( a - \frac{1}{x} + \frac{1}{x} e^{-ax} \right) dx \quad \dots(1)$

$$\begin{aligned} \frac{dI}{da} &= \int_0^\infty \frac{\partial}{\partial a} \left[ \frac{e^{-x}}{x} \left( a - \frac{1}{x} + \frac{1}{x} e^{-2ax} \right) \right] dx = \int_0^\infty \frac{e^{-x}}{x} \left( 1 - 0 - \frac{x}{x} e^{-ax} \right) dx \\ &= \int_0^\infty \frac{e^{-x}}{x} (1 - e^{-ax}) dx \end{aligned} \quad \dots(2)$$

$$\begin{aligned} \frac{d^2I}{da^2} &= \int_0^\infty \frac{\partial}{\partial a} \left[ \frac{e^{-x}}{x} (1 - e^{-ax}) \right] dx = \int_0^\infty \frac{e^{-x}}{x} (xe^{-ax}) dx = \int_0^\infty e^{-(a+1)x} dx \\ &= \left[ \frac{e^{-(a+1)x}}{-(a+1)} \right]_0^\infty = \left[ 0 + \frac{1}{a+1} \right] = \frac{1}{a+1} \end{aligned} \quad \dots(3)$$

Integrating w.r.t.  $a$ , we have  $\frac{dI}{da} = \log(a+1) + c_1 \quad \dots(4)$

Putting  $a = 0$  in (2), we get  $\frac{dI}{da} = 0$

Putting  $a = 0$  and  $\frac{dI}{da} = 0$  in (4), we get  $c_1 = 0$

From (4),  $\frac{dI}{da} = \log(a+1)$

$$\begin{aligned} I &= \int \log(a+1) da = \log(a+1) \cdot a - \int \frac{a}{a+1} da = a \log(a+1) - \int \left( 1 - \frac{1}{a+1} \right) da \\ I &= a \log(a+1) - a + \log(a+1) + c_2 \\ I &= (a+1) \log(a+1) - a + c_2 \end{aligned} \quad \dots(5)$$

Putting  $a = 0$  in (1), we get  $I = 0$

Putting  $a = 0, I = 0$  in (5), we get

$$0 = c_2$$

Hence (5) gives

$$I = (a+1) \log(a+1) - a$$

**Ans.**

**Example 57.** Evaluate the integral

$$\int_0^\infty \frac{e^{-x} \sin bx}{x} dx$$

**Solution.** Let  $I = \int_0^\infty \frac{e^{-x} \sin bx}{x} dx \quad \dots(1)$

$$\frac{dI}{db} = \int_0^\infty \frac{\partial}{\partial b} \left( \frac{e^{-x} \sin bx}{x} \right) dx = \int_0^\infty \frac{e^{-x} \cdot x \cos bx}{x} dx = \int_0^\infty e^{-x} \cos bx dx$$

[We know that  $\int e^{ax} \cos bx dx = \frac{e^{ax}}{a^2 + b^2} (a \cos bx + b \sin bx)$ ]

$$= \left[ \frac{e^{-x}}{1+b^2} (-\cos bx + b \sin bx) \right]_0^\infty$$

$$\frac{dl}{db} = \frac{1}{1+b^2} \quad \dots(2)$$

Integrating both sides of (2) w.r.t. 'b', we have  $I = \tan^{-1} b + c$  ... (3)

On putting  $b = 0$  in (1), we have  $I = 0$

On putting  $b = 0$ ,  $I = 0$  in (3), we get  $c = 0$

Hence (3) gives

$$I = \tan^{-1} b$$

$$\text{or } \int_0^\infty \frac{e^{-x} \sin bx}{x} dx = \tan^{-1} b \quad \text{Ans.}$$

**Example 58.** Find the value of  $\int_0^\pi \frac{dx}{a+b \cos x}$  (when  $a > 0$ ,  $|b| < a$ )

$$\text{and deduce that } \int_0^\pi \frac{dx}{(a+b \cos x)^2} = \frac{\pi a}{(a^2 - b^2)^{3/2}}$$

$$\text{Solution. Let } I = \int_0^\pi \frac{dx}{a+b \cos x} = \int_0^\pi \frac{dx}{a \left( \cos^2 \frac{x}{2} + \sin^2 \frac{x}{2} \right) + b \left( \cos^2 \frac{x}{2} - \sin^2 \frac{x}{2} \right)}$$

$$\begin{aligned} &= \int_0^\pi \frac{dx}{(a+b) \cos^2 \frac{x}{2} + (a-b) \sin^2 \frac{x}{2}} = \frac{1}{a-b} \int_0^\infty \frac{\sec^2 \frac{x}{2}}{\frac{a+b}{a-b} + \tan^2 \frac{x}{2}} dx \\ &= \frac{2}{a-b} \frac{\sqrt{a-b}}{a+b} \left[ \tan^{-1} \left\{ \tan \frac{x}{2} \frac{\sqrt{a-b}}{a+b} \right\} \right]_0^\pi = \frac{2}{a-b} \frac{\sqrt{a-b}}{a+b} [\tan^{-1} \infty - \tan^{-1} 0] \end{aligned}$$

Now differentiating both sides w.r.t. 'a' we get

$$\begin{aligned} \frac{dI}{da} &= -\frac{1}{2} \frac{2\pi a}{(a^2 - b^2)^{3/2}} \quad \text{or } \int_0^\pi \frac{\partial}{\partial a} \left( \frac{1}{a+b \cos x} \right) dx = -\frac{1}{2} \frac{2\pi a}{(a^2 - b^2)^{3/2}} \\ \Rightarrow \quad &\int_0^\pi \frac{-1}{(a+b \cos x)^2} dx = \frac{-\pi a}{(a^2 - b^2)^{3/2}} \\ \Rightarrow \quad &\int_0^\pi \frac{1}{(a+b \cos x)^2} dx = \frac{\pi a}{(a^2 - b^2)^{3/2}} \quad \text{Ans.} \end{aligned}$$

### EXERCISE 38.6

**Prove that:**

$$1. \int_0^\infty \frac{1-e^{-ax}}{x} e^{-x} dx = \log(1+a) \quad 2. \int_0^\infty \frac{e^{-ax}-e^{-bx}}{x} dx = \log \frac{b}{a}$$

$$3. \int_0^\infty \frac{e^{-ax} \sin x}{x} dx = \cot^{-1} \alpha \text{ and hence deduce that } \int_0^\infty \frac{\sin x}{x} dx = \frac{\pi}{2}$$

$$4. \int_0^1 \frac{x^a - x^b}{\log x} dx = \log \frac{a+1}{b+1}$$

5.  $\int_0^\infty \frac{\cos \lambda x}{x} (e^{-ax} - e^{-bx}) dx = \frac{1}{2} \log \frac{b^2 + \lambda^2}{a^2 + \lambda^2}, (a > 0, b > 0)$

6.  $\int_0^\infty e^{-bx^2} \cos 2ax dx = \frac{1}{2} \frac{\sqrt{\pi}}{b} e^{-a^2/b} \quad (b > 0) \text{ Assume } \int_0^\infty e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$

**Evaluate the following.**

7.  $\int_0^{\frac{\pi}{2}} \log(\alpha^2 \cos^2 \theta + \beta^2 \sin^2 \theta) d\theta \quad (\alpha > 0, \beta > 0)$

**Ans.**  $\pi \log \frac{\alpha+\beta}{2}$

8.  $\int_0^\infty \frac{\log(1+a^2 x^2)}{1+b^2 x^2} dx$

**Ans.**  $\frac{\pi}{l} \log \frac{a+b}{b}$

9.  $\int_0^{\frac{\pi}{2}} \log \left( \frac{a+b \sin \theta}{a-b \sin \theta} \right) \frac{d\theta}{\sin \theta}$

**Ans.**  $\pi \sin^{-1} \frac{b}{a}$

10.  $\int_0^{\frac{\pi}{2}} \frac{\log(1+\cos \alpha \cdot \cos x)}{\cos x} dx$

**Ans.**  $\frac{1}{2} \left( \frac{\pi^2}{4} - \alpha^2 \right)$

**Prove that**

11.  $\int_0^{\frac{\pi}{2}} \frac{\log(1+y \sin^2 x)}{\sin^2 x} dx = \pi [\sqrt{(1+y)} - 1] \quad \text{When } y > 1.$

12.  $\int_0^{\frac{\pi}{2}} \frac{dx}{(a^2 + \sin^2 x + b^2 \cos^2 x)^2} = \frac{\pi(a^2 + b^2)}{4a^3 b^3}$

### 38.21 RULE OF DIFFERENTIATION UNDER THE INTEGRAL SIGN WHEN THE LIMITS OF INTEGRATION ARE FUNCTIONS OF THE PARAMETER

If  $f(x, \alpha)$ ,  $\frac{\partial f(x, \alpha)}{\partial \alpha}$  be continuous functions of  $x$  and  $\alpha$ , then

$$\frac{d}{d\alpha} \left\{ \int_{\phi(\alpha)}^{\psi(\alpha)} f(x, \alpha) dx \right\} = \int_{\phi(\alpha)}^{\psi(\alpha)} \frac{\partial f(x, \alpha)}{\partial \alpha} dx - \frac{d\phi}{d\alpha} f[\phi(\alpha), \alpha] + \frac{d\psi}{d\alpha} f[\psi(\alpha), \alpha]$$

**Example 59.** Verify the rule of differentiation under the sign of integration for  $\int_0^{a^2} \tan^{-1} \frac{x}{a} dx$

**Solution.** Let  $I = \int_0^{a^2} \tan^{-1} \frac{x}{a} dx$

$$\frac{d}{d\alpha} \left\{ \int_{\phi(\alpha)}^{\psi(\alpha)} f(x, \alpha) dx \right\} = \int_{\phi(\alpha)}^{\psi(\alpha)} \frac{\partial f(x, \alpha)}{\partial \alpha} dx - \frac{d\phi}{d\alpha} f[\phi(\alpha), \alpha] + \frac{d\psi}{d\alpha} f[\psi(\alpha), \alpha]$$

$$\frac{dI}{da} = \int_0^{a^2} \left[ \frac{\partial}{\partial \alpha} \left( \tan^{-1} \frac{x}{a} \right) \right] dx - 0 + 2a \left[ \tan^{-1} \frac{a^2}{a} \right]$$

$$= \int_0^{a^2} \frac{1}{1 + \frac{x^2}{a^2}} \left( -\frac{x^2}{a^2} \right) dx + 2a \tan^{-1} a = \int_0^{a^2} -\frac{x}{a^2 + x^2} dx + 2a \tan^{-1} a$$

$$= \left[ -\frac{1}{2} \log(a^2 + x^2) \right]_0^{a^2} + 2a \tan^{-1} a = -\frac{1}{2} \log(a^2 + a^4) + \frac{1}{2} \log a^2 + 2a \tan^{-1} a$$

$$= -\frac{1}{2} \log \frac{a^2 + a^4}{a^2} + 2a \tan^{-1} a = -\frac{1}{2} \log(a^2 + 1) + 2a \tan^{-1} a \quad \dots(1)$$

Now integration by parts

$$\begin{aligned}
 I &= \int_0^{a^2} \tan^{-1} \frac{x}{a} dx = \left[ \left( \tan^{-1} \frac{x}{a} \right) \cdot x \right]_0^{a^2} - \int_0^{a^2} \frac{1}{1 + \frac{x^2}{a^2}} \cdot \frac{1}{a} \cdot x dx \\
 &= \left[ a^2 \tan^{-1} \frac{a^2}{a} \right] - \int_0^{a^2} \frac{ax}{a^2 + x^2} dx = a^2 \tan^{-1} a - \frac{a}{2} [\log(x^2 + a^2)]_0^{a^2} \\
 &= a^2 \tan^{-1} a - \frac{a}{2} [\log(a^4 + a^2) - \log a^2] = a^2 \tan^{-1} a - \frac{a}{2} \log \frac{a^4 + a^2}{a^2} \\
 &= a^2 \tan^{-1} a - \frac{a}{2} \log(a^2 + 1) \\
 \frac{dI}{da} &= \left[ a^2 \frac{1}{1+a^2} + 2a \tan^{-1} a \right] - \left[ \frac{a}{2} \frac{2a}{a^2+1} + \frac{1}{2} \log(a^2+1) \right] \\
 &= \frac{a^2}{1+a^2} + 2a \tan^{-1} a - \frac{a^2}{a^2+1} - \frac{1}{2} \log(a^2+1) = 2a \tan^{-1} a - \frac{1}{2} \log(a^2+1) \quad \dots(2)
 \end{aligned}$$

From (1) and (2), the rule is verified.

**Example 60.** Evaluate  $\int_0^a \frac{\log(1+\alpha x)}{1+x^2} dx$  and hence show that

$$\int_0^1 \frac{\log(1+x)}{1+x^2} dx = \frac{\pi}{8} \log_e 2$$

**Solution.** Let  $I = \int_0^a \frac{\log(1+\alpha x)}{1+x^2} dx$  ... (1)

$$\begin{aligned}
 \left[ \frac{d}{d\alpha} \left\{ \int_{\phi(\alpha)}^{\psi(\alpha)} f(x, \alpha) dx \right\} \right] &= \int_{\phi(\alpha)}^{\psi(\alpha)} \frac{\partial f(x, \alpha)}{\partial \alpha} dx - \frac{d\phi}{d\alpha} f[\phi(\alpha), \alpha] + \frac{d\psi}{d\alpha} f[\psi(\alpha), \alpha] \\
 \frac{dI}{d\alpha} &= \int_0^a \frac{\partial}{\partial \alpha} \left\{ \frac{\log(1+\alpha x)}{1+x^2} \right\} dx + \frac{d\alpha}{d\alpha} f(\alpha, \alpha) = \int_0^a \frac{x}{(1+x^2)(1+\alpha x)} dx + \frac{\log(1+\alpha^2)}{1+\alpha^2}
 \end{aligned}$$

Converting into partial fractions,

$$\begin{aligned}
 &= -\frac{\alpha}{1+\alpha^2} \int_0^a \frac{dx}{1+\alpha x} + \frac{1}{2(1+\alpha^2)} \int_0^a \frac{2x}{1+x^2} dx + \frac{\alpha}{1+\alpha^2} \int_0^a \frac{dx}{1+x^2} + \frac{\log(1+\alpha^2)}{1+\alpha^2} \\
 &= -\frac{\alpha}{1+\alpha^2} \left[ \frac{1}{\alpha} \log(1+\alpha x) \right]_0^a + \frac{1}{2(1+\alpha^2)} [\log(1+x^2)]_0^a + \frac{\alpha}{1+\alpha^2} [\tan^{-1} x]_0^a + \frac{\log(1+\alpha^2)}{1+\alpha^2} \\
 &= -\frac{1}{1+\alpha^2} \log(1+\alpha^2) + \frac{\log(1+\alpha^2)}{2(1+\alpha^2)} + \frac{\alpha}{1+\alpha^2} \tan^{-1} \alpha + \frac{\log(1+\alpha^2)}{1+\alpha^2} \\
 &= \frac{\log(1+\alpha^2)}{2(1+\alpha^2)} + \frac{\alpha}{1+\alpha^2} \tan^{-1} \alpha
 \end{aligned}$$

On integrating both sides w.r.t.  $\alpha$ , we have

$$\begin{aligned}
 I &= \frac{1}{2} \int \log(1+\alpha^2) \cdot \frac{1}{1+\alpha^2} d\alpha + \int \frac{\alpha \tan^{-1} \alpha}{1+\alpha^2} d\alpha + C \\
 I &= \frac{1}{2} \log(1+\alpha^2) \cdot \tan^{-1} \alpha - \frac{1}{2} \int \frac{2\alpha}{1+\alpha^2} \cdot \tan^{-1} \alpha d\alpha + \int \frac{\alpha \tan^{-1} \alpha}{1+\alpha^2} d\alpha
 \end{aligned}$$

$$I = \frac{1}{2} \log(1+\alpha^2) \cdot \tan^{-1} \alpha + c \quad \dots (2)$$

From (1), when  $\alpha = 0$ , then  $I = 0$ . From (2), when  $\alpha = 0$ ,  $I = 0$ , then  $c = 0$

Hence (2) gives

$$I = \frac{1}{2} \log(1+\alpha^2) \cdot \tan^{-1} \alpha \quad \dots (3)$$

On putting  $\alpha = 1$  in (3), we have

$$\int_0^1 \frac{\log(1+x)}{1+x^2} dx = \frac{1}{2} \log(1+1) \cdot \tan^{-1}(1) = \frac{1}{2} (\log_e 2) \frac{\pi}{4} = \frac{\pi}{8} \log_e 2 \quad \text{Ans.}$$

**Example 61.** Evaluate  $\int_{\frac{\pi}{6a}}^{\frac{\pi}{2a}} \frac{\sin ax}{x} dx$

**Solution.** Let  $I = \int_{\frac{\pi}{6a}}^{\frac{\pi}{2a}} \frac{\sin ax}{x} dx \quad \dots (1)$

$$\left[ \frac{d}{d\alpha} \left\{ \int_{\phi(\alpha)}^{\psi(\alpha)} f(x, \alpha) dx \right\} \right] = \int_{\phi(\alpha)}^{\psi(\alpha)} \frac{\partial f(x, \alpha)}{\partial \alpha} dx - \frac{d\phi}{d\alpha} f[\phi(\alpha), \alpha] + \frac{d\psi}{d\alpha} f[\psi(\alpha), \alpha]$$

$$\frac{dl}{da} = \int_{\frac{\pi}{6a}}^{\frac{\pi}{2a}} \frac{\partial}{\partial a} \left( \frac{\sin ax}{x} \right) dx - \frac{d}{da} \left( \frac{\pi}{6a} \right) \left[ \frac{\sin a \cdot \frac{\pi}{6a}}{\frac{\pi}{6a}} \right] + \frac{d}{da} \left( \frac{\pi}{2a} \right) \left[ \frac{\sin a \cdot \frac{\pi}{2a}}{\frac{\pi}{2a}} \right]$$

$$= \int_{\frac{\pi}{6a}}^{\frac{\pi}{2a}} \frac{x \cos ax}{x} dx + \frac{\pi}{6a^2} \frac{6a}{\pi} \sin \frac{\pi}{6} - \frac{\pi}{2a^2} \frac{2a}{\pi} \sin \frac{\pi}{2}$$

$$= \int_{\frac{\pi}{6a}}^{\frac{\pi}{2a}} \cos ax dx + \frac{1}{2a} - \frac{1}{a} = \left[ \frac{\sin ax}{a} \right]_{\frac{\pi}{6a}}^{\frac{\pi}{2a}} - \frac{1}{2a}$$

$$= \frac{1}{a} \left[ \sin a \frac{\pi}{2a} - \sin a \frac{\pi}{6a} \right] - \frac{1}{2a}$$

$$= \frac{1}{a} \left[ \sin \frac{\pi}{2} - \sin \frac{\pi}{6} \right] - \frac{1}{2a} = \frac{1}{a} \left[ 1 - \frac{1}{2} \right] - \frac{1}{2a} = \frac{1}{2a} - \frac{1}{2a} = 0$$

Integrating we have  $I = \text{Constant}$

**Ans.**

**Example 62.** If  $y = \int_0^x f(t) \sin [k(x-t)] dt$ , prove that  $y$  satisfies the differential equation

$$\frac{d^2y}{dx^2} + k^2 y = k f(x)$$

**Solution.**

$$y = \int_0^x f(t) \sin [k(x-t)] dt$$

$$\frac{dy}{dx} = \int_0^x \frac{\partial}{\partial x} [f(t) \sin \{k(x-t)\}] dt - 0 \frac{d}{dx}(x) \cdot f(x) \sin \{k(x-x)\}$$

$$= \int_0^x f(t) k \cos \{k(x-t)\} \cdot dt = k \int_0^x f(t) \cos \{k(x-t)\} dt$$

Again applying the same rule

$$\begin{aligned} \frac{d^2y}{dx^2} &= k \left[ \int_0^x \frac{\partial}{\partial x} \{f(t) \cos k(x-t)\} dt - 0 + \frac{d}{dx}(x) \cdot f(x) \cos k(x-x) \right] \\ &= -k^2 \int_0^x f(t) \sin [k(x-t)] dt + k f(x) = -k^2 y + k f(x) \\ \Rightarrow \quad \frac{d^2y}{dx^2} + k^2 y &= k f(x) \end{aligned}$$

**Proved.**

**Example 63.** Using differentiation under integral sign, evaluate  $\int_0^1 \frac{x^\alpha - 1}{\log x} dx, \alpha \geq 0$

(AMIETE, June 2010)

**Solution.** Here, we have

$$\begin{aligned} I &= \int_0^1 \frac{x^\alpha - 1}{\log x} dx \quad \dots (1) \\ \left[ \frac{d}{d\alpha} \left\{ \int_{\phi(\alpha)}^{\psi(\alpha)} f(x, \alpha) dx \right\} \right] &= \int_{\phi(\alpha)}^{\psi(\alpha)} \frac{\partial f(x, \alpha)}{\partial \alpha} dx - \frac{d\phi}{d\alpha} f[\phi(\alpha), \alpha] + \frac{d\psi}{d\alpha} f[\psi(\alpha), \alpha] \\ \frac{dI}{d\alpha} &= \int_0^1 \frac{\partial}{\partial \alpha} \left( \frac{x^\alpha - 1}{\log x} \right) dx - \frac{d(0)}{d(\alpha)} f(0, \alpha) + \frac{d(1)}{d\alpha} f(1, \alpha) \\ &= \int_0^1 \frac{x^\alpha \log x}{\log x} dx - 0 + 0 = \int_0^1 x^\alpha dx \\ &= \left[ \frac{x^{\alpha+1}}{\alpha+1} \right]_0^1 = \frac{1}{\alpha+1} \end{aligned}$$

$$\frac{dI}{d\alpha} = \frac{1}{\alpha+1}$$

Now, integrating both sides w.r.t.  $\alpha$ , we get

$$I = \int \frac{d\alpha}{\alpha+1} = \log(\alpha+1) + C \quad \dots (2)$$

From (1), when  $\alpha = 0$ , then  $I = 0$

Putting  $\alpha = 0$  and  $I = 0$  in (2), we get  $C = 0$

Hence (2) becomes  $I = \log(\alpha+1)$

**Ans.**

# CHAPTER 39

## INFINITE SERIES

---

### 39.1 SEQUENCE

A *sequence* is a succession of numbers or terms formed according to some definite rule. The  $n$ th term in a sequence is denoted by  $u_n$ .

For example, if  $u_n = 2n + 1$ .

By giving different values of  $n$  in  $u_n$ , we get different terms of the sequence.

Thus,  $u_1 = 3$ ,  $u_2 = 5$ ,  $u_3 = 7$ , ...

A sequence having unlimited number of terms is known as an *infinite sequence*.

### 39.2 LIMIT

If a sequence tends to a limit  $l$ , then we write  $\lim_{n \rightarrow \infty} (u_n) = l$

### 39.3 CONVERGENT SEQUENCE

If the limit of a sequence is finite, the sequence is *convergent*. If the limit of a sequence does not tend to a finite number, the sequence is said to be *divergent*.

e.g.,  $1, \frac{1}{4}, \frac{1}{9}, \frac{1}{16}, \dots, \frac{1}{n^2} + \dots$  is a convergent sequence.

$3, 5, 7, \dots, (2n + 1), \dots$  is a divergent sequence.

### 39.4 BOUNDED SEQUENCE

$u_1, u_2, u_3, \dots, u_n, \dots$  is a bounded sequence if  $u_n < k$  for every  $n$ .

### 39.5 MONOTONIC SEQUENCE

The sequence is either increasing or decreasing, such sequences are called *monotonic*.

e.g.,  $1, 4, 7, 10, \dots$  is a monotonic sequence.

$1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots$  is also a monotonic sequence.

$1, -1, 1, -1, 1, \dots$  is not a monotonic sequence.

A sequence which is monotonic and bounded is a convergent sequence.

### EXERCISE 39.1

Determine the general term of each of the following sequence. Prove that the following sequences are convergent.

1.  $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \dots$       Ans.  $\frac{1}{2^n}$

2.  $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \dots$       Ans.  $\frac{n}{n+1}$

3.  $1, -1, 1, -1, \dots$       Ans.  $(-1)^{n-1}$

4.  $\frac{1^2}{1!}, \frac{2^2}{2!}, \frac{3^2}{3!}, \frac{4^2}{4!}, \frac{5^2}{5!}, \dots$       Ans.  $\frac{n^2}{n!}$

Which of the following sequences are convergent ?

$$5. \ u_n = \frac{n+1}{n}$$

**Ans.** Convergent

$$6. \ u_n = 3n$$

**Ans.** Divergent

$$7. \ u_n = n^2$$

**Ans.** Divergent

$$8. \ u_n = \frac{1}{n}$$

**Ans.** Convergent

### 39.6 REMEMBER THE FOLLOWING LIMITS

$$(i) \ \lim_{n \rightarrow \infty} x^n = 0 \text{ if } x < 1 \text{ and } \lim_{n \rightarrow \infty} x^n = \infty \text{ if } x > 1$$

$$(ii) \ \lim_{n \rightarrow \infty} \frac{x^n}{n!} = 0 \text{ for all values of } x \quad (iii) \ \lim_{n \rightarrow \infty} \frac{\log n}{n} = 0$$

$$(iv) \ \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = e$$

$$(v) \ \lim_{n \rightarrow \infty} (n)^{1/n} = 1$$

$$(vi) \ \lim_{n \rightarrow \infty} [n!]^{1/n} = \infty$$

$$(vii) \ \lim_{n \rightarrow \infty} \left[ \frac{(n!)^{1/n}}{n} \right] = \frac{1}{e}$$

$$(viii) \ \lim_{n \rightarrow \infty} n x^n = 0 \text{ if } x < 1$$

$$(ix) \ \lim_{n \rightarrow \infty} n^h = \infty$$

$$(x) \ \lim_{n \rightarrow \infty} \frac{1}{n^h} = 0$$

$$(xi) \ \lim_{x \rightarrow \infty} \left[ \frac{a^x - 1}{x} \right] = \log a \text{ or } \lim_{n \rightarrow \infty} \frac{a^{1/n} - 1}{1/n} = \log a$$

$$(xii) \ \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

$$(xiii) \ \lim_{x \rightarrow 0} \frac{\tan x}{x} = 1$$

### 39.7 SERIES

A *series* is the sum of a sequence.

Let  $u_1, u_2, u_3, \dots, u_n, \dots$  be a given sequence. Then, the expression

$u_1 + u_2 + u_3 + \dots + u_n + \dots$  is called the series associated with the given sequence.  
For example,  $1 + 3 + 5 + 7 + \dots$  is a series.

If the number of terms of a series is limited, the series is called *finite*. When the number of terms of a series are unlimited, it is called an *infinite series*.

$$u_1 + u_2 + u_3 + u_4 + \dots + u_n + \dots \infty$$

is called an infinite series and it is denoted by  $\sum_{n=1}^{\infty} u_n$  or  $\Sigma u_n$ . The sum of the first  $n$  terms of a series is denoted by  $S_n$ .

### 39.8 CONVERGENT, DIVERGENT AND OSCILLATORY SERIES

Consider the infinite series  $\Sigma u_n = u_1 + u_2 + u_3 + \dots + u_n + \dots \infty$

$$S_n = u_1 + u_2 + u_3 + \dots + u_n$$

Three cases arise:

(i) If  $S_n$  tends to a finite number as  $n \rightarrow \infty$ , the series  $\Sigma u_n$  is said to be *convergent*.

(ii) If  $S_n$  tends to infinity as  $n \rightarrow \infty$ , the series  $\Sigma u_n$  is said to be *divergent*.

(iii) If  $S_n$  does not tend to a unique limit, finite or infinite, the series  $\Sigma u_n$  is called *oscillatory*.

### 39.9 PROPERTIES OF INFINITE SERIES

1. The nature of an infinite series does not change:

- (i) by multiplication of all terms by a constant  $k$ .
- (ii) by addition or deletion of a finite number of terms.

2. If two series  $\sum u_n$  and  $\sum v_n$  are convergent, then  $\sum (u_n + v_n)$  is also convergent.

**Example 1.** Examine the nature of the series  $1 + 2 + 3 + 4 + \dots + n + \dots \infty$ .

**Solution.** Let  $S_n = 1 + 2 + 3 + 4 + \dots + n = \frac{n(n+1)}{2}$  [Series in A.P.]

$$\text{Since } \lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{n(n+1)}{2} \Rightarrow \infty$$

Hence, this series is divergent.

**Ans.**

**Example 2.** Test the convergence of the series  $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots \infty$

**Solution.** Let  $S_n = 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots \infty$  [Series in G.P.]  
 $= \frac{1}{1 - \frac{1}{2}} = 2 \quad \left( S_n = \frac{a}{1 - r} \right)$

$$\lim_{n \rightarrow \infty} S_n = 2$$

Hence, the series is convergent.

**Ans.**

**Example 3.** Prove that the following series:

$\frac{2}{3!} + \frac{3}{4!} + \frac{4}{5!} + \dots$  is convergent and find its sum. (M.U. 2008)

**Solution.** Here,  $u_n = \frac{n+1}{(n+2)!} = \frac{n+2-1}{(n+2)!} = \frac{n+2}{(n+2)!} - \frac{1}{(n+2)!}$   
 $= \frac{1}{(n+1)!} - \frac{1}{(n+2)!}$

$$\begin{aligned} S_n &= \left( \frac{1}{2!} - \frac{1}{3!} \right) + \left( \frac{1}{3!} - \frac{1}{4!} \right) + \left( \frac{1}{4!} - \frac{1}{5!} \right) + \dots \\ &\quad + \left( \frac{1}{(n+1)!} - \frac{1}{(n+2)!} \right) = \frac{1}{2!} - \frac{1}{(n+2)!} \end{aligned}$$

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left[ \frac{1}{2!} - \frac{1}{(n+2)!} \right] = \frac{1}{2}$$

$\therefore \sum u_n$  converges and its limit is  $\frac{1}{2}$ .

**Ans.**

**Example 4.** Discuss the nature of the series  $2 - 2 + 2 - 2 + 2 - \dots \infty$ .

**Solution.** Let  $S_n = 2 - 2 + 2 - 2 + 2 - \dots \infty$   
 $= 0 \text{ if } n \text{ is even}$   
 $= 2 \text{ if } n \text{ is odd.}$

Hence,  $S_n$  does not tend to a unique limit, and, therefore, the given series is oscillatory.

**Ans.**

**EXERCISE 39.2**

**Discuss the nature of the following series:**

- |  |                        |   |                         |
|--|------------------------|---|-------------------------|
| 1. $1 + 4 + 7 + 10 + \dots \infty$                               | <b>Ans.</b> Divergent  | 2. $1 + \frac{5}{4} + \frac{6}{4} + \frac{7}{4} + \dots \infty$   | <b>Ans.</b> Divergent   |
| 3. $6 - 5 - 1 + 6 - 5 - 1 + 6 - 5 - 1 + \dots \infty$            |                        |   | <b>Ans.</b> Oscillatory |
| 4. $3 + \frac{3}{2} + \frac{3}{2^2} + \dots \infty$              | <b>Ans.</b> Convergent | 5. $1^2 + 2^2 + 3^2 + 4^2 + \dots \infty$                         | <b>Ans.</b> Divergent   |
| 6. $1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \dots \infty$  | <b>Ans.</b> Convergent | 7. $\frac{1}{1.3} + \frac{1}{3.5} + \frac{1}{5.7} + \dots \infty$ | <b>Ans.</b> Convergent  |
| 8. $\frac{1}{2!} + \frac{2}{3!} + \frac{3}{4!} + \dots \infty$   | <b>Ans.</b> Convergent |   |                         |
| 9. $\log 3 + \log \frac{4}{3} + \log \frac{5}{4} + \dots \infty$ |                        |   | <b>Ans.</b> Divergent   |
| 10. $\sum \log \frac{n}{n+1}$                                    | <b>Ans.</b> Divergent  | 11. $\sum (\sqrt{n+1} - \sqrt{n})$                                | <b>Ans.</b> Divergent   |
| 12. $\sum \frac{1}{n(n+2)}$                                      | <b>Ans.</b> Convergent | 13. $\sum \frac{1}{n(n+1)(n+2)(n+3)}$                             | <b>Ans.</b> Convergent  |
| 14. $\sum \frac{n}{(n+1)(n+2)(n+3)}$                             | <b>Ans.</b> Convergent | 15. $\sum \frac{2n+1}{n^2(n+1)^2}$                                | <b>Ans.</b> Convergent  |

**39.10 PROPERTIES OF GEOMETRIC SERIES**

The series  $1 + r + r^2 + r^3 + \dots \infty$  is

(i) convergent if  $|r| < 1$       (ii) divergent if  $r \geq 1$       (iii) oscillatory if  $r \leq -1$ .

**Proof.**

$$S_n = 1 + r + r^2 + \dots + r^{n-1} = \frac{1 - r^n}{1 - r}$$

(i) When  $|r| < 1$ ,

$$\lim_{n \rightarrow \infty} r^n = 0$$

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{1 - r^n}{1 - r} = \frac{1 - 0}{1 - r} = \frac{1}{1 - r}$$

Hence, the series is convergent.

(ii) (a) When  $r > 1$ ,

$$\lim_{n \rightarrow \infty} r^n = \infty \quad \therefore \quad \lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{r^n - 1}{r - 1} \Rightarrow \infty$$

Hence, the series is divergent.

(b) When  $r = 1$ , the series becomes  $1 + 1 + 1 + 1 + \dots \infty$

$$S_n = 1 + 1 + 1 + 1 + \dots = n$$

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} n = \infty$$

Hence, the series is divergent.

(iii) (a) When  $r = -1$ , the series becomes  $1 - 1 + 1 - 1 + 1 - \dots \infty$

$$\begin{aligned} S_n &= 0 \text{ if } n \text{ is even} \\ &= 1 \text{ if } n \text{ is odd} \end{aligned}$$

Hence, the series is oscillatory.

(b) When  $r < -1$ , let  $r = -k$  where  $k > 1$ .

$$r^n = (-k)^n = (-1)^n k^n$$

$$\begin{aligned}\lim_{n \rightarrow \infty} S_n &= \lim_{n \rightarrow \infty} \frac{1 - r^n}{1 - r} = \lim_{n \rightarrow \infty} \frac{1 - (-1)^n k^n}{1 - (-k)} \\ &= +\infty \text{ if } n \text{ is odd} \\ &= -\infty \text{ if } n \text{ is even}\end{aligned}$$

Hence, the series is oscillatory.

**Proved.**

### EXERCISE 39.3

Test the nature of the following series :

1.  $1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots \infty$  **Ans.** Convergent
2.  $1 + \frac{3}{4} + \frac{9}{16} + \frac{27}{64} + \dots \infty$  **Ans.** Convergent
3.  $1 - \frac{1}{3} + \frac{1}{9} - \frac{1}{27} + \dots \infty$  **Ans.** Convergent
4.  $1 - 2 + 4 - 8 + \dots \infty$  **Ans.** Oscillatory
5.  $2 + 3 + \frac{9}{2} + \frac{27}{4} + \dots \infty$  **Ans.** Divergent
6.  $1 + \frac{4}{3} + \left(\frac{4}{3}\right)^2 + \left(\frac{4}{3}\right)^3 + \dots \infty$  **Ans.** Divergent

7. State, which one of the alternatives in the following is correct:

The series  $1 - 1 + 1 - 1 + \dots$  is

(i) Convergent with its sum equal to 0. (ii) Convergent with its sum equal to 1.

(iii) Divergent. (iv) Oscillatory. **Ans.** Oscillatory series

### 39.11 POSITIVE TERM SERIES

If all terms after few negative terms in an infinite series are positive, such a series is a positive term series.

e.g.,  $-10 - 6 - 1 + 5 + 12 + 20 + \dots$  is a positive term series.

By omitting the negative terms, the nature of a positive term series remains unchanged.

### 39.12 NECESSARY CONDITIONS FOR CONVERGENT SERIES

For every convergent series  $\sum u_n$ ,

$$\lim_{n \rightarrow \infty} u_n = 0$$

**Solution.** Let  $S_n = u_1 + u_2 + u_3 + \dots + u_n$  (a finite quantity)

$$\lim_{n \rightarrow \infty} S_n = k \quad (\text{a finite quantity})$$

Also  $\lim_{n \rightarrow \infty} S_{n-1} = k \quad (\text{a finite quantity})$

$$S_n = S_{n-1} + u_n$$

$$u_n = S_n - S_{n-1}$$

$$\lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} [S_n - S_{n-1}] = 0$$

$$\lim_{n \rightarrow \infty} u_n = 0$$

**Corollary.** Converse of the above theorem is not true.

e.g.,  $1 + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} + \dots + \frac{1}{\sqrt{n}} + \dots \infty$  is divergent.

$$\begin{aligned}S_n &= 1 + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} + \dots + \frac{1}{\sqrt{n}} \\ &> \frac{1}{\sqrt{n}} + \frac{1}{\sqrt{n}} + \frac{1}{\sqrt{n}} + \frac{1}{\sqrt{n}} + \dots + \frac{1}{\sqrt{n}}\end{aligned}$$

$$> \frac{n}{\sqrt{n}} > \sqrt{n}$$

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \sqrt{n} = \infty$$

Thus, the series is divergent, although  $\lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n}} = 0$

So  $\lim_{n \rightarrow \infty} u_n = 0$  is a necessary condition but not a sufficient condition for convergence.

**Note: 1. Test for divergence**

If  $\lim_{n \rightarrow \infty} u_n \neq 0$ , the series  $\sum u_n$  must be divergent.

**2. To determine the nature of a series we have to find  $S_n$ . Since it is not possible to find  $S_n$  for every series, we have to device tests for convergence without involving  $S_n$ .**

### 39.13 CAUCHY'S FUNDAMENTAL TEST FOR DIVERGENCE

If  $\lim_{n \rightarrow \infty} u_n \neq 0$ , the series is divergent.

**Example 5.** Test for convergence of the series  $1 + \frac{2}{3} + \frac{3}{4} + \frac{4}{5} + \dots + \frac{n}{n+1} + \dots \infty$

**Solution.** Here,  $\lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} \frac{n}{n+1} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n}} = 1 \neq 0$

Hence, by **Cauchy's Fundamental Test** for divergence, the series is divergent. Ans.

**Example 6.** Test for convergence the series  $1 + \frac{3}{5} + \frac{8}{10} + \frac{15}{17} + \dots + \frac{2^n - 1}{2^n + 1} + \dots \infty$

**Solution.** Here,  $\lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} \frac{2^n - 1}{2^n + 1} = \lim_{n \rightarrow \infty} \frac{1 - \frac{1}{2^n}}{1 + \frac{1}{2^n}} = 1 \neq 0$

Hence, by **Cauchy's Fundamental Test** for divergence the series is divergent. Ans.

**Example 7.** Test the convergence of the following series:

$$\sqrt{\frac{1}{4}} + \sqrt{\frac{2}{6}} + \sqrt{\frac{3}{8}} + \dots + \sqrt{\frac{n}{2(n+1)}} + \dots \quad (M.D.U., 2000)$$

**Solution.** Here, we have

$$u_n = \sqrt{\frac{n}{2(n+1)}} = \sqrt{\frac{1}{2\left(1 + \frac{1}{n}\right)}}$$

$$\lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} \sqrt{\frac{1}{2\left(1 + \frac{1}{n}\right)}} = \frac{1}{\sqrt{2}} \neq 0$$

$\Rightarrow \sum u_n$  does not converge.

The given series is a series of + ve terms,

Hence by Cauchy fundamental test for divergence, the series is divergent.

Ans.

## EXERCISE 39.4

Examine for convergence:

1.  $\frac{1}{\sqrt{2}} + \frac{2}{\sqrt{5}} + \frac{4}{\sqrt{17}} + \dots + \frac{2^n}{\sqrt{4^n + 1}} + \dots \infty$  Ans. Divergent
2.  $\sum_{n=1}^{\infty} \frac{n}{n+1}$  Ans. Divergent
3.  $\sum_{n=1}^{\infty} \sqrt{\frac{n}{n+1}}$  Ans. Divergent
4.  $\sum \cos \frac{1}{n}$  Ans. Divergent
5.  $1 + \frac{1}{2} + 2 + \frac{1}{3} + 3 + \frac{1}{4} + 4 + \dots$  Ans. Divergent
6.  $\Sigma (6 - n^2)$  Ans. Divergent
7.  $\Sigma (-2^n)$  Ans. Divergent
8.  $\Sigma 3^{n+1}$  Ans. Divergent

## 39.14 p-SERIES

The series  $\frac{1}{1^p} + \frac{1}{2^p} + \frac{1}{3^p} + \dots \infty$  is (i) convergent if  $p > 1$  (ii) Divergent if  $p \leq 1$ .  
(MDU, Dec. 2010)

**Solution. Case 1: ( $p > 1$ )**

The given series can be grouped as

$$\begin{aligned} \frac{1}{1^p} + \left( \frac{1}{2^p} + \frac{1}{3^p} \right) + \left( \frac{1}{4^p} + \frac{1}{5^p} + \frac{1}{6^p} + \frac{1}{7^p} \right) + \\ \left( \frac{1}{8^p} + \frac{1}{9^p} + \frac{1}{10^p} + \frac{1}{11^p} + \frac{1}{12^p} + \frac{1}{13^p} + \frac{1}{14^p} + \frac{1}{15^p} \right) + \dots \end{aligned}$$

Now

$$\frac{1}{1^p} = 1 \quad \dots(1)$$

$$\frac{1}{2^p} + \frac{1}{3^p} < \frac{1}{2^p} + \frac{1}{2^p} = \frac{2}{2^p} \quad \dots(2)$$

$$\frac{1}{4^p} + \frac{1}{5^p} + \frac{1}{6^p} + \frac{1}{7^p} < \frac{1}{4^p} + \frac{1}{4^p} + \frac{1}{4^p} + \frac{1}{4^p} = \frac{4}{4^p} \quad \dots(3)$$

$$\frac{1}{8^p} + \frac{1}{9^p} + \dots + \frac{1}{15^p} < \frac{1}{8^p} + \frac{1}{8^p} + \dots + \frac{1}{8^p} = \frac{8}{8^p} \quad \dots(4)$$

On adding (1), (2), (3) and (4), we get:

$$\begin{aligned} \frac{1}{1^p} + \left( \frac{1}{2^p} + \frac{1}{3^p} \right) + \left( \frac{1}{4^p} + \frac{1}{5^p} + \frac{1}{6^p} + \frac{1}{7^p} \right) + \left( \frac{1}{8^p} + \frac{1}{9^p} + \dots + \frac{1}{15^p} \right) + \dots \\ < \frac{1}{1^p} + \frac{2}{2^p} + \frac{4}{4^p} + \frac{8}{8^p} + \dots \\ < 1 + \left( \frac{1}{2} \right)^{p-1} + \left( \frac{1}{2} \right)^{2p-2} + \left( \frac{1}{2} \right)^{3p-3} + \dots \\ < \frac{1}{1 - \left( \frac{1}{2} \right)^{p-1}} \quad \left[ \text{G.P., } r = \left( \frac{1}{2} \right)^{p-1}, S = \frac{1}{1-r} \right] \\ < \text{Finite number if } p > 1 \end{aligned}$$

Hence, the given series is convergent when  $p > 1$ .

**Case 2:  $p = 1$**

When  $p = 1$ , the given series becomes

$$1 + \frac{1}{2} + \left( \frac{1}{3} + \frac{1}{4} \right) + \left( \frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8} \right) + \left( \frac{1}{9} + \frac{1}{10} + \dots + \frac{1}{16} \right) + \dots$$

$$1 + \frac{1}{2} = 1 + \frac{1}{2} \quad \dots(1)$$

$$\frac{1}{3} + \frac{1}{4} > \frac{1}{4} + \frac{1}{4} = \frac{1}{2} \quad \dots(2)$$

$$\frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8} > \frac{1}{8} + \frac{1}{8} + \frac{1}{8} + \frac{1}{8} = \frac{4}{8} = \frac{1}{2} \quad \dots(3)$$

$$\frac{1}{9} + \frac{1}{10} + \dots + \frac{1}{16} > \frac{1}{16} + \frac{1}{16} + \dots + \frac{1}{16} = \frac{8}{16} = \frac{1}{2} \quad \dots(4)$$

On adding (1), (2), (3) and (4), we get

$$\begin{aligned} 1 + \frac{1}{2} + \left( \frac{1}{3} + \frac{1}{4} \right) + \left( \frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8} \right) + \left( \frac{1}{9} + \frac{1}{10} + \dots + \frac{1}{16} \right) + \dots \\ > 1 + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \dots \\ > 1 + \frac{n}{2} \quad (n \rightarrow \infty) \\ > \infty \end{aligned}$$

Hence, the given series is divergent when  $p = 1$ .

**Case 3:  $p < 1$**

$$\frac{1}{2^p} > \frac{1}{2}, \quad \frac{1}{3^p} > \frac{1}{3}, \quad \frac{1}{4^p} > \frac{1}{4} \text{ and so on}$$

$$\begin{aligned} \text{Therefore, } \frac{1}{1^p} + \frac{1}{2^p} + \frac{1}{3^p} + \frac{1}{4^p} + \dots &> 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots \\ &> \text{divergent series } (p = 1) \quad [\text{From Case 2}] \end{aligned}$$

$$\left[ \text{As the series on R.H.S. } \left( 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots \right) \text{ is divergent} \right]$$

Hence, the given series is divergent when  $p < 1$ .

### 39.15 COMPARISON TEST

If two positive terms  $\sum u_n$  and  $\sum v_n$  be such that

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = k \text{ (finite number), then both series converge or diverge together.}$$

**Proof.** By definition of limit there exists a positive number  $\epsilon$ , however small, such that

$$\left| \frac{u_n}{v_n} - k \right| < \epsilon \text{ for } n > m \quad i.e., -\epsilon < \frac{u_n}{v_n} - k < +\epsilon$$

$$k - \epsilon < \frac{u_n}{v_n} < k + \epsilon \text{ for } n > m$$

Ignoring the first  $m$  terms of both series, we have

$$k - \varepsilon < \frac{u_n}{v_n} < k + \varepsilon \text{ for all } n. \quad \dots(1)$$

**Case 1.**  $\Sigma v_n$  is convergent, then

$$\lim_{n \rightarrow \infty} (v_1 + v_2 + \dots + v_n) = h \text{ (say)} \quad \text{where } h \text{ is a finite number.}$$

From (1),  $u_n < (k + \varepsilon) v_n$  for all  $n$ .

$$\lim_{n \rightarrow \infty} (u_1 + u_2 + \dots + u_n) < (k + \varepsilon) \lim_{n \rightarrow \infty} (v_1 + v_2 + \dots + v_n) = (k + \varepsilon)h$$

Hence,  $\Sigma u_n$  is also convergent.

**Case 2.**  $\Sigma v_n$  is divergent, then

$$\lim_{n \rightarrow \infty} (v_1 + v_2 + \dots + v_n) \rightarrow \infty \quad \dots(2)$$

Now from (1)

$$k - \varepsilon < \frac{u_n}{v_n}$$

$$u_n > (k - \varepsilon)v_n \text{ for all } n$$

$$\lim_{n \rightarrow \infty} (u_1 + u_2 + \dots + u_n) > (k - \varepsilon) \lim_{n \rightarrow \infty} (v_1 + v_2 + \dots + v_n)$$

From (2),  $\lim_{n \rightarrow \infty} (u_1 + u_2 + \dots + u_n) \rightarrow \infty$

Hence,  $\Sigma u_n$  is also divergent.

**Note.** For testing the convergence of a series, this Comparison Test is very useful. We choose  $\Sigma v_n$  ( $p$ -series) in such a way that

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \text{finite number.}$$

Then the nature of both the series is the same. The nature of  $\Sigma v_n$  ( $p$ -series) is already known, so the nature of  $\Sigma u_n$  is also known.

**Example 8.** Test the series  $\sum_{n=1}^{\infty} \frac{1}{n+10}$  for convergence or divergence.

**Solution.** Here,  $u_n = \frac{1}{n+10}$

Let  $v_n = \frac{1}{n}$

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \lim_{n \rightarrow \infty} \frac{n}{n+10} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{10}{n}} = 1 = \text{finite number.}$$

According to Comparison Test both series converge or diverge together, but  $\Sigma v_n$  is divergent as  $p = 1$ .

$\therefore \Sigma u_n$  is also divergent.

**Ans.**

**Example 9.** Test the convergence of the following series:

$$\frac{1}{\sqrt{1} + \sqrt{2}} + \frac{1}{\sqrt{2} + \sqrt{3}} + \frac{1}{\sqrt{3} + \sqrt{4}} + \dots \quad (\text{M.D.U., 2000})$$

**Solution.** Here, we have

$$\frac{1}{\sqrt{1} + \sqrt{2}} + \frac{1}{\sqrt{2} + \sqrt{3}} + \frac{1}{\sqrt{3} + \sqrt{4}} + \dots$$

$$u_n = \frac{1}{\sqrt{n} + \sqrt{n+1}} = \frac{1}{\sqrt{n} \left[ 1 + \sqrt{1 + \frac{1}{n}} \right]}$$

Let us compare  $\sum u_n$  with  $\sum v_n$ , where

$$\begin{aligned} v_n &= \frac{1}{\sqrt{n}} \\ \frac{u_n}{v_n} &= \frac{1}{\sqrt{n} \left[ 1 + \sqrt{1 + \frac{1}{n}} \right]} \cdot \frac{\sqrt{n}}{1} = \frac{1}{1 + \sqrt{1 + \frac{1}{n}}} \\ \lim_{n \rightarrow \infty} \frac{u_n}{v_n} &= \lim_{n \rightarrow \infty} \frac{1}{1 + \sqrt{1 + \frac{1}{n}}} = \frac{1}{1+1} = \frac{1}{2} \end{aligned}$$

Which is finite and non-zero.

$\therefore \sum u_n$  and  $\sum v_n$ , converge or diverge together since  $\sum v_n = \sum \frac{1}{n^{\frac{1}{2}}}$  is of the form  $\sum \frac{1}{n^p}$ .

$$P = \frac{1}{2} < 1$$

$\therefore \sum v_n$  is divergent  $\Rightarrow \sum u_n$  is also divergent.

**Ans.**

**Example 10.** Examine the convergence of the series:

$$\sum (\sqrt[3]{n^3 + 1} - n) \quad (M.D.U. 2003)$$

**Solution.** Here, we have  $\sum (\sqrt[3]{n^3 + 1} - n)$

$$\begin{aligned} u_n &= (n^3 + 1)^{\frac{1}{3}} - n = \left[ n^3 \left( 1 + \frac{1}{n^3} \right) \right]^{\frac{1}{3}} - n \\ &= n \left[ \left( 1 + \frac{1}{n^3} \right)^{\frac{1}{3}} - 1 \right] = n \left[ 1 + \frac{1}{3} \cdot \frac{1}{n^3} + \frac{\frac{1}{3} \left( \frac{1}{3} - 1 \right)}{2!} \left( \frac{1}{n^3} \right)^2 + \dots - 1 \right] \\ &= \frac{n}{n^3} \left[ \frac{1}{3} - \frac{1}{9} \cdot \frac{1}{n^3} \dots \right] = \frac{1}{n^2} \left[ \frac{1}{3} - \frac{1}{9} \cdot \frac{1}{n^3} \dots \right] \end{aligned}$$

Let

$$v_n = \frac{1}{n^2}$$

$$\frac{u_n}{v_n} = \frac{1}{n^2} \left[ \frac{1}{3} - \frac{1}{9} \cdot \frac{1}{n^3} \dots \right] \cdot \frac{n^2}{1} = \left[ \frac{1}{3} - \frac{1}{9} \cdot \frac{1}{n^3} \dots \right]$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \lim_{n \rightarrow \infty} \left( \frac{1}{3} - \frac{1}{9} \cdot \frac{1}{n^3} \dots \right) = \frac{1}{3}$$

which is finite and non-zero.

$\therefore \sum u_n$  and  $\sum v_n$  converge or diverge together.

Since  $\sum v_n = \sum \frac{1}{n^2}$  is of the form  $\sum \frac{1}{n^p}$  with  $p = 2 > 1$

$\therefore \sum v_n$  is convergent  $\Rightarrow \sum u_n$  is convergent.

**Ans.**

**Example 11.** Test the convergence of the following series

$$\frac{1}{1+2^{-1}} + \frac{2}{1+2^{-2}} + \frac{3}{1+2^{-3}} + \dots \quad (\text{M.D.U., 2000})$$

**Solution.** Here, we have

$$\frac{1}{1+2^{-1}} + \frac{2}{1+2^{-2}} + \frac{3}{1+2^{-3}} + \dots$$

Here

$$u_n = \frac{n}{1+2^{-n}} = \frac{n}{1+\frac{1}{2^n}}$$

Let

$$u_n = n$$

Let us compare  $\sum u_n$  with  $\sum v_n$ ,

$$\frac{u_n}{v_n} = \frac{n}{1+\frac{1}{2^n}} \cdot \frac{1}{n} = \frac{1}{1+\frac{1}{2^n}}$$

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \lim_{n \rightarrow \infty} \frac{1}{1+\frac{1}{2^n}} = \frac{1}{1+0} = 1$$

Which is finite and non-zero.

$\therefore \sum u_n$  and  $\sum v_n$ , converge or diverge together since  $\sum v_n = \sum \frac{1}{n}$  is of the form  $\sum \frac{1}{n^p}$  with  $p = 1$ .

$\therefore \sum v_n$  is divergent  $\Rightarrow \sum u_n$  is also divergent.

**Ans.**

**Example 12.** Examine the convergence of the series  $\frac{\sqrt{2}-1}{3^3-1} + \frac{\sqrt{3}-1}{4^3-1} + \frac{\sqrt{4}-1}{5^3-1} + \dots$

(M.D.U., 2000)

**Solution.** Here, we have

$$\frac{\sqrt{2}-1}{3^3-1} + \frac{\sqrt{3}-1}{4^3-1} + \frac{\sqrt{4}-1}{5^3-1} + \dots$$

Here

$$u_n = \frac{\sqrt{n+1}-1}{(n+2)^3-1} = \frac{\sqrt{n}\left(\sqrt{1+\frac{1}{n}}-\frac{1}{\sqrt{n}}\right)}{n^3\left[\left(1+\frac{2}{n}\right)^3-\frac{1}{n^3}\right]} = \frac{\sqrt{1+\frac{1}{n}}-\frac{1}{\sqrt{n}}}{n^2\left[\left(1+\frac{2}{n}\right)^3-\frac{1}{n^3}\right]}$$

Let

$$v_n = \frac{1}{\frac{5}{n^2}}$$

Let us compare  $\sum u_n$  with  $\sum v_n$ ,

$$\frac{u_n}{v_n} = \frac{\sqrt{1+\frac{1}{n}}-\frac{1}{\sqrt{n}}}{\frac{5}{n^2}\left[\left(1+\frac{2}{n}\right)^3-\frac{1}{n^3}\right]} \times \frac{\frac{5}{n^2}}{1} = \frac{\sqrt{1+\frac{1}{n}}-\frac{1}{\sqrt{n}}}{\left[\left(1+\frac{2}{n}\right)^3-\frac{1}{n^3}\right]}$$

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \lim_{n \rightarrow \infty} \frac{\sqrt{1 + \frac{1}{n}} - \frac{1}{\sqrt{n}}}{\left(1 + \frac{2}{n}\right)^3 - \frac{1}{n^3}} = \frac{\sqrt{1+0} - 0}{(1-0)^3 - 0} = 1$$

Which is finite and non-zero.

$\therefore \sum u_n$  and  $\sum v_n$ , converge or diverge together since  $\sum v_n = \sum \frac{1}{n^2}$  is of the form

$$\sum \frac{1}{n^p} \quad \text{where } P = \frac{5}{2} > 1.$$

$\therefore \sum v_n$  is convergent  $\Rightarrow \sum u_n$  is convergent.

**Ans.**

**Example 13.** Test the convergence and divergence of the following series.

$$\sum_{n=1}^{\infty} \frac{2n^2 + 3n}{5 + n^5} \quad (\text{Gujarat, I Semester, Jan. 2009})$$

**Solution.** Here,  $u_n = \frac{2n^2 + 3n}{5 + n^5} = \frac{n^2 \left(2 + \frac{3}{n}\right)}{n^5 \left(\frac{5}{n^5} + 1\right)} = \frac{1}{n^3} \frac{2 + \frac{3}{n}}{\frac{5}{n^5} + 1}$

Let

$$v_n = \frac{1}{n^3}$$

**By Comparison Test**

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \lim_{n \rightarrow \infty} \frac{n^3 \left(2 + \frac{3}{n}\right)}{n^3 \left(\frac{5}{n^5} + 1\right)} = \lim_{n \rightarrow \infty} \frac{2 + \frac{3}{n}}{\frac{5}{n^5} + 1} = 2 = \text{Finite number.}$$

According to comparison test both series converge or diverge together but  $\sum v_n$  is convergent as  $p = 2$ .

Hence, the given series is convergent.

**Ans.**

**Example 14.** Test the following series for convergence  $\frac{2}{1^p} + \frac{3}{2^p} + \frac{4}{3^p} + \frac{5}{4^p} + \dots$

**Solution.** Given series is  $\frac{2}{1^p} + \frac{3}{2^p} + \frac{4}{3^p} + \frac{5}{4^p} + \dots$

Here  $u_n = \frac{n+1}{n^p} = \frac{1 + \frac{1}{n}}{n^{p-1}}$

Let  $v_n = \frac{1}{n^{p-1}}$   $\therefore \frac{u_n}{v_n} = \frac{1 + \frac{1}{n}}{n^{p-1}} \times \frac{n^{p-1}}{1} = 1 + \frac{1}{n}$

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = 1$$

Therefore, both the series are either convergent or divergent.

But  $\sum v_n$  is convergent if  $p - 1 > 1$ , i.e., if  $p > 2$  (P series)  
and is divergent if  $p - 1 \leq 1$ , i.e., if  $p \leq 2$

$\therefore$  The given series is convergent if  $p > 2$  and divergent if  $p \leq 2$ .

**Ans.**

**EXERCISE 39.5**

Examine the convergence or divergence of the following series:

1.  $2 + \frac{3}{2} \cdot \frac{1}{4} + \frac{4}{3} \cdot \frac{1}{4^2} + \frac{5}{4} \cdot \frac{1}{4^3} + \dots \infty$  **Ans.** Convergent

2.  $1 + \frac{1.2}{1.3} + \frac{1.2.3}{1.3.5} + \frac{1.2.3.4}{1.3.5.7} + \dots \infty$  **Ans.** Convergent

3.  $\frac{1}{1.2} + \frac{2}{3.4} + \frac{3}{5.6} + \dots \infty$  **Ans.** Divergent

4.  $\frac{1}{1.2.3} + \frac{1}{2.3.4} + \frac{1}{3.4.5} + \dots \infty$  **Ans.** Convergent *(M.D. University, Dec. 2004)*

5.  $1 + \frac{2^2}{2!} + \frac{3^2}{3!} + \frac{4^2}{4!} + \dots \infty$  **Ans.** Convergent

6.  $\frac{1}{1+2} + \frac{2}{1+2^2} + \frac{3}{1+2^3} + \dots$  **Ans.** Convergent *(M.D. University, 2001)*

7.  $\frac{1}{3} + \frac{2!}{3^2} + \frac{3!}{3^3} + \dots \infty$  **Ans.** Convergent

8.  $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n} + \sqrt{n+1}}$  **Ans.** Divergent 9.  $\sum_{n=1}^{\infty} \frac{2n^3 + 5}{4n^5 + 1}$  **Ans.** Convergent

10.  $\sum_{n=1}^{\infty} \frac{a^n}{x^n + n^a}$  **Ans.** If  $x > a$ , convergent; if  $x \leq a$ , Divergent

11.  $\sum_{n=1}^{\infty} \frac{\sqrt{n}}{n^2 + 1}$  **Ans.** Convergent 12.  $\sum_{n=1}^{\infty} \sqrt{(n^2 + 1)} - n$  **Ans.** Divergent

13.  $\sum_{n=1}^{\infty} \left[ \sqrt{(n^4 + 1)} - \sqrt{(n^4 - 1)} \right]$  **Ans.** Convergent

14.  $\sum_{n=1}^{\infty} \frac{2^n + 1}{3^n + n}$  **Ans.** Convergent

15.  $\sum_{n=1}^{\infty} \frac{n^n}{n!}$  **Ans.** Convergent 16.  $\sum_{n=1}^{\infty} \frac{n^2}{e^n}$  **Ans.** Convergent

**39.16 D'ALEMBERT'S RATIO TEST**

**Statement.** If  $\sum u_n$  is a positive term series such that  $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = k$  then

(i) the series is convergent if  $k < 1$       (ii) the series is divergent if  $k > 1$

**Solution.**

**Case I.** When  $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = k < 1$

By definition of a limit, we can find a number  $r (< 1)$  such that

$$\frac{u_{n+1}}{u_n} < r \text{ for all } n \geq m \quad \left[ \frac{u_2}{u_1} < r, \frac{u_3}{u_2} < r, \frac{u_4}{u_3} < r \dots \right]$$

Omitting the first  $m$  terms, let the series be

$$= u_1 \left( 1 + \frac{u_2}{u_1} + \frac{u_3}{u_1} + \frac{u_4}{u_1} + \dots \right) = u_1 \left( 1 + \frac{u_2}{u_1} + \frac{u_3}{u_2} \cdot \frac{u_2}{u_1} + \frac{u_4}{u_3} \cdot \frac{u_3}{u_2} \cdot \frac{u_2}{u_1} + \dots \infty \right) \\ < u_1 (1 + r + r^2 + r^3 + \dots \infty) \quad (r < 1)$$

$$= \frac{u_1}{1-r}, \text{ which is a finite quantity.}$$

Hence,  $\sum u_n$  is convergent.

**Case 2.** When  $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = k > 1$

By definition of limit, we can find a number  $m$  such that  $\frac{u_{n+1}}{u_n} \geq 1$  for all  $n \geq m$

$$\frac{u_2}{u_1} > 1, \quad \frac{u_3}{u_2} > 1, \quad \frac{u_4}{u_3} > 1$$

Ignoring the first  $m$  terms, let the series be

$$\begin{aligned} & u_1 + u_2 + u_3 + u_4 + \dots \infty \\ &= u_1 \left( 1 + \frac{u_2}{u_1} + \frac{u_3}{u_1} + \frac{u_4}{u_1} + \dots \right) = u_1 \left( 1 + \frac{u_2}{u_1} + \frac{u_3}{u_2} \cdot \frac{u_2}{u_1} + \frac{u_4}{u_3} \cdot \frac{u_3}{u_2} \cdot \frac{u_2}{u_1} + \dots \infty \right) \\ &\geq u_1 (1 + 1 + 1 + 1 \dots \text{to } n \text{ terms}) = nu_1 \\ &\quad [\because \lim_{n \rightarrow \infty} (u_1 + u_2 + \dots + u_n) = nu_1] \end{aligned}$$

$$\lim_{n \rightarrow \infty} S_n \geq \lim_{n \rightarrow \infty} nu_1 = \infty$$

Hence,  $\sum u_n$  is divergent.

**Note.** When  $\frac{u_{n+1}}{u_n} = 1 \quad (k = 1)$

The ratio test fails.

**For Example.** Consider the series whose  $n^{\text{th}}$  term is  $\frac{1}{n}$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n+1}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n}{n+1} = \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n}} = 1 \quad \dots(1)$$

Consider the second series whose  $n^{\text{th}}$  term is  $\frac{1}{n^2}$ .

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{(n+1)^2}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \left( \frac{n}{n+1} \right)^2 = 1 \quad \dots(2)$$

Thus, from (1) and (2) in both cases  $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = 1$

But we know that the first series is divergent as  $p = 1$ .

The second series is convergent as  $p = 2$ .

Hence, when  $\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = 1$ , the series may be convergent or divergent.

Thus, ratio test fails when  $k = 1$ .

**Example 15.** Test for convergence of the series whose  $n^{\text{th}}$  term is  $\frac{n^2}{2^n}$ .

**Solution.** Here, we have  $u_n = \frac{n^2}{2^n}$ ,  $u_{n+1} = \frac{(n+1)^2}{2^{n+1}}$

**By D'Alembert's Test**

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{(n+1)^2}{2^{n+1}} \cdot \frac{2^n}{n^2} = \lim_{n \rightarrow \infty} \frac{1}{2} \left( 1 + \frac{1}{n} \right)^2 = \frac{1}{2} < 1$$

Hence, the series is convergent by D'Alembert's Ratio Test.

**Ans.**

**Example 16.** Test for convergence the series whose  $n^{\text{th}}$  term is  $\frac{2^n}{n^3}$ .

**Solution.** Here, we have  $u_n = \frac{2^n}{n^3}$ ,  $u_{n+1} = \frac{2^{n+1}}{(n+1)^3}$

**By D'Alembert's Ratio Test**

$$\frac{u_{n+1}}{u_n} = \frac{2^{n+1}}{(n+1)^3} \cdot \frac{n^3}{2^n} = \frac{2}{\left(1 + \frac{1}{n}\right)^3} \Rightarrow \lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{2}{\left(1 + \frac{1}{n}\right)^3} = 2 > 1$$

Hence, the series is divergent.

**Ans.**

**Example 17.** Discuss the convergence of the series:

$$\sum \frac{\sqrt{n}}{\sqrt{n^2+1}} x^n. \quad (x > 0)$$

(M.D. University, Dec., 2001)

**Solution.** Here, we have

$$\begin{aligned} u_n &= \sqrt{\frac{n}{n^2+1}} x^n \\ \therefore u_{n+1} &= \sqrt{\frac{n+1}{(n+1)^2+1}} x^{n+1} \\ \frac{u_n}{u_{n+1}} &= \sqrt{\frac{n}{n+1}} \cdot \sqrt{\frac{n^2+2n+2}{n^2+1}} \cdot \frac{1}{x} = \sqrt{\frac{1}{1+\frac{1}{n}} \cdot \frac{\left(1+\frac{2}{n}+\frac{2}{n^2}\right)}{\left(1+\frac{1}{n^2}\right)} \cdot \frac{1}{x}} \\ \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} &= \lim_{n \rightarrow \infty} \sqrt{\frac{1}{1+\frac{1}{n}} \cdot \frac{\left(1+\frac{2}{n}+\frac{2}{n^2}\right)}{\left(1+\frac{1}{n^2}\right)} \cdot \frac{1}{x}} = \frac{1}{x} \end{aligned}$$

$\therefore$  By D'Alembert's Ratio Test,  $\sum u_n$  converges if  $\frac{1}{x} > 1$ , i.e.  $x < 1$  and diverges if  $\frac{1}{x} < 1$  i.e.,  $x > 1$ .

When  $x = 1$ , the Ratio Test fails.

$$\text{When } x = 1, u_n = \sqrt{\frac{n}{n^2+1}} = \sqrt{\frac{n}{n^2\left(1+\frac{1}{n^2}\right)}} = \frac{1}{\sqrt{n}} \cdot \frac{1}{\sqrt{1+\frac{1}{n^2}}}$$

$$v_n = \frac{1}{\sqrt{n}},$$

$$\frac{u_n}{v_n} = \frac{1}{\sqrt{n}} \cdot \frac{1}{\sqrt{1+\frac{1}{n^2}}} \cdot \frac{\sqrt{n}}{1} = \frac{1}{\sqrt{1+\frac{1}{n^2}}}$$

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{1+\frac{1}{n^2}}} = 1$$

Which is finite and non-zero.

$\therefore$  By comparison test,  $\sum u_n$  and  $\sum v_n$  converge or diverge together.

Since  $\sum v_n = \sum \frac{1}{\sqrt{n}}$  is of the form  $\sum \frac{1}{n^p}$  with  $p = \frac{1}{2} < 1$ .

$\sum v_n$  diverges  $\Rightarrow \sum u_n$  diverges.

Hence, the given series  $\sum u_n$  converges if  $x < 1$  and diverges if  $x \geq 1$ . **Ans.**

### EXERCISE 39.6

Test the convergence for series:

$$1. \sum_{n=1}^{\infty} \frac{n^2}{3^n}$$

**Ans.** Convergent

$$2. \sum_{n=1}^{\infty} \frac{n!}{n^n}$$

**Ans.** Convergent

$$3. \left(\frac{1}{3}\right)^2 + \left(\frac{1 \cdot 2}{3 \cdot 5}\right)^2 + \left(\frac{1 \cdot 2 \cdot 3}{3 \cdot 5 \cdot 7}\right)^2 + \dots \infty$$

**Ans.** Convergent

$$4. \frac{2}{1} + \frac{2 \cdot 5 \cdot 8}{1 \cdot 5 \cdot 9} + \frac{2 \cdot 5 \cdot 8 \cdot 11}{1 \cdot 5 \cdot 9 \cdot 13} + \dots \infty$$

**Ans.** Convergent

$$5. \sum_{n=1}^{\infty} \frac{n! \cdot 2^n}{n^n}$$

**Ans.** Convergent

$$6. \sum_{n=1}^{\infty} \frac{x^{n-1}}{n \cdot 3^n}$$

**Ans.** Convergent if  $x > 3$ , Divergent if  $x < 3$

7. Prove that, if  $u_{n+1} = \frac{k}{1+u_n}$ , where  $k > 0$ ,  $u_1 > 0$ , then the series  $\sum u_n$  converges to the positive root of the equation  $x^2 + x = k$ .

### 39.17 RAABE'S TEST (HIGHER RATIO TEST)

If  $\sum u_n$  is a positive term series such that  $\lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) = k$ , then

(i) the series is convergent if  $k > 1$       (ii) the series is divergent if  $k < 1$ .

**Proof. Case I.**  $k > 1$

Let  $p$  be such that  $k > p > 1$  and compare the given series  $\sum u_n$  with  $\sum \frac{1}{n^p}$  which is convergent as  $p > 1$ .

$$\frac{u_n}{u_{n+1}} > \frac{(n+1)^p}{n^p} \quad \text{or} \quad \left( \frac{u_n}{u_{n+1}} \right) > \left( 1 + \frac{1}{n} \right)^p > 1 + \frac{p}{n} + \frac{p(p-1)}{2!} \frac{1}{n^2} + \dots$$

(Binomial Theorem)

$$n \left( \frac{u_n}{u_{n+1}} - 1 \right) > p + \frac{p(p-1)}{2!} \frac{1}{n} + \dots$$

$$\text{If } \lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) > p$$

and  $k > p$  which is true as  $k > p > 1$ ;  $\sum u_n$  is convergent when  $k > 1$ .

**Case II.**  $k < 1$    Same steps as in Case I.

**Notes:**

1. Raabe's Test fails if  $k = 1$

2. Raabe's Test is applied only when D'Alembert's Ratio Test fails.

**Example 18.** Test the convergence for the series  $\frac{x}{1.2} + \frac{x^2}{3.4} + \frac{x^3}{5.6} + \frac{x^4}{7.8} + \dots$  (M.U. 2009)

**Solution.** Here,  $u_n = \frac{x^n}{(2n-1)2n}$  and  $u_{n+1} = \frac{x^{n+1}}{(2n+1)(2n+2)}$

**By D'Alembert's Test**

$$\frac{u_{n+1}}{u_n} = \frac{x^{n+1}}{(2n+1)(2n+2)} \times \frac{(2n-1)2n}{x^n} = \frac{x\left(1 - \frac{1}{2n}\right)}{\left(1 + \frac{1}{2n}\right)\left(1 + \frac{2}{2n}\right)}$$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = x$$

(i) If  $x < 1$ ,  $\sum u_n$  is convergent (ii) If  $x > 1$ ,  $\sum u_n$  is divergent (iii) If  $x = 1$ , Test fails.

Let us apply Raabe's Test when  $x = 1$

$$\begin{aligned} \lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) &= \lim_{n \rightarrow \infty} n \left[ \frac{(2n+1)(2n+2)}{2n(2n-1)} - 1 \right] \\ &= \lim_{n \rightarrow \infty} n \left[ \frac{(2n+1)(2n+2) - 2n(2n-1)}{2n(2n-1)} \right] \\ &= \lim_{n \rightarrow \infty} n \left[ \frac{(8n+2)}{(2n)(2n-1)} \right] = \lim_{n \rightarrow \infty} \frac{\left(2 + \frac{2}{4n}\right)}{1 - \frac{1}{2n}} = 2 \end{aligned}$$

So the series is convergent.

Hence we can say that the given series is convergent if  $x \leq 1$  and divergent, if  $x > 1$ . **Ans.**

**Example 19.** Test the following series for convergence  $\sum \frac{1}{\sqrt{n+1} - 1}$ .

**Solution.** Here,  $u_n = \frac{1}{\sqrt{n+1} - 1}$ ,  $u_{n+1} = \frac{1}{\sqrt{n+2} - 1}$

$$\frac{u_{n+1}}{u_n} = \frac{\sqrt{n+1} - 1}{\sqrt{n+2} - 1}$$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{\sqrt{1 + \frac{1}{n}} - \frac{1}{n}}{\sqrt{1 + \frac{2}{n}} - \frac{1}{n^2}} = 1$$

D'Alembert's test fails.

**By Raabe's test.**

$$\begin{aligned} \lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) &= \lim_{n \rightarrow \infty} n \left( \frac{\sqrt{n+2} - 1}{\sqrt{n+1} - 1} - 1 \right) \\ &= \lim_{n \rightarrow \infty} n \left[ \frac{\sqrt{n+2} - 1 - \sqrt{n+1} + 1}{\sqrt{n+1} - 1} \right] = \lim_{n \rightarrow \infty} n \left[ \frac{\sqrt{n+2} - \sqrt{n+1}}{\sqrt{n+1} - 1} \right] \end{aligned}$$

$$= \lim_{n \rightarrow \infty} n \left[ \frac{\sqrt{1 + \frac{2}{n}} - \sqrt{1 + \frac{1}{n}}}{\sqrt{1 + \frac{1}{n}} - \frac{1}{n^2}} \right] = 0 < 1$$

Hence,  $\sum u_n$  is divergent.

**Ans.**

**Example 20.** Discuss the convergence of the series:

$$\frac{x}{1} + \frac{1 \cdot 3}{2 \cdot 3} \cdot \frac{x^3}{3} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 5} \cdot \frac{x^5}{5} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{2 \cdot 4 \cdot 6 \cdot 7} \cdot \frac{x^7}{7} + \dots \quad (x > 0)$$

(M.D.U. Dec., 2001)

**Solution.** Here, we have

$$\frac{x}{1} + \frac{1 \cdot 3}{2 \cdot 3} \cdot \frac{x^3}{3} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 5} \cdot \frac{x^5}{5} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{2 \cdot 4 \cdot 6 \cdot 7} \cdot \frac{x^7}{7} + \dots$$

Neglecting the first term, we have

$$u_n = \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{2 \cdot 4 \cdot 5 \dots (2n)} \cdot \frac{x^{2n+1}}{2n+1}$$

$$\text{and } u_{n+1} = \frac{1 \cdot 3 \cdot 5 \dots (2n-1)(2n+1)}{2 \cdot 4 \cdot 5 \dots (2n)(2n+2)} \cdot \frac{x^{2n+3}}{2n+3}$$

$$\begin{aligned} \frac{u_n}{u_{n+1}} &= \frac{(2n-1)x^{2n+1}}{2n(2n+1)} \times \frac{2n(2n+2)(2n+3)}{(2n-1)(2n+1)x^{2n+3}} = \frac{(2n+2)(2n+3)}{(2n+1)(2n+1)} \cdot \frac{1}{x^2} \\ \therefore \quad &= \frac{2n+2}{2n+1} \cdot \frac{2n+3}{2n+1} \cdot \frac{1}{x^2} = \frac{2n\left(1+\frac{1}{n}\right) \cdot 2n\left(1+\frac{3}{2n}\right)}{2n\left(1+\frac{1}{2n}\right) \cdot 2n\left(1+\frac{1}{2n}\right)} \cdot \frac{1}{x^2} = \frac{\left(1+\frac{1}{n}\right)\left(1+\frac{3}{2n}\right)}{\left(1+\frac{1}{2n}\right)^2} \cdot \frac{1}{x^2} \end{aligned}$$

$$\lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = \lim_{n \rightarrow \infty} \frac{\left(1+\frac{1}{n}\right)\left(1+\frac{3}{2n}\right)}{\left(1+\frac{1}{2n}\right)^2} \cdot \frac{1}{x^2} = \frac{1}{x^2}$$

$\therefore$  Ratio Test,  $\sum u_n$  is convergent if  $\frac{1}{x^2} > 1$ .

i.e.;  $x^2 < 1$  and divergent if  $\frac{1}{x^2} < 1$ . i.e.,  $x^2 > 1$ .

If  $x^2 = 1$ , then Ratio Test fails.

Now Raabe's test

$$\text{When } x^2 = 1, \text{ we have } \frac{u_n}{u_{n+1}} = \frac{(2n+2)(2n+3)}{(2n+1)^2} = \frac{4n^2 + 10n + 6}{4n^2 + 4n + 1}$$

$$\lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) = \lim_{n \rightarrow \infty} n \left( \frac{4n^2 + 10n + 6}{4n^2 + 4n + 1} - 1 \right)$$

$$= \lim_{n \rightarrow \infty} \frac{6n^2 + 5n}{4n^2 + 4n + 1} = \lim_{n \rightarrow \infty} \frac{6 + \frac{5}{n}}{4 + \frac{4}{n} + \frac{1}{n^2}} = \frac{6}{4} = \frac{3}{2} > 1$$

$\therefore$  By Raabe's Test, the series converges.

Hence,  $\sum u_n$  is convergent if  $x^2 \leq 1$  and divergent if  $x^2 > 1$ .

**Ans.**

**Example 21.** Test the following series for convergence

$$\frac{1}{2}x + x^2 + \frac{9}{8}x^3 + x^4 + \frac{25}{32}x^5 + \dots \infty$$

**Solution.** Here,  $u = \frac{n^2 \cdot x^n}{2^n}$ ,  $u_{n+1} = \frac{(n+1)^2 \cdot x^{n+1}}{2^{n+1}}$

By D'Alembert's Test

$$\frac{u_{n+1}}{u_n} = \frac{(n+1)^2 x^{n+1}}{2^{n+1}} \cdot \frac{2^n}{n^2 x^n} = \left( \frac{n+1}{n} \right)^2 \frac{x}{2}$$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \left( 1 + \frac{1}{n} \right)^2 \frac{x}{2} = \frac{x}{2}$$

(i) If  $\frac{x}{2} < 1$  or  $x < 2$ , then  $\sum u_n$  is convergent. (ii) If  $\frac{x}{2} > 1$  or  $x > 2$ , then  $\sum u_n$  is divergent.

(iii) If  $\frac{x}{2} = 1$  or  $x = 2$ , then the test fails.

Let us apply Raabe's test

$$n \left( \frac{u_n}{u_{n+1}} - 1 \right) = n \left[ \frac{n^2}{(n+1)^2} \frac{2}{2} - 1 \right] = n \left[ \frac{n^2 - n^2 - 2n - 1}{(n+1)^2} \right] = \frac{-2n^2 - n}{(n+1)^2}$$

$$\lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) = \lim_{n \rightarrow \infty} \frac{-2 - \frac{1}{n}}{\left( 1 + \frac{1}{n} \right)^2} = -2 < 1$$

Hence,  $\sum u_n$  is divergent if  $x \geq 2$ , and convergent if  $x < 2$ .

**Ans.**

**Example 22.** Show that the series  $\frac{1}{x} + \frac{2!}{x(x+1)} + \frac{3!}{x(x+1)(x+2)} + \dots$  converges if  $x > 2$

and diverges if  $x < 2$ .

**Solution.** Here,  $u_n = \frac{n!}{x(x+1)(x+2)\dots(x+n-1)}$   
 $u_{n+1} = \frac{(n+1)!}{x(x+1)(x+2)\dots(x+n-1)(x+n)}$

By D'Alembert's test

$$\frac{u_{n+1}}{u_n} = \frac{n+1}{(x+n)}, \quad \lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \frac{1 + \frac{1}{n}}{1 + \frac{x}{n}} = 1$$

Test fails. Let us apply Raabe's Test.

$$\lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) = \lim_{n \rightarrow \infty} n \left( \frac{x+n}{n+1} - 1 \right) = \lim_{n \rightarrow \infty} n \left( \frac{x-1}{n+1} \right) = \lim_{n \rightarrow \infty} \frac{x-1}{1 + \frac{1}{n}} = x-1$$

If  $x-1 > 1$  or  $x > 2$ , then  $\sum u_n$  is convergent.

If  $x-1 < 1$  or  $x < 2$ , then  $\sum u_n$  is divergent.

**Ans.**

**Example 23.** Discuss the convergence of the series  $\frac{x^2}{2 \log 2} + \frac{x^3}{3 \log 3} + \frac{x^4}{4 \log 4} + \dots$

**Solution.** Here, we have  $\frac{x^2}{2 \log 2} + \frac{x^3}{3 \log 3} + \frac{x^4}{4 \log 4} + \dots$

$$u_n = \frac{x^{n+1}}{(n+1) \log(n+1)}, \quad u_{n+1} = \frac{x^{n+2}}{(n+2) \log(n+2)}$$

By D'Alembert's Test

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} &= \lim_{n \rightarrow \infty} \frac{x^{n+2}}{(n+2) \log(n+2)} \times \frac{(n+1) \log(n+1)}{x^{n+1}} \\ &= \lim_{n \rightarrow \infty} x \left( \frac{n+1}{n+2} \right) \frac{\log(n+1)}{\log(n+2)} \\ &= \lim_{n \rightarrow \infty} x \left( \frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} \right) \frac{\log n + \log \left( 1 + \frac{1}{n} \right)}{\log n + \log \left( 1 + \frac{2}{n} \right)} \\ &= \lim_{n \rightarrow \infty} x \left( \frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} \right) \left[ \frac{\log n + \frac{1}{n} - \frac{1}{2} \cdot \frac{1}{n^2} + \dots}{\log n + \frac{2}{n} - \frac{1}{2} \cdot \frac{4}{n^2} + \dots} \right] \\ &= \lim_{n \rightarrow \infty} x \left( \frac{1 + \frac{1}{n}}{1 + \frac{2}{n}} \right) \left[ \frac{1 + \frac{1}{n \log n} + \dots}{1 + \frac{2}{n \log n} + \dots} \right] = x \end{aligned}$$

- (i) When  $x < 1$ , the series is convergent      (ii) When  $x > 1$ , the series is divergent.  
 (iii) When  $x = 1$ , the test fails.

Let us apply Raabe's Test

$$\frac{u_n}{u_{n+1}} = \left( \frac{n+2}{n+1} \right) \frac{\log(n+2)}{\log(n+1)} = \left( \frac{n+2}{n+1} \right) \frac{\log n + \log \left( 1 + \frac{2}{n} \right)}{\log n + \log \left( 1 + \frac{1}{n} \right)}$$

By D'Alembert's Test

$$\begin{aligned} &= \left( \frac{n+2}{n+1} \right) \frac{\log n + \frac{2}{n} - \frac{1}{2} \cdot \frac{4}{n^2} + \dots}{\log n + \frac{1}{n} - \frac{1}{2} \cdot \frac{1}{n^2} + \dots} = \left( \frac{n+2}{n+1} \right) \frac{1 + \frac{2}{n \log n} + \dots}{1 + \frac{1}{n \log n} + \dots} \\ &= \frac{n+2}{n+1} \left( 1 + \frac{2}{n \log n} \right) \left( 1 + \frac{1}{n \log n} \right)^{-1} = \frac{n+2}{n+1} \left( 1 + \frac{2}{n \log n} \right) \left( 1 - \frac{1}{n \log n} \right) \\ &= \frac{n+2}{n+1} \left( 1 + \frac{2}{n \log n} - \frac{1}{n \log n} + \dots \right) = \left( \frac{n+2}{n+1} \right) \left[ 1 + \frac{1}{n \log n} \right] \\ &\lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = \lim_{n \rightarrow \infty} = \left[ \frac{1 + \frac{2}{n}}{1 + \frac{1}{n}} \right] \left[ 1 + \frac{1}{n \log n} \right] = 1 + \frac{1}{n \log n} \end{aligned}$$

$$n \left[ \frac{u_n}{u_{n+1}} - 1 \right] = n \left[ 1 + \frac{1}{n \log n} - 1 \right] = \frac{1}{\log n} = 0 < 1$$

Thus the series is divergent when  $x = 1$ .

Hence, the series converges if  $x < 1$  and diverges if  $x \geq 1$ .

**Ans.**

**Example 24.** Test the series for convergence

$$1 + \frac{\alpha \cdot \beta}{1 \cdot \gamma} x + \frac{\alpha(\alpha+1) \cdot \beta(\beta+1)}{1 \cdot 2 \cdot \gamma(\gamma+1)} x^2 + \frac{\alpha(\alpha+1)(\alpha+2) \cdot \beta(\beta+1)(\beta+2)}{1 \cdot 2 \cdot 3 \cdot \gamma(\gamma+1)(\gamma+2)} x^3 + \dots$$

**Solution.**  $u_n = \frac{\alpha(\alpha+1)(\alpha+2) \dots [\alpha+(n-1)] \cdot \beta(\beta+1) \dots [\beta+(n-1)]}{n! \gamma(\gamma+1) \dots [\gamma+(n-1)]} x^n$

$$u_{n+1} = \frac{\alpha(\alpha+1)(\alpha+2) \dots [\alpha+(n-1)](\alpha+n) \cdot \beta(\beta+1) \dots [\beta+(n-1)](\beta+n)}{(n+1)! \gamma(\gamma+1) \dots [\gamma+(n-1)](\gamma+n)} x^{n+1}$$

By D'Alembert's Test

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{(\alpha+n)(\beta+n)}{(n+1)(\gamma+n)} x = \lim_{n \rightarrow \infty} \frac{\left(1 + \frac{\alpha}{n}\right)\left(1 + \frac{\beta}{n}\right)}{\left(1 + \frac{1}{n}\right)\left(1 + \frac{\gamma}{n}\right)} \cdot x$$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = x$$

(i) If  $x < 1$ , the series is convergent.

(ii) If  $x > 1$ , the series is divergent.

(iii) If  $x = 1$ , the test fails.

Let us apply Raabe's Test

$$n \left( \frac{u_n}{u_{n+1}} - 1 \right) = n \left[ \frac{(n+1)(\gamma+n)}{(\alpha+n)(\beta+n)} - 1 \right] = n \left[ \frac{n\gamma + n^2 + \gamma + n - \alpha\beta - n\alpha - n\beta - n^2}{(\alpha+n)(\beta+n)} \right]$$

$$\lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) = \lim_{n \rightarrow \infty} \frac{\gamma + \frac{\gamma}{n} + 1 - \frac{\alpha\beta}{n} - \alpha - \beta}{\left( \frac{\alpha}{n} + 1 \right) \left( \frac{\beta}{n} + 1 \right)} = \gamma + 1 - \alpha - \beta$$

(i) If  $\gamma + 1 - \alpha - \beta > 1$  or  $\gamma > \alpha + \beta$ , then  $\sum u_n$  is convergent.

(ii) If  $\gamma + 1 - \alpha - \beta < 1$  or  $\gamma < \alpha + \beta$ , then  $\sum u_n$  is divergent.

**Ans.** \

### EXERCISE 39.7

Determine the nature of the following series:

1.  $1 + \frac{2!}{2^2} + \frac{3!}{3^2} + \frac{4!}{4^2} + \dots \infty$  **Ans.** Divergent

2.  $\frac{1}{1} + \frac{1 \cdot 3}{1 \cdot 4} + \frac{1 \cdot 3 \cdot 5}{1 \cdot 4 \cdot 7} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{1 \cdot 4 \cdot 7 \cdot 10} + \dots \infty$  **Ans.** Convergent

3.  $1 + \frac{1+\alpha}{1+\beta} + \frac{(1+\alpha)(2+\alpha)}{(1+\beta)(2+\beta)} + \dots \infty$  **Ans.** If  $\beta - \alpha > 1$ , convergent. If  $\beta - \alpha \leq 1$ , Divergent.

4.  $\sum_{n=1}^{\infty} \frac{n^3}{e^n}$  **Ans.** Convergent 5.  $x + \frac{2x^2}{2!} + \frac{3x^3}{3!} + \frac{4x^4}{4!} + \dots \infty$  **Ans.** Convergent

6.  $1 + \frac{x}{2} + \frac{x^2}{3} + \frac{x^3}{4} + \dots$  **Ans.** Divergent

7.  $1 + \frac{1}{2}x + \frac{1}{5}x^2 + \frac{1}{10}x^3 + \dots$  **Ans.** Convergent if  $-1 \leq x < 1$  and divergent if  $|x| > 1$

8.  $1 + \frac{(1!)^2}{2!}x^2 + \frac{(2!)^2}{4!}x^4 + \frac{(3!)^2}{6!}x^6 + \dots \infty$  ( $x > 0$ )

**Ans.** If  $x^2 < 4$ , convergent; and divergent if  $x^2 \geq 4$

**Find the values of  $x$  for which the following series converges:**

9.  $x^2 (\log 2)^q + x^3 (\log 3)^q + x^4 (\log 4)^q + \dots$

**Ans.** If  $x < 1$ , convergent; and divergent if  $x \geq 1$

10.  $\sum_{n=0}^{\infty} \frac{(-1)^n n! x^n}{10^n}$

12.  $\sum \frac{x^n}{2n(2n+1)}$

**Ans.** If  $x \leq 1$ , convergent; and if  $x > 1$ , divergent

11.  $\sum \frac{1.2 \dots n}{4.7 \dots (3n+1)} x^n$

**Ans.** If  $0 < x < 3$ , convergent and divergent if  $x \geq 3$ .

12.  $1 + \frac{(1!)^2}{2!} x + \frac{(2!)^2}{4!} x^2 + \frac{(3!)^2}{6!} x^3 + \dots$

(M.D.U., Dec. 2010)

**Ans.** convergent if  $x < 4$ ; divergent if  $x \geq 4$ .

### 39.18. GAUSS'S TEST

**Statement.** If  $\sum u_n$  is a positive term series such that

$$\frac{u_n}{u_{n+1}} = \alpha + \frac{\beta}{n} + \frac{\gamma}{n^2} \quad \text{where } \alpha > 0$$

(i) if  $\alpha > 1$ , convergent      if  $\alpha < 1$ , divergent, whatever  $\beta$  may be

(ii) if  $\alpha = 1$  and  $\begin{cases} \beta > 1, \text{ convergent} \\ \beta \leq 1, \text{ divergent} \end{cases}$

**Example 25.** Test for convergence the series  $\frac{2^2 \cdot 4^2}{3^2 \cdot 5^2} + \frac{2^2 \cdot 4^2 \cdot 6^2}{3^2 \cdot 5^2 \cdot 7^2} + \frac{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2}{3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2} + \dots$

**Solution.** The given series is  $\frac{2^2 \cdot 4^2}{3^2 \cdot 5^2} + \frac{2^2 \cdot 4^2 \cdot 6^2}{3^2 \cdot 5^2 \cdot 7^2} + \frac{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2}{3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2} + \dots$

$$+ \frac{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2 \dots (2n+2)^2}{3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2 \dots (2n+3)^2} + \dots \infty$$

$$u_{n+1} = \frac{2^2 \cdot 4^2 \cdot 6^2 \cdot 8^2 \dots (2n+2)^2 (2n+4)^2}{3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2 \dots (2n+3)^2 (2n+5)^2}$$

**By D'Alembert's Test**

$$\frac{u_{n+1}}{u_n} = \frac{(2n+4)^2}{(2n+5)^2} = \frac{4n^2 + 16n + 16}{4n^2 + 20n + 25} = \frac{4 + \frac{16}{n} + \frac{16}{n^2}}{4 + \frac{20}{n} + \frac{25}{n^2}}$$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{4 + \frac{16}{n} + \frac{16}{n^2}}{4 + \frac{20}{n} + \frac{25}{n^2}} = 1$$

D'Alembert's Test fails. Let us apply Raabe's Test.

$$\begin{aligned} \lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) &= \lim_{n \rightarrow \infty} n \left( \frac{4n^2 + 20n + 25}{4n^2 + 16n + 16} - 1 \right) \\ &= \lim_{n \rightarrow \infty} \left( \frac{4n^2 + 9n}{4n^2 + 16n + 16} \right) = \lim_{n \rightarrow \infty} \left[ \frac{\frac{4}{n} + \frac{9}{n^2}}{4 + \frac{16}{n} + \frac{16}{n^2}} \right] = 1, \text{ Raabe's Test fails} \end{aligned}$$

Let us apply Gauss's Test

$$\begin{aligned}
 \frac{u_n}{u_{n+1}} &= \frac{(2n+5)^2}{(2n+4)^2} = \frac{\left(1 + \frac{5}{2n}\right)^2}{\left(1 + \frac{2}{n}\right)^2} = \left(1 + \frac{5}{n} + \frac{25}{4n^2}\right) \left(1 + \frac{2}{n}\right)^{-2} \\
 &= \left(1 + \frac{5}{n} + \frac{25}{4n^2}\right) \left(1 - \frac{4}{n} + \frac{(-2) \times (-3)}{2!} \frac{4}{n^2} + \dots\right) = \left(1 + \frac{5}{n} + \frac{25}{4n^2}\right) \left(1 - \frac{4}{n} + \frac{12}{n^2} + \dots\right) \\
 &= 1 - \frac{4}{n} + \frac{12}{n^2} + \frac{5}{n} - \frac{20}{n^2} + \frac{25}{4n^2} + \dots = 1 + \frac{1}{n} - \frac{7}{n^2} \quad \left(\frac{u_n}{u_{n+1}} = \alpha + \frac{\beta}{n} + \frac{\gamma}{n^2}\right)
 \end{aligned}$$

Hence,  $\alpha = 1$ ,  $\beta = 1$ . Thus, the series is divergent.

**Ans.**

### 39.19 CAUCHY'S INTEGRAL TEST

**Statement.** A positive term series  $f(1) + f(2) + f(3) + \dots + f(n) + \dots$  where  $f(n)$  decreases as  $n$  increases, converges or diverges according to the integral

$$\int_1^\infty f(x) dx$$

is finite or infinite.

**Proof.** In the figure, the area under the curve from  $x = 1$  to  $x = n + 1$  lies between the sum of the areas of small rectangles (small height) and sum of the areas of large rectangles (large height).

[ $f(1), f(2), \dots$  represent the height of the rectangles]

$$\begin{aligned}
 \Rightarrow f(1) + f(2) + \dots + f(n) &\geq \int_1^{n+1} f(x) dx \geq f(2) + f(3) + \dots + f(n+1) \\
 S_n &\geq \int_1^{n+1} f(x) dx \geq S_{n+1} - f(1)
 \end{aligned}$$

As  $n \rightarrow \infty$ , from the second inequality that if the integral has a finite value then  $\lim_{n \rightarrow \infty} S_{n+1}$  is also finite, so  $\sum f(n)$  is convergent.

Similarly, if the integral is infinite, then from the first inequality that  $\lim_{n \rightarrow \infty} S_n \rightarrow \infty$ , so the series is divergent.

**Example 26.** Apply the integral test to determine the convergence of the p-series

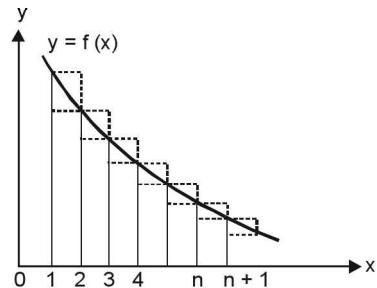

$$\frac{1}{1^p} + \frac{1}{2^p} + \frac{1}{3^p} + \dots + \frac{1}{n^p} + \dots \infty$$

**Solution.** (i) When  $p > 1$ ,  $f(x) = \frac{1}{x^p}$

$$\begin{aligned}
 \int_1^\infty f(x) dx &= \lim_{m \rightarrow \infty} \int_1^m \frac{1}{x^p} dx = \lim_{m \rightarrow \infty} \left[ \frac{x^{1-p}}{1-p} \right]_1^m = \lim_{m \rightarrow \infty} \frac{1}{1-p} (m^{1-p} - 1) \\
 &= \lim_{m \rightarrow \infty} \frac{1}{1-p} \left[ \frac{1}{m^{p-1}} - 1 \right] = \frac{1}{p-1}, \text{ which is finite.}
 \end{aligned}$$

By Cauchy's Integral Test, the series is convergent for  $p > 1$ .

(ii) When  $p < 1$ ,

$$\int_1^{\infty} f(x) dx = \frac{1}{1-p} \left[ \lim_{m \rightarrow \infty} (m^{1-p} - 1) \right] \rightarrow \infty$$

Thus, the series is divergent, if  $p < 1$ .

(iii) When  $p = 1$ ,

$$\int_1^{\infty} \frac{1}{x} dx = [\log x]_1^{\infty} \rightarrow \infty$$

Thus, the series is divergent.

Hence,  $\sum \frac{1}{n^p}$  is convergent if  $p > 1$  and divergent if  $p \leq 1$ .

**Ans.**

**Example 27.** Examine the convergence of  $\sum_{n=2}^{\infty} \frac{1}{n \log n}$ .

**Solution.** Here  $f(x) = \frac{1}{x \log x}$

$$\int_2^{\infty} \frac{1}{x \log x} dx = \lim_{m \rightarrow \infty} [\log \log x]_2^m = \lim_{m \rightarrow \infty} [\log \log m - \log \log 2] \rightarrow \infty$$

By Cauchy's Integral Test the series is divergent.

**Ans.**

**Example 28.** Examine the convergence of  $\sum_{x=1}^{\infty} x e^{-x^2}$

**Solution.** Here  $f(x) = x e^{-x^2}$

$$\text{Now, } \int_1^{\infty} x e^{-x^2} dx = \lim_{m \rightarrow \infty} \left[ \frac{e^{-x^2}}{-2} \right]_1^m = \lim_{m \rightarrow \infty} \left[ \frac{e^{-m^2}}{-2} + \frac{e^{-1}}{2} \right] = \frac{e^{-1}}{2} = \frac{1}{2e}, \text{ which is finite.}$$

Hence, the given series is convergent.

**Ans.**

### EXERCISE 39.8

Examine the convergence:

1.  $1 + \frac{x}{2} + \frac{x^2}{3^2} + \frac{x^2}{4^3} + \dots \infty$  ( $x > 0$ )

**Ans.** Convergent

2.  $\frac{2}{1^2} x + \frac{3^2}{2^3} x^2 + \frac{4^3}{3^4} x^3 + \dots + \frac{(n+1)^n}{n^{n+1}} x^n + \dots$

**Ans.**  $x < 1$ , convergent;  $x \geq 1$ , divergent

3.  $1 + \frac{2^2}{3^2} + \frac{2^2 \cdot 4^2}{3^2 \cdot 5^2} + \frac{2^2 \cdot 4^2 \cdot 6^2}{3^2 \cdot 5^2 \cdot 7^2} + \dots \infty$

**Ans.** Divergent

4.  $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$

**Ans.** Divergent

5.  $\sum_{n=1}^{\infty} \frac{1}{n^2 + 1}$

**Ans.** Convergent

6.  $\sum_{n=1}^{\infty} \frac{1}{n^n}$

**Ans.** Convergent

7.  $\sum_{n=1}^{\infty} n^2 e^{-n^3}$

**Ans.** Convergent

8.  $\sum_{n=1}^{\infty} \frac{1}{n (\log n)^2}$

**Ans.** Convergent

### 39.20 CAUCHY'S ROOT TEST

**Statement.** If  $\sum u_n$  is positive term series such that  $\lim_{n \rightarrow \infty} (u_n)^{1/n} = k$ , then

(i) if  $k < 1$ , the series converges.      (ii) if  $k > 1$ , the series diverges.

**Proof.** By definition of limit

$$|(u_n)^{1/n} - k| < \varepsilon \text{ for } n > m$$

$$\begin{aligned}
 (i) \quad & k - \varepsilon < (u_n)^{1/n} < k + \varepsilon \text{ for } n > m \\
 & k < 1 \\
 & k + \varepsilon < r < 1 \\
 & (u_n)^{1/n} < k \Rightarrow u_n < k^n \\
 & u_1 + u_2 + \dots \infty < k + k^2 + \dots + k^n + \dots \infty \\
 & < \frac{1}{1-k} \text{ (a finite quantity)}
 \end{aligned}$$

$\therefore$  The series is convergent.

$$\begin{aligned}
 (ii) \quad & k > 1 \\
 & k - \varepsilon > 1 \\
 & (u_n)^{1/n} > k - \varepsilon > 1 \\
 & u_n > 1 \\
 & S_n = u_1 + u_2 + \dots + u_n > n \\
 & \lim_{n \rightarrow \infty} S_n \rightarrow \infty
 \end{aligned}$$

$\therefore$  The series is divergent.

$$\begin{aligned}
 (iii) \quad & k = 1 \\
 & \text{If } \lim_{n \rightarrow \infty} (u_n)^{1/n} = 1, \text{ the test fails.}
 \end{aligned}$$

$$\text{For example, } \sum u_n = \sum \frac{1}{n^p}$$

$$\lim_{n \rightarrow \infty} (u_n)^{1/n} = \lim_{n \rightarrow \infty} \left( \frac{1}{n^p} \right)^{1/n} = \lim_{n \rightarrow \infty} \left( \frac{1}{n^{1/p}} \right)^{-p} = 1 \text{ for all } p, k = 1$$

But  $\sum \frac{1}{n^p}$  is convergent for  $p > 1$  and divergent for  $p \leq 1$ .

Thus, we cannot say whether  $\sum u_n$  is convergent or divergent for  $k = 1$ .

**Example 29.** Examine the convergence of the series  $\sum \frac{1}{\left(1 + \frac{1}{n}\right)^{n^2}}$  (MDU, Dec. 2010)

$$\begin{aligned}
 \text{Solution. Here, } u_n = \frac{1}{\left(1 + \frac{1}{n}\right)^{n^2}} \Rightarrow (u_n)^{1/n} = \left[ \frac{1}{\left(1 + \frac{1}{n}\right)^{n^2}} \right]^{\frac{1}{n}} = \frac{1}{\left(1 + \frac{1}{n}\right)^n}
 \end{aligned}$$

$$\lim_{n \rightarrow \infty} (u_n)^{1/n} = \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{1}{n}\right)^n} = \frac{1}{e} < 1$$

Hence, the given series is convergent.

Ans.

**Example 30.** Test the following series for convergence

$$\sum_{n=1}^{\infty} \frac{(n+1)^n x^n}{n^{n+1}} \quad (\text{M.D.U. Dec., 2001})$$

**Solution.** Here, we have

$$\sum_{n=1}^{\infty} \frac{(n+1)^n x^n}{n^{n+1}}$$

Here,

$$u_n = \frac{(n+1)^n x^n}{n^{n+1}} = \left[ \frac{(n+1)x}{n} \right]^n \cdot \frac{1}{n}$$

$$\Rightarrow (u_n)^{\frac{1}{n}} = \frac{(n+1)x}{n} \cdot \frac{1}{\frac{1}{n^n}} = \left(1 + \frac{1}{n}\right)x \cdot \frac{1}{\frac{1}{n^n}}$$

$$\Rightarrow \lim_{n \rightarrow \infty} (u_n)^{\frac{1}{n}} = \left[ \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)x \right] \left[ \lim_{n \rightarrow \infty} \frac{1}{\frac{1}{n^n}} \right]$$

$$= (1+0)x \cdot \frac{1}{1} = x \quad \left[ \because \lim_{n \rightarrow \infty} n^n = 1 \right]$$

∴ By Cauchy's root test,  $\sum u_n$  is convergent if  $x < 1$  and divergent if  $x > 1$ . The test fails when  $x = 1$ .

When  $x = 1$ ,

$$u_n = \frac{(n+1)^n}{n^{n+1}} = \frac{1}{n} \cdot \frac{(n+1)^n}{n^n} = \frac{1}{n} \left(1 + \frac{1}{n}\right)^n$$

Let

$$v_n = \frac{1}{n},$$

$$\frac{u_n}{v_n} = \left(1 + \frac{1}{n}\right)^n$$

$$\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = e, \text{ which is finite and non-zero.}$$

∴ By comparison test,  $\sum u_n$  and  $\sum v_n$  converge or diverge together.

Since  $\sum v_n = \sum \frac{1}{n}$  is of the form  $\sum \frac{1}{n^p}$  with  $p = 1$ ,

$\sum v_n$  divergent  $\Rightarrow \sum u_n$  also divergent

Hence,  $\sum u_n$  is convergent if  $x < 1$  and divergent if  $x \geq 1$ .

Ans.

**Example 31.** Discuss the convergence of the following series:

$$\left(\frac{2^2}{1^2} - \frac{2}{1}\right)^{-1} + \left(\frac{3^3}{2^3} - \frac{3}{2}\right)^{-2} + \left(\frac{4^4}{3^4} - \frac{4}{3}\right)^{-3} + \dots \infty$$

**Solution.** Here,  $u_n = \left[ \frac{(n+1)^{n+1}}{n^{n+1}} - \frac{(n+1)}{n} \right]^{-n}$

$$[u_n]^{1/n} = \left[ \left[ \frac{(n+1)^{n+1}}{n^{n+1}} - \frac{n+1}{n} \right]^{-n} \right]^{\frac{1}{n}} = \left[ \frac{(n+1)^{n+1}}{n^{n+1}} - \frac{n+1}{n} \right]^{-1}$$

$$\lim_{n \rightarrow \infty} (u_n)^{1/n} = \lim_{n \rightarrow \infty} \left[ \left(1 + \frac{1}{n}\right)^{n+1} - \left(1 + \frac{1}{n}\right) \right]^{-1} = (e-1)^{-1} = \frac{1}{e-1} < 1$$

Hence, the given series is convergent.

Ans.

### EXERCISE 39.9

Discuss the convergence of the following series:

1.  $\sum_{n=1}^{\infty} \frac{1}{n^n}$

Ans. Convergent

2.  $\sum_{n=1}^{\infty} \left(1 + \frac{1}{n}\right)^{n^2}$

Ans. Divergent

3.  $\sum_{n=1}^{\infty} \left(1 + \frac{1}{\sqrt{n}}\right)^{-n^{3/2}}$  **Ans.** Convergent      4.  $\sum_{n=1}^{\infty} \frac{1}{(\log n)^n}$  **Ans.** Convergent
5.  $\sum n^{-k}$  **Ans.** If  $k > 1$ , convergent
6.  $\sum_{n=2}^{\infty} \frac{1}{n(\log n)^k}$  **Ans.** If  $k > 1$ , convergent; and divergent if  $k \leq 1$ .
7.  $\sum (n \log n)^{-1} (\log \log n)^{-k}$  **Ans.** If  $k > 1$ , convergent; and divergent if  $k \leq 1$ .
8.  $\sum \left(1 - \frac{1}{n}\right)^{n^2}$  **Ans.** Convergent      9.  $\sum \frac{x^n}{n^n}$  **Ans.** Convergent
10.  $(a+b) + (a^2 + b^2) + (a^3 + b^3) + \dots$  **Ans.** Convergent if  $a < 1, b < 1$ ; divergent if  $a \geq 1, b \geq 1$

### 39.21 LOGARITHMIC TEST

If  $\Sigma u_n$  is a positive term series such that  $\lim_{n \rightarrow \infty} \left( n \log \frac{u_n}{u_{n+1}} \right) = k$

(i) If  $k > 1$ , then the series is convergent. (ii) If  $k < 1$ , then the series is divergent.

**Proof.** (i) If  $k > 1$

Compare  $\Sigma u_n$  with  $\sum \frac{1}{n^p}$ , if  $k > p > 1$ , then  $\Sigma u_n$  converges.

$$\frac{u_n}{u_{n+1}} = \frac{(n+1)^p}{n^p} = \left(1 + \frac{1}{n}\right)^p \quad \dots(1)$$

Taking logarithm of both sides of (1), we have:

$$\log \frac{u_n}{u_{n+1}} > p \log \left(1 + \frac{1}{n}\right) \left[ \log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots \right]$$

if  $\log \frac{u_n}{u_{n+1}} > p \left( \frac{1}{n} - \frac{1}{2n^2} + \frac{1}{3n^3} - \frac{1}{4n^4} + \dots \right)$

if  $n \log \frac{u_n}{u_{n+1}} > p \left( 1 - \frac{1}{2n} + \frac{1}{3n^2} - \frac{1}{4n^3} + \dots \right)$

$$\lim_{n \rightarrow \infty} n \log \frac{u_n}{u_{n+1}} > p$$

i.e.,  $k > p$  which is true as  $k > p > 1$ .  $\left[ \lim_{n \rightarrow \infty} n \log \frac{u_n}{u_{n+1}} = k \right]$

Hence,  $\Sigma u_n$  is convergent.

When  $p < 1$

Similarly, when  $p < 1$ ,  $\Sigma u_n$  is divergent.

When  $p = 1$ , the test fails.

**Example 32.** Test the convergence of the series  $x + \frac{2^2 \cdot x^2}{2!} + \frac{3^3 \cdot x^3}{3!} + \frac{4^4 \cdot x^4}{4!} + \dots \infty$  (MDU, Dec. 2010)

**Solution.** Here the series is  $x + \frac{2^2 \cdot x^2}{2!} + \frac{3^3 \cdot x^3}{3!} + \frac{4^4 \cdot x^4}{4!} + \dots + \frac{n^n \cdot x^n}{n!} + \dots \infty$

$$u_n = \frac{n^n \cdot x^n}{n!} \text{ and } u_{n+1} = \frac{(n+1)^{n+1} \cdot x^{n+1}}{(n+1)!}$$

$$\frac{u_n}{u_{n+1}} = \frac{n^n \cdot x^n}{n!} \frac{(n+1)!}{(n+1)^{n+1} x^{n+1}} = \frac{n^n}{(n+1)^n} \frac{1}{x} = \frac{1}{\left(1 + \frac{1}{n}\right)^n} \frac{1}{x}$$

$$\lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = \lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{1}{n}\right)^n} \frac{1}{x} = \frac{1}{e} \cdot \frac{1}{x}$$

If  $\frac{1}{e x} > 1$  or  $x < \frac{1}{e}$ , the series is convergent.

If  $\frac{1}{e x} < 1$  or  $\frac{1}{e} < x$ , the series is divergent. If  $\frac{1}{e x} = 1$  or  $x = \frac{1}{e}$ , the test fails.

$$\begin{aligned} \log \frac{u_n}{u_{n+1}} &= \log \frac{1}{\left(1 + \frac{1}{n}\right)^n} \cdot e = \log e - \log \left(1 + \frac{1}{n}\right)^n \\ &= 1 - n \log \left(1 + \frac{1}{n}\right) = 1 - n \left[ \frac{1}{n} - \frac{1}{2n^2} + \frac{1}{3n^3} + \dots \right] \\ &= 1 - 1 + \frac{1}{2n} - \frac{1}{3n^2} + \dots = \frac{1}{2n} - \frac{1}{3n^2} \end{aligned}$$

$$\lim_{n \rightarrow \infty} n \log \frac{u_n}{u_{n+1}} = \lim_{n \rightarrow \infty} \left[ \frac{1}{2} - \frac{1}{3n} \right] = \frac{1}{2} < 1.$$

Thus, the series is divergent.

**Ans.**

**Example 33.** Discuss the convergence of the series:

$$1 + \frac{x}{2} + \frac{2!}{3^2} x^2 + \frac{3!}{4^3} x^3 + \frac{4!}{5^4} x^4 + \dots \quad (x > 0) \quad (\text{M.D. University, I Semester, 2009})$$

**Solution.** Here, we have

$$1 + \frac{x}{2} + \frac{2!}{3^2} x^2 + \frac{3!}{4^3} x^3 + \frac{4!}{5^4} x^4 + \dots \quad \infty$$

Neglecting the first term, we get

$$\begin{aligned} u_n &= \frac{n!}{(n+1)^n} x^n \quad \text{and} \quad u_{n+1} = \frac{(n+1)!}{(n+2)^{n+1}} x^{n+1} \\ \frac{u_n}{u_{n+1}} &= \frac{n!}{(n+1)^n} \cdot x^n \cdot \frac{(n+2)^{n+1}}{(n+1)! \cdot x^{n+1}} = \frac{(n+2)^{n+1}}{(n+1)^n \cdot (n+1)} \cdot \frac{1}{x} \\ \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} &= \lim_{n \rightarrow \infty} \frac{(n+2)^{n+1}}{(n+1)^n \cdot (n+1)} \cdot \frac{1}{x} \\ &= \lim_{n \rightarrow \infty} \frac{n^{n+1} \left(1 + \frac{2}{n}\right)^{n+1}}{n^n \left(1 + \frac{1}{n}\right)^n \cdot n \left(1 + \frac{1}{n}\right)} \cdot \frac{1}{x} = \lim_{n \rightarrow \infty} \frac{\left(1 + \frac{2}{n}\right)^n \left(1 + \frac{2}{n}\right)}{\left(1 + \frac{1}{n}\right)^n \left(1 + \frac{1}{n}\right)} \cdot \frac{1}{x} \quad \dots(1) \\ &= \frac{e^2}{e} \cdot \frac{1}{x} = \frac{e}{x} \cdot \left[ \because \lim_{n \rightarrow \infty} \left(1 + \frac{a}{n}\right)^n = \lim_{n \rightarrow \infty} \left\{ \left(1 + \frac{a}{n}\right)^{\frac{n}{a}} \right\} = e \right] \\ &\quad \left[ \lim_{n \rightarrow \infty} \left(1 + \frac{2}{n}\right)^n = \lim_{n \rightarrow \infty} \left[ \left(1 + \frac{2}{n}\right)^{\frac{n}{2}} \right]^2 = e^2 \right] \end{aligned}$$

$\therefore$  By D'Alembert's ratio test, the series converges if  $1 < \frac{e}{x}$  or if  $x < e$  and diverges if  $\frac{e}{x} < 1$  or if  $e < x$ .

If  $x = e$ , the ratio test fails,  $\because \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = 1$

Now when  $x = e$

Putting the value of  $x$  in (1), we get

$$\frac{u_n}{u_{n+1}} = \frac{\left(1 + \frac{2}{n}\right)^{n+1}}{\left(1 + \frac{1}{n}\right)^{n+1}} \cdot \frac{1}{e}$$

Since the expression  $\frac{u_n}{u_{n+1}}$  involves the number  $e$ , so we do not apply Raabe's test but apply logarithmic test.

$$\begin{aligned} \therefore \log \frac{u_n}{u_{n+1}} &= (n+1) \log \left(1 + \frac{2}{n}\right) - (n+1) \log \left(1 + \frac{1}{n}\right) - \log e \\ &= (n+1) \left[ \log \left(1 + \frac{2}{n}\right) - \log \left(1 + \frac{1}{n}\right) \right] - 1 \\ &= (n+1) \left[ \left( \frac{2}{n} - \frac{1}{2} \cdot \frac{4}{n^2} + \frac{1}{3} \cdot \frac{8}{n^3} \dots \right) - \left( \frac{1}{n} - \frac{1}{2n^2} + \frac{1}{3n^3} + \dots \right) \right] - 1 \\ &= (n+1) \left[ \frac{1}{n} - \frac{3}{2n^2} + \frac{7}{3n^3} - \dots \right] - 1 \\ &= \left(1 - \frac{3}{2n}\right) + \left(\frac{1}{n} - \frac{3}{n^2} + \dots\right) - 1 = \frac{1}{n} - \frac{3}{n^2} - \frac{3}{2n^2} \\ &= 1 - \frac{1}{2n} - \frac{3}{2n^2} + \dots - 1 = -\frac{1}{2n} - \frac{3}{2n^2} \end{aligned}$$

$$\therefore \lim_{n \rightarrow \infty} n \log \frac{u_n}{u_{n+1}} = \lim_{n \rightarrow \infty} n \left[ -\frac{1}{2n} - \frac{3}{2n^2} + \dots \right] = \lim_{n \rightarrow \infty} \left( -\frac{1}{2} - \frac{3}{2n} + \dots \right) = -\frac{1}{2} < 1$$

$\therefore$  By log test, the series diverges.

Hence, the given series  $\sum u_n$  converges if  $x < e$  and diverges if  $x \geq e$ . Ans.

### EXERCISE 39.10

Examine the convergence for the following series :

$$1. \quad \frac{1^2}{4^2} + \frac{5^2}{8^2} + \frac{9^2}{12^2} + \frac{13^2}{16^2} + \dots \infty \quad \text{Ans. Convergent}$$

$$2. \quad 1 + \frac{1!}{2} x + \frac{2!}{3^2} x^2 + \frac{3!}{4^3} x^3 + \dots \infty \quad \text{Ans. If } x < e, \text{ convergent and divergent if } x \geq e$$

$$3. \quad \frac{1^2}{2^2} + \frac{1^2 \cdot 3^2}{2^2 \cdot 4^2} x + \frac{1^2 \cdot 3^2 \cdot 5^2}{2^2 \cdot 4^2 \cdot 6^2} x^2 + \dots \infty \quad \text{Ans. Convergent if } x < 1, \text{ and divergent if } x \geq 1$$

$$4. \quad \frac{a+x}{1!} + \frac{(a+2x)^2}{2!} + \frac{(a+3x)^3}{3!} + \dots \quad \text{Ans. Convergent if } x < \frac{1}{e}, \text{ divergent if } x \geq \frac{1}{e}$$

### 39.22 DE MORGAN'S AND BERTRAND'S TEST

If  $\sum u_n$  is a positive term series such that

$$\lim_{n \rightarrow \infty} \left[ \left\{ n \left( \frac{u_n}{u_{n+1}} - 1 \right) - 1 \right\} \log n \right] = k$$

then the series is convergent if  $k > 1$  and divergent if  $k < 1$ .

**Example 34.** Test for convergence the series  $1^p + \left(\frac{1}{2}\right)^p + \left(\frac{1 \times 3}{2 \times 4}\right)^p + \left(\frac{1 \times 3 \times 5}{2 \times 4 \times 6}\right)^p + \dots$

**Solution.** The given series is :

$$1^p + \left(\frac{1}{2}\right)^p + \left(\frac{1 \times 3}{2 \times 4}\right)^p + \left(\frac{1 \times 3 \times 5}{2 \times 4 \times 6}\right)^p + \dots$$

Here

$$u_n = \left[ \frac{1 \times 3 \times 5 \times \dots \times (2n-3)}{2 \times 4 \times 6 \times \dots \times (2n-2)} \right]^p$$

∴

$$u_{n+1} = \left[ \frac{1 \times 3 \times 5 \times \dots \times (2n-3)(2n-1)}{2 \times 4 \times 6 \times \dots \times (2n-2)(2n)} \right]^p$$

∴

$$\frac{u_{n+1}}{u_n} = \left( \frac{2n-1}{2n} \right)^p = \left( 1 - \frac{1}{2n} \right)^p$$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = 1$$

∴ D'Alembert's Test fails.

Now let us apply Raabe's Test.

$$\text{Here } n \left( \frac{u_n}{u_{n+1}} - 1 \right) = n \left[ \left( 1 - \frac{1}{2n} \right)^{-p} - 1 \right] = n \left[ 1 + \frac{p}{2n} + \frac{p(p+1)}{8n^2} + \dots - 1 \right] = \frac{p}{2} + \frac{p(p+1)}{8n} + \dots$$

$$\therefore \lim_{n \rightarrow \infty} n \left[ \frac{u_n}{u_{n+1}} - 1 \right] = \frac{p}{2}$$

If  $\frac{p}{2} > 1$ , i.e.,  $p > 2$ , the series is convergent and divergent if  $\frac{p}{2} < 1$ , i.e.,  $p < 2$ .

This test fails if  $\frac{p}{2} = 1$ , i.e.,  $p = 2$ .

Now let us apply De Morgan's Test. When  $p = 2$

$$n \left[ \frac{u_n}{u_{n+1}} - 1 \right] = 1 + \frac{3}{4n} + \dots$$

$$\begin{aligned} \text{Now, } \lim_{n \rightarrow \infty} \left[ n \left( \frac{u_n}{u_{n+1}} - 1 \right) - 1 \right] \log n &= \lim_{n \rightarrow \infty} \left[ 1 + \frac{3}{4n} + \dots - 1 \right] \log n \\ &= \lim_{n \rightarrow \infty} \frac{3}{4} \left[ \frac{\log n}{n} - \dots \right] = 0 < 1 \quad \left[ \lim_{x \rightarrow \infty} \frac{\log n}{n} = 0 \right] \end{aligned}$$

∴  $\sum u_n$  is divergent when  $p = 2$ .

**Ans.**

### 39.23 CAUCHY'S CONDENSATION TEST

If  $\phi(n)$  is positive for all positive integral values of  $n$  and continually diminishes as  $n$  increases and if  $a$  be a positive integer greater than 1, then the two series  $\sum \phi(n)$  and  $\sum a^n \phi(a^n)$  are either both convergent or both divergent.

**Example 35.** Show that the series

$$1 + \frac{1}{2(\log 2)^p} + \frac{1}{3(\log 3)^p} + \dots + \frac{1}{n(\log n)^p} + \dots$$

is convergent if  $p > 1$  and divergent if  $p = 1$  or  $p < 1$ .

**Solution.** We apply Cauchy's Condensation Test.

Here

$$\phi(n) = \frac{1}{n(\log n)^p}$$

$\therefore$   $n$ th term of the second series  $\sum a^n \phi(a^n)$  is :

$$a^n \left[ \frac{1}{a^n (\log a^n)^p} \right] \text{ i.e., } \frac{1}{(\log a^n)^p} \text{ i.e., } \frac{1}{(n \log a)^p} \text{ i.e., } \frac{1}{(\log a)^p} \times \frac{1}{n^p}$$

$\therefore$  The given series will be convergent or divergent if  $\sum \left[ \frac{1}{(\log a)^p} \times \frac{1}{n^p} \right]$  is convergent or divergent, i.e., if  $\sum \frac{1}{n^p}$  is convergent or divergent.

But we know the  $\sum \frac{1}{n^p}$  is convergent when  $p > 1$  and divergent if  $p = 1$  or  $< 1$ .

Hence, the given series is convergent if  $p > 1$  and divergent if  $p = 1$  or  $< 1$ . **Proved.**

### 39.24 ALTERNATING SERIES

A series in which the terms are alternately negative is called the alternating series.

e.g.,  $u_1 - u_2 + u_3 - u_4 + \dots \infty$

### 39.25 LEIBNITZ'S RULE FOR CONVERGENCE OF AN ALTERNATING SERIES

(i) Each term is numerically less than its preceding term.

(ii)  $\lim_{n \rightarrow \infty} u_n = 0$

**Exmaple 36.** Discuss the convergence of the series  $\sum_{n=1}^{\infty} (-1)^n \frac{n}{n^2 + 1}$ .

**Solution.** The terms of the given series are alternately positive and negative;

$$(i) |u_n| = \frac{n}{n^2 + 1} \quad \text{and} \quad |u_{n+1}| = \frac{(n+1)}{(n+1)^2 + 1}$$

$$\begin{aligned} |u_n| - |u_{n+1}| &= \frac{n}{n^2 + 1} - \frac{(n+1)}{(n+1)^2 + 1} = \frac{n(n+1)^2 + n - (n+1)(n^2 + 1)}{(n^2 + 1)[(n+1)^2 + 1]} \\ &= \frac{n^2 + n - 1}{(n^2 + 1)[(n+1)^2 + 1]} = +\text{ve} \end{aligned}$$

and each term is numerically less than its preceeding term.

$$(ii) \lim_{n \rightarrow \infty} |u_n| = \lim_{n \rightarrow \infty} \frac{n}{n^2 + 1} = \lim_{n \rightarrow \infty} \frac{1}{n + \frac{1}{n}} = 0$$

Both conditions are satisfied.

Hence, by Leibnitz's rule, the given series is convergent.

**Ans.**

**Example 37.** Test the convergence of the series  $\frac{1}{6} - \frac{2}{11} + \frac{3}{16} - \frac{4}{21} + \frac{5}{26} - \dots \infty$

**Solution.** The terms of the given series are alternately positive and negative.

$$u_n = (-1)^{n-1} \frac{n}{5n+1}$$

$$|u_n| = \frac{n}{5n+1} \text{ and } |u_{n+1}| = \frac{n+1}{5(n+1)+1}$$

$$\begin{aligned} (i) |u_n| - |u_{n+1}| &= \frac{n}{5n+1} - \frac{n+1}{5(n+1)+1} = \frac{5n^2+6n-5n^2-5n-n-1}{(5n+1)(5n+6)} \\ &= \frac{-1}{(5n+1)(5n+6)} \end{aligned}$$

$$\therefore |u_n| > |u_{n+1}|$$

Thus each term is not numerically less than its preceding terms.

$$\begin{aligned} (ii) \lim_{n \rightarrow \infty} u_n &= \lim_{n \rightarrow \infty} \frac{n}{5n+1} = \lim_{n \rightarrow \infty} \frac{1}{5 + \frac{1}{n}} = \frac{1}{5} \neq 0 \\ \lim_{n \rightarrow \infty} u_n &\neq 0 \end{aligned}$$

Both conditions for convergence are not satisfied.

Hence, the series is not convergent. It is oscillatory.

**Ans.**

**Example 38.** Test the following series for convergence and absolute convergence:

$$1 - \frac{1}{2\sqrt{2}} + \frac{1}{3\sqrt{3}} - \frac{1}{4\sqrt{4}} + \dots \quad (\text{M.D.U. Dec., 2002})$$

**Solution.** The given series is

$$\sum_{n=1}^{\infty} u_n = \sum_{n=1}^{\infty} (-1)^{n-1} \cdot \frac{1}{n\sqrt{n}} = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{1}{n^{\frac{3}{2}}} = \sum_{n=1}^{\infty} (-1)^{n-1} a_n$$

It is an alternating series.

Here,

$$a_n = \frac{1}{n^{\frac{3}{2}}}$$

$$a_{n+1} = \frac{1}{(n+1)^{\frac{3}{2}}}$$

Since,

$$\frac{1}{n^{\frac{3}{2}}} > \frac{1}{(n+1)^{\frac{3}{2}}} \quad \forall n \quad (\because a_n > a_{n+1} \quad \forall n)$$

Also,

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{n^{\frac{3}{2}}} = 0$$

$\therefore$  By Leibnitz's test, the series  $\sum u_n$  is convergent.

$$|u_n| = \frac{1}{n^{\frac{3}{2}}}$$

Now  $\sum |u_n| = \sum \frac{1}{n^{\frac{3}{2}}}$  is convergent  $\left(\because p = \frac{3}{2} > 1\right)$

Hence, the series  $\sum u_n$  is absolutely convergent.

**Ans.**

**Example 39.** Test the convergence of the series:

$$\sum_{n=1}^{\infty} \frac{(-1)^n (x+1)^n}{2^n n^2}$$

(M.D. University, I Semester, 2009)

**Solution.** Here, we have

$$\sum_{n=1}^{\infty} \frac{(-1)^n (x+1)^n}{2^n n^2} \quad \dots(1)$$

$$\text{Here, } u_n = \frac{(-1)^n (x+1)^n}{2^n n^2} \text{ and } u_{n+1} = \frac{(-1)^{n+1} (x+1)^{n+1}}{2^{n+1} (n+1)^2}$$

$$\begin{aligned} \frac{|u_n|}{|u_{n+1}|} &= \frac{|x+1|^n}{2^n n^2} \cdot \frac{2^{n+1} (n+1)^2}{|x+1|^{n+1}} \\ &= 2 \left( \frac{n+1}{n} \right)^2 \cdot \frac{1}{|x+1|} = 2 \left( 1 + \frac{1}{n} \right)^2 \cdot \frac{1}{|x+1|} \end{aligned}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{|u_n|}{|u_{n+1}|} = \lim_{n \rightarrow \infty} 2 \left( 1 + \frac{1}{n} \right)^2 \cdot \frac{1}{|x+1|} = \frac{2}{|x+1|}$$

$\therefore$  By ratio test, the series  $\sum |u_n|$  is convergent if

$$\text{i.e., } 1 < \frac{2}{|x+1|} \text{ i.e., if } |x+1| < 2$$

i.e., if  $-2 < x+1 < 2$  i.e., if  $-3 < x < 1$

Also  $\sum |u_n|$  is divergent if  $\frac{2}{|x+1|} < 1$

i.e., if  $|x+1| > 2$  i.e., if  $x+1 > 2$  or  $x+1 < -2$  i.e., if  $x > 1$  or  $x < -3$ .

Ratio test fails when  $x = 1$  or  $-3$ .

$$\text{When } x = 1, \sum u_n = \sum \frac{(-1)^n \cdot 2^n}{2^n n^2} = \sum \frac{(-1)^n}{n^2} = \sum (-1)^n v_n \quad \text{From (1)}$$

It is an alternating series.

$$\text{Here, } v_n = \frac{1}{n^2}, \quad v_{n+1} = \frac{1}{(n+1)^2}$$

$$\text{Clearly } v_n > v_{n+1} \quad \forall n$$

$$\text{Also } \lim_{n \rightarrow \infty} v_n = \lim_{n \rightarrow \infty} \frac{1}{n^2} = 0$$

$\therefore$  By Leibnitz's test,  $\sum u_n$  is convergent.

$$\text{When } x = -3, \sum u_n = \sum \frac{(-1)^n \cdot (-2)^n}{2^n n^2} = \sum \frac{(-1)^{2n} 2^n}{2^n n^2} = \sum \frac{1}{n^2}$$

Which is convergent.

Hence, the given series is convergent if  $-3 \leq x \leq 1$  and divergent if  $x > 1$  or  $x < -3$

**EXERCISE 39.11**

Discuss the convergence of the following series :

1.  $1 - \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} - \frac{1}{\sqrt{4}} + \dots$  Ans. Convergent
2.  $1 - 2x + 3x^2 - 4x^3 + \dots \infty (x < 1)$  Ans. Convergent
3.  $\frac{x}{1+x} - \frac{x^2}{1+x^2} + \frac{x^3}{1+x^3} - \frac{x^4}{1+x^4} + \dots \infty (0 < x < 1)$  Ans. Convergent
4.  $\frac{1}{1^p} - \frac{1}{2^p} + \frac{1}{3^p} - \frac{1}{4^p} + \dots$  Ans. If  $p > 0$ , convergent; oscillatory if  $p < 0$ .
5.  $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{n}{2n-1}$  Ans. Oscillatory
6. Show that the series  $\frac{1}{x+1} - \frac{1}{x+2} + \frac{1}{x+3} - \frac{1}{x+4} + \dots$  is convergent for all real values of  $x$  other than negative integers.
7. Prove that the series  $x - \frac{x^2}{2} + \frac{x^3}{3} - \dots$  converges if  $-1 < x \leq 1$ .

**39.26 ALTERNATING CONVERGENT SERIES**

There are two types of alternating convergent series :

(1) **Absolutely convergent series.** (2) **Conditionally convergent series.**

**Absolutely convergent series.** If  $u_1 + u_2 + u_3 + \dots$  be such that

$|u_1| + |u_2| + |u_3| + \dots$  be convergent then  $u_1 + u_2 + u_3 + \dots \infty$  is called absolutely convergent.

**Example 40.** Show that the series  $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \dots$  is convergent but not absolutely convergent.

**Solution.**  $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$

The terms of the series are alternately positive and negative.

$$(i) |u_{n+1}| < |u_n| \text{ as } \frac{1}{n+1} < \frac{1}{n} \quad (ii) \lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$$

Both conditions are satisfied. Hence, the given series is convergent.

But  $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots \infty$  is divergent since in  $p$ -series,  $p = 1$ .

Hence, the given series is conditionally convergent.

**Ans.**

**Example 41.** What can you say about the series  $1 - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots \infty$  ?

**Solution.**  $1 - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots$

$$|u_n| = \frac{1}{n^2}, \quad \text{and} \quad |u_{n+1}| = \frac{1}{(n+1)^2}$$

$$(i) |u_{n+1}| < |u_n| \quad (ii) \lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} \frac{1}{n^2} = 0$$

Thus, the given series is convergent by Leibnitz's rule.

And  $1 + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots$  is also convergent since in  $p$ -series,  $p = 2 > 1$ .

Both the conditions are satisfied.

Hence, the given series is absolutely convergent.

Ans.

**Example 42.** Discuss the series for convergence  $1 - \frac{1}{3} + \frac{1}{2} - \frac{1}{3^3} + \frac{1}{2^2} - \frac{1}{3^5} + \frac{1}{2^3} - \frac{1}{3^7} + \dots$

**Solution.** The given series is rewritten as

$$1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots - \left( \frac{1}{3} + \frac{1}{3^3} + \frac{1}{3^5} + \frac{1}{3^7} + \dots \right)$$

$$\lim_{n \rightarrow \infty} S_n = \frac{\frac{1}{2}}{1 - \frac{1}{2}} - \frac{\frac{1}{3}}{1 - \frac{1}{3}} = 2 - \frac{3}{8} = 1\frac{5}{8}$$

The given series is convergent.

Again  $1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots + \frac{1}{3} + \frac{1}{3^3} + \frac{1}{3^5} + \dots$

$$\lim_{n \rightarrow \infty} S_n = \frac{\frac{1}{2}}{1 - \frac{1}{2}} + \frac{\frac{1}{3}}{1 - \frac{1}{3}} \quad \left( \lim_{n \rightarrow \infty} S_n = \frac{a}{1-r} \right)$$

$$\lim_{n \rightarrow \infty} S_n = 2 + \frac{3}{8} = \frac{19}{8}$$

Both the conditions are satisfied.

This series is also convergent.

Hence, the given series is absolutely convergent.

Ans.

**Example 43.** Test the convergence and divergence of the series

$$5 - \frac{10}{3} + \frac{20}{9} - \frac{40}{27} + \dots \quad (\text{Gujarat, I Semester, Jan. 2009})$$

**Solution.** The terms of the given series are alternately positive and negative and the given series is geometric infinite series.

$$(i) \quad S = 5 - \frac{10}{3} + \frac{20}{9} - \frac{40}{27} + \frac{80}{81} + \dots$$

$$\text{Here } a = 5 \text{ and } r = -\frac{2}{3}, \quad S = \frac{a}{1-r}$$

$$S = \frac{5}{1 - \left(-\frac{2}{3}\right)} = \frac{5}{1 + \frac{2}{3}} = \frac{5}{\frac{5}{3}} = 3$$

Sum of the series is finite.

Hence, the given series is convergent.

$$(ii) \quad \text{Again } 5 + \frac{10}{3} + \frac{20}{9} + \frac{40}{27} + \frac{80}{81} + \dots$$

This is also G.P.

$$\text{Here, } a = 5 \text{ and } r = \frac{2}{3}$$

$$S = \frac{a}{1-r}, \quad S = \frac{5}{1 - \frac{2}{3}} = \frac{5}{\frac{1}{3}} = 15$$

Again sum of the positive terms is finite.

Thus the series is also convergent.

Both of the conditions are satisfied.

Hence, the given series is absolutely convergent.

**Ans.**

**Example 44.** Test the following series for convergence and divergence.

$$\sum_{n=1}^{\infty} \tan^{-1} \left( \frac{1}{n^2 + n + 1} \right) \quad (\text{Gujarat, I Semester, Jan. 2009})$$

**Solution.** Let  $u_n = \tan^{-1} \frac{1}{1+n(n+1)}$

$$u_n = \tan^{-1} \frac{(n+1)-n}{1+n(n+1)}$$

$$u_n = \tan^{-1}(n+1) - \tan^{-1}(n)$$

$$u_{n+1} = \tan^{-1}(n+2) - \tan^{-1}(n+1)$$

By D'Alembert's test

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} &= \lim_{n \rightarrow \infty} \frac{\tan^{-1}(n+2) - \tan^{-1}(n+1)}{\tan^{-1}(n+1) - \tan^{-1}n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{1+(n+2)^2} - \frac{1}{1+(n+1)^2}}{\frac{1}{1+(n+1)^2} - \frac{1}{1+n^2}} \\ &\quad [\text{L'Hopital Rule}] \\ &= \lim_{n \rightarrow \infty} \frac{\frac{1+(n+1)^2 - 1 - (n+2)^2}{[1+(n+2)^2][1+(n+1)^2]}}{\frac{1+n^2 - 1 - (n+1)^2}{[1+(n+1)^2][1+n^2]}} = \lim_{n \rightarrow \infty} \frac{(2n+3)(-1)}{(2n+1)(-1)} \times \frac{1+n^2}{1+(n+2)^2} \\ &= \lim_{n \rightarrow \infty} \frac{(2n+3)(1+n^2)}{(2n+1)[n^2+4n+5]} = \lim_{n \rightarrow \infty} \frac{\left(2+\frac{3}{n}\right)\left(\frac{1}{n^2}+1\right)}{\left(2+\frac{1}{n}\right)\left(1+\frac{4}{n}+\frac{5}{n^2}\right)} = \frac{2}{2} = 1 \end{aligned}$$

Test fails.

Let us apply Raabe's Test.

$$\begin{aligned} \lim_{n \rightarrow \infty} n \left( \frac{u_n}{u_{n+1}} - 1 \right) &= \lim_{n \rightarrow \infty} n \left[ \frac{(2n+1)(n^2+4n+5)}{(2n+3)(n^2+1)} - 1 \right] \\ &= \lim_{n \rightarrow \infty} n \left[ \frac{(2n+1)(n^2+4n+5) - (2n+3)(n^2+1)}{(2n+3)(n^2+1)} \right] \\ &= \lim_{n \rightarrow \infty} n \left[ \frac{2n^3+8n^2+10n+n^2+4n+5-2n^3-2n-3n^2-3}{(2n+3)(n^2+1)} \right] \end{aligned}$$

$$= \lim_{n \rightarrow \infty} n \left[ \frac{6n^2+12n+2}{(2n+3)(n^2+1)} \right] = \lim_{n \rightarrow \infty} \frac{\frac{6}{n} + \frac{12}{n^2} + \frac{2}{n^3}}{\left(2+\frac{3}{n}\right)\left(1+\frac{1}{n^2}\right)} = \frac{6}{2} = 3 > 1$$

Hence, the given series is convergent.

**Ans.**

## EXERCISE 39.12

Discuss the convergence of the following series :

$$1. \ 1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \dots \infty$$

**Ans.** Absolutely convergent

$$2. \ 1 - \frac{2}{5} + \frac{3}{10} - \frac{4}{17} + \dots + \frac{(-1)^{n-1} n}{n^2 + 1} + \dots \infty$$

**Ans.** Conditionally convergent

$$3. \ 1 - \frac{2}{3} + \frac{3}{3^2} - \frac{4}{3^3} + \dots$$

**Ans.** Absolutely convergent

$$4. \ 1 + \frac{1}{2^2} - \frac{1}{3^2} - \frac{1}{4^2} + \frac{1}{5^2} + \frac{1}{6^2} - \frac{1}{7^2} - \frac{1}{8^2} + \dots$$

**Ans.** Absolutely convergent

$$5. \ 1 - \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} - \frac{1}{\sqrt{4}} + \dots \infty$$

**Ans.** Conditionally convergent

$$6. \ \frac{\sin x}{1^3} - \frac{\sin 2x}{2^3} + \frac{\sin 3x}{3^3} + \dots$$

**Ans.** Absolutely convergent

39.27 POWER SERIES IN  $x$ 

$$a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots$$

is power series in  $x$ , here  $a$ 's are independent of  $x$ .

**Proof.**  $u_n = a_n x^n$  and  $u_{n+1} = a_{n+1} x^{n+1}$

**D'Alembert's Ratio Test**

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{a_{n+1} x^{n+1}}{a_n x^n} = \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} x$$

$$\text{If } \frac{a_{n+1}}{a_n} = k,$$

If  $|kx| < 1 \Rightarrow |x| < \frac{1}{k}$ , then the series is convergent.

Thus, the power series is convergent if  $-\frac{1}{k} < x < \frac{1}{k}$ .

Thus, the interval of the power series is  $-\frac{1}{k}$  to  $\frac{1}{k}$  for convergence. Outside this interval the series is divergent. **Ans.**

**Example 45.** Find the values of  $x$  for which the series  $x - \frac{x^2}{2^2} + \frac{x^3}{3^2} - \frac{x^4}{4^2} + \dots \infty$  converges.

**Solution.** Here  $u_n = (-1)^{n-1} \frac{x^n}{n^2}$ , and  $u_{n+1} = (-1)^n \frac{x^{n+1}}{(n+1)^2}$

$$\frac{u_{n+1}}{u_n} = -\frac{n^2}{(n+1)^2} x \Rightarrow \lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = -\lim_{n \rightarrow \infty} \frac{1}{\left(1 + \frac{1}{n}\right)^2} x = -x$$

By **D'Alembert's Test** the given series is convergent for  $|x| < 1$  and divergent if  $|x| > 1$ .

**At  $x = 1$ .** The series becomes  $1 - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots$

This is an alternately convergent series.

**At  $x = -1$ .** The series becomes  $-1 - \frac{1}{2^2} - \frac{1}{3^2} - \frac{1}{4^2} + \dots$

This is also convergent series,  $p = 2$

Hence, the interval of convergence is  $-1 \leq x \leq 1$ .

**Ans.**

### 39.28 EXPONENTIAL SERIES

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots + \frac{x^n}{n!} + \dots$$

is convergent for all values of  $x$ .

**Proof.** Here, we have  $u_n = \frac{x^{n-1}}{(n-1)!}$ , and  $u_{n+1} = \frac{x^n}{n!}$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{x^n}{n!} \cdot \frac{(n-1)!}{x^{n-1}} = \lim_{n \rightarrow \infty} \frac{x}{n} = 0 < 1$$

Hence, by D'Alembert's Test the exponential series is convergent for all values of  $x$ .

### 39.29 LOGARITHMIC SERIES

$$\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots + (-1)^{n-1} \frac{x^n}{n} + \dots$$

is convergent for  $-1 < x \leq 1$ .

**Proof.** Here,  $u_n = (-1)^{n-1} \frac{x^n}{n}$ , and  $u_{n+1} = (-1)^n \frac{x^{n+1}}{n+1}$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} \frac{(-1)^n x^{n+1}}{n+1} \cdot \frac{n}{(-1)^{n-1} x^n} = -\lim_{n \rightarrow \infty} \left( \frac{n}{n+1} \right) x = -\lim_{n \rightarrow \infty} \left( \frac{1}{1+\frac{1}{n}} \right) x = -x$$

Thus, the series is convergent for  $|x| < 1$  and divergent for  $|x| > 1$ .

At  $x = 1$ . The series becomes

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots \infty \text{ which is convergent.}$$

At  $x = -1$ . The series becomes

$$-1 - \frac{1}{2} - \frac{1}{3} - \frac{1}{4} + \dots \infty \text{ which is divergent.}$$

### 39.30 BINOMIAL SERIES

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{2!} x^2 + \frac{n(n-1)(n-2)}{3!} x^3 + \dots$$

is convergent for  $|x| < 1$ .

**Proof.**  $u_r = \frac{n(n-1) \dots (n-r+2)}{(r-1)!} x^{r-1}$

$$u_{r+1} = \frac{n(n-1) \dots (n-r+1)}{r!} x^r$$

$$\lim_{r \rightarrow \infty} \frac{u_{r+1}}{u_r} = \lim_{r \rightarrow \infty} \frac{n-r+1}{r} x = \lim_{r \rightarrow \infty} \left( \frac{n+1}{r} - 1 \right) x = -x \text{ for } r > n+1$$

If  $|x| < 1$ , the series is convergent by D'Alembert's Test.

### EXERCISE 39.13

Test the convergence of the following series

1.  $1 + x + 2x^2 + 3x^3 + \dots + nx^n + \dots \infty$  **Ans.** Convergent if  $-1 < x > 1$

2.  $\frac{1}{2} + \frac{x}{3} + \frac{x^2}{4} + \frac{x^3}{5} + \dots + \frac{x^n}{n+2} + \dots \infty$  **Ans.** Convergent for  $-1 < x < 1$

3.  $1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \dots \infty$  **Ans.** Convergent    4.  $1 + \frac{4}{1!} + \frac{4^2}{2!} + \frac{4^3}{3!} + \dots \infty$  **Ans.** Convergent

5.  $3 - \frac{3^2}{2} + \frac{3^3}{3} - \frac{3^4}{4} + \dots \infty$  **Ans.** Convergent    6.  $\sqrt{2} - \frac{2}{2} + \frac{2^{\frac{3}{2}}}{3} - \frac{2^2}{4} + \dots \infty$  **Ans.** Convergent
7.  $\frac{1}{1-x} + \frac{1}{2(1-x)^2} + \frac{1}{3(1-x)^3} + \dots \infty$  **Ans.** Convergent, if  $x \neq 1$

### 39.31 UNIFORM CONVERGENCE

If for a given  $\varepsilon > 0$ , a number  $N$  can be found independent of  $x$ , such that for every  $x$  in the interval  $(a, b)$ , the series is said to be uniformly convergent in the interval  $(a, b)$ .

**Example 46.** Discuss the uniform convergence of the series

$$1 + x + x^2 + \dots \infty$$

**Solution.**  $S_n = 1 + x + x^2 + \dots + x^n = \frac{1-x^n}{1-x}$

$$S_\infty(x) = \lim_{n \rightarrow \infty} \frac{1-x^n}{1-x} = \frac{1}{1-x} \quad \text{for } |x| < 1$$

$$|S_\infty(x) - S_n(x)| = \left| \frac{1}{1-x} - \frac{1-x^n}{1-x} \right| = \left| \frac{x^n}{1-x} \right| = \frac{|x|^n}{1-x} < \varepsilon$$

if  $|x|^n < \varepsilon (1-x)$

Let  $|x|^N = \varepsilon (1-x) \Rightarrow N = \frac{\log \varepsilon (1-x)}{\log |x|}$

In the interval  $\left(-\frac{1}{2}, \frac{1}{2}\right)$ ,  $N$  has maximum value.  $N = \frac{\log \frac{\varepsilon}{2}}{\log \frac{1}{2}}$

Hence, the given series is uniformly convergent in the interval  $\left(-\frac{1}{2}, \frac{1}{2}\right)$ .

**Note.** The series is convergent in  $(-1, 1)$  but not uniformly convergent.

### 39.32 ABEL'S TEST

If  $v_n(x)$  be either monotonic decreasing in  $n$  for each fixed  $x$  in  $(a, b)$  or monotonic increasing in  $n$  for each fixed  $x$  in  $(a, b)$ ,  $\sum a_n(x)v_n(x)$  is uniformly convergent in  $(a, b)$  if

(i)  $\sum a_n(x)$  is uniformly convergent in  $(a, b)$ .

(ii) There exists  $k$  such that  $|v_n(x)| < k$  for all  $n$  when  $a \leq x < b$ .

**Example 47.** Prove that  $\frac{x^n}{n^3}$  is uniformly convergent in  $(-1, 1)$ .

**Solution.** (i)  $\sum \frac{1}{n^3}$  is uniformly convergent. (ii)  $|x^n| < k$  for all  $n$  when  $-1 < k < 1$

Hence,  $\sum \frac{x^n}{n^3}$  is uniformly convergent by Abel's Test. **Ans.**

### EXERCISE 39.14

Prove that the following series are uniformly convergent in  $(-1, 1)$ .

1.  $\sum \frac{x^n}{n^2}$
2.  $\sum \frac{x^n}{n(n+1)}$
3.  $\sum \frac{x^{2n}}{x^{2n} + n^2}$
4. Prove that the series  $1 + \frac{e^{-2x}}{2^2 - 1} - \frac{e^{-4x}}{4^2 - 1} + \frac{e^{-6x}}{6^2 - 1} + \dots \infty$  is uniformly convergent with regard to  $x$  in  $x \geq 0$ .

## FOURIER SERIES

---

### 40.1 PERIODIC FUNCTIONS

If the value of each ordinate  $f(t)$  repeats itself at equal intervals in the abscissa, then  $f(t)$  is said to be a periodic function.

If  $f(t) = f(t + T) = f(t + 2T) = \dots$  then  $T$  is called the period of the function  $f(t)$ .

*For example:*

The period of  $\sin x$ ,  $\cos x$ ,  $\sec x$ , and  $\operatorname{cosec} x$  is  $2\pi$ .

The period of  $\tan x$  and  $\cot x$  is  $\pi$ .

$\sin x = \sin(x + 2\pi) = \sin(x + 4\pi) = \dots$  so  $\sin x$  is a periodic function with the period  $2\pi$ .

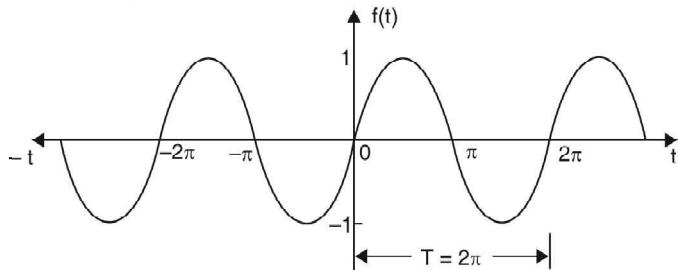

$$\sin 5x = \sin(5x + 2\pi) = \sin 5\left(x + \frac{2\pi}{5}\right), \text{ Period} = \frac{2\pi}{5}$$

$$\cos 3x = \cos(3x + 2\pi) = \cos 3\left(x + \frac{2\pi}{3}\right), \text{ Period} = \frac{2\pi}{3}$$

$$\begin{aligned} \cos \frac{2n\pi x}{k} &= \cos\left(\frac{2n\pi x}{k} + 2\pi\right) = \cos \frac{2n\pi}{k}\left(x + \frac{2\pi k}{2n\pi}\right) \\ &= \cos \frac{2n\pi}{k}\left(x + \frac{k}{n}\right), \text{ Period} = \frac{k}{n} \end{aligned}$$

$$\tan 2x = \tan(2x + \pi) = \tan 2\left(x + \frac{\pi}{2}\right), \text{ Period} = \frac{\pi}{2}$$

This is also called sinusoidal periodic function.

### 40.2 FOURIER SERIES

Here we will express a non-sinusoidal periodic function into a fundamental and its harmonics. A series of sines and cosines of an angle and its multiples of the form.

$$\begin{aligned} \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + a_3 \cos 3x + \dots + a_n \cos nx + \dots \\ + b_1 \sin x + b_2 \sin 2x + b_3 \sin 3x + \dots + b_n \sin nx + \dots \\ = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx. \end{aligned}$$

is called the Fourier series, where  $a_0, a_1, a_2, \dots, a_n, \dots, b_1, b_2, b_3, \dots, b_n, \dots$  are constants.

A periodic function  $f(x)$  can be expanded in a Fourier Series. The series consists of the following:

- (i) A constant term  $a_0$  (called d.c. component in electrical work).
  - (ii) A component at the fundamental frequency determined by the values of  $a_1, b_1$ .
  - (iii) Components of the harmonics (multiples of the fundamental frequency) determined by  $a_2, a_3 \dots b_2, b_3 \dots$  And  $a_0, a_1, a_2 \dots, b_1, b_2 \dots$  are known as *Fourier coefficients* or Fourier constants.

**Note.** (1) When the function and its derivatives are continuous then the function can be expanded in powers of  $x$  by Maclaurin's theorem.

(2) But by Fourier series we can expand continuous and discontinuous both types of functions under certain conditions.

### 40.3 DIRICHLET'S CONDITIONS FOR A FOURIER SERIES

If the function  $f(x)$  for the interval  $(-\pi, \pi)$

$$S_P(x) = \frac{a_0}{2} + \sum_{n=1}^P a_n \cos nx + \sum_{n=1}^P b_n \sin nx$$

converges to  $f(x)$  as  $P \rightarrow \infty$  at values of  $x$  for which  $f(x)$  is continuous and the sum of the series is equal to  $\frac{1}{2}[f(x+0) + f(x-0)]$  at points of discontinuity.

## 40.4 ADVANTAGES OF FOURIER SERIES

1. Discontinuous function can be represented by Fourier series. Although derivatives of the discontinuous functions do not exist. (This is not true for Taylor's series).
  2. The Fourier series is useful in expanding the periodic functions since outside the closed interval, there exists a periodic extension of the function.
  3. Expansion of an oscillating function by Fourier series gives all modes of oscillation (fundamental and all overtones) which is extremely useful in physics.
  4. Fourier series of a discontinuous function is not uniformly convergent at all points.
  5. Term by term integration of a convergent Fourier series is always valid, and it may be valid if the series is not convergent. However, term by term, differentiation of a Fourier series is not valid in most cases.

## 40.5 USEFUL INTEGRALS

The following integrals are useful in Fourier Series.

$$(i) \int_0^{2\pi} \sin nx \, dx = 0 \quad (ii) \int_0^{2\pi} \cos nx \, dx = 0$$

$$(iii) \int_0^{2\pi} \sin^2 nx \, dx = \pi \quad (iv) \int_0^{2\pi} \cos^2 nx \, dx = \pi$$

$$(v) \int_0^{2\pi} \sin nx \cdot \sin mx dx = 0 \quad (vi) \int_0^{2\pi} \cos nx \cos mx dx = 0$$

$$(vii) \int_0^{2\pi} \sin nx \cdot \cos mx dx = 0 \quad (viii) \int_0^{2\pi} \sin nx \cdot \cos nx dx = 0$$

$$(ix) [uv]_1 = uv_1 - u'v_2 + u''v_3 - u'''v_4 + \dots$$

where  $v_1 = \int v dx, v_2 = \int v_1 dx$  and so on  $u' = \frac{du}{dx}, u'' = \frac{d^2u}{dx^2}$  and so on and

(x)  $\sin n \pi = 0, \cos n \pi = (-1)^n$  where  $n \in I$

#### 40.6 DETERMINATION OF FOURIER COEFFICIENTS (EULER'S FORMULAE)

$$\begin{aligned} f(x) &= \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + \dots + a_n \cos nx + \dots \\ &\quad + b_1 \sin x + b_2 \sin 2x + \dots + b_n \sin nx + \dots \end{aligned} \quad \dots(1)$$

(i) **To find  $a_0$ :** Integrate both sides of (1) from  $x = 0$  to  $x = 2\pi$ .

$$\begin{aligned} \int_0^{2\pi} f(x) dx &= \frac{a_0}{2} \int_0^{2\pi} dx + a_1 \int_0^{2\pi} \cos x dx + a_2 \int_0^{2\pi} \cos 2x dx + \dots + a_n \int_0^{2\pi} \cos nx dx + \dots \\ &\quad + b_1 \int_0^{2\pi} \sin x dx + b_2 \int_0^{2\pi} \sin 2x dx + \dots + b_n \int_0^{2\pi} \sin nx dx + \dots \\ &= \frac{a_0}{2} \int_0^{2\pi} dx \quad (\text{other integrals} = 0 \text{ by formulae (i) and (ii) of Art 40.5}) \\ \int_0^{2\pi} f(x) dx &= \frac{a_0}{2} 2\pi \quad \Rightarrow \quad \boxed{a_0 = \frac{1}{\pi} \int_0^{2\pi} f(x) dx} \end{aligned} \quad \dots(2)$$

(ii) **To find  $a_n$ :** Multiply each side of (1) by  $\cos nx$  and integrate from  $x = 0$  to  $x = 2\pi$ .

$$\begin{aligned} \int_0^{2\pi} f(x) \cos nx dx &= \frac{a_0}{2} \int_0^{2\pi} \cos nx dx + a_1 \int_0^{2\pi} \cos x \cos nx dx + \dots + a_n \int_0^{2\pi} \cos^2 nx dx \dots \\ &\quad + b_1 \int_0^{2\pi} \sin x \cos nx dx + b_2 \int_0^{2\pi} \sin 2x \cos nx dx + \dots \\ &= a_n \int_0^{2\pi} \cos^2 nx dx = a_n \pi \quad (\text{Other integrals} = 0, \text{ by formulae Art. 40.5}) \end{aligned}$$

$$\therefore \boxed{a_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx} \quad \dots(3)$$

By taking  $n = 1, 2, \dots$  we can find the values of  $a_1, a_2, \dots$

(iii) **To find  $b_n$ :** Multiply each side of (1) by  $\sin nx$  and integrate from  $x = 0$  to  $x = 2\pi$ .

$$\begin{aligned} \int_0^{2\pi} f(x) \sin nx dx &= \frac{a_0}{2} \int_0^{2\pi} \sin nx dx + a_1 \int_0^{2\pi} \cos x \sin nx dx + \dots + a_n \int_0^{2\pi} \cos nx \sin nx dx + \dots \\ &\quad \dots + b_1 \int_0^{2\pi} \sin x \sin nx dx + \dots + b_n \int_0^{2\pi} \sin^2 nx dx + \dots \\ &= b_n \int_0^{2\pi} \sin^2 nx dx \\ &= b_n \pi \quad (\text{All other integrals} = 0, \text{ Article No. 40.5}) \\ \therefore \boxed{b_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx dx} \end{aligned} \quad \dots(4)$$

**Note :** To get similar formula of  $a_0$ ,  $\frac{1}{2}$  has been written with  $a_0$  in Fourier series.

**Example 1.** Find the Fourier series representing

$$f(x) = x, \quad 0 < x < 2\pi$$

and sketch its graph from  $x = -4\pi$  to  $x = 4\pi$ .

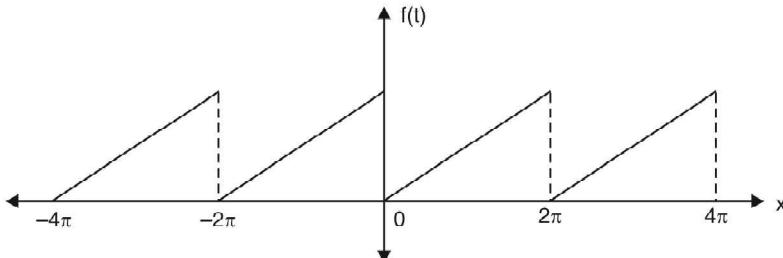

**Solution.** Let  $f(x) = \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + \dots + b_1 \sin x + b_2 \sin 2x + \dots \quad \dots(1)$

$$\text{Hence } a_0 = \frac{1}{\pi} \int_0^{2\pi} f(x) dx = \frac{1}{\pi} \int_0^{2\pi} x dx = \frac{1}{\pi} \left[ \frac{x^2}{2} \right]_0^{2\pi} = 2\pi$$

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_0^{2\pi} x \cos nx dx \\ &= \frac{1}{\pi} \left[ x \frac{\sin nx}{n} - 1 \cdot \left( -\frac{\cos nx}{n^2} \right) \right]_0^{2\pi} = \frac{1}{\pi} \left[ \frac{\cos 2n\pi}{n^2} - \frac{1}{n^2} \right] = \frac{1}{n^2\pi} (1 - 1) = 0 \\ b_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx dx = \frac{1}{\pi} \int_0^{2\pi} x \sin nx dx \\ &= \frac{1}{\pi} \left[ x \left( -\frac{\cos nx}{n} \right) - 1 \cdot \left( \frac{-\sin nx}{n^2} \right) \right]_0^{2\pi} = \frac{1}{\pi} \left[ \frac{-2\pi \cos 2n\pi}{n} \right] = -\frac{2}{n} \end{aligned}$$

Substituting the values of  $a_0$ ,  $a_1$ ,  $a_2 \dots$ ,  $b_1$ ,  $b_2 \dots$  in (1), we get

$$x = \pi - 2 \left[ \sin x + \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x + \dots \right] \quad \text{Ans.}$$

**Example 2.** Given that  $f(x) = x + x^2$  for  $-\pi < x < \pi$ , find the Fourier expression of  $f(x)$ .

$$\text{Deduce that } \frac{\pi^2}{6} = 1 + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots$$

(U.P., II Semester, Summer 2003, Uttarakhand, June 2009)

**Solution.** Let  $x + x^2 = \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + \dots + b_1 \sin x + b_2 \sin 2x + \dots \quad \dots(1)$

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_{-\pi}^{\pi} (x + x^2) dx \\ &= \frac{1}{\pi} \left[ \frac{x^2}{2} + \frac{x^3}{3} \right]_{-\pi}^{\pi} = \frac{1}{\pi} \left[ \frac{\pi^2}{2} + \frac{\pi^3}{3} - \frac{\pi^2}{2} + \frac{\pi^3}{3} \right] = \frac{2\pi^2}{3} \end{aligned}$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \int_{-\pi}^{\pi} (x + x^2) \cos nx dx$$

$$\begin{aligned}
&= \frac{1}{\pi} \left[ (x + x^2) \frac{\sin nx}{n} - (2x + 1) \frac{(-\cos nx)}{n^2} + (2) \left( -\frac{\sin nx}{n^3} \right) \right]_{-\pi}^{\pi} \\
&= \frac{1}{\pi} \left[ (2\pi + 1) \frac{\cos n\pi}{n^2} - (-2\pi + 1) \frac{\cos(-n\pi)}{n^2} \right] = \frac{1}{\pi} \left[ 4\pi \frac{\cos n\pi}{n^2} \right] = \frac{4(-1)^n}{n^2} \\
b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx = \frac{1}{\pi} \int_{-\pi}^{\pi} (x + x^2) \sin nx \, dx \\
&= \frac{1}{\pi} \left[ (x + x^2) \left( -\frac{\cos nx}{n} \right) - (2x + 1) \left( \frac{-\sin nx}{n^2} \right) + 2 \frac{\cos nx}{n^3} \right]_{-\pi}^{\pi} \\
&= \frac{1}{\pi} \left[ -(\pi + \pi^2) \frac{\cos n\pi}{n} + 2 \frac{\cos n\pi}{n^3} + (-\pi + \pi^2) \frac{\cos n\pi}{n} - 2 \frac{\cos n\pi}{n^3} \right] \\
&= \frac{1}{\pi} \left[ -\frac{2\pi}{n} \cos n\pi \right] = -\frac{2}{n} (-1)^n
\end{aligned}$$

Substituting the values of  $a_0$ ,  $a_n$ ,  $b_n$  in (1), we get

$$\begin{aligned}
x + x^2 &= \frac{\pi^2}{3} + 4 \left[ -\cos x + \frac{1}{2^2} \cos 2x - \frac{1}{3^2} \cos 3x + \dots \right] \\
&\quad - 2 \left[ -\sin x + \frac{1}{2} \sin 2x - \frac{1}{3} \sin 3x + \dots \right] \quad \dots(2)
\end{aligned}$$

Here,  $f(x) = x + x^2$  is valid for all values of  $x$  between  $-\pi$  and  $\pi$  but not at the end points  $-\pi$  and  $\pi$  due to open interval.

$$\begin{aligned}
f(-\pi) &= \frac{1}{2} [f(-\pi-0) + f(-\pi+0)] \\
&= \frac{1}{2} [f(\pi-0) + f(-\pi+0)] \quad [f(x) \text{ is periodic with period } 2\pi] \\
&= \frac{1}{2} [(\pi + \pi^2) + \{(-\pi) + (-\pi)^2\}] = \pi^2 \quad \dots(3)
\end{aligned}$$

Putting the value of  $f(-\pi)$  from (3) and  $x = -\pi$  in (2), we get

$$\pi^2 = \frac{\pi^2}{3} + 4 \left[ \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots \right] \Rightarrow \frac{\pi^2}{6} = \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots \quad \text{Ans.}$$

**Example 3.** Find the Fourier series expansion for  $f(x) = x + \frac{x^2}{4}$ ,  $-\pi \leq x \leq \pi$   
(U.P. II Semester, 2009)

**Solution.** Let  $x + \frac{x^2}{4} = \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + \dots + b_1 \sin x + b_2 \sin 2x + \dots$

$$\begin{aligned}
\text{where } a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \, dx = \frac{1}{\pi} \int_{-\pi}^{\pi} \left( x + \frac{x^2}{4} \right) dx \\
&= \frac{1}{\pi} \left[ \frac{x^2}{2} + \frac{x^3}{12} \right]_{-\pi}^{\pi} = \frac{1}{\pi} \left[ \frac{\pi^2}{2} + \frac{\pi^3}{12} - \frac{\pi^2}{2} + \frac{\pi^3}{12} \right] = \frac{1}{\pi} \left[ \frac{2\pi^3}{12} \right] = \frac{\pi^2}{6}
\end{aligned}$$

$$\begin{aligned}
a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx \, dx = \frac{1}{\pi} \int_{-\pi}^{\pi} \left( x + \frac{x^2}{4} \right) \cos nx \, dx \\
&= \frac{1}{\pi} \left[ \left( x + \frac{x^2}{4} \right) \left( \frac{\sin nx}{n} \right) - \left( 1 + \frac{2x}{4} \right) \left( \frac{-\cos nx}{n^2} \right) + \frac{1}{2} \left( -\frac{\sin nx}{n^3} \right) \right]_{-\pi}^{\pi}
\end{aligned}$$

$$\begin{aligned}
&= \frac{1}{\pi} \left[ \left( \pi + \frac{\pi^2}{4} \right) \left( \frac{\sin n\pi}{n} \right) + \left( 1 + \frac{2\pi}{4} \right) \left( \frac{\cos n\pi}{n^2} \right) - \frac{1}{2} \left( \frac{\sin n\pi}{n^3} \right) - \left( -\pi + \frac{\pi^2}{4} \right) \left( \frac{\sin (-n\pi)}{n} \right) \right. \\
&\quad \left. - \left( 1 - \frac{2\pi}{4} \right) \frac{\cos (-n\pi)}{n^2} + \frac{1}{2} \frac{\sin (-n\pi)}{n^3} \right] \\
&= \frac{1}{\pi} \left[ \left( 1 + \frac{\pi}{2} \right) \frac{(-1)^n}{n^2} - \left( 1 - \frac{\pi}{2} \right) \frac{(-1)^n}{n^2} \right] = \frac{(-1)^n}{n^2 \pi} \left[ 1 + \frac{\pi}{2} - 1 + \frac{\pi}{2} \right] = \frac{(-1)^n}{n^2 \pi} (\pi) = \frac{(-1)^n}{n^2} \\
a_1 &= -1, \quad a_2 = \frac{1}{4}, \quad a_3 = -\frac{1}{9}, \quad a_4 = \frac{1}{16} \quad \dots \\
b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx = \frac{1}{\pi} \int_{-\pi}^{\pi} \left( x + \frac{x^2}{4} \right) \sin nx \, dx \\
&= \frac{1}{\pi} \int_{-\pi}^{\pi} x \sin nx \, dx + \frac{1}{\pi} \int_{-\pi}^{\pi} \frac{x^2}{4} \sin nx \, dx \\
&\text{Even function} \quad \text{Odd function} \\
&= \frac{2}{\pi} \int_0^{\pi} x \sin nx \, dx + 0 \\
&= \frac{2}{\pi} \left[ x \left( -\frac{\cos nx}{n} \right) - (1) \left( \frac{-\sin nx}{n^2} \right) \right]_0^{\pi} \\
&= \frac{2}{\pi} \left[ -\pi \frac{\cos n\pi}{n} + \frac{\sin n\pi}{n^2} \right] \\
&= \frac{2}{\pi} \left[ -\pi \frac{(-1)^n}{n} \right] = -\frac{2(-1)^n}{n} \\
b_1 &= \frac{2}{1}, \quad b_2 = -1, \quad b_3 = \frac{2}{3}, \quad b_4 = -\frac{1}{2} \dots
\end{aligned}$$

Hence, Fourier series of the given function is

$$\begin{aligned}
f(x) &= \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx = \frac{\pi^2}{12} + \sum \frac{(-1)^n}{n^2} \cos nx - \sum_{n=1}^{\infty} \frac{2}{n} (-1)^n \sin nx \\
f(x) &= \frac{\pi^2}{12} - \cos x + \frac{1}{4} \cos 2x - \frac{1}{9} \cos 3x + \frac{1}{16} \cos 4x + \dots + 2 \sin x - \sin 3x + \frac{2}{3} \sin 4x - \frac{1}{2} \sin 4x + \dots
\end{aligned}$$

**Ans.**

### EXERCISE 40.1

1. Find a Fourier series to represent,  $f(x) = \pi - x$  for  $0 < x < 2\pi$ .

$$\text{Ans. } 2 \left[ \sin x + \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x + \dots + \frac{1}{n} \sin nx + \dots \right]$$

2. Find a Fourier series to represent  $x - x^2$  from  $x = -\pi$  to  $\pi$  and show that

$$\frac{\pi^2}{12} = \frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots$$

$$\text{Ans. } -\frac{\pi^2}{3} + 4 \left[ \frac{\cos x}{1^2} - \frac{\cos 2x}{2^2} + \frac{\cos 3x}{3^2} - \frac{\cos 4x}{4^2} + \dots \right] + 2 \left[ \frac{\sin x}{1} - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} - \frac{\sin 4x}{4} + \dots \right]$$

3. Find a Fourier series to represent the function  $f(x) = e^x$ , for  $-\pi < x < \pi$  and hence derive a series for  $\frac{\pi}{\sinh \pi}$ .

$$\text{Ans. } \frac{2 \sinh \pi}{\pi} \left[ \frac{1}{2} - \frac{1}{1^2 + 1} \cos x + \frac{1}{2^2 + 1} \cos 2x - \frac{1}{3^2 + 1} \cos 3x + \dots \right]$$

$$+ \frac{1}{1^2 + 1} \sin x - \frac{2}{2^2 + 1} \sin 2x - \frac{3}{3^2 + 1} \sin 3x \dots, \quad \frac{\pi}{\sinh \pi} = 1 + 2 \left[ -\frac{1}{2} + \frac{1}{5} - \frac{1}{10} + \dots \right]$$

4. Obtain the Fourier series for  $f(x) = e^{-x}$  in the interval  $0 \leq x < 2\pi$ .

$$\text{Ans. } \frac{1 - e^{-2\pi}}{\pi} \left[ \frac{1}{2} + \frac{1}{2} \cos x + \frac{1}{5} \cos 2x + \frac{1}{10} \cos 3x + \frac{1}{2} \sin x + \frac{2}{5} \sin 2x + \frac{3}{10} \sin 3x + \dots \right]$$

5. If  $f(x) = \left(\frac{\pi-x}{2}\right)^2$ ,  $0 < x < 2\pi$ , show that  $f(x) = \frac{\pi^2}{12} + \sum_{n=1}^{\infty} \frac{\cos nx}{n^2}$

6. Prove that  $x^2 = \frac{\pi^2}{3} + 4 \sum_{n=1}^{\infty} (-1)^n \frac{\cos nx}{n^2}$ ,  $-\pi < x < \pi$ . Hence show that

$$(i) \quad \sum \frac{1}{(2n-1)^2} = \frac{\pi^2}{8}$$

$$(ii) \quad \sum \frac{1}{n^4} = \frac{\pi^4}{90}$$

7. If  $f(x)$  is a periodic function defined over a period  $(0, 2\pi)$  by  $f(x) = \frac{(3x^2 - 6x\pi + 2\pi^2)}{12}$ .

$$\text{Prove that } f(x) = \sum_{n=1}^{\infty} \frac{\cos nx}{n^2} \text{ and hence show that } \frac{\pi^2}{6} = 1 + \frac{1}{2^2} + \frac{1}{3^2} + \dots$$

#### 40.7 FOURIER SERIES FOR DISCONTINUOUS FUNCTIONS

Let the function  $f(x)$  be defined by

$$\begin{aligned} f(x) &= f_1(x), \quad c < x < x_0 \\ &= f_2(x), \quad x_0 < x < c + 2\pi, \end{aligned}$$

where  $x_0$  is the point of discontinuity in the interval  $(c, c + 2\pi)$ .

In such cases also, we obtain the Fourier series for  $f(x)$  in the usual way. The values of  $a_0$ ,  $a_n$ ,  $b_n$  are evaluated by

$$a_0 = \frac{1}{\pi} \left[ \int_c^{x_0} f_1(x) dx + \int_{x_0}^{c+2\pi} f_2(x) dx \right];$$

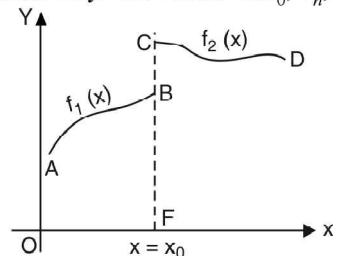

$$a_n = \frac{1}{\pi} \left[ \int_c^{x_0} f_1(x) \cos nx dx + \int_{x_0}^{c+2\pi} f_2(x) \cos nx dx \right]$$

$$b_n = \frac{1}{\pi} \left[ \int_c^{x_0} f_1(x) \sin nx dx + \int_{x_0}^{c+2\pi} f_2(x) \sin nx dx \right]$$

If  $x = x_0$  is the point of finite discontinuity, then the sum of the Fourier series

$$= \frac{1}{2} \left[ \lim_{h \rightarrow 0} f(x_0 - h) + \lim_{h \rightarrow 0} f(x_0 + h) \right]$$

$$= \frac{1}{2} [f(x_0 - 0) + f(x_0 + 0)] = \frac{1}{2} (FB + FC)$$

#### Remarks.

- It may be seen from the graph, that at a point of finite discontinuity  $x = x_0$ , there is a finite jump equal to  $BC$  in the value of the function  $f(x)$  at  $x = x_0$ .
- A given function  $f(x)$  may be defined by different formulae in different regions. Such types of functions are quite common in Fourier Series.
- At a point of discontinuity the sum of the series is equal to the mean of the limits on the right and left.

### 40.8 FUNCTION DEFINED IN TWO OR MORE SUB-RANGES

**Example 4.** Find the fourier series to represent the function  $f(x)$  given by :

$$f(x) = \begin{cases} -k & \text{for } -\pi < x < 0 \\ k & \text{for } 0 < x < \pi \end{cases} \quad \text{Hence show that :}$$

$$1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots = \frac{\pi}{4}.$$

(U.P. II Semester 2010)

**Solution.**  $f(x) = \begin{cases} -k, & -\pi < x < 0 \\ k, & 0 < x < \pi \end{cases}$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \left[ \int_{-\pi}^0 -k dx + \int_0^{\pi} k dx \right] = \frac{1}{\pi} \left[ [-kx]_{-\pi}^0 + [kx]_0^{\pi} \right]$$

$$= \frac{1}{\pi} k [0 - \pi + \pi - 0] = 0$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \left[ \int_{-\pi}^0 -k \cos nx dx + \int_0^{\pi} k \cos nx dx \right]$$

$$= \frac{1}{\pi} k \left[ - \left\{ \frac{\sin nx}{n} \right\}_{-\pi}^0 + \left\{ \frac{\sin nx}{n} \right\}_0^{\pi} \right] = \frac{1}{\pi} k [-0 + 0] = 0$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{1}{\pi} \left[ \int_{-\pi}^0 -k \sin nx dx + \int_0^{\pi} k \sin nx dx \right]$$

$$= \frac{1}{\pi} k \left[ \left\{ \frac{\cos nx}{n} \right\}_{-\pi}^0 - \left\{ \frac{\cos nx}{n} \right\}_0^{\pi} \right]$$

$$= \frac{1}{\pi} k \left[ \frac{1}{n} - \frac{(-1)^n}{n} - \frac{(-1)^n}{n} + \frac{1}{n} \right] = \frac{1}{\pi} k \left[ \frac{2}{n} - \frac{2(-1)^n}{n} \right]$$

If  $n$  is even  $b_n = 0$

If  $n$  is odd  $b_n = \frac{4k}{n\pi}$

$$f(x) = a_0 + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx \quad \dots (1)$$

$$f(x) = \sum_{n=1}^{\infty} b_n \sin nx = b_1 \sin x + b_2 \sin 2x + b_3 \sin 3x + b_4 \sin 4x + \dots$$

Thus required Fourier sine series is

$$f(x) = \frac{4k}{\pi} \sin x + \frac{4k}{3\pi} \sin 3x + \frac{4k}{5\pi} \sin 5x + \dots$$

$$\Rightarrow f(x) = \frac{4k}{\pi} \left[ \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \dots \right] \quad \dots (2)$$

Putting  $x = \frac{\pi}{2}$  in (2), we get

$$k = \frac{4k}{\pi} \left[ \sin \frac{\pi}{2} + \frac{1}{3} \sin \frac{3\pi}{2} + \frac{1}{5} \sin \frac{5\pi}{2} + \dots \right]$$

$$\Rightarrow 1 = \frac{4}{\pi} \left[ 1 + \frac{1}{3} (-1) + \frac{1}{5} (1) + \frac{1}{7} (-1) + \dots \right]$$

$$= \frac{4}{\pi} \left[ 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots \right] \Rightarrow \frac{\pi}{4} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots$$

**Proved.**

**Example 5.** Find the Fourier series of the function

$$f(x) = \begin{cases} -1 & \text{for } -\pi < x < -\frac{\pi}{2} \\ 0 & \text{for } -\frac{\pi}{2} < x < \frac{\pi}{2} \\ +1 & \text{for } \frac{\pi}{2} < x < \pi. \end{cases}$$

**Solution.** Let  $f(x) = \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + \dots + b_1 \sin x + b_2 \sin 2x + \dots \quad \dots(1)$

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_{-\pi}^{-\pi/2} (-1) dx + \frac{1}{\pi} \int_{-\pi/2}^{\pi/2} 0 dx + \frac{1}{\pi} \int_{\pi/2}^{\pi} 1 dx \\ &= \frac{1}{\pi} [-x]_{-\pi}^{-\pi/2} + \frac{1}{\pi} [x]_{\pi/2}^{\pi} = \frac{1}{\pi} \left[ \frac{\pi}{2} - \pi + \pi - \frac{\pi}{2} \right] = 0 \end{aligned}$$

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx \\ &= \frac{1}{\pi} \int_{-\pi}^{-\pi/2} (-1) \cos nx dx + \frac{1}{\pi} \int_{-\pi/2}^{\pi/2} (0) \cos nx dx + \frac{1}{\pi} \int_{\pi/2}^{\pi} (1) \cos nx dx \\ &= -\frac{1}{\pi} \left[ \frac{\sin nx}{n} \right]_{-\pi}^{-\pi/2} + \frac{1}{\pi} \left[ \frac{\sin nx}{n} \right]_{\pi/2}^{\pi} \\ &= -\frac{1}{\pi} \left[ -\frac{\sin \frac{n\pi}{2}}{n} \right] + \frac{1}{\pi} \left[ -\frac{\sin \frac{n\pi}{2}}{n} \right] = 0 \end{aligned}$$

$$\begin{aligned} b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx \\ &= \frac{1}{\pi} \int_{-\pi}^{-\pi/2} (-1) \sin nx dx + \frac{1}{\pi} \int_{-\pi/2}^{\pi/2} (0) \sin nx dx \\ &\quad + \frac{1}{\pi} \int_{\pi/2}^{\pi} (1) \sin nx dx = \frac{1}{\pi} \left[ \frac{\cos nx}{n} \right]_{-\pi}^{-\pi/2} - \frac{1}{\pi} \left[ \frac{\cos nx}{n} \right]_{\pi/2}^{\pi} \end{aligned}$$

$$= \frac{1}{n\pi} \left[ \cos \frac{n\pi}{2} - \cos n\pi \right] - \frac{1}{n\pi} \left( \cos n\pi - \cos \frac{n\pi}{2} \right) = \frac{2}{n\pi} \left[ \cos \frac{n\pi}{2} - \cos n\pi \right]$$

$$b_1 = \frac{2}{\pi}, \quad b_2 = -\frac{2}{\pi}, \quad b_3 = \frac{2}{3\pi}$$

Putting the values of  $a_0$ ,  $a_n$ ,  $b_n$  in (1), we get

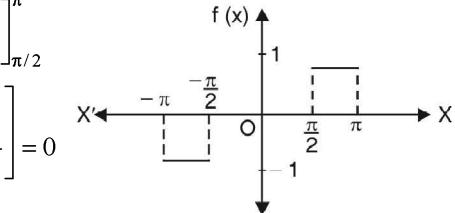

$$f(x) = \frac{1}{\pi} \left[ 2 \sin x - 2 \sin 2x + \frac{2}{3} \sin 3x + \dots \right] \quad \text{Ans.}$$

#### 40.9 DISCONTINUOUS FUNCTIONS

At a point of discontinuity, Fourier series gives the value of  $f(x)$  as the arithmetic mean of left and right limits.

At the point of discontinuity,  $x = c$

$$\text{At } x = c, \quad f(x) = \frac{1}{2} [f(c - 0) + f(c + 0)]$$

**Example 6.** Find the Fourier series for  $f(x)$ , if  $f(x) = \begin{cases} -\pi, & -\pi < x < 0 \\ x, & 0 < x < \pi \end{cases}$

$$\text{Deduce that } \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$$

**Solution.** Let  $f(x) = \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + \dots + a_n \cos nx + \dots + b_1 \sin x + b_2 \sin 2x + \dots + b_n \sin nx + \dots \quad \dots(1)$

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx$$

$$\text{Then } a_0 = \frac{1}{\pi} \left[ \int_{-\pi}^0 (-\pi) dx + \int_0^\pi x dx \right] = \frac{1}{\pi} \left[ -\pi (x) \Big|_{-\pi}^0 + (x^2/2) \Big|_0^\pi \right] = \frac{1}{\pi} (-\pi^2 + \pi^2/2) = -\frac{\pi}{2};$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx$$

$$a_n = \frac{1}{\pi} \left[ \int_{-\pi}^0 (-\pi) \cos nx dx + \int_0^\pi x \cos nx dx \right] = \frac{1}{\pi} \left[ -\pi \left( \frac{\sin nx}{n} \right) \Big|_{-\pi}^0 + \left( \frac{x \sin nx}{n} + \frac{\cos nx}{n^2} \right) \Big|_0^\pi \right]$$

$$= \frac{1}{\pi} \left[ 0 + \frac{1}{n^2} \cos n\pi - \frac{1}{n^2} \right] = \frac{1}{\pi n^2} (\cos n\pi - 1)$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx$$

$$= \frac{1}{\pi} \left[ \int_{-\pi}^0 (-\pi) \sin nx dx + \int_0^\pi x \sin nx dx \right]$$

$$= \frac{1}{\pi} \left[ \left( \frac{\pi \cos nx}{n} \right) \Big|_{-\pi}^0 + \left( -x \frac{\cos nx}{n} + \frac{\sin nx}{n^2} \right) \Big|_0^\pi \right]$$

$$= \frac{1}{\pi} \left[ \frac{\pi}{n} (1 - \cos n\pi) - \frac{\pi}{n} \cos n\pi \right] = \frac{1}{n} (1 - 2 \cos n\pi)$$

$$f(x) = -\frac{\pi}{4} - \frac{2}{\pi} \left( \cos x + \frac{\cos 3x}{3^2} + \frac{\cos 5x}{5^2} + \dots \right) + 3 \sin x - \frac{\sin 2x}{2} + \frac{3 \sin 3x}{3} - \frac{\sin 4x}{4} \quad \dots(2)$$

$$\text{Putting } x = 0 \text{ in (2), we get } f(0) = -\frac{\pi}{4} - \frac{2}{\pi} \left( 1 + \frac{1}{3^2} + \frac{1}{5^2} + \dots \infty \right) \quad \dots(3)$$

Now,  $f(x)$  is discontinuous at  $x = 0$ .  
But  $f(0 - 0) = -\pi$  and  $f(0 + 0) = 0$

$$\therefore f(0) = \frac{1}{2} [f(0 - 0) + f(0 + 0)] = -\pi/2 \quad \dots(4)$$

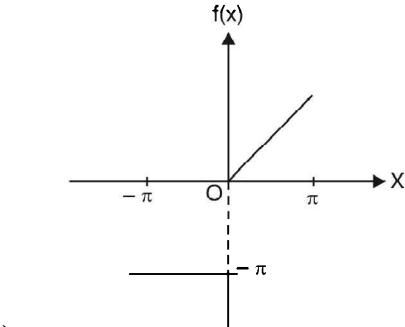

$$\text{From (3) and (4)} \quad -\frac{\pi}{2} = -\frac{\pi}{4} - \frac{2}{\pi} \left[ \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \right] \Rightarrow \frac{\pi^2}{8} = \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \quad \text{Proved.}$$

**Example 7.** Obtain Fourier Series of the function

$$f(x) = \begin{cases} x, & -\pi < x < 0 \\ -x, & 0 < x < \pi \end{cases}$$

and hence show that

$$\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$$

**Solution.** We have,  $f(x) = \begin{cases} x, & -\pi < x < 0 \\ -x, & 0 < x < \pi \end{cases}$

(U.P., II Semester, June 2008, 2002)

Here  $f(x)$  is an even function so  $b_n = 0$

$$\begin{aligned} a_0 &= \frac{2}{\pi} \int_0^\pi f(x) dx = \frac{2}{\pi} \int_0^\pi -x dx = -\frac{2}{\pi} \left[ \frac{x^2}{2} \right]_0^\pi = -\frac{2}{\pi} \left[ \frac{\pi^2}{2} \right] = -\pi \\ a_n &= \frac{2}{\pi} \int_0^\pi f(x) \cos nx dx = \frac{2}{\pi} \int_0^\pi -x \cos nx dx = -\frac{2}{\pi} \left[ x \frac{\sin nx}{n} + \frac{\cos nx}{n^2} \right]_0^\pi \\ &= -\frac{2}{\pi} \left[ \frac{(-1)^n}{n^2} - \frac{1}{n^2} \right] = \frac{2}{\pi n^2} [1 - (-1)^n] = \begin{cases} 0, & n \text{ is even} \\ \frac{4}{\pi n^2}, & n \text{ is odd} \end{cases} \end{aligned}$$

Fourier series

$$f(x) = -\frac{\pi}{2} + \frac{4}{\pi} \left[ \frac{\cos x}{1^2} + \frac{\cos 3x}{3^2} + \frac{\cos 5x}{5^2} + \dots \right] \quad \dots (1) \text{ Ans.}$$

Now  $f(x)$  is discontinuous at  $x = 0$ .

At  $x = 0$  the point of discontinuity  $f[0^- - 0] = 0$  and  $f(0^+ + 0) = 0$

$$f(0) = \frac{1}{2} [f(0^- - 0) + f(0^+ + 0)] = \frac{1}{2} (0 + 0) = 0$$

Putting  $x = 0$  in 1, we get

$$0 = -\frac{\pi}{2} + \frac{4}{\pi} \left( \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \right) \Rightarrow \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8} \quad \text{Ans.}$$

**Example 8.** Find the Fourier series of the function defined as

$$f(x) = \begin{cases} x + \pi, & \text{for } 0 \leq x \leq \pi, \\ -x - \pi, & \text{for } -\pi \leq x < 0 \end{cases} \quad \text{and} \quad f(x + 2\pi) = f(x).$$

(U.P., II Semester Summer 2006)

$$\begin{aligned} \text{Solution. } a_0 &= \frac{1}{\pi} \int_{-\pi}^\pi f(x) dx = \frac{1}{\pi} \int_{-\pi}^0 f(x) dx + \frac{1}{\pi} \int_0^\pi f(x) dx \\ &= \frac{1}{\pi} \int_{-\pi}^0 (-x - \pi) dx + \frac{1}{\pi} \int_0^\pi (x + \pi) dx = \frac{1}{\pi} \left( -\frac{x^2}{2} - \pi x \right)_{-\pi}^0 + \frac{1}{\pi} \left( \frac{x^2}{2} + \pi x \right)_0^\pi \\ &= \frac{1}{\pi} \left( \frac{\pi^2}{2} - \pi^2 \right) + \frac{1}{\pi} \left( \frac{\pi^2}{2} + \pi^2 \right) = \pi \left( \frac{1}{2} - 1 \right) + \pi \left( \frac{1}{2} + 1 \right) = \pi \end{aligned}$$

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_{-\pi}^0 f(x) \cos nx dx = \frac{1}{\pi} \int_{-\pi}^0 f(x) \cos nx dx + \frac{1}{\pi} \int_0^\pi f(x) \cos nx dx \\ &= \frac{1}{\pi} \int_{-\pi}^0 (-x - \pi) \cos nx dx + \frac{1}{\pi} \int_0^\pi (x + \pi) \cos nx dx \\ &= \frac{1}{\pi} \left[ (-x - \pi) \frac{\sin nx}{n} - (-1) \left\{ -\frac{\cos nx}{n^2} \right\} \right]_{-\pi}^0 + \frac{1}{\pi} \left[ (x + \pi) \frac{\sin nx}{n} - (-1) \left\{ -\frac{\cos nx}{n^2} \right\} \right]_0^\pi \\ &= \frac{1}{\pi} \left[ -\frac{1}{n^2} + \frac{(-1)^n}{n^2} \right] + \frac{1}{\pi} \left[ \frac{(-1)^n}{n^2} - \frac{1}{n^2} \right] = \frac{2}{n^2 \pi} [(-1)^n - 1] = \frac{-4}{n^2 \pi}, \text{ if } n \text{ is odd.} \\ &= 0, \text{ if } n \text{ is even.} \end{aligned}$$

$$\begin{aligned} b_n &= \frac{1}{\pi} \int_{-\pi}^\pi f(x) \sin nx dx = \frac{1}{\pi} \int_{-\pi}^0 f(x) \sin nx dx + \frac{1}{\pi} \int_0^\pi f(x) \sin nx dx \\ &= \frac{1}{\pi} \int_{-\pi}^0 (-x - \pi) \sin nx dx + \frac{1}{\pi} \int_0^\pi (x + \pi) \sin nx dx \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{\pi} \left[ (-x - \pi) \left( -\frac{\cos nx}{n} \right) - (-1) \left( -\frac{\sin nx}{n^2} \right) \right]_{-\pi}^0 \\
&\quad + \frac{1}{\pi} \left[ (x + \pi) \left( -\frac{\cos nx}{n} \right) - (-1) \left( -\frac{\sin nx}{n^2} \right) \right]_0^\pi \\
&= \frac{1}{\pi} \left[ \frac{\pi}{n} \right] + \frac{1}{\pi} \left[ -\frac{2\pi}{n} (-1)^n + \frac{\pi}{n} \right] = \frac{1}{n} [(1) - 2(-1)^n + (1)] = \frac{2}{n} [1 - (-1)^n] \\
&= \frac{4}{n}, \quad \text{if } n \text{ is odd.} \\
&= 0, \quad \text{if } n \text{ is even.}
\end{aligned}$$

Fourier series is

$$\begin{aligned}
f(x) &= \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + \dots + b_1 \sin x + b_2 \sin 2x + \dots \\
f(x) &= \frac{\pi}{2} - \frac{4}{\pi} \left( \frac{\cos x}{1^2} + \frac{\cos 3x}{3^2} + \dots \right) + 4 \left( \frac{\sin x}{1} + \frac{\sin 3x}{3} + \dots \right) \quad \text{Ans.}
\end{aligned}$$

### EXERCISE 40.2

1. Find the Fourier series of the function

$$f(x) = \begin{cases} -1 & \text{for } -\pi < x < 0 \\ 1 & \text{for } 0 < x < \pi \end{cases} \quad (\text{U.P. II Semester 2005})$$

where  $f(x + 2\pi) = f(x)$ . Ans.  $\frac{4}{\pi} \left[ \frac{1}{1} \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \frac{1}{7} \sin 7x + \dots \right]$

2. Find the Fourier series of the function

$$f(x) = \begin{cases} 0 & \text{for } -\pi \leq x \leq 0 \\ 1 & \text{for } 0 < x < \frac{\pi}{2} \\ 0 & \text{for } \frac{\pi}{2} \leq x \leq \pi \end{cases}$$

Ans.  $\frac{1}{4} + \frac{1}{\pi} \left[ \frac{\cos x}{1} - \frac{\cos 3x}{3} + \frac{\cos 5x}{5} + \dots + \frac{\sin x}{1} + \frac{\sin 2x}{2} + \frac{\sin 3x}{3} + \dots \right]$

3. Obtain a Fourier series to represent the following periodic function

$$f(x) = 0 \text{ when } 0 < x < \pi \quad \text{Ans. } \frac{1}{2} - \frac{2}{\pi} \left( \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \dots \right)$$

4. Find the Fourier expansion of the function defined in a single period by the relations.

$$f(x) = \begin{cases} 1 & \text{for } 0 < x < \pi \\ 2 & \text{for } \pi < x < 2\pi \end{cases}$$

and from it deduce that  $\frac{\pi}{4} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots$  Ans.  $\frac{3}{2} - \frac{2}{\pi} \left( \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \dots \right)$

5. Find a Fourier series to represent the function

$$f(x) = \begin{cases} 0 & \text{for } -\pi < x \leq 0 \\ \frac{1}{4}\pi x & \text{for } 0 < x < \pi \end{cases}$$

and hence deduce that  $\frac{\pi^2}{8} = \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots$

Ans.  $\frac{\pi^2}{16} + \sum_{n=1}^{\infty} \left( \frac{[(-1)^n - 1]}{4n^2} \cos nx - \frac{(-1)^n \pi}{4n} \sin nx + \dots \right)$

6. Find the Fourier series for  $f(x)$ , if

$$\begin{array}{lll} -\pi & \text{for} & -\pi < x \leq 0 \\ f(x) = x & \text{for} & 0 < x < \pi \end{array}$$

$$\frac{-\pi}{2} \quad \text{for} \quad x = 0$$

Deduce that  $\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$

$$\text{Ans. } -\frac{\pi}{4} - \frac{2}{\pi} \left( \cos x + \frac{\cos 3x}{3^2} + \frac{\cos 5x}{5^2} + \dots \right) + 3 \sin x - \frac{1}{2} \sin 2x + \frac{3}{3} \sin 3x - \frac{1}{4} \sin 4x + \dots$$

7. Obtain a Fourier series to represent the function

$$f(x) = |x| \quad \text{for} \quad -\pi < x < \pi$$

$$\text{and hence deduce } \frac{\pi^2}{8} = \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \quad \text{Ans. } \frac{\pi}{2} - \frac{4}{\pi} \left[ \cos x + \frac{1}{3^2} \cos 3x + \frac{1}{5^2} \cos 5x + \dots \right]$$

8. Expand as a Fourier series, the function  $f(x)$  defined as

$$f(x) \begin{cases} \pi + x & \text{for } -\pi < x < -\frac{\pi}{2} \\ \frac{\pi}{2} & \text{for } -\frac{\pi}{2} < x < \frac{\pi}{2} \\ \pi - x & \text{for } \frac{\pi}{2} < x < \pi \end{cases} \quad \text{Ans. } \frac{3\pi}{8} + \frac{2}{\pi} \left[ \frac{1}{1^2} \cos x - \frac{2}{2^2} \cos 2x + \frac{1}{3^2} \cos 3x + \dots \right]$$

9. Obtain a Fourier series to represent the function

$$f(x) = |\sin x| \quad \text{for} \quad -\pi < x < \pi$$

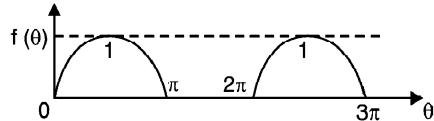

$$\begin{cases} \text{Hint } f(x) = -\sin x & \text{for } -\pi < x < 0 \\ & = \sin x & \text{for } 0 < x < \pi \end{cases}$$

$$\text{Ans. } \frac{2}{\pi} - \frac{4}{\pi} \left[ \frac{1}{3} \cos 2x + \frac{1}{15} \cos 4x + \frac{1}{35} \cos 6x + \dots \right]$$

10. An alternating current after passing through a rectifier has the form

$$\begin{aligned} i &= I \sin \theta & \text{for } 0 < \theta < \pi \\ &= 0 & \text{for } \pi < \theta < 2\pi \end{aligned}$$

Find the Fourier series of the function.

$$\text{Ans. } \frac{I}{\pi} - \frac{2I}{\pi} \left( \frac{\cos 2\theta}{3} + \frac{\cos 4\theta}{15} + \dots \right) + \frac{I}{2} \sin \theta$$

11. If  $f(x) = 0$  for  $-\pi < x < 0$

$$= \sin x \text{ for } 0 < x < \pi$$

Prove that  $f(x) = \frac{1}{\pi} + \frac{\sin x}{2} - \frac{2}{\pi} \sum_{m=1}^{\infty} \frac{\cos 2mx}{4m^2 - 1}$ . Hence show that  $\frac{1}{1.3} - \frac{1}{3.5} + \frac{1}{5.7} \dots \infty = \frac{1}{4}(\pi - 2)$

#### 40.10 EVEN FUNCTION AND ODD FUNCTION

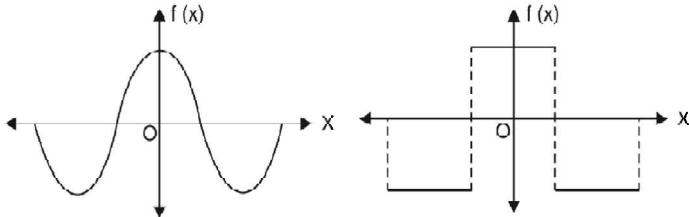

##### (a) Even Function

A function  $f(x)$  is said to be even (or symmetric) function if,  $f(-x) = f(x)$

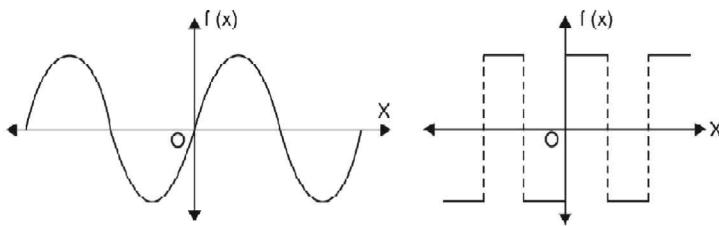

The graph of such a function is symmetrical with respect to  $y$ -axis [ $f(x)$  axis]. Here  $y$ -axis is a mirror for the reflection of the curve.

The area under such a curve from  $-\pi$  to  $\pi$  is double the area from 0 to  $\pi$ .

$$\therefore \int_{-\pi}^{\pi} f(x) dx = 2 \int_0^{\pi} f(x) dx$$

(b) Odd Function

A function  $f(x)$  is called odd (or skew symmetric) function if

$$f(-x) = -f(x)$$

Here the area under the curve from  $-\pi$  to  $\pi$  is zero.

$$\int_{-\pi}^{\pi} f(x) dx = 0$$

**Expansion of an even function:**

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{2}{\pi} \int_0^{\pi} f(x) dx$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{2}{\pi} \int_0^{\pi} f(x) \cos nx dx$$

As  $f(x)$  and  $\cos nx$  are both even functions, therefore, the product of  $f(x) \cdot \cos nx$  is also an even function.

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = 0$$

As  $\sin nx$  is an odd function so  $f(x) \cdot \sin nx$  is also an odd function. We need not to calculate  $b_n$ . It saves our labour a lot.

The series of the even function will contain only cosine terms. (U.P. II Semester 2010)

**Expansion of an odd function :**

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = 0$$

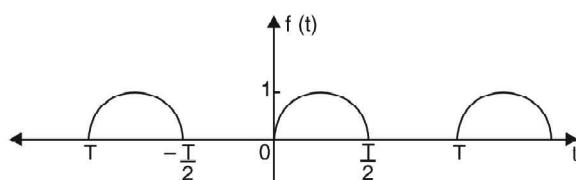

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = 0 \quad [f(x) \cdot \cos nx \text{ is odd function.}]$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{2}{\pi} \int_0^{\pi} f(x) \sin nx dx$$

[ $f(x) \cdot \sin nx$  is even function.]

The series of the odd function will contain only sine terms.

The function shown below is neither odd nor even so it contains both sine and cosine terms

**Example 9.** Find the Fourier series expansion of the periodic function of period  $2\pi$

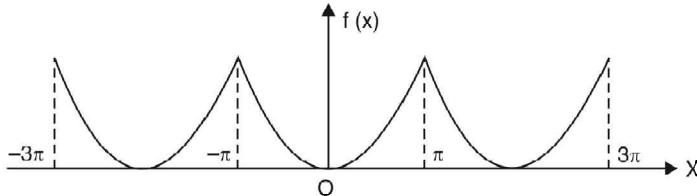

$$f(x) = x^2, -\pi \leq x \leq \pi.$$

Hence, find the sum of the series  $\frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots$  (U.P., II Semester 2004)

**Solution.**  $f(x) = x^2, -\pi \leq x \leq \pi$

This is an even function.  $\therefore b_n = 0$   $[f(-x) = f(x)]$

$$\begin{aligned} a_0 &= \frac{2}{\pi} \int_0^\pi f(x) dx = \frac{2}{\pi} \int_0^\pi x^2 dx = \frac{2}{\pi} \left[ \frac{x^3}{3} \right]_0^\pi = \frac{2\pi^2}{3} \\ a_n &= \frac{2}{\pi} \int_0^\pi f(x) \cos nx dx = \frac{2}{\pi} \int_0^\pi x^2 \cos nx dx \\ &= \frac{2}{\pi} \left[ x^2 \left( \frac{\sin nx}{n} \right) - (2x) \left( -\frac{\cos nx}{n^2} \right) + (2) \left( -\frac{\sin nx}{n^3} \right) \right]_0^\pi \\ &= \frac{2}{\pi} \left[ \frac{\pi^2 \sin n\pi}{n} + \frac{2\pi \cos n\pi}{n^2} - \frac{2 \sin n\pi}{n^3} \right] = \frac{4(-1)^n}{n^2} \end{aligned}$$

Fourier series is

$$\begin{aligned} f(x) &= \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + a_3 \cos 3x + \dots + a_n \cos nx + \dots \\ x^2 &= \frac{\pi^2}{3} - 4 \left[ \frac{\cos x}{1^2} - \frac{\cos 2x}{2^2} + \frac{\cos 3x}{3^2} - \frac{\cos 4x}{4^2} + \dots \right] \end{aligned}$$

On putting  $x = 0$ , we have

$$\begin{aligned} 0 &= \frac{\pi^2}{3} - 4 \left[ \frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} \dots \right] \\ \Rightarrow \quad \frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} \dots &= \frac{\pi^2}{12} \quad \text{Ans.} \end{aligned}$$

**Example 10.** Obtain a Fourier expression for  $f(x) = x^3$  for  $-\pi < x < \pi$ .

**Solution.**  $f(x) = x^3$  is an odd function.

$$\begin{aligned} \therefore a_0 &= 0 \quad \text{and} \quad a_n = 0 \quad [f(-x) = -f(x)] \\ b_n &= \frac{2}{\pi} \int_0^\pi f(x) \sin nx dx = \frac{2}{\pi} \int_0^\pi x^3 \sin nx dx \quad \left[ \int uv = uv_1 - u'v_2 + u''v_3 - u'''v_4 + \dots \right] \\ &= \frac{2}{\pi} \left[ x^3 \left( -\frac{\cos nx}{n} \right) - 3x^2 \left( -\frac{\sin nx}{n^2} \right) + 6x \left( \frac{\cos nx}{n^3} \right) - 6 \left( \frac{\sin nx}{n^4} \right) \right]_0^\pi \\ &= \frac{2}{\pi} \left[ -\frac{\pi^3 \cos n\pi}{n} + \frac{6\pi \cos n\pi}{n^3} \right] = 2(-1)^n \left[ -\frac{\pi^2}{n} + \frac{6}{n^3} \right] \\ f(x) &= b_1 \sin x + b_2 \sin 2x + b_3 \sin 3x + \dots \\ \therefore x^3 &= 2 \left[ -\left( -\frac{\pi^2}{1} + \frac{6}{1^3} \right) \sin x + \left( -\frac{\pi^2}{2} + \frac{6}{2^3} \right) \sin 2x - \left( -\frac{\pi^2}{3} + \frac{6}{3^3} \right) \sin 3x + \dots \right] \quad \text{Ans.} \end{aligned}$$

**Example 11.** Expand the function  $f(x) = x \sin x$ , as a Fourier series in the interval  $-\pi \leq x \leq \pi$ .

$$\text{Hence deduce that } \frac{1}{1.3} - \frac{1}{3.5} + \frac{1}{5.7} - \frac{1}{7.9} + \dots = \frac{\pi - 2}{4}$$

(MDU, Dec. 2010, U.P., II Sem., Summer 2008, 2001, Uttarakhand, II Sem., June 2007)

**Solution.**  $f(x) = x \sin x$

$$a_0 = \frac{2}{\pi} \int_0^\pi f(x) dx = \frac{2}{\pi} \int_0^\pi x \sin x dx \quad (\text{Here } x \sin x \text{ is an even function})$$

$$= \frac{2}{\pi} [x(-\cos x) - (1)(-\sin x)]_0^\pi = \frac{2}{\pi}(\pi) = 2$$

$$a_n = \frac{2}{\pi} \int_0^\pi f(x) \cos nx dx = \frac{2}{\pi} \int_0^\pi x \sin x \cos nx dx$$

$$= \frac{1}{\pi} \int_0^\pi x \{ \sin(n+1)x - \sin(n-1)x \} dx$$

$$= \frac{1}{\pi} \int_0^\pi x \sin(n+1)x dx - \frac{1}{\pi} \int_0^\pi x \sin(n-1)x dx$$

$$= \frac{1}{\pi} \left[ x \left( -\frac{\cos(n+1)x}{n+1} \right)_0^\pi - (1) \left\{ -\frac{\sin(n+1)x}{(n+1)^2} \right\}_0^\pi \right]$$

$$- \frac{1}{\pi} \left[ x \left( -\frac{\cos(n-1)x}{(n-1)} \right) - (1) \left\{ -\frac{\sin(n-1)x}{(n-1)^2} \right\} \right]_0^\pi$$

$$= \frac{1}{\pi} \left[ -\pi \frac{(-1)^{(n+1)}}{n+1} + 0 \right] - \frac{1}{\pi} \left[ -\pi \frac{(-1)^{(n-1)}}{n-1} - 0 \right]$$

$$= -\frac{(-1)^{n+1}}{n+1} + \frac{(-1)^{n-1}}{n-1} = (-1)^{n+1} \left[ -\frac{1}{n+1} + \frac{1}{n-1} \right] = \frac{2(-1)^{n+1}}{n^2 - 1}$$

$$a_1 = \frac{2}{\pi} \int_0^\pi x \sin x \cos x dx = \frac{1}{\pi} \int_0^\pi x \sin 2x dx$$

$$= \frac{1}{\pi} \left[ x \left( -\frac{\cos 2x}{2} \right) - (1) \left( \frac{-\sin 2x}{4} \right) \right]_0^\pi = \frac{1}{\pi} \left[ -\frac{\pi}{2} \right] = -\frac{1}{2}$$

$$b_n = 0 \quad [\text{As } x \sin x \sin nx \text{ is an odd function}]$$

$$\text{Hence } f(x) = 1 - \frac{1}{2} \cos x + 2 \sum_{n=2}^{\infty} \frac{(-1)^{n+1}}{n^2 - 1} \cos nx = 1 - \frac{1}{2} \cos x + 2 \sum_{n=2}^{\infty} \frac{(-1)^{n+1}}{(n-1)(n+1)} \cos nx$$

$$x \sin x = 1 + 2 \left[ -\frac{1}{4} \cos x - \frac{1}{1.3} \cos 2x + \frac{1}{2.4} \cos 3x - \frac{1}{3.5} \cos 4x + \dots \right] \quad \dots (1)$$

$$\text{Putting } x = \frac{\pi}{2} \text{ in (1), we get } \frac{\pi}{2} = 1 + 2 \left\{ \frac{1}{1.3} - \frac{1}{3.5} + \frac{1}{5.7} - \dots \right\}$$

$$\text{or } \frac{\pi}{4} = \frac{1}{2} + \frac{1}{1.3} - \frac{1}{3.5} + \frac{1}{5.7} - \dots \Rightarrow \frac{\pi}{4} - \frac{1}{2} = \frac{1}{1.3} - \frac{1}{3.5} + \frac{1}{5.7} - \dots$$

$$\Rightarrow \frac{\pi - 2}{4} = \frac{1}{1.3} - \frac{1}{3.5} + \frac{1}{5.7} - \dots$$

**Proved.**

**Example 12.** Find the Fourier Series expansion for the function

$$f(x) = x \cos x, -\pi < x < \pi. \quad (\text{U.P., II Semester, Summer 2002})$$

**Solution.** Since  $x \cos x$  is an odd function therefore,  $a_0 = a_n = 0$ .

Let  $x \cos x = \sum b_n \sin bx$ , where

$$\begin{aligned} b_n &= \frac{2}{\pi} \int_0^\pi x \cos x \cdot \sin nx dx, = \frac{1}{\pi} \int_0^\pi x \{ \sin(n+1)x + \sin(n-1)x \} dx \\ &= \frac{1}{\pi} \int_0^\pi x \sin(n+1)x dx + \frac{1}{\pi} \int_0^\pi x \sin(n-1)x dx \\ &= \frac{1}{\pi} \left[ x \left( \frac{-\cos(n+1)x}{n+1} \right) + \frac{\sin(n+1)x}{(n+1)^2} \right]_0^\pi + \frac{1}{\pi} \left[ -x \left( \frac{\cos(n-1)x}{n-1} \right) + \frac{\sin(n-1)x}{(n-1)^2} \right]_0^\pi \\ &= \frac{1}{\pi} \left[ x \cdot \left\{ -\frac{\cos(n+1)x}{(n+1)} - \frac{\cos(n-1)x}{(n-1)} \right\} + 1 \cdot \left\{ \frac{\sin(n+1)x}{(n+1)^2} + \frac{\sin(n-1)x}{(n-1)^2} \right\} \right]_0^\pi \\ &= \frac{1}{\pi} \left[ \pi \cdot \left\{ -\frac{\cos(n+1)\pi}{(n+1)} - \frac{\cos(n-1)\pi}{(n-1)} \right\} \right] \\ \Rightarrow b_n &= \left\{ -\frac{(-1)^{n+1}}{n+1} - \frac{(-1)^{n-1}}{n-1} \right\}, n \neq 1 \\ b_n &= -(-1)^{n+1} \left[ \frac{1}{n+1} + \frac{1}{n-1} \right] \\ &= -\left\{ \frac{1}{(n+1)} + \frac{1}{(n-1)} \right\} = \frac{-2n}{n^2-1}, \quad \text{If } n \text{ is odd; } n \neq 1. \end{aligned}$$

$$\text{But } b_n = \left\{ \frac{1}{n+1} + \frac{1}{n-1} \right\} = \frac{2n}{n^2-1}, \quad \text{If } n \text{ is even; } n \neq 1$$

$$\begin{aligned} \text{If } n = 1, \text{ then } b_1 &= \frac{2}{\pi} \int_0^\pi x \cos x \cdot \sin x dx = \frac{1}{\pi} \int_0^\pi x \cdot \sin 2x dx \\ &= \frac{1}{\pi} \left[ x \left( -\frac{\cos 2x}{2} \right) - 1 \left( -\frac{\sin 2x}{4} \right) \right]_0^\pi = \frac{1}{\pi} \left[ \pi \left( -\frac{1}{2} \right) \right] = -\frac{1}{2} \end{aligned}$$

$$\therefore x \cos x = b_1 \sin x + b_2 \sin 2x + b_3 \sin 3x + \dots$$

$$= -\frac{1}{2} \sin x + \frac{4 \sin 2x}{2^2-1} - \frac{6 \sin 3x}{3^2-1} + \dots \quad \text{Ans.}$$

#### 40.11 HALF-RANGE SERIES, PERIOD 0 TO $\pi$

The given function is defined in the interval  $(0, \pi)$  and it is immaterial whatever the function may be outside the interval  $(0, \pi)$ . To get the series of cosines only we assume that  $f(x)$  is an even function in the interval  $(-\pi, \pi)$ .

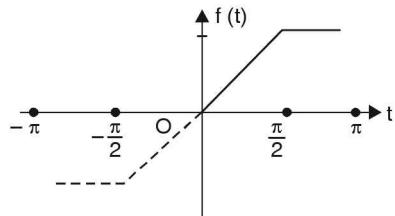

$$a_n = \frac{2}{\pi} \int_0^\pi f(x) \cos nx dx \text{ and } b_n = 0$$

To expand  $f(x)$  as a sine series we extend the function in the interval  $(-\pi, \pi)$  as an odd function.

$$b_n = \frac{2}{\pi} \int_0^\pi f(x) \sin nx dx \text{ and } a_n = 0$$

**Example 13.** Represent the following function by a Fourier sine series :

$$f(t) = \begin{cases} t, & 0 < t \leq \frac{\pi}{2} \\ \frac{\pi}{2}, & \frac{\pi}{2} < t \leq \pi \end{cases}$$

**Solution.**  $b_n = \frac{2}{\pi} \int_0^\pi f(t) \sin nt dt$

$$\begin{aligned} &= \frac{2}{\pi} \int_0^{\pi/2} t \sin nt dt + \frac{2}{\pi} \int_{\pi/2}^\pi \frac{\pi}{2} \sin nt dt \\ &= \frac{2}{\pi} \left[ t \left( -\frac{\cos nt}{n} \right) - (1) \left( -\frac{\sin nt}{n^2} \right) \right]_0^{\pi/2} + \frac{2}{\pi} \left[ -\frac{\cos nt}{n} \right]_{\pi/2}^\pi \end{aligned}$$

$$= \frac{2}{\pi} \left[ -\frac{\pi}{2} \frac{\cos \frac{n\pi}{2}}{n} + \frac{\sin \frac{n\pi}{2}}{n^2} \right] + \left[ -\frac{\cos n\pi}{n} + \frac{\cos \frac{n\pi}{2}}{n} \right]$$

$$b_1 = \frac{2}{\pi} \left[ -\frac{\pi}{2} \cos \frac{\pi}{2} + \sin \frac{\pi}{2} \right] + \left[ -\cos \pi + \cos \frac{\pi}{2} \right] = \frac{2}{\pi} [0 + 1] + [1] = \frac{2}{\pi} + 1$$

$$\begin{aligned} b_2 &= \frac{2}{\pi} \left[ -\frac{\pi}{2} \frac{\cos \pi}{2} + \frac{\sin \pi}{2^2} \right] + \left[ -\frac{\cos 2\pi}{2} + \frac{\cos \pi}{2} \right] = \frac{2}{\pi} \left[ -\frac{\pi}{2} \frac{(-1)}{2} + 0 \right] + \left[ -\frac{1}{2} - \frac{1}{2} \right] \\ &= \frac{2}{\pi} \left[ \frac{\pi}{4} \right] - 1 = \frac{1}{2} - 1 = -\frac{1}{2} \end{aligned}$$

$$\begin{aligned} b_3 &= \frac{2}{\pi} \left[ -\frac{\pi}{2} \frac{\cos \frac{3\pi}{2}}{3} + \frac{\sin \frac{3\pi}{2}}{3^2} \right] + \left[ -\frac{\cos 3\pi}{3} + \frac{\cos \frac{3\pi}{2}}{3} \right] \\ &= \frac{2}{\pi} \left[ -\frac{\pi}{2} (0) - \frac{1}{9} \right] + \left[ \frac{1}{3} + 0 \right] = -\frac{2}{9\pi} + \frac{1}{3} \end{aligned}$$

$$f(t) = \left( \frac{2}{\pi} + 1 \right) \sin t - \frac{1}{2} \sin 2t + \left( -\frac{2}{9\pi} + \frac{1}{3} \right) \sin 3t + \dots$$

**Ans.**

**Example 14.** Find the Fourier sine series for the function

$$f(x) = e^{ax} \text{ for } 0 < x < \pi$$

where  $a$  is constant.

**Solution.**  $b_n = \frac{2}{\pi} \int_0^\pi e^{ax} \sin nx dx$        $\left[ \int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2 + b^2} [a \sin bx - b \cos bx] \right]$

$$\begin{aligned} &= \frac{2}{\pi} \left[ \frac{e^{ax}}{a^2 + n^2} (a \sin nx - n \cos nx) \right]_0^\pi \\ &= \frac{2}{\pi} \left[ \frac{e^{a\pi}}{a^2 + n^2} (a \sin n\pi - n \cos n\pi) + \frac{n}{a^2 + n^2} \right] \\ &= \frac{2}{\pi} \frac{n}{a^2 + n^2} \left[ -(-1)^n e^{a\pi} + 1 \right] = \frac{2n}{(a^2 + n^2)\pi} [1 - (-1)^n e^{a\pi}] \end{aligned}$$

$$b_1 = \frac{2(1 + e^{a\pi})}{(a^2 + 1^2)\pi}, \quad b_2 = \frac{2.2.(1 - e^{a\pi})}{(a^2 + 2^2)\pi}$$

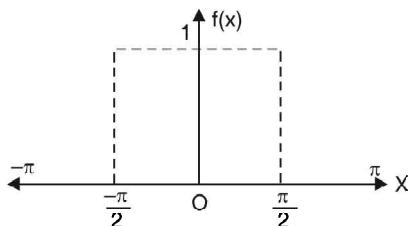

$$e^{ax} = \frac{2}{\pi} \left[ \frac{1 + e^{a\pi}}{a^2 + 1^2} \sin x + \frac{2(1 - e^{a\pi})}{a^2 + 2^2} \sin 2x + \dots \right] \quad \text{Ans.}$$

### EXERCISE 40.3

1. Find the Fourier cosine series for the function

$$f(x) = \begin{cases} 1 & \text{for } 0 < x < \frac{\pi}{2} \\ 0 & \text{for } \frac{\pi}{2} < x < \pi. \end{cases}$$

$$\text{Ans. } \frac{1}{2} + \frac{2}{\pi} \left[ \cos x - \frac{1}{3} \cos 3x + \frac{1}{5} \cos 5x - \dots \right]$$

2. Find a series of cosine of multiples of  $x$  which will represent  $f(x)$  in  $(0, \pi)$  where

$$f(x) = \begin{cases} 0 & \text{for } 0 < x < \frac{\pi}{2} \\ \frac{\pi}{2} & \text{for } \frac{\pi}{2} < x < \pi \end{cases}$$

$$\text{Deduce that } 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots \infty = \frac{\pi}{4}$$

$$\text{Ans. } \frac{\pi}{4} - \cos x + \frac{1}{3} \cos 3x - \frac{1}{5} \cos 5x + \dots$$

3. Express  $f(x) = x$  as a sine series in  $0 < x < \pi$ .

$$\text{Ans. } 2 \left[ \sin x - \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x - \dots \right]$$

4. Find the cosine series for  $f(x) = \pi - x$  in the interval  $0 < x < \pi$ .

$$\text{Ans. } \frac{\pi}{2} + \frac{4}{\pi} \left( \cos x + \frac{\cos 3x}{3^2} + \frac{\cos 5x}{5^2} + \dots \right)$$

$$5. \text{ If } f(x) = \begin{cases} 0 & \text{for } 0 < x < \frac{\pi}{2} \\ \pi - x, & \text{for } \frac{\pi}{2} < x < \pi \end{cases}$$

$$\text{Show that: (i) } f(x) = \frac{4}{\pi} \left( \sin x - \frac{1}{3^2} \sin 3x + \frac{1}{5^2} \sin 5x - \dots \right)$$

$$(ii) f(x) = \frac{\pi}{4} - \frac{2}{\pi} \left( \frac{1}{1^2} \cos 2x + \frac{1}{3^2} \cos 6x + \frac{1}{5^2} \cos 10x + \dots \right)$$

6. Obtain the half-range cosine series for  $f(x) = x^2$  in  $0 < x < \pi$ .

$$\text{Ans. } \frac{\pi^2}{3} - \frac{4}{\pi} \left( \cos x - \frac{1}{2^2} \cos 2x + \frac{1}{3^2} \cos 3x - \dots \right)$$

7. Find (i) sine series and (ii) cosine series for the function

$$f(x) = e^x \text{ for } 0 < x < \pi.$$

$$\text{Ans. (i) } \frac{2}{\pi} \sum_{n=1}^{\infty} n \left[ \frac{1 - (-1)^n e^{\pi}}{n^2 + 1} \right] \sin nx \quad \text{(ii) } \frac{e^{\pi} - 1}{\pi} - \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{1 - (-1)^n e^{\pi}}{n^2 + 1} \cos nx$$

8. If  $f(x) = x + 1$ , for  $0 < x < \pi$ , find its Fourier (i) sine series (ii) cosine series. Hence deduce that

$$(i) 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots = \frac{\pi}{4}$$

$$(ii) 1 + \frac{1}{3^2} + \frac{1}{5^2} + \frac{1}{7^2} + \dots = \frac{\pi^2}{8}$$

$$\text{Ans. (i) } \frac{2}{\pi} \left[ (\pi + 2) \sin x - \frac{\pi}{2} \sin 2x + \frac{1}{3} (\pi + 2) \sin 3x - \frac{\pi}{4} \sin 4x + \dots \right]$$

$$(ii) \frac{\pi}{2} + 1 - 4 \left( \cos x + \frac{\cos 3x}{3^2} + \frac{\cos 5x}{5^2} + \dots \right)$$

9. Find the Fourier series expansion of the function

$$f(x) = \cos(sx), -\pi \leq x \leq \pi$$

where  $s$  is a fraction. Hence, show that  $\cot \theta = \frac{1}{\theta} + \frac{2\theta}{\theta^2 - \pi^2} + \frac{2\theta}{\theta^2 - 4\pi^2} + \dots$

$$\text{Ans. } \frac{\sin \pi x}{\pi s} + \frac{1}{\pi} \sum \left( \frac{\sin(s\pi + n\pi)}{s+n} + \frac{\sin(s\pi - n\pi)}{s-n} \right) \cos nx$$

#### 40.12 CHANGE OF INTERVAL AND FUNCTIONS HAVING ARBITRARY PERIOD

In electrical engineering problems, the period of the function is not always  $2\pi$  but  $T$  or  $2c$ . This period must be converted to the length  $2\pi$ . The independent variable  $x$  is also to be changed proportionally.

Let the function  $f(x)$  be defined in the interval  $(-c, c)$ . Now we want to change the function to the period of  $2\pi$  so that we can use the formulae of  $a_n, b_n$  as discussed in Article 40.6.

$\therefore -2c$  is the interval for the variable  $x$ .

$\therefore 1$  is the interval for the variable  $= \frac{x}{2c}$

$\therefore 2\pi$  is the interval for the variable  $= \frac{x}{2c} \cdot 2\pi = \frac{\pi x}{c}$

so put  $z = \frac{\pi x}{c}$  or  $x = \frac{z c}{\pi}$

Thus the function  $f(x)$  of period  $2c$  is transformed to the function

$$f\left(\frac{cz}{\pi}\right) \quad \text{or} \quad F(z) \text{ of period } 2\pi.$$

$F(z)$  can be expanded in the Fourier series.

$$F(z) = f\left(\frac{cz}{\pi}\right) = \frac{a_0}{2} + a_1 \cos z + a_2 \cos 2z + \dots + b_1 \sin z + b_2 \sin 2z + \dots$$

$$\text{where } a_0 = \frac{1}{\pi} \int_0^{2\pi} F(z) dz = \frac{1}{\pi} \int_0^{2\pi} f\left(\frac{cz}{\pi}\right) dz$$

$$= \frac{1}{\pi} \int_0^{2c} f(x) d\left(\frac{\pi x}{c}\right) = \frac{1}{c} \int_0^{2c} f(x) dx \quad \left[ \text{put } z = \frac{\pi x}{c} \right]$$

$$\boxed{a_0 = \frac{1}{c} \int_0^{2c} f(x) dx}$$

$$a_n = \frac{1}{\pi} \int_0^{2\pi} F(z) \cos nz dz = \frac{1}{\pi} \int_0^{2\pi} f\left(\frac{cz}{\pi}\right) \cos nz dz$$

$$= \frac{1}{\pi} \int_0^{2c} f(x) \cos \frac{n\pi x}{c} d\left(\frac{\pi x}{c}\right) = \frac{1}{c} \int_0^{2c} f(x) \cos \frac{n\pi x}{c} dx. \quad \left[ \text{Put } z = \frac{\pi x}{c} \right]$$

$$\boxed{a_n = \frac{1}{c} \int_0^{2c} f(x) \cos \frac{n\pi x}{c} dx}$$

Similarly,

$$\boxed{b_n = \frac{1}{c} \int_0^{2c} f(x) \sin \frac{n\pi x}{c} dx}$$

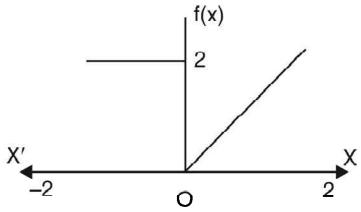

**Example 15.** Find the Fourier series corresponding to the function  $f(x)$  defined in  $(-2, 2)$  as follows

$$f(x) = \begin{cases} 2 & \text{in } -2 \leq x \leq 0 \\ x & \text{in } 0 < x < 2 \end{cases}$$

**Solution.** Here the interval is  $(-2, 2)$  and  $c = 2$

$$a_0 = \frac{1}{c} \int_{-c}^c f(x) dx = \frac{1}{2} \left[ \int_{-2}^0 2 \cdot dx + \int_0^2 x \cdot dx \right]$$

$$= \frac{1}{2} \left[ [2x]_{-2}^0 + \left( \frac{x^2}{2} \right)_0^2 \right] = \frac{1}{2} [4 + 2] = 3$$

$$a_n = \frac{1}{c} \int_{-c}^c f(x) \cos \left( \frac{n\pi x}{c} \right) dx = \frac{1}{2} \left[ \int_{-2}^0 2 \cos \frac{n\pi x}{2} dx + \int_0^2 x \cos \frac{n\pi x}{2} dx \right]$$

$$= \frac{1}{2} \left[ \frac{4}{n\pi} \left( \sin \frac{n\pi x}{2} \right) \Big|_{-2}^0 + \left( x \frac{2}{n\pi} \sin \frac{n\pi x}{2} + \frac{4}{n^2\pi^2} \cos \frac{n\pi x}{2} \right) \Big|_0^2 \right]$$

$$= \frac{1}{2} \left[ \frac{4}{n^2\pi^2} \cos n\pi - \frac{4}{n^2\pi^2} \right] = \frac{2}{n^2\pi^2} [(-1)^n - 1]$$

$$= -\frac{4}{n^2\pi^2}, \quad \text{when } n \text{ is odd}$$

$$= 0, \quad \text{when } n \text{ is even.}$$

$$b_n = \frac{1}{c} \int_{-c}^c f(x) \sin \frac{n\pi x}{c} dx = \frac{1}{2} \int_{-2}^0 2 \sin \frac{n\pi x}{2} dx + \frac{1}{2} \int_0^2 x \sin \frac{n\pi x}{2} dx$$

$$= \frac{1}{2} \left[ 2 \left( -\frac{2}{n\pi} \cos \frac{n\pi x}{2} \right) \Big|_{-2}^0 + \frac{1}{2} \left[ x \left( -\frac{2}{n\pi} \cos \frac{n\pi x}{2} \right) + (1) \frac{4}{n^2\pi^2} \sin \frac{n\pi x}{2} \right] \Big|_0^2 \right]$$

$$= \frac{1}{2} \left[ -\frac{4}{n\pi} + \frac{4}{n\pi} \cos n\pi \right] + \frac{1}{2} \left[ -\frac{4}{n\pi} \cos n\pi + \frac{4}{n^2\pi^2} \sin n\pi \right] = \frac{1}{2} \left[ -\frac{4}{n\pi} \right] = -\frac{2}{n\pi}$$

$$f(x) = \frac{a_0}{2} + a_1 \cos \frac{\pi x}{c} + a_2 \cos \frac{2\pi x}{c} + a_3 \cos \frac{3\pi x}{c} + \dots + b_1 \sin \frac{\pi x}{c} + b_2 \sin \frac{2\pi x}{c} + b_3 \sin \frac{3\pi x}{c} + \dots$$

$$= \frac{3}{2} - \frac{4}{\pi^2} \left\{ \frac{1}{1^2} \cos \frac{\pi x}{2} + \frac{1}{3^2} \cos \frac{3\pi x}{2} + \dots \right\} - \frac{2}{\pi} \left\{ \frac{1}{1} \sin \frac{\pi x}{2} + \frac{1}{2} \sin \frac{2\pi x}{2} + \frac{1}{3} \sin \frac{3\pi x}{2} + \dots \right\} \quad \text{Ans.}$$

**Example 16.** A periodic function of period 4 is defined as

$$f(x) = |x|, -2 < x < 2.$$

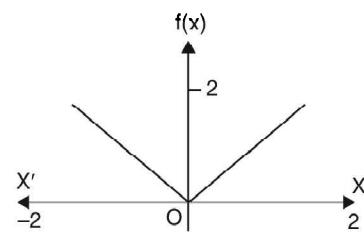

Find its Fourier series expansion.

**Solution.**

$$f(x) = |x| \quad -2 < x < 2$$

$$\Rightarrow f(x) = \begin{cases} x, & 0 < x < 2 \\ -x, & -2 < x < 0 \end{cases}$$

$$a_0 = \frac{1}{c} \int_{-c}^c f(x) dx = \frac{1}{2} \int_0^2 x dx + \frac{1}{2} \int_{-2}^0 (-x) dx$$

$$= \frac{1}{2} \left[ \frac{x^2}{2} \right]_0^2 + \frac{1}{2} \left[ -\frac{x^2}{2} \right]_{-2}^0 = \frac{1}{4} (4 - 0) + \frac{1}{4} (0 + 4) = 2$$

$$\begin{aligned} a_n &= \frac{1}{c} \int_{-c}^c f(x) \cos \frac{n\pi x}{c} dx = \frac{1}{2} \int_0^2 x \cos \frac{n\pi x}{2} dx + \frac{1}{2} \int_{-2}^0 (-x) \cos \frac{n\pi x}{2} dx \\ &= \frac{1}{2} \left[ x \left( \frac{2}{n\pi} \sin \frac{n\pi x}{2} \right) - (1) \left( -\frac{4}{n^2 \pi^2} \cos \frac{n\pi x}{2} \right) \right]_0^2 \\ &\quad + \frac{1}{2} \left[ (-x) \left( \frac{2}{n\pi} \sin \frac{n\pi x}{2} \right) - (-1) \left( -\frac{4}{n^2 \pi^2} \right) \cos \frac{n\pi x}{2} \right]_{-2}^0 \\ &= \frac{1}{2} \left[ 0 + \frac{4}{n^2 \pi^2} (-1)^n - \frac{4}{n^2 \pi^2} \right] + \frac{1}{2} \left[ 0 - \frac{4}{n^2 \pi^2} + \frac{4}{n^2 \pi^2} (-1)^n \right] \\ &= \frac{1}{2} \frac{4}{n^2 \pi^2} [(-1)^n - 1 - 1 + (-1)^n] = \frac{4}{n^2 \pi^2} [(-1)^n - 1] \\ &= -\frac{8}{n^2 \pi^2} \quad (\text{If } n \text{ is odd.}) \\ &= 0 \quad (\text{If } n \text{ is even}) \end{aligned}$$

$b_n = 0$  as  $f(x)$  is even function.

Fourier series is

$$\begin{aligned} f(x) &= \frac{a_0}{2} + a_1 \cos \frac{\pi x}{c} + a_2 \cos \frac{2\pi x}{c} + \dots + b_1 \sin \frac{\pi x}{c} + b_2 \sin \frac{2\pi x}{c} + \dots \\ f(x) &= 1 - \frac{8}{\pi^2} \left[ \frac{\cos \frac{\pi x}{2}}{1^2} + \frac{\cos \frac{3\pi x}{2}}{3^2} + \frac{\cos \frac{5\pi x}{2}}{5^2} + \dots \right] \end{aligned}$$

Ans.

**Example 17.** Prove that

$$\frac{l}{2} - x = \frac{l}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{2n\pi x}{l}, \quad 0 < x$$

**Solution.**

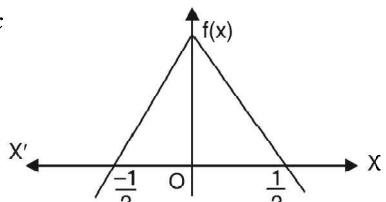

$$f(x) = \frac{1}{2} - x$$

$$a_0 = \frac{1}{l/2} \int_0^{l/2} f(x) dx = \frac{2}{l} \int_0^{l/2} \left( \frac{1}{2} - x \right) dx = \frac{2}{l} \left[ \frac{lx}{2} - \frac{x^2}{2} \right]_0^{l/2} = 0$$

$$a_n = \frac{1}{l/2} \int_0^{l/2} f(x) \cos \frac{n\pi x}{l/2} dx = \frac{2}{l} \int_0^{l/2} \left( \frac{1}{2} - x \right) \cos \frac{2n\pi x}{l} dx$$

$$= \frac{2}{l} \left[ \left( \frac{l}{2} - x \right) \frac{l}{2n\pi} \sin \frac{2n\pi x}{l} + (-1) \frac{l^2}{4n^2\pi^2} \cos \frac{2n\pi x}{l} \right]_0^{l/2}$$

$$= \frac{2}{l} \left[ 0 - \frac{l^2}{4n^2\pi^2} \cos 2n\pi + \frac{l^2}{4n^2\pi^2} \right]$$

$$\begin{aligned}
&= \frac{2}{l} \frac{l^2}{4n^2\pi^2} (-\cos 2n\pi + 1) = \frac{l}{2n^2\pi^2} (-1 + 1) = 0 \\
b_n &= \frac{1}{l/2} \int_0^{l/2} f(x) \sin \frac{n\pi x}{l/2} dx = \frac{2}{l} \int_0^{l/2} \left( \frac{1}{2} - x \right) \sin \frac{2n\pi x}{l} dx \\
&= \frac{2}{l} \left[ \left( \frac{1}{2} - x \right) \left( -\frac{1}{2n\pi} \cos \frac{2n\pi x}{l} \right) - (-1) \left( -\frac{l^2}{4n^2\pi^2} \sin \frac{2n\pi x}{l} \right) \right]_0^{l/2} \\
&= \frac{2}{l} \left[ \frac{l}{2} \frac{l}{2n\pi} \cos 2n\pi - 0 + \frac{l}{2} \cdot \frac{l}{2n\pi} (1) \right] = \frac{2}{l} \left[ \frac{l^2}{2n\pi} \right] = \frac{l}{n\pi}
\end{aligned}$$

Fourier series is

$$\begin{aligned}
f(x) &= \frac{a_0}{2} + a_1 \cos \frac{\pi x}{l/2} + a_2 \cos \frac{2\pi x}{l/2} + a_3 \cos \frac{3\pi x}{l/2} + \dots \\
&\quad + b_1 \sin \frac{\pi x}{l/2} + b_2 \sin \frac{2\pi x}{l/2} + b_3 \sin \frac{3\pi x}{l/2} + \dots \\
\frac{l}{2} - x &= \frac{l}{\pi} \sin \frac{2\pi x}{l} + \frac{l}{2\pi} \sin \frac{4\pi x}{l} + \frac{l}{3\pi} \sin \frac{6\pi x}{l} + \dots \\
&= \frac{l}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{2n\pi x}{l}
\end{aligned}$$

**Proved.**

#### 40.13 HALF PERIOD SERIES

**Cosine series:**  $f(x) = \frac{a_0}{2} + a_1 \cos \frac{\pi x}{c} + a_2 \cos \frac{2\pi x}{c} + \dots + a_n \cos \frac{n\pi x}{c} + \dots$

where  $a_0 = \frac{2}{c} \int_0^c f(x) dx, a_n = \frac{2}{c} \int_0^c f(x) \cos \frac{n\pi x}{c} dx$

**Sine series:**  $f(x) = b_1 \sin \frac{\pi x}{c} + b_2 \sin \frac{2\pi x}{c} + \dots + b_n \sin \frac{n\pi x}{c} + \dots$

where  $b_n = \frac{2}{c} \int_0^c f(x) \sin \frac{n\pi x}{c} dx$ .

**Example 18.** Expand for  $f(x) = k$  for  $0 < x < 2$  in a half range sine series.

(U.P., II Semester, June 2007)

**Solution.**  $f(x) = k$

$$\begin{aligned}
b_n &= \frac{2}{c} \int_0^c f(x) \cdot \sin \frac{n\pi x}{c} dx \text{ in half range } (0, c) = \frac{2}{2} \int_0^2 k \sin \frac{n\pi x}{2} dx \\
&= k \frac{2}{n\pi} \left( -\cos \frac{n\pi x}{2} \right)_0^2 = \frac{2k}{n\pi} [-\cos n\pi + 1]
\end{aligned}$$

Half range sine series is

$$f(x) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{2}$$

$$k = \sum_{n=1}^{\infty} \frac{2k}{n\pi} [1 - \cos n\pi] \sin \frac{n\pi x}{2}$$

**Ans.**

**Example 19.** Obtain the half-range sine series for the function  $f(x) = x^2$  in the interval  $0 < x < 3$ .  
(U.P., II Semester, Summer 2002)

**Solution.** We know that half range sine series is given by  $f(x) = \sum b_n \sin nx$

Where  $b_n = \frac{2}{c} \int_0^c f(x) \sin \frac{n\pi x}{c} dx$  in the half-range  $(0, c)$ .

Here, we have half range  $0 < x < 3$  and  $f(x) = x^2$

$$\begin{aligned} b_n &= \frac{2}{3} \int_0^3 x^2 \sin \frac{n\pi x}{3} dx \\ &= \frac{2}{3} \left[ x^2 \left( \frac{3}{n\pi} \right) \left( -\cos \frac{n\pi x}{3} \right) + 2x \times \left( \frac{3}{n\pi} \right) \left( \frac{3}{n\pi} \right) \sin \frac{n\pi x}{3} - 2 \left( \frac{3}{n\pi} \right) \left( \frac{3}{n\pi} \right) \left( -\cos \frac{n\pi x}{3} \right) \right]_0^3 \end{aligned}$$

$$\Rightarrow b_n = \frac{2}{3} \left[ \left\{ -\frac{27}{n\pi} (-1)^n - \frac{54}{n^3 \pi^3} (-1)^n \right\} + \frac{54}{n^3 \pi^3} \right]$$

$$\Rightarrow b_n = \frac{2}{3} \left[ \frac{54}{n^3 \pi^3} \{1 - (-1)^n\} - \frac{27}{n\pi} (-1)^n \right] \Rightarrow b_n = \frac{2}{3} \left[ \frac{108}{n^3 \pi^3} + \frac{27}{n\pi} \right] \text{ when } n \text{ is odd}$$

$$\text{And } b_n = -\frac{18}{n\pi} \text{ when } n \text{ is even}$$

∴ Half range sine series

$$\begin{aligned} f(x) &= b_1 \sin x + b_2 \sin 2x + b_3 \sin 3x + \dots \\ &= \frac{2}{3} \left[ \frac{108}{\pi^3} \left( \frac{\sin x}{1^3} + \frac{\sin 3x}{3^3} + \frac{\sin 5x}{5^3} + \dots \right) + \frac{27}{\pi} \left( \frac{\sin x}{1} + \frac{\sin 3x}{3} + \frac{\sin 5x}{5} + \dots \right) \right] \\ &\quad - \frac{18}{\pi} \left( \frac{\sin 2x}{2} + \frac{\sin 4x}{4} + \dots \right) \text{ Ans.} \end{aligned}$$

**Example 20.** Expand  $f(x) = e^x$  in a cosine series over  $(0, 1)$ .

**Solution.** Here, we have  $f(x) = e^x$  and  $c = 1$

$$a_0 = \frac{2}{c} \int_0^c f(x) dx = \frac{2}{1} \int_0^1 e^x dx = 2(e - 1)$$

$$a_n = \frac{2}{c} \int_0^c f(x) \cos \frac{n\pi x}{c} dx = \frac{2}{1} \int_0^1 e^x \cos \frac{n\pi x}{1} dx$$

$$= 2 \left[ \frac{e^x}{n^2 \pi^2 + 1} (n\pi \sin n\pi x + \cos n\pi x) \right]_0^1$$

$$= 2 \left[ \frac{e^1}{n^2 \pi^2 + 1} (n\pi \sin n\pi + \cos n\pi) - \frac{1}{n^2 \pi^2 + 1} \right]$$

$$= \frac{2}{n^2 \pi^2 + 1} [(-1)^n e - 1]$$

$$f(x) = \frac{a_0}{2} + a_1 \cos \pi x + a_2 \cos 2\pi x + a_3 \cos 3\pi x + \dots$$

$$e^x = e - 1 + 2 \left[ \frac{-e - 1}{\pi^2 + 1} \cos \pi x + \frac{e - 1}{4\pi^2 + 1} \cos 2\pi x + \frac{-e - 1}{9\pi^2 + 1} \cos 3\pi x + \dots \right] \text{ Ans.}$$

**Example 21.** Find the Fourier half-range cosine series of the function

$$f(t) = \begin{cases} 2t, & 0 < t < 1 \\ 2(2-t), & 1 < t < 2 \end{cases} \quad (\text{U.P., II Semester, Summer 2007, 2006, 2001})$$

$$\text{Solution. } f(t) = \begin{cases} 2t, & 0 < t < 1 \\ 2(2-t), & 1 < t < 2 \end{cases}$$

$$\text{Let } f(t) = \frac{a_0}{2} + a_1 \cos \frac{\pi t}{c} + a_2 \cos \frac{2\pi t}{c} + a_3 \cos \frac{3\pi t}{c} + \dots + b_1 \sin \frac{\pi t}{c} + b_2 \sin \frac{2\pi t}{c} + b_3 \sin \frac{3\pi t}{c} + \dots \quad \dots(1)$$

Here,  $c = 2$ , because it is half range series.

$$\text{Hence, } a_0 = \frac{2}{c} \int_0^c f(t) dt = \frac{2}{2} \int_0^1 2t dt + \frac{2}{2} \int_1^2 2(2-t) dt$$

$$= [t^2]_0^1 + \left[ 2 \left( 2t - \frac{t^2}{2} \right) \right]_1^2 = 1 + [4t - t^2]_1^2 = 1 + (8 - 4 - 4 + 1) = 2$$

$$a_n = \frac{2}{c} \int_0^c f(t) \cos \frac{n\pi t}{c} dt = \frac{2}{2} \int_0^1 2t \cos \frac{n\pi t}{2} dt + \frac{2}{2} \int_1^2 2(2-t) \cos \frac{n\pi t}{2} dt$$

$$= \left[ 2t \left( \frac{2}{n\pi} \sin \frac{n\pi t}{2} \right) - (2) \left( -\frac{4}{n^2\pi^2} \cos \frac{n\pi t}{2} \right) \right]_0^1$$

$$+ \left[ (4-2t) \left( \frac{2}{n\pi} \sin \frac{n\pi t}{2} \right) - (-2) \left( -\frac{4}{n^2\pi^2} \cos \frac{n\pi t}{2} \right) \right]_1^2$$

$$= \left[ \frac{4}{n\pi} \sin \frac{n\pi}{2} + \frac{8}{n^2\pi^2} \cos \frac{n\pi}{2} - \frac{8}{n^2\pi^2} \right] + \left[ 0 - \frac{8}{n^2\pi^2} \cos n\pi - \frac{4}{n\pi} \sin \frac{n\pi}{2} + \frac{8}{n^2\pi^2} \cos \frac{n\pi}{2} \right]$$

$$= \frac{16}{n^2\pi^2} \cos \frac{n\pi}{2} - \frac{8}{n^2\pi^2} - \frac{8}{n^2\pi^2} \cos n\pi = \frac{8}{n^2\pi^2} \left[ 2 \cos \frac{n\pi}{2} - 1 - \cos n\pi \right]$$

$$f(t) = 1 + \frac{8}{\pi^2} \sum_{n=1}^{\infty} \left[ 2 \cos \frac{n\pi}{2} - 1 - \cos n\pi \right] \cos \frac{n\pi t}{2} \quad \text{Ans.}$$

**Example 22.** Obtain the Fourier cosine series expansion of the periodic function defined by

$$f(t) = \sin \left( \frac{\pi t}{l} \right), \quad 0 < t < l \quad (\text{U.P., II Semester, Summer 2001})$$

**Solution.** We have,  $f(t) = \sin \left( \frac{\pi t}{l} \right), \quad 0 < t < l$

$$\begin{aligned}
a_0 &= \frac{2}{l} \int_0^l \sin\left(\frac{\pi t}{l}\right) dt = \frac{2}{l} \left( -\frac{l}{\pi} \cos \frac{\pi t}{l} \right)_0^l = -\frac{2}{\pi} (\cos \pi - \cos 0) = -\frac{2}{\pi} (-1 - 1) = \frac{4}{\pi} \\
a_n &= \frac{2}{l} \int_0^l \sin\left(\frac{\pi t}{l}\right) \cos \frac{n\pi t}{l} dt = \frac{1}{l} \int_0^l \left[ \sin\left(\frac{\pi t}{l} + \frac{n\pi t}{l}\right) - \sin\left(\frac{\pi t}{l} - \frac{n\pi t}{l}\right) \right] dt \\
&= \frac{1}{l} \int_0^l \sin(n+1)\frac{\pi t}{l} dt - \frac{1}{l} \int_0^l \sin(n-1)\frac{\pi t}{l} dt \\
&= \frac{1}{l} \left[ -\frac{l}{(n+1)\pi} \cos \frac{(n+1)\pi t}{l} \right]_0^l - \frac{1}{l} \left[ \frac{l}{(n-1)\pi} \cos \frac{(n-1)\pi t}{l} \right]_0^l \\
&= \frac{-1}{(n+1)\pi} [\cos(n+1)\pi - \cos 0] + \frac{1}{(n-1)\pi} [\cos(n-1)\pi - \cos 0] \\
&= \frac{1}{(n+1)\pi} [(-1)^{n+1} - 1] + \frac{1}{(n-1)\pi} [(-1)^{n+1} - 1] \\
&= (-1)^{n+1} \left[ \frac{1}{(n+1)\pi} + \frac{1}{(n-1)\pi} \right] + \frac{1}{(n+1)\pi} - \frac{1}{(n-1)\pi} \\
&= (-1)^{n+1} \frac{2}{(n^2-1)\pi} - \frac{2}{(n^2-1)\pi} = \frac{2}{(n^2-1)\pi} [(-1)^{n+1} - 1] \\
&= \frac{-4}{(n^2-1)\pi}, \quad \text{when } n \text{ is even} \\
&= 0, \quad \text{when } n \text{ is odd.}
\end{aligned}$$

The above formula for finding the value of  $a_1$  is not applicable.

$$\begin{aligned}
a_1 &= \frac{2}{l} \int_0^l \sin \frac{\pi t}{l} \cos \frac{\pi t}{l} dt = \frac{1}{l} \int_0^l \sin \frac{2\pi t}{l} dt \\
&= \frac{1}{l} \left( -\frac{l}{2\pi} \cos \frac{2\pi t}{l} \right)_0^l = -\frac{l}{2\pi l} (\cos 2\pi - \cos 0) = -\frac{1}{2\pi} (1 - 1) = 0 \\
f(t) &= \frac{a_0}{2} + a_1 \cos \frac{\pi t}{l} + a_2 \cos \frac{2\pi t}{l} + a_3 \cos \frac{3\pi t}{l} + a_4 \cos \frac{4\pi t}{l} + \dots \\
&= \frac{2}{\pi} - \frac{4}{\pi} \left[ \frac{1}{3} \cos \frac{2\pi t}{l} + \frac{1}{15} \cos \frac{4\pi t}{l} + \frac{1}{35} \cos \frac{6\pi t}{l} + \dots \right]
\end{aligned}$$

Ans.

**Example 23.** Find the Fourier cosine series expansion of the periodic function of period 1

$$f(x) = \begin{cases} \frac{l}{2} + x, & -\frac{l}{2} < x \leq 0 \\ \frac{l}{2} - x, & 0 < x < \frac{l}{2} \end{cases}$$

**Solution.** Let  $f(x) = \frac{a_0}{2} + a_1 \cos \frac{\pi x}{c} + a_2 \cos \frac{2\pi x}{c} + \dots$  ... (1)  
as  $f(x)$  is a cosine series.

Here  $2c = 1 \Rightarrow c = \frac{1}{2}$

$$\begin{aligned}
 a_0 &= \frac{1}{c} \int_{-c}^c f(x) dx = \frac{1}{1/2} \int_{-1/2}^0 \left( \frac{1}{2} + x \right) dx + \frac{1}{1/2} \int_0^{1/2} \left( \frac{1}{2} - x \right) dx \\
 &= 2 \left[ \frac{x}{2} + \frac{x^2}{2} \right]_{-1/2}^0 + 2 \left[ \frac{x}{2} - \frac{x^2}{2} \right]_0^{1/2} = 2 \left[ \frac{1}{4} - \frac{1}{8} \right] + 2 \left[ \frac{1}{4} - \frac{1}{8} \right] = \frac{1}{2} \\
 a_n &= \frac{1}{c} \int_{-c}^c f(x) \cos \frac{n\pi x}{c} dx \\
 &= \frac{1}{1/2} \int_{-1/2}^0 \left( \frac{1}{2} + x \right) \cos \frac{n\pi x}{1/2} dx + \frac{1}{1/2} \int_0^{1/2} \left( \frac{1}{2} - x \right) \cos \frac{n\pi x}{1/2} dx \\
 &= 2 \int_{-1/2}^0 \left( \frac{1}{2} + x \right) \cos 2n\pi x dx + 2 \int_0^{1/2} \left( \frac{1}{2} - x \right) \cos 2n\pi x dx \\
 &= 2 \left[ \left( \frac{1}{2} + x \right) \frac{\sin 2n\pi x}{2n\pi} - (-1) \left( -\frac{\cos 2n\pi x}{4n^2\pi^2} \right) \right]_{-1/2}^0 \\
 &\quad + 2 \left[ \left( \frac{1}{2} - x \right) \frac{\sin 2n\pi x}{2n\pi} - (-1) \left( \frac{-\cos 2n\pi x}{4n^2\pi^2} \right) \right]_0^{1/2} \\
 &= 2 \left[ 0 + \frac{1}{4n^2\pi^2} - \frac{(-1)^n}{4n^2\pi^2} \right] + 2 \left[ 0 - \frac{(-1)^n}{4n^2\pi^2} + \frac{1}{4n^2\pi^2} \right] = \frac{1}{\pi^2} \left[ \frac{1}{n^2} - \frac{(-1)^n}{n^2} \right] \\
 &= \frac{2}{n^2\pi^2} \quad (\text{if } n \text{ is odd}) \\
 &= 0 \quad (\text{if } n \text{ is even})
 \end{aligned}$$

Substituting the values of  $a_0, a_1, a_2, a_3, \dots$  in (1), we have

$$f(x) = \frac{1}{4} + \frac{2}{\pi^2} \left[ \frac{\cos 2\pi x}{1^2} + \frac{\cos 6\pi x}{3^2} + \frac{\cos 10\pi x}{5^2} + \dots \right] \quad \text{Ans.}$$

**Example 24.** Let  $f(x) = \begin{cases} wx, & \text{where } 0 \leq x \leq \frac{l}{2} \\ w(l-x), & \text{where } \frac{l}{2} \leq x \leq l \end{cases}$

$$\text{Show that } f(x) = \frac{4wl}{\pi^2} \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)^2} \sin \frac{(2n+1)\pi x}{l}$$

Hence, obtain the sum of the series

$$1 + \frac{1}{3^2} + \frac{1}{5^2} + \dots \quad (\text{U.P., Second Semester 2003})$$

**Solution.** Half range sine series is

$$f(x) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l} \quad \dots(1)$$

$$\text{where, } b_n = \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx$$

$$b_n = \frac{2}{l} \left[ \int_0^{\frac{l}{2}} f(x) \sin \frac{n\pi x}{l} dx + \int_{\frac{l}{2}}^l f(x) \sin \frac{n\pi x}{l} dx \right]$$

$$\begin{aligned}
&= \frac{2}{l} \left[ \int_0^{\frac{l}{2}} wx \sin \frac{n\pi x}{l} dx + \int_{\frac{l}{2}}^l w(l-x) \sin \frac{n\pi x}{l} dx \right] \\
&= \frac{2}{l} \left[ \left\{ wx \frac{\left( -\cos \frac{n\pi x}{l} \right)}{\left( \frac{n\pi}{l} \right)} - w \frac{\left( -\sin \frac{n\pi x}{l} \right)}{\left( \frac{n\pi}{l} \right)^2} \right\}_0^{\frac{l}{2}} + \left\{ w(l-x) \frac{\left( -\cos \frac{n\pi x}{l} \right)}{\left( \frac{n\pi}{l} \right)} - w(-1) \frac{\left( -\sin \frac{n\pi x}{l} \right)}{\left( \frac{n\pi}{l} \right)^2} \right\}_{\frac{l}{2}}^l \right] \\
&= \frac{2}{l} \left[ \left\{ \frac{wl}{2} \frac{\left( -\cos \frac{n\pi}{2} \right)}{\left( \frac{n\pi}{l} \right)} + \frac{w \sin \frac{n\pi}{2}}{\left( \frac{n\pi}{l} \right)^2} - 0 - 0 \right\} - \left\{ \frac{wl}{2} \frac{\left( -\cos \frac{n\pi}{2} \right)}{\left( \frac{n\pi}{l} \right)} - \frac{w \sin \frac{n\pi}{2}}{\left( \frac{n\pi}{l} \right)^2} \right\} \right] \\
&= \frac{2w}{l} \left[ -\frac{l^2}{2n\pi} \cos \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} + \frac{l^2}{2n\pi} \cos \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] \\
&= \frac{2w}{l} \left[ \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] = \frac{4wl^2}{ln^2\pi^2} \sin \frac{n\pi}{2}
\end{aligned}$$

$$b_n = \frac{4wl}{n^2\pi^2} \sin \frac{n\pi}{2}, \text{ when } n \text{ is odd.}$$

$$b_n = 0, \quad \text{when } n \text{ is even.}$$

Now, putting the value of  $b_n$  in (1), we get

$$f(x) = \sum_{n=1}^{\infty} \frac{4wl}{n^2\pi^2} \sin \frac{n\pi}{2} \sin \frac{n\pi x}{l}, \text{ when } n \text{ is odd}$$

$$f(x) = \sum_{n=1}^{\infty} \frac{4wl}{(2n+1)^2\pi^2} \sin \frac{(2n+1)\pi}{2} \sin \frac{(2n+1)\pi x}{l}$$

$$f(x) = \frac{4wl}{\pi^2} \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)^2} \sin \frac{(2n+1)\pi x}{l}$$

$$f(x) = \frac{4wl}{\pi^2} \left[ \frac{1}{1^2} \sin \frac{\pi x}{l} - \frac{1}{3^2} \sin \frac{3\pi x}{l} + \frac{1}{5^2} \sin \frac{5\pi x}{l} + \dots \right] \quad \dots(2)$$

Putting  $x = \frac{l}{2}$ ,  $f(x) = wx$  and  $f\left(\frac{l}{2}\right) = \frac{wl}{2}$  in (2), we get

$$\frac{wl}{2} = \frac{4wl}{\pi^2} \left[ \frac{1}{1^2} \sin \frac{\pi}{2} - \frac{1}{3^2} \sin \frac{3\pi}{2} + \frac{1}{5^2} \sin \frac{5\pi}{2} + \dots \right]$$

$$\Rightarrow \frac{\pi^2}{8} = \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \quad \text{Ans.}$$

$$\begin{aligned}
&n \rightarrow 2n+1 \\
&\sin(2n+1) \frac{\pi}{2} \\
&= \sin\left(n\pi + \frac{\pi}{2}\right) \\
&= \cos n\pi = (-1)^n
\end{aligned}$$

**Example 25.** Find the half period sine series for  $f(x)$  given in the range  $(0, l)$  by the graph  $OPQ$  as shown in figure. (U.P. II semester, 2009)

**Solution.** The equation of line  $OP$  is  $y - 0 = \frac{0-k}{l-\frac{l}{2}}(x-l) \Rightarrow y = \frac{2kx}{l} + 2k$

and the equation of the line  $PQ$  is  $y = -\frac{kx}{l} \Rightarrow y = -\frac{2kx}{l}$

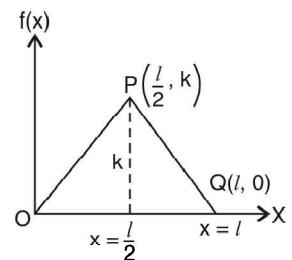

$f(x)$  is the half period

$$f(x) = \begin{cases} \frac{2kx}{l}, & 0 < x < \frac{l}{2} \\ -\frac{2kx}{l} + 2k, & \frac{l}{2} < x < l \end{cases}$$

$f(x)$  is half period series. It is to be expanded as sine series.

Here,  $a_0 = 0$  and  $a_n = 0$

$$\begin{aligned} b_n &= \frac{2}{l} \int_0^{\frac{l}{2}} f(x) \sin \frac{n\pi x}{l} dx + \frac{2}{l} \int_{\frac{l}{2}}^l f(x) \sin \frac{n\pi x}{l} dx \\ &= \frac{2}{l} \int_0^{\frac{l}{2}} \frac{2kx}{l} \sin \frac{n\pi x}{l} dx + \frac{2}{l} \int_{\frac{l}{2}}^l \left( -\frac{2kx}{l} + 2k \right) \sin \frac{n\pi x}{l} dx \\ &= \frac{4k}{l^2} \int_0^{\frac{l}{2}} x \sin \frac{n\pi x}{l} dx + \frac{4k}{l^2} \int_{\frac{l}{2}}^l (-x+l) \sin \frac{n\pi x}{l} dx \\ &= \frac{4k}{l^2} \left[ x \left( -\frac{l}{n\pi} \cos \frac{n\pi x}{l} \right) - \left( \frac{-l^2}{n^2\pi^2} \sin \frac{n\pi x}{l} \right) \right]_0^{\frac{l}{2}} + \frac{4k}{l^2} \left[ (-x+l) \left( -\frac{l}{n\pi} \cos \frac{n\pi x}{l} \right) - (-1) \left( \frac{-l^2}{n^2\pi^2} \sin \frac{n\pi x}{l} \right) \right]_{\frac{l}{2}}^l \\ &= \frac{4k}{l^2} \left[ -\frac{l}{2} \left( \frac{l}{n\pi} \right) \cos \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] \\ &\quad + \frac{4k}{l^2} \left[ (-l+l) \left( -\frac{l}{n\pi} \cos n\pi \right) - \frac{l^2}{n^2\pi^2} \sin n\pi - \left( -\frac{l}{2} + l \right) \left( -\frac{l}{n\pi} \cos \frac{n\pi}{2} \right) + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] \\ &= \frac{4k}{l^2} \left[ -\frac{l^2}{2n\pi} \cos \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] + \frac{4k}{l^2} \left[ 0 - 0 + \frac{l^2}{2n\pi} \cos \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] \\ &= \frac{4k}{l^2} \left( \frac{l^2}{2n\pi} \right) \left[ -\cos \frac{n\pi}{2} + \frac{2}{n\pi} \sin \frac{n\pi}{2} \right] + \frac{4k}{l^2} \left[ \frac{l^2}{2n\pi} \cos \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] \\ &= \frac{4k}{l^2} \left( \frac{l^2}{2n\pi} \right) \left[ -\cos \frac{n\pi}{2} + \frac{2}{n\pi} \sin \frac{n\pi}{2} + \cos \frac{n\pi}{2} + \frac{2}{n\pi} \sin \frac{n\pi}{2} \right] \\ &= \frac{2k}{n\pi} \left[ \frac{4}{n\pi} \sin \frac{n\pi}{2} \right] = \frac{8k}{n^2\pi^2} \sin \frac{n\pi}{2} \end{aligned}$$

Hence, Fourier series of  $f(x)$  is

$$f(x) = \frac{8k}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{n^2} \sin \frac{n\pi}{2} \sin \frac{n\pi x}{l} \quad \text{Ans.}$$

### EXERCISE 40.4

1. Find the Fourier series to represent  $f(x)$ , where

$$f(x) = \begin{cases} -a, & -c < x < 0 \\ a, & 0 < x < c \end{cases} \quad \text{Ans. } \frac{4a}{\pi} \left[ \sin \frac{\pi x}{c} + \frac{1}{3} \sin \frac{3\pi x}{c} + \frac{1}{5} \sin \frac{5\pi x}{c} + \dots \right]$$

2. Find the half-range sine series for the function

$$f(x) = 2x - 1 \quad 0 < x < 1 \quad \text{Ans. } -\frac{2}{\pi} \left[ \sin 2\pi x + \frac{1}{2} \sin 4\pi x + \frac{1}{3} \sin 6\pi x + \dots \right]$$

3. Express  $f(x) = x$  as a cosine, half range series in  $0 < x < 2$ .

$$\text{Ans. } 1 - \frac{8}{\pi^2} \left[ \frac{1}{1^2} \cos \frac{\pi x}{2} + \frac{1}{3^2} \cos \frac{3\pi x}{2} + \frac{1}{5^2} \cos \frac{5\pi x}{2} + \dots \right]$$

4. Find the Fourier series of the function

$$f(x) = \begin{cases} -2 & \text{for } -4 < x < -2 \\ x & \text{for } -2 < x < 2 \\ 2 & \text{for } 2 < x < 4 \end{cases} \quad \text{Ans. } \frac{4}{\pi} + \frac{8}{\pi^2} \sin \frac{\pi x}{4} - \frac{2}{\pi} \sin \frac{2\pi x}{4} + \left( \frac{4}{3\pi} - \frac{8}{3^2\pi} \right) \sin \frac{3\pi x}{4} - \frac{2}{2\pi} \sin \frac{4\pi x}{4} + \dots$$

5. Find the Fourier series to represent  $f(x) = x^2 - 2$  from  $-2 < x < 2$ .

$$\text{Ans. } -\frac{2}{3} - \frac{16}{\pi^2} \left[ \cos \frac{\pi x}{2^2} - \frac{1}{4} \cos \pi x + \frac{1}{9} \cos \frac{3\pi x}{2} + \dots \right]$$

6. If  $f(x) = e^{-x}$ ,  $-c < x < c$ , show that

$$f(x) = (e^c - e^{-c}) \left\{ \frac{1}{2c} - c \left( \frac{1}{c^2 + \pi^2} \cos \frac{\pi x}{c} - \frac{1}{c^2 + 4\pi^2} \cos \frac{2\pi x}{c} + \dots \right) - \pi \left( \frac{1}{c^2 + \pi^2} \sin \frac{\pi x}{c} - \frac{2}{c^2 + 4\pi^2} \sin \frac{2\pi x}{c} \dots \right) \right\} \quad (\text{MDU, Dec. 2010})$$

7. A sinusoidal voltage  $E \sin \omega t$  is passed through a half wave rectifier which clips the negative portion of the wave. Develop the resulting portion of the function

$$u(t) = \begin{cases} 0, & \text{when } -\frac{T}{2} < t < 0 \\ E \sin \omega t, & \text{when } 0 < t < \frac{T}{2} \end{cases} \quad \left( T = \frac{2\pi}{\omega} \right)$$

$$\text{Ans. } \frac{E}{\pi} + \frac{E}{2} \sin \omega t - \frac{2E}{\pi} \left[ \frac{1}{1.3} \cos 2\omega t + \frac{1}{3.5} \cos 4\omega t + \frac{1}{5.7} \cos 6\omega t + \dots \right]$$

8. A periodic square wave has a period 4. The function generating the square is

$$f(t) = \begin{cases} 0 & \text{for } -2 < t < -1 \\ k & \text{for } -1 < t < 1 \\ 0 & \text{for } 1 < t < 2 \end{cases}$$

Find the Fourier series of the function.

$$\text{Ans. } f(t) = \frac{k}{2} + \frac{2k}{\pi} \left[ \cos \frac{\pi t}{2} - \frac{1}{3} \cos \frac{3\pi t}{2} + \dots \right]$$

9. Find a Fourier series to represent  $x^2$  in the interval  $(-l, l)$ .

$$\text{Ans. } \frac{l^2}{3} - \frac{4l^2}{\pi^2} \left[ \cos \pi x - \frac{\cos \pi x}{2^2} + \frac{\cos 3\pi x}{3^2} \right]$$

#### 40.14. PARSEVAL'S FORMULA

$$\int_{-c}^c [f(x)]^2 dx = c \left\{ \frac{1}{2} a_0^2 + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \right\}$$

We know that  $f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left( a_n \cos \frac{n\pi x}{c} + b_n \sin \frac{n\pi x}{c} \right)$  ... (1)

Multiplying (1) by  $f(x)$ , we get

$$[f(x)]^2 = \frac{a_0}{2} f(x) + \sum_{n=1}^{\infty} a_n f(x) \cos \frac{n\pi x}{c} + \sum_{n=1}^{\infty} b_n f(x) \sin \frac{n\pi x}{c} .. (2)$$

Integrating term by term from  $-c$  to  $c$ , we have

$$\begin{aligned} \int_{-c}^c [f(x)]^2 dx &= \frac{a_0}{2} \int_{-c}^c f(x) dx + \sum_{n=1}^{\infty} a_n \int_{-c}^c f(x) \cos \frac{n\pi x}{c} dx \\ &\quad + \sum_{n=1}^{\infty} b_n \int_{-c}^c f(x) \sin \frac{n\pi x}{c} dx \quad ... (3) \end{aligned}$$

In article 40.12, we have the following results

$$\int_{-c}^c f(x) dx = c a_0$$

$$\int_{-c}^c f(x) \cos \frac{n\pi x}{c} dx = c a_n$$

$$\int_{-c}^c f(x) \sin \frac{n\pi x}{c} dx = c b_n$$

On putting these integrals in (3), we get

$$\int_{-c}^c [f(x)]^2 dx = c \frac{a_0^2}{2} + \sum_{n=1}^{\infty} c a_n^2 + \sum_{n=1}^{\infty} c b_n^2 = c \left[ \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \right]$$

This is the Parseval's formula.

**Note.1.** If  $0 < x < 2c$ , then  $\int_0^{2c} [f(x)]^2 dx = c \left[ \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2) \right]$

**2.** If  $0 < x < c$  (Half range cosine series),  $\int_0^c [f(x)]^2 dx = \frac{c}{2} \left[ \frac{a_0^2}{2} + \sum_{n=1}^{\infty} a_n^2 \right]$

**3.** If  $0 < x < c$  (Half range sine series),  $\int_0^c [f(x)]^2 dx = \frac{c}{2} \left[ \sum_{n=1}^{\infty} b_n^2 \right]$

**4.** R.M.S. =  $\sqrt{\frac{\int_a^b [f(x)]^2 dx}{b-a}}$

**Example 26.** By using the series for  $f(x) = 1$  in  $0 < x < \pi$  show that

$$\frac{\pi^2}{8} = 1 + \frac{1}{3^2} + \frac{1}{5^2} + \frac{1}{7^2} + \dots$$

**Solution.** Sine series is  $f(x) = \sum b_n \sin nx$

$$b_n = \frac{2}{\pi} \int_0^\pi f(x) \sin nx dx$$

$$= \frac{2}{\pi} \int_0^\pi (1) \sin nx dx = \frac{2}{\pi} \left( \frac{-\cos nx}{n} \right)_0^\pi = \frac{-2}{n\pi} [\cos n\pi - 1] = \frac{-2}{n\pi} [(-1)^n - 1]$$

$$= \frac{4}{n\pi} \text{ if } n \text{ is odd} = 0 \quad \text{if } n \text{ is even}$$

Then the sine series is

$$1 = \frac{4}{\pi} \sin x + \frac{4}{3\pi} \sin 3x + \frac{4}{5\pi} \sin 5x + \frac{4}{7\pi} \sin 7x + \dots$$

$$\begin{aligned}\int_0^c [f(x)]^2 dx &= \frac{c}{2} [b_1^2 + b_2^2 + b_3^2 + b_4^2 + b_5^2 + \dots] \\ \int_0^\pi (1)^2 dx &= \frac{\pi}{2} \left[ \left(\frac{4}{\pi}\right)^2 + \left(\frac{4}{3\pi}\right)^2 + \left(\frac{4}{5\pi}\right)^2 + \left(\frac{4}{7\pi}\right)^2 + \dots \right] \\ [x]_0^\pi &= \left(\frac{\pi}{2}\right) \left(\frac{16}{\pi^2}\right) \left[ 1 + \frac{1}{3^2} + \frac{1}{5^2} + \frac{1}{7^2} + \dots \right] \\ \pi &= \frac{\pi}{2} \left(\frac{16}{\pi^2}\right) \left[ 1 + \frac{1}{3^2} + \frac{1}{5^2} + \frac{1}{7^2} + \dots \right]\end{aligned}$$

$$\frac{\pi^2}{8} = 1 + \frac{1}{3^2} + \frac{1}{5^2} + \frac{1}{7^2} + \dots$$

**Proved.**

**Example 27.** If  $f(x) = \begin{cases} \pi x & 0 < x < 1 \\ \pi(2-x), & 1 < x < 2 \end{cases}$

using half range cosine series, show that

$$\frac{1}{1^4} + \frac{1}{3^4} + \frac{1}{5^4} + \dots = \frac{\pi^4}{96}$$

**Solution.** Half range cosine series is

$$f(x) = \frac{a_0}{2} + \sum a_n \cos \frac{n\pi x}{c}$$

$$\begin{aligned}\text{where } a_0 &= \frac{2}{c} \int_0^c f(x) dx = \frac{2}{2} \left[ \int_0^1 \pi x dx + \int_1^2 \pi (2-x) dx \right] \\ &= \pi \left( \frac{x^2}{2} \right)_0^1 + \pi \left( 2x - \frac{x^2}{2} \right)_1^2 = \frac{\pi}{2} + \pi \left[ (4-2) - \left( 2 - \frac{1}{2} \right) \right] = \pi\end{aligned}$$

$$a_n = \frac{2}{c} \int_0^c f(x) \cos \frac{n\pi x}{c} dx$$

$$= \frac{2}{2} \left[ \int_0^1 \pi x \cos \frac{n\pi x}{2} dx + \int_1^2 \pi (2-x) \cos \frac{n\pi x}{2} dx \right]$$

$$= \pi \left[ \frac{x \frac{\sin n\pi x}{2}}{\frac{n\pi}{2}} - \left( \frac{-\cos \frac{n\pi x}{2}}{\frac{n^2\pi^2}{4}} \right) \right]_0^1 + \pi \left[ (2-x) \frac{\sin \frac{n\pi x}{2}}{\frac{n\pi}{2}} - (-1) \left( \frac{-\cos \frac{n\pi x}{2}}{\frac{n^2\pi^2}{4}} \right) \right]_1^2$$

$$= \pi \left[ \frac{2}{n\pi} \sin \frac{n\pi}{2} + \frac{4}{n^2\pi^2} \cos \frac{n\pi}{2} - \frac{4}{n^2\pi^2} \right] + \pi \left[ 0 - \frac{4}{n^2\pi^2} \cos n\pi - \frac{2}{n\pi} \sin \frac{n\pi}{2} + \frac{4}{n^2\pi^2} \cos \frac{n\pi}{2} \right]$$

$$= \pi \left[ \frac{8}{n^2\pi^2} \cos \frac{n\pi}{2} - \frac{4}{n^2\pi^2} - \frac{4}{n^2\pi^2} \cos n\pi \right] = \frac{4}{n^2\pi} \left[ 2 \cos \frac{n\pi}{2} - 1 - \cos n\pi \right]$$

$$a_1 = 0, a_2 = \frac{-4}{\pi}, a_3 = 0, a_4 = 0, a_5 = 0, a_6 = \frac{-4}{9\pi} \dots$$

$$\int_0^c [f(x)]^2 dx = \frac{c}{2} \left[ \frac{a_0^2}{2} + a_1^2 + a_2^2 + a_3^2 + \dots \right]$$

$$\int_0^1 (\pi x)^2 dx + \int_1^2 \pi^2 (2-x)^2 dx = \frac{2}{2} \left[ \frac{\pi^2}{2} + \frac{16}{\pi^2} + \frac{16}{81\pi^2} + \dots \right]$$

$$\pi^2 \left[ \frac{x^3}{3} \right]_0^1 - \pi^2 \left[ \frac{(2-x)^3}{3} \right]_1^2 = \frac{\pi^2}{2} + \frac{16}{\pi^2} + \frac{16}{81\pi^2} + \dots$$

$$\frac{\pi^2}{3} - \pi^2 \left( 0 - \frac{1}{3} \right) = \frac{\pi^2}{2} + \frac{16}{\pi^2} \left[ 1 + \frac{1}{81} + \dots \right]$$

$$\frac{2\pi^2}{3} - \frac{\pi^2}{2} = \frac{16}{\pi^2} \left[ 1 + \frac{1}{3^4} + \frac{1}{5^4} + \dots \right]$$

$$\frac{\pi^2}{6} = \frac{16}{\pi^2} \left[ 1 + \frac{1}{3^4} + \frac{1}{5^4} + \dots \right]$$

$$\frac{\pi^4}{96} = 1 + \frac{1}{3^4} + \frac{1}{5^4} + \dots$$

Ans.

**Example 28.** Prove that for  $0 < x < \pi$

$$(a) x(\pi - x) = \frac{\pi^2}{6} - \left[ \frac{\cos 2x}{1^2} + \frac{\cos 4x}{2^2} + \frac{\cos 6x}{3^2} + \dots \right]$$

$$(b) x(\pi - x) = \frac{8}{\pi} \left[ \frac{\sin x}{1^2} + \frac{\sin 3x}{3^2} + \frac{\sin 5x}{5^2} + \dots \right]$$

Deduce from (a) and (b) respectively that

$$(c) \sum_{n=1}^{\infty} \frac{1}{n^4} = \frac{\pi^4}{90} \quad (d) \sum_{n=1}^{\infty} \frac{1}{n^6} = \frac{\pi^4}{945}$$

**Solution.** (a) Half range cosine series

$$a_0 = \frac{2}{\pi} \int_0^\pi x(\pi - x) dx = \frac{2}{\pi} \left[ \frac{\pi x^2}{2} - \frac{x^3}{3} \right]_0^\pi = \frac{2}{\pi} \left[ \frac{\pi^3}{2} - \frac{\pi^3}{3} \right] = \frac{\pi^2}{3}$$

$$a_n = \frac{2}{\pi} \int_0^\pi x(\pi - x) \cos nx dx$$

$$= \frac{2}{\pi} \left[ (\pi x - x^2) \frac{\sin nx}{n} - (\pi - 2x) \left( \frac{-\cos nx}{n^2} \right) + (-2) \left( \frac{-\sin nx}{n^3} \right) \right]_0^\pi$$

$$= \frac{2}{\pi} \left[ 0 - \frac{\pi(-1)^n}{n^2} + 0 - \frac{\pi}{n^2} \right] = \frac{2}{\pi} \left( \frac{\pi}{n^2} \right) [-(-1)^n - 1]$$

$$= -\frac{4}{n^2}$$

(when  $n$  is even)

$$= 0$$

(when  $n$  is odd)

$$\text{Hence, } x(\pi - x) = \frac{\pi^2}{6} - 4 \left[ \frac{\cos 2x}{2^2} + \frac{\cos 4x}{4^2} + \dots \right]$$

By Parseval's formula

$$\frac{2}{\pi} \int_0^\pi x^2 (\pi - x)^2 dx = \frac{a_0^2}{2} + \sum a_n^2$$

$$\frac{2}{\pi} \int_0^\pi (\pi^2 x^2 - 2\pi x^3 + x^4) dx = \frac{1}{2} \left( \frac{\pi^4}{9} \right) + 16 \left[ \frac{1}{2^4} + \frac{1}{4^4} + \frac{1}{6^4} + \dots \right]$$

$$\frac{2}{\pi} \left[ \frac{\pi^2 x^3}{3} - \frac{2\pi x^4}{4} + \frac{x^5}{5} \right]_0^\pi = \frac{\pi^4}{18} + \left[ \frac{1}{1^4} + \frac{1}{2^4} + \frac{1}{3^4} + \dots \right]$$

$$\frac{2}{\pi} \left[ \frac{\pi^5}{3} - \frac{2\pi^5}{4} + \frac{\pi^5}{5} \right] = \frac{\pi^4}{18} + \left[ \frac{1}{1^4} + \frac{1}{2^4} + \frac{1}{3^4} + \dots \right]$$

$$\frac{\pi^4}{15} = \frac{\pi^4}{18} + \sum_{n=1}^{\infty} \frac{1}{n^4} \quad \text{or} \quad \sum_{n=1}^{\infty} \frac{1}{n^4} = \frac{\pi^4}{90}$$

(b) Half range sine series

$$b_n = \frac{2}{\pi} \int_0^\pi x (\pi - x) \sin nx dx$$

$$= \frac{2}{\pi} \left[ (\pi x - x^2) \left( \frac{-\cos nx}{n} \right) - (\pi - 2x) \left( \frac{-\sin nx}{n^2} \right) + (-2) \frac{\cos nx}{n^3} \right]_0^\pi$$

$$= \frac{2}{\pi} \left[ -2 \frac{(-1)^n}{n^3} + \frac{2}{n^3} \right] = \frac{4}{\pi n^3} [-(-1)^n + 1]$$

$$= \begin{cases} \frac{8}{n^3 \pi} & \text{(when } n \text{ is odd)} \\ 0 & \text{(when } n \text{ is even)} \end{cases}$$

$$\therefore x(\pi - x) = \frac{8}{\pi} \left[ \frac{\sin x}{1^3} + \frac{\sin 3x}{3^3} + \frac{\sin 5x}{5^3} + \dots \right]$$

By Parseval's formula

$$\frac{2}{\pi} \int_0^\pi x^2 (\pi - x^2) dx = \sum b_n^2$$

$$\frac{\pi^4}{15} = \frac{64}{\pi^2} \left[ \frac{1}{1^6} + \frac{1}{3^6} + \frac{1}{5^6} + \dots \right]$$

$$\frac{\pi^6}{960} = \frac{1}{1^6} + \frac{1}{3^6} + \frac{1}{5^6} + \dots$$

$$\text{Let } S = \frac{1}{1^6} + \frac{1}{2^6} + \frac{1}{3^6} + \frac{1}{4^6} + \dots = \left( \frac{1}{1^6} + \frac{1}{3^6} + \frac{1}{5^6} \dots \right) + \left( \frac{1}{2^6} + \frac{1}{4^6} + \frac{1}{6^6} + \dots \right)$$

$$S = \frac{\pi^6}{960} + \left( \frac{1}{2^6} + \frac{1}{4^6} + \frac{1}{6^6} + \dots \right) = \frac{\pi^6}{960} + \frac{1}{2^6} \left[ \frac{1}{1^6} + \frac{1}{2^6} + \frac{1}{3^6} + \dots \right]$$

$$S = \frac{\pi^6}{960} + \frac{S}{64}$$

$$S - \frac{S}{64} = \frac{\pi^6}{960} \Rightarrow \frac{63}{64} S = \frac{\pi^6}{960}$$

$$S = \frac{\pi^6}{960} \times \frac{64}{63} = \frac{\pi^6}{945}$$

$$\sum_{n=1}^{\infty} \frac{1}{n^6} = \frac{\pi^6}{945}$$

**Proved.**

### EXERCISE 40.5

1. Prove that in  $0 < x < c$ ,

$$x = \frac{c}{2} - \frac{4c}{\pi^2} \left( \cos \frac{\pi x}{c} + \frac{1}{3^2} \cos \frac{3\pi x}{c} + \frac{1}{5^2} \cos \frac{5\pi x}{c} + \dots \right) \text{ and deduce that}$$

$$(i) \frac{1}{1^4} + \frac{1}{3^4} + \frac{1}{5^4} + \dots = \frac{\pi^4}{96} \quad (ii) \frac{1}{1^4} + \frac{1}{2^4} + \frac{1}{3^4} + \frac{1}{4^4} + \dots = \frac{\pi^4}{90}$$

#### 40.15 FOURIER SERIES IN COMPLEX FORM

Fourier series of a function  $f(x)$  of period  $2l$  is

$$\begin{aligned} f(x) = \frac{a_0}{2} + a_1 \cos \frac{\pi x}{l} + a_2 \cos \frac{2\pi x}{l} + \dots + a_n \cos \frac{n\pi x}{l} + \dots \\ + b_1 \sin \frac{\pi x}{l} + b_2 \sin \frac{2\pi x}{l} + \dots + b_n \sin \frac{n\pi x}{l} + \dots \quad \dots(1) \end{aligned}$$

We know that  $\cos x = \frac{e^{ix} + e^{-ix}}{2}$  and  $\sin x = \frac{e^{ix} - e^{-ix}}{2i}$

On putting the values of  $\cos x$  and  $\sin x$  in (1), we get

$$\begin{aligned} f(x) &= \frac{a_0}{2} + a_1 \frac{e^{\frac{i\pi x}{l}} + e^{-\frac{i\pi x}{l}}}{2} + a_2 \frac{e^{\frac{2i\pi x}{l}} + e^{-\frac{2i\pi x}{l}}}{2} + \dots + b_1 \frac{e^{\frac{i\pi x}{l}} - e^{-\frac{i\pi x}{l}}}{2i} + b_2 \frac{e^{\frac{2i\pi x}{l}} - e^{-\frac{2i\pi x}{l}}}{2i} + \dots \\ &= \frac{a_0}{2} + (a_1 - ib_1) e^{\frac{i\pi x}{l}} + (a_2 - ib_2) e^{\frac{2i\pi x}{l}} + \dots + (a_1 + ib_1) e^{-\frac{i\pi x}{l}} + (a_2 + ib_2) e^{-\frac{2i\pi x}{l}} + \dots \\ &= c_0 + c_1 e^{\frac{i\pi x}{l}} + c_2 e^{\frac{2i\pi x}{l}} + \dots + c_{-1} e^{-\frac{i\pi x}{l}} + c_{-2} e^{-\frac{2i\pi x}{l}} + \dots \\ &= c_0 + \sum_{n=1}^{\infty} c_n e^{\frac{in\pi x}{l}} + \sum_{n=1}^{\infty} c_{-n} e^{-\frac{in\pi x}{l}} \\ c_n &= \frac{1}{2} (a_n - ib_n), c_{-n} = \frac{1}{2} (a_n + ib_n) \end{aligned}$$

where  $c_0 = \frac{a_0}{2} = \frac{1}{2} \frac{1}{l} \int_0^{2l} f(x) dx$

$$\begin{aligned} c_n &= \frac{1}{2} \left[ \frac{1}{l} \int_0^{2l} f(x) \cos \frac{n\pi x}{l} dx - \frac{i}{l} \int_0^{2l} f(x) \sin \frac{n\pi x}{l} dx \right] \\ \Rightarrow c_n &= \frac{1}{2} \frac{1}{l} \int_0^{2l} f(x) \left\{ \cos \frac{n\pi x}{l} - i \sin \frac{n\pi x}{l} \right\} dx \\ c_n &= \frac{1}{2l} \int_0^{2l} f(x) e^{\frac{-in\pi x}{l}} dx, \\ c_{-n} &= \frac{1}{2l} \int_0^{2l} f(x) e^{\frac{in\pi x}{l}} dx \end{aligned}$$

**Example 29.** Obtain the complex form of the Fourier series of the function

$$f(x) = \begin{cases} 0, & -\pi \leq x \leq 0 \\ 1, & 0 \leq x \leq \pi \end{cases}$$

**Solution.**  $c_0 = \frac{1}{2\pi} \int_0^\pi dx = \frac{1}{2}$

$$\begin{aligned}
c_n &= \frac{1}{2\pi} \int_{-\pi}^{\pi} f(x) e^{-inx} dx \\
&= \frac{1}{2\pi} \left[ \int_{-\pi}^0 0 \cdot e^{-inx} dx + \int_0^{\pi} 1 \cdot e^{-inx} dx \right] = \frac{1}{2\pi} \int_0^{\pi} e^{-inx} dx = \frac{1}{2\pi} \left[ \frac{e^{-inx}}{-in} \right]_0^{\pi} \\
&= -\frac{1}{2n\pi i} [e^{-in\pi} - 1] = -\frac{1}{2n\pi i} [\cos n\pi - i \sin n\pi - 1] = -\frac{1}{2n\pi i} [(-1)^n - 0 - 1] \\
&= \begin{cases} \frac{1}{in\pi}, & n \text{ is odd} \\ 0, & n \text{ is even} \end{cases} \\
f(x) &= \frac{1}{2} + \frac{1}{i\pi} \left[ \frac{e^{ix}}{1} + \frac{e^{3ix}}{3} + \frac{e^{5ix}}{5} + \dots \right] + \frac{1}{i\pi} \left[ \frac{e^{-ix}}{-1} + \frac{e^{-3ix}}{-3} + \frac{e^{-5ix}}{-5} + \dots \right] \\
&= \frac{1}{2} - \frac{1}{i\pi} \left[ (e^{ix} - e^{-ix}) + \frac{1}{3}(e^{3ix} - e^{-3ix}) + \frac{1}{5}(e^{5ix} - e^{-5ix}) + \dots \right] \\
&= \frac{1}{2} - \frac{2}{\pi} \left[ \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \dots \right]
\end{aligned}
\tag{Ans.}$$

### EXERCISE 40.6

Find the complex form of the Fourier series of

1.  $f(x) = e^{-x}$ ,  $-1 \leq x \leq 1$ . Ans.  $\sum_{n=-\infty}^{\infty} \frac{(-1)^n (1-in\pi)}{1+n^2\pi^2} \sinh 1 \cdot e^{inx}$
2.  $f(x) = e^{ax}$ ,  $-l < x < l$  Ans.  $\frac{2}{\pi} - \frac{2}{\pi} \left[ \frac{e^{2it} + e^{-2it}}{1 \cdot 3} + \frac{e^{4it} + e^{-4it}}{3 \cdot 5} + \frac{e^{6it} + e^{-6it}}{5 \cdot 7} + \dots \right]$
3.  $f(x) = \cos ax$ ,  $-\pi < x < \pi$  Ans.  $\frac{a}{\pi} \sin a\pi \sum_{n=-\infty}^{\infty} \frac{(-1)^n e^{inx}}{a^2 - n^2}$

### 40.16 PRACTICAL HARMONIC ANALYSIS

Some times the function is not given by a formula, but by a graph or by a table of corresponding values. The process of finding the Fourier series for a function given by such values of the function and independent variable is known as Harmonic Analysis. The Fourier constants are evaluated by the following formulae :

$$\begin{aligned}
(1) \quad a_0 &= \frac{1}{\pi} \int_0^{2\pi} f(x) dx \\
&= 2 \frac{1}{2\pi - 0} \int_0^{2\pi} f(x) dx \quad \left[ \text{Mean} = \frac{1}{b-a} \int_a^b f(x) dx \right] \\
&\Rightarrow a_0 = 2 \text{ [mean value of } f(x) \text{ in } (0, 2\pi)] \\
(2) \quad a_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx = 2 \frac{1}{2\pi - 0} \int_0^{2\pi} f(x) \cos nx dx \\
&= 2 \text{ [mean value of } f(x) \cos nx \text{ in } (0, 2\pi)] \\
(3) \quad b_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx dx = 2 \frac{1}{2\pi - 0} \int_0^{2\pi} f(x) \sin nx dx \\
&= 2 \text{ [mean value of } f(x) \sin nx \text{ in } (0, 2\pi)]
\end{aligned}$$

**Fundamental or first harmonic.** The term  $(a_1 \cos x + b_1 \sin x)$  in Fourier series is called the fundamental or first harmonic.

**Second harmonic.** The term  $(a_2 \cos 2x + b_2 \sin 2x)$  in Fourier series is called the second harmonic and so on.

**Example 30.** Find the Fourier series as far as the second harmonic to represent the function given by table below :

$x$	$0^\circ$	$30^\circ$	$60^\circ$	$90^\circ$	$120^\circ$	$150^\circ$	$180^\circ$	$210^\circ$	$240^\circ$	$270^\circ$	$300^\circ$	$330^\circ$
$f(x)$	2.34	3.01	3.69	4.15	3.69	2.20	0.83	0.51	0.88	1.09	1.19	1.64

**Solution.**

$x^\circ$	$\sin x$	$\sin 2x$	$\cos x$	$\cos 2x$	$f(x)$	$f(x)$ $\sin x$	$f(x)$ $\sin 2x$	$f(x)$ $\cos x$	$f(x)$ $\cos 2x$
$0^\circ$	0	0	1	1	2.34	0	0	2.340	2.340
$30^\circ$	0.50	0.87	0.87	0.50	3.01	1.505	2.619	2.619	1.505
$60^\circ$	0.87	0.87	0.50	-0.50	3.69	3.210	3.210	1.845	-1.845

$270^\circ$	-1.00	0	0	-1.00	1.09	-1.090	0	0	-1.090
$300^\circ$	-0.87	-0.87	0.50	-0.50	1.19	-1.035	-1.035	0.595	-0.595
$330^\circ$	-0.50	-0.87	0.87	0.50	1.64	-0.820	-1.427	1.427	0.820
					25.22	9.209	-0.547	3.353	-3.115

$$a_0 = 2 \times \text{Mean of } f(x) = 2 \times \frac{25.22}{12} = 4.203$$

$$a_1 = 2 \times \text{Mean of } f(x) \cos x = 2 \times \frac{3.353}{12} = 0.559$$

$$a_2 = 2 \times \text{Mean of } f(x) \cos 2x = 2 \times \frac{-3.115}{12} = -0.519$$

$$b_1 = 2 \times \text{Mean of } f(x) \sin x = 2 \times \frac{9.209}{12} = 1.535$$

$$b_2 = 2 \times \text{Mean of } f(x) \sin 2x = 2 \times \frac{-0.547}{12} = -0.091$$

Fourier series is

$$\begin{aligned} f(x) &= \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + \dots + b_1 \sin x + b_2 \sin 2x + \dots \\ &= 2.1015 + 0.559 \cos x - 0.519 \cos 2x + \dots + 1.535 \sin x - 0.091 \sin 2x + \dots \quad \text{Ans.} \end{aligned}$$

**Example 31.** A machine completes its cycle of operations every time as certain pulley completes a revolution. The displacement  $f(x)$  of a point on a certain portion of the machine is given in the table given below for twelve positions of the pulley,  $x$  being the angle in degree turned through by the pulley. Find a Fourier series to represent  $f(x)$  for all values of  $x$ .

$x$	$30^\circ$	$60^\circ$	$90^\circ$	$120^\circ$	$150^\circ$	$180^\circ$	$210^\circ$	$240^\circ$	$270^\circ$	$300^\circ$	$330^\circ$	$360^\circ$
$f(x)$	7.976	8.026	7.204	5.676	3.674	1.764	0.552	0.262	0.904	2.492	4.736	6.824

**Solution.**

$x$	$\sin x$	$\sin 2x$	$\sin 3x$	$\cos x$	$\cos 2x$	$\cos 3x$	$f(x)$	$f(x) \times \sin x$	$f(x) \times \sin 2x$	$f(x) \times \sin 3x$	$f(x) \times \cos x$	$f(x) \times \cos 2x$	$f(x) \times \cos 3x$	
$30^\circ$	0.50	0.87	1	0.87	0.50	0	7.976	3.988	6.939	7.976	6.939	3.988	0

$210^\circ$	-0.50	0.87	-1	-0.87	0.50	0	0.552	-0.276	0.480	0.480	-0.480	0.276	0	
$240^\circ$	-0.87	0.87	0	-0.50	-0.50	1	0.262	-0.228	0.228	-0.131	-0.131	0.131	0.262	
$270^\circ$	-1.00	0	1	0	-1.00	0	0.904	-0.904	0	0	0	-0.904	0	
$300^\circ$	-0.87	-0.87	0	0.50	-0.50	-1	2.492	-2.168	-2.168	1.246	1.246	-1.296	-2.492	
$330^\circ$	-0.50	-0.87	-1	0.87	0.50	0	4.736	-2.368	-4.120	4.120	4.120	2.368	0	
$360^\circ$	0	0	0	1	1	1	6.824	0	0	0	6.824	6.824	6.824	
							$\Sigma$	50.09	19.206	0.207	0.062	14.733	0.721	0.460

$$a_0 = 2 \times \text{Mean value of } f(x) = 2 \times \frac{50.09}{12} = 8.34$$

$$a_1 = 2 \times \text{Mean value of } f(x) \cos x = 2 \times \frac{14.733}{12} = 2.45$$

$$a_2 = 2 \times \text{Mean value of } f(x) \cos 2x = 2 \times \frac{0.721}{12} = 0.12$$

$$a_3 = 2 \times \text{Mean value of } f(x) \cos 3x = 2 \times \frac{0.460}{12} = 0.08$$

$$b_1 = 2 \times \text{Mean value of } f(x) \sin x = 2 \times \frac{19.206}{12} = 3.16$$

$$b_2 = 2 \times \text{Mean value of } f(x) \sin 2x = 2 \times \frac{0.207}{12} = 0.03$$

$$b_3 = 2 \times \text{Mean value of } f(x) \sin 3x = 2 \times \frac{0.062}{12} = 0.01$$

Fourier series is

$$\begin{aligned} f(x) &= \frac{a_0}{2} + a_1 \cos x + a_2 \cos 2x + a_3 \cos 3x + \dots + b_1 \sin x + b_2 \sin 2x + b_3 \sin 3x + \dots \\ &= 4.17 + 2.45 \cos x + 0.12 \cos 2x + 0.08 \cos 3x + \dots \\ &\quad + 3.16 \sin x + 0.03 \sin 2x + 0.01 \sin 3x + \dots \text{ Ans.} \end{aligned}$$

**Example 32.** Obtain the constant term and the coefficient of the first sine and cosine terms in the Fourier series of  $f(x)$  as given in the following table.

$x$	0	1	2	3	4	5
$f(x)$	9	18	24	28	26	20

## Solution.

$x$	$\frac{x\pi}{3}$	$\sin \frac{\pi x}{3}$	$\cos \frac{\pi x}{3}$	$f(x)$	$f(x) \sin \frac{\pi x}{3}$	$f(x) \cos \frac{\pi x}{3}$
0	0	0	1.0	9	0	9
1	$\frac{\pi}{3}$	0.87	0.5	18	15.66	9
2	$\frac{2\pi}{3}$	0.87	-0.5	24	20.88	-12
3	$\frac{3\pi}{3}$	0	-1.0	28	0	-28
4	$\frac{4\pi}{3}$	-0.87	-0.5	26	-22.62	-13
5	$\frac{5\pi}{3}$	-0.87	0.5	20	-17.4	10
				$\Sigma = 125$	$\Sigma = -3.468$	$\Sigma = 25$

$$a_0 = 2 \text{ Mean value of } f(x) = 2 \times \frac{125}{6} = 41.67$$

$$a_1 = 2 \text{ Mean value of } f(x) \cos \frac{\pi x}{3} = 2 \times \frac{-25}{6} = -8.33$$

$$b_1 = 2 \text{ Mean value of } f(x) \sin \frac{\pi x}{3} = 2 \times \frac{-3.48}{6} = -1.16$$

Fourier series is

$$f(x) = \frac{a_0}{2} + a_1 \cos \frac{\pi x}{3} + \dots + b_1 \sin \frac{\pi x}{3} + \dots$$

$$= 20.84 - 8.33 \cos \frac{\pi x}{3} + \dots - 1.16 \sin \frac{\pi x}{3} + \dots \quad \text{Ans.}$$

## **EXERCISE 40.7**

1. In a machine the displacement  $f(x)$  of a given point is given for a certain angle  $x^\circ$  as follows:

$x^\circ$	$0^\circ$	$30^\circ$	$60^\circ$	$90^\circ$	$120^\circ$	$150^\circ$	$180^\circ$	$210^\circ$	$240^\circ$	$270^\circ$	$300^\circ$	$330^\circ$
$f(x)$	7.9	8.0	7.2	5.6	3.6	1.7	0.5	0.2	0.9	2.5	4.7	6.8

Find the coefficient of  $\sin 2x$  in the Fourier series representing the above variations. **Ans.** - 0.072

2. The displacement  $f(x)$  of a part of a machine is tabulated with corresponding angular moment ' $x$ ' of the crank. Express  $f(x)$  as a Fourier series upto third harmonic.

$x^\circ$	$0^\circ$	$30^\circ$	$60^\circ$	$90^\circ$	$120^\circ$	$150^\circ$	$180^\circ$	$210^\circ$	$240^\circ$	$270^\circ$	$300^\circ$	$330^\circ$
$f(x)$	1.80	1.10	0.30	0.16	0.50	1.30	2.16	1.25	1.30	1.52	1.76	2.00

$$\text{Ans. } f(x) = 1.26 + 0.04 \cos x + 0.53 \cos 2x - 0.1 \cos 3x + \dots$$

$$- 0.63 \sin x - 0.23 \sin 2x + 0.085 \sin 3x + \dots$$

## INTEGRAL TRANSFORMS

---

### 41.1 INTRODUCTION

Integral transforms are used in the solution of partial differential equations. The choice of a particular transform to be used for the solution of a differential equations depends upon the nature of the boundary conditions of the equation and the facility with which the transform  $F(s)$  can be converted to give  $f(x)$ .

### 41.2 INTEGRAL TRANSFORMS

The integral transform  $F(s)$  of a function  $f(x)$  with the kernel  $k(s, x)$  is defined as

$$I[f(x)] = F(s) = \int_a^b f(x)k(s, x)dx.$$

*For example*

1. Laplace transform with the kernel  $k(s, x) = e^{-sx}$

$$L[f(x)] = F(s) = \int_0^\infty f(x).e^{-sx}dx$$

2. Fourier Complex transform with the kernel  $k(s, k) = e^{isx}$

$$F[f(x)] = F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x)e^{isx}dx.$$

$$f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} F(s)e^{-isx}ds \quad (\text{Inversion formula})$$

3. Fourier Sine transform with the kernel  $k(s, x) = \sin sx$

$$F_s[f(x)] = F_s(s) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(x) \sin sx dx$$

$$f(x) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} F_s(s) \sin sx ds \quad (\text{Inversion formula})$$

4. Fourier Cosine transform with the kernel  $k(s, x) = \cos sx$

$$F_c[f(x)] = F_c(s) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(x) \cos sx dx$$

$$f(x) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} F_c(s) \cos sx ds \quad (\text{Inversion formula})$$

5. Hankel Transform with the kernel  $(k, s) = x J_n(sx)$

$$H[f(x)] = F(s) = \int_0^{\infty} f(x).x J_n(sx) dx$$

$$f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} F(s) e^{-isx} ds \quad (\text{Inversion formula})$$

6. Hilbert Transform with the kernel  $k(s, x) = \frac{1}{s - x}$

$$\begin{aligned} F(s) &= \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{f(x)}{s - x} dx \\ f(x) &= \frac{-1}{\pi} \int_{-\infty}^{\infty} \frac{F(s)}{s - x} ds \end{aligned} \quad (\text{Inversion formula})$$

7. Mellin transform with the kernel  $k(s, x) = x^{s-1}$

$$M[f(x)] = F(s) = \int_0^{\infty} f(x) x^{s-1} dx.$$

The students have already done “Laplace transform” and also learnt to solve the ordinary differential equations by using Laplace transforms.

Integral transforms are used in solving the partial differential equation with boundary conditions.

### List of Formulae of Fourier Integrals

1. Fourier Integral for  $f(x)$  is  $f(x) = \frac{1}{\pi} \int_0^{\infty} \int_{-\infty}^{\infty} f(t) \cos u(t-x) du dt$
2. Fourier Sine Integral for  $f(x)$  is  $f(x) = \frac{2}{\pi} \int_0^{\infty} \int_0^{\infty} f(t) \sin ut \sin ux du dt$
3. Fourier Cosine Integral for  $f(x)$  is  $f(x) = \frac{2}{\pi} \int_0^{\infty} \int_0^{\infty} f(t) \cos ut \cos ux du dt$

### 41.3 FOURIER INTEGRAL THEOREM

It states that  $f(x) = \frac{1}{\pi} \int_0^{\infty} \int_{-\infty}^{\infty} f(t) \cos u(t-x) dt du$

**Proof.** We know that Fourier series of a function  $f(x)$  in  $(-c, c)$  is given by

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{c} + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{c} \quad \dots (1)$$

where  $a_0$ ,  $a_n$  and  $b_n$  are given by

$$\begin{aligned} a_0 &= \frac{1}{c} \int_{-c}^c f(t) dt, \\ a_n &= \frac{1}{c} \int_{-c}^c f(t) \cos \frac{n\pi t}{c} dt \\ b_n &= \frac{1}{c} \int_{-c}^c f(t) \sin \frac{n\pi t}{c} dt \end{aligned}$$

Substituting the values of  $a_0$ ,  $a_n$  and  $b_n$  in (1), we get

$$\begin{aligned} f(x) &= \frac{1}{2c} \int_{-c}^c f(t) dt + \sum_{n=1}^{\infty} \frac{1}{c} \int_{-c}^c f(t) \cos \frac{n\pi t}{c} \cos \frac{n\pi x}{c} dt + \sum_{n=1}^{\infty} \frac{1}{c} \int_{-c}^c f(t) \sin \frac{n\pi t}{c} \sin \frac{n\pi x}{c} dt \\ &= \frac{1}{2c} \int_{-c}^c f(t) dt + \sum_{n=1}^{\infty} \frac{1}{c} \int_{-c}^c f(t) \left[ \cos \frac{n\pi t}{c} \cos \frac{n\pi x}{c} + \sin \frac{n\pi t}{c} \sin \frac{n\pi x}{c} \right] dt \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{2c} \int_{-c}^c f(t) dt + \sum_{n=1}^{\infty} \frac{1}{c} \int_{-c}^c f(t) \cos \left( \frac{n\pi t}{c} - \frac{n\pi x}{c} \right) dt \\
&= \frac{1}{2c} \int_{-c}^c f(t) dt + \sum_{n=1}^{\infty} \frac{1}{c} \int_{-c}^c f(t) \cos \frac{n\pi}{c} (t-x) dt \\
&= \frac{1}{2c} \int_{-c}^c f(t) \left\{ 1 + 2 \sum_{n=1}^{\infty} \cos \frac{n\pi}{c} (t-x) \right\} dt
\end{aligned} \quad \dots (2)$$

Since cosine functions are even functions *i.e.*,  $\cos(-\theta) = \cos \theta$  the expression

$$1 + 2 \sum_{n=1}^{\infty} \cos \frac{n\pi}{c} (t-x) = \sum_{n=-\infty}^{\infty} \cos \frac{n\pi}{c} (t-x)$$

Therefore, (2) becomes

$$\begin{aligned}
f(x) &= \frac{1}{2c} \int_{-c}^c f(t) \left\{ \sum_{n=-\infty}^{\infty} \cos \frac{n\pi}{c} (t-x) \right\} dt \\
&= \frac{1}{2\pi} \int_{-c}^c f(t) \left\{ \frac{\pi}{c} \sum_{n=-\infty}^{\infty} \cos \frac{n\pi}{c} (t-x) \right\} dt
\end{aligned} \quad \dots (3)$$

Let us now assume that  $c$  increases indefinitely, so that we may write  $\frac{n\pi}{c} = u$  and  $\frac{\pi}{c} = du$ .

This assumption gives

$$\begin{aligned}
\lim_{c \rightarrow \infty} \left\{ \frac{\pi}{c} \sum_{n=-\infty}^{\infty} \cos \frac{n\pi}{c} (t-x) \right\} &= \int_{-\infty}^{\infty} \cos u (t-x) du \\
&= 2 \int_0^{\infty} \cos u (t-x) du
\end{aligned} \quad \dots (4)$$

Substituting in (3) from (4), we obtain

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} f(t) \left\{ 2 \int_0^{\infty} \cos u (t-x) du \right\} dt \quad \dots (5)$$

Thus

$$f(x) = \frac{1}{\pi} \int_0^{\infty} \int_{-\infty}^{\infty} f(t) \cos u (t-x) du dt$$

**Proved.**

**Note.** We have assumed the following conditions on  $f(x)$ .

- (i)  $f(x)$  is defined as single-valued except at finite points in  $(-c, c)$ .
- (ii)  $f(x)$  is periodic outside  $(-c, c)$  with period  $2c$ .
- (iii)  $f(x)$  and  $f'(x)$  are sectionally continuous in  $(-c, c)$ .

(iv)  $\int_{-\infty}^{\infty} |f(x)| dx$  converges, *i.e.*,  $f(x)$  is absolutely integrable in  $(-\infty, \infty)$ .

#### 41.4 FOURIER SINE AND COSINE INTEGRALS

$$f(x) = \frac{2}{\pi} \int_0^{\infty} \sin ux du \int_0^{\infty} f(t) \sin ut dt \quad (\text{Fourier Sine Integral})$$

$$f(x) = \frac{2}{\pi} \int_0^{\infty} \cos ux du \int_0^{\infty} f(t) \cos ut dt \quad (\text{Fourier Cosine Integral})$$

**Proof.** We know that,

$$\begin{aligned} \cos u(t-x) &= \cos(ut-ux) \\ \Rightarrow \cos u(t-x) &= \cos ut \cos ux + \sin ut \sin ux \end{aligned}$$

Then equation (5) of article 1.3, can be written as

$$\begin{aligned} f(x) &= \frac{1}{\pi} \int_0^\infty \int_{-\infty}^\infty f(t) (\cos ut \cos ux + \sin ut \sin ux) du dt \\ \Rightarrow f(x) &= \frac{1}{\pi} \int_0^\infty \int_{-\infty}^\infty f(t) \cos ut \cos ux du dt + \frac{1}{\pi} \int_0^\infty \int_{-\infty}^\infty f(t) \sin ut \sin ux du dt \dots (6) \end{aligned}$$

**Case 1.** When  $f(t)$  is odd.

$$\therefore f(t) \cos ut is odd hence \int_0^\infty \int_{-\infty}^\infty f(t) \cos ut \cos ux du dt = 0$$

$$\left[ \begin{array}{ll} \text{For odd function,} & \int_{-a}^a f(x) dx = 0 \\ \text{For even function,} & \int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx \end{array} \right]$$

From (6), we have

$$\boxed{\therefore f(x) = \frac{2}{\pi} \int_0^\infty \sin ux du \int_0^\infty f(t) \sin ut dt} \dots (7)$$

The relation (7) is called **Fourier sine integral**.

**Case 2.** When  $f(t)$  is even.

$$\therefore f(t) \sin ut is odd hence \int_0^\infty \int_{-\infty}^\infty f(t) \sin ut \sin ux du dt = 0$$

$$\therefore f(t) \cos ut is even.$$

From (6), we have

$$\boxed{f(x) = \frac{2}{\pi} \int_0^\infty \cos ux du \int_0^\infty f(t) \cos ut dt} \dots (8)$$

The relation (8) is known as **Fourier cosine integral**.

#### 41.5 FOURIER'S COMPLEX INTEGRAL

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^\infty e^{-iux} du \int_{-\infty}^\infty f(t) e^{iut} dt$$

**Proof.** We know that  $\int_{-a}^a f(x) dx = 0$  if  $f(x)$  is odd function.

$$\therefore \int_{-\infty}^\infty \sin u(t-x) du = 0 \quad [\text{since } \sin u(t-x) \text{ is odd.}]$$

Obviously we have

$$\begin{aligned} \frac{1}{2\pi} \int_{-\infty}^\infty f(t) dt \int_{-\infty}^\infty \sin u(t-x) du &= 0 \\ \Rightarrow \frac{i}{2\pi} \int_{-\infty}^\infty f(t) dt \int_{-\infty}^\infty \sin u(t-x) du &= 0 \quad (\text{Multiplying by } i) \end{aligned} \dots (9)$$

On adding (5) and (9), we have

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^\infty \int_{-\infty}^\infty f(t) \cos u(t-x) du dt + \frac{i}{2\pi} \int_{-\infty}^\infty f(t) dt \int_{-\infty}^\infty \sin u(t-x) du$$

$$\begin{aligned}
 &= \frac{1}{2\pi} \int_{-\infty}^{\infty} f(t) dt \int_{-\infty}^{\infty} [\cos u(t-x) + i \sin u(t-x)] du \\
 &= \frac{1}{2\pi} \int_{-\infty}^{\infty} f(t) dt \int_{-\infty}^{\infty} e^{iu(t-x)} du \\
 \Rightarrow f(x) &= \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-iux} du \int_{-\infty}^{\infty} f(t) e^{iut} dt
 \end{aligned} \quad \dots (10)$$

Relation (10) is called **Fourier's Complex Integral**.

### Some Useful Results

1.  $\int_0^\infty \frac{\sin ax}{x} dx = \frac{\pi}{2}$   $(a > 0)$
2.  $\int_0^\infty e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$
3.  $\int_{-\infty}^\infty \frac{\sin mx}{(x-b)^2 + a^2} dx = \frac{\pi}{a} e^{-am} \sin b m,$   $(m > 0)$

### Examples based on Fourier integral

**Example 1.** Express the function

$$f(x) = \begin{cases} 1 & \text{when } |x| \leq 1 \\ 0 & \text{when } |x| > 1 \end{cases}$$

as a Fourier integral. Hence evaluate

$$\int_0^\infty \frac{\sin \lambda \cos \lambda x}{\lambda} d\lambda \quad (\text{U.P. \& Uttarakhand, III Semester 2008, Dec. 2004})$$

**Solution.** The Fourier Integral for  $f(x)$  is  $\frac{1}{\pi} \int_0^\infty \int_{-\infty}^\infty f(t) \cos u(t-x) du dt$

On replacing  $u$  by  $\lambda$ , we have

$$\begin{aligned}
 f(x) &= \frac{1}{\pi} \int_0^\infty \int_{-\infty}^\infty f(t) \cos \lambda(t-x) dt d\lambda \\
 &= \frac{1}{\pi} \int_0^\infty \int_{-1}^1 \cos \lambda(t-x) dt d\lambda \quad (\text{Since } f(t) = 1) \\
 &= \frac{1}{\pi} \int_0^\infty \left[ \frac{\sin \lambda(t-x)}{\lambda} \right]_{-1}^1 d\lambda = \frac{1}{\pi} \int_0^\infty \left[ \frac{\sin \lambda(1-x)}{\lambda} - \frac{\sin \lambda(-1-x)}{\lambda} \right] d\lambda \\
 &= \frac{1}{\pi} \int_0^\infty \frac{\sin \lambda(1-x) + \sin \lambda(1+x)}{\lambda} d\lambda \quad \left[ \sin C + \sin D = 2 \sin \frac{C+D}{2} \cos \frac{C-D}{2} \right] \\
 &= \frac{1}{\pi} \int_0^\infty \frac{2 \sin \frac{[\lambda(1-x) + \lambda(1+x)]}{2} \cos \frac{[\lambda(1-x) - \lambda(1+x)]}{2}}{\lambda} d\lambda
 \end{aligned}$$

Thus,  $f(x) = \frac{2}{\pi} \int_0^\infty \frac{\sin \lambda \cos \lambda x}{\lambda} d\lambda$  **Ans.**

$$\Rightarrow \int_0^\infty \frac{\sin \lambda \cos \lambda x}{\lambda} d\lambda = \frac{\pi}{2} f(x)$$

$$\Rightarrow \int_0^\infty \frac{\sin \lambda \cos \lambda x}{\lambda} d\lambda = \begin{cases} \frac{\pi}{2} \times 1 = \frac{\pi}{2} & \text{for } |x| < 1 \\ \frac{\pi}{2} \times 0 = 0 & \text{for } |x| > 1 \end{cases} \quad \begin{cases} f(x) = 1 & \text{for } |x| \leq 1 \\ f(x) = 0 & \text{for } |x| > 1 \end{cases}$$

For  $|x| = 1$ , which is a point of discontinuity of  $f(x)$ , value of integral  $= \frac{\pi/2 + 0}{2} = \frac{\pi}{4}$  **Ans.**

**Example 2.** Find the Fourier Sine integral for

$$f(x) = e^{-\beta x} \quad (\beta > 0) \quad (\text{U.P. III Semester Comp., 2004})$$

$$\text{hence show that } \frac{\pi}{2} e^{-\beta x} = \int_0^\infty \frac{\lambda \sin \lambda x}{\beta^2 + \lambda^2} d\lambda$$

**Solution.** The Fourier Sine Integral of  $f(x)$  is

$$f(x) = \frac{2}{\pi} \int_0^\infty \sin ux du \int_0^\infty f(t) \sin ut dt$$

On replacing  $u$  by  $\lambda$ , we get

$$f(x) = \frac{2}{\pi} \int_0^\infty \sin \lambda x d\lambda \int_0^\infty f(t) \sin \lambda t dt \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$e^{-\beta x} = \frac{2}{\pi} \int_0^\infty \sin \lambda x d\lambda \int_0^\infty e^{-\beta t} \sin \lambda t dt \quad \left[ \int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) \right]$$

$$= \frac{2}{\pi} \int_0^\infty \sin \lambda x d\lambda \left[ \frac{e^{-\beta t}}{\beta^2 + \lambda^2} (-\beta \sin \lambda t - \lambda \cos \lambda t) \right]_0^\infty = \frac{2}{\pi} \int_0^\infty \sin \lambda x d\lambda \left[ 0 + \frac{\lambda}{\beta^2 + \lambda^2} \right]$$

$$e^{-\beta x} = \frac{2}{\pi} \int_0^\infty \frac{\lambda \sin \lambda x}{\beta^2 + \lambda^2} d\lambda \quad \text{or} \quad \frac{\pi}{2} e^{-\beta x} = \int_0^\infty \frac{\lambda \sin \lambda x}{\beta^2 + \lambda^2} d\lambda. \quad \text{Proved.}$$

**Example 3.** Using Fourier Cosine Integral representation of an appropriate function, show that

$$\int_0^\infty \frac{\cos wx}{k^2 + w^2} dw = \frac{\pi e^{-kx}}{2k}, \quad x > 0, \quad k > 0.$$

**Solution.** We know that Fourier Cosine Integral is  $f(x) = \frac{2}{\pi} \int_0^\infty \cos ux du \int_0^\infty f(t) \cos ut dt$

Putting the value of  $f(t)$  and replacing  $u$  by  $w$ , we get

$$e^{-kx} = \frac{2}{\pi} \int_0^\infty \cos wx dw \int_0^\infty e^{-kt} \cos wt dt \quad \left[ f(t) = e^{-kt} \right]$$

$$= \frac{2}{\pi} \int_0^\infty \cos wx dw \left[ \frac{e^{-kt}}{k^2 + w^2} \{-k \cos wt + w \sin wt\} \right]_0^\infty \quad \left\{ \int e^{ax} \cos bx dx = \frac{e^{ax}}{a^2 + b^2} [a \cos bx + b \sin bx] \right\}$$

$$e^{-kx} = \frac{2}{\pi} \int_0^\infty \cos wx dw \left[ 0 + \frac{k}{k^2 + w^2} \right]$$

$$e^{-kx} = \frac{2k}{\pi} \int_0^\infty \frac{\cos wx dw}{k^2 + w^2} \quad \Rightarrow \quad \int_0^\infty \frac{\cos wx}{k^2 + w^2} dw = \frac{\pi e^{-kx}}{2k} \quad \text{Proved.}$$

**Example 4.** Using Fourier integral representation, show that

$$\int_0^\infty \frac{\cos(\lambda x)}{(1+\lambda^2)} d\lambda = \frac{\pi}{2} e^{-x}, (x>0) \quad (\text{U.P. \& Uttarakhand, III Semester 2008})$$

**Solution.** Fourier cosine integral is

$$\begin{aligned} F(x) &= \frac{2}{\pi} \int_0^\infty \cos \lambda x \int_0^\infty F(t) \cos \lambda t dt d\lambda \Rightarrow e^{-x} = \frac{2}{\pi} \int_0^\infty \cos \lambda x \int_0^\infty e^{-t} \cos \lambda t dt d\lambda \\ &\quad [\text{Put } F(x) = e^{-x}] \\ e^{-x} &= \frac{2}{\pi} \int_0^\infty \cos \lambda x \left[ \frac{e^{-t}}{1+\lambda^2} (-\cos \lambda t + \lambda \sin \lambda t) \right]_0^\infty d\lambda \\ e^{-x} &= \frac{2}{\pi} \int_0^\infty \cos \lambda x \cdot \left( \frac{1}{1+\lambda^2} \right) d\lambda \Rightarrow \int_0^\infty \frac{\cos \lambda x}{1+\lambda^2} d\lambda = \frac{\pi}{2} e^{-x}, x \geq 0 \quad \text{Proved} \end{aligned}$$

**Example 5.** Using Fourier integral representation, show that

$$\int_0^\infty \frac{\cos x\omega + \omega \sin x\omega}{1+\omega^2} d\omega = \begin{cases} 0, & \text{if } x < 0 \\ \pi/2, & \text{if } x = 0 \\ \pi e^{-x}, & \text{if } x > 0 \end{cases}$$

**Solution.** Putting  $k = 1$  in example 4, we have

$$\int_0^\infty \frac{\cos x\omega}{1+\omega^2} d\omega = \frac{\pi}{2} e^{-x}, x > 0 \quad \dots (1)$$

Putting  $\beta = 1$  and  $\lambda = \omega$  in example 2, we have

$$\int_0^\infty \frac{\omega \sin x\omega}{1+\omega^2} d\omega = \frac{\pi}{2} e^{-x}, x > 0 \quad \dots (2)$$

Adding (1) and (2), we get

$$\int_0^\infty \frac{\cos x\omega + \omega \sin x\omega}{1+\omega^2} d\omega = \frac{\pi}{2} e^{-x} + \frac{\pi}{2} e^{-x} \quad \dots (3)$$

**Case I.** When  $x < 0 \Rightarrow x$  is replaced by  $-x$  in (3), we have

$$\int_0^\infty \frac{\cos(-x\omega) + \omega \sin(-x\omega)}{1+\omega^2} d\omega = \int_0^\infty \frac{\cos(x\omega) - \omega \sin(x\omega)}{1+\omega^2} d\omega = \frac{\pi}{2} e^{-x} - \frac{\pi}{2} e^{-x} = 0$$

**Case II.** When  $x = 0$ , L.H.S. of (3) becomes

$$\int_0^\infty \frac{\cos 0\omega + \omega \sin 0\omega}{1+\omega^2} d\omega = \int_0^\infty \frac{d\omega}{1+\omega^2} = \left( \tan^{-1} \omega \right)_0^\infty = \frac{\pi}{2}$$

**Case III.** When  $x > 0$ , (3) is

$$\begin{aligned} \int_0^\infty \frac{\cos x\omega + \omega \sin x\omega}{1+\omega^2} d\omega &= \frac{\pi}{2} e^{-x} + \frac{\pi}{2} e^{-x} \\ &= \pi e^{-x}. \end{aligned}$$

From case I, case II and case III, we get

$$\int_0^\infty \frac{\cos x\omega + \omega \sin x\omega}{1+\omega^2} d\omega = \begin{cases} 0, & \text{if } x < 0 \\ \frac{\pi}{2}, & \text{if } x = 0 \\ \pi e^{-x}, & \text{if } x > 0 \end{cases} \quad \text{Proved.}$$

**Example 6.** Find the complex form of the Fourier integral representation of

$$f(x) = \begin{cases} e^{-kx}, & x > 0 \text{ and } k > 0 \\ 0, & \text{otherwise} \end{cases}$$

(U.P. III semester Dec. 2005; U.P. III Semester Dec. 2004)

$$\text{Solution. We have, } f(x) = \begin{cases} e^{-kx}, & x > 0 \text{ and } k > 0 \\ 0, & \text{otherwise} \end{cases}$$

We know that the complex form of Fourier integral representation of  $f(x)$  is given

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-iux} du \int_{-\infty}^{\infty} f(t) e^{iut} dt$$

On replacing  $u$  by  $\lambda$ , we have

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i\lambda x} d\lambda \int_{-\infty}^{\infty} f(t) e^{i\lambda t} dt \quad \dots (1)$$

On putting the value of  $f(t)$  in (1), we get

$$\begin{aligned} f(x) &= \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i\lambda x} d\lambda \left[ \int_0^{\infty} e^{-kt} e^{i\lambda t} dt \right] = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i\lambda x} d\lambda \left[ \int_0^{\infty} e^{-(k-i\lambda)t} dt \right] \\ &= \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i\lambda x} d\lambda \left[ \frac{e^{-(k-i\lambda)x}}{-(k-i\lambda)} \right]_0^{\infty} = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-i\lambda x} d\lambda \left[ 0 - \frac{1}{-k+i\lambda} \right] = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{e^{-i\lambda x}}{k-i\lambda} d\lambda. \end{aligned}$$

Subtracting (2) from (1)

### EXERCISE 41.1

1. Find the Fourier Sine Integral representation of

$$f(x) = \begin{cases} 0, & 0 < x < 1 \\ k, & 1 < x < 2 \\ 0, & x > 2 \end{cases} \quad \text{where } k \text{ is constant.} \quad \text{Ans. } f(x) = \frac{2k}{\pi} \int_0^{\infty} \left( \frac{\cos \lambda - \cos 2\lambda}{\lambda} \right) \sin \lambda x d\lambda$$

2. Find Fourier Sine Integral representation of

$$f(x) = x^2, \quad 0 \leq x \leq 1. \quad \text{Ans. } f(x) = \frac{2}{\pi} \int_0^{\infty} \left[ \left( \frac{-1}{\lambda} + \frac{2}{\lambda^3} \right) \cos \lambda + \frac{2 \sin \lambda}{\lambda^2} - \frac{2}{\lambda^3} \right] \sin \lambda x d\lambda$$

3. Find Fourier Sine Integral of

$$f(x) = \begin{cases} x & \text{for } 0 < x < 1 \\ 2-x & \text{for } 1 < x < 2. \\ 0 & \text{for } x > 2 \end{cases} \quad \text{Ans. } f(x) = \frac{2}{\pi} \int_0^{\infty} \left[ \frac{4 \sin u}{u} - \frac{4 \sin \bar{u}}{u^2} x \frac{2 \cos u}{u} - \frac{\cos 2u}{u^2} - \frac{1}{u^2} \right] \sin x dx$$

4. Find Fourier Cosine Integral representation of

$$f(x) = \begin{cases} \sin x, & 0 \leq x \leq \pi \\ 0, & x > \pi \end{cases} \quad \text{Ans. } f(x) = -\frac{2}{\pi} \int_0^{\infty} \left( \frac{1 + \cos \lambda \pi}{\lambda^2 - 1} \right) \cos \lambda x d\lambda$$

5. Find Fourier Cosine Integral representation of

$$f(x) = \begin{cases} x, & 0 \leq x \leq 2 \\ 0, & \text{otherwise} \end{cases} \quad \text{Ans. } f(x) = \frac{2}{\pi} \int_0^{\infty} \left( \frac{2 \sin 2\lambda}{\lambda} + \frac{\cos 2\lambda - 1}{\lambda^2} \right) \cos \lambda x d\lambda$$

6. Find the Fourier Cosine Integral of the function  $e^{-ax}$ . Hence show that

$$\int_0^{\infty} \frac{\cos 2x}{\lambda^2 + 1^2} d\lambda = \frac{\pi}{2} e^{-x}, \quad x \geq 0 \quad \text{Ans. } \frac{2a}{\pi} \int_0^{\infty} \frac{\cos x}{\lambda^2 + a^2} d\lambda.$$

7. Express  $f(x) = \begin{cases} 1 & \text{for } 0 \leq x \leq \pi \\ 0 & \text{for } x > \pi \end{cases}$  as a Fourier Sine Integral and hence evaluate

$$\int_0^{\infty} \frac{1 - \cos \pi \lambda}{\lambda} \sin \lambda x d\lambda \quad \text{Ans. } \frac{\pi}{4}$$

8. Find the Fourier Integral representation of the function

$$f(x) = \begin{cases} 1 & \text{for } |x| < 1 \\ 0 & \text{for } |x| > 1 \end{cases}$$

Evaluate  $\int_0^\infty \frac{\cos ux \sin u}{u} du$  at  $x=1$  and  $\int_0^\infty \frac{\sin u}{u} du$

Ans.  $\frac{2}{u} \sin u \cos ux, \frac{\pi}{2}, \frac{\pi}{2}$   
(U.P. III Semester, 2008)

9. Using Fourier Integral representation, show that

$$\int_0^\infty \frac{\lambda \sin \lambda x}{(\lambda^2 + \alpha^2)(\lambda^2 + \beta^2)} d\lambda = \frac{\pi}{2} \frac{(e^{-\alpha x} - e^{-\beta x})}{(\beta^2 - \alpha^2)}$$

Hence find the Fourier Sine integral representation of  $e^{-x} - e^{-2x}$ .

10. If  $f(x) = \begin{cases} 0, & x < 0 \\ x, & 0 \leq x \leq \pi \\ 0, & x > \pi \end{cases}$  then show that

$$f(x) = \frac{1}{\pi \lambda^2} \int_0^\infty [\lambda \pi \sin \lambda(\pi-x) + \cos \lambda(\pi-x) - \cos \lambda x] d\lambda$$

11. Using Fourier Integral formula, prove that  $\int_0^\infty \left( \frac{\lambda^2 + 2}{\lambda^4 + 4} \right) \cos \lambda x d\lambda = \frac{\pi}{2} e^{-x} \cos x$ , if  $x > 0$ .

12. Using Fourier Integral method, prove that  $\int_0^\infty \left( \frac{\sin \pi \lambda}{1 - \lambda^2} \right) \sin \lambda x d\lambda = \begin{cases} \frac{\pi}{2} \sin x, & \text{if } 0 \leq x \leq \pi \\ 0, & \text{if } x > \pi \end{cases}$

13. Solve the integral equation

$$\int_0^\infty f(x) \cos \lambda x dx = e^{-\lambda}$$

Ans.  $f(x) = \frac{2}{\pi(1+x^2)}$

#### 41.6 FOURIER TRANSFORMS

We have done in Article 41.5 that

(U.P. III Semester, Dec. 2005)

$$\begin{aligned} f(x) &= \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-iux} du \int_{-\infty}^{\infty} f(t) e^{iut} dt \\ &= \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-isx} ds \int_{-\infty}^{\infty} f(t) e^{ist} dt = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-isx} ds \left[ \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(t) e^{ist} dt \right] \quad (u=s) \dots (1) \end{aligned}$$

Putting  $\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(t) e^{ist} dt = F(s)$  in (1), we get  $\dots (2)$

$$\Rightarrow f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-isx} F(s) ds \quad \dots (3)$$

In (2),  $F(s)$  is called the **Fourier transform** of  $f(x)$ .

In (3),  $f(x)$  is called the **inverse Fourier transform** of  $F(s)$ .

**Note:** For reasons of symmetry, we multiply both  $f(x)$  and  $F(s)$  by  $\sqrt{\frac{1}{2\pi}}$  instead of having the factor  $\frac{1}{2\pi}$  in only one function. Thus, we obtain the definition of Fourier transform as

$F(s) = F[f(x)] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(t) e^{ist} dt$
$f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} F(s) e^{-isx} ds$

### 41.7 FOURIER SINE AND COSINE TRANSFORMS

#### Fourier Sine Transform

From equation (7) of Article 47.4 we know that

$$\begin{aligned} f(x) &= \frac{2}{\pi} \int_0^\infty \sin sx ds \int_0^\infty f(t) \sin st dt = \sqrt{\frac{2}{\pi}} \int_0^\infty \sin sx ds \left[ \sqrt{\frac{2}{\pi}} \int_0^\infty f(t) \sin st dt \right] \quad (s = u) \\ &= \sqrt{\frac{2}{\pi}} \int_0^\infty \sin sx ds F(s) \end{aligned}$$

$$F(s) = F_s[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(t) \sin st dt \quad \dots (1)$$

$$f(x) = \sqrt{\frac{2}{\pi}} \int_0^\infty F(s) \sin sx ds \quad \dots (2)$$

In equation (1),  $F(s)$  is called **Fourier Sine transform** of  $f(x)$ .

In equation (2),  $f(x)$  is called the **Inverse Fourier Sine transform** of  $F(s)$ .

#### Fourier Cosine Transform

From equation (8) of Article 41.4, we have

$$\begin{aligned} f(x) &= \sqrt{\frac{2}{\pi}} \int_0^\infty \cos sx ds \left[ \sqrt{\frac{2}{\pi}} \int_0^\infty f(t) \cos st dt \right] = \sqrt{\frac{2}{\pi}} \int_0^\infty \cos sx ds F(s) \\ F(s) &= F_c[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(t) \cos st dt \quad \dots (3) \end{aligned}$$

$$f(x) = \sqrt{\frac{2}{\pi}} \int_0^\infty \cos sx F(s) ds \quad \dots (4)$$

In equation (3),  $F(s)$  is called **Fourier Cosine transform** of  $f(x)$ .

In equation (4),  $f(x)$  is called the **Inverse Fourier Cosine transform of  $F(s)$** .

#### Examples based on Fourier Transform.

**Example 7.** Find the Fourier transform of

$$f(x) = \begin{cases} 1 & \text{for } |x| < a \\ 0 & \text{for } |x| > a \end{cases}$$

**Solution.** The Fourier transform of a function  $f(x)$  is given by

$$F[f(x)] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{isx} dx \quad \dots (1)$$

Substituting the value of  $f(x)$  in (1), we get

$$\begin{aligned} F[f(x)] &= \frac{1}{\sqrt{2\pi}} \int_{-a}^a 1 \cdot e^{isx} dx = \left[ \frac{e^{isx}}{is} \right]_{-a}^a = \frac{1}{\sqrt{2\pi}} \frac{1}{(is)} [e^{ias} - e^{-ias}] \\ &= \frac{1}{\sqrt{2\pi}} \frac{2}{s} \cdot \frac{e^{ias} - e^{-ias}}{2i} = \frac{1}{\sqrt{2\pi}} \frac{2 \sin sa}{s} = \sqrt{\frac{2}{\pi}} \frac{\sin sa}{s} \quad \text{Ans.} \end{aligned}$$

**Example 8.** Find the Fourier transform of

(Uttarakhand, III Semester, 2009)

$$f(x) = \begin{cases} 1-x^2 & \text{if } |x| \leq 1. \\ 0 & \text{if } |x| > 1. \end{cases}$$

and use it to evaluate  $\int_0^\infty \left( \frac{x \cos x - \sin x}{x^3} \right) \cos \frac{x}{2} dx$ .

**Solution.** We have  $f(x) = \begin{cases} 1-x^2, & -1 < x < 1 \\ 0, & |x| > 1 \end{cases}$

The Fourier transform of a function  $f(x)$  is given by

$$F[f(x)] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{ix} dx \quad \dots (1)$$

Substituting the values of  $f(x)$  in (1), we get

$$F[f(x)] = \frac{1}{\sqrt{2\pi}} \int_{-1}^1 (1-x^2) e^{ix} dx$$

Integrating by parts, we get  $\left[ \int [uv] = uv_1 - u'v_2 + u''v_3 \dots \right]$

$$\begin{aligned} F[f(x)] &= \frac{1}{\sqrt{2\pi}} \left[ (1-x^2) \frac{e^{ix}}{is} - (-2x) \frac{e^{ix}}{(is)^2} + (-2) \frac{e^{ix}}{(is)^3} \right]_{-1}^1 \\ \Rightarrow F(s) &= \frac{1}{\sqrt{2\pi}} \left[ -2 \frac{e^{is}}{s^2} + 2 \frac{e^{is}}{is^3} - 2 \frac{e^{-is}}{s^2} - 2 \frac{e^{-is}}{is^3} \right] \\ &= \frac{1}{\sqrt{2\pi}} \left[ -\frac{2}{s^2} (e^{is} + e^{-is}) + \frac{2}{is^3} (e^{is} - e^{-is}) \right] \\ &= \frac{1}{\sqrt{2\pi}} \left[ -\frac{2}{s^2} (2 \cos s) + \frac{2}{is^3} (2i \sin s) \right] = \frac{1}{\sqrt{2\pi}} \frac{4}{s^3} [-s \cos s + \sin s] \end{aligned}$$

**Ans.**

By inversion formula for Fourier transform

$$f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} F(s) e^{-isx} dx \quad \dots (2)$$

Putting the value of  $F(s)$  in (2), we get

$$\begin{aligned} f(x) &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} \frac{4}{s^3} (\sin s - s \cos s) e^{-isx} ds \\ &= \frac{2}{\pi} \int_{-\infty}^{\infty} \frac{1}{s^3} (\sin s - s \cos s) (\cos sx - i \sin sx) ds \\ &= \frac{2}{\pi} \left[ \int_{-\infty}^{\infty} \frac{1}{s^3} \sin s \cos sx ds - \int_{-\infty}^{\infty} \frac{i}{s^3} \sin s \sin sx ds - \int_{-\infty}^{\infty} \frac{1}{s^3} s \cos s \cos sx ds \right. \\ &\quad \left. + i \int_{-\infty}^{\infty} \frac{s}{s^3} \cos s \sin sx ds \right] \\ &= \frac{4}{\pi} \left[ \int_0^{\infty} \frac{1}{s^3} \sin s \cos sx ds - 0 - \int_0^{\infty} \frac{s}{s^3} \cos s \cos sx ds + 0 \right] \\ &\quad [\text{I, III, functions are even and II, IV functions are odd}] \\ &= \frac{4}{\pi} \int_0^{\infty} \left( \frac{\sin s - s \cos s}{s^3} \right) \cos sx ds \end{aligned}$$

Putting  $x = \frac{1}{2}$ , we get

$$\begin{aligned} f\left(\frac{1}{2}\right) &= \frac{4}{\pi} \int_0^{\infty} \left( \frac{\sin s - s \cos s}{s^3} \right) \cos \frac{s}{2} ds \quad \left[ f\left(\frac{1}{2}\right) = 1 - \left(\frac{1}{2}\right)^2 = \frac{3}{4} \right] \\ \frac{3}{4} &= -\frac{4}{\pi} \int_0^{\infty} \left( \frac{s \cos s - \sin s}{s^3} \right) \cos \frac{s}{2} ds \end{aligned}$$

$$-\frac{3\pi}{16} = \int_0^\infty \left( \frac{s \cos s - \sin s}{s^3} \right) \cos \frac{s}{2} ds$$

Hence,  $\int_0^\infty \left( \frac{s \cos s - \sin s}{s^3} \right) \cos \frac{s}{2} ds = -\frac{3\pi}{16}$  Ans.

**Example 9.** Find the Fourier transform of  $e^{-ax^2}$ , where  $a > 0$ .

(U.P. III Semester, Dec. 2002)

**Solution.** The Fourier transform of  $f(x)$ :

$$F\{f(x)\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{ixx} dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$F\{e^{-ax^2}\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-ax^2} e^{ixx} dx = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-x^2 a - \frac{s^2}{4a} + isx + \frac{s^2}{4a}} dx = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\left(x\sqrt{a} - \frac{is}{2\sqrt{a}}\right)^2} e^{-\frac{s^2}{4a}} dx$$

$$\begin{aligned} \text{Putting } x\sqrt{a} - \frac{is}{2\sqrt{a}} = y, \quad dx = \frac{dy}{\sqrt{a}}, \text{ we get } &= \frac{e^{-s^2/4a}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-y^2} \frac{dy}{\sqrt{a}}. \\ &= \frac{e^{-s^2/4a}}{\sqrt{2\pi}} \times \frac{\sqrt{\pi}}{\sqrt{a}} \quad \left( \text{Since } \int_{-\infty}^{\infty} e^{-y^2} dy = \sqrt{\pi} \right) \end{aligned}$$

$$F\{e^{-ax^2}\} = \frac{e^{-s^2/4a}}{\sqrt{2a}} \quad \text{Ans.}$$

**Example 10.** Find the Fourier transform of the function

$$f(x) = \begin{cases} \frac{1}{2}, & |x| \leq \epsilon \\ 0, & x > \epsilon \end{cases}$$

$$\text{Solution. We have, } f(x) = \begin{cases} \frac{1}{2}, & |x| \leq \epsilon \\ 0, & x > \epsilon \end{cases}$$

The Fourier transform of the function  $f(x)$  is given by

$$F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{ixs} dx \quad \dots (1)$$

Substituting the value of  $f(x)$  in (1), we get

$$\begin{aligned} F[f(x)] &= \frac{1}{\sqrt{2\pi}} \int_{-\epsilon}^{\epsilon} \frac{1}{2} e^{ixs} dx = \frac{1}{\sqrt{2\pi}} \cdot \frac{1}{2} \int_{-\epsilon}^{\epsilon} (\cos sx + i \sin sx) dx \\ &= \frac{1}{\sqrt{2\pi}} \cdot \frac{1}{2} \left[ \int_{-\epsilon}^{\epsilon} \cos sx dx + i \int_{-\epsilon}^{\epsilon} \sin sx dx \right] = \frac{1}{\sqrt{2\pi}} \cdot \frac{2}{2} \left[ \int_0^{\epsilon} \cos sx dx + 0 \right] \\ &\quad [\text{First function is even and second is odd}] \end{aligned}$$

$$= \frac{1}{\sqrt{2\pi}} \cdot \frac{1}{\epsilon} \left[ \frac{\sin sx}{s} \right]_0^{\epsilon} = \frac{1}{\sqrt{2\pi}} \cdot \frac{1}{\epsilon} \left[ \frac{\sin s\epsilon - \sin 0}{s} \right] = \frac{1}{\sqrt{2\pi}} \frac{\sin s\epsilon}{s} \quad \text{Ans.}$$

**Example 11.** Find the Fourier transform of function

$$f(t) = \begin{cases} t, & \text{for } |t| < a \\ 0, & \text{for } |t| > a \end{cases}$$

**Solution.** We have,

$$f(t) = \begin{cases} t, & \text{for } |t| < a \\ 0, & \text{for } |t| > a \end{cases}$$

The Fourier Transform of the function  $f(t)$  is given by

$$F[f(t)] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(t) e^{ist} dt \quad \dots(1)$$

Substituting the value of  $f(t)$  in (1), we get

$$\begin{aligned} F[f(t)] &= \frac{1}{\sqrt{2\pi}} \int_{-a}^a t e^{ist} dt = \frac{1}{\sqrt{2\pi}} \int_{-a}^a t (\cos st + i \sin st) dt \\ &= \frac{1}{\sqrt{2\pi}} \left[ 0 + 2 \int_0^a t \sin st dt \right] \quad [\text{First is odd and second is even}] \\ &= \frac{2i}{\sqrt{2\pi}} \left[ \left\{ t \left( \frac{-\cos st}{s} \right) \right\}_0^a - \int_0^a 1 \left( \frac{-\cos st}{s} \right) dt \right] = \frac{2i}{\sqrt{2\pi}} \left[ -\frac{a}{s} \cos as + \frac{1}{s} \left[ \frac{\sin st}{s} \right]_0^a \right] \\ &= \frac{2i}{\sqrt{2\pi}} \left[ -\frac{a}{s} \cos as + \frac{1}{s^2} \sin as \right] = \frac{2i}{\sqrt{2\pi}} \frac{1}{s^2} [\sin as - a \cos as] \quad \text{Ans.} \end{aligned}$$

**Example 12.** Find the Fourier transform of the function shown in the adjoining figure.

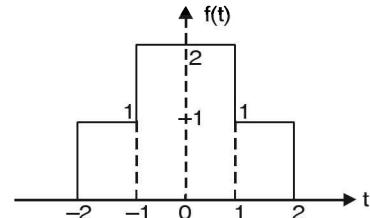

**Solution.** Here,  $f(t) = \begin{cases} 2, & \text{for } -1 < t < 1 \\ 1, & \text{for } -2 < t < -1 \\ 1, & \text{for } 1 < t < 2 \end{cases}$

The Fourier transform of the function  $f(t)$  is given by

$$F[f(t)] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(t) e^{ist} dt \quad \dots(1)$$

Putting the value of  $f(t)$  in (1), we get

$$\begin{aligned} &= \frac{1}{\sqrt{2\pi}} \left[ \int_{-1}^1 2e^{ist} dt + \int_{-2}^{-1} 1 \cdot e^{ist} dt + \int_1^2 1 \cdot e^{ist} dt \right] = \frac{1}{\sqrt{2\pi}} \left[ 2 \left( \frac{e^{ist}}{is} \right) \Big|_{-1}^1 + \left( \frac{e^{ist}}{is} \right) \Big|_{-2}^{-1} + \left( \frac{e^{ist}}{is} \right) \Big|_1^2 \right] \\ &= \frac{1}{\sqrt{2\pi}} \left[ 2 \left( \frac{e^{is} - e^{-is}}{is} \right) + \left( \frac{e^{-is} - e^{-2is}}{is} \right) + \left( \frac{e^{2is} - e^{is}}{is} \right) \right] \\ &= \frac{1}{\sqrt{2\pi s}} \left[ 2 \left( \frac{e^{is} - e^{-is}}{i} \right) + \left( \frac{e^{2is} - e^{-2is}}{i} \right) - \left( \frac{e^{is} - e^{-is}}{i} \right) \right] = \frac{1}{\sqrt{2\pi s}} \left[ \left( \frac{e^{is} - e^{-is}}{i} \right) + \left( \frac{e^{2is} - e^{-2is}}{i} \right) \right] \\ &= \frac{1}{\sqrt{2\pi s}} [2 \sin s + 2 \sin 2s] = \frac{1}{\sqrt{2\pi s}} [2 \sin s + 4 \sin s \cos s] \\ &= \frac{2}{\sqrt{2\pi s}} \sin s (1 + 2 \cos s) = \frac{2}{\sqrt{2\pi s}} \cdot \frac{\sin s}{\pi} (1 + 2 \cos s) \quad \text{Ans.} \end{aligned}$$

**Example 13.** Find the Fourier transform of the function

$$f(x) = \begin{cases} 1 + \frac{x}{a}, & (-a < x < 0) \\ 1 - \frac{x}{a}, & 0 < x < a \\ 0, & \text{otherwise} \end{cases}$$

(U.P., III Semester, Summer 2002)

**Solution.** Fourier transform of  $f(x)$  is given by

$$F[f(x)] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) \cdot e^{isx} dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$\begin{aligned} F[f(x)] &= \frac{1}{\sqrt{2\pi}} \int_{-a}^0 \left(1 + \frac{x}{a}\right) e^{isx} dx + \frac{1}{\sqrt{2\pi}} \int_0^a \left(1 - \frac{x}{a}\right) e^{isx} dx \\ &= \frac{1}{\sqrt{2\pi}} \left[ \left(1 + \frac{x}{a}\right) \times \frac{e^{isx}}{is} - \left(\frac{1}{a}\right) \frac{e^{isx}}{-s^2} \right]_{-a}^0 + \frac{1}{\sqrt{2\pi}} \left[ \left(1 - \frac{x}{a}\right) \frac{e^{isx}}{is} - \left(-\frac{1}{a}\right) \frac{e^{isx}}{-s^2} \right]_0^a \\ &= \frac{1}{\sqrt{2\pi}} \left[ \frac{1}{is} + \frac{1}{a} \cdot \frac{1}{s^2} + \frac{1}{a} \frac{e^{-isa}}{-s^2} \right] + \frac{1}{\sqrt{2\pi}} \left[ \frac{1}{a} \cdot \frac{e^{isa}}{-s^2} - \frac{1}{is} + \frac{1}{a} \frac{1}{s^2} \right] \\ &= \frac{1}{\sqrt{2\pi}} \left[ \frac{2}{as^2} + \frac{1}{-as^2} (e^{isa} + e^{-isa}) \right] \\ &= \frac{1}{\sqrt{2\pi}} \left[ \frac{2}{as^2} - \frac{2}{as^2} \cos sa \right] = \frac{1}{\sqrt{2\pi}} \frac{2}{as^2} [1 - \cos as] \\ &= \frac{2}{\sqrt{2\pi} as^2} 2 \sin^2 \frac{as}{2} = \frac{2\sqrt{2} \sin^2 \frac{as}{2}}{\sqrt{\pi} as^2} \end{aligned}$$

Ans.

#### Examples based on Fourier Sine Transform:

**Example 14.** Find Fourier Sine transform of  $\frac{1}{x}$ .

**Solution.** Here,  $f(x) = \frac{1}{x}$

$$F_s[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(x) \sin sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$\begin{aligned} F_s\left(\frac{1}{x}\right) &= \sqrt{\frac{2}{\pi}} \int_0^{\infty} \frac{\sin sx}{x} dx = \sqrt{\frac{2}{\pi}} \int_0^{\infty} \frac{\sin \theta}{\theta} \frac{d\theta}{s} \quad \text{Putting } s x = \theta \text{ so that } s dx = d\theta \\ &= \sqrt{\frac{2}{\pi}} \int_0^{\infty} \frac{\sin \theta}{\theta} d\theta = \sqrt{\frac{2}{\pi}} \left(\frac{\pi}{2}\right) \quad [\text{Some useful result I on page 1087}] \text{ Ans.} \\ &= \sqrt{\frac{\pi}{2}} \end{aligned}$$

**Example 15.** Find the Fourier Sine Transform of  $e^{-ax}$ .

**Solution.** Here,  $f(x) = e^{-ax}$

The Fourier sine transform of  $f(x)$ :

$$F_s[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(x) \sin sx dx \quad \dots (1)$$

On putting the value of  $f(x)$  in (1), we get

$$F_s[e^{-ax}] = \sqrt{\frac{2}{\pi}} \int_0^{\infty} e^{-ax} \sin sx dx$$

On integrating by parts, we get

$$\begin{aligned} F_s[e^{-ax}] &= \sqrt{\frac{2}{\pi}} \left[ \frac{e^{-ax}}{a^2+s^2} [-a\sin sx - s\cos sx] \right]_0^\infty \left[ \int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2+b^2} (a\sin bx - b\cos bx) \right] \\ &= \sqrt{\frac{2}{\pi}} \left[ 0 - \frac{1}{a^2+s^2} (-s) \right] = \sqrt{\frac{2}{\pi}} \left( \frac{s}{a^2+s^2} \right) \end{aligned} \quad \text{Ans.}$$

### Examples based on Fourier Cosine transform

**Example 16.** Find the Fourier Cosine Transform of  $f(x) = e^{-ax}$ .

**Solution.** The Fourier Cosine Transform is

$$F_c[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$\begin{aligned} F_c[e^{-ax}] &= \sqrt{\frac{2}{\pi}} \int_0^\infty e^{-ax} \cos sx dx \quad \left[ \int e^{ax} \cos bx dx = \frac{e^{ax}}{a^2+b^2} (a \cos bx + b \sin bx) \right] \\ &= \sqrt{\frac{2}{\pi}} \left[ \frac{e^{-ax}}{a^2+s^2} \{-a \cos sx + s \sin sx\} \right]_0^\infty = \sqrt{\frac{2}{\pi}} \left[ 0 + \frac{a}{a^2+s^2} \right] = \sqrt{\frac{2}{\pi}} \frac{a}{a^2+s^2} \end{aligned} \quad \text{Ans.}$$

**Example 17.** Find the Fourier Cosine Transform of  $f(x) = 5e^{-2x} + 2e^{-5x}$

**Solution.** The Fourier Cosine Transform of  $f(x)$  is given by

$$F_c\{f(x)\} = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get  $F_c\{f(x)\} = \int_0^\infty (5e^{-2x} + 2e^{-5x}) \cos sx dx$

$$\begin{aligned} &= 5 \int_0^\infty e^{-2x} \cos sx dx + 2 \int_0^\infty e^{-5x} \cos sx dx \\ &= 5 \left[ \frac{e^{-2x}}{(-2)^2+s^2} (-2 \cos sx + s \sin sx) \right]_0^\infty + 2 \left[ \frac{e^{-5x}}{(-5)^2+s^2} (-5 \cos sx + s \sin sx) \right]_0^\infty \\ &= 5 \left[ 0 - \frac{1}{4+s^2} (-2) \right] + 2 \left[ 0 - \frac{1}{25+s^2} (-5) \right] = 5 \left( \frac{2}{s^2+4} \right) + 2 \left( \frac{5}{s^2+25} \right) \\ &= 10 \left( \frac{1}{s^2+4} + \frac{1}{s^2+25} \right) \end{aligned} \quad \text{Ans.}$$

**Example 18.** Obtain Fourier Cosine Transform of

$$f(x) = \begin{cases} x, & \text{for } 0 < x < 1 \\ 2-x, & \text{for } 1 < x < 2 \\ 0, & \text{for } x > 2 \end{cases} \quad (\text{U.P., III Semester Dec. 2002})$$

**Solution.** Fourier Cosine Transform

$$F_c\{f(x)\} = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$\begin{aligned}
 F_c[f(x)] &= \sqrt{\frac{2}{\pi}} \left[ \int_0^1 x \cos sx dx + \int_1^2 (2-x) \cos sx dx + \int_2^\infty 0 \cdot \cos sx dx \right] \\
 &= \sqrt{\frac{2}{\pi}} \left[ \left\{ x \frac{\sin sx}{s} - \left( -\frac{\cos sx}{s^2} \right) \right\}_0^1 + \left\{ (2-x) \frac{\sin sx}{s} - (-1) \left( -\frac{\cos sx}{s^2} \right) \right\}_1^\infty \right] + 0 \\
 &= \sqrt{\frac{2}{\pi}} \left[ \left\{ \left( \frac{\sin s}{s} + \frac{\cos s}{s^2} \right) - \frac{1}{s^2} \right\} + \left\{ \left( -\frac{\cos 2s}{s^2} \right) - \left( \frac{\sin s}{s} - \frac{\cos s}{s^2} \right) \right\} \right] \\
 &= \sqrt{\frac{2}{\pi}} \left[ \frac{2 \cos s}{s^2} - \frac{1}{s^2} - \frac{\cos 2s}{s^2} \right] = \sqrt{\frac{2}{\pi}} \left[ \frac{2 \cos s - 1 - (2 \cos^2 s - 1)}{s^2} \right] \\
 &= \sqrt{\frac{2}{\pi}} \left[ \frac{2 \cos s - 1 - 2 \cos^2 s + 1}{s^2} \right] = \sqrt{\frac{2}{\pi}} \frac{2 \cos s (1 - \cos s)}{s^2} \quad \text{Ans.}
 \end{aligned}$$

### Examples based on Fourier Sine and Fourier Cosine Transform

**Example 19.** Find Fourier Sine and Cosine Transform of (a)  $x^{n-1}$ . (b)  $\frac{1}{\sqrt{x}}$ .

(U.P. III Semester (Comp.) 2004)

**Solution.** Here,  $f(x) = x^{n-1}$

The Fourier Sine Transform of  $f(x)$ :

$$F_s[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \sin sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$(a) \quad F_s(x^{n-1}) = \sqrt{\frac{2}{\pi}} \int_0^\infty \sin sx \cdot x^{n-1} dx \quad \dots (2)$$

The Fourier Cosine Transform of  $f(x)$ :

$$F_c[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx dx \quad \dots (3)$$

Putting the value of  $f(x)$  in (3), we get

$$F_c(x^{n-1}) = \sqrt{\frac{2}{\pi}} \int_0^\infty \cos sx \cdot x^{n-1} dx \quad \dots (4)$$

Multiplying (2) by  $i$  and adding to (4), we have

$$F_c(x^{n-1}) + iF_s(x^{n-1}) = \sqrt{\frac{2}{\pi}} \int_0^\infty (\cos sx + i \sin sx) x^{n-1} dx = \sqrt{\frac{2}{\pi}} \int_0^\infty e^{isx} x^{n-1} dx$$

On putting  $i s x = -t$  so that  $isdx = -dt$ , we get

$$\begin{aligned}
 &= \sqrt{\frac{2}{\pi}} \int_0^\infty e^{-t} \left( -\frac{t}{is} \right)^{n-1} \left( -\frac{dt}{is} \right) = \sqrt{\frac{2}{\pi}} \frac{1}{(is)^n} (-1)^n \int_0^\infty e^{-t} t^{n-1} dt \\
 &= \sqrt{\frac{2}{\pi}} \frac{(i)^{2n}}{(i)^n s^n} \lceil n \rceil = \sqrt{\frac{2}{\pi}} \frac{(i)^n}{s^n} \lceil n \rceil \quad \left[ \int_0^\infty e^{-t} t^{n-1} dt = \lceil n \rceil \right]
 \end{aligned}$$

$$\begin{aligned}
 &= \sqrt{\frac{2}{\pi}} \frac{\left( \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \right)^n}{s^n} \lceil n \rceil = \sqrt{\frac{2}{\pi}} \frac{\left( \cos \frac{n\pi}{2} + i \sin \frac{n\pi}{2} \right) \lceil n \rceil}{s^n}
 \end{aligned}$$

Equating real and imaginary parts, we get

$$F_c(x^{n-1}) = \sqrt{\frac{2}{\pi}} \frac{n}{s^n} \cos \frac{n\pi}{2} \quad \dots (5)$$

$$F_s(x^{n-1}) = \sqrt{\frac{2}{\pi}} \frac{n}{s^n} \sin \frac{n\pi}{2} \quad \dots (6) \text{ Ans.}$$

$$(b) \text{ Putting } n = \frac{1}{2} \text{ in (5), we get } F_c\left(\frac{1}{\sqrt{x}}\right) = \sqrt{\frac{2}{\pi}} \frac{\frac{1}{2}}{s^{\frac{1}{2}}} \cos \frac{\pi}{4} = \sqrt{\frac{2}{\pi}} \frac{\sqrt{\pi}}{\sqrt{s}} \frac{1}{\sqrt{2}} = \frac{1}{\sqrt{s}}$$

$$\text{Putting } n = \frac{1}{2} \text{ in (6), we get } F_s\left(\frac{1}{\sqrt{x}}\right) = \sqrt{\frac{2}{\pi}} \frac{\frac{1}{2}}{s^{\frac{1}{2}}} \sin \frac{\pi}{4} = \sqrt{\frac{2}{\pi}} \frac{\sqrt{\pi}}{\sqrt{s}} \frac{1}{\sqrt{2}} = \frac{1}{\sqrt{s}} \quad \text{Ans.}$$

### Second Method.

**Example 20.** Find the Fourier Sine Transform of

$$f(x) = \frac{e^{-ax}}{x}. \quad (\text{U.P. III Seamester 2008})$$

**Solution.** The Sine Transform of the function  $f(x)$  is given by

$$F(s) = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \sin sx dx \quad \dots (1)$$

Substituting the value of  $f(x)$  in (1), we get

$$F(s) = \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{e^{-ax}}{x} \sin sx dx$$

Differentiating both sides w.r.t. 's', we get

$$\begin{aligned} \frac{d}{ds}[F(s)] &= \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{e^{-ax}}{x} (x \cos sx) dx \\ &= \sqrt{\frac{2}{\pi}} \int_0^\infty e^{-ax} \cos sx dx = \sqrt{\frac{2}{\pi}} \left[ \frac{e^{-ax}}{a^2 + s^2} (-a \cos + \sin sx) \right]_0^\infty \\ &= \sqrt{\frac{2}{\pi}} \frac{a}{s^2 + a^2} \end{aligned} \quad \dots (2)$$

Integrating (2) w.r.t. 's', we get

$$F(s) = \sqrt{\frac{2}{\pi}} \int \frac{a}{s^2 + a^2} ds = \sqrt{\frac{2}{\pi}} \tan^{-1} \frac{s}{a} + C \quad \dots (3)$$

For  $s = 0$ ,  $F(s) = 0$

Putting  $s = 0$ ,  $F(s) = 0$  in (3), we get

$$0 = 0 + C \quad \text{or} \quad C = 0 \quad \text{Ans.}$$

On putting the value of  $C$  in (3), we get

$$F(s) = \sqrt{\frac{2}{\pi}} \tan^{-1} \frac{s}{a}$$

**Example 21.** Find Fourier Cosine Transform of  $e^{-a^2 x^2}$  and hence evaluate Fourier Sine Transform of  $x e^{-a^2 x^2}$ .

**Solution.** Here,  $f(x) = e^{-a^2 x^2}$

The Fourier Cosine Transform of  $f(x)$ :

$$F_c[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$\begin{aligned}
 F_c(e^{-a^2x^2}) &= \sqrt{\frac{2}{\pi}} \int_0^\infty e^{-a^2x^2} \cdot \cos sx dx \\
 &= \text{Real part of } \sqrt{\frac{2}{\pi}} \int_0^\infty e^{-a^2x^2} \cdot e^{isx} dx \quad [\cos sx + i \sin sx = e^{isx}] \\
 &= \text{Real part of } \sqrt{\frac{2}{\pi}} \int_0^\infty e^{-a^2x^2+isx} dx = \frac{1}{a\sqrt{2}} e^{-\frac{s^2}{4a^2}} \quad (\text{See Example 9 on page 1294})
 \end{aligned}$$

We know that

$$\begin{aligned}
 F_s[(xf(x))] &= -\frac{d}{ds} F_c f(x) \quad (\text{See Example 22 page 1300}) \\
 F_s(xe^{-a^2x^2}) &= -\frac{d}{ds} F_c(e^{-a^2x^2}) \quad [\because f(x) = e^{-a^2x^2}] \\
 &= -\frac{d}{ds} \frac{1}{a\sqrt{2}} e^{-\frac{s^2}{4a^2}} = \frac{1}{a\sqrt{2}} e^{-\frac{s^2}{4a^2}} \frac{s}{2a^2} = \frac{s}{2\sqrt{2}a^3} e^{-\frac{s^2}{4a^2}} \quad \text{Ans.}
 \end{aligned}$$

**Example 22.** Find Fourier Cosine Transform of  $\frac{1}{1+x^2}$  and hence find Fourier Sine

Transform of  $\frac{x}{1+x^2}$ . (Uttarakhand, III Semester, June 2009; U.P. III Semester Dec. 2004)

**Solution.** Here,  $f(x) = \frac{1}{1+x^2}$

The Fourier Cosine Transform of  $f(x)$ :

$$F_c[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$F_c(s) = \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{1}{1+x^2} \cos sx dx = I \text{ (say)} \quad \dots (2)$$

Differentiating w.r.t. 's', we get

$$\begin{aligned}
 \frac{dI}{ds} &= \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{1}{1+x^2} \left( \frac{d}{ds} \cos sx \right) dx \\
 \Rightarrow \quad \frac{dI}{ds} &= \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{-x \sin sx}{1+x^2} dx = -\sqrt{\frac{2}{\pi}} \int_0^\infty \frac{x^2 \sin sx}{x(1+x^2)} dx \\
 &= -\sqrt{\frac{2}{\pi}} \int_0^\infty \frac{(1+x^2-1) \sin sx}{x(1+x^2)} dx \\
 &= -\sqrt{\frac{2}{\pi}} \int_0^\infty \frac{(1+x^2) \sin sx}{x(1+x^2)} dx + \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{\sin sx}{x(1+x^2)} dx \\
 &= -\sqrt{\frac{2}{\pi}} \int_0^\infty \frac{\sin sx}{x} dx + \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{\sin sx}{x(1+x^2)} dx \quad \left[ \int_0^\infty \frac{\sin sx}{x} dx = \frac{\pi}{2} \right] \\
 \Rightarrow \quad \frac{dI}{ds} &= -\sqrt{\frac{2}{\pi}} \cdot \frac{\pi}{2} + \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{\sin sx}{x(1+x^2)} dx \quad \dots (3)
 \end{aligned}$$

Again differentiating, we get

$$\begin{aligned}
 \Rightarrow \quad \frac{d^2I}{ds^2} &= 0 + \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{ds \sin sx}{x(1+x^2)} dx \\
 \Rightarrow \quad \frac{d^2I}{ds^2} &= \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{x \cos sx}{x(1+x^2)} dx = \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{\cos sx}{1+x^2} dx \quad [\text{From (2)}] \\
 \Rightarrow \quad \frac{d^2I}{ds^2} - I &= 0 \Rightarrow D^2 I - I = 0 \Rightarrow (D^2 - 1) I = 0 \\
 &\text{A.E. is } m^2 - 1 = 0 \Rightarrow m = \pm 1 \\
 &\text{C.F.} = C_1 e^s + C_2 e^{-s} \quad \text{and} \quad \text{P.I.} = 0 \\
 \Rightarrow \quad I &= C_1 e^s + C_2 e^{-s} \quad \dots(4) \\
 \therefore \quad \frac{dI}{ds} &= C_1 e^s - C_2 e^{-s} \quad \dots(5)
 \end{aligned}$$

Putting  $s = 0$  in (2), we get

$$I = \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{1}{1+x^2} dx = \sqrt{\frac{2}{\pi}} \left[ \tan^{-1} x \right]_0^\infty = \sqrt{\frac{2}{\pi}} \left[ \tan^{-1} \infty - 0 \right] = \sqrt{\frac{2}{\pi}} \left( \frac{\pi}{2} \right) = \sqrt{\frac{\pi}{2}} \quad \dots(6)$$

$$\text{Again putting } s = 0 \text{ in (3), we get } \frac{dI}{ds} = -\sqrt{\frac{\pi}{2}} \quad \dots(7)$$

Putting  $s = 0$  and equating (4) and (6); (5) and (7), we get

$$C_1 + C_2 = \sqrt{\frac{\pi}{2}} \text{ and } C_1 - C_2 = -\sqrt{\frac{\pi}{2}}$$

$$\text{On solving, we get} \quad C_1 = 0, \quad C_2 = \sqrt{\frac{\pi}{2}}$$

Putting the values of  $C_1$  and  $C_2$  in (4), we get

$$\begin{aligned}
 I &= \sqrt{\frac{\pi}{2}} e^{-s} \\
 \Rightarrow \quad \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{\cos sx}{1+x^2} dx &= \sqrt{\frac{\pi}{2}} e^{-s} \quad \left[ I = \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{\cos sx}{1+x^2} dx \right]
 \end{aligned}$$

Differentiating w.r.t.  $s$ , we get

$$\begin{aligned}
 \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{-x \sin sx}{1+x^2} dx &= -\sqrt{\frac{\pi}{2}} e^{-s} \\
 \Rightarrow \quad \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{x \sin sx}{1+x^2} dx &= \sqrt{\frac{\pi}{2}} e^{-s} \\
 \Rightarrow \quad \int_0^\infty \frac{x \sin sx}{1+x^2} dx &= \frac{\pi}{2} e^{-s} \quad \text{Ans.}
 \end{aligned}$$

**Example 23.** Taking the function  $f(x) = \begin{cases} 1, & 0 < x < \pi \\ 0, & x > \pi \end{cases}$

show that  $\int_0^\infty \left( \frac{1 - \cos sx}{s} \right) \cdot \sin sx ds = \begin{cases} \frac{\pi}{2}, & 0 < x < \pi \\ 0, & x > \pi \end{cases}$ .

**Solution.** We have,  $f(x) = \begin{cases} 1, & 0 < x < \pi \\ 0, & x > \pi \end{cases}$

The Fourier Sine Transform of  $f(x)$ :

$$F_s[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(x) \sin sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$= \sqrt{\frac{2}{\pi}} \int_0^{\pi} 1 \cdot \sin sx dx + \sqrt{\frac{2}{\pi}} \int_{\pi}^{\infty} 0 \cdot \sin sx dx = \sqrt{\frac{2}{\pi}} \left[ -\frac{\cos sx}{s} \right]_0^{\pi} = \sqrt{\frac{2}{\pi}} \left( \frac{1 - \cos s\pi}{s} \right)$$

By inverse formula for Fourier sine transform

$$\begin{aligned} \sqrt{\frac{2}{\pi}} \int_0^{\infty} \sqrt{\frac{2}{\pi}} \left( \frac{1 - \cos s\pi}{s} \right) \sin sx ds &= \begin{cases} 1, & 0 < x < \pi \\ 0, & x > \pi \end{cases} \\ \Rightarrow \frac{2}{\pi} \int_0^{\infty} \left( \frac{1 - \cos s\pi}{s} \right) \sin sx ds &= \begin{cases} 1, & 0 < x < \pi \\ 0, & x > \pi \end{cases} \\ \Rightarrow \int_0^{\infty} \left( \frac{1 - \cos s\pi}{s} \right) \sin sx ds &= \begin{cases} \frac{\pi}{2}, & 0 < x < \pi \\ 0, & x > \pi \end{cases} \end{aligned} \quad \text{Ans.}$$

**Example 24.** Find the Fourier sine transform of  $e^{-|x|}$ .

$$\text{Hence evaluate } \int_0^{\infty} \frac{x \sin mx}{1+x^2} dx \quad (\text{U.P. III Semester, Dec. 2003})$$

**Solution.** In the interval  $(0, \infty)$ ,  $x$  is always positive therefore  $e^{-|x|} = e^{-x}$

Now, Fourier sine transform of  $e^{-x}$  is given by

$$\begin{aligned} F_s\{e^{-x}\} &= \sqrt{\frac{2}{\pi}} \int_0^{\infty} e^{-x} \sin sx dx = \sqrt{\frac{2}{\pi}} \left[ \frac{e^{-x}}{(-1)^2 + s^2} (-\sin sx - s \cos sx) \right]_0^{\infty} \\ &= \sqrt{\frac{2}{\pi}} \frac{1}{1+s^2} (0+s) = \sqrt{\frac{2}{\pi}} \left( \frac{s}{1+s^2} \right) = F(s) \quad \dots (1) \end{aligned}$$

Now, the inverse sine transform of  $F(s)$ , is  $e^{-x}$ . Using inverse formula for the Sine Transform, we get

$$e^{-x} = \sqrt{\frac{2}{\pi}} \int_0^{\infty} F(s) \sin sx ds = \sqrt{\frac{2}{\pi}} \int_0^{\infty} \sqrt{\frac{2}{\pi}} \left( \frac{s}{1+s^2} \right) \sin sx ds \quad [\text{Using (1)}]$$

Replacing  $x$  by  $m$ , we get

$$e^{-m} = \frac{2}{\pi} \int_0^{\infty} \frac{s}{1+s^2} \sin ms ds$$

Replacing  $s$  by  $x$ , we get

$$e^{-m} = \frac{2}{\pi} \int_0^{\infty} \frac{x \sin mx}{1+x^2} dx \quad \left[ \int_a^b F(s) ds = \int_a^b f(x) dx \right]$$

$$\text{Hence, we get } \int_0^{\infty} \frac{x \sin mx}{1+x^2} dx = \frac{\pi}{2} e^{-m}. \quad \text{Ans.}$$

**Example 25.** Find the function whose Sine Transform is  $\frac{e^{-as}}{s}$ .

**Solution.** Here,  $F_s[f(x)] = \frac{e^{-as}}{s}$

The inverse Fourier Sine Transform of  $F_s[f(x)]$  or  $F_s(s)$ :

$$f(x) = \sqrt{\frac{2}{\pi}} \int_0^\infty F(s) \cdot \sin sx \, ds \quad \dots (1)$$

Putting the value of  $F(s)$  in (1), we get  $f(x) = \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{e^{-as}}{s} \sin sx \, dx$

Differentiating w.r.t 'x' we get

$$\begin{aligned} \frac{df}{dx} &= \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{e^{-as}}{s} \frac{d}{dx} (\sin sx) \, ds = \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{e^{-as}}{s} (s \cos sx) \, ds \\ &= \sqrt{\frac{2}{\pi}} \int_0^\infty e^{-as} \cos sx \, ds = \sqrt{\frac{2}{\pi}} \left[ \frac{e^{-as}}{a^2 + x^2} (-a \cos sx + x \sin sx) \right]_0^\infty \\ &= \sqrt{\frac{2}{\pi}} \left[ 0 - \frac{1}{a^2 + x^2} (-a) \right] = \sqrt{\frac{2}{\pi}} \frac{a}{a^2 + x^2} \end{aligned} \quad \dots (2)$$

Integrating both sides, of (2) w.r.t. 'x', we get

$$f(x) = \left( \sqrt{\frac{2}{\pi}} a \right) \frac{1}{a} \tan^{-1} \frac{x}{a} + C = \sqrt{\frac{2}{\pi}} \cdot \tan^{-1} \frac{x}{a} + C \quad \dots (3)$$

On putting  $x = 0$  and  $f(0) = 0$  in (2), we get

$$f(0) = 0 + C \Rightarrow 0 = 0 + C \Rightarrow C = 0$$

On putting the value of  $C$  in (3), we get

$$\begin{aligned} f(x) &= \sqrt{\frac{2}{\pi}} \tan^{-1} \frac{x}{a} \\ F_s^{-1} \left( \frac{e^{-as}}{s} \right) &= \sqrt{\frac{2}{\pi}} \tan^{-1} \frac{x}{a} \end{aligned} \quad \dots (3)$$

On substituting  $a = 0$  in (3), we have

$$F^{-1} \left( \frac{1}{s} \right) = \sqrt{\frac{2}{\pi}} \cdot \frac{\pi}{2} = \sqrt{\frac{\pi}{2}} \quad \text{Ans.}$$

**Example 26.** Find the Fourier Cosine transform of

$$f(x) = \begin{cases} x & \text{for } 0 < x < \frac{1}{2} \\ 1-x & \text{for } \frac{1}{2} < x < 1 \\ 0 & \text{for } x > 1. \end{cases}$$

Write the inverse transform.

**Soluton.** The Fourier Cosine Transform of  $f(x)$ :

$$F_c [f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cdot \cos sx \, dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$\begin{aligned} &= \sqrt{\frac{2}{\pi}} \int_0^{1/2} x \cos sx \, dx + \sqrt{\frac{2}{\pi}} \int_{1/2}^1 (1-x) \cos sx \, dx \\ &= \sqrt{\frac{2}{\pi}} \left[ x \frac{\sin sx}{s} - \left( \frac{-\cos sx}{s^2} \right) \right]_0^{1/2} + \sqrt{\frac{2}{\pi}} \left[ (1-x) \frac{\sin sx}{s} - (-1) \frac{(-\cos sx)}{s^2} \right]_{1/2}^1 \end{aligned}$$

$$\begin{aligned}
&= \sqrt{\frac{2}{\pi}} \left[ \frac{1}{2} \frac{\sin \frac{s}{2}}{s} + \frac{\cos \frac{s}{2}}{s^2} - \frac{1}{s^2} \right] + \sqrt{\frac{2}{\pi}} \left[ -\frac{\cos s}{s^2} - \frac{1}{2} \frac{\sin \frac{s}{2}}{s} + \frac{\cos \frac{s}{2}}{s^2} \right] \\
&= \sqrt{\frac{2}{\pi}} \left[ -\frac{\cos s}{s^2} + \frac{2 \cos \frac{s}{2}}{s^2} - \frac{1}{s^2} \right]
\end{aligned}$$

Ans.

**Example 27.** Solve the integral equation

$$\int_0^\infty f(x) \cos sx \, dx = \begin{cases} 1-s, & 0 \leq s \leq 1 \\ 0, & s > 1 \end{cases}$$

$$\text{Hence prove that } \int_0^\infty \frac{\sin^2 t}{t^2} dt = \frac{\pi}{2}. \quad (\text{U.P. III Semester (SUM) 2004})$$

$$\text{Solution. } F_c(s) = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx \, dx \text{ and } F_c(s) = \begin{cases} 1-s, & 0 \leq s \leq 1 \\ 0, & s > 1 \end{cases}$$

∴ By inversion formula for Fourier cosine transform, we have

$$f_c(x) = \sqrt{\frac{2}{\pi}} \int_{-\infty}^\infty F_c(s) \cos sx \, ds \quad \dots(1)$$

Putting the value of  $F_c(s)$  in (1), we get

$$\begin{aligned}
f(x) &= \sqrt{\frac{2}{\pi}} \left[ \int_0^1 (1-s) \cos sx \, ds + \int_1^\infty 0 \cdot \cos sx \, ds \right] = \sqrt{\frac{2}{\pi}} \int_0^1 (1-s) \cos sx \, ds \\
&= \sqrt{\frac{2}{\pi}} \left[ (1-s) \cdot \frac{\sin sx}{x} - (-1) \cdot \frac{-\cos sx}{x^2} \right]_0^1 = \sqrt{\frac{2}{\pi}} \left[ 0 - \frac{\cos x}{x^2} + \frac{1}{x^2} \right] = \sqrt{\frac{2}{\pi}} \left[ \frac{1-\cos x}{x^2} \right] \dots(2)
\end{aligned}$$

$$\text{Deduction. Since } \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx \, dx = \begin{cases} 1-s, & 0 \leq s \leq 1 \\ 0, & s > 1 \end{cases} \text{ where } f(x) = \sqrt{\frac{2}{\pi}} \left[ \frac{1-\cos x}{x^2} \right]$$

From (1) and (2), we have

$$\sqrt{\frac{2}{\pi}} \int_0^\infty \sqrt{\frac{2}{\pi}} \left( \frac{1-\cos x}{x^2} \right) \cos sx \, dx = \begin{cases} 1-s, & 0 \leq s \leq 1 \\ 0, & s > 1 \end{cases} \quad \dots(3)$$

On putting  $s = 0$  in (3), we have

$$\frac{2}{\pi} \int_0^\infty \frac{1-\cos x}{x^2} dx = 1 \Rightarrow \int_0^\infty \frac{2 \sin^2 \frac{x}{2}}{x^2} dx = \frac{\pi}{2}$$

$$\text{Putting } x = 2t \text{ so that } dx = 2dt, \text{ we get } \int_0^\infty \frac{\sin^2 t}{t^2} dt = \frac{\pi}{2}.$$

Proved.

**Example 28.** Show that

$$(a) F_s[x f(x)] = -\frac{d}{ds} F_c(s) \quad (b) F_c[x f(x)] = \frac{d}{ds} F_s(s)$$

and hence find Fourier Cosine and Sine Transform of  $x e^{-ax}$ .

**Solution.** (a) The Fourier Cosine Transform of  $f(x)$

$$F_c[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx \, dx \quad \dots(1)$$

$$\text{Differentiating (1), w.r.t. 's', we get } \frac{d}{ds} F_c[f(x)] = -\sqrt{\frac{2}{\pi}} \int_0^\infty x f(x) \sin sx \, dx$$

$$\frac{d}{ds} F_c(s) = -F_s[x f(x)] \quad \dots(2)$$

(b) The Fourier Sine Transform of  $f(x)$

$$F_s[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \sin sx dx$$

Differentiating w.r.t 's' we get

$$\begin{aligned} \frac{d}{ds} F_s[f(x)] &= \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \frac{d}{ds} (\sin sx) dx = \sqrt{\frac{2}{\pi}} \int_0^\infty x f(x) \cos sx dx \\ \frac{d}{ds} F_s(s) &= F_c\{x f(x)\} \end{aligned} \quad \dots (3)$$

$$\begin{aligned} (c) F_c\{x f(x)\} &= \frac{d}{ds} F_s[f(x)] \quad [\text{From (3)}] \Rightarrow F_c(xe^{-ax}) = \frac{d}{ds} F_s(e^{-ax}) \\ &= \frac{d}{ds} \left[ \sqrt{\frac{2}{\pi}} \frac{s}{a^2 + s^2} \right] \quad (\text{Using example ???on page ???}) \\ &= \sqrt{\frac{2}{\pi}} \frac{(a^2 + s^2) - s(2s)}{(a^2 + s^2)^2} = \sqrt{\frac{2}{\pi}} \frac{a^2 - s^2}{(a^2 + s^2)^2} \end{aligned}$$

$$\begin{aligned} (d) F_s\{x f(x)\} &= \frac{-d}{ds} F_c\{f(x)\} \quad [\text{From (2)}] \\ F_s(xe^{-ax}) &= -\frac{d}{ds} F_c(e^{-ax}) = -\frac{d}{ds} \left( \sqrt{\frac{2}{\pi}} \frac{a}{a^2 + s^2} \right) \\ &= \sqrt{\frac{2}{\pi}} \frac{2as}{(a^2 + s^2)^2} \end{aligned}$$

**Ans.**

**Example 29.** If  $F_c(s) = \frac{1}{2} \tan^{-1}\left(\frac{2}{s^2}\right)$ , then find  $f(x)$ .

$$\begin{aligned} \text{Solution.} \quad \tan^{-1}\left(\frac{2}{s^2}\right) &= \tan^{-1}\left[\frac{2}{(s^2 - 1) + 1}\right] = \tan^{-1}\left[\frac{(s+1) - (s-1)}{1 + (s+1)(s-1)}\right] \\ &= \tan^{-1}\left(\frac{\frac{1}{s-1} - \frac{1}{s+1}}{1 + \left(\frac{1}{s+1}\right)\left(\frac{1}{s-1}\right)}\right) = \tan^{-1}\left(\frac{1}{s-1}\right) - \tan^{-1}\left(\frac{1}{s+1}\right) \end{aligned}$$

The inversion Fourier Cosine formula is

$$f(x) = \sqrt{\frac{2}{\pi}} \int_0^\infty F(s) \cos sx dx \quad \dots (1)$$

Putting the value of  $F(s)$  in (1), we get

$$\begin{aligned} f(x) &= \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{1}{2} \tan^{-1}\left(\frac{2}{s^2}\right) \cos sx ds = \sqrt{\frac{1}{2\pi}} \int_0^\infty \left\{ \tan^{-1}\left(\frac{1}{s-1}\right) - \tan^{-1}\left(\frac{1}{s+1}\right) \right\} \cos sx ds \\ &= \sqrt{\frac{1}{2\pi}} \left[ \int_0^\infty \tan^{-1}\left(\frac{1}{s-1}\right) \cos sx ds - \int_0^\infty \tan^{-1}\left(\frac{1}{s+1}\right) \cos sx ds \right] \\ &= I_1 - I_2 = I \text{ (say)} \end{aligned} \quad \dots (1)$$

Where

$$I_1 = \sqrt{\frac{1}{2\pi}} \left[ \left\{ \tan^{-1} \left( \frac{1}{s-1} \right) \cdot \frac{\sin sx}{x} \right\}_0^\infty - \int_0^\infty \frac{-1}{(s-1)^2} \cdot \frac{1}{1 + \frac{1}{(s-1)^2}} \cdot \frac{\sin sx}{x} ds \right]$$

$$I_1 = 0 + \frac{1}{x} \sqrt{\frac{1}{2\pi}} \int_0^\infty \frac{\sin sx}{(s-1)^2 + 1} ds$$

Similarly,

$$I_2 = \frac{1}{x} \sqrt{\frac{1}{2\pi}} \int_0^\infty \frac{\sin sx}{(s+1)^2 + 1} ds$$

On putting the value of  $I_1$  and  $I_2$  in (1), we get

$$\begin{aligned} I &= \frac{1}{x} \sqrt{\frac{1}{2\pi}} \int_0^\infty \left\{ \frac{\sin sx}{(s-1)^2 + 1} - \frac{\sin sx}{(s+1)^2 + 1} \right\} ds \\ &= \frac{1}{x} \sqrt{\frac{1}{2\pi}} \pi \left[ -\pi e^{-x} \sin x - e^{-x} \sin(-x) \right] [\text{See formula 3 on page 5}] \\ \Rightarrow f(x) &= \frac{1}{x} \sqrt{\frac{1}{2\pi}} \pi \left[ e^{-x} \sin x + e^{-x} \sin x \right] = \frac{\pi}{x} \sqrt{\frac{2}{\pi}} e^{-x} \sin x \\ &= \sqrt{\frac{\pi}{2}} \left[ \frac{e^{-x} \sin x}{x} \right] \end{aligned}$$

**Ans.**

**Example 30.** By finding the Fourier Transform of  $f(x) = e^{-a^2 x^2}$ ,  $a > 0$ , show that the transform

of  $e^{-\frac{x^2}{2}}$  is  $e^{-\frac{s^2}{2}}$ .

**Solution.** The Fourier Transform of  $f(x)$  is

$$F_c[f(x)] = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx dx \quad \dots (1)$$

Putting the value of  $f(x)$  in (1), we get

$$\begin{aligned} F\{e^{-a^2 x^2}\} &= \sqrt{\frac{2}{\pi}} \int_{-\infty}^\infty e^{-a^2 x^2} e^{isx} dx = \sqrt{\frac{2}{\pi}} \int_{-\infty}^\infty e^{-a^2 x^2 + isx + \frac{s^2}{4a^2}} e^{-\frac{s^2}{4a^2}} dx \\ &= \sqrt{\frac{2}{\pi}} \int_{-\infty}^\infty e^{-\left[(ax)^2 - \left(\frac{is}{2a}\right)^2 + 2(ax)\left(\frac{is}{2a}\right)\right]} e^{-\frac{s^2}{4a^2}} dx = \sqrt{\frac{2}{\pi}} \int_{-\infty}^\infty e^{-\left(ax - \frac{is}{2a}\right)^2} e^{-\frac{s^2}{4a^2}} dx \\ &= e^{-\frac{s^2}{4a^2}} \cdot \sqrt{\frac{2}{\pi}} \int_{-\infty}^\infty e^{-t^2} \frac{dt}{a} \\ &= e^{-\frac{s^2}{4a^2}} \cdot \frac{1}{a} \sqrt{\frac{2}{\pi}} \times \frac{\sqrt{\pi}}{2} \\ &= \frac{1}{\sqrt{2a}} e^{-\frac{s^2}{4a^2}} \end{aligned}$$

Putting  $ax - \frac{is}{2a} = t$  and  $a > 0$   
 so that  $adx = dt \Rightarrow dx = \frac{dt}{a}$   
 since  $\int_{-\infty}^\infty e^{-t^2} dt = \frac{\sqrt{\pi}}{2}$

Putting  $a = \frac{1}{\sqrt{2}}$ , we get

$$F\left\{e^{-\frac{x^2}{2}}\right\} = e^{-\frac{s^2}{2}}$$

Thus,  $e^{-\frac{x^2}{2}}$  is self-reciprocal.

**Proved.**

**EXERCISE 41.2**

1. Find the Fourier Transform of  $f(x)$  if

$$f(x) = \begin{cases} x, & |x| \leq a \\ 0, & |x| > a \end{cases}$$

**Ans.**  $\frac{1}{\sqrt{2\pi}} \frac{2i}{s^2} (as \cos as - \sin as)$

2. Show that the Fourier Transform of

$$f(x) = \begin{cases} a - |x| & \text{for } |x| < a \\ 0 & \text{for } |x| > a > 0 \end{cases}$$

is  $\sqrt{\frac{2}{\pi}} \left( \frac{1 - \cos as}{s^2} \right)$ .

Hence show that  $\int_0^\infty \left( \frac{\sin t}{t} \right)^2 dt = \frac{\pi}{2}$

3. Show that the Fourier Transform of

$$f(x) = \begin{cases} \frac{\sqrt{2\pi}}{2a} & \text{for } |x| \leq a \\ 0 & \text{for } |x| > a \\ \frac{\sin sa}{sa} & \text{is} \end{cases}$$

4. Find Fourier Transform of  $e^{-a|x|}$  if  $a > 0$  and  $x > 0$

**Ans.**  $\frac{2a}{a^2 + s^2}$

5. Find Fourier Transform of  $\frac{1}{\sqrt{|x|}}$ .

6. Find the Fourier Transform of  $f(x) = \begin{cases} e^{ikx}, & a < x < b \\ 0, & x < a \text{ and } x > b \end{cases}$

**Ans.**  $\frac{i}{\sqrt{2\pi(k+s)}} [e^{i(k+s)a} - e^{i(k+s)b}]$

7. Show that the Fourier Transform of

$$f(x) = \begin{cases} 0 & \text{for } x < \alpha \\ 1 & \text{for } \alpha < x < \beta \\ 0 & \text{for } x > \beta \end{cases}$$

is  $\frac{1}{\sqrt{2\pi}} \frac{2i}{s^2} (as \cos as - \sin as)$

8. If  $F(s)$  is the Fourier Transform of  $f(x)$ , prove that

$$f[e^{jax} f(x)] = F(s+a)$$

9. Find Fourier transform of

$$F(x) = \begin{cases} x^2, & |x| < a \\ 0, & |x| > a \end{cases}$$

**Ans.**  $\left( \frac{2a^2}{s} - \frac{4}{s^3} \right) \sin as + \frac{4a}{s^2} \cos as$

10. Show that the Fourier Sine Transform of  $f(x) = \begin{cases} x & \text{for } 0 < x < 1 \\ 2-x & \text{for } 1 < x < 2 \\ 0 & \text{for } x > 2 \end{cases}$  is  $\frac{2 \sin s(1 - \cos s)}{s^2}$ .

11. Show that the Fourier Sine Transform of  $\frac{x}{1+x^2}$  is  $\sqrt{\frac{\pi}{2}} as e^{-as}$ .

12. Find Fourier Sine Transform of

$$f(x) = \frac{1}{x(x^2 + a^2)} \quad (\text{U.P.T.U. 2001})$$

**Ans.**  $\frac{\pi}{2a^2} (1 - e^{-as})$

13. Find Fourier Sine Transform of  $xe^{-x^2/2}$ .

$$\text{Ans. } \frac{1}{2} se^{-\frac{s^2}{2}}$$

14. Find Fourier Sine Transform of  $\frac{e^{-ax}-e^{-bx}}{x}$ .

$$\text{Ans. } \tan^{-1}\frac{s}{a} - \tan^{-1}\frac{s}{b}$$

15. Find Fourier Sine transform of  $\frac{\cosh ax}{\sinh \pi x}$ .

$$\text{Ans. } \frac{\sinh s}{2(\cos a + \cosh s)}$$

16. Find the Fourier Cosine Transform of  $\frac{e^{ax}+e^{-ax}}{e^{\pi x}-e^{-\pi x}}$ .

$$\text{Ans. } \cos \frac{a}{2} \left( \frac{\frac{s}{2} + e^{-\frac{s}{2}}}{2 \cos sa + e^s + e^{-s}} \right) \quad a, b > 0.$$

17. Find the Fourier Sine and Cosine Transform of  $ae^{-\alpha x} + be^{-\beta x}$ ,

$$\text{Ans. } \frac{as}{s^2 + \alpha^2} + \frac{bs}{s^2 + \beta^2}, \quad \frac{a\alpha}{s^2 + \alpha^2} + \frac{b\beta}{s^2 + \beta^2}$$

18. If  $F(s)$  is the Fourier Transform of  $f(x)$ , prove that  $F[x^n f(x)] = (-i)^n \frac{d^n}{ds^n} \{F(s)\}$

[Hint: See Art. 1.8 Properties of Fourier Transform on page 35]

19. Find the function  $f(x)$  if its Cosine Transform is

$$F_c(s) = \begin{cases} \frac{1}{2\pi} \left( a - \frac{s}{2} \right), & s < 2a \\ 0, & s \geq 2a \end{cases}$$

$$\text{Ans. } \frac{2\sin^2 ax}{\pi^2 x^2}$$

20. Find  $f(x)$  if its Fourier Sine Transform is  $\frac{s}{1+s^2}$

$$\text{Ans. } e^{-x}$$

21. Find  $f(x)$  if its Fourier Sine Transform is  $e^{-\pi s}$

$$\text{Ans. } \frac{2}{\pi} \left( \frac{s}{1+s^2} \right)$$

22. Find  $f(x)$  if its Fourier Sine Transform is  $\frac{\pi}{2}$ .

$$\text{Ans. } \frac{1}{x}$$

23. Find  $f(x)$  if its Fourier Sine Transform is  $\frac{1}{(2\pi s)^2}$ .

$$\text{Ans. } \frac{1}{x\sqrt{x}}$$

24. Find  $f(x)$  if its Fourier Sine Transform is  $\begin{cases} \sin s, & 0 < s < \pi \\ 0, & s \geq \pi \end{cases}$

$$\text{Ans. } \frac{2}{\pi} \cdot \frac{\sin \pi x}{(1-x^2)}$$

25. Find  $f(x)$  whose Fourier Sine Transform is  $se^{-as}$ .

$$\text{Ans. } \frac{2}{\pi} \frac{\sin 2\theta}{a^2 + x^2}, \text{ where } \tan \theta = \frac{x}{a}$$

#### 41.8 PROPERTIES OF FOURIER TRANSFORMS

(1) **LINEAR PROPERTY.** If  $F_1(s)$  and  $F_2(s)$  are Fourier transforms of  $f_1(x)$  and  $f_2(x)$  respectively, then

$$F[af_1(x) + bf_2(x)] = aF_1(s) + bF_2(s)$$

where  $a$  and  $b$  are constants.

$$\text{We know that } F_1(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} \cdot f_1(x) dx$$

and

$$F_2(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f_2(x) dx$$

$$F[af_1(x) + bf_2(x)] = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} [af_1(x) + bf_2(x)] dx$$

$$= a \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f_1(x) dx + b \int_{-\infty}^{\infty} e^{isx} f_2(x) dx = a F_1(s) + b F_2(s) \quad \text{Proved.}$$

## (2) CHANGE OF SCALE PROPERTY

If  $F(s)$  is the complex Fourier transform of  $f(x)$ , then  $F\{f(ax)\} = \frac{1}{a} F\left(\frac{s}{a}\right)$

**Proof.** We know that  $F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) dx$

$$F\{f(ax)\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(ax) dx \quad \left[ \text{Put } ax = t \Rightarrow dx = \frac{dt}{a} \right]$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{is\frac{t}{a}} f(t) \frac{dt}{a} = \frac{1}{a} \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{i\left(\frac{s}{a}\right)t} f(t) dt = \frac{1}{a} F\left(\frac{s}{a}\right) \quad \text{Proved.}$$

## (3) SHIFTING PROPERTY

If  $F(s)$  is the complex Fourier transform of  $f(x)$ , then

$$F\{f(x-a)\} = e^{isa} F(s)$$

**Proof.**

$$F(s) = \int_{-\infty}^{\infty} e^{isx} f(x) dx$$

$$F\{f(x-a)\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x-a) dx \quad [\text{Put } x-a=t, \text{ so that } dx=dt]$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{is(t+a)} f(t) dt = \frac{e^{isa}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{ist} f(t) dt = e^{isa} F(s) \quad \text{Proved.}$$

$$(4) F\{e^{iax} f(x)\} = F(s+a)$$

$$\begin{aligned} \text{Proof.} \quad F\{e^{iax} f(x)\} &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{iax} f(x) e^{isx} dx = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{i(s+a)x} f(x) dx \\ &= F(s+a) \end{aligned} \quad \text{Proved.}$$

## (5) MODULATION THEOREM

[U.P. III semester Dec. 2005]

If  $F(s)$  is the complex Fourier transform of  $f(x)$ , then

$$F\{f(x) \cos ax\} = \frac{1}{2} [F(s+a) + F(s-a)]$$

Proof. We know that  $F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) dx$

$$\begin{aligned} F\{f(x) \cos ax\} &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) \cos ax dx = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) \frac{e^{iax} + e^{-iax}}{2} dx \\ &= \frac{1}{2} \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) e^{iax} dx + \frac{1}{2} \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) e^{-iax} dx \\ &= \frac{1}{2} \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{i(s+a)x} f(x) dx + \frac{1}{2} \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{i(s-a)x} f(x) dx \\ &= \frac{1}{2} F(s+a) + \frac{1}{2} F(s-a) = \frac{1}{2} [F(s+a) + F(s-a)] \end{aligned} \quad \text{Proved.}$$

$$(6) \text{ If } F\{f(x)\} = F(s), \text{ then } F\{x^n f(x)\} = (-i)^n \frac{d^n}{ds^n} F(s).$$

**Proof.** We know that  $F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) dx$  ... (1)

Differentiating (1) w.r.t.  $s$  both sides,  $n$  times, we get

$$\frac{d^n F(s)}{ds^n} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} (ix)^n e^{isx} f(x) dx = (i)^n \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} x^n e^{isx} \cdot f(x) \cdot dx = (i)^n F(x^n f(x))$$

$$F(x^n f(x)) = (-i)^n \frac{d^n \{F(s)\}}{ds^n}$$

(7)  $F\{f'(x)\} = is F(s)$  if  $f(x) \rightarrow 0$  as  $x \rightarrow \pm \infty$

$$\begin{aligned} \text{Proof. } F\{f'(x)\} &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f'(x) dx = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} d\{f(x)\} dx \\ &= \frac{1}{\sqrt{2\pi}} \left[ \left\{ e^{isx} f(x) \right\}_{-\infty}^{\infty} - is \int_{-\infty}^{\infty} e^{isx} f(x) dx \right] = \frac{1}{\sqrt{2\pi}} \left[ 0 - is \int_{-\infty}^{\infty} e^{isx} f(x) dx \right] \\ &= -is F(s). \end{aligned}$$

**Proved.**

$$(8) \quad F\left\{ \int_a^x f(x) dx \right\} = \frac{F(s)}{(-is)}$$

**Proof.** Let  $f_1(x) = \int_a^x f(x) dx \Rightarrow f_1'(x) = f(x)$

$$F\{f'(x)\} = (-is) F_1(s) = (-is) F\{f_1(x)\} = -is F\left\{ \int_a^x f(x) dx \right\}$$

$$F\left\{ \int_a^x f(x) dx \right\} = \frac{1}{(-is)} F\{f_1'(x)\} = \frac{1}{(-is)} F\{f(x)\} = \frac{F(s)}{(-is)}$$

**Proved.**

**Note.**  $F_s(s)$  and  $F_c(s)$  are Fourier Sine and Cosine transforms of  $f(x)$  respectively.

**Properties.**

$$1. \quad F_s\{af(x) + bg(x)\} = aF_s\{f(x)\} + bF_s\{g(x)\}$$

$$2. \quad F_c\{af(x) + bg(x)\} = aF_c\{f(x)\} + bF_c\{g(x)\}$$

$$3. \quad F_s\{f(ax)\} = \frac{1}{a} F_s\left(\frac{s}{a}\right) \quad 4. \quad F_c\{f(ax)\} = \frac{1}{a} F_c\left(\frac{s}{a}\right)$$

$$5. \quad F_s[f(x) \sin ax] = \frac{1}{2} [F_c(s-a) - F_c(s+a)]$$

$$6. \quad F_c[f(x) \sin ax] = \frac{1}{2} [F_s(s+a) - F_s(s-a)]$$

$$7. \quad F_s\{f(x) \cos ax\} = \frac{1}{2} [F_s(s+a) + F_s(s-a)]$$

**Proof of (5) :**  $F_s\{f(x) \sin ax\} = \int_0^{\infty} f(x) \sin ax \cdot \sin sx dx$

$$= \frac{1}{2} \int_0^{\infty} f(x) \{\cos(s-a)x - \cos(s+a)x\} dx$$

$$= \frac{1}{2} \left[ \int_0^{\infty} f(x) \cos(s-a)x dx - \int_0^{\infty} f(x) \cos(s+a)x dx \right]$$

$$= \frac{1}{2} [F_c(s-a) - F_c(s+a)]$$

**Proved**

### 41.9 CONVOLUTION

The Convolution of two functions  $f(x)$  and  $g(x)$  is defined as

$$f(x) * g(x) = \int_{-\infty}^{\infty} f(u) g(x-u) du$$

#### Convolution Theorem on Fourier Transform

(U.P., III Semester, Dec. 2006)

The Fourier transform of the convolution of  $f(x)$  and  $g(x)$  is the product of their Fourier transforms, i.e.,

$$F[f(x) * g(x)] = F[f(x)] \cdot F[g(x)]$$

**Proof.** We know that  $f(x) * g(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(u) \cdot g(x-u) du$  ... (1)

Taking Fourier transform of both sides of (1), we have

$$\begin{aligned} F[f(x) * g(x)] &= F\left[\int_{-\infty}^{\infty} f(u) \cdot g(x-u) du\right] \\ &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \left[ \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(u) \cdot g(x-u) du \right] e^{isx} dx \\ &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(u) du \cdot \frac{1}{\sqrt{2\pi}} \left\{ \int_{-\infty}^{\infty} g(x-u) e^{isx} dx \right\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(u) du \cdot F\{g(x-u)\} \\ &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(u) du \cdot e^{ius} G(s) \quad (\text{Using shifting property}) \\ &= G(s) \cdot \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(u) e^{ius} du = G(s) \cdot F(s) = F(s) \cdot G(s) \end{aligned}$$

**Proved.**

By inversion

$$F^{-1}\{F(s) \cdot G(s)\} = f * g = F^{-1}\{F(s)\} * F^{-1}\{G(s)\}$$

**Question:** Verify the above statement to find the Fourier Inverse Transform of  $e^{-as} \sin bs$ .  
(U.P., III Semester, Dec. 2006)

### 41.10 PARSEVAL'S IDENTITY FOR FOURIER TRANSFORMS

(U.P. III Semester Dec. 2005)

If the Fourier transform of  $f(x)$  and  $g(x)$  be  $F(s)$  and  $G(s)$  respectively, then

$$(i) \int_{-\infty}^{\infty} F(x) \bar{G}(s) ds = \int_{-\infty}^{\infty} f(x) \bar{g}(x) dx$$

where  $\bar{G}(s)$  is the complex conjugate of  $G(s)$  and  $\bar{g}(x)$  is the complex conjugate of  $g(x)$

$$(ii) \int_{-\infty}^{\infty} |F(s)|^2 ds = \int_{-\infty}^{\infty} |f(x)|^2 dx$$

**Proof.** (i)  $\int_{-\infty}^{\infty} [f(x) \bar{g}(x)] dx = \int_{-\infty}^{\infty} f(x) \left[ \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \bar{G}(s) e^{isx} ds \right] dx$

Since  $\bar{g}(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \bar{G}(s) e^{isx} ds$

$$\int_{-\infty}^{\infty} f(x) \bar{g}(x) dx = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \bar{G}(s) ds \cdot \int_{-\infty}^{\infty} f(x) e^{isx} dx$$

[since  $\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{isx} dx = F(s)$ ] Fourier Transform

$$= \int_{-\infty}^{\infty} \bar{G}(s) F(s) ds \quad \dots (1)$$

Putting  $g(x) = f(x)$  in (1), we get

$$\begin{aligned} & \int_{-\infty}^{\infty} F(s) \cdot \bar{F}(s) = \int_{-\infty}^{\infty} f(x) \cdot \bar{f}(x) dx \\ \Rightarrow & \int_{-\infty}^{\infty} [F(s)]^2 ds = \int_{-\infty}^{\infty} [f(x)]^2 dx \end{aligned} \quad \text{Proved.}$$

#### 41.11 PARSEVAL'S IDENTITY FOR COSINE TRANSFORM

$$(i) \frac{2}{\pi} \int_0^{\infty} F_c(s) \cdot G_c(s) ds = \int_0^{\infty} f(x) \cdot g(x) dx \quad (ii) \frac{2}{\pi} \int_0^{\infty} |F_c(s)|^2 ds = \int_0^{\infty} |f(x)|^2 dx$$

#### 41.12 PARSEVAL'S IDENTITY FOR SINE TRANSFORM

$$(i) \frac{2}{\pi} \int_0^{\infty} F_s(s) \cdot G_s(s) ds = \int_0^{\infty} f(x) \cdot g(x) dx \quad (ii) \frac{2}{\pi} \int_0^{\infty} |F_s(s)|^2 ds = \int_0^{\infty} |f(x)|^2 dx$$

**Example 31.** Using Parseval's identity, show that

$$\int_0^{\infty} \frac{x^2 dx}{(x^2 + 1)^2} = \frac{\pi}{4}$$

**Solution.** Let  $f(x) = \frac{x}{x^2 + 1}$  so that  $F_s(s) = \frac{\pi}{2} e^{(-s)}$

By Parseval's identity for sine transformation

$$\begin{aligned} & \frac{2}{\pi} \int_0^{\infty} |F_s(s)|^2 ds = \int_0^{\infty} |f(x)|^2 dx \\ & \int_0^{\infty} \left| \frac{x}{x^2 + 1} \right|^2 dx = \frac{2}{\pi} \int_0^{\infty} \left| \frac{\pi}{2} e^{-s} \right|^2 ds \\ & = \left( \frac{2}{\pi} \right) \left( \frac{\pi^2}{4} \right) \int_0^{\infty} e^{-2s} ds = \frac{\pi}{2} \left[ \frac{e^{-2s}}{-2} \right]_0^{\infty} = \frac{\pi}{2} \left[ 0 + \frac{1}{2} \right] = \frac{\pi}{4} \end{aligned} \quad \text{Proved.}$$

**Example 32.** Using Parseval's identity, prove that

$$\int_0^{\infty} \frac{dt}{(a^2 + t^2)(b^2 + t^2)} = \frac{\pi}{2ab(a+b)}$$

**Solution.** Let  $f(x) = e^{-ax}$ ,  $g(x) = e^{-bx}$

$$\text{Then } F_c(s) = \frac{a}{a^2 + s^2}, \quad G_c(s) = \frac{b}{b^2 + s^2}$$

By Parseval's identity for Fourier cosine transformation

$$\frac{2}{\pi} \int_0^{\infty} F_c(s) G_c(s) ds = \int_0^{\infty} f(x) \cdot g(x) dx \quad \dots (1)$$

On substituting the values of  $F_c(s)$ ,  $G_c(s)$ ,  $f(x)$  and  $g(x)$  in (1), we get

$$\begin{aligned} & \frac{2}{\pi} \int_0^{\infty} \left( \frac{a}{a^2 + s^2} \right) \left( \frac{b}{b^2 + s^2} \right) ds = \int_0^{\infty} e^{-ax} \cdot e^{-bx} dx \\ \Rightarrow & \frac{2}{\pi} \int_0^{\infty} \frac{ab}{(a^2 + s^2)(b^2 + s^2)} ds = \int_0^{\infty} e^{-(a+b)x} dx = \left[ \frac{e^{-(a+b)x}}{-(a+b)} \right]_0^{\infty} = \left[ 0 + \frac{1}{a+b} \right] \\ \Rightarrow & \int_0^{\infty} \frac{ds}{(a^2 + s^2)(b^2 + s^2)} = \frac{\pi}{2ab} \frac{1}{a+b} \\ & \int_0^{\infty} \frac{dt}{(a^2 + t^2)(b^2 + t^2)} = \frac{\pi}{2ab(a+b)} \end{aligned} \quad \text{Proved}$$

**Example 33.** Using Parseval's identity, prove  $\int_0^\infty \left(\frac{\sin t}{t}\right)^2 dt = \frac{\pi}{2}$ .

**Solution.** By example 24, we know that

$$\text{if } f(x) = \begin{cases} 1 & \text{for } |x| < a \\ 0 & \text{for } |x| > a > 0 \end{cases}$$

$$\text{then } F(s) = \sqrt{\frac{2}{\pi}} \frac{\sin as}{s}$$

Using Parseval's identity

$$\begin{aligned} \int_{-\infty}^{\infty} |f(t)|^2 dt &= \int_{-\infty}^{\infty} |F(s)|^2 ds \\ \therefore \int_{-a}^a (1)^2 dt &= \int_{-\infty}^{\infty} \frac{2}{\pi} \left( \frac{\sin as}{s} \right)^2 ds \\ 2a &= \frac{2}{\pi} \int_{-\infty}^{\infty} \left( \frac{\sin as}{s} \right)^2 ds \\ \text{Putting } as = t, \text{ we get } 2a &= \frac{2}{\pi} \int_{-\infty}^{\infty} \left( \frac{\sin t}{t} \right)^2 \frac{dt}{a} \quad \left( \because ads = dt \Rightarrow ds = \frac{dt}{a} \right) \\ a\pi &= a \int_{-\infty}^{\infty} \left( \frac{\sin t}{t} \right)^2 dt \quad \Rightarrow \quad \pi = \int_{-\infty}^{\infty} \left( \frac{\sin t}{t} \right)^2 dt \\ \Rightarrow \int_0^{\infty} \left( \frac{\sin t}{t} \right)^2 dt &= \frac{\pi}{2} \end{aligned}$$

**Proved.**

**Example 34.** Find the Fourier transform of

$$f(x) = \begin{cases} 1 - |x| & \text{if } |x| < 1 \\ 0 & \text{if } |x| > 1 \end{cases}$$

and hence find the value of  $\int_0^\infty \frac{\sin t}{t} dt$ .

$$\begin{aligned} \text{Solution. } F\{f(x)\} &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} (1-|x|) e^{isx} dx \\ &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} (1-|x|) (\cos sx + i \sin sx) dx \\ &= \frac{1}{\sqrt{2\pi}} \int_{-1}^1 (1-|x|) \cos sx dx + \frac{i}{\sqrt{2\pi}} \int_{-1}^1 (1-|x|) \sin sx dx \\ &\quad (\text{Even function}) \quad (\text{odd function}) \\ &= \frac{2}{\sqrt{2\pi}} \int_0^1 (1-x) \cos sx dx + 0 = \sqrt{\frac{2}{\pi}} \left[ \left\{ (1-x) \frac{\sin sx}{s} \right\}_0^1 + \int_0^1 \frac{\sin sx}{s} dx \right] \\ &= \sqrt{\frac{2}{\pi}} \left[ 0 + \left\{ \frac{-\cos sx}{s^2} \right\}_0^1 \right] = \sqrt{\frac{2}{\pi}} \left( \frac{1-\cos s}{s^2} \right) \end{aligned}$$

Using Parseval's identity, we get  $\int_{-\infty}^{\infty} |F(s)|^2 ds = \int_{-\infty}^{\infty} |f(t)|^2 dt$

$$\frac{2}{\pi} \int_{-\infty}^{\infty} \frac{(1-\cos s)^2}{s^4} ds = \int_{-1}^{+1} (1-|x|)^2 dx$$

$$\frac{4}{\pi} \int_0^\infty \frac{\left(1 - 1 + 2 \sin^2 \frac{s}{2}\right)^2}{s^4} ds = \int_{-1}^1 (1 + x^2 - 2x) dx$$

(L.H.S. is even function,  $2x$  on R.H.S. is odd function)

$$\frac{16}{\pi} \int_0^\infty \frac{\sin^4 \frac{s}{2}}{s^4} ds = 2 \int_0^1 (1 + x^2) dx = 2 \left( x + \frac{x^3}{3} \right)_0^1 = \frac{8}{3}$$

Putting  $\frac{s}{2} = x$ , we get

$$\frac{16}{\pi} \int_0^\infty \frac{\sin^4 x}{16x^4} 2 dx = \frac{8}{3}, \quad \int_0^\infty \frac{\sin^4 x}{x^4} dx = \frac{4\pi}{3} \quad \text{Ans.}$$

**Example 35.** Solve for  $f(x)$  from the integral equation

$$\int_0^\infty f(x) \cos sx dx = e^{-s}$$

**Solution.**  $\int_0^\infty f(x) \cos sx dx = e^{-s} \quad \dots (1)$

Multiplying (1) by  $\sqrt{\frac{2}{\pi}}$ , we get  $\sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos sx dx = \sqrt{\frac{2}{\pi}} e^{-s}$

$$\begin{aligned} F_c \{f(x)\} &= \sqrt{\frac{2}{\pi}} e^{-s} \\ f(x) &= F_c^{-1} \left[ \sqrt{\frac{2}{\pi}} e^{-s} \right] = \sqrt{\frac{2}{\pi}} \left[ \sqrt{\frac{2}{\pi}} \int_0^\infty e^{-s} \cos sx ds \right] \\ &= \frac{2}{\pi} \int_0^\infty e^{-s} \cos sx ds = \frac{2}{\pi} \left[ \frac{e^{-s}}{1+x^2} \{-\cos sx + x \sin sx\} \right]_0^\infty = \frac{2}{\pi} \frac{1}{1+x^2} \quad \text{Ans.} \end{aligned}$$

**Example 36.** Solve for  $f(x)$  from the integral equation

$$\int_0^\infty f(x) \sin sx dx = \begin{cases} 1 & \text{for } 0 \leq s < 1 \\ 2 & \text{for } 1 \leq s < 2 \\ 0 & \text{for } s \geq 2 \end{cases}$$

**Solution.** Multiplying by  $\sqrt{\frac{2}{\pi}}$  both sides of the given equation, we get

$$\begin{aligned} \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \sin sx dx &= \begin{cases} \sqrt{\frac{2}{\pi}} & \text{for } 0 \leq s < 1 \\ 2\sqrt{\frac{2}{\pi}} & \text{for } 1 \leq s < 2 \\ 0 & \text{for } s \geq 2 \end{cases} \\ F_s [f(x)] &= \begin{cases} \sqrt{\frac{2}{\pi}} & \text{for } 0 \leq s < 1 \\ 2\sqrt{\frac{2}{\pi}} & \text{for } 1 \leq s < 2 \\ 0 & \text{for } s \geq 2 \end{cases} \end{aligned}$$

$$f(x) = F_s^{-1} (\text{R.H.S.}) = \sqrt{\frac{2}{\pi}} \int_0^1 \sqrt{\frac{2}{\pi}} \sin sx ds + \sqrt{\frac{2}{\pi}} \int_1^2 2\sqrt{\frac{2}{\pi}} \sin sx ds$$

$$\begin{aligned}
&= \frac{2}{\pi} \left[ \frac{-\cos sx}{x} \right]_0^1 + \frac{4}{\pi} \left[ \frac{-\cos sx}{x} \right]_1^\infty = \frac{2}{\pi} \left( \frac{1 - \cos x}{x} \right) + \frac{4}{\pi} \left( \frac{\cos x - \cos 2x}{x} \right) \\
&= \frac{2}{\pi x} [1 - \cos x + 2 \cos x - 2 \cos 2x] \\
f(x) &= \frac{2}{\pi x} (1 + \cos x - 2 \cos 2x) \quad \text{Ans.}
\end{aligned}$$

**Example 37.** Prove (i)  $F\{f^n(x)\} = (-is)^n F(s)$

(ii) Hence solve for  $f(x)$  if  $\int_{-\infty}^{\infty} f(t) e^{|x-t|} dt = \phi(x)$  is known.

**Proof.** (i) See property (7) on page 1110  $F\{f'(x)\} = -is F(s)$

Similarly

$$F\{f''(x)\} = (-is)^2 F(s)$$

$$F\{f'''(x)\} = (-is)^3 F(s)$$

Using integration by parts successively and making assumptions that  $f, f', \dots, f^{(n-1)} \rightarrow 0$  as  $f(x) \rightarrow \pm \infty$ .

$$F\{f^n(x)\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} \frac{d^n}{dx^n} f(x) dx = (-is)^n F(s).$$

$$(ii) \quad \frac{1}{\sqrt{2\pi}} \phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(t) e^{|x-t|} dt, \text{ from the given equation } = f(x) * e^{-|x|}$$

By convolution theorem,

$$\begin{aligned}
\frac{1}{\sqrt{2\pi}} \bar{\phi}(s) &= F(s) \cdot \sqrt{\frac{2}{\pi}} \frac{1}{1+s^2} \\
F(s) &= \frac{1}{2} (1+s^2) \bar{\phi}(s) = \frac{1}{2} [\bar{\phi}(s) - (-is)^2 \bar{\phi}(s)] \\
\therefore f(x) &= \frac{1}{2} \phi(x) - \frac{1}{2} \phi''(x) \text{ using the result derived in (i)}
\end{aligned}$$

### EXERCISE 41.3

Using Parseval's identity

$$1. \quad \text{Evaluate } \int_0^\infty \left( \frac{1 - \cos x}{x} \right)^2 dx \quad \text{Ans. } \frac{\pi}{2} \quad 2. \quad \text{Prove that } \int_0^\infty \frac{\sin at}{t(a^2 + t^2)} dt = \frac{\pi}{2} \frac{1 - e^{-a^2}}{a^2}$$

#### 41.13 FOURIER TRANSFORM OF DERIVATIVES

We have already seen that,

$$F\{f^n(x)\} = (-is)^n F(s)$$

$$(i) \quad \therefore F\left(\frac{\partial^2 u}{\partial x^2}\right) = (-is)^2 F(u(x)) = -s^2 \bar{u} \quad \text{where } \bar{u} \text{ is Fourier transform of } u \text{ w.r.t. } x.$$

$$(ii) \quad F_c\{f'(x)\} = -\sqrt{\frac{2}{\pi}} f(o) + s F_s(s)$$

$$\text{L.H.S.} = \sqrt{\frac{2}{\pi}} \int_0^\infty f'(x) \cos sx dx = \sqrt{\frac{2}{\pi}} \int_0^\infty \cos sx d\{f(x)\}$$

$$\begin{aligned}
 &= \sqrt{\frac{2}{\pi}} \left[ \{f(x) \cos sx\}_0^\infty + s \int_0^\infty f(x) \sin sx dx \right] \\
 &= s F_s(s) - \sqrt{\frac{2}{\pi}} f(0) \text{ assuming } f(x) \rightarrow 0 \text{ as } x \rightarrow \infty \\
 (iii) \quad F_s\{f'(x)\} &= \sqrt{\frac{2}{\pi}} \int_0^\infty \sin sx d[f(x)] = \sqrt{\frac{2}{\pi}} \left[ \{f(x) \sin sx\}_0^\infty - s \int_0^\infty f(x) \cos sx dx \right] \\
 &= -s F_c(s) \\
 (iv) \quad F_c\{f''(x)\} &= \sqrt{\frac{2}{\pi}} \int_0^\infty \cos sx d[f'(x)] = \sqrt{\frac{2}{\pi}} \left[ \{f'(x) \cos sx\}_0^\infty + s \int_0^\infty f'(x) \sin sx dx \right] \\
 &= -\sqrt{\frac{2}{\pi}} f'(0) + s F_s\{f'(x)\} = -s^2 F_c(s) - \sqrt{\frac{2}{\pi}} f'(0) \text{ assuming } f(x), f'(x) \rightarrow 0 \text{ as } x \rightarrow \infty \\
 (v) \quad F_s\{f''\}(x) &= \sqrt{\frac{2}{\pi}} \left[ \int_0^\infty \sin sx d[f'(x)] \right] = \sqrt{\frac{2}{\pi}} \left[ (f'(x) \sin sx)_0^\infty - s \int_0^\infty f'(x) \cos sx dx \right] \\
 &= -s F_c\{f'(x)\} = -s \left[ s F_s(s) - \sqrt{\frac{2}{\pi}} f(0) \right] \\
 &= -s^2 F_s(s) + \sqrt{\frac{2}{\pi}} s f(0) \text{ assuming } f(x), f'(x) \rightarrow 0 \text{ as } x \rightarrow \infty.
 \end{aligned}$$

#### 41.14 RELATIONSHIP BETWEEN FOURIER AND LAPLACE TRANSFORMS

Consider

$$f(t) = \begin{cases} e^{-st} g(t) & \text{for } t > 0 \\ 0 & \text{for } t < 0 \end{cases} \quad \dots (1)$$

Then the Fourier transform of  $f(t)$  is given by

$$\begin{aligned}
 F\{f(t)\} &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{ist} f(t) dt = \frac{1}{\sqrt{2\pi}} \int_0^{\infty} e^{ist} f(t) dt \\
 &= \frac{1}{\sqrt{2\pi}} \int_0^{\infty} e^{(is-x)t} g(t) dt = \frac{1}{\sqrt{2\pi}} \int_0^{\infty} e^{-pt} g(t) dt \text{ where } p = x - is = \frac{1}{\sqrt{2\pi}} L\{g(t)\}
 \end{aligned}$$

$\therefore$  Fourier transform of  $f(t) = \frac{1}{\sqrt{2\pi}} \times$  Laplace transform of  $g(t)$  defined by (1).

#### 41.15 SOLUTION OF BOUNDARY VALUE PROBLEMS BY USING INTEGRAL TRANSFORM

**Solution of heat conduction problems by Laplace transform.**

**Example 38.** Use Fourier sine transform to solve the equation

$$\frac{\partial u}{\partial t} = k \frac{\partial^2 u}{\partial x^2}$$

under the conditions

$$(i) \quad u(0, t) = 0 \qquad (ii) \quad u(x, 0) = e^{-x}$$

$$(iii) \quad u(x, t) \text{ is bounded.}$$

(U.P. III Semester, Dec. 2006)

**Solution.** The given equation is

$$\frac{\partial u}{\partial t} = k \frac{\partial^2 u}{\partial x^2} \quad \dots (1)$$

Taking Fourier sine transform of both the sides, we get

$$\begin{aligned}
 \int_0^\infty \frac{\partial u}{\partial t} \sin sx dx &= k \int_0^\infty \frac{\partial^2 u}{\partial x^2} \sin sx dx \\
 \frac{d\bar{u}}{dt} &= k \left[ s(u)_{x=0} - s^2 \bar{u} \right] \\
 \Rightarrow \quad \frac{d\bar{u}}{dt} + ks^2 \bar{u} &= 0 \quad \left[ \text{where } \bar{u} = \int_0^\infty u \sin sx dx \right] \\
 \Rightarrow \quad D\bar{u} + ks^2 \bar{u} &= 0 \\
 \Rightarrow \quad (D + ks^2) \bar{u} &= 0 \\
 \text{A.E. is} \quad m + ks^2 &= 0 \quad \Rightarrow \quad m = -ks^2 \\
 \text{C.F.} &= c_1 e^{-ks^2 t} \\
 \bar{u} &= c_1 e^{-ks^2 t} \quad \dots (2)
 \end{aligned}$$

$$\begin{aligned}
 \text{At } t=0, \quad (\bar{u})_{t=0} &= \int_0^\infty (u)_{t=0} \sin sx dx = \int_0^\infty e^{-x} \sin sx dx \\
 &= \frac{e^{-s}}{1+s^2} [-\sin sx - s \cos sx]_0^\infty \quad \left[ \int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2+b^2} (a \sin bx - b \cos bx) \right] \\
 &= \frac{s}{1+s^2} \quad \dots (3)
 \end{aligned}$$

$$\text{From (2), } (\bar{u})_{t=0} = c_1 \quad \dots (4)$$

From (3) and (4), we have

$$c_1 = \frac{s}{1+s^2}$$

$$\text{From (2), } \bar{u} = \frac{s}{1+s^2} e^{-ks^2 t}$$

Taking inverse Fourier sine transform, we get

$$\begin{aligned}
 u(x, t) &= \sqrt{\frac{2}{\pi}} \int_0^\infty \sqrt{\frac{2}{\pi}} \frac{s}{1+s^2} e^{-ks^2 t} \sin sx ds \\
 \Rightarrow \quad u(x, t) &= \frac{2}{\pi} \int_0^\infty \frac{s}{1+s^2} e^{-ks^2 t} \sin sx ds \quad \text{Ans.}
 \end{aligned}$$

**Example 39.** Solve the equation  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$ ,  $x > 0, t > 0$

subject to the conditions:

$$(i) \quad u = 0, \quad \text{when } x = 0, t > 0 \quad (ii) \quad u = \begin{cases} 1, & 0 \leq x < 1 \\ 0 & x > 1 \end{cases}, \quad \text{when } t = 0$$

(iii)  $u(x, t)$  is bounded.

(U.P., III Semester Dec. 2003)

**Solution.** In view of the initial condition (i), we apply Fourier Sine Transform to both sides of the given equation.

$$\begin{aligned}
 \int_0^\infty \frac{\partial u}{\partial t} \sin sx dx &= \int_0^\infty \frac{\partial^2 u}{\partial x^2} \sin sx dx \\
 \Rightarrow \quad \frac{\partial}{\partial t} \int_0^\infty u \sin sx dx &= -s^2 \bar{u}(s) + su(0) \quad (\text{See Article 41.13 on page 1115})
 \end{aligned}$$

On putting  $u = 0$  and  $x = 0$ , we get

$$\Rightarrow \frac{\partial \bar{u}}{\partial t} + s^2 \bar{u} = 0, \quad \Rightarrow \quad \left( \frac{\partial}{\partial t} + s^2 \right) \bar{u} = 0$$

Its solution i.e. complementary function is  $\bar{u}(s, t) = A e^{-s^2 t}$  ... (1)

Since we have assumed

$$\begin{aligned} \bar{u} &= \bar{u}(s, t) = \int_0^\infty u(x, t) \sin sx dx, \quad \Rightarrow \quad \bar{u}(s, 0) = \int_0^\infty u(x, 0) \sin sx dx \\ \Rightarrow \quad \bar{u}(s, 0) &= \int_0^1 1 \cdot \sin sx dx = \left[ \frac{-\cos sx}{s} \right]_0^1 = \frac{1 - \cos s}{s} \quad [u(x, 0) = 1] \dots (2) \end{aligned}$$

From (1) and (2), we get  $A = \bar{u}(s, 0) = \frac{1 - \cos s}{s}$

On putting the value of A in (1), we get

$$\text{Hence, } \bar{u}(s, t) = \frac{1 - \cos s}{s} e^{-s^2 t}$$

Now applying the Inverse Fourier Sine Transform, we have

$$u(x, t) = \frac{2}{\pi} \int_0^\infty \left( \frac{1 - \cos s}{s} \right) \cdot e^{-s^2 t} ds,$$

which is the required solution.

**Ans.**

#### Solution of wave equation by Laplace transform

**Example 40.** An infinitely long string having one end at  $x = 0$  is initially at rest along  $x$ -axis. The end  $x = 0$  is given a transverse displacement  $f(t)$ , when  $t > 0$ . Find the displacement of any point of the string at any time.

**Solution.** Let  $y(x, t)$  be the displacement, then wave equation is

$$\frac{\partial^2 y}{\partial x^2} = c^2 \frac{\partial^2 y}{\partial t^2} \quad \dots (1)$$

subject to the conditions

$$y(x, 0) = 0 \quad \dots (2) \qquad \frac{\partial y}{\partial t}(x, 0) = 0 \quad \dots (3)$$

$$y(0, t) = f(t) \quad \dots (4) \qquad y(x, t) \text{ is bounded} \quad \dots (5)$$

On taking Laplace transform of (1), we have

$$L\left(\frac{\partial^2 y}{\partial x^2}\right) = c^2 L\frac{\partial^2 y}{\partial t^2}$$

$$s^2 \bar{y} - sy(x, 0) - \frac{\partial y}{\partial t}(x, 0) = c^2 \frac{d^2 \bar{y}}{dx^2} \quad \dots (6)$$

On putting  $y(x, 0) = 0$ ,  $\frac{\partial y}{\partial t}(x, 0) = 0$  in (6) get

$$s^2 \bar{y} = c^2 \frac{d^2 \bar{y}}{dx^2} \quad \text{or} \quad \frac{d^2 \bar{y}}{dx^2} = \left( \frac{s}{c} \right)^2 \bar{y} \quad \dots (7)$$

Laplace transform of (4),  $\bar{y}(0, s) = \bar{f}(s)$  at  $x = 0$  ... (8)

$$\text{On solving (7), we get } \bar{y} = Ae^{\frac{sx}{c}} + Be^{-\frac{sx}{c}} \quad \dots (9)$$

According to condition (5),  $y$  is finite at  $x \rightarrow \infty$ , this gives  $A = 0$ .

Equation (9) becomes

$$\bar{y} = Be^{-\frac{sx}{c}} \quad \dots (10)$$

Putting the value of  $\bar{y}(0, s) = \bar{f}(s)$  at  $x = 0$  in (10), we get  $\bar{f}(s) = B$

$$\text{Thus (10) becomes } y = \bar{f}(s) \cdot e^{-\frac{sx}{c}}$$

To get  $y$  from  $\bar{y}$ , we use complex inversion formula

$$y = \frac{1}{2\pi i} \int_{a-i\infty}^{a+i\infty} e^{\left(t-\frac{x}{c}\right)s} - f(s) ds$$

Hence

$$y = f\left(t - \frac{x}{c}\right) \quad \text{Ans.}$$

### Solution of Transmission Lines equations by Laplace Transformations.

**Example 41.** A semi-infinite transmission line, of negligible inductance and leakage per unit length has its voltage and current equal to zero. A constant voltage  $v_0$  is applied at the sending end ( $x = 0$ ) at  $t = 0$ . Find the voltage and current at any point ( $x > 0$ ) at any instant.

**Solution.** Let  $v$  and  $i$  be the voltage and current at any point  $x$  and at any time  $t$ .

$$\begin{aligned} -\frac{\partial v}{\partial x} &= Ri + L \frac{\partial i}{\partial t} \\ -\frac{\partial i}{\partial x} &= c \frac{\partial v}{\partial t} + GV \end{aligned}$$

On putting  $L = 0, G = 0$  in above equations, we get

$$\frac{\partial v}{\partial x} = -Ri \quad \dots (1)$$

$$\frac{\partial i}{\partial x} = -c \frac{\partial v}{\partial t} \quad \dots (2)$$

Conditions are  $v(x, 0) = 0 \quad \dots (3)$

$i(x, 0) = 0 \quad \dots (4)$

$v(0, t) = v_0 \quad \dots (5)$

$v(x, t)$  finite for all  $x$  and  $t$ .  $\dots (6)$

Applying Laplace transform of (1) and (2), we get

$$\frac{d\bar{v}}{dx} = -R\bar{i} \quad \dots (7)$$

$$\frac{di}{dx} = -c(s\bar{v} - v) \text{ and } v(x, 0) = 0 \text{ or } \frac{di}{dx} = -c\bar{s}\bar{v} \quad \dots (8)$$

Differentiating (7) w.r.t. 'x', we get  $\frac{d^2\bar{v}}{dx^2} = -R \frac{di}{dx}$

$$\Rightarrow \frac{d^2\bar{v}}{dx^2} = -R(-c\bar{s}\bar{v}) \quad \left( \frac{d\bar{v}}{dx} = -c\bar{s}\bar{v} \right)$$

$$\Rightarrow \frac{d^2\bar{v}}{dx^2} = Rcs\bar{v} \Rightarrow \frac{d^2\bar{v}}{dx^2} - Rcs\bar{v} = 0$$

$$\Rightarrow (D^2 - Rcs)\bar{v} = 0 \Rightarrow D = \pm\sqrt{Rcs} \quad \dots (9)$$

$$\text{Laplace transform of (5) is } \bar{v}(0, s) = \frac{v_0}{s} \quad \dots (10)$$

And Laplace transform of (6) is  $\bar{v}(x, s)$  remains finite as  $x \rightarrow \infty$ .  $\dots (11)$

Equation (9) is an ordinary differential equation and its solution is

$$\bar{v} = Ae^{\sqrt{Rcs}x} + Be^{-\sqrt{Rcs}x} \quad \dots (12)$$

As  $x \rightarrow \infty$ ,  $\bar{v}$  remains finite only when  $A = 0$ .

$$\text{So (12) becomes } \bar{v} = Be^{-\sqrt{Rcs}x} \quad \dots (13)$$

$$\text{Putting } \bar{v} = \frac{v_0}{s} \text{ in (13), we get } \frac{v_0}{s} = Be^{-\sqrt{Rcs}x} \quad \dots (14)$$

$$\text{Putting } x = 0 \text{ in (14), we get } \frac{v_0}{s} = B$$

Substituting the value of  $B$  in (13) we have

$$\bar{v} = \frac{v_0}{s} e^{-\sqrt{Rcs}x}$$

On applying inversion transform, we get

$$\begin{aligned} v &= v_0 L^{-1} \left[ \frac{e^{-\sqrt{Rcs}x}}{s} \right] = v_0 \operatorname{erfc} \left[ \frac{x\sqrt{Rc}}{2\sqrt{t}} \right] \\ v &= v_0 \frac{x\sqrt{Rc}}{2\sqrt{\pi}} \int_0^t u^{-\frac{3}{2}} e^{-\frac{Rcx^2}{4u}} du \end{aligned} \quad \dots (15)$$

From (1)

$$i = \frac{-1}{r} \frac{\partial v}{\partial x} \quad \dots (16)$$

$$\text{On differentiating (15), we get } \frac{\partial v}{\partial x} = \frac{v_0 x \sqrt{Rc}}{2\sqrt{\pi}} t^{-\frac{3}{2}} e^{-\frac{Rcx^2}{4t}}$$

$$\text{Putting the value of } \frac{\partial v}{\partial x} \text{ in (16), we obtain } i = \frac{v_0 x}{2\sqrt{\pi}} \sqrt{\frac{c}{R}} \cdot t^{-\frac{3}{2}} e^{-\frac{Rcx^2}{4t}}$$

**Ans.**

### Solution of partial differential Equations by Fourier Transform

$$\text{Example 42. Solve } \frac{\partial^2 u}{\partial t^2} = \alpha^2 \frac{\partial^2 u}{\partial x^2}, \quad -\infty < x < \infty, \quad t \geq 0$$

with conditions  $u(x, 0) = f(x)$ ,

$$\frac{\partial u}{\partial t}(x, 0) = g(x) \text{ and assuming } u, \frac{\partial u}{\partial x} \rightarrow 0 \text{ as } x \rightarrow \pm\infty.$$

**Solution.** Taking Fourier transform on both sides of the differential equation,

$$\frac{d^2 \bar{u}}{dt^2} = \alpha^2 (-s^2 \bar{u}) \text{ where } \bar{u} \text{ is Fourier transform of } u \text{ with respect to } x.$$

$$\frac{d^2 \bar{u}}{dt^2} + \alpha^2 s^2 \bar{u} = 0$$

Auxiliary equation is  $D^2 + \alpha^2 s^2 = 0 \Rightarrow D = \pm i\alpha s$

$$\therefore \bar{u}(s, t) = Ae^{i\alpha st} + Be^{-i\alpha st} \quad \dots (1)$$

$$\text{Since } u(x, 0) = f(x) \text{ and } \frac{\partial u}{\partial t}(x, 0) = g(x),$$

$$\bar{u}(s, 0) = F(s) \text{ and } \frac{d\bar{u}}{dt}(s, 0) = G(s) \text{ on taking transform.}$$

Using these condition in (1), we get

$$\bar{u}(s, 0) = A + B = F(s) \quad \dots (2)$$

$$\frac{d\bar{u}}{dt}(s, 0) = i\alpha s(A - B) = G(s) \quad \dots (3)$$

$$\text{Solving (2) and (3), we get } A = \frac{1}{2} \left[ F(s) + \frac{G(s)}{i\alpha s} \right] \Rightarrow B = \frac{1}{2} \left[ F(s) - \frac{G(s)}{i\alpha s} \right]$$

Using these values in (1), we get

$$\bar{u}(s, t) = \frac{1}{2} \left[ F(s) + \frac{G(s)}{i\alpha s} \right] e^{i\alpha st} + \frac{1}{2} \left[ F(s) - \frac{G(s)}{i\alpha s} \right] e^{-i\alpha st} \quad \dots (4)$$

By inversion theorem, (4) reduces to

$$u(x, t) = \frac{1}{2} \left[ f(x - \alpha t) - \frac{1}{\alpha} \int_{\alpha}^{x - \alpha t} g(\theta) d\theta \right] + \frac{1}{2} \left[ f(x + \alpha t) + \frac{1}{\alpha} \int_{\alpha}^{x + \alpha t} g(\theta) d\theta \right]$$

$$\text{Using the result } F \left( \int_{\alpha}^x f(t) dt \right) = \frac{F(s)}{(-is)} \quad \text{Ans.}$$

#### 41.16 FOURIER TRANSFORMS OF PARTIAL DERIVATIVE OF A FUNCTION

$$F_f \left[ \frac{\partial^2 u}{\partial x^2} \right] = -s^2 F(u) \text{ where } F(u) \text{ is Fourier transform of } u \text{ w.r.t. } x.$$

$$F_s \left[ \frac{\partial^2 u}{\partial x^2} \right] = s(u)_{x=0} - s^2 F_s(u) \quad (\text{sine transform})$$

$$F_c \left[ \frac{\partial^2 u}{\partial x^2} \right] = - \left[ \frac{\partial u}{\partial x} \right]_{x=0} - s^2 F_c(u) \quad (\text{cosine transform})$$

**Proof.** Let  $F[u(x, t)]$  be the Fourier transform of the function  $u(x, t)$ , i.e.

$$F[u(x, t)] = \int_{-\infty}^{\infty} e^{isx} u(x, t) dx$$

$$\text{The Fourier transform of } \frac{\partial^2 u}{\partial x^2} \text{ is given by } F \left[ \frac{\partial^2 u}{\partial x^2} \right] = \int_{-\infty}^{\infty} e^{isx} \frac{\partial^2 u}{\partial x^2} dx.$$

Integrating by parts, we have

$$\begin{aligned} F \left[ \frac{\partial^2 u}{\partial x^2} \right] &= \left[ e^{isx} \frac{\partial u}{\partial x} - \int i s e^{isx} \frac{\partial u}{\partial x} dx \right]_{-\infty}^{\infty} \\ &= \left[ e^{isx} \frac{\partial u}{\partial x} - i s e^{isx} u + \int (is)^2 e^{isx} u dx \right]_{-\infty}^{\infty} \\ &= \left[ 0 - 0 - s^2 \int_{-\infty}^{\infty} e^{isx} u dx \right] \end{aligned} \quad \begin{array}{l} \text{Again integrating} \\ \left[ u = 0, \frac{\partial u}{\partial x} = 0 \right] \\ \text{when } x \rightarrow \infty \end{array}$$

$$\text{Thus } F \left[ \frac{\partial^2 u}{\partial x^2} \right] = -s^2 F[u(x, t)]$$

Similarly, the Fourier sine transform of  $\frac{\partial^2 u}{\partial x^2}$  is given by

$$F_s \left[ \frac{\partial^2 u}{\partial x^2} \right] = \int_0^{\infty} \frac{\partial^2 u}{\partial x^2} \sin sx dx$$

$$\Rightarrow F_s \left[ \frac{\partial^2 u}{\partial x^2} \right] = s[u(x, t)]_{x=0} - s^2 F_s[u(s, t)] \quad (\text{sine transform})$$

$$\text{and } F_c \left[ \frac{\partial^2 u}{\partial x^2} \right] = - \left[ \frac{\partial u}{\partial x} \right]_{x=0} - s^2 F_c[u(s, t)] \quad (\text{cosine transform})$$

### 41.17 APPLICATIONS TO SIMPLE HEAT TRANSFER EQUATIONS

**Solution of heat conduction problems by Fourier sine Transforms**

**Example 43.** Solve  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$ ,  $0 < x < 4$ ,  $t > 0$ , subject to conditions  $u(0, t) = 0$ ,  $u(4, 0) = 0$ ,  $u(x, 0) = 2x$ .

**Solution.** Here  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$      $0 < x < 4$ ,  $t > 0$  ... (1)

subject to boundary conditions;  $u(0, t) = 0$ ,  $u(4, t) = 0$  ... (2)

and initial condition:  $u(x, 0) = 2x$  ... (3)

On applying Fourier sine transform on (1), we get (initial conditions are given)

$$\int_0^4 \frac{\partial u}{\partial t} \sin \frac{s\pi x}{4} dx = \int_0^4 \frac{\partial^2 u}{\partial x^2} \sin \frac{s\pi x}{4} dx$$

Integrating by parts, we get

$$\begin{aligned} \frac{d}{dt} \int_0^4 u(x, t) \sin \frac{s\pi x}{4} dx &= \left[ \frac{\partial u}{\partial x} \sin \frac{s\pi x}{4} \right]_0^4 - \frac{s\pi}{4} \int_0^4 \frac{\partial u}{\partial x} \cos \frac{s\pi x}{4} dx \\ \Rightarrow \quad \frac{d}{dt} (\bar{u}_s) &= 0 - \frac{s\pi}{4} \left\{ \left[ u(x, t) \cos \frac{s\pi x}{4} \right]_0^4 + \frac{s\pi}{4} \int_0^4 u(x, t) \sin \frac{s\pi x}{4} dx \right\} \\ \Rightarrow \quad &= -\frac{s\pi}{4} [u(4, t) \cos s\pi - u(0, t)] - \frac{s^2 \pi^2}{16} \bar{u}_s \end{aligned} \quad \dots (4)$$

Putting the values of  $u(0, t)$  and  $u(4, t)$  from (2) in (4), we get

$$\frac{d}{dt} \bar{u}_s = 0 - \frac{s^2 \pi^2}{16} \bar{u}_s \Rightarrow \left( \frac{1}{\bar{u}_s} \right) d\bar{u}_s = -\left( \frac{s^2 \pi^2}{16} \right) dt, \text{ whose solution is}$$

$$\bar{u}_s(s, t) = ce^{-s^2 \pi^2 t / 16}$$

On putting  $t = 0$  in (5), we have  $c = \bar{u}_s(s, 0)$  ... (5)

$$\text{Now } \bar{u}_s(s, t) = \int_0^4 u(x, t) \sin \frac{s\pi x}{4} dx \quad \dots (6) \text{ (By definition)}$$

$$\text{On putting } t = 0 \text{ in (6), we get } \bar{u}_s(s, 0) = \int_0^4 u(x, 0) \sin \frac{s\pi x}{4} dx$$

$$\begin{aligned} c &= \int_0^4 u(x, 0) \sin \frac{s\pi x}{4} du \quad [\because c = \bar{u}_s(s, 0)] \quad [\because u(x, 0) = 2x] \\ &= \int_0^4 2x \sin \frac{s\pi x}{4} dx = \left[ (2x) \times \left( -\frac{4}{s\pi} \cos \frac{s\pi x}{4} \right) - (2) \times \left( \frac{-16}{s^2 \pi^2} \sin \frac{s\pi x}{4} \right) \right]_0^4 \quad (\text{Integrating by parts}) \\ &= 2 \times 4 \left( -\frac{4}{s\pi} \cos \pi \right) - 0 = \frac{-32}{s\pi} (-1)^5 = \frac{32}{s\pi} (-1)^{s+1} \end{aligned}$$

$$\text{Putting the value of } c \text{ in (5), we get } \bar{u}_s(s, t) = (32/s\pi) (-1)^{s+1} e^{-s^2 \pi^2 t / 16} \quad \dots (7)$$

Now, taking the inverse finite Fourier sine transform, we get

$$u(x, t) = \frac{2}{4} \sum_{s=1}^{\infty} \bar{u}_s(s, t) \sin \frac{s\pi x}{4} \quad \dots (8)$$

Putting the value of  $\bar{u}_s(s, t)$  from (7) in (8), we get

$$u(x, t) = \frac{16}{\pi} \sum_{s=1}^{\infty} \frac{(-1)^{s+1}}{s} e^{-s^2 \pi^2 t / 16} \sin \frac{s\pi x}{4} \quad \text{Ans.}$$

**Example 44.** Solve  $\frac{\partial u}{\partial t} = k \frac{\partial^2 u}{\partial x^2}$  for  $x \geq 0, t \geq 0$  under the given conditions  $u = u_0$  at  $x = 0, t > 0$  with initial condition  $u(x, 0) = 0, x \geq 0$

**Solution.** Taking Fourier sine transforms

$$\begin{aligned} F_s\left(\frac{\partial u}{\partial t}\right) &= F_s\left(k \frac{\partial^2 u}{\partial x^2}\right) & \frac{d\bar{u}}{dt} &= k \left[ -s^2 \bar{u} + \sqrt{\frac{2}{\pi}} s u(0, t) \right] \\ &= -ks^2 \bar{u} + \sqrt{\frac{2}{\pi}} k s u_0 & \text{where } \bar{u} \text{ is the Fourier sine transform of } u. \\ \frac{d\bar{u}}{dt} + ks^2 \bar{u} &= \sqrt{\frac{2}{\pi}} s k u_0 \end{aligned}$$

This is linear in  $\bar{u}$ .

$$\therefore \bar{u} e^{ks^2 t} = \sqrt{\frac{2}{\pi}} k u_0 \int s e^{ks^2 t} dt = \sqrt{\frac{2}{\pi}} \frac{u_0}{s} e^{ks^2 t} + c \quad \dots (1)$$

Since,  $u(x, 0) = 0, \bar{u}(s, 0) = 0$ . Using this in (1), we have

$$\begin{aligned} 0 &= \sqrt{\frac{2}{\pi}} \frac{u_0}{s} + c & \Rightarrow & c = -\sqrt{\frac{2}{\pi}} \frac{u_0}{s} \\ e^{ks^2 t} &= \sqrt{\frac{2}{\pi}} \frac{u_0}{s} (e^{ks^2 t} - 1) & \Rightarrow & \bar{u} = \sqrt{\frac{2}{\pi}} \frac{u_0}{s} (1 - e^{ks^2 t}) \end{aligned}$$

By inversion theorem, we have

$$u(x, t) = \frac{2u_0}{\pi} \int_0^\infty \left( \frac{1 - e^{ks^2 t}}{s} \right) \sin sx ds. \quad \text{Ans.}$$

**Example 45.** Solve  $\frac{\partial u}{\partial t} = k \frac{\partial^2 u}{\partial x^2}$  for  $0 \leq x < \infty, t > 0$  given the conditions

$$(i) u(x, 0) = 0 \text{ for } x \geq 0$$

$$(ii) \frac{\partial u}{\partial x}(0, t) = -a \text{ (constant)}$$

$$(iii) u(x, t) \text{ is bounded.}$$

**Solution.** In this problem,  $\frac{\partial u}{\partial x}$  at  $x = 0$  is given. Hence, take Fourier cosine transform on both sides of the given equation.

$$\begin{aligned} F_c\left(\frac{\partial u}{\partial t}\right) &= F_c\left(k \frac{\partial^2 u}{\partial x^2}\right) \\ \frac{d\bar{u}}{dt} &= k \left( -s^2 \bar{u} - \sqrt{\frac{2}{\pi}} \cdot \frac{\partial u}{\partial x}(0, t) \right) = -ks^2 \bar{u} + \sqrt{\frac{2}{\pi}} ka & \text{[Using condition (ii)]} \\ \frac{d\bar{u}}{dt} + ks^2 \bar{u} &= \sqrt{\frac{2}{\pi}} ka \end{aligned}$$

This is linear in  $\bar{u}$ . Therefore, solving

$$\begin{aligned} \bar{u} e^{ks^2 t} &= \int \sqrt{\frac{2}{\pi}} ka e^{ks^2 t} dt = \sqrt{\frac{2}{\pi}} ka \frac{e^{ks^2 t}}{ks^2} + c \\ \bar{u}(s, t) &= \sqrt{\frac{2}{\pi}} \frac{a}{s^2} + c e^{-ks^2 t} \quad \dots (1) \end{aligned}$$

$$\text{Since} \quad u(x, 0) = 0 \quad \text{for} \quad x \geq 0.$$

$$\bar{u}(s, 0) = 0.$$

Using this in (1), we get

$$\bar{u}(s, 0) = c + \sqrt{\frac{2}{\pi}} \frac{a}{s^2} = 0$$

$$\therefore c = -\sqrt{\frac{2}{\pi}} \frac{a}{s^2}$$

Substituting this in (1), we have  $\bar{u}(s, t) = \sqrt{\frac{2}{\pi}} \frac{a}{s^2} (1 - e^{-ks^2 t})$

By inversion theorem, we have  $u(x, t) = \frac{2}{\pi} \cdot a \int_0^\infty \frac{1 - e^{-ks^2 t}}{s^2} \cos sx ds$ . **Ans.**

#### EXERCISE 41.4

1. Use Fourier transform to solve the equation  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$

under the conditions  $u = 0$  at  $x = 0$

$$u = \begin{cases} 1, & 0 < x < 1 \\ 0, & x \geq 1 \end{cases} \text{ when } t = 0$$

and  $u$  is bounded.

$$\text{Ans. } u = \frac{2}{\pi} \int_{\pi}^{\infty} \frac{1 - \cos s}{s} e^{-s^2 t} \sin sx ds$$

2. Use Fourier sine transform to solve the equation  $\frac{\partial u}{\partial t} = 2 \frac{\partial^2 u}{\partial x^2}$

Under the conditions  $u(0, t) = 0$ ,  $u(x, 0) = e^{-x}$ ,  $u(x, t)$  is bounded.

$$\text{Ans. } u(x, t) = \frac{2}{\pi} \int_0^{\infty} \frac{s}{s^2 + 1} e^{-2s^2 t} \sin sx ds$$

3. A tightly stretched string with fixed end points  $x = b$  and  $x = c$  is initially in a position given by

$y = b \sin \left( \frac{\pi x}{c} \right)$ . It is released from rest in this position. Show by the method of Laplace transform that the displacement  $y$  at any distance  $x$  from one end and at any time  $t$  is given by

$$y = b \sin \frac{\pi x}{c} \cos \frac{\pi q}{c} t.$$

and  $y$  satisfies the equation  $\frac{\partial^2 y}{\partial x^2} = a^2 \frac{\partial^2 y}{\partial t^2}$

4. A string is stretched tightly between  $x = 0$  and  $x = l$  and both ends are given displacement  $y = a \sin pt$  perpendicular to the string. If the string satisfies the differential equation

$$\frac{\partial^2 y}{\partial x^2} = \frac{1}{c^2} \frac{\partial^2 y}{\partial t^2}$$

Show that the oscillations of the string are given by

$$y = a \sec \frac{Pl}{2c} \cos \left( \frac{Px}{c} - \frac{Pl}{2c} \right) \sin pt.$$

5. An infinite cable with resistance  $R$  ohms/km, capacitance  $C$  Farads/km, and negligible inductance and leakage is subjected to constant E.M.F.  $E_0$  at the home end at time  $t = 0$ . Using the operational method show that the entering current at any subsequent time  $t$  is

$$I(t) = E_0 \left( \frac{C}{\pi R t} \right)^{1/2}$$

6. Solve the equation for high voltage semi-infinite line with the following initial and boundary conditions  $v(x, t) = 0$  and  $i(x, 0) = 0$ ,  $v(0, t) = v_0$ ,  $u(t)$ ,  $v(x, t)$  is finite as  $x \rightarrow \infty$ .

$$\text{Ans. } v = v_0 u[t - x \sqrt{LC}], \text{ for } x \leq \frac{t}{\sqrt{LC}} \text{ and}$$

$$v = 0 \quad \text{for } x > \frac{t}{\sqrt{LC}}$$

7. Solve  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$  if

$$(i) \frac{\partial u}{\partial x}(0, t) = 0 \text{ for } t > 0.$$

$$(ii) u(x, 0) = \begin{cases} x & 0 \leq x \leq 0 \\ 0 & x > 1 \end{cases}$$

$$(iii) \text{ and } u(x, t) \text{ is bounded for } x > 0, t > 0 \quad \text{Ans. } \left[ u(x, t) = \frac{2}{\pi} \int_0^\infty \left( \frac{\sin s}{s} + \frac{\cos s - 1}{s^2} \right) e^{-s^2 t} \cos sx ds \right]$$

### 41.18 FINITE FOURIER TRANSFORMS

Let  $f(x)$  denote a function which is sectionally continuous over the range  $(0, l)$ . Then the **Finite Fourier sine transform** of  $f(x)$  on this interval is defined as

$$F_s(p) = \bar{f}_s(P) = \int_0^l f(x) \sin \frac{p\pi x}{l} dx$$

where  $p$  is an integer (Instead of  $s$ , we take  $p$  as a parameter)

#### Inversion formula for sine transform

If  $\bar{f}_s(p) = F_s(p)$  is the finite Fourier sine transform of  $f(x)$  in  $(0, l)$  then the inversion formula for sine transform is

$$f(x) = \frac{2}{l} \sum_{p=1}^{\infty} \bar{f}_s(p) \sin \frac{p\pi x}{l}$$

**Proof.** For the given function  $f(x)$  in  $(0, l)$ , if we find the half range Fourier sine series, we get.

$$f(x) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l} \quad \dots (1)$$

where

$$b_n = \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx$$

$$\therefore b_p = \frac{2}{l} \int_0^l f(x) \sin \frac{p\pi x}{l} dx = \frac{2}{l} \bar{f}_s(p) \text{ by definition}$$

$$\text{Substituting in (1), we get } f(x) = \frac{2}{l} \sum_{p=1}^{\infty} \bar{f}_s(p) \sin \frac{p\pi x}{l}$$

#### Finite Fourier Cosine Transform

Let  $f(x)$  denote a sectionally continuous function in  $(0, l)$ .

Then the Finite Fourier cosine transform of  $f(x)$  over  $(0, l)$  is defined as

$$F_c(p) = \bar{f}_c(p) = \int_0^l f(x) \cos \frac{p\pi x}{l} dx \text{ where } p \text{ is an integer.}$$

#### Inversion formula for cosine transform

If  $\bar{f}_c(p)$  is the finite Fourier cosine transform of  $f(x)$  in  $(0, l)$ , then the inversion formula for cosine transform is

$$f(x) = \frac{1}{l} \bar{f}_c(0) + \frac{2}{l} \sum_{p=1}^{\infty} \bar{f}_c(p) \cos \frac{p\pi x}{l}$$

$$\text{where } \bar{f}_c(0) = \int_0^l f(x) dx.$$

**Proof.** If we find half range Fourier cosine series for  $f(x)$  in  $(0, l)$ , we obtain.

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l} \quad \dots (2)$$

where

$$a_n = \frac{2}{l} \int_0^l f(x) \cos \frac{n\pi x}{l} dx$$

$\therefore$

$$a_p = \frac{2}{l} \bar{f}_c(p)$$

$$a_0 = \frac{2}{l} \int_0^l f(x) dx = \frac{2}{l} \bar{f}_c(0).$$

Substituting in (2), we get

$$f(x) = \frac{1}{l} f_c(0) + \frac{2}{l} \sum_{p=1}^{\infty} f_c(p) \cos \frac{p\pi x}{l}$$

**Example. 46.** Find the finite Fourier sine and cosine transforms of

- (i)  $f(x) = 1$  in  $(0, \pi)$
- (ii)  $f(x) = x$  in  $(0, l)$
- (iii)  $f(x) = x^2$  in  $(0, l)$
- (iv)  $f(x) = 1$  in  $0 < x < \pi/2$   
 $= -1$  in  $\pi/2 < x < \pi$
- (v)  $f(x) = x^3$  in  $(0, l)$
- (vi)  $f(x) = e^{ax}$  in  $(0, l)$

**Solution.**

$$(i) \bar{f}_s(p) = F_s(1) = \int_0^\pi 1 \cdot \sin \frac{p\pi x}{\pi} dx = \left( -\frac{\cos px}{p} \right)_0^\pi = \frac{1 - \cos p\pi}{p} \quad [\text{If } p \neq 0]$$

$$\bar{f}_c(p) = \int_0^\pi 1 \cdot \cos px dx = \left( \frac{\sin px}{p} \right)_0^\pi = \frac{1}{p}(0 - 0) = 0$$

$$(ii) \bar{f}_s(p) = F_s(p) = \int_0^l x \sin \frac{p\pi x}{l} dx \\ = \left[ (x) \left( \frac{-\cos \frac{p\pi x}{l}}{\frac{p\pi}{l}} \right) - (1) \left( -\frac{\sin \frac{p\pi x}{l}}{\frac{p^2\pi^2}{l^2}} \right) \right]_0^l = \frac{-l}{p\pi} (l \cos p\pi) \\ = \frac{-l^2}{p\pi} (-1)^p \quad [\text{If } p \neq 0]$$

$$\bar{f}_c(p) = F_c(x) = \int_0^l x \cos \frac{p\pi x}{l} dx \\ = \left[ (x) \left( \frac{\sin \frac{p\pi x}{l}}{\frac{p\pi}{l}} \right) - (1) \left( -\frac{\cos \frac{p\pi x}{l}}{\frac{p^2\pi^2}{l^2}} \right) \right]_0^l = \frac{l^2}{p^2\pi^2} [(-1)^p - 1] \quad [\text{If } p \neq 0]$$

$$(iii) \bar{f}_s(p) = F_s(x^2) = \int_0^l x^2 \sin \frac{p\pi x}{l} dx$$

$$\begin{aligned}
&= \left[ (x^2) \left( -\frac{\cos \frac{p\pi x}{l}}{\frac{p\pi}{l}} \right) - (2x) \left( -\frac{\sin \frac{p\pi x}{l}}{\frac{p^2\pi^2}{l^2}} \right) + (2) \left( \frac{\cos \frac{p\pi x}{l}}{\frac{p^3\pi^3}{l^3}} \right) \right]_0^l \\
&= \frac{-l^3}{p\pi} (-1)^p + \frac{2l^3}{p^3\pi^3} [(-1)^p - 1] \quad [\text{If } p \neq 0]
\end{aligned}$$

$$\begin{aligned}
\bar{f}_c(p) &= \int_0^l (x^2) \cos \frac{p\pi x}{l} dx \\
&= \left[ (x^2) \left( \frac{\sin \frac{p\pi x}{l}}{\frac{p\pi}{l}} \right) - (2x) \left( -\frac{\cos \frac{p\pi x}{l}}{\frac{p^2\pi^2}{l^2}} \right) + (2) \left( -\frac{\sin \frac{p\pi x}{l}}{\frac{p^3\pi^3}{l^3}} \right) \right]_0^l = \frac{2l^3}{p^2\pi^2} (-1)^p \quad [\text{If } p \neq 0]
\end{aligned}$$

$$\begin{aligned}
(iv) \quad F_s \{ f(x) \} &= \int_0^{\pi/2} \sin px dx + \int_{\pi/2}^{\pi} (-1) \sin px dx \\
&= \left( -\frac{\cos px}{p} \right)_0^{\pi/2} + \left( \frac{\cos px}{p} \right)_{\pi/2}^{\pi} = -\frac{1}{p} \left( \cos \frac{p\pi}{2} - 1 \right) + \frac{1}{p} \left( \cos p\pi - \cos \frac{p\pi}{2} \right) \\
&= -\frac{1}{p} \left( \cos p\pi - 2 \cos \frac{p\pi}{2} - 1 \right) \quad [\text{If } p \neq 0]
\end{aligned}$$

$$\begin{aligned}
F_c(f(x)) &= \int_0^{\pi/2} \cos px dx - \int_{\pi/2}^{\pi} \cos px dx \\
&= \left( \frac{\sin px}{p} \right)_0^{\pi/2} - \left( \frac{\sin px}{p} \right)_{\pi/2}^{\pi} = \frac{2}{p} \sin \frac{p\pi}{2} \quad [\text{If } p \neq 0]
\end{aligned}$$

$$\begin{aligned}
(v) \quad F_s(x^3) &= \int_0^l x^3 \sin \frac{p\pi x}{l} dx \\
&= \left[ (x^3) \left( -\frac{\cos \frac{p\pi x}{l}}{\frac{p\pi}{l}} \right) - (3x^2) \left( \frac{\sin \frac{p\pi x}{l}}{\frac{p^2\pi^2}{l^2}} \right) + (6x) \left( \frac{\cos \frac{p\pi x}{l}}{\frac{p^3\pi^3}{l^3}} \right) - (6) \left( \frac{\sin \frac{p\pi x}{l}}{\frac{p^4\pi^4}{l^4}} \right) \right]_0^l \\
&= -\frac{l^4}{p\pi} (-1)^p + \frac{6l^4}{p^3\pi^3} (-1)^p \quad [\text{If } p \neq 0]
\end{aligned}$$

$$\begin{aligned}
F_c(x^3) &= \int_0^l x^3 \cos \frac{p\pi x}{l} dx \\
&= \left[ (x^3) \left( \frac{\sin \frac{p\pi x}{l}}{\frac{p\pi}{l}} \right) - (3x^2) \left( -\frac{\cos \frac{p\pi x}{l}}{\frac{p^2\pi^2}{l^2}} \right) + (6x) \left( -\frac{\sin \frac{p\pi x}{l}}{\frac{p^3\pi^3}{l^3}} \right) - (6) \left( \frac{\cos \frac{p\pi x}{l}}{\frac{p^4\pi^4}{l^4}} \right) \right]_0^l \\
&= \frac{3l^4}{\pi^2 p^2} (-1)^p - \frac{6l^4}{p^4\pi^4} [(-1)^p - 1] \quad [\text{If } p \neq 0]
\end{aligned}$$

$$(vi) \quad F_s(e^{ax}) = \int_0^l e^{ax} \sin \frac{p\pi x}{l} dx \\ = \left\{ \frac{e^{ax}}{a^2 + \frac{p^2\pi^2}{l^2}} \left[ a \sin \frac{p\pi x}{l} - \frac{p\pi}{l} \cos \frac{p\pi x}{l} \right] \right\}_0^l = \frac{e^{al}}{a^2 + \frac{p^2\pi^2}{l^2}} \cdot \left( -\frac{p\pi}{l} (-1)^p \right) + \frac{1}{a^2 + \frac{p^2\pi^2}{l^2}} \left( \frac{p\pi}{l} \right)$$

$$F_c(e^{ax}) = \int_0^l e^{ax} \cos \frac{p\pi x}{l} dx \\ F_c(e^{ax}) = \left\{ \frac{e^{ax}}{a^2 + \frac{p^2\pi^2}{l^2}} \left[ a \cos \frac{p\pi x}{l} + \frac{p\pi}{l} \sin \frac{p\pi x}{l} \right] \right\}_0^l = \frac{e^{al}}{a^2 + \frac{p^2\pi^2}{l^2}} a(-1)^p - \frac{1}{a^2 + \frac{p^2\pi^2}{l^2}} (a) \text{ Ans.}$$

**Example 47.** Find  $f(x)$  if its finite Fourier sine transform is  $\frac{2\pi}{p^3}(-1)^{p-1}$  for  $p = 1, 2, \dots$ ,  $0 < x < \pi$ .

**Solution.** By inversion Theorem, we have

$$f(x) = \frac{2}{\pi} \sum_{p=1}^{\infty} \frac{2\pi}{p^3} (-1)^{p-1} \sin px = 4 \sum_{p=1}^{\infty} \frac{(-1)^{p-1}}{p^3} \sin px \text{ Ans.}$$

**Example 48.** Find  $f(x)$  if its finite Fourier sine transform is given by

$$(i) \quad F_s(p) = \frac{1 - \cos p\pi}{p^2\pi^2} \quad \text{for } p = 1, 2, 3, \dots \text{ and } 0 < x < \pi$$

$$(ii) \quad F_s(p) = \frac{16(-1)^{p-1}}{p^3} \quad \text{for } p = 1, 2, 3, \dots \text{ and } 0 < x < 8$$

$$(iii) \quad F_s(p) = \frac{\cos \frac{2\pi p}{3}}{(2p+1)^2} \quad \text{for } p = 1, 2, 3, \dots \text{ and } 0 < x < 1.$$

**Solution.** By inversion theorem, we have

$$(i) \quad f(x) = \frac{2}{\pi} \sum_{p=1}^{\infty} \left( \frac{1 - \cos p\pi}{p^2\pi^2} \right) \sin px = \frac{2}{\pi^3} \sum_{p=1}^{\infty} \left( \frac{1 - \cos p\pi}{p^2} \right) \sin px$$

$$(ii) \quad f(x) = \frac{2}{l} \sum_{p=1}^{\infty} F_s(p) \sin \left( \frac{p\pi x}{l} \right) = \frac{2}{8} \sum_{p=1}^{\infty} \frac{16(-1)^{p-1}}{p^3} \sin \left( \frac{p\pi x}{8} \right) \quad [\text{Since } l = 8]$$

$$= 4 \sum_{p=1}^{\infty} \frac{(-1)^{p-1}}{p^3} \sin \left( \frac{p\pi x}{8} \right)$$

$$(iii) \quad f(x) = \frac{2}{l} \sum_{p=1}^{\infty} F_s(p) \sin \left( \frac{p\pi x}{l} \right) = 2 \sum_{p=1}^{\infty} \frac{\cos \left( \frac{2\pi p}{3} \right)}{(2p+1)^2} \sin(p\pi x) \quad [\text{Since } l = 1] \text{ Ans.}$$

**Example 49.** Find  $f(x)$  if its finite Fourier cosine transform is

$$(i) \quad F_c(p) = \frac{1}{2p} \sin \left( \frac{p\pi}{2} \right) \quad \text{for } p = 1, 2, 3, \dots$$

$$\begin{aligned}
 &= \frac{\pi}{4} && \text{for } p = 0 \text{ given } 0 < x < 2\pi \\
 (ii) \quad F_c(p) &= \frac{6\sin \frac{p\pi}{2} - \cos p\pi}{(2p+1)\pi} && \text{for } p = 1, 2, 3, \dots \\
 &= \frac{2}{\pi} && \text{for } p = 0 \text{ given } 0 < x < 4 \\
 (iii) \quad F_c(p) &= \frac{\cos\left(\frac{2p\pi}{3}\right)}{(2p+1)^2} && \text{for } p = 1, 2, 3, \dots \\
 &= 1 && \text{for } p = 0 \text{ given } 0 < x < 1
 \end{aligned}$$

**Solution.** By inversion theorem, we have

$$f(x) = \frac{1}{l} F_c(0) + \frac{2}{l} \sum_{p=1}^{\infty} F_c(p) \cdot \cos \frac{p\pi x}{l}$$

(i) Here  $F_c(0) = \pi/4$  and  $l = 2\pi$

$$\begin{aligned}
 \therefore f(x) &= \frac{1}{2\pi} \left( \frac{\pi}{4} \right) + \frac{2}{2\pi} \sum_{p=1}^{\infty} \frac{1}{2p} \sin \left( \frac{p\pi}{2} \right) \cos \left( \frac{p\pi x}{2\pi} \right) \\
 &= \frac{1}{8} + \frac{1}{2\pi} \sum_{p=1}^{\infty} \frac{1}{p} \sin \left( \frac{p\pi}{2} \right) \cos \left( \frac{px}{2} \right)
 \end{aligned}$$

(ii) Here  $F_c(0) = \frac{2}{\pi}$  and  $l = 4$

$$\begin{aligned}
 f(x) &= \frac{1}{4} \left( \frac{2}{\pi} \right) + \frac{2}{4} \sum_{p=1}^{\infty} \frac{\left( 6 \sin \frac{p\pi}{2} - \cos p\pi \right)}{(2p+1)\pi} \cos \left( \frac{p\pi x}{4} \right) \\
 &= \frac{1}{2\pi} + \frac{1}{2\pi} \sum_{p=1}^{\infty} \frac{\left( 6 \sin \frac{p\pi}{2} - \cos p\pi \right)}{(2p+1)} \cos \left( \frac{p\pi x}{4} \right)
 \end{aligned}$$

(iii) Here  $F_c(0) = 1$ ,  $l = 1$

$$\begin{aligned}
 \therefore f(x) &= \frac{1}{1} + \frac{2}{1} \sum_{p=1}^{\infty} \frac{1}{(2p+1)^2} \cos \left( \frac{2p\pi}{3} \right) \cos(p\pi x) \\
 &= 1 + 2 \sum_{p=1}^{\infty} \frac{\cos \left( \frac{2p\pi}{3} \right)}{(2p+1)^2} \cos(p\pi x)
 \end{aligned}$$

**Ans.**

**Example 50.** Find the finite Fourier sine transform of  $f(x) = 1$  in  $(0, \pi)$ . Use the inversion theorem and find Fourier series for  $f(x) = 1$  in  $(0, \pi)$ . Hence prove

$$(i) 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots = \pi/4 \quad (ii) \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \pi^2/8$$

**Solution.**  $F_s(1) = \int_0^\pi 1 \cdot \sin \left( \frac{p\pi x}{\pi} \right) dx = \left[ -\frac{\cos px}{p} \right]_0^\pi$

$$\bar{f}_s(p) = \frac{1 - \cos p\pi}{p} \text{ if } p \neq 0$$

By inversion theorem,

$$\begin{aligned}
 f(x) &= \frac{2}{l} \sum_{p=1}^{\infty} F_s(p) \sin \frac{p\pi x}{l} \\
 1 &= \frac{2}{\pi} \sum_{p=1}^{\infty} \frac{1 - (-1)^p}{p} \cdot \sin px \quad [\text{Since } l = \pi] \\
 1 &= \frac{4}{\pi} \left[ \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \dots \right] \quad [p \text{ is odd}] \quad \dots (1)
 \end{aligned}$$

This is the half range Fourier sine series for  $f(x) = 1$  in  $(0, \pi)$  getting  $x = \pi/2$ .

$$\begin{aligned}
 \text{On putting } x = \frac{\pi}{2} \text{ in (1), we get } \frac{4}{\pi} \left[ 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots \right] &= 1 \\
 \therefore 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots &= \frac{\pi}{4}
 \end{aligned}$$

In the half Fourier sine series  $I_n = \frac{4}{\pi} \cdot \frac{1}{n}$  for n odd

By using Parseval's Theorem

$$\begin{aligned}
 (\text{Range}) \left[ \frac{1}{2} \sum b_n^2 \right] &= \int_0^\pi (1)^2 dx \\
 \pi \left[ \frac{1}{2} \cdot \frac{16}{\pi^2} \sum_{n=1,3,5,\dots}^{\infty} \frac{1}{n^2} \right] &= \pi \quad i.e., \quad \sum_{n=1,3,5}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{8} \quad \text{Ans.}
 \end{aligned}$$

$$(ii) \quad \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$$

### EXERCISE 41.5

Find the finite Fourier sine and cosine transforms of

$$\begin{aligned}
 1. \quad f(x) = 2x \text{ in } (0, 4) \quad \text{Ans. } F_s(s) &= \begin{cases} \frac{32}{s\pi} (1 - \cos s\pi), & s \neq 0 \\ 0, & s = 0 \end{cases}, \quad F_c(s) = \begin{cases} \frac{32}{s^2\pi^2} (\cos s\pi - 1), & s \neq 0 \\ 16, & s = 0 \end{cases} \\
 2. \quad f(x) = x \text{ in } (0, \pi) \quad \text{Ans. } F_s(s) &= \begin{cases} \frac{\pi}{s} (-1)^{s+1}, & s \neq 0 \\ 0, & s = 0 \end{cases}, \quad F_c(s) = \begin{cases} \frac{(-1)^s - 1}{s^2}, & s \neq 0 \\ \frac{\pi^2}{2}, & s = 0 \end{cases}
 \end{aligned}$$

$$3. \quad f(x) = \cos ax \text{ in } (0, \pi) \quad F_s(s) = \frac{s}{s^2 - a^2} [1 - (-1)^s \cos a\pi]$$

$$\boxed{1 - \frac{x}{\pi}} \quad \boxed{\cos} \quad \boxed{\cos ax} \quad \boxed{\pi} \quad F_s(s) = \frac{1}{s}$$

$$5. \quad f(x) = \begin{cases} x \text{ in } (0, \pi/2) \\ \pi - x \text{ in } (\pi/2, \pi) \end{cases} \quad \text{Ans. } F_s(s) = \frac{2}{s^2} \sin \frac{s\pi}{2}$$

$$6. \quad f(x) = e^{-ax} \text{ in } (0, l) \quad \text{Ans. } F_s(e^{-ax}) = \frac{e^{-al}}{a^2 + \frac{s^2\pi^2}{l^2}} \left( -\frac{s\pi}{l} (-1)^s \right) + \frac{1}{a^2 + \frac{s^2\pi^2}{l^2}} \left( \frac{s\pi}{l} \right)$$

$$F_c(e^{-ax}) = \frac{ae^{-al}}{a^2 + \frac{s^2\pi^2}{l^2}} (-1)^{s+1} + \frac{a}{a^2 + \frac{s^2\pi^2}{l^2}}$$

$$7. \quad f(x) = \frac{\pi}{3} - x + \frac{x^2}{2\pi} \text{ in } (0, \pi) \quad \text{Ans. } F_s(s) = \frac{\pi (-1)^p}{6p} + \frac{1 (-1)^p}{\pi p^3} + \frac{\pi}{3p} - \frac{1}{\pi p^3}$$

8. Find finite Fourier cosine transform of  $\left(1 - \frac{x}{\pi}\right)^2, 0 < x < \pi.$

$$\text{Ans. } F_c(s) = \begin{cases} \frac{2}{\pi s^2}, & s \neq 0 \\ \frac{\pi}{3}, & s = 0 \end{cases}$$

9. Find  $f(x)$  if  $\bar{f}_c(s) = \begin{cases} \frac{\sin\left(\frac{s\pi}{2}\right)}{2s}, & s = 1, 2, 3 \dots \\ \frac{\pi}{4}, & s = 0 \text{ given } 0 < x < 2x. \end{cases}$

$$\text{Ans. } \frac{1}{8} + \frac{1}{\pi} \sum_{s=1}^{\infty} \frac{\sin \frac{s\pi}{2}}{2s} \cos \frac{sx}{2}$$

#### 41.19 FINITE FOURIER SINE AND COSINE TRANSFORMS OF DERIVATIVES

Using the definition and the integration by parts, we can easily prove the following results.  
For  $0 \leq x \leq l,$

$$(i) \quad F_s(f'(x)) = -\frac{p\pi}{l} \bar{f}_c(p)$$

$$(ii) \quad F_c\{f'(x)\} = f(l)(-1)^p - f(0) + \frac{p\pi}{l} \bar{f}_s(p)$$

$$(iii) \quad F_s\{f''(x)\} = -\frac{p^2\pi^2}{l^2} \bar{f}_s(p) + \frac{p\pi}{l} \left[ f(0) - (-1)^n f(l) \right]$$

$$(iv) \quad F_c\{f''(x)\} = -\frac{p^2\pi^2}{l^2} \bar{f}_c(p) + f'(l)(-1)^p - f'(0)$$

$$\begin{aligned} \text{Proof: (i)} \quad F_s(f'(x)) &= \int_0^l f'(x) \sin \frac{p\pi x}{l} dx = \int_0^l \sin \frac{p\pi x}{l} \cdot d\{f(x)\} \\ &= \left( f(x) \sin \frac{p\pi x}{l} \right)_0^l - \int_0^l f(x) \frac{p\pi}{l} \cdot \cos \frac{p\pi x}{l} dx \\ &= -\frac{p\pi}{l} \bar{f}_c(p) \end{aligned} \quad \dots (1)$$

$$\begin{aligned} (ii) \quad F_c\{f'(x)\} &= \int_0^l f'(x) \cos \frac{p\pi x}{l} dx = \left( f(x) \cos \frac{p\pi x}{l} \right)_0^l - \int_0^l f(x) \cdot \left( -\frac{p\pi}{l} \sin \frac{p\pi x}{l} \right) dx \\ &= (-1)^p \bar{f}(l) - f(0) + \frac{p\pi}{l} \bar{f}_s(p) \end{aligned} \quad \dots (2)$$

$$\begin{aligned} (iii) \quad F_s\{f''(x)\} &= \int_0^l \sin \frac{p\pi x}{l} d[f'(x)] \\ &= \left( f'(x) \sin \frac{p\pi x}{l} \right)_0^l - \frac{p\pi}{l} \int_0^l f'(x) \cos \frac{p\pi x}{l} ds \\ &= -\frac{p\pi}{l} \left[ (-1)^p f(l) - f(0) + \frac{p\pi}{l} \bar{f}_s(p) \right] \\ &= -\frac{p^2\pi^2}{l^2} \bar{f}_s(p) + \frac{p\pi}{l} \left[ f(0) - (-1)^p f(l) \right] \end{aligned} \quad \text{[Using (2)]} \quad \dots (3)$$

$$\begin{aligned}
 (iv) \quad F_c \{f''(x)\} &= \int_0^l \cos \frac{p\pi x}{l} d[f'(x)] \\
 &= \left[ f'(x) \cos \frac{p\pi x}{l} \right]_0^l + \frac{p\pi}{l} \int_0^l f'(x) \sin \frac{p\pi x}{l} dx \quad [\text{Using (1)}] \\
 &= (-1)^p f'(l) - f'(0) + \frac{p\pi}{l} \left[ -\frac{p\pi}{l} \bar{f}_c(p) \right] \\
 &= -\frac{p^2 \pi^2}{l^2} \bar{f}_c(p) + f'(l)(-1)^p - f'(0)
 \end{aligned} \tag{4}$$

**Note.** if  $u = u(x, t)$ , then

$$\begin{aligned}
 F_s \left[ \frac{\partial u}{\partial x} \right] &= \frac{-p\pi}{l} F_c(u) \\
 F_c \left[ \frac{\partial u}{\partial x} \right] &= \frac{p\pi}{l} F_s(u) - u(0, t) + (-1)^p u(l, t) \\
 F_s \left[ \frac{\partial^2 u}{\partial x^2} \right] &= \frac{p^2 \pi^2}{l^2} F_s(u) + \frac{p\pi}{l} [u(0, t) - (-1)^p u(l, t)] \\
 F_c \left[ \frac{\partial^2 u}{\partial x^2} \right] &= -\frac{p^2 \pi^2}{l^2} F_c(u) + \frac{\partial u}{\partial x}(l, t) \cos p\pi - \frac{\partial u}{\partial x}(0, t)
 \end{aligned}$$

**Example 51.** Using finite Fourier transform, solve

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}, \text{ given } u(0, t) = 0 \text{ and } u(4, t) = 0$$

and  $u(x, 0) = 2x$  where  $0 < x < 4$ ,  $t > 0$ .

**Solution.** Since  $u(0, t)$  given, take finite Fourier sine transform.

$$\begin{aligned}
 \int_0^4 \frac{\partial u}{\partial t} \sin \frac{p\pi x}{4} dx &= \int_0^4 \frac{\partial^2 u}{\partial x^2} \sin \frac{p\pi x}{4} dx \\
 \frac{d\bar{u}_s}{dt} &= F_s \left( \frac{\partial^2 u}{\partial x^2} \right) = -\frac{p^2 \pi^2}{16} \bar{u}_s + \frac{p\pi}{4} [u(0, t) - (-1)^n u(4, t)] \\
 &= -\frac{p^2 \pi^2}{16} \bar{u}_s \text{ using } u(0, t) = 0, u(4, t) = 0 \\
 \frac{d\bar{u}_s}{\bar{u}_s} &= -\frac{p^2 \pi^2}{16} dt
 \end{aligned}$$

$$\text{Integrating} \quad \log \bar{u}_s = -\frac{p^2 \pi^2}{16} t + c$$

$$\bar{u}_s = A e^{-\frac{\pi^2 p^2}{16} t} \tag{1}$$

Since  $u(x, 0) = 2x$

$$\begin{aligned}
 \bar{u}_s(p, 0) &= \int_0^4 (2x) \sin \left( \frac{p\pi x}{4} \right) dx = \left[ (2x) \left( -\frac{4}{p\pi} \cos \left( \frac{p\pi x}{4} \right) + (2) \frac{16}{p^2 \pi^2} \sin \left( \frac{p\pi x}{4} \right) \right) \right]_0^4 \\
 &= -\frac{32}{p\pi} \cos p\pi
 \end{aligned} \tag{2}$$

Using (2) in (1), we get  $\bar{u}_s(p, 0) = A = -\frac{32}{p\pi} \cos p\pi = -\frac{32}{p\pi}(-1)^p$

Substituting in (1), we get

$$\therefore \bar{u}_s = -\frac{32}{p\pi}(-1)^p e^{-\frac{p^2\pi^2}{16}t}$$

By inversion Theorem, we get

$$u(x, t) = \frac{2}{4} \sum_{p=1}^{\infty} \frac{32}{p\pi} (-1)^{p+1} e^{-\frac{p^2\pi^2}{16}t} \sin\left(\frac{p\pi x}{4}\right) \quad \text{Ans.}$$

**Example 52.** Solve  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}, \quad 0 < x < 6, t > 0$

given  $\frac{\partial u}{\partial x}(0, t) = 0, \frac{\partial u}{\partial x}(6, t) = 0$  and  $u(x, 0) = 2x$ .

**Solution.** Since  $\frac{\partial u}{\partial x}(0, t)$  is given, use finite Fourier cosine transform of

$$\begin{aligned} \frac{\partial u}{\partial t} &= \frac{\partial^2 u}{\partial x^2} \\ \int_0^6 \frac{\partial u}{\partial t} \cos \frac{p\pi x}{6} dx &= \int_0^6 \frac{\partial^2 u}{\partial x^2} \cos \frac{p\pi x}{6} dx \\ \frac{d\bar{u}_c}{dt} &= -\frac{p^2\pi^2}{36} \bar{u}_c + \frac{\partial u}{\partial x}(6, t) \cos p\pi - \frac{\partial u}{\partial x}(0, t) = -\frac{p^2\pi^2}{36} \bar{u}_c \\ \Rightarrow \frac{d\bar{u}_c}{\bar{u}_c} &= -\frac{p^2\pi^2}{36} dt \quad \Rightarrow \log \bar{u}_c = -\frac{p^2\pi^2}{36} t + c \\ \bar{u}_c &= A e^{-\frac{p^2\pi^2}{36}t} \quad \dots (1) \end{aligned}$$

$$u(x, 0) = 2x.$$

$\therefore$  At  $t = 0$

$$\bar{u}_c(p, 0) = \int_0^6 (2x) \cos \frac{p\pi x}{6} dx = \frac{72}{p^2\pi^2} (\cos p\pi - 1) \quad \dots (2)$$

Using this in (1), we get

$$\bar{u}_c(p, 0) = A = \frac{72}{p^2\pi^2} (\cos p\pi - 1)$$

Substituting in (1), we get

$$\bar{u}_c(p, t) = \frac{72}{p^2\pi^2} (\cos p\pi)$$

By inversion theorem, we get

$$\begin{aligned} u(x, t) &= \frac{1}{l} \bar{f}_c(0) + \frac{2}{l} \sum_{p=1}^{\infty} \bar{f}_c(p) \cos\left(\frac{p\pi x}{l}\right) \\ &= \frac{1}{6} \int_0^6 (2x) dx + \frac{2}{6} \sum_{p=1}^{\infty} \frac{72}{p^2\pi^2} (\cos p\pi - 1) e^{-\frac{p^2\pi^2}{36}t} \cdot \cos\left(\frac{p\pi x}{6}\right) \\ &= 6 + \frac{24}{\pi^2} \sum_{p=1}^{\infty} \frac{(\cos p\pi - 1)}{p^2} e^{-\frac{p^2\pi^2}{36}t} \cos\left(\frac{p\pi x}{6}\right). \quad \text{Ans.} \end{aligned}$$

**Example 53.** Solve  $\frac{\partial u}{\partial t} = 2 \frac{\partial^2 u}{\partial x^2}$ ,  $0 < x < 4, t > 0$

given  $u(0, t) = 0$ ;  $u(4, t) = 0$ ;  $u(x, 0) = 3 \sin \pi x - 2 \sin 5\pi x$ .

**Solution.** Since  $u(0, t)$  is given, take finite Fourier sine transform. The equation becomes (as in example 62 on page 68).

$$\frac{d \bar{u}_s}{dt} = 2 \left[ -\frac{p^2 \pi^2}{16} \bar{u}_s + \frac{p\pi}{4} \{u(0, t) - (-1)^p u(4, t)\} \right] = -\frac{p^2 \pi^2}{8} \bar{u}_s$$

Solving, we get  $\bar{u}_s = A e^{-\frac{p^2 \pi^2 t}{8}}$  ... (1)

$$u(x, 0) = 3 \sin \pi x - 2 \sin 5\pi x$$

$$\begin{aligned} \text{Taking sine Transform, } \bar{u}_s(p, 0) &= \int_0^4 (3 \sin \pi x - 2 \sin 5\pi x) \sin \frac{p\pi x}{4} dx \\ &= 0, \text{ if } p \neq 4 \quad \text{or} \quad p \neq 20. \end{aligned}$$

If  $p = 4$ ,  $\bar{u}_s(4, 0) = 6$

If  $p = 20$ ,  $\bar{u}_s(20, 0) = -4$

$$\begin{aligned} u(x, t) &= \frac{2}{4} \sum_{p=1}^{\infty} \bar{u}_s(p, t) \sin \left( \frac{p\pi x}{4} \right) \\ &= \frac{1}{2} [6 e^{-\frac{p^2 \pi^2 t}{8}} \sin \pi x - 4 e^{-\frac{p^2 \pi^4 t}{8}} \sin 5\pi x] \end{aligned}$$

where  $p$  in the first term is 4 and  $p$  in the second term is 20

$$= 3e^{-2\pi^2 t} \sin \pi x - 2e^{-50\pi^2 t} \sin 5\pi x. \quad \text{Ans.}$$

## EXERCISE 41.6

1. Solve  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$ ,  $0 < x < 6, t > 0$  given that  $u(0, t) = 0 = u(6, t)$  and  $u(x, 0) = \begin{cases} 1 & \text{for } 0 < x < 3 \\ 0 & \text{for } 3 < x < 6 \end{cases}$

$$\text{Ans. } u(x, t) = \frac{2}{\pi} \sum_{p=1}^{\infty} \left( \frac{1 - \cos \frac{p\pi}{2}}{p} \right) e^{-\frac{p^2 \pi^2 t}{36}} \sin \left( \frac{p\pi x}{6} \right)$$

2. Solve  $\frac{\partial v}{\partial t} = \frac{\partial^2 v}{\partial x^2}$  subject to conditions  $v(0, t) = 1$ ,  $v(\pi, t) = 3$

$$v(x, 0) = 1 \text{ for } 0 < x < \pi, \quad t > 0 \quad \text{Ans. } v(x, t) = \frac{4}{\pi} \sum_{p=1}^{\infty} \frac{\cos p\pi}{p} e^{-p^2 t} \sin px + 1 + \frac{2x}{\pi}$$

3. Solve  $\frac{\partial \theta}{\partial t} = \frac{\partial^2 \theta}{\partial x^2}$

given  $\theta(0, t) = 0$ ,  $\theta(\pi, t) = 0$ ,  $\theta(x, 0) = 2x$  for  $0 < x < \pi, t > 0$

$$\text{Ans. } \theta(x, t) = 4 \sum_{n=1}^{\infty} \frac{1}{n} (-1)^{n+1} e^{-n^2 t} \sin nx$$

## LAPLACE TRANSFORM

---

---

### 42.1 INTRODUCTION

Laplace transforms help in solving the differential equations with boundary values without finding the general solution and the values of the arbitrary constants.

### 42.2 LAPLACE TRANSFORM

**Definition.** Let  $f(t)$  be function defined for all positive values of  $t$ , then

$$F(s) = \int_0^\infty e^{-st} f(t) dt$$

provided the integral exists, is called the **Laplace Transform** of  $f(t)$ . It is denoted as

$$L[f(t)] = F(s) = \int_0^\infty e^{-st} f(t) dt$$

### 42.3 IMPORTANT FORMULAE

$$1. L(1) = \frac{1}{s} \quad 2. L(t^n) = \frac{n!}{s^{n+1}}, \text{ when } n = 0, 1, 2, 3\dots$$

$$3. L(e^{at}) = \frac{1}{s-a} \quad (s > a) \quad 4. L(\cosh at) = \frac{s}{s^2 - a^2} \quad (s^2 > a^2)$$

$$5. L(\sinh at) = \frac{a}{s^2 - a^2} \quad (s^2 > a^2) \quad 6. L(\sin at) = \frac{a}{s^2 + a^2} \quad (s > 0)$$

$$7. L(\cos at) = \frac{s}{s^2 + a^2} \quad (s > 0)$$

$$1. L(1) = \frac{1}{s}$$

$$\text{Proof. } L(1) = \int_0^\infty 1 \cdot e^{-st} dt = \left[ \frac{e^{-st}}{-s} \right]_0^\infty = -\frac{1}{s} \left[ \frac{1}{e^{st}} \right]_0^\infty = -\frac{1}{s} [0 - 1] = \frac{1}{s}$$

$$\text{Hence } L(1) = \frac{1}{s}$$

**Proved.**

$$2. L(t^n) = \frac{n!}{s^{n+1}} \quad \text{where } n \text{ and } s \text{ are positive.}$$

$$\text{Proof. } L(t^n) = \int_0^\infty e^{-st} t^n dt$$

$$\text{Putting } st = x \quad \text{or} \quad t = \frac{x}{s} \quad \text{or} \quad dt = \frac{dx}{s}$$

Thus, we have  $L(t^n) = \int_0^\infty e^{-x} \left(\frac{x}{s}\right)^n \frac{dx}{s} \Rightarrow L(t^n) = \frac{1}{s^{n+1}} \int_0^\infty e^{-x} \cdot x^n dx$

 $\Rightarrow L(t^n) = \frac{\boxed{n+1}}{s^{n+1}} \Rightarrow L(t^n) = \frac{n!}{s^{n+1}} \quad \left[ \begin{array}{l} \boxed{n+1} = \int_0^\infty e^{-x} \cdot x^n dx \\ \text{and} \quad \boxed{n+1} = n! \end{array} \right] \quad \text{Proved.}$

3.  $\boxed{L(e^{at}) = \frac{1}{s-a}}$ , where  $s > a$

**Proof.**  $L(e^{at}) = \int_0^\infty e^{-st} \cdot e^{at} dt = \int_0^\infty e^{-st+at} dt$

 $= \int_0^\infty e^{(a-s)t} dt = \int_0^\infty e^{-(s-a)t} dt = \left[ \frac{e^{-(s-a)t}}{-(s-a)} \right]_0^\infty = -\frac{1}{s-a} \left[ \frac{1}{e^{(s-a)t}} \right]_0^\infty$ 
 $= \frac{-1}{(s-a)} (0-1) = \frac{1}{s-a} \quad \text{Proved.}$

4.  $\boxed{L(\cosh at) = \frac{s}{s^2 - a^2}}$

**Proof.**  $L(\cosh at) = L\left[\frac{e^{at} + e^{-at}}{2}\right] \quad \left( \because \cosh at = \frac{e^{at} + e^{-at}}{2} \right)$

 $= \frac{1}{2} L(e^{at}) + \frac{1}{2} L(e^{-at}) = \frac{1}{2} \left[ \frac{1}{s-a} + \frac{1}{s+a} \right] \quad \left[ L(e^{at}) = \frac{1}{s-a} \right]$ 
 $= \frac{1}{2} \left[ \frac{s+a+s-a}{s^2 - a^2} \right] = \frac{s}{s^2 - a^2} \quad \text{Proved.}$

5.  $\boxed{L(\sinh at) = \frac{a}{s^2 - a^2}}$

**Proof.**  $L(\sinh at) = L\left[\frac{1}{2}(e^{at} - e^{-at})\right]$

 $= \frac{1}{2}[L(e^{at}) - L(e^{-at})] = \frac{1}{2} \left[ \frac{1}{s-a} - \frac{1}{s+a} \right] = \frac{1}{2} \left[ \frac{s+a-s+a}{s^2 - a^2} \right]$ 
 $= \frac{a}{s^2 - a^2} \quad \text{Proved.}$

6.  $\boxed{L(\sin at) = \frac{a}{s^2 + a^2}}$

**Proof.**  $L(\sin at) = L\left[\frac{e^{iat} - e^{-iat}}{2i}\right] \quad \left( \because \sin at = \frac{e^{iat} - e^{-iat}}{2i} \right)$

 $= \frac{1}{2i} [L(e^{iat}) - L(e^{-iat})] = \frac{1}{2i} [L(e^{iat}) - L(e^{-iat})]$ 
 $= \frac{1}{2i} \left[ \frac{1}{s-ia} - \frac{1}{s+ia} \right] = \frac{1}{2i} \frac{s+ia-s+ia}{s^2 + a^2} = \frac{1}{2i} \frac{2ia}{s^2 + a^2} = \frac{a}{s^2 + a^2} \quad \text{Proved.}$

7.  $\boxed{L(\cos at) = \frac{s}{s^2 + a^2}}$

**Proof.**  $L(\cos at) = L\left(\frac{e^{iat} + e^{-iat}}{2}\right) \quad \left( \because \cos at = \frac{e^{iat} + e^{-iat}}{2} \right)$

$$\begin{aligned}
 &= \frac{1}{2} [\mathcal{L}(e^{iat}) + \mathcal{L}(e^{-iat})] = \frac{1}{2} [\mathcal{L}(e^{iat}) + \mathcal{L}(e^{-iat})] = \frac{1}{2} \left[ \frac{1}{s-i\alpha} + \frac{1}{s+i\alpha} \right] = \frac{1}{2} \frac{s+i\alpha+s-i\alpha}{s^2+\alpha^2} \\
 &= \frac{s}{s^2+\alpha^2} \quad \text{Proved.}
 \end{aligned}$$

**Example 1.** Find the Laplace transform of  $f(t)$  defined as

$$f(t) = \begin{cases} \frac{t}{k}, & \text{when } 0 < t < k \\ 1, & \text{when } t > k \end{cases}$$

$$\begin{aligned}
 \mathbf{Solution.} \quad \mathcal{L}[f(t)] &= \int_0^k \frac{t}{k} e^{-st} dt + \int_k^\infty 1 \cdot e^{-st} dt = \frac{1}{k} \left[ \left( t \frac{e^{-st}}{-s} \right)_0^k - \int_0^k \frac{e^{-st}}{-s} dt \right] + \left[ \frac{e^{-st}}{-s} \right]_k^\infty \\
 &= \frac{1}{k} \left[ \frac{ke^{-ks}}{-s} - \left( \frac{e^{-st}}{s^2} \right)_0^k \right] + \frac{e^{-ks}}{s} = \frac{1}{k} \left[ \frac{ke^{-ks}}{-s} - \frac{e^{-sk}}{s^2} + \frac{1}{s^2} \right] + \frac{e^{-ks}}{s} \\
 &= -\frac{e^{-sk}}{s} - \frac{1}{k} \frac{e^{-ks}}{s^2} + \frac{1}{k} \frac{1}{s^2} + \frac{e^{-ks}}{s} = \frac{1}{ks^2} [-e^{-ks} + 1] \quad \mathbf{Ans.}
 \end{aligned}$$

**Example 2.** Find the Laplace transform of the function  $f(t) = \begin{cases} t-1, & 1 < t < 2 \\ 3-t, & 2 < t < 3 \end{cases}$  (U.P., II Semester, 2009)

**Solution.** The given function is periodic with period 3.

$$\begin{aligned}
 \mathcal{L}[f(t)] &= \int_1^3 f(t) e^{-st} dt \\
 &= \left[ \int_1^2 f(t) e^{-st} dt + \int_2^3 f(t) e^{-st} dt \right] \\
 &= \left[ \int_1^2 (t-1) e^{-st} dt + \int_2^3 (3-t) e^{-st} dt \right] \\
 &= \left[ \left\{ (t-1) \frac{e^{-st}}{-s} - \frac{e^{-st}}{(-s)^2} \right\}_1^2 + \left\{ (3-t) \frac{e^{-st}}{-s} + \frac{e^{-st}}{(-s)^2} \right\}_2^3 \right] \\
 &= \left[ \left\{ \frac{e^{-2s}}{-s} - \frac{e^{-2s}}{s^2} + \frac{e^{-s}}{s^2} \right\} + \left\{ \frac{e^{-3s}}{-s} - \frac{e^{-2s}}{s^2} - \frac{e^{-2s}}{s^2} \right\} \right] \\
 &= \left[ -\frac{e^{-2s}}{s} - \frac{e^{-2s}}{s^2} + \frac{e^{-s}}{s^2} + \frac{e^{-3s}}{s^2} + \frac{e^{-2s}}{s} - \frac{e^{-2s}}{s^2} \right] \\
 &= \left[ \frac{1}{s^2} (-e^{-2s} + e^{-s} + e^{-3s} - e^{-2s}) \right] = \frac{1}{s^2} [e^{-s} - 2e^{-2s} + e^{-3s}] \quad \mathbf{Ans.}
 \end{aligned}$$

**Example 3.** Find the Laplace transform of  $F(t) = \begin{cases} 1, & 0 \leq t < 1 \\ t, & 1 \leq t < 2 \\ t^2, & 2 \leq t < \infty \end{cases}$  (Q. Bank U.P. 2001)

**Solution.** Here, we have  $F(t) = \begin{cases} 1, & 0 \leq t < 1 \\ t, & 1 \leq t < 2 \\ t^2, & 2 \leq t < \infty \end{cases}$

$$\mathcal{L}[F(t)] = \int_0^\infty e^{-st} \cdot F(t) dt = \int_0^1 e^{-st} dt + \int_1^2 t e^{-st} dt + \int_2^\infty t^2 e^{-st} dt$$

$$\begin{aligned}
&= \left( \frac{e^{-st}}{-s} \right)_0^1 + \left( t \frac{e^{-st}}{-s} - \frac{e^{-st}}{s^2} \right)_1^2 + \left( t^2 \frac{e^{-st}}{-s} \right)_2^\infty - \int_2^\infty 2t \cdot \frac{e^{-st}}{-s} dt \\
&= \left( \frac{1-e^{-s}}{s} \right) + \left( \frac{-2}{s} e^{-2s} - \frac{e^{-2s}}{s^2} \right) - \left( \frac{e^{-s}}{-s} - \frac{e^{-s}}{s^2} \right) + \frac{4}{s} e^{-2s} + \frac{2}{s} \int_2^\infty t e^{-st} dt \\
&= \frac{1}{s} + \frac{2}{s} e^{-2s} + \frac{e^{-s}}{s^2} - \frac{e^{-2s}}{s^2} + \frac{2}{s} \left[ \left( t \frac{e^{-st}}{-s} \right)_2^\infty - \int_2^\infty 1 \cdot \frac{e^{-st}}{-s} dt \right] \\
&= \frac{1}{s} + \frac{2}{s} e^{-2s} + \frac{e^{-s}}{s^2} - \frac{e^{-2s}}{s^2} + \frac{2}{s} \left[ \frac{2}{s} e^{-2s} + \frac{1}{s} \left( \frac{e^{-st}}{-s} \right)_2^\infty \right] \\
&= \frac{1}{s} + \frac{2}{s} e^{-2s} + \frac{e^{-s}}{s^2} + \frac{3}{s^2} e^{-2s} + \frac{2}{s^3} e^{-2s}. \tag{Ans.}
\end{aligned}$$

**Example 4.** Find the Laplace transform of  $f(t) = \begin{cases} t^2, & 0 < t < 2 \\ t-1, & 2 < t < 3 \\ 7, & t > 3 \end{cases}$

(U.P., II Semester, June 2007)

$$\begin{aligned}
\text{Solution. } L[f(t)] &= \int_0^\infty e^{-st} f(t) dt = \int_0^2 t^2 e^{-st} dt + \int_2^3 (t-1) e^{-st} dt + \int_3^\infty 7 e^{-st} dt \\
&\quad \left[ \int I II = I II_1 - I' II_{11} + I'' II_{111} - \dots \right] \\
&= \left[ t^2 \left( \frac{e^{-st}}{(-s)} \right) - 2t \frac{e^{-st}}{(-s)^2} + 2 \frac{e^{-st}}{(-s)^3} \right]_0^2 + \left[ (t-1) \left( \frac{e^{-st}}{(-s)} \right) - \frac{e^{-st}}{(-s)^2} \right]_2^\infty + 7 \left[ \frac{e^{-st}}{-s} \right]_3^\infty \\
&= \left[ -4 \left( \frac{e^{-2s}}{s} \right) - 4 \left( \frac{e^{-2s}}{s^2} \right) - 2 \left( \frac{e^{-2s}}{s^3} \right) + \frac{2}{s^3} \right] + \left[ 2 \left( \frac{e^{-3s}}{-s} \right) - \frac{e^{-3s}}{s^2} + \frac{e^{-2s}}{s} + \frac{e^{-2s}}{s^2} \right] + 7 \left( 0 + \frac{e^{-3s}}{s} \right) \\
&= \frac{2}{s^3} + e^{-2s} \left[ -\frac{4}{s} - \frac{4}{s^2} - \frac{2}{s^3} \right] + e^{-3s} \left[ -\frac{2}{s} - \frac{1}{s^2} \right] + e^{-2s} \left[ \frac{1}{s} + \frac{1}{s^2} \right] + e^{-3s} \left[ \frac{7}{s} \right] \\
&= \frac{2}{s^3} + e^{-2s} \left[ -\frac{4}{s} - \frac{4}{s^2} - \frac{2}{s^3} + \frac{1}{s} + \frac{1}{s^2} \right] + e^{-3s} \left[ -\frac{2}{s} - \frac{1}{s^2} + \frac{7}{s} \right] \\
&= \frac{2}{s^3} + e^{-2s} \left[ -\frac{3}{s} - \frac{3}{s^2} - \frac{2}{s^3} \right] + e^{-3s} \left[ \frac{5}{s} - \frac{1}{s^2} \right] = \frac{2}{s^3} - \frac{e^{-2s}}{s^3} (2+3s+3s^2) + \frac{e^{-3s}}{s^2} (5s-1) \tag{Ans.}
\end{aligned}$$

**Example 5.** Find the Laplace transform of  $(1 + \sin 2t)$ .

**Solution.** Laplace transform of  $(1 + \sin 2t)$

$$\begin{aligned}
&= \int_0^\infty e^{-st} (1 + \sin 2t) dt = \int_0^\infty e^{-st} \left( 1 + \frac{e^{2it} - e^{-2it}}{2i} \right) dt \\
&= \frac{1}{2i} \int_0^\infty [2ie^{-st} + e^{(-s+2i)t} - e^{(-s-2i)t}] dt = \frac{1}{2i} \left[ \frac{2ie^{-st}}{-s} + \frac{e^{(-s+2i)t}}{-s+2i} - \frac{e^{(-s-2i)t}}{-s-2i} \right]_0^\infty \\
&= \frac{1}{2i} \left[ \left( 0 + \frac{2i}{s} \right) + \frac{1}{-s+2i} (0-1) - \frac{1}{-s-2i} (0-1) \right] \\
&= \frac{1}{2i} \left[ \frac{2i}{s} + \frac{1}{s-2i} - \frac{1}{s+2i} \right] = \frac{1}{2} \left[ \frac{2}{s} + \frac{4}{s^2+4} \right] = \frac{1}{s} + \frac{2}{s^2+4} \tag{Ans.}
\end{aligned}$$

**Alternate Method**

$$L(1 + \sin 2t) = L(1) + L \sin 2t = \frac{1}{s} + \frac{2}{s^2 + 4} \quad \text{Ans.}$$

**42.4 PROPERTIES OF LAPLACE TRANSFORM**

$$(1) \quad L[af_1(t) + bf_2(t)] = a L[f_1(t)] + b L[f_2(t)]$$

$$\begin{aligned} \text{Proof.} \quad L[af_1(t) + bf_2(t)] &= \int_0^\infty e^{-st} [af_1(t) + bf_2(t)] dt \\ &= a \int_0^\infty e^{-st} f_1(t) dt + b \int_0^\infty e^{-st} f_2(t) dt \\ &= a L[f_1(t)] + b L[f_2(t)] \end{aligned}$$

**Proved.****42.5 CHANGE OF SCALE PROPERTY**

$$\text{If } L\{f(t)\} = F(s) \text{ then } \boxed{L\{f(at)\} = \frac{1}{a} F\left(\frac{s}{a}\right)}$$

$$\begin{aligned} \text{Proof.} \quad L\{f(at)\} &= \int_0^\infty e^{-st} f(at) dt = \int_0^\infty e^{-\left(\frac{s}{a}\right)u} f(u) \frac{du}{a} \quad \left[ \text{Put } at = u \Rightarrow dt = \frac{du}{a} \right] \\ &= \frac{1}{a} \int_0^\infty e^{-\left(\frac{s}{a}\right)u} f(u) du = \frac{1}{a} \int_0^\infty e^{-\left(\frac{s}{a}\right)t} f(t) dt \\ &= \frac{1}{a} \int_0^\infty e^{-st} f(t) dt = \frac{1}{a} L\{f(t)\} = \frac{1}{a} F(s) \quad \left[ \text{Put } S = \frac{s}{a} \right] \\ &= \frac{1}{a} F\left(\frac{s}{a}\right) \end{aligned}$$

**Proved.**

$$\text{Example 6. If } L\{J_0(\sqrt{t})\} = \frac{e^{-\frac{1}{4s}}}{s}, \text{ find } L\{J_0(2\sqrt{t})\}.$$

**Solution.** Here, we have

$$L\{J_0(\sqrt{t})\} = \frac{e^{-\frac{1}{4s}}}{s}$$

By change of scale property,

$$L\{J_0(\sqrt{4t})\} = \frac{1}{4} \cdot \left\{ \frac{e^{-\frac{1}{4(s/4)}}}{(s/4)} \right\}$$

$$\Rightarrow L\{J_0(2\sqrt{t})\} = \frac{1}{s} e^{-1/s}$$

**Ans.****(2) First Shifting Theorem.** If  $L\{f(t)\} = F(s)$ , then

$$\boxed{L[e^{at} f(t)] = F(s-a)}$$

$$\begin{aligned} \text{Proof.} \quad L[e^{at} f(t)] &= \int_0^\infty e^{-st} e^{at} f(t) dt = \int_0^\infty e^{-(s-a)t} f(t) dt \\ &= \int_0^\infty e^{-rt} f(t) dt \quad \text{where } r = s - a \\ &= F(r) = F(s-a) \end{aligned}$$

**Proved.**

With the help of this property, we can have the following important results :

$$1. \quad L(e^{at} t^n) = \frac{n!}{(s-a)^{n+1}}$$

$$2. L(e^{at} \cosh bt) = \frac{s-a}{(s-a)^2 - b^2}$$

$$4. L(e^{at} \sin bt) = \frac{b}{(s-a)^2 + b^2}$$

$$3. L(e^{at} \sinh bt) = \frac{b}{(s-a)^2 - b^2}$$

$$5. L(e^{at} \cos bt) = \frac{s-a}{(s-a)^2 + b^2}$$

#### 42.6 HEAVISIDE'S SHIFTING THEOREM (Second Translation Property)

If  $L\{f(t)\} = F(s)$  and  $g(t) = \begin{cases} f(t-a), & t > a \\ 0, & 0 < t < a \end{cases}$  then prove that

$$L\{g(t)\} = e^{-as} F(s)$$

(U.P. II Semester, Summer 2006)

$$\begin{aligned} \text{Proof. } L\{g(t)\} &= \int_0^\infty e^{-st} g(t) dt \\ &= \int_0^a e^{-st} g(t) dt + \int_a^\infty e^{-st} g(t) dt \quad [g(t) = 0, \text{ when } 0 < t < a] \\ &= 0 + \int_a^\infty e^{-st} \cdot f(t-a) dt = \int_a^\infty e^{-st} f(t-a) dt \quad [\text{Put } t-a = u \Rightarrow dt = du] \\ &= \int_0^\infty e^{-s(u+a)} f(u) du = e^{-sa} \int_0^\infty e^{-su} f(u) du = e^{-as} \int_0^\infty e^{-st} f(t) dt \quad \text{Proved.} \end{aligned}$$

$$L\{g(t)\} = e^{-as} F(s)$$

**Example 7.** Find the Laplace transform of  $\cos^2 t$ .

**Solution.** We know that  $\cos 2t = 2 \cos^2 t - 1$

$$\begin{aligned} \cos^2 t &= \frac{1}{2}[\cos 2t + 1] \\ L(\cos^2 t) &= L\left[\frac{1}{2}(\cos 2t + 1)\right] = \frac{1}{2}[L(\cos 2t) + L(1)] \\ &= \frac{1}{2}\left[\frac{s}{s^2 + (2)^2} + \frac{1}{s}\right] = \frac{1}{2}\left[\frac{s}{s^2 + 4} + \frac{1}{s}\right] \end{aligned} \quad \text{Ans.}$$

**Example 8.** If  $L(\cos^2 t) = \frac{s^2 + 2}{s(s^2 + 4)}$ , find  $L(\cos^2 at)$ . (U.P., II Semester, Summer 2006)

**Solution.** We have,  $L(\cos^2 t) = \frac{s^2 + 2}{s(s^2 + 4)}$

By change of scale property, we have

$$L(\cos^2 at) = \frac{1}{a} \cdot \frac{\left(\frac{s}{a}\right)^2 + 2}{a \left[\left(\frac{s}{a}\right)^2 + 4\right]} = \frac{1}{a} \left[ \frac{\frac{s^2}{a^2} + 2a^2}{\frac{s^2}{a^2} + 4a^2} \right] = \frac{s^2 + 2a^2}{s(s^2 + 4a^2)} \quad \text{Ans.}$$

**Example 9.** Find the Laplace transform of  $t^{-\frac{1}{2}}$ .

**Solution.** We know that  $L(t^n) = \frac{n+1}{s^{n+1}}$

$$\text{Put } n = -\frac{1}{2}, L(t^{-1/2}) = \frac{\sqrt{-\frac{1}{2} + 1}}{s^{-1/2+1}} = \frac{\sqrt{\frac{1}{2}}}{\sqrt{s}} = \frac{\sqrt{\pi}}{\sqrt{s}}, \quad \text{where} \quad \frac{\sqrt{1}}{\sqrt{2}} = \sqrt{\pi} \quad \text{Ans.}$$

**Example 10.** Find the Laplace transform of  $2 \sin 2t \cos 4t$ .

**Solution.** We have

$$\begin{aligned} f(t) &= 2 \sin 2t \cos 4t = \sin \frac{2t+4t}{2} + \sin \frac{2t-4t}{2} = \sin 3t - \sin t \\ L[f(t)] &= L(\sin 3t) - L(\sin t) = \frac{3}{s^2+9} - \frac{1}{s^2+1} \end{aligned} \quad \text{Ans.}$$

**Example 11.** Find the Laplace transform of  $4 \sin^3 t$ .

**Solution.** We have

$$\begin{aligned} f(t) &= 4 \sin^3 t = 3 \sin t - \sin 3t \quad [\sin 3t = 3 \sin t - 4 \sin^3 t] \\ L[f(t)] &= 3 L(\sin t) - L(\sin 3t) = \frac{3}{s^2+1} - \frac{3}{s^2+9} \end{aligned} \quad \text{Ans.}$$

**Example 12.** Find the Laplace transform of  $4 \cosh 2t \sin 4t$ .

**Solution.** We have

$$\begin{aligned} f(t) &= 4 \cosh 2t \sin 4t = 4 \left( \frac{e^{2t} + e^{-2t}}{2} \right) \left( \frac{e^{4it} - e^{-4it}}{2i} \right) \\ &= \frac{1}{i} \left[ e^{(2+4i)t} - e^{(2-4i)t} + e^{(-2+4i)t} - e^{(-2-4i)t} \right] \\ L[f(t)] &= -i \left[ L(e^{(2+4i)t}) - L(e^{(2-4i)t}) + L(e^{(-2+4i)t}) - L(e^{(-2-4i)t}) \right] \\ &= -i \left[ \frac{1}{s-2-4i} - \frac{1}{s-2+4i} + \frac{1}{s+2-4i} - \frac{1}{s+2+4i} \right] \\ &= -i \left[ \left( \frac{1}{s-2-4i} - \frac{1}{s+2+4i} \right) - \left( \frac{1}{s-2+4i} - \frac{1}{s+2-4i} \right) \right] \\ &= -i \left[ \frac{4+8i}{s^2-(2+4i)^2} - \frac{4-8i}{s^2-(2-4i)^2} \right] \end{aligned} \quad \text{Ans.}$$

### EXERCISE 42.1

Find the Laplace transforms of the following:

- |                        |  |   |  |
|------------------------|--|---|--|
| 1. $t + t^2 + t^3$     | <b>Ans.</b> $\frac{1}{s^2} + \frac{2}{s^3} + \frac{6}{s^4}$                                | 2. $\sin t \cos t$                                | <b>Ans.</b> $\frac{1}{s^2+4}$                  |
| 3. $t^{7/2} e^{5t}$    | (M.D.U. Dec. 2009)   | <b>Ans.</b> $\frac{105\sqrt{\pi}}{16(s-5)^{9/2}}$ |  |
| 4. $\sin^3 2t$         | <b>Ans.</b> $\frac{48}{(s^2+4)(s^2+36)}$   |   |  |

$$12. \quad f(t) = \begin{cases} \cos\left(t - \frac{2\pi}{3}\right), & t > \frac{2\pi}{3} \\ 0, & t < \frac{2\pi}{3} \end{cases}$$

Ans.  $e^{\frac{-2\pi s}{3}} \cdot \frac{s}{s^2 + 1}$

### 42.7 EXISTENCE THEOREM

According to this theorem  $\int_0^\infty e^{-st} f(t) dt$  exists if  $\int_0^\lambda e^{-st} f(t) dt$  can actually be evaluated and its limit as  $\lambda \rightarrow \infty$  exists.

Otherwise we may use the following theorem:

If  $f(t)$  is continuous and  $\lim_{t \rightarrow \infty} [e^{-at} f(t)]$  is finite, then Laplace transform of  $f(t)$  i.e.

$\int_0^\infty e^{-st} f(t) dt$  exists for  $s > a$ .

It should however, be kept in mind that the above foresaid conditions are sufficient but not necessary.

For example;  $L\left(\frac{1}{\sqrt{t}}\right)$  exists though  $\frac{1}{\sqrt{t}}$  is infinite at  $t = 0$ . Similarly a function  $f(t)$  for

which  $\lim_{t \rightarrow \infty} [e^{-at} f(t)]$  is finite and having a finite discontinuity will have a Laplace transform of  $s > a$ .

### 42.8 LAPLACE TRANSFORM OF THE DERIVATIVE OF $f(t)$

$$L[f'(t)] = sL[f(t)] - f(0) \quad \text{where} \quad L[f(t)] = F(s).$$

**Proof.**  $L[f'(t)] = \int_0^\infty e^{-st} f'(t) dt$

Integrating by parts, we get

$$\begin{aligned} L[f'(t)] &= \left[ e^{-st} f(t) \right]_0^\infty - \int_0^\infty (-se^{-st}) f(t) dt \\ &= -f(0) + s \int_0^\infty e^{-st} f(t) dt \quad (e^{-st} f(t) = 0, \text{ when } t = \infty) \\ &= -f(0) + s L[f(t)] \end{aligned}$$

$L[f'(t)] = s L[f(t)] - f(0).$

Proved.

**Note.** Roughly, Laplace transform of derivative of  $f(t)$  corresponds to **multiplication** of the Laplace transform of  $f(t)$  by  $s$ .

### 42.9 LAPLACE TRANSFORM OF DERIVATIVE OF ORDER $n$ (M.D.U. Dec. 2009)

$$L[f^n(t)] = s^n L[f(t)] - s^{n-1} f(0) - s^{n-2} f'(0) - s^{n-3} f''(0) - \dots - f^{n-1}(0)$$

**Proof.** We have already proved in Article 42.8 that

$$L[f'(t)] = s L[f(t)] - f(0) \quad \dots(1)$$

Replacing  $f(t)$  by  $f'(t)$  and  $f'(t)$  by  $f''(t)$  in (1), we get

$$L[f''(t)] = s L[f'(t)] - f'(0) \quad \dots(2)$$

Putting the value of  $L[f'(t)]$  from (1) in (2), we have

$$L[f''(t)] = s[s L[f(t)] - f(0)] - f'(0)$$

$$\Rightarrow L[f''(t)] = s^2 L[f(t)] - sf(0) - f'(0)$$

$$\text{Similarly, } L[f'''(t)] = s^3 L[f(t)] - s^2 f(0) - s f'(0) - f''(0)$$

$$L[f^{(iv)}(t)] = s^4 L[f(t)] - s^3 f(0) - s^2 f'(0) - s f''(0) - f'''(0)$$

$$L[f^n(t)] = s^n L[f(t)] - s^{n-1} f(0) - s^{n-2} f'(0) - s^{n-3} f''(0) - \dots - f^{n-1}(0)$$

**Example 13.** Given  $L\left(2\sqrt{\frac{t}{\pi}}\right) = \frac{1}{s^{3/2}}$ , show that  $L\left(\frac{1}{\sqrt{\pi t}}\right) = \frac{1}{\sqrt{s}}$ . (U.P., II Semester, 2005)

**Solution.** Let  $F(t) = 2\sqrt{\frac{t}{\pi}} \Rightarrow F'(t) = \frac{1}{\sqrt{\pi t}}$ . Also  $F(0) = 0$

$$\therefore L\{F'(t)\} = s L\{F(t)\} - F(0) = s \cdot \frac{1}{s^{3/2}} - 0$$

$$\therefore L\left(\frac{1}{\sqrt{\pi t}}\right) = \frac{1}{\sqrt{s}}.$$

**Proved.**

**Example 14.** Find the Laplace transform of  $\sin \sqrt{t}$ ; Hence find  $L\left(\frac{\cos \sqrt{t}}{2\sqrt{t}}\right)$

$$\text{Solution. } \sin \sqrt{t} = \sqrt{t} - \frac{(\sqrt{t})^3}{3!} + \frac{(\sqrt{t})^5}{5!} - \dots$$

$$= t^{1/2} - \frac{t^{3/2}}{3!} + \frac{t^{5/2}}{5!} - \dots \quad \left[ \sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \right]$$

$$\therefore L(\sin \sqrt{t}) = L\left(t^{1/2} - \frac{t^{3/2}}{3!} + \frac{t^{5/2}}{5!} - \dots\right) = \frac{\Gamma 3/2}{s^{3/2}} - \frac{\Gamma 5/2}{3! s^{5/2}} + \frac{\Gamma 7/2}{5! s^{7/2}} - \dots$$

$$= \frac{\sqrt{\pi}}{2s^{3/2}} \left\{ 1 - \left( \frac{1}{2^2 s} \right) + \frac{1}{2!} \left( \frac{1}{2^2 s} \right)^2 - \dots \right\}$$

$$= \frac{\sqrt{\pi}}{2s^{3/2}} \left\{ 1 - \left( \frac{1}{2^2 s} \right) + \frac{1}{2!} \left( \frac{1}{2^2 s} \right)^2 - \dots \right\} \quad \left[ e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \right]$$

$$\Rightarrow L(\sin \sqrt{t}) = \frac{\sqrt{\pi}}{2s^{3/2}} e^{-(1/4s)}$$

$$\text{Now, } L\left[\frac{d}{dt}(\sin \sqrt{t})\right] = s L(\sin \sqrt{t}) - 0 \quad \left[ \because F(0) = 0 \text{ and } L\left[\frac{d}{dt}[F(t)]\right] = sF(s) \right]$$

$$L\left(\frac{\cos \sqrt{t}}{2\sqrt{t}}\right) = \frac{\sqrt{\pi}}{2\sqrt{s}} e^{-\left(\frac{1}{4s}\right)} \Rightarrow L\left(\frac{\cos \sqrt{t}}{\sqrt{t}}\right) = \frac{\sqrt{\pi}}{\sqrt{5}} e^{-1/4s}$$

**Ans.**

## 42.10 LAPLACE TRANSFORM OF INTEGRAL OF $f(t)$

$$L\left[\int_0^t f(t) dt\right] = \frac{1}{s} F(s) \quad \text{where } L[f(t)] = F(s)$$

**Proof.** Let  $\phi(t) = \int_0^t f(t) dt$  and  $\phi(0) = 0$  then  $\phi'(t) = f(t)$

We know the formula of Laplace transforms of  $\phi'(t)$  i.e.

$$L[\phi'(t)] = s L[\phi(t)] - \phi(0)$$

$$\Rightarrow L[\phi'(t)] = s L[\phi(t)] \quad [\phi(0) = 0]$$

$$\Rightarrow L[\phi(t)] = \frac{1}{s} L[\phi'(t)]$$

Putting the values of  $\phi(t)$  and  $\phi'(t)$ , we get

$$L\left[\int_0^t f(t) dt\right] = \frac{1}{s} L[f(t)] \Rightarrow \boxed{L\left[\int_0^t f(t) dt\right] = \frac{1}{s} F(s)} \quad \text{Proved.}$$

**Note.** (1) Laplace transform of Integral of  $f(t)$  corresponds to the division of the Laplace transform of  $f(t)$  by  $s$ .

$$(2) \quad \int_0^t f(t) dt = L^{-1}\left[\frac{1}{s} F(s)\right]$$

#### 42.11 LAPLACE TRANSFORM OF $t \cdot f(t)$ (Multiplication by $t$ )

If  $L[f(t)] = F(s)$ , then

$$L[t^n f(t)] = (-1)^n \frac{d^n}{ds^n} [F(s)]. \quad (\text{U.P., II Semester, Summer 2005})$$

$$\text{Proof. } L[f(t)] = F(s) = \int_0^\infty e^{-st} f(t) dt \quad \dots(1)$$

Differentiating (1) w.r.t. 's', we get

$$\begin{aligned} \frac{d}{ds}[F(s)] &= \frac{d}{ds} \left[ \int_0^\infty e^{-st} f(t) dt \right] = \int_0^\infty \frac{\partial}{\partial s} (e^{-st}) f(t) dt \\ &= \int_0^\infty (-t e^{-st}) f(t) dt = \int_0^\infty e^{-st} [-t f(t)] dt \\ &= L[-t f(t)] \Rightarrow L[t f(t)] = (-1)^1 \frac{d}{ds}[F(s)] \end{aligned}$$

$$\text{Similarly, } L[t^2 f(t)] = (-1)^2 \frac{d^2}{ds^2} [F(s)]$$

$$L[t^3 f(t)] = (-1)^3 \frac{d^3}{ds^3} [F(s)]$$

$$\boxed{L[t^n f(t)] = (-1)^n \frac{d^n}{ds^n} [F(s)]}$$

Proved.

#### 42.12 INITIAL AND FINAL VALUE THEOREMS

(a) **Initial Value Theorem.**  $L\{f(t)\} = F(s)$

$$\Rightarrow \lim_{t \rightarrow 0} f(t) = \lim_{s \rightarrow \infty} [sF(s)], \text{ provided the limit exists.}$$

$$\text{Proof. } L\{f'(t)\} = sL\{f(t)\} - f(0)$$

$$\Rightarrow \int_0^\infty e^{-st} f'(t) dt = sF(s) - f(0)$$

$$\Rightarrow \lim_{s \rightarrow \infty} \int_0^\infty e^{-st} f'(t) dt = \lim_{s \rightarrow \infty} [sF(s) - f(0)]$$

$$\Rightarrow \lim_{s \rightarrow \infty} [sF(s)] = f(0) + \int_0^\infty \left( \lim_{s \rightarrow \infty} e^{-st} \right) f'(t) dt$$

$$\begin{aligned}
 &= f(0) + \int_0^\infty (0) f'(t) dt \\
 &= f(0) + 0 = f(0) = \lim_{t \rightarrow 0} f(t)
 \end{aligned}
 \quad (\because \lim_{s \rightarrow \infty} e^{-st} = 0)$$

(b) **Final Value Theorem.**  $L\{f(t)\} = F(s)$

$$\Rightarrow \lim_{t \rightarrow \infty} f(t) = \lim_{s \rightarrow 0} [sF(s)], \text{ provided the limits exist.}$$

$$\text{Proof. } L\{f'(t)\} = sL\{f(t)\} - f(0) \Rightarrow \int_0^\infty e^{-st} f'(t) dt = sF(s) - f(0)$$

$$\Rightarrow \lim_{s \rightarrow 0} \int_0^\infty e^{-st} f'(t) dt = \lim_{s \rightarrow 0} [sF(s) - f(0)]$$

$$\Rightarrow \lim_{s \rightarrow 0} [sF(s) - f(0)] = \lim_{s \rightarrow 0} \int_0^\infty e^{-st} f'(t) dt$$

$$\Rightarrow \lim_{s \rightarrow 0} [sF(s) - f(0)] = \lim_{s \rightarrow 0} \int_0^\infty e^{-st} f'(t) dt$$

$$\Rightarrow \lim_{s \rightarrow 0} [sF(s) - f(0)] = \int_0^\infty \lim_{s \rightarrow 0} e^{-st} f'(t) dt = \int_0^\infty (1) f'(t) dt \quad \left[ \because \lim_{s \rightarrow 0} e^{-st} = 1 \right]$$

$$\Rightarrow \boxed{\lim_{s \rightarrow 0} [sF(s)] = \lim_{t \rightarrow \infty} f(t)}$$

**Example 15.** If  $L\{F(t)\} = \frac{1}{s(s+\beta)}$  then, find  $\lim_{t \rightarrow \infty} F(t)$

**Solution.** By final-value theorem,

$$\lim_{t \rightarrow \infty} F(t) = \lim_{s \rightarrow 0} sL\{F(t)\} = \lim_{s \rightarrow 0} \frac{s}{s(s+\beta)} = \lim_{s \rightarrow 0} \frac{1}{s+\beta} = \frac{1}{\beta} \quad \text{Ans.}$$

### 42.13. EXPONENTIAL INTEGRAL FUNCTION $\int_t^\infty \left( \frac{e^{-x}}{x} \right) dx$

$$\text{Let } f(t) = \int_t^\infty \frac{e^{-x}}{x} dx$$

$$\Rightarrow f'(t) = -\frac{e^{-t}}{t} \Rightarrow tf'(t) = -e^{-t} \quad [\text{Here - ve sign appears due to lower limit}]$$

Taking Laplace Transform of  $tf'(t)$ , we get  $L\{tf'(t)\} = L\{-e^{-t}\} = -L\{e^{-t}\}$

$$\Rightarrow -\frac{d}{ds} [sF(s) - f(0)] = -\frac{1}{s+1}$$

$$\Rightarrow \frac{d}{ds} [sF(s)] = \frac{1}{s+1} \quad [\because f(0) = \text{constant} \therefore \frac{d}{ds} f(0) = 0]$$

Integrating both the sides, we get

$$sF(s) = \log(s+1) + C \quad \dots(1)$$

Now, by final value theorem, we have

$$\lim_{s \rightarrow 0} sF(s) = \lim_{t \rightarrow \infty} f(t) \quad \dots(2)$$

$$\text{Hence, } \lim_{s \rightarrow 0} [sF(s)] = \lim_{s \rightarrow 0} [\log(s+1) + C] = 0 + C = C \quad \dots(3)$$

$$\text{Also, } \lim_{t \rightarrow \infty} [f(t)] = \lim_{t \rightarrow \infty} \int_t^\infty \left( \frac{e^{-x}}{x} \right) dx = 0 \quad \dots(4)$$

Putting the values of  $\lim_{s \rightarrow 0} [s F(s)]$  and  $\lim_{t \rightarrow \infty} [f(t)]$  from (3) and (4) in (2), we get  
 $C = 0$ .

Hence from (1),  $sF(s) = \log(s+1) \Rightarrow F(s) = \left\{ \frac{\log(s+1)}{s} \right\}$

$$\Rightarrow L \int_t^{\infty} \left( \frac{e^{-x}}{x} \right) dx = \left[ \frac{\log(s+1)}{s} \right]$$

**Example 16.** Find the Laplace Transform of  $t \sin at$ .

$$\begin{aligned} \text{Solution. } L(t \sin at) &= L \left( t \frac{e^{iat} - e^{-iat}}{2i} \right) = \frac{1}{2i} [L(t e^{iat}) - L(t e^{-iat})] \\ &= \frac{1}{2i} \left[ -\frac{d}{ds} \frac{1}{s-ia} + \frac{d}{ds} \frac{1}{s+ia} \right] = \frac{1}{2i} \left[ \frac{1}{(s-ia)^2} - \frac{1}{(s+ia)^2} \right] = \frac{1}{2i} \left[ \frac{(s+ia)^2 - (s-ia)^2}{(s-ia)^2 (s+ia)^2} \right] \\ &= \frac{1}{2i} \frac{(s^2 + 2ias - a^2) - (s^2 - 2ias - a^2)}{(s^2 + a^2)^2} = \frac{1}{2i} \frac{4ias}{(s^2 + a^2)^2} = \frac{2as}{(s^2 + a^2)^2} \quad \text{Ans.} \end{aligned}$$

**Example 17.** Find the Laplace transform of  $t \sinh at$ .

$$\begin{aligned} \text{Solution. } L(\sinh at) &= \frac{a}{s^2 - a^2} \\ L[t \sinh at] &= -\frac{d}{ds} \left( \frac{a}{s^2 - a^2} \right) = \frac{2as}{(s^2 - a^2)^2} \quad \text{Ans.} \end{aligned}$$

**Example 18.** Find the Laplace transform of  $t^2 \cos at$

$$\begin{aligned} \text{Solution. } L(\cos at) &= \frac{s}{s^2 + a^2} \\ L(t^2 \cos at) &= (-1)^2 \frac{d^2}{ds^2} \left[ \frac{s}{s^2 + a^2} \right] = \frac{d}{ds} \frac{(s^2 + a^2) \cdot 1 - s(2s)}{(s^2 + a^2)^2} = \frac{d}{ds} \frac{a^2 - s^2}{(s^2 + a^2)^2} \\ &= \frac{(s^2 + a^2)^2 (-2s) - (a^2 - s^2) \cdot 2(s^2 + a^2)(2s)}{(s^2 + a^2)^4} = \frac{(s^2 + a^2)(-2s) - (a^2 - s^2)4s}{(s^2 + a^2)^3} \\ &= \frac{-2s^3 - 2a^2s - 4a^2s + 4s^3}{(s^2 + a^2)^3} = \frac{2s(s^2 - 3a^2)}{(s^2 + a^2)^3} \quad \text{Ans.} \end{aligned}$$

**Example 19.** Obtain the Laplace transform of  $t^2 e^t \sin 4t$ .

(Uttarakhand II Sem., Summer 2010, U.P. II Semester, Summer 2002)

**Solution.**  $L(\sin 4t) = \frac{4}{s^2 + 16}$ ,

$$L(e^t \sin 4t) = \frac{4}{(s-1)^2 + 16}$$

$$L(t e^t \sin 4t) = -\frac{d}{ds} \left( \frac{4}{s^2 - 2s + 17} \right) = \frac{4(2s-2)}{(s^2 - 2s + 17)^2}$$

$$\begin{aligned}
 L(t^2 e^t \sin 4t) &= -\frac{d}{ds} \left( \frac{4(2s-2)}{(s^2-2s+17)^2} \right) = -4 \frac{(s^2-2s+17)^2 2 - (2s-2) 2(s^2-2s+17)(2s-2)}{(s^2-2s+17)^4} \\
 &= -4 \frac{(s^2-2s+17) 2 - 2(2s-2)^2}{(s^2-2s+17)^3} = \frac{-4(2s^2-4s+34-8s^2+16s-8)}{(s^2-2s+17)^3} \\
 &= \frac{-4(-6s^2+12s+26)}{(s^2-2s+17)^3} = \frac{8[3s^2-6s-13]}{(s^2-2s+17)^3} \quad \text{Ans.}
 \end{aligned}$$

**Example 20.** Find the Laplace transform of the function

$$f(t) = te^{-t} \sin 2t \quad (\text{U.P. II Semester, Summer 2002})$$

$$\text{Solution. } L[\sin 2t] = \frac{2}{s^2+4}$$

$$L[e^{-t} \sin 2t] = \frac{2}{(s+1)^2+4} = F(s) \quad (\text{say})$$

$$L(te^{-t} \sin 2t) = -F'(s) = -\frac{d}{ds} \left[ \frac{2}{(s+1)^2+4} \right] = \frac{2 \cdot 2(s+1)}{[(s+1)^2+4]^2} = \frac{4(s+1)}{[(s+1)^2+4]^2} \quad \text{Ans.}$$

## EXERCISE 42.2

Find the Laplace transforms of the following :

$$1. t_e^{at} \quad \text{Ans. } \frac{1}{(s-a)^2} \quad 2. t \cosh at \quad \text{Ans. } \frac{s^2+a^2}{(s^2-a^2)^2}$$

$$3. t \cos t \quad \text{Ans. } \frac{s^2-1}{(s^2+1)^2} \quad 4. t \cosh t \quad \text{Ans. } \frac{s^2+1}{(s^2-1)^2}$$

$$5. t^2 \sin t \quad \text{Ans. } \frac{2(3s^2-1)}{(s^2+1)^3} \quad 6. t^3 e^{-3t} \quad \text{Ans. } \frac{6}{(s+3)^4}$$

$$7. t \sin^2 3t \quad \text{Ans. } \frac{1}{2} \left[ \frac{1}{s^2} - \frac{s^2-36}{(s^2+36)^2} \right] \quad 8. t e^{at} \sin at \quad \text{Ans. } \frac{2a(s-a)}{(s^2-2as+2a^2)^2}$$

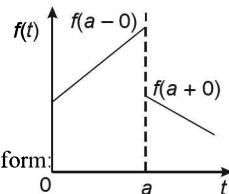

$$9. t e^{-t} \cosh t \quad \text{Ans. } \frac{s^2+2s+2}{(s^2+2s)^2} \quad 10. t^2 e^{-2t} \cos t \quad \text{Ans. } \frac{2(s^3+6s^2+9s+2)}{(s^2+4s+5)^3}$$

$$11. \int_0^t e^{-2t} t \sin^3 t dt \quad \text{Ans. } \frac{3(s+2)}{2s} \left[ \frac{1}{[(s+2)^2+9]^2} - \frac{1}{[(s+2)^2+1]^2} \right]$$

12. If  $f(t)$  is continuous, except for an ordinary discontinuity at  $t = a$ , ( $a > 0$ ) as given in the figure, then show that

$$L[f'(t)] = s[f(t)] - f(0) - e^{-as} [f(a+0) - f(a-0)] \quad (\text{U.P. II Semester 2003})$$

13. Pick the correct statement for final value theorem of Laplace transform:

$$(i) \quad \underset{t \rightarrow 0}{\text{Lt}} f(t) = \underset{s \rightarrow \infty}{\text{Lt}} s F(s) \quad (ii) \quad \underset{t \rightarrow \infty}{\text{Lt}} f(t) = \underset{s \rightarrow 0}{\text{Lt}} s F(s)$$

(U.P. II Semester 2010) **Ans. (ii)**

### 42.14 LAPLACE TRANSFORM OF $\frac{1}{t}f(t)$ (Division by $t$ )

If  $L[f(t)] = F(s)$ , then  $L\left[\frac{1}{t}f(t)\right] = \int_s^\infty f(s) ds$  (U.P. II Semester Summer, 2007, 2005)

**Proof.** We know that  $L[f(t)] = F(s)$  or  $F(s) = \int_0^\infty e^{-st} f(t) dt$  ... (1)

Integrating (1) w.r.t. 's', we have

$$\begin{aligned} \int_s^\infty F(s) ds &= \int_s^\infty \left[ \int_0^\infty e^{-st} f(t) dt \right] ds = \int_0^\infty f(t) \left[ \int_s^\infty e^{-st} ds \right] dt = \int_0^\infty f(t) \left[ \frac{e^{-st}}{-t} \right]_s^\infty dt \\ &= \int_0^\infty \frac{-f(t)}{t} \left[ e^{-st} \right]_s^\infty dt = \int_0^\infty \frac{-f(t)}{t} \left[ 0 - e^{-st} \right] dt = \int_0^\infty e^{-st} \left\{ \frac{1}{t} \cdot f(t) \right\} dt = L\left[\frac{1}{t}f(t)\right] \\ \Rightarrow \quad \boxed{L\left[\frac{1}{t}f(t)\right] = \int_0^\infty F(s) ds} &\qquad \text{Proved.} \end{aligned}$$

**Cor.**  $L^{-1} \int_s^\infty F(s) ds = \frac{1}{t} f(t)$

**Example 21.** Find the Laplace transform of  $\frac{\sin 2t}{t}$

**Solution.**  $L(\sin 2t) = \frac{2}{s^2 + 4}$

$$\begin{aligned} L\left(\frac{\sin 2t}{t}\right) &= \int_s^\infty \frac{2}{s^2 + 4} ds = 2 \cdot \frac{1}{2} \left[ \tan^{-1} \frac{s}{2} \right]_s^\infty = \left[ \tan^{-1} \infty - \tan^{-1} \frac{s}{2} \right] = \frac{\pi}{2} - \tan^{-1} \frac{s}{2} \\ &= \cot^{-1} \frac{s}{2} \qquad \text{Ans.} \end{aligned}$$

**Example 22.** Find the Laplace transform of  $f(t) = \int_0^t \frac{\sin at}{t} dt$

(M.D.U., Dec. 2009, U.P., II Semester, Summer 2005)

**Solution.**  $L(\sin at) = \frac{a}{s^2 + a^2}$

$$L\left(\frac{\sin at}{t}\right) = \int_s^\infty \frac{a}{s^2 + a^2} ds = \left[ \tan^{-1} \frac{s}{a} \right]_s^\infty = \frac{\pi}{2} - \tan^{-1} \frac{s}{a} = \cot^{-1} \frac{s}{a}$$

Hence,  $L\left[\int_0^t \frac{\sin at}{t} dt\right] = \frac{1}{s} \cot^{-1} \frac{s}{a}$

**Ans.**

**Example 23.** Find the Laplace transform of:

$$\frac{\cos at - \cos bt}{t} \quad (\text{Uttarakhand, II Semester, June 2007, U.P., II Semester, 2004})$$

**Solution.** Here,  $f(t) = \frac{\cos at - \cos bt}{t}$

We know that,  $L(\cos at - \cos bt) = L(\cos at) - L(\cos bt) = \frac{s}{s^2 + a^2} - \frac{s}{s^2 + b^2}$

$$\begin{aligned}
L\left(\frac{\cos at - \cos bt}{t}\right) &= \int_s^\infty \left( \frac{s}{s^2 + a^2} - \frac{s}{s^2 + b^2} \right) ds = \left[ \frac{1}{2} \log(s^2 + a^2) - \frac{1}{2} \log(s^2 + b^2) \right]_s^\infty \\
&= \frac{1}{2} \left[ \log \frac{s^2 + a^2}{s^2 + b^2} \right]_s^\infty = \frac{1}{2} \left[ \log \frac{1 + \frac{a^2}{s^2}}{1 + \frac{b^2}{s^2}} \right]_s^\infty = \frac{1}{2} \log 1 - \frac{1}{2} \log \frac{1 + \frac{a^2}{s^2}}{1 + \frac{b^2}{s^2}} = 0 - \frac{1}{2} \log \frac{s^2 + a^2}{s^2 + b^2} \quad [\log 1 = 0] \\
&= \frac{1}{2} \log \frac{s^2 + b^2}{s^2 + a^2}
\end{aligned}$$

**Ans.**

**Example 24.** If  $f(t) = \frac{e^{at} - \cos bt}{t}$ , find the Laplace transform of  $f(t)$ .

(U.P. II Semester, Summer 2003)

$$\text{Solution. } f(t) = \frac{e^{at} - \cos bt}{t} = \frac{e^{at}}{t} - \frac{\cos bt}{t}$$

$$\text{We know that, } L(e^{at} - \cos bt) = \left( \frac{1}{s-a} - \frac{s}{s^2 + b^2} \right)$$

$$\begin{aligned}
\therefore L\left(\frac{e^{at} - \cos bt}{t}\right) &= \int_s^\infty \left( \frac{1}{s-a} - \frac{s}{s^2 + b^2} \right) ds = \left[ \log(s-a) - \frac{1}{2} \log(s^2 + b^2) \right]_s^\infty \\
&= \left[ \frac{2 \log(s-a) - \log(s^2 + b^2)}{2} \right]_s^\infty = \frac{1}{2} \left[ \log(s-a)^2 - \log(s^2 + b^2) \right]_s^\infty \\
&= \frac{1}{2} \left[ \log \frac{(s-a)^2}{s^2 + b^2} \right]_s^\infty = \frac{1}{2} \left[ \log \left\{ \frac{\left(1 - \frac{a}{s}\right)^2}{1 + \frac{b^2}{s^2}} \right\} \right]_s^\infty \\
&= \frac{1}{2} \left[ 0 - \log \left( \frac{\left(1 - \frac{a}{s}\right)^2}{1 + \frac{b^2}{s^2}} \right) \right] = \frac{1}{2} \left[ \log \frac{s^2 + b^2}{(s-a)^2} \right]
\end{aligned}$$

**Ans.**

**Example 25.** Find the Laplace transform of  $\frac{1 - \cos t}{t^2}$ .

$$\text{Solution. } L(1 - \cos t) = L(1) - L(\cos t) = \frac{1}{s} - \frac{s}{s^2 + 1}$$

$$\begin{aligned}
L\left[\frac{1 - \cos t}{t}\right] &= \int_s^\infty \left( \frac{1}{s} - \frac{s}{s^2 + 1} \right) ds = \left[ \log s - \frac{1}{2} \log(s^2 + 1) \right]_s^\infty \\
&= \frac{1}{2} \left[ \log s^2 - \log(s^2 + 1) \right]_s^\infty = \frac{1}{2} \left[ \log \frac{s^2}{s^2 + 1} \right]_s^\infty \\
&= \frac{1}{2} \left[ \log \frac{1}{\left(1 + \frac{1}{s^2}\right)} \right]_s^\infty = \frac{1}{2} \left[ 0 - \log \frac{s^2}{s^2 + 1} \right] = -\frac{1}{2} \log \frac{s^2}{s^2 + 1}
\end{aligned}$$

Again,  $L\left[\frac{1-\cos t}{t^2}\right] = -\frac{1}{2} \int_s^\infty \log \frac{s^2}{s^2+1} ds = -\frac{1}{2} \int_s^\infty \left(\log \frac{s^2}{s^2+1} \cdot 1\right) ds$

Integrating by parts, we have,

$$\begin{aligned} &= -\frac{1}{2} \left[ \log \frac{s^2}{s^2+1} \cdot s - \int \frac{s^2+1}{s^2} \frac{(s^2+1)2s - s^2(2s)}{(s^2+1)^2} s ds \right]_s^\infty \\ &= -\frac{1}{2} \left[ s \log \frac{s^2}{s^2+1} - 2 \int \frac{1}{s^2+1} ds \right]_s^\infty = -\frac{1}{2} \left[ s \log \frac{s^2}{s^2+1} - 2 \tan^{-1} s \right]_s^\infty \\ &= -\frac{1}{2} \left[ 0 - 2\left(\frac{\pi}{2}\right) - s \log \frac{s^2}{s^2+1} + 2 \tan^{-1} s \right] = -\frac{1}{2} \left[ -\pi - s \log \frac{s^2}{s^2+1} + 2 \tan^{-1} s \right] \\ &= \frac{\pi}{2} + \frac{s}{2} \log \frac{s^2}{s^2+1} - \tan^{-1} s = \left(\frac{\pi}{2} - \tan^{-1} s\right) + \frac{s}{2} \log \frac{s^2}{s^2+1} = \cot^{-1} s + \frac{s}{2} \log \frac{s^2}{s^2+1} \quad \text{Ans.} \end{aligned}$$

**Example 26.** Evaluate  $L\left[e^{-4t} \frac{\sin 3t}{t}\right]$

**Solution.**  $L [\sin 3t] = \frac{3}{s^2 + 3^2}$

$$\Rightarrow L\left[\frac{\sin 3t}{t}\right] = \int_s^\infty \frac{3}{s^2 + 9} ds = \left[ \frac{3}{3} \tan^{-1} \frac{s}{3} \right]_s^\infty = \left[ \tan^{-1} \frac{s}{3} \right]_s^\infty = \frac{\pi}{2} - \tan^{-1} \frac{s}{3} = \cot^{-1} \frac{s}{3}$$

$$L\left[e^{-4t} \frac{\sin 3t}{t}\right] = \cot^{-1} \frac{s+4}{3} = \tan^{-1} \frac{3}{s+4} \quad \text{Ans.}$$

### EXERCISE 42.3

Find Laplace transform of the following:

1.  $\frac{1}{t}(1-e^t)$       Ans.  $\log \frac{s-1}{s}$       2.  $\frac{1}{t}(e^{-at} - e^{-bt})$       Ans.  $\log \frac{s+b}{s+a}$

3.  $\frac{1}{t}(1-\cos at)$       Ans.  $-\frac{1}{2} \log \frac{s^2}{s^2+a^2}$

4.  $\frac{1}{t} \sin^2 t$       Ans.  $\frac{1}{4} \log \frac{s^2+4}{s^2}$       5.  $\frac{1}{t} \sinh t$       Ans.  $-\frac{1}{2} \log \frac{s-1}{s+1}$

6.  $\frac{1}{t}(e^{-t} \sin t)$       Ans.  $\cot^{-1}(s+1)$       7.  $\frac{1}{t}(1-\cos t)$       Ans.  $\frac{1}{2} [\log(s^2+1) - \log s^2]$

8.  $\int_0^\infty \frac{1}{t} e^{-2t} \sin t dt$       Ans.  $\frac{1}{s} \cot^{-1}(s+2)$       9.  $\int_0^\infty \frac{e^{-t} - e^{-3t}}{t} dt$       Ans.  $\log 3$

### 42.15 LAPLACE TRANSFORM OF ERROR FUNCTION

**Example 27.** Find  $L \{ \operatorname{erf} \sqrt{t} \}$  and hence prove that

$$L \{ t \operatorname{erf} 2\sqrt{t} \} = \frac{3s+8}{s^2(s+4)^{3/2}} \quad (\text{U.P. II Semester, Summer 2001})$$

**Solution.** We know that  $\operatorname{erf} \sqrt{t} = \frac{2}{\sqrt{\pi}} \int_0^{\sqrt{t}} e^{-x^2} dx$

$$\begin{aligned}
&= \frac{2}{\sqrt{\pi}} \int_0^{\sqrt{t}} \left( 1 - x^2 + \frac{x^4}{2!} - \frac{x^6}{3!} + \dots \right) dx = \frac{2}{\sqrt{\pi}} \left[ x - \frac{x^3}{3} + \frac{x^5}{10} - \frac{x^7}{42} + \dots \right]_0^{\sqrt{t}} \\
&= \frac{2}{\sqrt{\pi}} \left[ \sqrt{t} - \frac{t^{3/2}}{3} + \frac{t^{5/2}}{10} - \frac{t^{7/2}}{42} + \dots \right] \\
L\{erf\sqrt{t}\} &= \frac{2}{\sqrt{\pi}} \left[ \frac{\overline{3}}{\overline{2}} - \frac{\overline{5}}{\overline{2}} + \frac{\overline{7}}{\overline{2}} - \frac{\overline{9}}{\overline{2}} + \dots \right] \\
&= \frac{2}{\sqrt{\pi}} \left[ \frac{1}{2} \left| \frac{1}{2} \right| - \frac{3}{2} \cdot \frac{1}{2} \left| \frac{1}{2} \right| + \frac{5}{2} \cdot \frac{3}{2} \cdot \frac{1}{2} \left| \frac{1}{2} \right| - \frac{7}{2} \cdot \frac{5}{2} \cdot \frac{3}{2} \cdot \frac{1}{2} \left| \frac{1}{2} \right| + \dots \right] \quad \left[ \because \left| \frac{1}{2} \right| = \sqrt{\pi} \right] \\
&= \frac{1}{s^{3/2}} - \frac{1}{2} \frac{1}{s^{5/2}} + \frac{1.3}{2.4} \frac{1}{s^{7/2}} - \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{5}{6} \frac{1}{s^{9/2}} + \dots \\
&= \frac{1}{s^{3/2}} \left[ 1 - \frac{1}{2} \cdot \frac{1}{s} + \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{1}{s^2} - \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{5}{6} \frac{1}{s^3} + \dots \right] \\
&= \frac{1}{s^{3/2}} \left[ 1 - \frac{1}{2} \cdot \frac{1}{s} + \frac{\left( -\frac{1}{2} \right) \left( -\frac{3}{2} \right)}{2!} \frac{1}{s^2} + \frac{\left( -\frac{1}{2} \right) \left( -\frac{3}{2} \right) \left( -\frac{5}{2} \right)}{3!} \frac{1}{s^3} + \dots \right] \\
&= \frac{1}{s^{3/2}} \left[ 1 + \frac{1}{s} \right]^{-\frac{1}{2}} = \frac{1}{s^{3/2}} \left[ \frac{s}{s+1} \right]^{\frac{1}{2}} = \frac{1}{s \sqrt{(s+1)}} \quad \text{Ans.}
\end{aligned}$$

Now,  $L\{erf(2\sqrt{t})\} = L\{erf\sqrt{4t}\} = \frac{1}{4} \frac{1}{\frac{s}{4} \sqrt{\frac{s}{4} + 1}} = \frac{2}{s \sqrt{s+4}}$

$$\begin{aligned}
L\{t.erf(2\sqrt{t})\} &= -\frac{d}{ds} \frac{2}{\sqrt{s^3 + 4s^2}} = -2 \left( -\frac{1}{2} \right) \left[ s^3 + 4s^2 \right]^{-\frac{3}{2}} (3s^2 + 8s) \\
&= \frac{3s^2 + 8s}{(s^3 + 4s^2)^{3/2}} = \frac{s(3s+8)}{s^3(s+4)^{3/2}} = \frac{3s+8}{s^2(s+4)^{3/2}} \quad \text{Proved.}
\end{aligned}$$

#### 42.16 COMPLEMENTARY ERROR FUNCTION

This function is defined by

$$erf_c(\sqrt{t}) = 1 - erf(\sqrt{t}) = 1 - \frac{2}{\sqrt{\pi}} \int_0^{\sqrt{t}} e^{-x^2} dx$$

Now,  $L\{erf_c(\sqrt{t})\} = L\left\{1 - \frac{2}{\sqrt{\pi}} \int_0^{\sqrt{t}} e^{-x^2} dx\right\} = L(1) - \frac{2}{\sqrt{\pi}} L\left\{\int_0^{\sqrt{t}} e^{-x^2} dx\right\} = \frac{1}{s} - \frac{1}{s \sqrt{s+1}}$

$$\begin{aligned}
 &= \frac{\sqrt{(s+1)} - 1}{s \sqrt{(s+1)}} = \frac{\{\sqrt{(s+1)} - 1\} \{\sqrt{(s+1)} + 1\}}{s \sqrt{(s+1)} \{\sqrt{(s+1)} + 1\}} \\
 &= \frac{s+1-1}{s \sqrt{s+1} (\sqrt{s+1} + 1)} = \frac{1}{\sqrt{(s+1)} \{\sqrt{(s+1)} + 1\}}
 \end{aligned}$$

$$\therefore L[\operatorname{erfc}(\sqrt{t})] = \frac{1}{\sqrt{s+1} \{\sqrt{s+1} + 1\}}$$

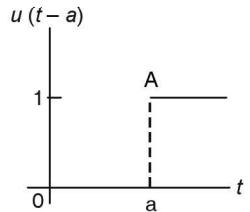

**Ans.**

#### 42.17 UNIT STEP FUNCTION

With the help of unit step functions, we can find the inverse transform of functions, which cannot be determined with previous methods.

The unit step function  $u(t-a)$  is defined as follows:

$$u(t-a) = \begin{cases} 0, & \text{when } t < a \\ 1, & \text{when } t \geq a \end{cases} \quad \text{where } a \geq 0$$

#### 42.18 LAPLACE TRANSFORM OF UNIT FUNCTION

$$L[u(t-a)] = \frac{e^{-as}}{s}$$

$$\text{Proof. } L[u(t-a)] = \int_0^\infty e^{-st} u(t-a) dt = \int_0^a e^{-st} \cdot 0 dt + \int_a^\infty e^{-st} \cdot 1 dt = 0 + \left[ \frac{e^{-st}}{-s} \right]_a^\infty$$

$$L[u(t-a)] = \frac{e^{-as}}{s}$$

**Proved.**

**Example 28.** Express the following function in terms of unit step functions and find its Laplace transform:

$$f(t) = \begin{cases} 8, & t < 2 \\ 6, & t \geq 2 \end{cases}$$

$$\text{Solution. } f(t) = \begin{cases} 8+0, & t < 2 \\ 8-2, & t \geq 2 \end{cases} = 8 + \begin{cases} 0, & t < 2 \\ -2, & t \geq 2 \end{cases} = 8 + (-2) \begin{cases} 0, & t < 2 \\ 1, & t \geq 2 \end{cases} = 8 - 2u(t-2)$$

$$L\{f(t)\} = 8L(1) - 2L u(t-2) = \frac{8}{s} - 2 \frac{e^{-2s}}{s}$$

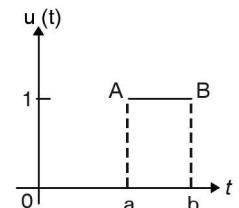

**Ans.**

**Example 29.** Draw the graph of  $u(t-a) - u(t-b)$ .

**Solution.** As in Art 42.17 the graph of  $u(t-a)$  is a straight line parallel to  $t$ -axis from  $A$  to  $\infty$ .

Similarly, the graph of  $u(t-b)$  is a straight line parallel to  $t$ -axis from  $B$  to  $\infty$ .

Hence, the graph of  $u(t-a) - u(t-b)$  is  $AB$ .

### 42.19 SECOND SHIFTING THEOREM

$$\text{If } L[f(t)] = F(s), \text{ then } \boxed{L[f(t-a) \cdot u(t-a)] = e^{-as}F(s)}$$

**Proof.**  $L[f(t-a) \cdot u(t-a)] = \int_0^\infty e^{-st} [f(t-a) \cdot u(t-a)] dt$

$$= \int_0^a e^{-st} f(t-a) \cdot 0 dt + \int_a^\infty e^{-st} f(t-a)(1) dt = \int_a^\infty e^{-st} f(t-a) dt$$

$$= \int_0^\infty e^{-s(u+a)} f(u) du, \quad \text{where } u = t - a$$

$$= e^{-sa} \int_0^\infty e^{-su} f(u) du = e^{-sa} F(s)$$

**Proved.**

**Example 30.** Express the following function in terms of unit step function and find its Laplace transform:

$$f(t) = \begin{cases} E, & a < t < b \\ 0, & t \geq b \end{cases}$$

**Solution.**  $f(t) = E \begin{cases} 1, & a < t < b \\ 0, & t \geq b \end{cases} \quad \boxed{L[f(t-a) \cdot u(t-a)] = e^{-as}F(s)}$

$$L\{f(t)\} = E \left[ \frac{e^{-as}}{s} - \frac{e^{-bs}}{s} \right]$$

**Ans.**

**Example 31.** Express the following function in terms of unit step function :

$$f(t) = \begin{cases} t-1, & 1 < t < 2 \\ 3-t, & 2 < t < 3 \end{cases}$$

and find its Laplace transform. (U.P.; II Semester, 2009)

**Solution.**  $f(t) = \begin{cases} t-1, & 1 < t < 2 \\ 3-t, & 2 < t < 3 \end{cases}$

$$= (t-1)[u(t-1) - u(t-2)] + (3-t)[u(t-2) - u(t-3)]$$

$$= (t-1)u(t-1) - (t-1)u(t-2) + (3-t)u(t-2) + (t-3)u(t-3)$$

$$= (t-1)u(t-1) - 2(t-2)u(t-2) + (t-3)u(t-3)$$

$$= e^{-s} L(t) - 2e^{-2s} L(t) - e^{-3s} L(t)$$

$$\quad \boxed{L[f(t-a) \cdot u(t-a)] = e^{-as}F(s)}$$

$$L\{f(t)\} = \frac{e^{-s}}{s^2} - 2 \frac{e^{-2s}}{s^2} + \frac{e^{-3s}}{s^2}$$

**Ans.**

**Example 32.** Find  $L\{F(t)\}$  if

$$F(t) = \begin{cases} \sin\left(t - \frac{\pi}{3}\right), & t > \frac{\pi}{3} \\ 0, & t < \frac{\pi}{3} \end{cases}$$

**Solution.**  $L\{F(t)\} = e^{-\frac{s\pi}{3}} L(\sin t) \quad \left[ \because a = \frac{\pi}{3} \right]$

$$= e^{-\frac{s\pi}{3}} \cdot \frac{1}{s^2 + 1} \quad (\text{Using second shifting property})$$

**Ans.**

**42.20 THEOREM.**  $L[f(t)u(t-a)] = e^{-as}L[f(t+a)]$ 

**Proof.** 
$$\begin{aligned} L[f(t)u(t-a)] &= \int_0^\infty e^{-st} [f(t)u(t-a)] dt \\ &= \int_0^a e^{-st} [f(t)u(t-a)] dt + \int_a^\infty e^{-st} [f(t)u(t-a)] dt = 0 + \int_a^\infty e^{-st} f(t)(1) dt \\ &= \int_a^\infty e^{-s(y+a)} f(y+a) dy = e^{-as} \int_a^\infty e^{-sy} f(y+a) dy \quad (t-a=y) \\ &= e^{-as} \int_a^\infty e^{-st} f(t+a) dt = e^{-as} L[f(t+a)] \end{aligned}$$

**Proved.****Example 33.** Find the Laplace transform of  $t^2 u(t-3)$ .

**Solution.** 
$$\begin{aligned} t^2 u(t-3) &= [(t-3)^2 + 6(t-3) + 9] u(t-3) \\ &= (t-3)^2 u(t-3) + 6(t-3)u(t-3) + 9u(t-3) \\ L[t^2 u(t-3)] &= L[(t-3)^2 \cdot u(t-3)] + 6L[(t-3)u(t-3)] + 9L[u(t-3)] \\ &= e^{-3s} \left[ \frac{2}{s^3} + \frac{6}{s^2} + \frac{9}{s} \right] \end{aligned}$$

**Aliter.**  $L[t^2 u(t-3)] = e^{-3s} L(t+3)^2 = e^{-3s} L[t^2 + 6t + 9] = e^{-3s} \left[ \frac{2}{s^3} + \frac{6}{s^2} + \frac{9}{s} \right]$  **Ans.**

**Example 34.** Find the Laplace transform of  $e^{-2t} u_\pi(t)$  where

**Solution.** 
$$u_\pi(t) = \begin{cases} 0; & t < \pi \\ 1; & t > \pi \end{cases}$$

$$u_\pi(t) = u(t-\pi)$$

$$L[u_\pi(t)] = L[u(t-\pi)] = \frac{e^{-\pi s}}{s}$$

$$L[e^{-2t} u_\pi(t)] = \frac{e^{-\pi(s+2)}}{s+2}$$
 **Ans.**

**Example 35.** Express the following function in terms of unit step function and find its Laplace

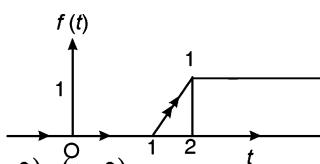

transform  $f(t) = \begin{cases} 0, & 0 < t < 1 \\ t-1, & 1 < t < 2 \\ 1, & 2 < t \end{cases}$  (U.P. II Semester, Summer 2002)

**Solution.** The above function shown in the figure is expressed in algebraic form

$$f(t) = \begin{cases} 0, & 0 < t < 1 \\ t-1, & 1 < t < 2 \\ 1, & 2 < t \end{cases} \dots (1)$$

$$\begin{aligned} f(t) &= (t-1)[u(t-1) - u(t-2)] + u(t-2) \\ &= (t-1)u(t-1) - u(t-2)\{t-1-1\} = (t-1)u(t-1) - (t-2)u(t-2) \end{aligned}$$

$$Lf(t) = L(t-1)u(t-1) - L(t-2)u(t-2) = \frac{e^{-s}}{s^2} - \frac{e^{-2s}}{s^2}$$
 **Ans.**

**Example 36.** Represent  $f(t) = \sin 2t$ ,  $2\pi < t < 4\pi$  and  $f(t) = 0$  otherwise, in terms of unit step function and then find its Laplace transform.

**Solution.**  $f(t) = \begin{cases} \sin 2t, & 2\pi < t < 4\pi \\ 0, & \text{otherwise} \end{cases}$

$$\begin{aligned} f(t) &= \sin 2t [u(t-2\pi) - u(t-4\pi)] \\ L[f(t)] &= L[\sin 2t \cdot u(t-2\pi)] - L[\sin 2t \cdot u(t-4\pi)] \\ &= e^{-2\pi s} L \sin 2(t+2\pi) - e^{-4\pi s} L \sin 2(t+4\pi) \\ &= e^{-2\pi s} L \sin 2t - e^{-4\pi s} L \sin(2t) \\ &= e^{-2\pi s} \frac{2}{s^2 + 4} - e^{-4\pi s} \frac{2}{s^2 + 4} = \left(e^{-2\pi s} - e^{-4\pi s}\right) \frac{2}{s^2 + 4} \end{aligned}$$

**Ans.**

**Example 37.** A function  $f(t)$  obeys the equation  $f(t) + 2 \int_0^t f(t) dt = \cosh 2t$

Find the Laplace transform of  $f(t)$ .

(U.P. II Semester Summer 2006)

**Solution.** We have,  $f(t) + 2 \int_0^t f(t) dt = \cosh 2t$

Taking Laplace transformation of both the sides, we get

$$\begin{aligned} L\{f(t)\} + 2L \int_0^t f(t) dt &= L(\cosh 2t) \quad \Rightarrow \quad F(s) + 2 \cdot \frac{1}{s} F(s) = \frac{s}{s^2 - 4} \\ \Rightarrow \quad F(s) \left\{ 1 + \frac{2}{s} \right\} &= \frac{s}{s^2 - 4} \quad \Rightarrow \quad F(s) \left\{ \frac{s+2}{s} \right\} = \frac{s}{s^2 - 4} \\ \Rightarrow \quad F(s) &= \left( \frac{s}{s^2 - 4} \right) \left( \frac{s}{s+2} \right) \quad \Rightarrow \quad F(s) = \frac{s^2}{(s^2 - 4)(s+2)} \quad \text{Ans.} \end{aligned}$$

#### EXERCISE 42.4

Find the Laplace transform of the following:

1.  $f(t) = \begin{cases} t-1, & 1 < t < 2 \\ 0, & \text{otherwise} \end{cases}$

**Ans.**  $\frac{e^{-s} - e^{-2s}}{s^2} - \frac{e^{-2s}}{s}$

**Ans.**  $\frac{e^{-(s-1)}}{s-1}$

2.  $e^t u(t-1)$

**Ans.**  $\log \frac{s-2}{s} + \frac{1}{s^2} + \frac{s^3}{s^4 + 4}$

3.  $\frac{1-e^{2t}}{t} + tu(t) + \cosh t \cos t$

**Ans.**  $\frac{e^{-2s}}{s^3} (4s^2 + 4s + 2)$

4.  $t^2 u(t-2)$

**Ans.**  $\frac{e^{-4s}}{s^2 + 1} [\cos 4 + s \sin 4]$

5.  $\sin t u(t-4)$

**Ans.**  $\frac{K}{s^2} [e^{-2s} - (s+1)e^{-3s}]$

6.  $f(t) = K(t-2)[u(t-2) - u(t-3)]$

**Ans.**  $\frac{K\pi T}{s^2 T^2 + \pi^2} (e^{-2sT} - e^{-3sT})$

7.  $f(t) = K \frac{\sin \pi t}{T} [u(t-2T) - u(t-3T)]$

Express the following in terms of unit step functions and obtain Laplace transforms.

8.  $f(t) = \begin{cases} t, & 0 < t < 2 \\ 0, & 2 < t \end{cases}$

**Ans.**  $u(t) - u(t-2), \frac{1 - (2s+1)e^{-2s}}{s^2}$

9.  $f(t) = \begin{cases} \sin t, & 0 < t < \pi \\ t, & t > \pi \end{cases}$

**Ans.**  $\frac{1 + e^{-\pi s}}{s^2 + 1} + \frac{e^{-\pi s} (\pi s + 1)}{s^2}$

10.  $f(t) = \begin{cases} 4, & 0 < t < 1 \\ -2, & 1 < t < 3 \\ 5, & t > 3 \end{cases}$

Ans.  $\frac{4 - 6e^{-s} + 7e^{-3s}}{s}$

### 42.21. PERIODIC FUNCTIONS

Let  $f(t)$  be a periodic function with period  $T$ , then

$$L[f(t)] = \frac{\int_0^T e^{-st} f(t) dt}{1 - e^{-sT}}$$

**Proof.**  $L[f(t)] = \int_0^\infty e^{-st} f(t) dt = \int_0^T e^{-st} f(t) dt + \int_T^{2T} e^{-st} f(t) dt + \int_{2T}^{3T} e^{-st} f(t) dt + \dots$

Substituting  $t = u + T$  in second integral and  $t = u + 2T$  in third integral, and so on.

$$\begin{aligned} L[f(t)] &= \int_0^T e^{-st} f(t) dt + \int_0^T e^{-s(u+T)} f(u+T) du + \int_0^T e^{-s(u+2T)} f(u+2T) du + \dots \\ &= \int_0^T e^{-st} f(t) dt + e^{-sT} \int_0^T e^{-su} f(u) du + e^{-2sT} \int_0^T e^{-su} f(u) du + \dots \\ &\quad [f(u) = f(u+T) = f(u+2T) = f(u+3T) = \dots] \\ &= \int_0^T e^{-st} f(t) dt + e^{-sT} \int_0^T e^{-st} f(t) dt + e^{-2sT} \int_0^T e^{-st} f(t) dt + \dots \\ &= [1 + e^{-sT} + e^{-2sT} + e^{-3sT} + \dots] \int_0^T e^{-st} f(t) dt \quad \left[ 1 + a + a^2 + a^3 + \dots = \frac{1}{1-a} \right] \\ &= \frac{1}{1 - e^{-sT}} \int_0^T e^{-st} f(t) dt. \end{aligned}$$

**Proved.**

**Example 38.** Find the Laplace transform of the waveform

$$f(t) = \left( \frac{2t}{3} \right), 0 \leq t \leq 3.$$

**Solution.**  $L[f(t)] = \frac{1}{1 - e^{-sT}} \int_0^T e^{-st} f(t) dt$

$$\begin{aligned} L\left[\frac{2t}{3}\right] &= \frac{1}{1 - e^{-3s}} \int_0^3 e^{-st} \left( \frac{2}{3}t \right) dt = \frac{1}{1 - e^{-3s}} \frac{2}{3} \left[ \frac{te^{-st}}{-s} - (1) \frac{e^{-st}}{s^2} \right]_0^3 \\ &= \frac{2}{3} \frac{1}{1 - e^{-3s}} \left[ \frac{3e^{-3s}}{-s} - \frac{e^{-3s}}{s^2} + \frac{1}{s^2} \right] = \frac{2}{3} \cdot \frac{1}{1 - e^{-3s}} \left[ \frac{3e^{-3s}}{-s} + \frac{1 - e^{-3s}}{s^2} \right] \\ &= \frac{2e^{-3s}}{-s(1 - e^{-3s})} + \frac{2}{3s^2} \end{aligned}$$

Ans.

**Example 39.** Draw the graph and find the Laplace transform of the triangular wave function of period  $2C$  given by

$$f(t) = \begin{cases} t, & 0 < t \leq C \\ 2C - t, & C < t < 2C \end{cases}$$

(Uttarakhand, II Semester, June 2007)

**Solution.** Period =  $2C = T$

Laplace transform of periodic function  $f(t)$

$$\begin{aligned} L\{f(t)\} &= \frac{\int_0^T e^{-st} f(t) dt}{1 - e^{-sT}} \\ L\{f(t)\} &= \frac{1}{1 - e^{-2Cs}} \int_0^{2C} e^{-st} f(t) dt \quad (T = 2C) \end{aligned}$$

On putting the values of  $f(t)$ , we get

$$\begin{aligned}
L[f(t)] &= \frac{1}{1-e^{-2Cs}} \left[ \int_0^C e^{-st} t dt + \int_C^{2C} e^{-st} (2C-t) dt \right] \\
&= \frac{1}{1-e^{-2Cs}} \left[ \left\{ \frac{te^{-st}}{-s} - 1 \cdot \frac{e^{-st}}{(-s)^2} \right\}_0^C + \left\{ (2C-t) \frac{e^{-st}}{(-s)} - (-1) \frac{e^{-st}}{(-s)^2} \right\}_C^{2C} \right] \\
&= \frac{1}{1-e^{-2Cs}} \left[ \left\{ \frac{Ce^{-Cs}}{-s} - \frac{e^{-Cs}}{(-s)^2} - 0 + \frac{1}{s^2} \right\} + \left\{ (2C-2C) \frac{e^{-2Cs}}{(-s)} + \frac{e^{-2Cs}}{s^2} - \left( (2C-C) \frac{e^{-Cs}}{-s} + \frac{e^{-Cs}}{s^2} \right) \right\} \right] \\
&= \frac{1}{1-e^{-2Cs}} \left\{ -\frac{Ce^{-Cs}}{s} - \frac{e^{-Cs}}{s^2} + \frac{1}{s^2} + \frac{e^{-2Cs}}{s^2} + \frac{Ce^{-Cs}}{s} - \frac{e^{-Cs}}{s^2} \right\} \\
&= \frac{1}{1-e^{-2Cs}} \left\{ \frac{1}{s^2} (1 - 2e^{-Cs} + e^{-2Cs}) \right\} = \frac{(1-e^{-Cs})^2}{s^2(1+e^{-Cs})(1-e^{-Cs})} = \frac{1-e^{-Cs}}{s^2(1+e^{-Cs})} \quad \text{Ans.}
\end{aligned}$$

**Example 40.** Draw the graph of the periodic function

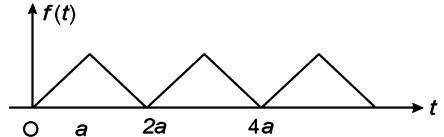

$$f(t) = \begin{cases} t, & 0 < t < \pi \\ \pi - t, & \pi < t < 2\pi \end{cases}$$

and find its Laplace transform. (U.P. Second Semester, 2003)

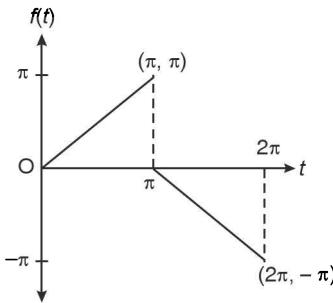

**Solution.** Period =  $2\pi = T$

Laplace transform of Periodic functions

$$\begin{aligned}
L\{f(t)\} &= \frac{\int_0^T e^{-st} f(t) dt}{1-e^{-sT}} \\
&= \frac{1}{1-e^{-2\pi s}} \int_0^{2\pi} e^{-st} f(t) dt = \frac{1}{1-e^{-2\pi s}} \left[ \int_0^\pi e^{-st} t dt + \int_\pi^{2\pi} e^{-st} (\pi - t) dt \right]
\end{aligned}$$

$$\begin{aligned}
&= \frac{1}{1-e^{-2\pi s}} \left[ \left\{ \frac{t \cdot e^{-st}}{-s} - 1 \cdot \frac{e^{-st}}{(-s)^2} \right\}_0^\pi + \left\{ (\pi - t) \frac{e^{-st}}{(-s)} - (-1) \frac{e^{-st}}{(-s)^2} \right\}_\pi^{2\pi} \right] \\
&= \frac{1}{1-e^{-2\pi s}} \left[ \left\{ \frac{\pi \cdot e^{-\pi s}}{-s} - \frac{e^{-\pi s}}{(-s)^2} - 0 + \frac{1}{s^2} \right\} + \left\{ (\pi - 2\pi) \frac{e^{-2\pi s}}{-s} + \frac{e^{-2\pi s}}{s^2} - \left( (\pi - \pi) \frac{e^{-\pi s}}{-s} + \frac{e^{-\pi s}}{s^2} \right) \right\} \right] \\
&= \frac{1}{1-e^{-2\pi s}} \left\{ -\frac{\pi e^{-\pi s}}{s} - \frac{e^{-\pi s}}{s^2} + \frac{1}{s^2} + \pi \frac{e^{-2\pi s}}{s} + \frac{e^{-2\pi s}}{s^2} - 0 - \frac{e^{-\pi s}}{s^2} \right\}
\end{aligned}$$

$$= \frac{1}{1-e^{-2\pi s}} \left\{ -\frac{\pi}{s} e^{-\pi s} + \frac{\pi}{s} e^{-2\pi s} + \frac{1}{s^2} - \frac{1}{s^2} e^{-\pi s} + \frac{1}{s^2} e^{-2\pi s} - \frac{e^{-\pi s}}{s^2} \right\}$$

$$\begin{aligned}
&= \frac{1}{1-e^{-2\pi s}} \left[ \frac{\pi}{s} (e^{-2\pi s} - e^{-\pi s}) + \frac{1}{s^2} (1+e^{-2\pi s} - 2e^{-\pi s}) \right] = \frac{-\pi s e^{-\pi s} (1-e^{-\pi s}) + (1-e^{-\pi s})^2}{s^2 (1+e^{-\pi s}) (1-e^{-\pi s})} \\
&= \frac{-\pi s e^{-\pi s} + 1 - e^{-\pi s}}{s^2 (1+e^{-\pi s})}
\end{aligned}
\tag{Ans.}$$

**Example 41.** Find the Laplace transform of the function (Halfwave rectifier)

$$f(t) = \begin{cases} \sin \omega t & \text{for } 0 < t < \frac{\pi}{\omega} \\ 0 & \text{for } \frac{\pi}{\omega} < t < \frac{2\pi}{\omega}. \end{cases} \quad (\text{U.P. II Semester, 2010, Summer 2002})$$

$$\begin{aligned}
\text{Solution.} \quad L[f(t)] &= \frac{1}{1-e^{-sT}} \int_0^T e^{-st} f(t) dt \\
&= \frac{1}{1-e^{-\frac{2\pi s}{\omega}}} \int_0^{\frac{2\pi}{\omega}} e^{-st} f(t) dt \quad \begin{array}{l} [f(t) \text{ is a periodic function} \\ T = \frac{2\pi}{\omega}] \end{array} \\
&= \frac{1}{1-e^{-\frac{2\pi s}{\omega}}} \left[ \int_0^{\frac{\pi}{\omega}} e^{-st} \sin \omega t dt + \int_{\frac{\pi}{\omega}}^{\frac{2\pi}{\omega}} e^{-st} \times 0 \times dt \right] \\
&= \frac{1}{1-e^{-\frac{2\pi s}{\omega}}} \int_0^{\frac{\pi}{\omega}} e^{-st} \sin \omega t dt \quad \left[ \int e^{ax} \sin bx dx = e^{ax} \frac{(a \sin bx - b \cos bx)}{a^2 + b^2} \right] \\
L[f(t)] &= \frac{1}{1-e^{-\frac{2\pi s}{\omega}}} \left[ \frac{e^{-st} (-s \sin \omega t - \omega \cos \omega t)}{s^2 + \omega^2} \right]_0^{\frac{\pi}{\omega}} \\
&= \frac{1}{1-e^{-\frac{2\pi s}{\omega}}} \left[ \frac{\omega e^{-\frac{\pi s}{\omega}} + \omega}{s^2 + \omega^2} \right] = \frac{\omega \left[ 1 + e^{-\frac{\pi s}{\omega}} \right]}{\left( s^2 + \omega^2 \right) \left[ 1 - e^{-\frac{2\pi s}{\omega}} \right]} = \frac{\omega \left[ 1 + e^{-\frac{\pi s}{\omega}} \right]}{\left( s^2 + \omega^2 \right) \left( 1 - e^{-\frac{\pi s}{\omega}} \right) \left( 1 + e^{-\frac{\pi s}{\omega}} \right)} \\
&= \frac{\omega}{\left( s^2 + \omega^2 \right) \left[ 1 - e^{-\frac{\pi s}{\omega}} \right]}
\end{aligned}
\tag{Ans.}$$

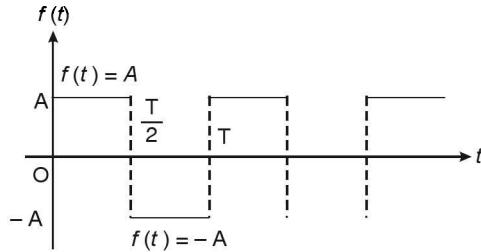

**Example 42.** Find the Laplace Transform of the Periodic function (saw tooth wave)

$$f(t) = \frac{kt}{T} \text{ for } 0 < t < T, \quad f(t+T) = f(t)$$

$$\begin{aligned}
\text{Solution.} \quad L[f(t)] &= \frac{1}{1-e^{-sT}} \int_0^T e^{-st} f(t) dt = \frac{1}{1-e^{-sT}} \int_0^T e^{-st} \frac{kt}{T} dt \\
&= \frac{1}{1-e^{-sT}} \frac{k}{T} \int_0^T e^{-st} \cdot t dt = \frac{k}{T(1-e^{-sT})} \left[ t \frac{e^{-st}}{-s} - \int 1 \cdot \frac{e^{-st}}{-s} dt \right]_0^T \quad \text{Integrating by parts} \\
&= \frac{k}{T(1-e^{-sT})} \left[ \frac{te^{-st}}{-s} - \frac{e^{-st}}{s^2} \right]_0^T = \frac{k}{T(1-e^{-sT})} \left[ \frac{Te^{-sT}}{-s} - \frac{e^{-sT}}{s^2} + \frac{1}{s^2} \right]
\end{aligned}$$

$$= \frac{k}{T(1-e^{-sT})} \left[ \frac{Te^{-sT}}{-s} + \frac{1}{s^2} (1 - e^{-sT}) \right] = -\frac{ke^{-sT}}{s(1-e^{-sT})} + \frac{k}{Ts^2} \quad \text{Ans.}$$

**Example 43.** Obtain Laplace transform of rectangular wave given by

**Solution.** We know that Laplace transform of a periodic function i.e.,

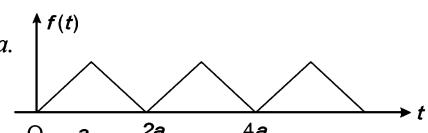

$$\begin{aligned} L[f(t)] &= \frac{\int_0^T e^{-st} f(t) dt}{1-e^{-sT}} = \frac{\int_{\frac{T}{2}}^{\frac{T}{2}} e^{-st} A dt + \int_{\frac{T}{2}}^T e^{-st} (-A) dt}{1-e^{-sT}} \\ &= A \frac{\left[ \frac{e^{-st}}{-s} \right]_{\frac{T}{2}}^{\frac{T}{2}} - \left[ \frac{e^{-st}}{-s} \right]_0^T}{1-e^{-sT}} = \frac{A}{1-e^{-sT}} \left[ -\frac{e^{-\frac{sT}{2}}}{s} + \frac{1}{s} + \frac{e^{-sT}}{s} - \frac{e^{-\frac{sT}{2}}}{s} \right] \\ &= \frac{A}{s(1-e^{-sT})} \left[ 1 - 2e^{-\frac{sT}{2}} + e^{-sT} \right] = \frac{A}{s(1-e^{-sT})} \left[ 1 - e^{-\frac{sT}{2}} \right]^2 \\ &= \frac{A \left[ 1 - e^{-\frac{sT}{2}} \right]^2}{s \left( 1 + e^{-\frac{sT}{2}} \right) \left( 1 - e^{-\frac{sT}{2}} \right)} = \frac{A \left( 1 - e^{-\frac{sT}{2}} \right)}{s \left( 1 + e^{-\frac{sT}{2}} \right)} = \frac{A \left( e^{\frac{sT}{4}} - e^{-\frac{sT}{4}} \right)}{s \left( e^{\frac{sT}{4}} + e^{-\frac{sT}{4}} \right)} = \frac{A}{s} \tanh \frac{sT}{4} \quad \text{Ans.} \end{aligned}$$

**Example 44.** Draw the graph of the following periodic function and find its Laplace transform:

$$f(t) = \begin{cases} t & \text{for } 0 < t \leq a \\ 2a-t & \text{for } a < t < 2a \end{cases} \quad (\text{U.P. II Semester, Summer 2002})$$

**Solution.** The given function is periodic with period  $2a$ .

$$\begin{aligned} \therefore L[f(t)] &= \frac{1}{1-e^{-2as}} \int_0^{2a} f(t) e^{-st} dt \\ &= \frac{1}{1-e^{-2as}} \left[ \int_0^a f(t) e^{-st} dt + \int_a^{2a} f(t) e^{-st} dt \right] \\ &= \frac{1}{1-e^{-2as}} \left[ \int_0^a t e^{-st} dt + \int_a^{2a} (2a-t) e^{-st} dt \right] \\ &= \frac{1}{1-e^{-2as}} \left[ \left\{ t \frac{e^{-st}}{-s} - \frac{e^{-st}}{(-s)^2} \right\}_0^a + \left\{ (2a-t) \frac{e^{-st}}{-s} + \frac{e^{-st}}{(-s)^2} \right\}_a^{2a} \right] \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{1-e^{-2as}} \left[ -\frac{ae^{-as}}{s} - \frac{e^{-as}}{s^2} + \frac{1}{s^2} + \frac{e^{-2as}}{s^2} + \frac{ae^{-as}}{s} - \frac{e^{-as}}{s^2} \right] = \frac{1}{1-e^{-2as}} \left[ \frac{1}{s^2} + \frac{e^{-2as}}{s^2} - 2 \frac{e^{-as}}{s^2} \right] \\
&= \frac{1}{s^2} \frac{1}{(1-e^{-2as})} (1+e^{-2as} - 2e^{-as}) = \frac{1}{s^2} \frac{(1-e^{-as})^2}{(1+e^{-as})(1-e^{-as})} = \frac{1}{s^2} \left[ \frac{1-e^{-as}}{1+e^{-as}} \right] \\
&= \frac{1}{s^2} \left[ \frac{\frac{as}{e^2} - \frac{-as}{e^2}}{\frac{as}{e^2} + \frac{-as}{e^2}} \right] = \frac{1}{s^2} \tanh \frac{as}{2} \quad \text{Ans.}
\end{aligned}$$

**Example 45.** A periodic square wave function  $f(t)$ , in terms of unit step functions, is written as

$$f(t) = k[u_0(t) - 2u_a(t) + 2u_{2a}(t) - 2u_{3a}(t) + \dots]$$

Show that the Laplace transform of  $f(t)$  is given by

$$L[f(t)] = \frac{k}{s} \tanh \left( \frac{as}{2} \right)$$

**Solution.**

$$\begin{aligned}
f(t) &= k[u_0(t) - 2u_a(t) + 2u_{2a}(t) - 2u_{3a}(t) + \dots] \\
f(t) &= k[u(t-0) - 2u(t-a) + 2u(t-2a) - 2u(t-3a) + \dots] \\
L[f(t)] &= k[Lu(t-0) - 2Lu(t-a) + 2Lu(t-2a) - 2Lu(t-3a) + \dots] \\
&= k \left[ \frac{1}{s} - 2 \frac{e^{-as}}{s} + 2 \frac{e^{-2as}}{s} - 2 \frac{e^{-3as}}{s} + \dots \right] = \frac{k}{s} [1 - 2e^{-as} + 2e^{-2as} - 2e^{-3as} + \dots] \\
&= \frac{k}{s} [1 - 2(e^{-as} - e^{-2as} + e^{-3as} - \dots)] = \frac{k}{s} \left[ 1 - 2 \frac{e^{-as}}{1+e^{-as}} \right] = \frac{k}{s} \left[ \frac{1+e^{-as}-2e^{-as}}{1+e^{-as}} \right] \\
&= \frac{k}{s} \left[ \frac{1-e^{-as}}{1+e^{-as}} \right] = \frac{k}{s} \left[ \frac{\frac{as}{e^2} - \frac{-as}{e^2}}{\frac{as}{e^2} + \frac{-as}{e^2}} \right] = \frac{k}{s} \tanh \frac{as}{2} \quad \text{Ans.}
\end{aligned}$$

### EXERCISE 42.5

1. Find the Laplace transform of the periodic function

$$f(t) = e^t \text{ for } 0 < t < 2\pi$$

$$\text{Ans. } \frac{e^{2(1-s)\pi} - 1}{(1-s)(1-e^{-2\pi s})}$$

2. Obtain Laplace transform of full wave rectified sine wave given by

$$f(t) = \sin \omega t, \quad 0 < t < \frac{\pi}{\omega}$$

$$\text{Ans. } \frac{\omega}{(s^2 + \omega^2)} \coth \frac{\pi s}{2\omega}$$

3. Find the Laplace transform of the staircase function

$$f(t) = kn, \quad np < t < (n+1)p, \quad n = 0, 1, 2, 3$$

$$\text{Ans. } \frac{ke^{ps}}{s(1-e^{-ps})}$$

**Find Laplace transform of the following:**

4.  $f(t) = t^2, \quad 0 < t < 2, \quad f(t+2) = f(t)$

$$\text{Ans. } \frac{2 - e^{-2s} - 4se^{-2s} - 4s^2e^{-2s}}{s^3(1-e^{-2s})}$$

5.  $f(t) = \begin{cases} 1, & 0 \leq t \leq \frac{a}{2} \\ -1, & \frac{a}{2} \leq t < a \end{cases}$  (U.P. II Semester, 2004)

$$\text{Ans. } \frac{1}{s} \tanh \frac{as}{4}$$

$$6. f(t) = \begin{cases} \cos \omega t, & 0 < t < \frac{\pi}{\omega} \\ 0, & \frac{\pi}{\omega} < t < \frac{2\pi}{\omega} \end{cases}$$

$$7. f(t) = \begin{cases} t, & 0 < t < 1 \\ 0, & 1 < t < 2 \end{cases} \quad f(t+2) = f(t)$$

$$8. f(t) = \begin{cases} \frac{2t}{T}, & 0 \leq t \leq \frac{T}{2} \\ \frac{2}{T}(T-t), & \frac{T}{2} \leq t \leq T \end{cases} \quad f(t+T) = f(t)$$

$$\text{Ans. } \frac{s}{(s^2 + \omega^2)} \left( 1 - e^{-\frac{\pi s}{\omega}} \right)$$

$$\text{Ans. } \frac{1 - e^{-s} (s+1)}{s^2 (1 - e^{-2s})}$$

$$\text{Ans. } \frac{2}{Ts^2} \tanh \frac{sT}{4} - \frac{1}{s \left( e^{\frac{sT}{2}} + 1 \right)}$$

## 42.22 IMPULSE FUNCTION

When a large force acts for a short time, then the product of the force and the time is called impulse in applied mechanics. The unit impulse function is the limiting function.

$$\delta(t-a) = \begin{cases} \frac{1}{\epsilon}, & a < t < a+\epsilon \\ 0, & \text{otherwise} \end{cases}$$

The value of the function (height of the strip in the figure) becomes infinite as  $\epsilon \rightarrow 0$  and the area of the rectangle is unity.

(1) The Unit Impulse function is defined as follows:

$$\delta(t-a) = \begin{cases} \infty & \text{for } t = a \\ 0 & \text{for } t \neq a \end{cases}$$

and

$$\int_0^\infty \delta(t-a) dt = 1$$

(2) Laplace Transform of Unit Impulse function

$$\begin{aligned} \int_0^\infty f(t) \delta(t-a) dt &= \int_a^{a+\epsilon} f(t) \cdot \frac{1}{\epsilon} dt \\ &= (a+\epsilon-a) f(\eta) \cdot \frac{1}{\epsilon} \\ &= f(\eta) \end{aligned}$$

$$\begin{cases} \text{Mean value Theorem} \\ \int_a^b f(t) dt = (b-a)f(\eta) \end{cases}$$

where  $a < \eta < a+\epsilon$

**Property I.**

$$\boxed{\int_0^\infty f(t) \delta(t-a) dt = f(a)}$$

as  $\epsilon \rightarrow 0$

**Note.** If  $f(t) = e^{-st}$  and  $L[\delta(t-a)] = e^{-as}$

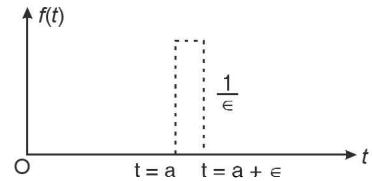

**Example 46.** Evaluate  $\int_{-\infty}^{\infty} e^{-5t} \delta(t-2) dt$ .

$$\text{Solution. } \int_{-\infty}^{\infty} e^{-5t} \delta(t-2) dt = e^{-5 \times 2} = e^{-10}$$

**Ans.**

$$\boxed{\text{Property II: } \int_{-\infty}^{\infty} f(t) \delta'(t-a) dt = -f'(a)}$$

$$\begin{aligned} \text{Proof. } \int_{-\infty}^{\infty} f(t) \delta'(t-a) dt &= [f(t) \delta(t-a)]_{-\infty}^{\infty} - \int_{-\infty}^{\infty} f'(t) \delta(t-a) dt \\ &= 0 - 0 - f'(a) = -f'(a) \end{aligned}$$

[Area of strip = 1]

**Example 47.** Find the Laplace transform of  $t^3\delta(t-4)$

**Solution.**  $Lt^3\delta(t-4) = \int_0^\infty e^{-st} t^3 \delta(t-4) dt = 4^3 e^{-4s}$  **Ans.**

### EXERCISE 42.6

Evaluate the following:

1.  $\int_0^\infty e^{-3t} \delta(t-4) dt$

**Ans.**  $e^{-12}$

2.  $\int_{-\infty}^\infty \sin 2t \delta\left(t - \frac{\pi}{4}\right) dt$

**Ans.** 1

3.  $\int_{-\infty}^\infty e^{-3t} \delta'(t-2) dt$

**Ans.**  $3e^{-6}$

Find Laplace transform of

4.  $\frac{\delta(t-4)}{t}$

**Ans.**  $\frac{e^{-4s}}{4}$

5.  $\cos t \log t \delta(t-\pi)$

**Ans.**  $-e^{-\pi s} \log \pi$

6.  $e^{-4t} \delta(t-3)$

**Ans.**  $e^{-3(s+4)}$

### 42.23 CONVOLUTION THEOREM

If  $L[f_1(t)] = F_1(s)$  and  $L[f_2(t)] = F_2(s)$

then  $L\left\{\int_0^t f_1(x) f_2(t-x) dx\right\} = F_1(s) \cdot F_2(s)$

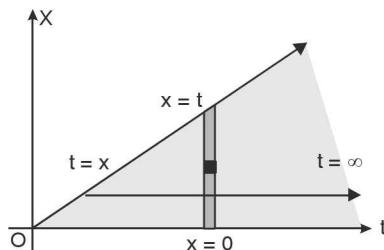

or 
$$\boxed{L^{-1}(F_1(s) \cdot F_2(s)) = \int_0^t f_1(x) f_2(t-x) dx}$$

**Proof.** We have

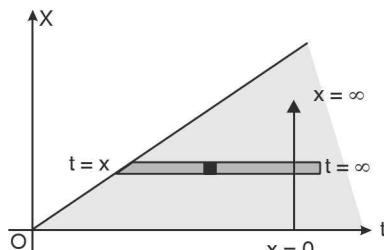

$$L\left\{\int_0^\infty f_1(x) f_2(t-x) dx\right\} = \int_0^\infty e^{-st} \left[ \int_0^t f_1(x) f_2(t-x) dx \right] dt \quad (\text{By Definition})$$

where the double integral is taken over the infinite region in the first quadrant lying between the lines  $x = 0$  and  $x = t$ .

Here first we are integrating w.r.t. "x", within limits  $x = 0$  and  $x = t$ , and then we will integrate w.r.t. "t" with limits  $t = 0$  and  $t = \infty$ .

On changing the order of integration first we integrate w.r.t. "t" with limits  $t = x$  and  $t = \infty$  and then w.r.t. "x" with limits  $x = 0$  and  $x = \infty$ .

On changing the order of integration, the integral becomes

$$\begin{aligned}
 & \int_0^\infty dx \left[ \int_x^\infty e^{-st} f_1(x) \cdot f_2(t-x) dt \right] \\
 &= \int_0^\infty dx \left[ \int_x^\infty e^{-s(t-x+x)} f_1(x) \cdot f_2(t-x) dt \right] = \int_0^\infty dx \left[ \int_x^\infty e^{-s(t-x)} \cdot e^{-sx} f_1(x) \cdot f_2(t-x) dt \right] \\
 &= \int_0^\infty e^{-sx} f_1(x) dx \left[ \int_x^\infty e^{-s(t-x)} f_2(t-x) dt \right] = \int_0^\infty e^{-sx} f_1(x) dx \left[ \int_x^\infty e^{-sz} f_2(z) dz \right] \\
 &\quad [\text{Put } t-x = z \Rightarrow dt = dz] \\
 &= \int_0^\infty e^{-sx} f_1(x) dx \int_0^\infty e^{-sz} f_2(z) dz, \quad \text{Lower limit } x-x=z \Rightarrow z=0 \\
 &= \int_0^\infty e^{-sx} f_1(x) F_2(s) dx = \left[ \int_0^\infty e^{-sx} f_1(x) dx \right] F_2(s) = F_1(s) F_2(s) \quad \text{Proved.}
 \end{aligned}$$

**Example 48.** Find the Laplace transform of  $\int_0^t e^x \cdot \sin(t-x) dx$

**Solution.** By Convolution Theorem

$$\begin{aligned}
 L \int_0^t f_1(x) f_2(t-x) dx &= F_1(s) \cdot F_2(s) \\
 \Rightarrow L \int_0^t e^x \cdot \sin(t-x) dx &= L(e^x) \cdot L(\sin t) = \frac{1}{s-1} \cdot \frac{1}{s^2+1} = \frac{1}{(s-1)(s^2+1)} \quad \text{Ans.}
 \end{aligned}$$

**Note.** Convolution Theorem is generally used to find Inverse Laplace transform of the product of two functions, discussed in the next chapter.

#### 42.24 LAPLACE TRANSFORM OF BESSSEL FUNCTIONS $J_0(x)$ and $J_1(x)$

We know that

$$\begin{aligned}
 J_n(x) &= \frac{x^n}{2^n \Gamma(n+1)} \left[ 1 - \frac{x^2}{2 \cdot (2n+2)} + \frac{x^4}{2 \cdot 4 \cdot (2n+2) \cdot (2n+4)} - \dots \right] \\
 J_0(t) &= \left[ 1 - \frac{t^2}{2^2} + \frac{t^4}{2^2 \cdot 4^2} - \frac{t^6}{2^2 \cdot 4^2 \cdot 6^2} + \dots \right]
 \end{aligned}$$

Taking Laplace transforms of both sides, we have

$$\begin{aligned}
 LJ_0(t) &= \frac{1}{s} - \frac{1}{s^2} \cdot \frac{2!}{s^3} + \frac{1}{s^2} \cdot \frac{4!}{2^2 \cdot 4^2 s^5} - \frac{1}{s^2} \cdot \frac{6!}{2^2 \cdot 4^2 \cdot 6^2 s^7} + \dots \\
 &= \frac{1}{s} \left[ 1 - \frac{1}{2} \left( \frac{1}{s^2} \right) + \frac{1.3}{2 \cdot 4} \left( \frac{1}{s^4} \right) - \frac{1.3.5}{2 \cdot 4 \cdot 6} \left( \frac{1}{s^6} \right) + \dots \right] \\
 &= \frac{1}{s} \left[ 1 + \left( -\frac{1}{2} \right) \left( \frac{1}{s^2} \right) + \frac{\left( -\frac{1}{2} \right) \left( -\frac{3}{2} \right)}{2!} \left( \frac{1}{s^2} \right)^2 + \frac{\left( -\frac{1}{2} \right) \left( -\frac{3}{2} \right) \left( -\frac{5}{2} \right)}{3!} \left( \frac{1}{s^2} \right)^3 + \dots \right] \\
 &= \frac{1}{s} \left[ 1 + \frac{1}{s^2} \right]^{-\frac{1}{2}} \quad (\text{By Binomial theorem})
 \end{aligned}$$

$$\begin{aligned}
 &= \frac{1}{s} \left[ \frac{s^2+1}{s^2} \right]^{-\frac{1}{2}} = \frac{1}{s} \left[ \frac{s^2}{s^2+1} \right]^{\frac{1}{2}} = \frac{1}{\sqrt{s^2+1}}
 \end{aligned}$$

$$\text{We know that } If(at) = \frac{1}{a} F\left(\frac{s}{a}\right)$$

... (1) Ans.

$$LJ_0(at) = \frac{1}{a} \frac{1}{\sqrt{\frac{s^2}{a^2} + 1}} = \frac{1}{\sqrt{s^2 + a^2}}$$

[From (1)]

$$LJ_1(x) = -LJ'_0(x) = -[s LJ_0(x) - J_0(0)] = -\left[s \cdot \frac{1}{\sqrt{s^2 + 1}} - 1\right] = 1 - \frac{s}{\sqrt{s^2 + 1}} \quad \text{Ans.}$$

### EXERCISE 42.7

**Find the Laplace transform of the following:**

- |                     |  |                |   |
|---------------------|--|----------------|---|
| 1. $e^{ax} J_0(bx)$ | <b>Ans.</b> $\frac{1}{\sqrt{s^2 + 2as + a^2 + b^2}}$ | 2. $x J_0(ax)$ | <b>Ans.</b> $\frac{s}{(s^2 + a^2)^{3/2}}$ |
| 3. $x J_1(x)$       | <b>Ans.</b> $\frac{1}{(s^2 + 1)^{3/2}}$              |                |   |

### 42.25 EVALUATION OF INTEGRALS

We can evaluate number of integrals having lower limit 0 and upper limit  $\infty$  by the help of Laplace transform.

**Example 49.** Evaluate  $\int_0^\infty te^{-3t} \sin t dt$

**Solution.**  $\int_0^\infty te^{-3t} \sin t dt = \int_0^\infty te^{-st} \sin t dt \quad (s = 3)$

$$= L(t \sin t) = -\frac{d}{ds} \left( \frac{1}{s^2 + 1} \right) = \frac{2s}{(s^2 + 1)^2}$$

Putting  $s = 3$ , we get  $= \frac{2 \times 3}{(3^2 + 1)^2} = \frac{6}{100} = \frac{3}{50} \quad \text{Ans.}$

**Example 50.** Evaluate  $\int_0^\infty \frac{e^{-t} \sin t}{t} dt$  and  $\int_0^\infty \frac{\sin t}{t} dt \quad (\text{U.P., II Semester, 2009})$

**Solution.**  $\int_0^\infty \frac{e^{-t} \sin t}{t} dt = \int_0^\infty e^{-st} \frac{\sin t}{t} dt \quad (s = 1)$

$$= L\left[\frac{\sin t}{t}\right] = \int_s^\infty \frac{1}{s^2 + 1} ds = \left[\tan^{-1} s\right]_s^\infty = \frac{\pi}{2} - \tan^{-1} s \quad \dots(1)$$

$$= \frac{\pi}{2} - \tan^{-1}(1) = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4} \quad (s = 1) \quad \text{Ans.}$$

On putting  $s = 0$  in (1), we get  $\int_0^\infty \frac{\sin t}{t} dt = \frac{\pi}{2} - \tan^{-1}(0) = \frac{\pi}{2} \quad \text{Ans.}$

**Example 51.** Evaluate  $\int_0^\infty \frac{e^{-at} - e^{-bt}}{t} dt$

**Solution.**  $\int_0^\infty e^{-st} (e^{-at} - e^{-bt}) dt = L(e^{-at} - e^{-bt}) = L(e^{-at}) - L(e^{-bt}) = \left(\frac{1}{s+a} - \frac{1}{s+b}\right)$

$$\int_0^\infty e^{-st} \left(\frac{e^{-at} - e^{-bt}}{t}\right) dt = L \frac{1}{t} (e^{-at} - e^{-bt}) = \int_s^\infty \left(\frac{1}{s+a} - \frac{1}{s+b}\right) ds$$

$$= [\log(s+a) - \log(s+b)]_s^\infty$$

$$= \left[ \log \left( \frac{s+a}{s+b} \right) \right]_s^\infty = \left[ \log \frac{1+\frac{a}{s}}{1+\frac{b}{s}} \right]_s^\infty = \left[ \log 1 - \log \frac{s+a}{s+b} \right] = \log \frac{s+b}{s+a}$$

Putting  $s = 0$  in above, we get  $\int_0^\infty \left( \frac{e^{-at} - e^{-bt}}{t} \right) dt = \log \left( \frac{b}{a} \right)$  Ans.

**Example 52.** Show that  $\int_0^\infty t^3 e^{-t} \sin t dt = 0$

**Solution.** L { $t^3 \sin t$ } =  $(-1)^3 \frac{d^3}{ds^3} L \{\sin t\}$

$$\begin{aligned} & \Rightarrow \int_0^\infty e^{-st} t^3 \sin t dt = \frac{-d^3}{ds^3} \frac{1}{s^2 + 1} \\ & = -\frac{d^2}{ds^2} \left[ -\frac{2s}{(s^2 + 1)^2} \right] = \frac{d}{ds} \left[ \frac{(s^2 + 1)^2 (2) - 2s [2(s^2 + 1)] (2s)}{(s^2 + 1)^4} \right] \quad \begin{matrix} \text{This is G.P.} \\ \text{Sum} = \frac{a}{1-r} \end{matrix} \\ & = \frac{d}{ds} \left[ \frac{2(s^2 + 1) - 8s^2}{(s^2 + 1)^3} \right] = \frac{d}{ds} \left[ \frac{-6s^2 + 2}{(s^2 + 1)^3} \right] = \frac{(s^2 + 1)^3 (-12s) - (-6s^2 + 2) 3(s^2 + 1)^2 (2s)}{(s^2 + 1)^6} \\ & = \frac{(s^2 + 1)(-12s) - (-6s^2 + 2) 6s}{(s^2 + 1)^4} = \frac{-12s^3 - 12s + 36s^3 - 12s}{(s^2 + 1)^4} \\ & \int_0^\infty e^{-st} t^3 \sin t dt = \frac{24s^3 - 24s}{(s^2 + 1)^4} = \frac{24s(s^2 - 1)}{(s^2 + 1)^4} \quad \dots (1) \end{aligned}$$

Putting  $s = 1$  in (1), we get  $\int_0^\infty e^{-t} t^3 \sin t dt = 0$  Ans.

**Example 53.** Evaluate  $\int_0^\infty t^2 e^{3t} \sin^2 t dt$ .

**Solution.** We have,  $\sin^2 t = \frac{1}{2}(1 - \cos 2t)$

$$\begin{aligned} & \Rightarrow L \{\sin^2 t\} = \frac{1}{2} [L\{1\} - L\{\cos 2t\}] = \frac{1}{2} \left[ \frac{1}{s} - \frac{s}{s^2 + 4} \right] \\ & \Rightarrow L[t^2 \sin^2 t] = (-1)^2 \cdot \frac{d^2}{ds^2} \left[ \frac{1}{2} \left\{ \frac{1}{s} - \frac{s}{s^2 + 4} \right\} \right] \\ & \Rightarrow \int_0^\infty e^{-st} t^2 \sin^2 t dt = \frac{1}{2} \frac{d}{ds} \left[ \frac{d}{ds} \left\{ \frac{1}{s} - \frac{s}{s^2 + 4} \right\} \right] = \frac{1}{2} \frac{d}{ds} \left[ -\frac{1}{s^2} - \frac{(s^2 + 4)(1) - s(2s)}{(s^2 + 4)^2} \right] \\ & = \frac{1}{2} \frac{d}{ds} \left[ -\frac{1}{s^2} - \frac{-s^2 + 4}{(s^2 + 4)^2} \right] = \frac{1}{2} \left[ \frac{2}{s^3} - \frac{(s^2 + 4)^2 (-2s) - (-s^2 + 4) 2(s^2 + 4)(2s)}{(s^2 + 4)^4} \right] \\ & = \frac{1}{2} \left[ \frac{2}{s^3} - \frac{(s^2 + 4)(-2s) - (-s^2 + 4) 4s}{(s^2 + 4)^3} \right] \quad \dots (1) \end{aligned}$$

Putting the value of  $s = -3$  in (1), we get

$$\begin{aligned} & \int_0^\infty e^{3t} t^2 \sin^2 t dt = \frac{1}{2} \left[ \frac{2}{-27} - \frac{(13)6 - (-5)(-12)}{(9+4)^3} \right] \\ & = -\frac{1}{27} - \frac{9}{(13)^3} = \frac{-2197 - 243}{59319} = \frac{-2440}{59319} \quad \text{Ans.} \end{aligned}$$

**EXERCISE 42.8**

Evaluate the following by using Laplace Transform:

$$1. \int_0^\infty t e^{-4t} \sin t dt$$

$$\text{Ans. } \frac{8}{289}$$

$$2. \int_0^\infty \frac{e^{-2t} \sinh t \sin t}{t} dt$$

$$\text{Ans. } \frac{1}{2} \tan^{-1} \frac{1}{2}$$

$$3. \int_0^\infty \frac{\sin^2 t}{t^2} dt$$

$$\text{Ans. } i \frac{5}{2}$$

$$4. \int_0^\infty \frac{e^{-t} - e^{-4t}}{t} dt$$

$$\text{Ans. } \log 4$$

**42.26 FORMULATION OF LAPLACE TRANSFORM**

S.No.	$f(t)$	$F(s)$
1.	$e^{at}$	$\frac{1}{s-a}$
2.	$t^n$	$\frac{n+1}{s^{n+1}}$ or $\frac{n!}{s^{n+1}}$
3.	$\sin at$	$\frac{a}{s^2+a^2}$
4.	$\cos at$	$\frac{s}{s^2+a^2}$
5.	$\sinh at$	$\frac{a}{s^2-a^2}$
6.	$\cosh at$	$\frac{s}{s^2-a^2}$
7.	$u(t-a)$	$\frac{e^{-as}}{s}$
8.	$\delta(t-a)$	$e^{-as}$
9.	$e^{bt} \sin at$	$\frac{a}{(s-b)^2+a^2}$
10.	$e^{bt} \cos at$	$\frac{s-b}{(s-b)^2+a^2}$
11.	$\frac{t}{2a} \sin at$	$\frac{s}{(s^2+a^2)^2}$
12.	$t \cos at$	$\frac{s^2-a^2}{(s^2+a^2)^2}$
13.	$\frac{1}{2a^3} (\sin at - at \cos at)$	$\frac{1}{(s^2+a^2)^2}$
14.	$\frac{1}{2a} (\sin at + at \cos at)$	$\frac{s^2}{(s^2+a^2)^2}$

**42.27 PROPERTIES OF LAPLACE TRANSFORM**

S.No.	Property	$f(t)$	$F(s)$
1.	Scaling	$f(at)$	$\frac{1}{a}F\left(\frac{s}{a}\right), \quad a > 0$
2.	Derivative	$\frac{df(t)}{dt}$	$sF(s) - f(0), \quad s > 0$
		$\frac{d^2f(t)}{dt^2}$	$s^2F(s) - sf(0) - f'(0), \quad s > 0$
		$\frac{d^3f(t)}{dt^3}$	$s^3F(s) - s^2f(0) - sf'(0) - f''(0), \quad s > 0$
3.	Integral	$\int_0^t f(t) dt$	$\frac{1}{s}F(s), \quad s > 0$
4.	Initial Value	$\lim_{t \rightarrow 0} f(t)$	$\lim_{s \rightarrow \infty} sF(s)$
5.	Final Value	$\lim_{t \rightarrow \infty} f(t)$	$\lim_{s \rightarrow \infty} sF(s)$
6.	First shifting	$e^{-at}f(t)$	$F(s + a)$
7.	Second shifting	$f(t) u(t - a)$	$e^{-a} Lf(t + a)$
8.	Multiplication by $t$	$tf(t)$	$-\frac{d}{ds}F(s)$
9.	Multiplication by $t^n$	$t^n f(t)$	$(-1)^n \frac{d^n}{ds^n}F(s)$
10.	Division by $t$	$\frac{1}{t}f(t)$	$\int_s^\infty F(s) ds$
11.	Periodic function	$f(t)$	$\frac{\int_0^T e^{-st}f(t) dt}{1 - e^{-st}} \quad f(t + T) = f(t)$
12.	Convolution	$f(t) * g(t)$	$F(s) G(s)$

**OBJECTIVE TYPE QUESTIONS****Choose the correct alternative :**

1. Laplace transform of  $t^3 e^{-3t}$  is :

$$(i) \frac{7}{(s+4)^3} \quad (ii) \frac{s}{(s+3)^3} \quad (iii) \frac{6}{(s+3)^4} \quad (iv) \frac{2}{(s+6)^3} \quad \text{Ans. (iii)}$$

2. Laplace transform of  $e^{-2t} \sin 4t$  is :

$$(i) \frac{2}{s^2 + 4s + 20} \quad (ii) \frac{s - 2}{s^2 + 4s + 20} \quad (iii) \frac{s - 4}{s^2 + 4s + 20} \quad (iv) \frac{4}{s^2 + 4s + 20} \quad \text{Ans. (iv)}$$

*(R.G.P.V., Bhopal, II Semester, June 2007)*

3. If  $\{F(t)\} = \bar{f}(s)$ , then  $L\left\{\int_0^t F(x) dx\right\}$  is :

$$(i) \int_0^s \bar{f}(s) ds \quad (ii) \int_0^s \frac{1}{s} \bar{f}(s) ds \quad (iii) \frac{1}{s} \bar{f}(s) \quad (iv) s \bar{f}(s) \quad \text{Ans. (iii)}$$

*(R.G.P.V., Bhopal, II Semester, June 2006)*

4. If  $L\{F(t)\} = \bar{f}(s)$ , then  $L\{t F(t)\}$  is :

$$(i) \bar{f}'(s) \quad (ii) -\bar{f}'(s) \quad (iii) \bar{f}'(s) + \bar{f}(s) \quad (iv) s\bar{f}'(s) + \bar{f}(s) \quad \text{Ans. (ii)}$$

*(R.G.P.V., Bhopal, II Semester, June 2006)*

5. Laplace transform of  $\frac{\cos at - \cos bt}{t}$  is

$$(i) \log \frac{s^2 + b^2}{s^2 + a^2} \quad (ii) \frac{1}{2} \log \frac{s^2 + a^2}{s^2 + b^2} \quad (iii) \frac{1}{2} \log \frac{s^2 + b^2}{s^2 + a^2} \quad (iv) \log \frac{s + b}{s + a} \quad \text{Ans. (iii)}$$

*(R.G.P.V., Bhopal, II Semester, Feb. 2006, 2005)*

6. The Laplace transform of the function

$$F(t) = \begin{cases} 1, & 0 \leq t < 2 \\ -1, & 2 \leq t < 4 \end{cases}, f(t+4) = f(t) \text{ is given as,}$$

$$(i) \frac{1 - e^{-2s}}{s(1 + e^{-2s})} \quad (ii) \frac{1 + e^{-2s}}{s(1 + e^{-2s})} \quad (iii) 0 \quad (iv) \frac{s+1}{s-1} \quad \text{Ans. (i)}$$

*(U.P., II Semester, 2009)*

**Fill in the blank for each of the following question:**

7. The Laplace transform of

$$\int_0^t \int_0^t \int_0^t \cos au du du du \text{ is given as ..... [U.P.T.U. (SUM) 2009]} \quad \text{Ans. } \frac{1}{s^2(s^2 + a^2)}$$

## INVERSE LAPLACE TRANSFORMS (SOLUTION OF DIFFERENTIAL EQUATIONS)

---

---

### 43.1 INVERSE LAPLACE TRANSFORMS

If  $F(s)$  is the Laplace Transform of a function  $f(t)$ , then  $f(t)$  is known as Inverse Laplace Transform. Now we will discuss how to find  $f(t)$  when  $F(s)$  is given.

If  $L[f(t)] = F(s)$ , then  $L^{-1}[F(s)] = f(t)$ , where  $L^{-1}$  is called the Inverse Laplace Transform operator.

From the application point of view, the Inverse Laplace Transform is very useful.

Inverse Laplace Transform is used in solving differential equations without finding the general solution and arbitrary constants.

### 43.2 IMPORTANT FORMULAE

$$1. \ L^{-1}\left(\frac{1}{s}\right) = 1$$

$$2. \ L^{-1}\frac{1}{s^n} = \frac{t^{n-1}}{(n-1)!}$$

$$3. \ L^{-1}\frac{1}{s-a} = e^{at}$$

$$4. \ L^{-1}\frac{s}{s^2 - a^2} = \cosh at$$

(R.G.P.V., Bhopal, Dec. 2007)

$$5. \ L^{-1}\frac{1}{s^2 - a^2} = \frac{1}{a} \sinh at$$

$$6. \ L^{-1}\frac{1}{s^2 + a^2} = \frac{1}{a} \sin at$$

$$7. \ L^{-1}\frac{s}{s^2 + a^2} = \cos at$$

$$8. \ L^{-1}F(s-a) = e^{at}f(t)$$

$$9. \ L^{-1}\frac{1}{(s-a)^2 + b^2} = \frac{1}{b} e^{at} \sin bt$$

$$10. \ L^{-1}\frac{s-a}{(s-a)^2 + b^2} = e^{at} \cos bt$$

$$11. \ L^{-1}\frac{1}{(s-a)^2 - b^2} = \frac{1}{b} e^{at} \sinh bt$$

$$12. \ L^{-1}\frac{s-a}{(s-a)^2 - b^2} = e^{at} \cosh bt$$

$$13. \ L^{-1}\frac{1}{(s^2 + a^2)^2} = \frac{1}{2a^3} (\sin at - at \cos at)$$

$$14. \ L^{-1}\frac{s}{(s^2 + a^2)^2} = \frac{1}{2a} t \sin at$$

$$15. \ L^{-1}\frac{s^2 - a^2}{(s^2 + a^2)^2} = t \cos at$$

$$16. \ L^{-1}(1) = s(t)$$

$$17. \ L^{-1}\frac{s^2}{(s^2 + a^2)^2} = \frac{1}{2a} [\sin at + at \cos at]$$

$$18. \ L^{-1}\left\{\frac{1}{s} F(s)\right\} = \int_0^t f(t) dt$$

**Example 1.** Show that  $\frac{1}{s^{1/2}} = L\left[\frac{1}{\sqrt{\pi t}}\right]$ . (U.P., II Semester, Summer 2005)

**Solution.** We have to show that  $\frac{1}{s^{1/2}} = L\left[\frac{1}{\sqrt{\pi t}}\right]$ .

$$\text{Now, } L^{-1}\left\{\frac{1}{s^n}\right\} = \frac{t^{n-1}}{(n-1)!} = \frac{t^{n-1}}{|n|}$$

$$\text{So } L^{-1}\left\{\frac{1}{s^{1/2}}\right\} = \frac{t^{\frac{1}{2}-1}}{|1/2|} = \frac{t^{-1/2}}{|1/2|} = \frac{t^{-1/2}}{\sqrt{\pi}}$$

$$\Rightarrow L^{-1}\left\{\frac{1}{s^{1/2}}\right\} = \frac{1}{\sqrt{\pi t}} \Rightarrow \frac{1}{s^{1/2}} = L\left[\frac{1}{\sqrt{\pi t}}\right]$$

**Proved.**

**Example 2.** Find the inverse Laplace Transform of the following:

$$(i) \frac{1}{s-2}$$

$$(ii) \frac{1}{s^2-9}$$

$$(iii) \frac{1}{s^2+25}$$

$$(iv) \frac{s}{s^2+9}$$

$$(v) \frac{1}{(s-2)^2+1}$$

$$(vi) \frac{s-1}{(s-1)^2+4}$$

$$(vii) \frac{1}{(s+3)^2-4}$$

$$(viii) \frac{s+2}{(s+2)^2-25}$$

**Solution.**

$$(i) L^{-1}\frac{1}{s-2} = e^{2t}$$

$$(ii) L^{-1}\frac{1}{s^2-9} = L^{-1}\frac{1}{3}\cdot\frac{3}{s^2-(3)^2} = \frac{1}{3}\sinh 3t$$

$$(iii) L^{-1}\frac{s}{s^2-16} = L^{-1}\frac{s}{s^2-(4)^2} = \cosh 4t \quad (iv) L^{-1}\frac{1}{s^2+25} = \frac{1}{5}\frac{5}{s^2+(5)^2} = \frac{1}{5}\sin 5t$$

$$(v) L^{-1}\frac{s}{s^2+9} = \frac{s}{s^2+(3)^2} = \cos 3t$$

$$(vi) L^{-1}\frac{1}{(s-2)^2+1} = e^{2t} \sin t$$

$$(vii) L^{-1}\frac{1}{(s+3)^2-4} = \frac{1}{2}\frac{2}{(s+3)^2-(2)^2} = \frac{1}{2}e^{-3t} \sinh 2t$$

$$(viii) L^{-1}\frac{s+2}{(s+2)^2-25} = L^{-1}\frac{(s+2)}{(s+2)^2-(5)^2} = e^{-2t} \cosh 5t$$

$$\text{Example 3. Find } L^{-1}\frac{s^2+2s+6}{s^3}$$

(M.D.U. 2010)

**Solution.** Here, we have

$$\begin{aligned} L^{-1}\frac{s^2+2s+6}{s^3} &= L^{-1}\left[\frac{1}{s} + \frac{2}{s^2} + \frac{6}{s^3}\right] = 1 + \frac{2t}{1!} + \frac{6}{2!}t^2 \\ &= 1 + 2t + 3t^2 \end{aligned}$$

**Ans.**

**Example 4.** Find Inverse Laplace Transform of

$$(a) \left\{ \frac{6}{2s-3} - \frac{3+4s}{9s^2-16} + \frac{8-6s}{16s^2+9} \right\} \quad (b) \frac{2s-5}{9s^2-25}$$

$$(c) \frac{s-2}{6s^2+20}$$

(U.P. II. Semester Summer 2001)

**Solution.**

$$(a) L^{-1}\left\{ \frac{6}{2s-3} - \frac{3}{9s^2-16} - \frac{4s}{9s^2-16} + \frac{8}{16s^2+9} - \frac{6s}{16s^2+9} \right\}$$

$$\begin{aligned}
&= L^{-1} \left\{ \frac{3}{s - \frac{3}{2}} - \frac{\frac{1}{3}}{s^2 - \left(\frac{4}{3}\right)^2} - \frac{\frac{4}{9}s}{s^2 - \left(\frac{4}{3}\right)^2} + \frac{\frac{1}{2}}{s^2 + \left(\frac{3}{4}\right)^2} - \frac{\frac{3}{8}s}{s^2 + \left(\frac{3}{4}\right)^2} \right\} \\
&= L^{-1} \left\{ \frac{3}{s - \frac{3}{2}} - \frac{\frac{1}{4}}{s^2 - \left(\frac{4}{3}\right)^2} - \frac{\frac{4}{9}}{s^2 - \left(\frac{4}{3}\right)^2} - \frac{\frac{2}{3}}{s^2 + \left(\frac{3}{4}\right)^2} - \frac{\frac{3}{8}}{s^2 + \left(\frac{3}{4}\right)^2} \right\} \\
&= 3e^{\frac{3}{2}t} - \frac{1}{4} \sinh \frac{4}{3}t - \frac{4}{9} \cosh \frac{4}{3}t + \frac{2}{3} \sin \frac{3}{4}t - \frac{3}{8} \cos \frac{3}{4}t \quad \text{Ans.}
\end{aligned}$$

$$\begin{aligned}
(b) \quad L^{-1} \frac{2s-5}{9s^2-25} &= L^{-1} \left[ \frac{2s}{9s^2-25} - \frac{5}{9s^2-25} \right] = L^{-1} \left[ \frac{2s}{9 \left[ s^2 - \left( \frac{5}{3} \right)^2 \right]} - \frac{5}{9 \left[ s^2 - \left( \frac{5}{3} \right)^2 \right]} \right] \\
&= \frac{2}{9} \cosh \frac{5}{3}t - \frac{1}{3} L^{-1} \left( \frac{\frac{5}{3}}{s^2 - \left( \frac{5}{3} \right)^2} \right) = \frac{2}{9} \cosh \frac{5t}{3} - \frac{1}{3} \sin \frac{5t}{3} \quad \text{Ans.} \\
(c) \quad L^{-1} \frac{s-2}{6s^2+20} &= L^{-1} \frac{s}{6s^2+20} - L^{-1} \frac{2}{6s^2+20} = \frac{1}{6} L^{-1} \frac{s}{s^2 + \frac{10}{3}} - \frac{1}{3} L^{-1} \frac{1}{s^2 + \frac{10}{3}} \\
&= \frac{1}{6} L^{-1} \frac{s}{s^2 + \frac{10}{3}} - \frac{1}{3} \times \sqrt{\frac{3}{10}} L^{-1} \frac{\sqrt{\frac{10}{3}}}{s^2 + \frac{10}{3}} = \frac{1}{6} \cos \sqrt{\frac{10}{3}}t - \frac{1}{\sqrt{30}} \sin \sqrt{\frac{10}{3}}t \quad \text{Ans.}
\end{aligned}$$

**Example 5.** Find the inverse Laplace transform of following function:

$$\frac{14s+10}{49s^2+28s+13}$$

[U.P., II Semester, 2007]

**Solution.** The given function can be written as

$$\begin{aligned}
\frac{14s+10}{49s^2+28s+13} &= \frac{14s+10}{(7s+2)^2+9} = \frac{14 \left( s + \frac{2}{7} \right) + 6}{49 \left( s + \frac{2}{7} \right)^2 + 9} \\
\therefore L^{-1} \left( \frac{14s+10}{49s^2+28s+13} \right) &= L^{-1} \left[ \frac{14 \left( s + \frac{2}{7} \right) + 6}{49 \left( s + \frac{2}{7} \right)^2 + 9} \right] = e^{-\frac{2t}{7}} L^{-1} \left( \frac{14s+6}{49s^2+9} \right) \\
&= e^{-\frac{2t}{7}} L^{-1} \frac{14}{49} \left( \frac{s + \frac{6}{14}}{s^2 + \frac{9}{49}} \right) = e^{-\frac{2t}{7}} \left[ \frac{14}{49} L^{-1} \left( \frac{s}{s^2 + \frac{9}{49}} \right) + \left( \frac{14}{49} \right) \left( \frac{6}{14} \right) L^{-1} \left( \frac{1}{s^2 + \frac{9}{49}} \right) \right] \\
&= e^{-\frac{2t}{7}} \left[ \frac{2}{7} \cos \frac{3}{7}t + \frac{6}{49} \cdot \frac{7}{3} \sin \frac{3}{7}t \right] \\
&= \frac{2}{7} e^{-\frac{2t}{7}} \left( \cos \frac{3}{7}t + \sin \frac{3}{7}t \right) \quad \text{Ans.}
\end{aligned}$$

### EXERCISE 43.1

Find the Inverse Laplace Transform of the following:

1.  $\frac{3s - 8}{4s^2 + 25}$       Ans.  $\frac{3}{4} \cos \frac{5t}{2} - \frac{4}{5} \sin \frac{5t}{2}$

2.  $\frac{3(s^2 - 2)^2}{2s^5}$       Ans.  $\frac{3}{2} - 3t^2 + \frac{1}{2}t^4$

3.  $\frac{2s - 5}{4s^2 + 25} + \frac{4s - 18}{9 - s^2}$       Ans.  $\frac{1}{2} \left( \cos \frac{5t}{2} - \sin \frac{5t}{2} \right) - 4 \cosh 3t + 6 \sinh 3t$

4.  $\frac{5s - 10}{9s^2 - 16}$       Ans.  $\frac{5}{9} \cosh \frac{4}{3}t - \frac{5}{6} \sinh \frac{4}{3}t$

5.  $\frac{1}{4s} + \frac{16}{1-s^2}$       Ans.  $\frac{1}{4} - 16 \sinh t$

 6.  $L^{-1} \left\{ \frac{1}{s^n} \right\}$  exist only when the value of  $n$  is :

- (i) Negative integer      (ii) Positive integer  
 (iii) Zero      (iv) None of these      Ans. (ii) (U.P. II Semester, 2010)

### 43.3 MULTIPLICATION BY S

$$L^{-1} [s F(s)] = \frac{d}{dt} f(t) + f(0) \delta(t)$$

**Example 6.** Find the Inverse Laplace Transform of (i)  $\frac{s}{s^2 + 1}$  (ii)  $\frac{s}{4s^2 - 25}$  (iii)  $\frac{3s}{2s + 9}$

**Solution.**

(i)  $L^{-1} \frac{1}{s^2 + 1} = \sin t$

$$L^{-1} \frac{s}{s^2 + 1} = \frac{d}{dt} (\sin t) + \sin(0) \delta(t) = \cos t \quad \text{Ans.}$$

(ii)  $L^{-1} \frac{1}{4s^2 - 25} = \frac{1}{4} L^{-1} \frac{1}{s^2 - \frac{25}{4}} = \frac{1}{4} \cdot \frac{2}{5} L^{-1} \frac{\frac{5}{2}}{s^2 - \left(\frac{5}{2}\right)^2} = \frac{1}{10} \sinh \frac{5}{2}t$

$$\begin{aligned} L^{-1} \frac{s}{4s^2 - 25} &= \frac{1}{10} \frac{d}{dt} \sinh \frac{5}{2}t + \frac{1}{10} \sinh \frac{5}{2}(0) \delta(t) \\ &= \frac{1}{10} \left( \frac{5}{2} \right) \cosh \frac{5}{2}t = \frac{1}{4} \cosh \frac{5}{2}t \end{aligned} \quad \text{Ans.}$$

(iii)  $L^{-1} \frac{3}{2s + 9} = \frac{3}{2} L^{-1} \frac{1}{s + \frac{9}{2}} = \frac{3}{2} e^{-\frac{9}{2}t}$ 

$$L^{-1} \frac{3s}{2s + 9} = \frac{3}{2} \frac{d}{dt} \left( e^{-\frac{9}{2}t} \right) + \frac{3}{2} e^{-\frac{9}{2}(0)\delta(t)} = \frac{3}{2} \left( -\frac{9}{2} \right) e^{-\frac{9}{2}t} + \frac{3}{2} = -\frac{27}{4} e^{-\frac{9}{2}t} + \frac{3}{2} \quad \text{Ans.}$$

### EXERCISE 43.2

Find the Inverse Laplace Transform of the following:

1.  $\frac{s}{s+5}$       Ans.  $-5 e^{-5t}$       2.  $\frac{2s}{3s+6}$       Ans.  $-\frac{4}{3} e^{-2t}$

3.  $\frac{s}{2s^2 - 1}$       Ans.  $\frac{1}{2} \cosh \frac{t}{2}$       4.  $\frac{s^2}{s^2 + a^2}$       Ans.  $-a \sin at + 1$       5.  $\frac{s^2 + 4}{s^2 + 9}$       Ans.  $-\frac{5}{3} \sin 3t + 1$

### 43.4 DIVISION BY $s$ (MULTIPLICATION BY $\frac{1}{s}$ )

$$\boxed{L^{-1} \left[ \frac{F(s)}{s} \right] = \int_0^t [L^{-1}[F(s)]] dt = \int_0^t f(t) dt}$$

**Example 7.** Find the Inverse Laplace Transform of

$$(i) \frac{1}{s(s+a)}$$

$$(ii) \frac{1}{s(s^2+1)}$$

$$(iii) \frac{s^2+3}{s(s^2+9)}$$

**Solution.**

$$(i) L^{-1} \left( \frac{1}{s+a} \right) = e^{-at}$$

$$L^{-1} \left[ \frac{1}{s(s+a)} \right] = \int_0^t L^{-1} \left( \frac{1}{s+a} \right) dt = \int_0^t e^{-at} dt = \left[ \frac{e^{-at}}{-a} \right]_0^t \\ = \frac{e^{-at}}{-a} + \frac{1}{a} = \frac{1}{a} [1 - e^{-at}]$$

**Ans.**

$$(ii) L^{-1} \frac{1}{s^2+1} = \sin t$$

$$L^{-1} \frac{1}{s} \left( \frac{1}{s^2+1} \right) = \int_0^t L^{-1} \left( \frac{1}{s^2+1} \right) dt = \int_0^t \sin t dt = [-\cos t]_0^t = -\cos t + 1$$

**Ans.**

$$(iii) L^{-1} \frac{s^2+3}{s(s^2+9)} = L^{-1} \left[ \frac{s^2+9-6}{s(s^2+9)} \right] = L^{-1} \left[ \frac{1}{s} - \frac{6}{s(s^2+9)} \right] \\ = 1 - 2 \int_0^t \sin 3t dt = 1 + 2 \times \frac{1}{3} [\cos 3t]_0^t = 1 + \frac{2}{3} \cos 3t - \frac{2}{3}$$

$$= \frac{2}{3} \cos 3t + \frac{1}{3} = \frac{1}{3} [2 \cos 3t + 1]$$

**Ans.**

### EXERCISE 43.3

Find the Inverse Laplace Transform of the following:

$$1. \frac{1}{2s(s-3)}$$

$$\text{Ans. } \frac{1}{2} \left[ \frac{e^{3t}}{3} - 1 \right]$$

$$2. \frac{1}{s(s+2)}$$

$$\text{Ans. } \frac{1-e^{-2t}}{2}$$

$$3. \frac{1}{s(s^2-16)}$$

$$\text{Ans. } \frac{1}{16} [\cosh 4t - 1]$$

$$4. \frac{1}{s(s^2+a^2)}$$

$$\text{Ans. } \frac{1-\cos at}{a^2}$$

$$5. \frac{s^2+2}{s(s^2+4)}$$

$$\text{Ans. } \cos^2 t$$

$$6. \frac{1}{s^2(s+1)}$$

$$\text{Ans. } t - 1 + e^{-t}$$

$$7. \frac{1}{s^3(s^2+1)}$$

$$\text{Ans. } \frac{t^2}{2} + \cos t - 1$$

### 43.5 FIRST SHIFTING PROPERTY

If  $L^{-1}[F(s)] = f(t)$ , then

$$\boxed{L^{-1}[F(s+a)] = e^{-at} L^{-1}[F(s)]}$$

**Example 8.** Find the Inverse Laplace Transform of

$$(i) \frac{1}{(s+2)^5}$$

$$(ii) \frac{s}{s^2+4s+13}$$

$$(iii) \frac{1}{9s^2+6s+1}$$

**Solution.**

$$(i) L^{-1} \frac{1}{s^5} = \frac{t^4}{4!}$$

$$\text{then } L^{-1} \frac{1}{(s+2)^5} = e^{-2t} \cdot \frac{t^4}{4!} \quad \text{Ans.}$$

$$(ii) L^{-1} \left( \frac{s}{s^2 + 4s + 13} \right) = L^{-1} \frac{s+2-2}{(s+2)^2 + (3)^2} = L^{-1} \frac{s+2}{(s+2)^2 + (3)^2} - L^{-1} \frac{2}{(s+2)^2 + (3)^2}$$

$$= e^{-2t} L^{-1} \frac{s}{s^2 + 3^2} - e^{-2t} L^{-1} \frac{2}{3} \left( \frac{3}{s^2 + 3^2} \right) = e^{-2t} \cos 3t - \frac{2}{3} e^{-2t} \sin 3t \quad \text{Ans.}$$

$$(iii) L^{-1} \frac{1}{9s^2 + 6s + 1} = L^{-1} \frac{1}{(3s+1)^2} = \frac{1}{9} L^{-1} \frac{1}{\left(s + \frac{1}{3}\right)^2} = \frac{1}{9} e^{-t/3} L^{-1} \frac{1}{s^2}$$

$$= \frac{1}{9} e^{-t/3} t = \frac{t e^{-t/3}}{9} \quad \text{Ans.}$$

**Example 9.** Find the Inverse Laplace Transform of  $\frac{s+1}{s^2 - 6s + 25}$

(U.P., II Semester 2010)

$$\begin{aligned} \text{Solution. } L^{-1} \left( \frac{s+1}{s^2 - 6s + 25} \right) &= L^{-1} \left[ \frac{s+1}{(s-3)^2 + (4)^2} \right] = L^{-1} \left[ \frac{s-3+4}{(s-3)^2 + (4)^2} \right] \\ &= L^{-1} \left[ \frac{s-3}{(s-3)^2 + (4)^2} \right] + L^{-1} \left[ \frac{4}{(s-3)^2 + (4)^2} \right] \\ &= e^{3t} \cos 4t + e^{3t} \sin 4t. \end{aligned} \quad \text{Ans.}$$

### EXERCISE 43.4

Obtain the Inverse Laplace Transform of the following:

$$1. \frac{s+8}{s^2 + 4s + 5} \quad \text{Ans. } e^{-2t} (\cos t + 6 \sin t) \quad 2. \frac{s}{(s+3)^2 + 4} \quad \text{Ans. } e^{-3t} (\cos 2t - 1.5 \sin 2t)$$

$$3. \frac{s}{(s+7)^4} \quad \text{Ans. } e^{-7t} \frac{t^2}{6} (3 - 7t) \quad 4. \frac{s+2}{s^2 - 2s - 8} \quad \text{Ans. } e^{-t} (\cosh 3t + \sinh 3t)$$

$$5. \frac{s}{s^2 + 6s + 25} \quad \text{Ans. } e^{-3t} \left[ \cos 4t - \frac{3}{4} \sin 4t \right] \quad 6. \frac{1}{2(s-1)^2 + 32} \quad \text{Ans. } \frac{e^t}{8} \sin 4t$$

$$7. \frac{s-4}{4(s-3)^2 + 16} \quad \text{Ans. } \frac{1}{4} e^{3t} \cos 2t - \frac{1}{8} e^{3t} \sin 2t$$

### 43.6 SECOND SHIFTING PROPERTY

$$\boxed{L^{-1} [e^{-as} F(s)] = f(t-a) u(t-a)}$$

**Example 10.** Obtain Inverse Laplace Transform of

$$(i) \frac{e^{-\pi s}}{(s+3)} \quad (ii) \frac{e^{-s}}{(s+1)^3}$$

**Solution.**

$$(i) L^{-1} \frac{1}{s+3} = e^{-3t}, \quad L^{-1} \frac{e^{-\pi s}}{s+3} = e^{-3(t-\pi)} u(t-\pi) \quad \text{Ans.}$$

$$(ii) L^{-1} \frac{1}{s^3} = \frac{t^2}{2!} \Rightarrow L^{-1} \frac{1}{(s+1)^3} = e^{-t} \frac{t^2}{2!}$$

$$L^{-1} \frac{e^{-s}}{(s+1)^3} = e^{-(t-1)} \cdot \frac{(t-1)^2}{2!} \cdot u(t-1)$$

**Ans.**

**Example 11.** Evaluate

$$\text{Solution. } L^{-1} \left[ \frac{e^{-s} - 3e^{-3s}}{s^2} \right] \quad (U.P. II Semester, Summer 2002)$$

$$L^{-1} \left[ \frac{e^{-s} - 3e^{-3s}}{s^2} \right] = L^{-1} \left[ \frac{e^{-s}}{s^2} - \frac{3e^{-3s}}{s^2} \right] \quad \dots(1)$$

We know that  $L[u(t-a)] = \frac{e^{-as}}{s}$ 

and  $L[(t-a)u(t-a)] = \frac{e^{-as}}{s^2}$

Using these results in (1), we get

$$\therefore L^{-1} \left[ \frac{e^{-s} - 3e^{-3s}}{s^2} \right] = (t-1)u(t-1) - 3(t-3)u(t-3) \quad \text{Ans.}$$

**Example 12.** Find the Inverse Laplace Transform of

$$\frac{se^{-s/2} + \pi e^{-s}}{s^2 + \pi^2}$$

in terms of unit step functions.

$$\text{Solution. } L^{-1} \frac{\pi}{s^2 + \pi^2} = \sin \pi t$$

$$L^{-1} \left[ e^{-s} \frac{\pi}{s^2 + \pi^2} \right] = \sin \pi(t-1) \cdot u(t-1) = -\sin(\pi t) \cdot u(t-1) \quad \dots(1)$$

and

$$L^{-1} \frac{s}{s^2 + \pi^2} = \cos \pi t$$

$$L^{-1} \left[ e^{-s/2} \frac{s}{s^2 + \pi^2} \right] = \cos \pi \left( t - \frac{1}{2} \right) \cdot u \left( t - \frac{1}{2} \right) = \sin \pi t \cdot u \left( t - \frac{1}{2} \right) \quad \dots(2)$$

On adding (1) and (2), we get

$$L^{-1} \left[ \frac{e^{-s/2} s + e^{-s} \cdot \pi}{s^2 + \pi^2} \right] = \sin \left( \pi t \right) \cdot u \left( t - \frac{1}{2} \right) - \sin \left( \pi t \right) \cdot u(t-1)$$

$$= \sin \pi t \left[ u \left( t - \frac{1}{2} \right) - u(t-1) \right] \quad \text{Ans.}$$

**Example 13.** Find the value of

$$\text{Solution } \frac{1}{(s^2 + a^2)^2} = \frac{1}{s} - \frac{s}{(s^2 + a^2)^2} = -\frac{1}{2s} \frac{d}{ds} \left( \frac{1}{s^2 + a^2} \right)$$

$$\Rightarrow L^{-1} \left\{ \frac{1}{(s^2 + a^2)^2} \right\} = L^{-1} \left\{ -\frac{1}{2s} \frac{d}{ds} \left( \frac{1}{s^2 + a^2} \right) \right\}$$

$$= -\frac{1}{2s} \left\{ -t \frac{1}{a} \sin at \right\} = -\frac{1}{2a} \frac{1}{s} \{ t - \sin at \} = \frac{1}{2a} \int_0^t \sin at dt$$

$$\begin{aligned}
 &= \frac{1}{2a} \left[ t \left( -\frac{\cos at}{a} \right) - \int_0^t \frac{\cos at}{a} dt \right]_0^t = \frac{1}{2a} \left[ -\frac{t}{a} \cos at + \frac{\sin at}{a^2} \right]_0^t \\
 &= \frac{1}{2a^3} [-at \cos at + \sin at]
 \end{aligned}
 \quad \text{Ans.}$$

### EXERCISE 43.5

Obtain Inverse Laplace Transform of the following:

- |   |  |
|---|--|
| 1. $\frac{e^{-s}}{(s+2)^3}$                                   | <b>Ans.</b> $e^{-(t-2)} \frac{(t-2)^2}{2} u(t-2)$  |
| 2. $\frac{e^{-2s}}{(s+1)(s^2+2s+2)}$                          | <b>Ans.</b> $e^{-(t-2)}  1 - \cos(t-2)  u(t-2)$  |
| 3. $\frac{e^{-s}}{\sqrt{s+1}}$                                | <b>Ans.</b> $\frac{e^{-(t-1)}}{\sqrt{\pi(t-1)}} \cdot u(t-1)$  |
| 4. $\frac{e^{-\frac{\pi}{2}s} + e^{-\frac{3\pi}{2}s}}{s^2+1}$ | <b>Ans.</b> $\cot t \left[ u\left(t - \frac{3\pi}{2}\right) - u\left(t - \frac{\pi}{2}\right) \right]$ |
| 5. $\frac{e^{-4s}(s+2)}{s^2+4s+5}$                            | <b>Ans.</b> $e^{-2(t-u)} \cos(t-u) u(t-4)$   |
| 6. $\frac{e^{-as}}{s^2}$                                      | <b>Ans.</b> $f(t) = t - a, \text{ when } t > a$<br>$= 0, \quad \text{when } t < a$                     |
| 7. $\frac{e^{-\pi s}}{s^2+1}$                                 | <b>Ans.</b> $-\sin t \cdot u(t-\pi)$   |

### 43.7 INVERSE LAPLACE TRANSFORMS OF DERIVATIVES

$$L^{-1} \left[ \frac{d}{ds} F(s) \right] = -t L^{-1}[F(s)] = -t f(t) \quad \Rightarrow \quad \boxed{L^{-1}[F(s)] = -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} F(s) \right]}$$

**Example 14.** Find  $L^{-1} \left\{ \log \frac{s+1}{s-1} \right\}$ . (Uttarakhand, II Semester, June 2010, 2009, 2007)

$$\begin{aligned}
 \text{Solution. } L^{-1} \left\{ \log \left( \frac{s+1}{s-1} \right) \right\} &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \log \left( \frac{s+1}{s-1} \right) \right] \\
 &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \log(s+1) - \frac{d}{ds} \log(s-1) \right] = -\frac{1}{t} L^{-1} \left[ \frac{1}{s+1} - \frac{1}{s-1} \right] \\
 &= -\frac{1}{t} \left[ e^{-t} - e^t \right] = \frac{1}{t} \left[ e^t - e^{-t} \right]
 \end{aligned}
 \quad \text{Ans.}$$

**Example 15.** Find the Inverse Laplace Transform of  $F(s) = \log \frac{s+a}{s+b}$  (U.P., II Semester, Summer 2003)

$$\begin{aligned}
 \text{Solution. } L^{-1} \log \left( \frac{s+a}{s+b} \right) &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \log \frac{s+a}{s+b} \right] \\
 &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \log(s+a) - \frac{d}{ds} \log(s+b) \right] = -\frac{1}{t} L^{-1} \left[ \frac{1}{s+a} - \frac{1}{s+b} \right] \\
 &= -\frac{1}{t} \left[ e^{-at} - e^{-bt} \right] = \frac{1}{t} (e^{-bt} - e^{-at})
 \end{aligned}
 \quad \text{Ans.}$$

**Example 16.** Obtain the Inverse Laplace Transform of  $\log \frac{s^2 - 1}{s^2}$ .

$$\begin{aligned}\text{Solution. } L^{-1} \left[ \log \frac{s^2 - 1}{s^2} \right] &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \log \frac{s^2 - 1}{s^2} \right] \\ &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \left\{ \log(s^2 - 1) - 2 \log s \right\} \right] = -\frac{1}{t} L^{-1} \left[ \frac{2s}{s^2 - 1} - \frac{2}{s} \right] = -\frac{1}{t} [2 \cosh t - 2] \\ &= \frac{2}{t} [1 - \cosh t]\end{aligned}$$

**Ans.**

**Example 17.** Find the function whose Laplace transform is

$$\log \left( 1 + \frac{1}{s} \right).$$

(U.P., II Semester, June 2007)

$$\begin{aligned}\text{Solution. } L^{-1} \left[ \log \left( 1 + \frac{1}{s} \right) \right] &= \frac{1}{t} L^{-1} \left[ \frac{d}{ds} \log \left( \frac{s+1}{s} \right) \right] \\ &= -\frac{1}{t} L^{-1} \left[ \left( \frac{s}{s+1} \right) \left( -\frac{1}{s^2} \right) \right] = -\frac{1}{t} L^{-1} \left[ -\frac{1}{s(s+1)} \right] \\ &= -\frac{1}{t} L^{-1} \left[ \frac{1}{s+1} - \frac{1}{s} \right] \quad (\text{Partial fraction}) \\ &= -\frac{1}{t} [e^{-t} - 1] = \frac{1}{t} [1 - e^{-t}]\end{aligned}$$

**Ans.**

**Example 18.** Find the inverse Laplace transform of  $\tan^{-1} \left( \frac{2}{s^2} \right)$

$$\begin{aligned}\text{Solution. Here, we have } L^{-1} \left[ \tan^{-1} \left( \frac{2}{s^2} \right) \right] &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \tan^{-1} \frac{2}{s^2} \right] \\ &= -\frac{1}{t} L^{-1} \left[ \frac{1}{1 + \frac{4}{s^4}} \left( -\frac{4}{s^3} \right) \right] = -\frac{1}{t} L^{-1} \left[ \frac{s^4}{s^4 + 4} \left( -\frac{4}{s^3} \right) \right] = \frac{1}{t} L^{-1} \left[ \frac{4s}{s^4 + 4} \right] \\ &= \frac{4}{t} L^{-1} \left[ \frac{s}{s^4 + 4} \right] = \frac{4}{t} L^{-1} \left[ \frac{s}{(s^2 + 2s + 2)(s^2 - 2s + 2)} \right] \\ &= \frac{4}{t} L^{-1} \left[ -\frac{1}{4(s^2 + 2s + 2)} + \frac{1}{4(s^2 - 2s + 2)} \right] \quad \begin{pmatrix} \text{By} \\ \text{partial} \\ \text{fraction} \end{pmatrix} \\ &= \frac{1}{t} L^{-1} \left[ -\frac{1}{(s^2 + 2s + 2)} + \frac{1}{(s^2 - 2s + 2)} \right] = \frac{1}{t} L^{-1} \left[ -\frac{1}{(s+1)^2 + 1} + \frac{1}{(s-1)^2 + 1} \right] \\ &= \frac{1}{t} \left[ -e^{-t} \sin t + e^t \sin t \right] = \frac{\sin t}{t} [e^t - e^{-t}]\end{aligned}$$

**Ans.**

**Example 19.** Find Inverse Laplace Transform of  $\tan^{-1} \frac{1}{s}$ .

$$\begin{aligned}\text{Solution. } L^{-1} \left( \tan^{-1} \frac{1}{s} \right) &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \tan^{-1} \frac{1}{s} \right] \quad (\text{M.D.U., 2010}) \\ &= -\frac{1}{t} L^{-1} \left[ \frac{1}{1 + \frac{1}{s^2}} \left( -\frac{1}{s^2} \right) \right] = \frac{1}{t} L^{-1} \left[ \frac{1}{1 + s^2} \right] = \frac{\sin t}{t}\end{aligned}$$

**Ans.**

**Example 20.** Find  $L^{-1} \left[ \tan^{-1}(1+s) \right]$  (M.D.U. 2010)

$$\begin{aligned}\textbf{Solution. } L^{-1} \left[ \tan^{-1}(1+s) \right] &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \tan^{-1}(1+s) \right] \\ &= -\frac{1}{t} L^{-1} \left[ \frac{1}{1+(s+1)^2} \right] = -\frac{1}{t} L^{-1} \left[ \frac{1}{(s+1)^2 + 1} \right] \\ &= -\frac{1}{t} e^{-t} \sin t\end{aligned}\quad \textbf{Ans.}$$

**Example 21.** Find the inverse Laplace transform of

$$\cot^{-1} \left( \frac{s}{2} \right) \quad (\text{Q.Bank U.P. 2001})$$

**Solution.**

$$\begin{aligned}\text{Let } L^{-1} \left[ \cot^{-1} \left( \frac{s}{2} \right) \right] &= f(t) \Rightarrow L^{-1} \left[ \frac{d}{ds} \cot^{-1} \left( \frac{s}{2} \right) \right] = -tf(t) \\ \Rightarrow L^{-1} \left[ \frac{-1}{1+\frac{s^2}{4}} \frac{1}{2} \right] &= -tf(t) \Rightarrow L^{-1} \left[ \frac{2}{s^2+2} \right] = tf(t) \\ \Rightarrow \sin 2t &= tf(t) \Rightarrow f(t) = \frac{1}{t} \sin 2t\end{aligned}\quad \textbf{Ans.}$$

**Example 22.** Obtain the Inverse Laplace Transform of  $\cot^{-1} \left( \frac{s+3}{2} \right)$  (U.P., II Semester, Summer 2002)

$$\begin{aligned}\textbf{Solution. } \text{We know that } L^{-1} \left[ F(s) \right] &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} F(s) \right] \\ \therefore L^{-1} \left[ \cot^{-1} \left( \frac{s+3}{2} \right) \right] &= -\frac{1}{t} L^{-1} \left[ \frac{d}{ds} \cot^{-1} \left( \frac{s+3}{2} \right) \right] \\ &= -\frac{1}{t} L^{-1} \left\{ \frac{-\frac{1}{2}}{1+\left(\frac{s+3}{2}\right)^2} \right\} = \frac{1}{2t} L^{-1} \left\{ \frac{4}{4+(s+3)^2} \right\} \\ &= \frac{1}{t} L^{-1} \left\{ \frac{2}{2^2+(s+3)^2} \right\} = \frac{1}{t} e^{-3t} L^{-1} \left( \frac{2}{2^2+s^2} \right) \\ &= \frac{e^{-3t}}{t} \sin 2t\end{aligned}\quad \textbf{Ans.}$$

**Example 23.** Find the inverse Laplace transform of  $\frac{2as}{(s^2+a^2)^2}$

$$\begin{aligned}\textbf{Solution. } L^{-1} \left( \frac{a}{s^2+a^2} \right) &= \sin at \\ L^{-1} \left[ \frac{d}{ds} \left\{ \frac{a}{s^2+a^2} \right\} \right] &= -t \sin at \Rightarrow L^{-1} \left\{ \frac{-2as}{(s^2+a^2)^2} \right\} = -t \sin at\end{aligned}$$

$$\Rightarrow L^{-1} \left\{ \frac{2as}{(s^2 + a^2)^2} \right\} = t \sin at \quad \text{Ans.}$$

**Example 24.** Find the inverse Laplace transform of  $\frac{s^2 - a^2}{(s^2 + a^2)^2}$

**Solution.** We know that

$$\begin{aligned} & L^{-1} \left\{ \frac{s}{s^2 + a^2} \right\} = \cos at \\ \therefore & L^{-1} \left[ \frac{d}{ds} \left\{ \frac{a}{s^2 + a^2} \right\} \right] = -t \cos at \\ \Rightarrow & L^{-1} \left\{ \frac{(s^2 + a^2) \cdot 1 - s(2s)}{(s^2 + a^2)^2} \right\} = -t \cos at \quad \Rightarrow L^{-1} \left[ \frac{a^2 - s^2}{(s^2 + a^2)^2} \right] = -t \cos at \\ \therefore & L^{-1} \left[ \frac{s^2 - a^2}{(s^2 + a^2)^2} \right] = t \cos at \quad \text{Ans.} \end{aligned}$$

### EXERCISE 43.6

Obtain Inverse Laplace Transform of the following:

$$1. \log \left( 1 + \frac{\omega^2}{s^2} \right) \quad \text{Ans. } -\frac{2}{t} \cos \omega t + 2 \quad 2. \log \left( 1 + \frac{1}{s^2} \right) \quad \text{Ans. } \frac{2}{t} [1 - \cos \omega t]$$

$$3. \frac{s}{1 + s^2 + s^4} \quad \text{Ans. } \frac{2}{\sqrt{3}} \sin \frac{\sqrt{3}}{2} t \sinh \frac{t}{2}$$

$$4. \frac{s}{(s^2 + a^2)^2} \quad \text{Ans. } \frac{t \sin at}{2a} \quad 5. s \log \frac{s}{\sqrt{s^2 + 1}} + \cot^{-1} s \quad \text{Ans. } \frac{1 - \cos t}{t^2}$$

$$6. \frac{1}{2} \log \left\{ \frac{s^2 + b^2}{(s - a)^2} \right\} \quad \text{Ans. } \frac{e^{-at} - \cos bt}{t}$$

### 43.8 INVERSE LAPLACE TRANSFORM OF INTEGRALS

$$L^{-1} \left[ \int_s^\infty F(s) ds \right] = \frac{f(t)}{t} = \frac{1}{t} L^{-1} [F(s)] \quad \text{or} \quad L^{-1} [F(s)] = t L^{-1} \left[ \int_s^\infty F(s) ds \right]$$

$$\text{Example 25. Obtain } L^{-1} \frac{2s}{(s^2 + 1)^2}$$

$$\begin{aligned} \text{Solution. } L^{-1} \frac{2s}{(s^2 + 1)^2} &= t L^{-1} \int_s^\infty \frac{2s}{(s^2 + 1)^2} ds = t L^{-1} \left[ -\frac{1}{s^2 + 1} \right]_s^\infty = t L^{-1} \left[ -0 + \frac{1}{s^2 + 1} \right] \\ &= t \sin t \quad \text{Ans.} \end{aligned}$$

### 43.9 PARTIAL FRACTIONS METHOD

**Example 26.** Find the Inverse Laplace Transform of  $\frac{1}{s^2 - 5s + 6}$ .

**Solution.** Let us convert the given function into partial fractions.

$$\begin{aligned} L^{-1} \left[ \frac{1}{s^2 - 5s + 6} \right] &= L^{-1} \left[ \frac{1}{s - 3} - \frac{1}{s - 2} \right] \\ &= L^{-1} \left( \frac{1}{s - 3} \right) - L^{-1} \left( \frac{1}{s - 2} \right) = e^{3t} - e^{2t} \quad \text{Ans.} \end{aligned}$$

**Example 27.** Find the inverse Laplace transform of

$$\frac{s^3}{s^4 - a^4}$$

(Q. Bank U.P. 2001)

**Solution.** Here, we have

$$\begin{aligned} L^{-1}\left(\frac{s^3}{s^4 - a^4}\right) &= L^{-1}\left[s \left\{ \frac{s^2}{(s^2 - a^2)(s^2 + a^2)} \right\} \right] = L^{-1}\left[\frac{s}{2} \left( \frac{1}{s^2 - a^2} + \frac{1}{s^2 + a^2} \right)\right] \\ &= \frac{1}{2} L^{-1}\left(\frac{s}{s^2 - a^2} + \frac{s}{s^2 + a^2}\right) \quad (\text{By partial fractions}) \\ &= \frac{1}{2} (\cosh at + \cos at) \end{aligned}$$

**Ans.**

**Example 28.** Find the Inverse Laplace Transforms of  $\frac{s+4}{s(s-1)(s^2+4)}$ .

**Solution.** Let us first resolve  $\frac{s+4}{s(s-1)(s^2+4)}$  into partial fractions.

$$\frac{s+4}{s(s-1)(s^2+4)} \equiv \frac{A}{s} + \frac{B}{s-1} + \frac{Cs+D}{s^2+4} \quad \dots (1)$$

$$s+4 \equiv A(s-1)(s^2+4) + Bs(s^2+4) + (Cs+D)s(s-1)$$

Putting  $s = 0$ , we get  $4 = -4A \Rightarrow A = -1$

Putting  $s = 1$ , we get  $5 = B \cdot 1 \cdot (1+4) \Rightarrow B = 1$

Equating the coefficients of  $s^3$  on both sides of (1), we have

$$0 = A + B + C \Rightarrow 0 = -1 + 1 + C \Rightarrow C = 0.$$

Equating the coefficients of  $s$  on both sides of (1), we get

$$1 = 4A + 4B - D \Rightarrow 1 = -4 + 4 - D \Rightarrow D = -1.$$

On putting the values of  $A, B, C, D$  in (1), we get

$$\begin{aligned} \frac{s+4}{s(s-1)(s^2+4)} &= -\frac{1}{s} + \frac{1}{s-1} - \frac{1}{s^2+4} \\ \therefore L^{-1}\left[\frac{s+4}{s(s-1)(s^2+4)}\right] &= L^{-1}\left[-\frac{1}{s} + \frac{1}{s-1} - \frac{1}{s^2+4}\right] \\ &= -L^{-1}\left(\frac{1}{s}\right) + L^{-1}\left(\frac{1}{s-1}\right) - \frac{1}{2} L^{-1}\left(\frac{2}{s^2+2^2}\right) = -1 + e^t - \frac{1}{2} \sin 2t. \end{aligned}$$

**Ans.**

**Example 29.** Find the inverse Laplace transform of

$$\frac{1}{s^4 + 4}$$

[U.P., II Semester, (SUM) 2007]

**Solution.** Here, we have

$$s^4 + 4 = (s^2 + 2)^2 - (2s)^2 = (s^2 - 2s + 2)(s^2 + 2s + 2)$$

$$\frac{1}{s^4 + 4} = \frac{1}{(s^2 - 2s + 2)(s^2 + 2s + 2)}$$

$$= \frac{1}{4s} \left[ \frac{1}{s^2 - 2s + 2} - \frac{1}{s^2 + 2s + 2} \right] \quad \begin{pmatrix} \text{By} \\ \text{partial} \\ \text{fractions} \end{pmatrix} \dots (1)$$

Now,  $L^{-1}\left(\frac{1}{s^2 - 2s + 2}\right) = L^{-1}\left[\frac{1}{(s-1)^2 + 1}\right] = e^t \sin t$

and  $L^{-1}\left(\frac{1}{s^2 + 2s + 2}\right) = L^{-1}\left[\frac{1}{(s+1)^2 + 1}\right] = e^{-t} \sin t$

$\therefore \frac{1}{4} L^{-1}\left(\frac{1}{s^2 - 2s + 2} - \frac{1}{s^2 + 2s + 2}\right) = \frac{1}{4} (e^t - e^{-t}) \sin t$

Hence,  $L^{-1}\left[\frac{1}{4s}\left(\frac{1}{s^2 - 2s + 2} - \frac{1}{s^2 + 2s + 2}\right)\right] = \frac{1}{4} \int_0^t (e^t - e^{-t}) \sin t dt$

$\Rightarrow L^{-1}\left(\frac{1}{s^2 + 4}\right) = \frac{1}{4} \left[ \frac{e^t}{2} (\sin t - \cos t) - \frac{e^{-t}}{2} (-\sin t - \cos t) \right]$

$= \frac{1}{4} \left[ \sin t \left(\frac{e^t + e^{-t}}{2}\right) - \cos t \left(\frac{e^t - e^{-t}}{2}\right) \right]$

$\Rightarrow L^{-1}\left(\frac{1}{s^2 + 4}\right) = \frac{1}{4} [\sin t \cosh t - \cos t \sinh t]$  Ans.

**Example 30.** Find the inverse Laplace transform of

$$\frac{s}{s^4 + 4a^4}$$

**Solution.**  $s^4 + 4a^4 = (s^2 + 2a^2)^2 - (2as)^2 = (s^2 - 2as + 2a^2)(s^2 + 2as + 2a^2)$   
 $= \{(s-a)^2 + a^2\} \{(s+a)^2 + a^2\}$

$$\begin{aligned} \frac{s}{s^4 + 4a^4} &= \frac{s}{\{(s-a)^2 + a^2\} \{(s+a)^2 + a^2\}} \\ &= \frac{1}{4a} \left[ \frac{1}{(s-a)^2 + a^2} - \frac{1}{(s+a)^2 + a^2} \right] \text{ (By partial fraction)} \end{aligned}$$

$\therefore L^{-1}\left(\frac{s}{s^4 + 4a^4}\right) = \frac{1}{4a} \left[ L^{-1}\left\{\frac{1}{(s-a)^2 + a^2}\right\} - L^{-1}\left\{\frac{1}{(s+a)^2 + a^2}\right\} \right]$

 $= \frac{1}{4a} \left[ \frac{1}{a} e^{at} \sin at - e^{-at} \frac{1}{a} \sin at \right]$ 
 $= \frac{1}{2a^2} \sin at \left(\frac{e^{at} - e^{-at}}{2}\right) = \frac{1}{2a^2} \sin at \sinh at.$  Ans.

**Example 31.** Find the Inverse Laplace Transform of  $\frac{e^{-cs}}{s^2(s+a)}$ ,  $c > 0$ .  
(U.P. II Semester, Summer 2002)

**Solution.** We have,

$$\begin{aligned} L^{-1}\left[\frac{e^{-cs}}{s^2(s+a)}\right] &= L^{-1}\left[-\frac{e^{-cs}}{a^2 s} + \frac{e^{-cs}}{a s^2} + \frac{e^{-cs}}{a^2 (s+a)}\right] \quad \text{(By Partial fractions)} \\ &= L^{-1}\left[\left(\frac{-1}{a^2} \frac{e^{-cs}}{s}\right) + \left(\frac{1}{a}\right) \frac{e^{-cs}}{s^2} + \left(\frac{1}{a^2}\right) \frac{e^{-c(s+a)}}{e^{-ca}(s+a)}\right] \\ &= -\frac{1}{a^2} u(t-c) + \frac{1}{a} (t-c) u(t-c) + \frac{1}{a^2 e^{-ca}} e^{at} u(t-c) \end{aligned}$$

$$= u(t-c) \left[ \frac{-1}{a^2} + \frac{1}{a} (t-c) + \frac{1}{a^2} e^{a(c+t)} \right], \text{ where } u(t-c) \text{ is unit step function.} \quad \text{Ans.}$$

**Example 32.** Find the Inverse Laplace Transform of

$$\frac{5s+3}{(s-1)(s^2+2s+5)} \quad (\text{U.P. II Semester Summer 2005})$$

**Solution.**  $L^{-1} \left\{ \frac{5s+3}{(s-1)(s^2+2s+5)} \right\}$

Let  $\frac{5s+3}{(s-1)(s^2+2s+5)} = \frac{A}{s-1} + \frac{Bs+C}{s^2+2s+5}$

$$5s+3 = A(s^2+2s+5) + (Bs+C)(s-1)$$

$$5s+3 = s^2(A+B) + s(2A-B+C) + (5A-C)$$

Comparing the coefficients of  $s^2$ ,  $s$  and constant, we get

$$A + B = 0 \quad \dots (1)$$

$$2A - B + C = 5 \quad \dots (2)$$

$$5A - C = 3 \quad \dots (3)$$

On adding equations (1) and (2), we have  $3A + C = 5$  ... (4)

Adding equations (3) and (4), we get  $8A = 8 \Rightarrow A = 1$

Putting  $A = 1$  in (3), we get  $C = 2$

Putting  $A = 1$ ,  $C = 2$  in (2), we get

$$B = -1$$

Thus 
$$\begin{aligned} \frac{5s+3}{(s-1)(s^2+2s+5)} &= \frac{1}{s-1} + \frac{-s+2}{s^2+2s+5} = \frac{1}{s-1} - \frac{s-2}{(s+1)^2+2^2} \\ &= \frac{1}{s-1} - \frac{s+1}{(s+1)^2+2^2} + \frac{3}{(s+1)^2+2^2} \\ L^{-1} \left\{ \frac{5s+3}{(s-1)(s^2+2s+5)} \right\} &= L^{-1} \left\{ \frac{1}{s-1} \right\} + L^{-1} \left\{ \frac{3}{(s+1)^2+2^2} \right\} - L^{-1} \left\{ \frac{s+1}{(s+1)^2+2^2} \right\} \\ &= e^t + 3e^{-t} L^{-1} \left\{ \frac{1}{s^2+2^2} \right\} - e^{-t} L^{-1} \left\{ \frac{s}{s^2+2^2} \right\} \\ &= e^t + 3e^{-t} \cdot \frac{1}{2} \sin 2t - e^{-t} \cos 2t \end{aligned} \quad \text{Ans.}$$

**Example 33.** Find the Inverse Laplace Transform of  $\frac{s^2}{(s^2+a^2)(s^2+b^2)}$ .

**Solution.** Let us convert the given function into partial fractions.

$$\begin{aligned} L^{-1} \left[ \frac{s^2}{(s^2+a^2)(s^2+b^2)} \right] &= L^{-1} \left[ \frac{a^2}{a^2-b^2} \cdot \frac{1}{s^2+a^2} - \frac{b^2}{a^2-b^2} \cdot \frac{1}{s^2+b^2} \right] \\ &= \frac{1}{a^2-b^2} L^{-1} \left[ \frac{a^2}{s^2+a^2} - \frac{b^2}{s^2+b^2} \right] = \frac{1}{a^2-b^2} \left[ a^2 \left( \frac{1}{a} \sin at \right) - b^2 \left( \frac{1}{b} \sin bt \right) \right] \\ &= \frac{1}{a^2-b^2} [ a \sin at - b \sin bt ] \end{aligned} \quad \text{Ans.}$$

**Note:** This question is also solved by using the Convolution Theorem as an example 37.

**EXERCISE 43.7**

**Find the Inverse Laplace Transforms of the following by partial fractions method:**

1.  $\frac{1}{s^2 - 7s + 12}$  Ans.  $e^{4t} - e^{3t}$
2.  $\frac{s+2}{s^2 - 4s + 13}$  Ans.  $e^{2t} \cos 3t + \frac{4}{3} e^{2t} \sin 3t$
3.  $\frac{3s+1}{(s-1)(s^2+1)}$  Ans.  $e^t - 2 \cos t + \sin t$
4.  $\frac{11s^2 - 2s + 5}{2s^3 - 3s^2 - 3s + 2}$  Ans.  $2e^{-t} + 5e^{2t} - \frac{3}{2} e^{t/2}$
5.  $\frac{2s^2 - 6s + 5}{(s-1)(s-2)(s-3)}$  Ans.  $\frac{1}{2} e^t - e^{2t} + \frac{5}{2} e^{3t}$
6.  $\frac{s-4}{(s-4)^2 + 9}$  Ans.  $e^{4t} \cos 3t$
7.  $\frac{16}{(s^2 + 2s + 5)^2}$  Ans.  $e^{-t} (\sin 2t - 2t \cos 2t)$
8.  $\frac{1}{(s+1)(s^2 + 2s + 2)}$  Ans.  $e^{-t} (1 - \cos t)$
9.  $\frac{1}{(s-2)(s^2+1)}$  Ans.  $\frac{1}{5} e^{2t} - \frac{1}{5} \cos t - \frac{2}{5} \sin t$
10.  $\frac{s^2 - 6s + 7}{(s^2 - 4s + 5)^2}$  Ans.  $t e^{2t} \{\cos t - \sin t\}$

**43.10 INVERSE LAPLACE TRANSFORM BY CONVOLUTION**

$$L \left\{ \int_0^t f_1(x) * f_2(t-x) dx \right\} = F_1(s) \cdot F_2(s) \text{ or } \boxed{\int_0^t f_1(x) \cdot f_2(t-x) dx = L^{-1}[F_1(s) \cdot F_2(s)]}$$

**Example 34.** Use convolution theorem to evaluate:

$$L^{-1} \left\{ \frac{s}{(s^2 + 4)^2} \right\} \quad (\text{U.P., II Semester, 2010})$$

**Solution.**  $\frac{s}{(s^2 + 4)^2} = \frac{1}{s^2 + 4} \cdot \frac{s}{s^2 + 4}$

Let  $F_1(s) = \frac{1}{s^2 + 4}$  and  $F_2(s) = \frac{s}{s^2 + 4}$

and  $L^{-1}[F_1(s)] = L^{-1}\left(\frac{1}{s^2 + 4}\right) = \frac{1}{2} \sin 2t$

and  $L^{-1}[F_2(s)] = L^{-1}\left(\frac{s}{s^2 + 4}\right) = \cos 2t$

According to Convolution Theorem

$$\begin{aligned} L^{-1}[F_1(s) \cdot F_2(s)] &= \int_0^t f_1(x) \cdot f_2(t-x) dx = \int_0^t \frac{1}{2} \sin 2x \cos 2(t-x) dx \\ &= \frac{1}{4} \int_0^t [\sin(2x+2t-2x) + \sin(2x-2t+2x)] dx = \frac{1}{4} \int_0^t [\sin 2t + \sin(4x-2t)] dx \\ &= \frac{1}{4} [x \sin 2t - \frac{1}{4} \cos(4x-2t)]_0^t = \frac{1}{4} \left[ t \sin 2t - \frac{1}{4} \cos(4t-2t) + \frac{1}{4} \cos(-2t) \right] \\ &= \frac{1}{4} \left[ t \sin 2t - \frac{1}{4} \cos 2t + \frac{1}{4} \cos 2t \right] = \frac{1}{4} \sin 2t \end{aligned} \quad \text{Ans.}$$

**Example 35.** Use convolution theorem to find the inverse of the function  $\frac{1}{(s^2 + a^2)^2}$ .

**Solution.** We know that

$$L^{-1}\left[\frac{1}{s^2 + a^2}\right] = \frac{1}{a} \sin at$$

(U.P., II Semester, 2009)

Hence by convolution theorem

$$L^{-1}\frac{1}{(s^2 + a^2)} \frac{1}{(s^2 + a^2)} = \int_0^t \frac{1}{a} \sin ax \frac{1}{a} \sin a(t-x) dx$$

$$\begin{aligned}
&= \frac{1}{a^2} \int_0^t \frac{1}{2} [\cos(ax - at + ax) - \cos(ax + at - ax)] dx \quad \left\{ \sin A \sin B = \frac{1}{2} [\cos(A-B) - \cos(A+B)] \right\} \\
&= \frac{1}{2a^2} \int_0^t [\cos(2ax - at) - \cos at] dx = \frac{1}{2a^2} \left[ \frac{1}{2a} \sin(2ax - at) - x \cos at \right]_0^t \\
&= \frac{1}{2a^2} \left[ \frac{1}{2a} \sin(2at - at) - t \cos at - \frac{1}{2a} \sin(-at) \right] = \frac{1}{2a^2} \left[ \frac{1}{2a} \sin at - t \cos at + \frac{1}{2a} \sin at \right] \\
&= \frac{1}{2a^2} \left[ \frac{2}{2a} \sin at - t \cos at \right] = \frac{1}{2a^3} [\sin at - at \cos at]
\end{aligned}
\tag{Ans.}$$

**Example 36.** State convolution theorem and hence find

$$L^{-1} \left\{ \frac{1}{(s+2)^2(s-2)} \right\} \quad (\text{Uttarakhand, II Semester, June 2007})$$

**Solution.** Convolution Theorem (See Art 43.10 on page 1185).

Let  $L\{f_1(t)\} = F_1(s)$  and Let  $L\{f_2(t)\} = F_2(s)$

$$F_1(s) = \frac{1}{(s+2)^2} \quad \text{and} \quad F_2(s) = \frac{1}{s-2}$$

$$f_1(t) = L^{-1} \left[ \frac{1}{(s+2)^2} \right] = t e^{-2t}$$

$$f_2(t) = L^{-1} \left[ \frac{1}{s-2} \right] = e^{2t}$$

According to Convolution Theorem

$$\begin{aligned}
L^{-1}[F_1(s)F_2(s)] &= \int_0^t f_1(x)f_2(t-x) dx \\
L^{-1} \left[ \frac{1}{(s+2)^2(s-2)} \right] &= \int_0^t x e^{-2x} \cdot e^{2(t-x)} dx = \int_0^t x e^{2t-4x} dx \\
&= \left[ x \frac{e^{2t-4x}}{-4} - \int 1 \cdot \frac{e^{2t-4x}}{-4} dx \right]_0^t = \left[ -\frac{x}{4} e^{2t-4x} + \frac{1}{4} \left\{ \frac{e^{2t-4x}}{-4} \right\} \right]_0^t \\
&= \frac{-t}{4} e^{2t-4t} - \frac{1}{16} e^{2t-4t} + \frac{1}{16} e^{2t} = \frac{-t}{4} e^{-2t} - \frac{1}{16} e^{-2t} + \frac{1}{16} e^{2t} \\
&= \frac{e^{2t}}{16} - \frac{1}{16} e^{-2t} [4t+1]
\end{aligned}
\tag{Ans.}$$

**Example 37.** Using the Convolution Theorem find

$$L^{-1} \left\{ \frac{s^2}{(s^2+a^2)(s^2+b^2)} \right\}, \quad a \neq b.$$

(M.D.U., 2009, U.P. II Semester Summer 2006, 2004)

**Solution.** We have,  $L(\cos at) = \frac{s}{s^2 + a^2}$  and  $L(\cos bt) = \frac{s}{s^2 + b^2}$

Hence, by the convolution theorem

$$L \left\{ \int_0^t \cos ax \cos b(t-x) dx \right\} = \frac{s^2}{(s^2 + a^2)(s^2 + b^2)}$$

Therefore,

$$L^{-1} \left\{ \frac{s^2}{(s^2 + a^2)(s^2 + b^2)} \right\} = \int_0^t \cos ax \cos b(t-x) dx$$

$$\begin{aligned}
&= \frac{1}{2} \int_0^t \left\{ \cos(ax + bt - bx) + \cos(ax - bt + bx) \right\} dx \\
&= \frac{1}{2} \int_0^t \cos[(a-b)x + bt] dx + \frac{1}{2} \int_0^t \cos[(a+b)x - bt] dx \\
&= \left[ \frac{\sin[(a-b)x + bt]}{2(a-b)} \right]_0^t + \left[ \frac{\sin[(a+b)x - bt]}{2(a+b)} \right]_0^t = \frac{\sin at - \sin bt}{2(a-b)} + \frac{\sin at + \sin bt}{2(a+b)} \\
&= \frac{a \sin at - b \sin bt}{a^2 - b^2} \quad \text{Ans.}
\end{aligned}$$

**Example 38.** Evaluate  $L^{-1} \left\{ \frac{s}{(s^2+1)(s^2+4)} \right\}$  (U.P., II Semester, Summer 2002)

**Solution.** We know that  $L^{-1} \frac{s}{s^2+1} = \cos x$  and  $L^{-1} \frac{2}{s^2+2^2} = \sin 2x$

$$\begin{aligned}
L^{-1} \left( \frac{s}{(s^2+1)(s^2+4)} \right) &= \frac{1}{2} L^{-1} \left[ \left( \frac{s}{s^2+1} \right) \left( \frac{2}{s^2+4} \right) \right] \\
&= \frac{1}{2} \int_0^t \sin 2x \cos(t-x) dx \quad [\text{By Convolution Th.}] \\
&= \int_0^t \sin x \cos x \{ \cos t \cos x + \sin t \sin x \} dx = \int_0^t [\sin x \cos^2 x \cos t + \sin^2 x \cos x \sin t] dx \\
&= \left[ -\frac{\cos^3 x}{3} \cos t + \frac{\sin^3 x}{3} \sin t \right]_0^t = -\frac{\cos^4 t}{3} + \frac{\sin^4 t}{3} + \frac{\cos t}{3} = \frac{1}{3} [\sin^4 t - \cos^4 t] + \frac{\cos t}{3} \\
&= \frac{1}{3} (\sin^2 t + \cos^2 t) (\sin^2 t - \cos^2 t) + \frac{\cos t}{3} = \frac{1}{3} (\sin^2 t - \cos^2 t) + \frac{\cos t}{3} = -\frac{1}{3} \cos 2t + \frac{\cos t}{3} \\
&= \frac{1}{3} (\cos t - \cos 2t) \quad \text{Ans.}
\end{aligned}$$

**Example 39.** Obtain  $L^{-1} \frac{1}{s(s^2+a^2)}$ .

**Solution.**  $L^{-1} \frac{1}{s} = 1$  and  $L^{-1} \frac{1}{s^2+a^2} = \frac{\sin at}{a}$ .

$$L^{-1} \{F_1(s) \cdot F_2(s)\} = \int_0^t f_1(t) f_2(t-x) dx \quad (\text{Convolution Theorem})$$

Hence by the Convolution Theorem

$$\begin{aligned}
L^{-1} \left[ \frac{1}{s} \cdot \frac{1}{s^2+a^2} \right] &= \int_0^t \frac{\sin a(t-x)}{a} dx = \left[ \frac{-\cos(at-ax)}{-a^2} \right]_0^t \\
&= \frac{1}{a^2} [1 - \cos at] \quad \text{Ans.}
\end{aligned}$$

**Example 40.** Using Convolution Theorem, prove that

$$L^{-1} \left[ \frac{1}{s^3(s^2+1)} \right] = \frac{t^2}{2} + \cos t - 1 \quad (\text{U.P., II Semester, Summer 2005})$$

**Solution.** We know that,

$$L^{-1} \left\{ \frac{1}{s^3} \right\} = \frac{t^2}{2!}$$

$$L^{-1} \left\{ \frac{1}{s^2 + 1} \right\} = \sin t$$

Using Convolution Theorem,

$$\begin{aligned} L^{-1} \left\{ \frac{1}{s^3 (s^2 + 1)} \right\} &= \int_0^t \frac{(t-x)^2}{2!} \sin x \, dx \\ &= \frac{1}{2} \int_0^t (t^2 + x^2 - 2tx) \sin x \, dx = \frac{1}{2} \left[ (t^2 + x^2 - 2tx)(-\cos x) - \int (2x - 2t)(-\cos x) \, dx \right]_0^t \\ &= \frac{1}{2} \left[ (t^2 + x^2 - 2tx)(-\cos x) + 2 \int (x-t) \cos x \, dx \right]_0^t \\ &= \frac{1}{2} \left[ (t^2 + x^2 - 2tx)(-\cos x) + 2(x-t) \sin x + 2 \cos x \right]_0^t \\ &= \frac{1}{2} \left[ (t^2 + t^2 - 2t^2)(-\cos t) + 0 + 2 \cos t + t^2 \cos 0 - 2 \cos 0 \right] \\ &= \frac{1}{2} [2 \cos t + t^2 - 2] = \cos t + \frac{t^2}{2} - 1 = \frac{t^2}{2} + \cos t - 1 \quad \text{Ans.} \end{aligned}$$

### EXERCISE 43.8

Obtain the Inverse Laplace Transform by convolution:

- |                                |   |                                |   |
|--------------------------------|---|--------------------------------|---|
| 1. $\frac{s^2}{(s^2 + a^2)^2}$ | Ans. $\frac{1}{2} t \cos at + \frac{1}{2a} \sin at$ | 2. $\frac{1}{(s^2 + 1)^3}$     | Ans. $\frac{1}{8} [(3 - t^2) \sin t - 3t \cos t]$ |
| 3. $\frac{s}{(s^2 + a^2)^2}$   | Ans. $\frac{t \sin at}{2a}$                         | 4. $\frac{1}{s^2 (s^2 - a^2)}$ | Ans. $\frac{1}{a^3} [-at + \sinh at]$             |
| 5. $\frac{1}{(s+1)(s^2 + 1)}$  | Ans. $\frac{1}{2} (\cos t - \sin t - e^{-t})$       |                                |   |

### 43.11 HEAVISIDE INVERSE FORMULA OF $\frac{F(s)}{G(s)}$

If  $F(s)$  and  $G(s)$  be two polynomials in  $S$ . The degree of  $F(s)$  is less than that of  $G(s)$ .

Let  $\alpha_1, \alpha_2, \alpha_3, \dots, \alpha_n$  be  $n$  roots of the equation  $G(s) = 0$

Inverse Laplace formula of  $\frac{F(s)}{G(s)}$  is given by

$$L^{-1} \left\{ \frac{F(s)}{G(s)} \right\} = \sum_{i=1}^n \frac{F(\alpha_i)}{G'(\alpha_i)} e^{\alpha_i t}$$

**Example 41.** Find  $L^{-1} \left\{ \frac{2s^2 + 5s - 4}{s^3 + s^2 - 2s} \right\}$ .

**Solution.** Let  
and

$$F(s) = 2s^2 + 5s - 4$$

$$G(s) = s^3 + s^2 - 2s = s(s^2 + s - 2) = s(s+2)(s-1)$$

$$G'(s) = 3s^2 + 2s - 2$$

$$G(s) = 0 \text{ has three roots, } 0, 1, -2$$

$$\Rightarrow \alpha_1 = 0, \alpha_2 = 1, \alpha_3 = -2$$

By Heaviside Inverse formula

$$L^{-1} \left\{ \frac{F(s)}{G(s)} \right\} = \sum_{i=1}^n \frac{F(\alpha_i)}{G'(\alpha_i)} e^{\alpha_i t}$$

$$\begin{aligned}
 &= \left\{ \frac{F(\alpha_1)}{G'(\alpha_1)} \right\} e^{t\alpha_1} + \frac{F(\alpha_2)}{G'(\alpha_2)} e^{t\alpha_2} + \frac{F(\alpha_3)}{G'(\alpha_3)} e^{t\alpha_3} = \frac{F(0)}{G'(0)} e^0 + \frac{F(1)}{G'(1)} e^t + \frac{F(-2)}{G'(-2)} e^{-2t} \\
 &= \frac{-4}{-2} e^0 + \frac{3}{3} e^t + \frac{(-6)}{(6)} e^{-2t} = 2 + e^t - e^{-2t} \quad \text{Ans.}
 \end{aligned}$$

**Example 42.** Find  $L^{-1} \left[ \frac{2s^2 - 6s + 5}{s^3 - 6s^2 + 11s - 6} \right]$  (U.P. II Semester, 2004)

**Solution.** Let

$$\begin{aligned}
 F(s) &= 2s^2 - 6s + 5 \\
 G(s) &= s^3 - 6s^2 + 11s - 6 = (s-1)(s-2)(s-3) \\
 G(s) &= 0 \text{ has three roots, } 1, 2, 3.
 \end{aligned}$$

$$\Rightarrow \begin{aligned}
 \alpha_1 &= 1, \quad \alpha_2 = 2, \quad \alpha_3 = 3 \\
 G'(s) &= 3s^2 - 12s + 11
 \end{aligned}$$

$$\begin{aligned}
 \text{By Heaviside Inverse formula, we have } L^{-1} \left\{ \frac{F(s)}{G(s)} \right\} &= \sum_{i=1}^n \frac{F(\alpha_i)}{G'(\alpha_i)} e^{t\alpha_i} \\
 L^{-1} \left\{ \frac{2s^2 - 6s + 5}{s^3 - 6s^2 + 11s - 6} \right\} &= \frac{F(\alpha_1)}{G'(\alpha_1)} e^{t\alpha_1} + \frac{F(\alpha_2)}{G'(\alpha_2)} e^{t\alpha_2} + \frac{F(\alpha_3)}{G'(\alpha_3)} e^{t\alpha_3} \\
 &= \frac{F(1)}{G'(1)} e^t + \frac{F(2)}{G'(2)} e^{2t} + \frac{F(3)}{G'(3)} e^{3t} = \frac{(1)}{(2)} e^t + \frac{(1)}{(-1)} e^{2t} + \frac{(5)}{(2)} e^{3t} = \frac{1}{2} e^t - e^{2t} + \frac{5}{2} e^{3t} \quad \text{Ans.}
 \end{aligned}$$

### EXERCISE 43.9

Using Heaviside expansion formula, find the Inverse Laplace Transform of the following :

$$1. \frac{s-1}{s^2+3s+2} \quad \text{Ans. } -2e^{-t} + 3e^{-2t} \quad 2. \frac{s}{(s-1)(s-2)(s-3)} \quad \text{Ans. } \frac{1}{2} e^t - 2e^{2t} + \frac{3}{2} e^{3t}$$

$$3. \frac{2s+3}{(s-2)(s-3)(s-4)} \quad \text{Ans. } \frac{7}{2} e^{2t} - 9e^{3t} + \frac{11}{2} e^{4t} \quad 4. \frac{11s^2 - 2s + 5}{2s^3 - 3s^2 - 3s + 2} \quad \text{Ans. } 2e^{-2t} + 5 \cdot e^{2t} - \frac{3}{2} e^{\frac{t}{2}}$$

### 43.12 SOLUTION OF DIFFERENTIAL EQUATIONS BY LAPLACE TRANSFORMS

Ordinary linear differential equations with constant coefficients can be easily solved by the Laplace Transform method, without finding the general solution and the arbitrary constants. The method will be clear from the following examples:

**Example 43.** Solve the following equation by Laplace transform

$$y''' - 2y'' + 5y' = 0 ; y = 0, \quad y' = 1 \text{ at } t = 0 \quad \text{and} \quad y = 1 \text{ at } t = \frac{\pi}{8}.$$

(Q. Bank U.P., II Semester 2001)

**Solution.** Here, we have

$$y''' - 2y'' + 5y' = 0 \quad \dots(1)$$

Taking Laplace transform on both sides of (1), we get

$$L(y''') - 2L(y'') + 5L(y') = L(0)$$

$$\Rightarrow s^3 \bar{y} - s^2 y(0) - sy'(0) - y''(0) - 2[s^2 \bar{y} - sy(0) - y'(0)] + 5[s \bar{y} - y(0)] = 0$$

$$\Rightarrow (s^3 - 2s^2 + 5s) \bar{y} - s - k + 2 = 0 \quad [\text{Let } y''(0) = k \text{ (say)}]$$

$$\Rightarrow \bar{y} = \frac{(k-2)+s}{s(s^2-2s+5)}$$

$$= \left( \frac{k-2}{5} \right) \left( \frac{1}{s} - \frac{s-2}{s^2-2s+5} \right) + \frac{1}{s^2-2s+5}$$

$$\begin{aligned}
 &= \left( \frac{k-2}{5} \right) \frac{1}{s} - \left( \frac{k-2}{5} \right) \left\{ \frac{(s-1)-1}{(s-1)^2 + 4} \right\} + \frac{1}{(s-1)^2 + 4} \\
 \Rightarrow \quad \bar{y} &= \left( \frac{k-2}{5} \right) \frac{1}{s} - \left( \frac{k-2}{5} \right) \left\{ \frac{(s-1)}{(s-1)^2 + 4} \right\} + \left( \frac{k+3}{10} \right) \cdot \left\{ \frac{2}{(s-1)^2 + 4} \right\} \quad \dots(3)
 \end{aligned}$$

Taking Inverse Laplace transform on both sides of (3), we get

$$y = \left( \frac{k-2}{5} \right) - \left( \frac{k-2}{5} \right) e^t \cos 2t + \left( \frac{k+3}{10} \right) e^t \sin 2t \quad \dots(4)$$

$$\text{Putting } y\left(\frac{\pi}{8}\right) = 1, \text{ we get } 1 = \left( \frac{k-2}{5} \right) - \left( \frac{k-2}{5} \right) e^{\pi/8} \cdot \frac{1}{\sqrt{2}} + \left( \frac{k+3}{10} \right) e^{\pi/8} \cdot \frac{1}{\sqrt{2}} \quad \dots(5)$$

$$\Rightarrow k = 7$$

On putting the value of  $k$  in (4), we get (on simplification)  
Hence required solution is

$$y = 1 + e^t (\sin 2t - \cos 2t) \quad \text{Ans.}$$

**Example 44.** Using Laplace transforms, find the solution of the initial value problem

$$\begin{aligned}
 y'' - 4y' + 4y &= 64 \sin 2t \\
 y(0) &= 0, \quad y'(0) = 1.
 \end{aligned}$$

**Solution.** Here, we have  $y'' - 4y' + 4y = 64 \sin 2t$  ... (1)  
 $y(0) = 0, y'(0) = 1.$

Taking Laplace transform of both sides of (1), we have

$$[s^2 \bar{y} - sy(0) - y'(0)] - 4[s\bar{y} - y(0)] + 4\bar{y} = \frac{64 \times 2}{s^2 + 4} \quad \dots(2)$$

On putting the values of  $y(0)$  and  $y'(0)$  in (2), we get

$$\begin{aligned}
 s^2 \bar{y} - 1 - 4s\bar{y} + 4\bar{y} &= \frac{128}{s^2 + 4} \\
 \Rightarrow (s^2 - 4s + 4)\bar{y} &= 1 + \frac{128}{s^2 + 4}, \quad \Rightarrow (s-2)^2 \bar{y} = 1 + \frac{128}{s^2 + 4} \\
 \Rightarrow \bar{y} &= \frac{1}{(s-2)^2} + \frac{128}{(s-2)^2(s^2 + 4)} = \frac{1}{(s-2)^2} - \frac{8}{s-2} + \frac{16}{(s-2)^2} + \frac{8s}{s^2 + 4} \\
 y &= L^{-1} \left[ -\frac{8}{s-2} + \frac{17}{(s-2)^2} + \frac{8s}{s^2 + 4} \right] \\
 y &= -8e^{2t} + 17t e^{2t} + 8 \cos 2t \quad \text{Ans.}
 \end{aligned}$$

**Example 45.** Using Laplace transforms, find the solution of the initial value problem

$$y'' + 9y = 6 \cos 3t \quad (U.P. II Semester Summer 2006)$$

**Solution.** We have,  $y'' + 9y = 6 \cos 3t$  ... (1)  
 $y(0) = 2, y'(0) = 0$

Taking Laplace transform of (1), we get

$$[s^2 \bar{y} - sy(0) - y'(0)] + 9\bar{y} = 6 \frac{s}{s^2 + 9} \quad \dots(2)$$

Putting the values of  $y(0)$  and  $y'(0)$  in (2), we have

$$\begin{aligned}
 s^2 \bar{y} - 2s + 9\bar{y} &= \frac{6s}{s^2 + 9} \\
 \Rightarrow (s^2 + 9)\bar{y} &= 2s + \frac{6s}{s^2 + 9} \quad \Rightarrow \bar{y} = \frac{2s}{s^2 + 9} + \frac{6s}{(s^2 + 9)^2} \\
 y &= L^{-1} \frac{2s}{s^2 + 9} + L^{-1} \frac{6s}{(s^2 + 9)^2} = 2 \cos 3t + L^{-1} \frac{d}{ds} \left[ \frac{-3}{(s^2 + 9)} \right] \\
 &= 2 \cos 3t - t \sin 3t \quad \text{Ans.}
 \end{aligned}$$

**Example 46.** Using Laplace transformation solve the following differential equation:

$$\frac{d^2 x}{dt^2} + 9x = \cos 2t, \quad \text{if } x(0) = 1, \quad x\left(\frac{\pi}{2}\right) = -1 \quad (\text{U.P. II Semester, Summer 2002})$$

**Solution.**  $\frac{d^2 x}{dt^2} + 9x = \cos 2t \quad \dots (1)$

Taking Laplace transform of both the sides of (1), we get

$$\begin{aligned} L \frac{d^2 x}{dt^2} + 9Lx &= L \cos 2t \\ \Rightarrow s^2 \bar{x} - sx(0) - x'(0) + 9\bar{x} &= \frac{s}{s^2 + 4} \end{aligned} \quad \dots (2)$$

On putting  $x(0) = 1$  in (2), we get

$$\begin{aligned} s^2 \bar{x} - s + 9\bar{x} - x'(0) &= \frac{s}{s^2 + 4} \\ (s^2 + 9)\bar{x} &= s + \frac{s}{s^2 + 4} + x'(0) = \frac{s(s^2 + 4) + s}{s^2 + 4} + x'(0) = \frac{s^3 + 5s}{s^2 + 4} + x'(0) \\ \Rightarrow \bar{x} &= \frac{(s^3 + 5s)}{(s^2 + 4)(s^2 + 9)} + \frac{x'(0)}{s^2 + 9} = \frac{1}{5} \frac{s}{s^2 + 4} + \frac{4}{5} \frac{s}{s^2 + 9} + \frac{x'(0)}{s^2 + 9} \end{aligned}$$

Taking the Inverse Laplace Transform, we get

$$\begin{aligned} x(t) &= \frac{1}{5} L^{-1} \frac{s}{s^2 + 4} + \frac{4}{5} L^{-1} \frac{s}{s^2 + 9} + L^{-1} \frac{x'(0)}{s^2 + 9} \\ x(t) &= \frac{1}{5} \cos 2t + \frac{4}{5} \cos 3t + \frac{x'(0) \sin 3t}{3} \end{aligned} \quad \dots (3)$$

On putting  $x\left(\frac{\pi}{2}\right) = -1$  in (3), we get

$$-1 = -\frac{1}{5} + 0 - \frac{x'(0)}{3} \Rightarrow x'(0) = \frac{12}{5}$$

On putting the value of  $x'(0)$  in (3), we get

$$x = \frac{1}{5} \cos 2t + \frac{4}{5} \cos 3t + \frac{12}{5} \frac{\sin 3t}{3} = \frac{1}{5} [\cos 2t + 4 \cos 3t + 4 \sin 3t] \quad \text{Ans.}$$

**Example 47.** Solve, using Laplace transform method

$$y(0) = -2, y'(0) = 8; \quad y'' + 4y' + 4y = 6e^{-t} \quad (\text{U.P. II Semester, 2007})$$

**Solution.** Here, we have

$$y'' + 4y' + 4y = 6e^{-t} \quad \dots (1)$$

Taking Laplace transform on both sides of (1), we get

$$\begin{aligned} L(y'') + 4L(y') + 4L(y) &= 6L(e^{-t}) \\ \Rightarrow [s^2 \bar{y} - sy(0) - y'(0)] + 4[s \bar{y} - y(0)] + 4\bar{y} &= \frac{6}{s+1} \end{aligned} \quad \dots (2) \quad [\text{Here } \bar{y} = L(y)]$$

Putting the values of  $y(0) = -2$  and  $y'(0) = 8$  in (2), we get

$$\begin{aligned} (s^2 + 4s + 4) \bar{y} + 2s - 8 + 8 &= \frac{6}{s+1} \\ \Rightarrow (s^2 + 4s + 4) \bar{y} + 2s &= \frac{6}{s+1} \\ (s+2)^2 \bar{y} + 2s &= \frac{6}{s+1} \end{aligned}$$

$$\begin{aligned}\bar{y} &= \frac{6}{(s+1)(s+2)^2} - \frac{2s}{(s+2)^2} = 6\left[\frac{1}{s+1} - \frac{1}{s+2} - \frac{1}{(s+2)^2}\right] - \frac{2\{(s+2)-2\}}{(s+2)^2} \\ &= \frac{6}{s+1} - \frac{6}{s+2} - \frac{6}{(s+2)^2} - \frac{2}{s+2} + \frac{4}{(s+2)^2} = \frac{6}{s+1} - \frac{8}{s+2} - \frac{2}{(s+2)^2}\end{aligned}\quad \dots(3)$$

Taking inverse Laplace transform on both sides of (3), we get

$$y = 6e^{-t} - 8e^{-2t} - 2t e^{-2t}$$

**Ans.**

**Example 48.** Solve the following differential equation using Laplace transform

$$\frac{d^3y}{dt^3} - 3\frac{d^2y}{dt^2} + 3\frac{dy}{dt} - y = t^2 e^t$$

$$\text{where } y(0) = 1, \left(\frac{dy}{dt}\right)_{t=0} = 0, \left(\frac{d^2y}{dt^2}\right)_{t=0} = -2 \quad (\text{U.P., II Semester, (SUM) 2008})$$

**Solution.** Here we have equation

$$y''' - 3y'' + 3y' - y = t^2 e^t \quad \dots(1)$$

Taking Laplace transform on both side of equation (1), we get

$$L(y''') - 3L(y'') + 3L(y') - L(y) = L(t^2 e^t)$$

$$\Rightarrow [s^3 \bar{y} - s^2 y(0) - sy'(0) - y''(0)] - 3[s^2 \bar{y} - sy(0) - y'(0)] + 3[s \bar{y} - y(0)] - \bar{y} = \frac{2}{(s-1)^3} \quad \dots(2) \quad [\text{where } \bar{y} = L(y)]$$

Putting the values of  $y(0)$ ,  $y'(0)$  and  $y''$  at  $x = 0$  in (2), we get

$$\Rightarrow (s^3 \bar{y} - s^2 + 2) - 3(s^2 \bar{y} - s) + 3(s \bar{y} - 1) - \bar{y} = \frac{2}{(s-1)^3}$$

$$\Rightarrow (s^3 - 3s^2 + 3s - 1) \bar{y} - s^2 + 3s - 1 = \frac{2}{(s-1)^3}$$

$$\Rightarrow (s-1)^3 \bar{y} = s^2 - 3s + 1 + \frac{2}{(s-1)^3}$$

$$\Rightarrow \bar{y} = \frac{(s-1)^2}{(s-1)^3} - \frac{s}{(s-1)^3} + \frac{2}{(s-1)^6} = \frac{1}{s-1} - \frac{(s-1)+1}{(s-1)^3} + \frac{2}{(s-1)^6}$$

$$= \frac{1}{s-1} - \frac{1}{(s-1)^2} - \frac{1}{(s-1)^3} + \frac{2}{(s-1)^6} \quad \dots(3)$$

Taking inverse Laplace transform on both sides of equation (3), we get

$$y = e^t - te^t - \frac{t^2}{2} e^t + \frac{t^5 e^t}{60} = \left(1 - t - \frac{t^2}{2} + \frac{t^5}{60}\right) e^t \quad \text{Ans.}$$

**Example 49.** Solve  $\frac{d^2y}{dx^2} + 2\frac{dy}{dx} + 5y = e^{-x} \sin x$  where  $y(0) = 0$ ,  $y'(0) = 1$ .

(U.P., II Semester, 2004)

**Solution.** Here, we have  $\frac{d^2y}{dx^2} + 2\frac{dy}{dx} + 5y = e^{-x} \sin x$

Taking the Laplace Transform of both the sides, we get

$$[s^2 \bar{y} - sy(0) - \bar{y}(0)] + 2[s \bar{y} - y(0)] + 5\bar{y} = L(e^{-x} \sin x)$$

$$[s^2 \bar{y} - sy(0) - y'(0)] + 2[s \bar{y} - y(0)] + 5\bar{y} = \frac{1}{(s+1)^2 + 1} \quad \dots(1)$$

On substituting the values of  $y(0)$  and  $y'(0)$  in (1), we get

$$(s^2 \bar{y} - 1) + 2(s\bar{y}) + 5\bar{y} = \frac{1}{s^2 + 2s + 2}$$

$$(s^2 + 2s + 5)\bar{y} = 1 + \frac{1}{s^2 + 2s + 2} = \frac{s^2 + 2s + 3}{s^2 + 2s + 2}$$

$$\bar{y} = \frac{s^2 + 2s + 3}{(s^2 + 2s + 5)(s^2 + 2s + 2)}$$

On resolving the R.H.S. into partial fractions, we get

$$\bar{y} = \frac{2}{3} \frac{1}{s^2 + 2s + 5} + \frac{1}{3} \frac{1}{s^2 + 2s + 2}$$

On inversion, we obtain

$$y = \frac{2}{3} L^{-1} \frac{1}{s^2 + 2s + 5} + \frac{1}{3} L^{-1} \frac{1}{s^2 + 2s + 2}$$

$$\Rightarrow y = \frac{1}{3} L^{-1} \frac{2}{(s+1)^2 + (2)^2} + \frac{1}{3} L^{-1} \frac{1}{(s+1)^2 + (1)^2}$$

$$\Rightarrow y = \frac{1}{3} e^{-x} \sin 2x + \frac{1}{3} e^{-x} \sin x \quad \Rightarrow \quad y = \frac{1}{3} e^{-x} (\sin x + \sin 2x) \quad \text{Ans.}$$

**Example 50.** Solve the equation by the transform method:

$$\frac{dy}{dt} + 2y + \int_0^t y dt = \sin t, \quad y(0) = 1$$

(R. G. P. V. Bhopal, June 2003)

**Solution.** Taking Laplace transform of the given equation, we get

$$[s\bar{y} - y(0)] + 2\bar{y} + \frac{\bar{y}}{s} = \frac{1}{s^2 + 1} \quad \dots (1) \quad \left[ \because L \left\{ \int_0^t y dt \right\} = \frac{\bar{y}}{s} \right]$$

Putting the values of  $y(0) = 1$  in (1), we get

$$[s\bar{y} - 1] + 2\bar{y} + \frac{\bar{y}}{s} = \frac{1}{s^2 + 1}$$

$$\bar{y} \left( s + 2 + \frac{1}{s} \right) = 1 + \frac{1}{s^2 + 1} \quad [\because y(0) = 1]$$

$$\frac{1}{s} \bar{y} (s^2 + 2s + 1) = \frac{s^2 + 1 + 1}{s^2 + 1}$$

$$\frac{1}{s} \bar{y} (s+1)^2 = \frac{s^2 + 2}{s^2 + 1} \quad \Rightarrow \quad \bar{y} (s+1)^2 = \frac{s^3 + 2s}{s^2 + 1}$$

$$\Rightarrow \bar{y} = \frac{s^3 + 2s}{(s+1)^2 (s^2 + 1)} = \frac{1}{s+1} - \frac{3}{2(s+1)^2} + \frac{1}{2(s^2 + 1)} \quad [\text{By partial fractions}]$$

Taking Inverse Laplace Transform, we have

$$y = e^{-t} - \frac{3}{2} t e^{-t} + \frac{1}{2} \sin t \quad \text{Ans.}$$

**Example 51.** Solve the following differential equation using Laplace transform:

$$x \frac{d^2 y}{dx^2} + \frac{dy}{dx} + xy = 0, \quad \text{given } y(0) = 2, y'(0) = 0.$$

(Uttarakhand, II Semester, June 2007)

**Solution.** Taking Laplace transform on both sides of the given equation, we have

$$L [xy''] + L [y'] + L [xy] = L(0)$$

$$\Rightarrow -\frac{d}{ds} L(y'') + L(y') - \frac{d}{ds} L(y) = 0$$

$$\Rightarrow -\frac{d}{ds} \{ s^2 \bar{y} - sy(0) - y'(0) \} + \{ s\bar{y} - y(0) \} - \frac{d\bar{y}}{ds} = 0 \quad \dots (1)$$

Putting  $y(0) = 2$  and  $y'(0) = 0$  in (1), we get

$$\begin{aligned} & -\frac{d}{ds} \{ s^2 \bar{y} - 2s - 0 \} + \{ s\bar{y} - 2 \} - \frac{d\bar{y}}{ds} = 0 \\ \Rightarrow & -s^2 \frac{d\bar{y}}{ds} - (2s)\bar{y} + 2 + s\bar{y} - 2 - \frac{d\bar{y}}{ds} = 0 \\ \Rightarrow & (s^2 + 1) \frac{d\bar{y}}{ds} + s\bar{y} = 0 \end{aligned} \quad \dots (2)$$

Separating the variables, we have

$$\frac{d\bar{y}}{\bar{y}} + \frac{s ds}{s^2 + 1} = 0 \quad \dots (3)$$

On integrating, we have

$$\begin{aligned} & \log \bar{y} + \frac{1}{2} \log(s^2 + 1) = \log C \\ \Rightarrow & \log \bar{y} = \log C - \log \sqrt{s^2 + 1} \quad \Rightarrow \quad \log \bar{y} = \log \frac{C}{\sqrt{s^2 + 1}} \\ \Rightarrow & \bar{y} = \frac{C}{\sqrt{s^2 + 1}} \end{aligned} \quad \dots (4)$$

Taking Inverse Laplace Transform, we get

$$\begin{aligned} & y = L^{-1} \left[ \frac{C}{\sqrt{s^2 + 1}} \right] \\ \Rightarrow & y = C J_0(x) \end{aligned} \quad \dots (5) \text{ [ See Art. 42.24]}$$

$$\text{At } x = 0 \quad y(0) = C J_0(0) \quad \dots (6)$$

Putting  $y(0) = 2$  and  $J_0(0) = 1$  in (6), we get

$$2 = C(1) \Rightarrow C = 2$$

On putting the value of  $C$  in (5), we get

$$y = 2 J_0(x) \quad \text{Ans.}$$

**Example 52.** Using Laplace transforms, find the solution of the initial value problem

$$y'' + 9y = 9u(t-3), \quad y(0) = y'(0) = 0$$

where  $u(t-3)$  is the unit step functions.

**Solution.** We have,  $y'' + 9y = 9u(t-3)$   $\dots (1)$

Taking Laplace transform of (1), we have

$$s^2 \bar{y} - sy(0) - y'(0) + 9\bar{y} = 9 \frac{e^{-3s}}{s} \quad \dots (2)$$

Putting the values of  $y(0) = 0$  and  $y'(0) = 0$  in (2), we get

$$\begin{aligned} & s^2 \bar{y} + 9\bar{y} = 9 \frac{e^{-3s}}{s} \\ & (s^2 + 9)\bar{y} = 9 \frac{e^{-3s}}{s} \\ & \bar{y} = \frac{9e^{-3s}}{s(s^2 + 9)} \quad \Rightarrow \quad y = L^{-1} \frac{9e^{-3s}}{s(s^2 + 9)} \end{aligned} \quad \dots (3)$$

$$\text{We know that } L^{-1} \frac{3}{s^2 + 9} = \sin 3t$$

$$\Rightarrow 3 L^{-1} \frac{3}{s(s^2 + 9)} = 3 \int_0^t \sin 3t \, dt = -[\cos 3t]_0^t = 1 - \cos 3t \quad \dots (4)$$

[Using second shifting theorem]

Using (4), we get the inverse of (3)

$$y = [1 - \cos 3(t - 3)] u(t - 3) \quad \text{Ans.}$$

**Example 53.** Solve, by the method of Laplace transform, the differential equation

$$(D^2 + n^2)x = a \sin(nt + \alpha),$$

$$x = Dx = 0 \text{ at } t = 0.$$

(U.P., II Semester, Summer, 2010, 2002)

**Solution.** Taking Laplace transform of the given differential equation, we get

$$\begin{aligned} & [s^2 \bar{x} - sx(0) - x'(0)] + n^2 \bar{x} = a L \sin(nt + \alpha) \\ & = a L [\sin nt \cos \alpha + \cos nt \sin \alpha] = a \left[ \frac{n}{s^2 + n^2} \cos \alpha + \frac{s}{s^2 + n^2} \sin \alpha \right] \\ & = \frac{a[n \cos \alpha + s \sin \alpha]}{s^2 + n^2} \end{aligned} \quad \dots (1)$$

Putting  $x(0) = x'(0) = 0$  in (1), we get

$$\begin{aligned} & s^2 \bar{x} + n^2 \bar{x} = a \left[ \frac{n \cos \alpha + s \sin \alpha}{s^2 + n^2} \right] \Rightarrow (s^2 + n^2) \bar{x} = \frac{a[n \cos \alpha + s \sin \alpha]}{s^2 + n^2} \\ & \Rightarrow \bar{x} = \frac{a n \cos \alpha + a s \sin \alpha}{(s^2 + n^2)^2} \\ & \Rightarrow \bar{x} = a \cos \alpha \cdot \frac{n}{(s^2 + n^2)^2} + a \sin \alpha \cdot \frac{s}{(s^2 + n^2)^2} \end{aligned} \quad \dots (2)$$

Taking the Inverse Laplace Transform of (2), we get

$$x = a \cos \alpha L^{-1} \left[ \frac{n}{(s^2 + n^2)^2} \right] + (a \sin \alpha) L^{-1} \left[ \frac{s}{(s^2 + n^2)^2} \right] \quad \dots (3)$$

Let us find out the inverse of the term on R.H.S.

$$\begin{aligned} \text{But } L^{-1} \left\{ \frac{2s}{(s^2 + n^2)^2} \right\} &= L^{-1} \frac{d}{ds} \frac{1}{s^2 + n^2} = \frac{t}{n} \sin nt \quad \left[ -\frac{d}{ds} [F(s)] = t f(t) \right] \\ \Rightarrow L^{-1} \left\{ \frac{s}{(s^2 + n^2)^2} \right\} &= \frac{t}{2n} \sin nt \end{aligned} \quad \dots (4)$$

$$\begin{aligned} \text{Again } L^{-1} \frac{1}{s} \left\{ \frac{s}{(s^2 + n^2)^2} \right\} &= \frac{1}{2n} \int_0^t t \sin nt \, dt \quad \left[ \frac{F(s)}{s} = \int_0^t f(t) \, dt \right] \\ L^{-1} \left[ \frac{1}{(s^2 + n^2)^2} \right] &= \frac{1}{2n} \left[ t \left( \frac{-\cos nt}{n} \right) + \frac{1}{n^2} \sin nt \right]_0^t \\ L^{-1} \left[ \frac{n}{(s^2 + n^2)^2} \right] &= \frac{1}{2n^2} [-nt \cos nt + \sin nt] \end{aligned} \quad \dots (5)$$

Putting the values of  $L^{-1} \left[ \frac{s}{(s^2 + n^2)^2} \right]$  from (4) and  $L^{-1} \left[ \frac{n}{(s^2 + n^2)^2} \right]$  from (5) in (3), we get

$$x = (a \cos \alpha) \frac{1}{2n^2} [\sin nt - nt \cos nt] + (a \sin \alpha) \frac{t}{2n} \sin nt$$

$$\begin{aligned}
 &= \frac{a}{2n^2} [\cos \alpha \sin nt - nt \cos \alpha \cos nt + nt \sin \alpha \sin nt] \\
 &= \frac{a}{2n^2} [\cos \alpha \sin nt - nt (\cos nt \cos \alpha - \sin nt \sin \alpha)] = \frac{a}{2n^2} [\sin nt \cos \alpha - nt \cos (nt + \alpha)]
 \end{aligned}$$

Which is the required solution.

**Ans.**

**Example 54.** Solve  $t y'' + 2 y' + t y = \cos t$ , if  $y(0) = 1$ ,  $y'(0) = 0$ .

**Solution.** We have,  $t y'' + 2 y' + t y = \cos t$

$$\begin{aligned}
 \Rightarrow L\{t y''\} + L\{2 y'\} + L\{t y\} &= L\{\cos t\} \\
 \Rightarrow -\frac{d}{ds} L\{y''\} + 2 L\{y'\} - \frac{d}{ds} L\{y\} &= L\{\cos t\} \\
 \Rightarrow -\frac{d}{ds}[s^2 \bar{y} - sy(0) - y'(0)] + 2[s \bar{y} - y(0)] - \frac{d}{ds} \bar{y} &= \frac{s}{s^2 + 1} \\
 \Rightarrow -\frac{d}{ds}[s^2 \bar{y} - s] + 2s \bar{y} - 2 - \frac{d}{ds} \bar{y} &= \frac{s}{s^2 + 1} \\
 \Rightarrow -2s \bar{y} - s^2 \frac{d \bar{y}}{ds} + 1 + 2s \bar{y} - 2 - \frac{d \bar{y}}{ds} &= \frac{s}{s^2 + 1} \\
 \Rightarrow (s^2 + 1) \frac{d \bar{y}}{ds} + 1 &= \frac{-s}{s^2 + 1} \quad \Rightarrow \quad \frac{d \bar{y}}{ds} = \frac{-s}{(s^2 + 1)^2} - \frac{1}{s^2 + 1}
 \end{aligned}$$

Taking Inverse Laplace Transform, we get

$$\begin{aligned}
 L^{-1}\frac{d}{ds}(\bar{y}) &= L^{-1}\left[\frac{-s}{(s^2 + 1)^2} - \frac{1}{s^2 + 1}\right] \quad \left[L^{-1}\frac{d}{ds}F(s) = (-1)^1 t^1 f(t)\right] \\
 \Rightarrow (-1)^1 t^1 y &= -\frac{1}{2} L^{-1}\left\{\frac{2s}{(s^2 + 1)^2}\right\} - L^{-1}\left\{\frac{1}{s^2 + 1}\right\} = -\frac{1}{2} t \sin t - \sin t \\
 \Rightarrow y &= \frac{1}{2}\left(1 + \frac{2}{t}\right) \sin t \quad \text{Ans.}
 \end{aligned}$$

**Example 55.** Solve  $[t D^2 + (1 - 2t) D - 2] y = 0$ , where  $y(0) = 1$ ,  $y'(0) = 2$ .

(M.D.U., 2010, U.P. II Semester, June 2002)

**Solution.** Here,  $t D^2 y + (1 - 2t) Dy - 2y = 0 \Rightarrow ty'' + y' - 2t y' - 2y = 0$

Taking Laplace transform of given differential equation, we get

$$\begin{aligned}
 L(t y'') + L(y') - 2 L(t y') - 2 L(y) &= 0 \\
 \Rightarrow -\frac{d}{ds} L\{y''\} + L\{y'\} + 2 \frac{d}{ds} L\{y'\} - 2 L(y) &= 0 \\
 \Rightarrow -\frac{d}{ds}[s^2 \bar{y} - sy(0) - y'(0)] + [s \bar{y} - y(0)] + 2 \frac{d}{ds}[s \bar{y} - y(0)] - 2\bar{y} &= 0
 \end{aligned}$$

Putting the values of  $y(0)$  and  $y'(0)$ , we get

$$\begin{aligned}
 -\frac{d}{ds}(s^2 \bar{y} - s - 2) + (s \bar{y} - 1) + 2 \frac{d}{ds}(s \bar{y} - 1) - 2\bar{y} &= 0 \quad [\because y(0) = 1, y'(0) = 2] \\
 \Rightarrow -s^2 \frac{d \bar{y}}{ds} - 2s \bar{y} + 1 + s \bar{y} - 1 + 2\left(s \frac{d \bar{y}}{ds} + \bar{y}\right) - 2\bar{y} &= 0 \\
 \Rightarrow -(s^2 - 2s) \frac{d \bar{y}}{ds} - s \bar{y} &= 0 \\
 \Rightarrow -\frac{d \bar{y}}{\bar{y}} - \frac{1}{s-2} ds &= 0 \quad (\text{Separating the variables})
 \end{aligned}$$

$$\Rightarrow \int \frac{d\bar{y}}{\bar{y}} + \int \frac{ds}{s-2} = 0 \Rightarrow \log \bar{y} + \log(s-2) = \log C \Rightarrow \log \bar{y}(s-2) = \log C$$

$$\Rightarrow \bar{y}(s-2) = C \Rightarrow \bar{y} = \frac{C}{s-2} \Rightarrow y = C L^{-1} \left\{ \frac{1}{s-2} \right\} \Rightarrow y = C e^{2t} \dots (1)$$

$$y(0) = C e^0 \dots (2)$$

Putting  $y(0) = 1$  in (2), we get  $1 = C e^0 \Rightarrow C = 1$ .

Putting  $C = 1$  in (1), we get  $y = e^{2t}$

This is the required solution.

**Ans.**

**Example 56.** Using Laplace transform, solve the following differential equation: -

$$y'' + 2t y' - y = t$$

when  $y(0) = 0$  and  $y'(0) = 1$

(U.P., II Semester, Summer 2003)

**Solution.** We have,  $y'' + 2t y' - y = t$  ... (1)

Taking Laplace transform of (1), we get

$$[s^2 \bar{y} - sy(0) - y'(0)] - 2 \frac{d}{ds}[s \bar{y} - y(0)] - \bar{y} = \frac{1}{s^2} \dots (2)$$

On putting  $y(0) = 0$  and  $y'(0) = 1$  in (2), we get

$$(s^2 \bar{y} - 1) - 2 \frac{d}{ds}(s \bar{y} - 0) - \bar{y} = \frac{1}{s^2}$$

$$\Rightarrow (s^2 \bar{y} - 1) - 2 \bar{y} - 2s \frac{d \bar{y}}{ds} - \bar{y} = \frac{1}{s^2} \Rightarrow -2s \frac{d \bar{y}}{ds} + (s^2 - 3) \bar{y} = \frac{1}{s^2} + 1 = \frac{1+s^2}{s^2}$$

$$\Rightarrow \frac{d \bar{y}}{ds} - \frac{s^2 - 3}{2s} \bar{y} = \frac{1+s^2}{-2s^3} \Rightarrow \frac{d \bar{y}}{ds} - \left( \frac{s}{2} - \frac{3}{2s} \right) \bar{y} = -\frac{1}{2s^3} - \frac{1}{2s} \dots (3)$$

Thus (3) is a linear differential equation.

$$\text{I.F.} = e^{\int \left( \frac{3}{s} - s \right) ds} = e^{\frac{1}{2} \left( 3 \log s - \frac{s^2}{2} \right)} = e^{-\frac{s^2}{4}} \cdot s^{\frac{3}{2}}$$

Solution of differential equation (3) is

$$\bar{y} e^{-\frac{s^2}{4}} \cdot s^{\frac{3}{2}} = -\frac{1}{2} \int \left( \frac{1}{s^3} + \frac{1}{s} \right) s^{\frac{3}{2}} \cdot e^{-\frac{s^2}{4}} ds = -\frac{1}{2} \int \left( \sqrt{s} + \frac{1}{s^{\frac{3}{2}}} \right) e^{-\frac{s^2}{4}} ds$$

$$\text{Put } s^2 = 4z \Rightarrow s = 2\sqrt{z} \quad \text{so that} \quad ds = \frac{dz}{\sqrt{z}}$$

$$\begin{aligned} \bar{y} s^{\frac{3}{2}} \cdot e^{-\frac{s^2}{4}} &= -\frac{1}{2} \int \left( \sqrt{2} z^{\frac{1}{4}} + \frac{1}{2\sqrt{2}} z^{-\frac{3}{4}} \right) e^{-z} \frac{dz}{\sqrt{z}} \\ &= -\frac{1}{\sqrt{2}} \int \left( z^{-\frac{1}{4}} + \frac{1}{4} z^{-\frac{5}{4}} \right) e^{-z} dz = -\frac{1}{\sqrt{2}} \int z^{-\frac{1}{4}} e^{-z} dz - \frac{1}{4\sqrt{2}} \int z^{-\frac{5}{4}} e^{-z} dz \\ &= -\frac{1}{\sqrt{2}} \left[ z^{-\frac{1}{4}} \frac{e^{-z}}{-1} + \int \left( -\frac{1}{4} \right) z^{-\frac{5}{4}} e^{-z} dz \right] - \frac{1}{4\sqrt{2}} \int z^{-\frac{5}{4}} e^{-z} dz + C \\ &= \frac{1}{\sqrt{2}} e^{-z} z^{-\frac{1}{4}} + C = \frac{1}{\sqrt{2}} e^{-\frac{s^2}{4}} \left( \frac{s^2}{4} \right)^{-\frac{1}{4}} + C = \frac{1}{\sqrt{s}} e^{-\frac{s^2}{4}} + C \Rightarrow \bar{y} = \frac{1}{s^2} + C \end{aligned}$$

(Particular case)

$$\Rightarrow \bar{y} = \frac{1}{s^2} + c \Rightarrow y = L^{-1} \left( \frac{1}{s^2} + c \right) = t + c$$

$y = t$  ( $c$  must vanish if  $\bar{y}$  is a transform since  $\bar{y} \rightarrow 0$  as  $s \rightarrow \infty$ )

**Ans.**

**Example 57.** A particle moves in a line so that its displacement  $x$  from a fixed point  $O$  at any time  $t$ , is given by

$$\frac{d^2x}{dt^2} + 4 \frac{dx}{dt} + 5x = 80 \sin 5t$$

Using Laplace transform, find its displacement at any time  $t$  if initially particle is at rest at  $x = 0$  (U.P., II Semester 2009)

**Solution.** Here, we have

$$\frac{d^2x}{dt^2} + 4 \frac{dx}{dt} + 5x = 80 \sin 5t, \quad x(0) = 0, \quad x'(0) = 0 \quad \dots(1)$$

Taking Laplace transform of both sides of (1), we get

$$[s^2\bar{x} - sx(0) - x'(0)] + 4[s\bar{x} - x(0)] + 5\bar{x} = L[80 \sin 5t]$$

$$\begin{aligned} [s^2\bar{x} - 0 - 0] + 4[s\bar{x} + 5\bar{x}] &= 80 \left( \frac{5}{s^2 + 25} \right), \quad (s^2 + 4s + 5)\bar{x} = \frac{400}{s^2 + 25} \\ \bar{x} &= \left( \frac{1}{s^2 + 4s + 5} \right) \left( \frac{400}{s^2 + 25} \right) \\ \bar{x} &= \frac{2s + 18}{s^2 + 4s + 5} - \frac{2s + 10}{s^2 + 25} \quad [\text{By Partial fraction}] \\ &= \frac{2(s+2)+14}{(s+2)^2+1} - \frac{2s}{s^2+(5)^2} - \frac{10}{s^2+(5)^2} \\ &= \frac{2(s+2)}{(s+2)^2+1} + \frac{14}{(s+2)^2+1} - \frac{2s}{s^2+(5)^2} - \frac{10}{s^2+(5)^2} \\ \Rightarrow x &= 2L^{-1}\frac{(s+2)}{(s+2)^2+1} + 14L^{-1}\frac{1}{(s+2)^2+1} - 2L^{-1}\frac{s}{s^2+(5)^2} - 2L^{-1}\frac{5}{s^2+(5)^2} \\ &= 2e^{-2t} \cos t + 14e^{-2t} \sin t - 2 \cos 5t - 2 \sin 5t \\ &= 2e^{-2t} (\cos t + 7 \sin t) - 2(\cos 5t + \sin 5t) \quad \text{Ans.} \end{aligned}$$

### 43.13 ELECTRIC CIRCUIT

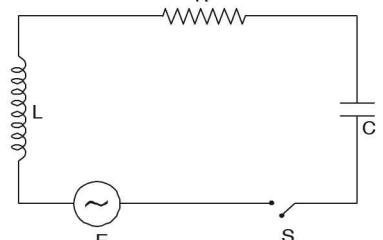

Consider an electric circuit consisting of a resistance  $R$ , inductance  $L$ , a condenser of capacity  $C$  and electromotive power of voltage  $E$  in a series. A switch is also connected in the circuit. Here,

$$i = \frac{dq}{dt}$$

Voltage developed by  $Ri$ ,  $L \frac{di}{dt}$  and  $\frac{q}{C}$

By Kirchhoff law

$$L \frac{di}{dt} + Ri + \frac{q}{C} = E$$

**Example 58.** A resistance  $R$  in series with inductance  $L$  is connected with e.m.f.  $E(t)$ . The current  $i$  is given by

$$L \frac{di}{dt} + Ri = E$$

If the switch is connected at  $t = 0$  and disconnected at  $t = a$ , find the current  $i$  in terms of  $t$ . (U.P. II Semester, Summer 2001)

**Solution.** Conditions under which current  $i$  flows are

$$E(t) = \begin{cases} E, & 0 < t < a \\ 0, & t > a \end{cases} \quad [i = 0 \text{ at } t = 0]$$

Given equation is  $L \frac{di}{dt} + Ri = E$  ... (1)

Taking Laplace transform of (1), we get

$$\begin{aligned} L[s\bar{i} - i(0)] + R\bar{i} &= \int_0^\infty e^{-st} E dt \\ Ls\bar{i} + R\bar{i} &= \int_0^\infty e^{-st} E dt \quad [i(0) = 0] \\ (Ls + R)\bar{i} &= \int_0^\infty e^{-st} \cdot E dt = \int_0^a e^{-st} E dt + \int_a^\infty e^{-st} E dt \\ &= E \left[ \frac{e^{-st}}{-s} \right]_0^a + 0 = \frac{E}{s} [1 - e^{-as}] = \frac{E}{s} - \frac{E}{s} e^{-as} \\ \Rightarrow \bar{i} &= \frac{E}{s(Ls + R)} - \frac{Ee^{-as}}{s(Ls + R)} \end{aligned}$$

Taking Inverse Laplace Transform, we obtain

$$i = \text{Inverse Lap.} \left[ \frac{E}{s(Ls + R)} \right] - \text{Inverse Lap.} \left[ \frac{Ee^{-as}}{s(Ls + R)} \right] \quad \dots (2)$$

Now we have to find the value of  $\text{Inverse Lap.} \left[ \frac{E}{s(Ls + R)} \right]$

$$\begin{aligned} \text{Inverse Lap.} \left[ \frac{E}{s(Ls + R)} \right] &= \frac{E}{L} \text{Inverse Lap.} \left[ \frac{1}{s \left( s + \frac{R}{L} \right)} \right] \\ &= \frac{E}{L} \frac{1}{R} \text{Inverse Lap.} \left[ \frac{1}{s} - \frac{1}{s + \frac{R}{L}} \right] = \frac{E}{R} \left[ 1 - e^{-\frac{R}{L}t} \right] \end{aligned}$$

(Resolving into partial fractions)

and  $\text{Inverse Lap.} \left[ \frac{Ee^{-as}}{s(Ls + R)} \right] = \frac{E}{R} \left[ 1 - e^{-\frac{R}{L}(t-a)} \right] u(t-a)$

(By the Second Shifting Theorem)

On substituting the values of the inverse transforms in (2), we get

$$i = \frac{E}{R} \left[ 1 - e^{-\frac{R}{L}t} \right] - \frac{E}{R} \left[ 1 - e^{-\frac{R}{L}(t-a)} \right] u(t-a)$$

Hence  $i = \frac{E}{R} \left[ 1 - e^{-\frac{R}{L}t} \right]$  for  $0 < t < a$ ,  $[u(t-a) = 0]$

$$\begin{aligned} i &= \frac{E}{R} \left[ 1 - e^{-\frac{R}{L}t} \right] - \frac{E}{R} \left[ 1 - e^{-\frac{R}{L}(t-a)} \right] \\ &= \frac{E}{R} \left[ e^{-\frac{R}{L}(t-a)} - e^{-\frac{R}{L}t} \right] = \frac{E}{R} e^{-\frac{R}{L}t} \left[ e^{\frac{Ra}{L}} - 1 \right] \quad [u(t-a) = 1] \end{aligned}$$

**Ans.**

**Example 59.** Voltage  $Ee^{-at}$  is applied at  $t = 0$  to a circuit of inductance  $L$  and resistance  $R$ .

Show that the current at time  $t$  is  $\frac{E}{R - aL} (e^{-at} - e^{-Rt/L})$ . [U.P., II Semester, (SUM) 2007]

**Solution.** We know that

$$L \frac{dI}{dt} + RI = Ee^{-at}, \quad \dots(1)$$

where  $I(0) = 0$

Taking Laplace transform of both sides of (1), we get

$$L[s\bar{I} - I(0)] + R\bar{I} = \frac{E}{s+a} \quad \dots(2)$$

Putting  $I(0) = 0$  in (2), we get

$$\begin{aligned} (Ls + R)\bar{I} &= \frac{E}{s+a} \\ \Rightarrow \bar{I} &= \frac{E}{(s+a)(Ls+R)} = \frac{E}{R-aL} \left( \frac{1}{s+a} - \frac{1}{Ls+R} \right) \\ &= \frac{E}{R-aL} \left( \frac{1}{s+a} - \frac{1}{s+R/L} \right) \end{aligned} \quad \dots(3)$$

Taking the Inverse Laplace transform of both sides of (3), we get

$$I = \frac{E}{R-aL} L^{-1} \left\{ \frac{1}{s+a} - \frac{1}{s+R/L} \right\} = \frac{E}{R-aL} [e^{-at} - e^{-Rt/L}] \quad \text{Ans.}$$

**Example 60.** Using the Laplace transform, find the current  $i(t)$  in the LC - circuit. Assuming  $L = 1$  henry,  $C = 1$  farad, zero initial current and charge on the capacitor, and

$$\begin{aligned} v(t) &= t, \text{ when } 0 < t < l \\ &= 0 \text{ otherwise.} \end{aligned}$$

**Solution.** The differential equation for L and C circuit is

$$\text{given by} \quad L \frac{d^2q}{dt^2} + \frac{q}{C} = E \quad \dots(1)$$

Putting  $L = 1$ ,  $C = 1$ ,  $E = v(t)$  in (1), we get

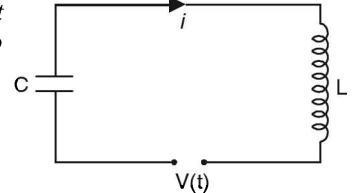

$$\frac{d^2q}{dt^2} + q = v(t) \quad \dots(2)$$

Taking Laplace Transform of (2), we have

$$s^2 \bar{q} - sq(0) - q'(0) + \bar{q} = \int_0^\infty v(t) e^{-st} dt$$

Substituting  $q(0) = 0$ , and  $q'(0) = 0$ , we get

$$\begin{aligned} s^2 \bar{q} + \bar{q} &= \int_0^1 te^{-st} dt + \int_1^\infty 0 e^{-st} dt \\ (s^2 + 1) \bar{q} &= \left[ t \frac{e^{-st}}{-s} \right]_0^1 - \int_0^1 \frac{e^{-st}}{-s} dt = \frac{e^{-s}}{-s} - \left[ \frac{e^{-st}}{s^2} \right]_0^1 = -\frac{e^{-s}}{s} - \frac{e^{-s}}{s^2} + \frac{1}{s^2} \\ \bar{q} &= \frac{1}{s^2 + 1} \left[ -\frac{e^{-s}}{s} - \frac{e^{-s}}{s^2} + \frac{1}{s^2} \right] \\ \bar{q} &= \frac{-e^{-s}}{s(s^2 + 1)} - \frac{e^{-s}}{s^2(s^2 + 1)} + \frac{1}{s^2(s^2 + 1)} \end{aligned}$$

Taking Inverse Laplace Transform, we get

$$q = \text{Inverse Lap. } \frac{-e^{-s}}{s(s^2+1)} - \text{Inverse Lap. } \frac{e^{-s}}{s^2(s^2+1)} + \text{Inverse Lap. } \frac{1}{s^2(s^2+1)} \quad \dots (3)$$

We know that

$$\text{Inverse Lap. } [e^{-as} F(s)] = f(t-a) u(t-a)$$

$$\text{Inverse Lap. } \frac{1}{s(s^2+1)} = \int_0^t \sin t \, dt = [-\cos t]_0^t = 1 - \cos t \quad \dots (4)$$

$$\text{Inverse Lap. } \frac{1}{s^2(s^2+1)} = \int_0^t (1 - \cos t) \, dt = t - \sin t \quad \dots (5)$$

In view of this, we have

$$\text{Inverse Lap. } \left[ \frac{-e^{-s}}{s(s^2+1)} \right] = -[1 - \cos(t-1)] u(t-1) \quad [\text{From (4)}]$$

$$\text{Inverse Lap. } \frac{e^{-s}}{s^2(s^2+1)} = [(t-1) - \sin(t-1)] u(t-1) \quad [\text{From (5)}]$$

Putting the above values in (3), we get

$$q = -[1 - \cos(t-1)] u(t-1) - [(t-1) - \sin(t-1)] u(t-1) + t - \sin t \quad \text{Ans.}$$

### EXERCISE 43.10

Solve the following differential equations:

1.  $\frac{d^2y}{dx^2} + y = 0$  where  $y = 1$  and  $\frac{dy}{dx} = -1$  at  $x = 0$ . Ans.  $y = \cos x - \sin x$
2.  $\frac{d^2y}{dx^2} + 2 \frac{dy}{dx} + 5y = 0$ , where  $y = 2$ ,  $\frac{dy}{dx} = -4$  at  $x = 0$ . Ans.  $y = e^{-x} (2 \cos 2x - \sin 2x)$
3.  $\frac{d^3y}{dx^3} + 2 \frac{d^2y}{dx^2} - \frac{dy}{dx} - 2y = 0$ , given  $y = \frac{dy}{dx} = 0$ ,  $\frac{d^2y}{dx^2} = 6$  at  $x = 0$ . Ans.  $y = e^x - 3e^{-x} + 2e^{-2x}$
4.  $\frac{d^2y}{dx^2} + y = 3 \cos 2x$ , where  $y = \frac{dy}{dx} = 0$  at  $x = 0$ . Ans.  $y = \cos x - \cos 2x$ .
5.  $\frac{d^2y}{dx^2} + \frac{dy}{dx} - 2y = 1 - 2x$ , given  $y = 0$ ,  $\frac{dy}{dx} = 4$  at  $x = 0$ . Ans.  $y = e^x - e^{-2x} + x$
6.  $\frac{d^2y}{dx^2} - 3 \frac{dy}{dx} + 2y = 4e^{2x}$ , given  $y = -3$ , and  $\frac{dy}{dx} = 5$  at  $x = 0$  Ans.  $y = -7e^x + 4e^{2x} + 4xe^{2x}$
7.  $\frac{d^2y}{dx^2} - 3 \frac{dy}{dx} + 2y = 4x + e^{2x}$ , where  $y = 1$ ,  $\frac{dy}{dx} = -1$  at  $x = 0$ . Ans.  $y = 3 + 2x + \frac{1}{2}e^{3x} - 2e^{2x} - \frac{1}{2}e^x$ .
8.  $\frac{d^3y}{dx^3} + 2 \frac{d^2y}{dx^2} - \frac{dy}{dx} - 2y = 0$ , where  $y = 1$ ,  $\frac{dy}{dx} = 2$ ,  $\frac{d^2y}{dx^2} = 2$  at  $x = 0$ . Ans.  $y = \frac{5}{3}e^x - e^{-x} + \frac{1}{2}e^{-2x}$
9.  $(D^2 - D - 2)x = 20 \sin 2t$ ,  $x_0 = -1$ ,  $x_1 = 2$  Ans.  $x = 2e^{2t} - 4e^{-t} + \cos 2t - 3 \sin 2t$
10.  $(D^3 + D^2)x = 6t^2 + 4$ ,  $x(0) = 0$ ,  $x'(0) = 2$ ,  $x''(0) = 0$  Ans.  $x = \frac{1}{2}t^4 - 2t^3 + 8t^2 - 16t + 16 - 16e^{-t}$

11.  $\frac{d^2x}{dt^2} - 2\frac{dx}{dt} + x = e^t$ , where  $x(0) = 2$ ,  $\frac{dx}{dt} = -1$  at  $t = 0$

**Ans.**  $x = 2e^t - 3t e^t + \frac{1}{2} t^2 e^t$

12.  $y'' + 2y' + y = t e^{-t}$  if  $y(0) = 1$ ,  $y'(0) = -2$ .

**Ans.**  $y = \left(1 - t + \frac{t^3}{6}\right) e^{-t}$

13.  $\frac{d^2y}{dx^2} + y = x \cos 2x$ , where  $y = \frac{dy}{dx} = 0$  at  $x = 0$ .

**Ans.**  $y = \frac{4}{9} \sin 2x - \frac{5}{9} \sin x - \frac{x}{3} \cos 2x$

14.  $\frac{d^3y}{dx^3} - 3\frac{d^2y}{dx^2} + 3\frac{dy}{dx} - y = x^2 e^{2x}$ , where  $y = 1$ ,  $\frac{dy}{dx} = 0$ ,  $\frac{d^2y}{dx^2} = -2$  at  $x = 0$ .

**Ans.**  $y = e^{2x} (x^2 - 6x + 12) - e^x (15x^2 + 7x + 11)$ .

15.  $y'' + 4y' + 3y = t$ ,  $t > 0$ ; given that  $y(0) = 0$  and  $y'(0) = 1$ .

**Ans.**  $y = -\frac{4}{9} + \frac{t}{6} + e^{-t} - \frac{5}{9} e^{-3t}$

#### 43.14 SOLUTION OF SIMULTANEOUS DIFFERENTIAL EQUATIONS BY LAPLACE TRANSFORMS

Simultaneous differential equations can also be solved by Laplace Transform method.

**Example 61.** Solve  $\frac{dx}{dt} + y = 0$  and  $\frac{dy}{dt} - x = 0$  under the condition  $x(0) = 1$ ,  $y(0) = 0$ .

**Solution.** We have,  $x' + y = 0$  ... (1)  
and  $y' - x = 0$  ... (2)

Taking the Laplace transform of (1) and (2), we get

$$[s \bar{x} - x(0)] + \bar{y} = 0 \quad \dots (3)$$

$$[s \bar{y} - y(0)] - \bar{x} = 0 \quad \dots (4)$$

On substituting the values of  $x(0)$  and  $y(0)$  in (3) and (4), we get

$$s \bar{x} - 1 + \bar{y} = 0 \quad \dots (5)$$

$$s \bar{y} - \bar{x} = 0 \quad \dots (6)$$

Solving (5) and (6) for  $\bar{x}$  and  $\bar{y}$ , we get

$$\bar{x} = \frac{s}{s^2 + 1}, \quad \bar{y} = \frac{1}{s^2 + 1},$$

On inversion, we obtain  $x = L^{-1}\left(\frac{s}{s^2 + 1}\right)$ ,  $y = L^{-1}\left(\frac{1}{s^2 + 1}\right)$ ,  
 $x = \cos t$ ,  $y = \sin t$  ... (Ans.)

**Example 62.** Solve the following simultaneous differential equations by Laplace transform

$$3\frac{dx}{dt} - y = 2t, \quad \frac{dx}{dt} + \frac{dy}{dt} - y = 0$$

with the conditions  $x(0) = y(0) = 0$ . [U.P., II Semester, (SUM) 2008]

**Solution.** Here, we have

$$3\frac{dx}{dt} - y = 2t, \quad \dots (1)$$

and  $\frac{dx}{dt} + \frac{dy}{dt} - y = 0 \quad \dots (2)$

Taking Laplace transform on both sides of equation (1), we get

$$3L(x') - L(y) = L(2t)$$

$$3[s\bar{x} - x(0)] - \bar{y} = \frac{2}{s^2} \quad [\text{where } L(x) = \bar{x} \text{ and } L(y) = \bar{y}]$$

$$3s\bar{x} - \bar{y} = \frac{2}{s^2} \quad \dots(3)$$

Again taking Laplace transform on both sides of equation (2), we get

$$\begin{aligned} L(x') + L(y') - L(y) &= L(0) \\ \Rightarrow [s\bar{x} - x(0)] + [s\bar{y} - y(0)] - \bar{y} &= 0 \Rightarrow s\bar{x} + (s-1)\bar{y} = 0 \end{aligned} \quad \dots(4)$$

Multiplying equation (4) by 3, we get

$$3s\bar{x} + 3(s-1)\bar{y} = 0 \quad \dots(5)$$

Subtracting equation (3) from (5), we get

$$\begin{aligned} (3s-2)\bar{y} &= -\frac{2}{s^2} \\ \Rightarrow \bar{y} &= -\frac{2}{s^2(3s-2)} = \frac{1}{s^2} + \frac{3}{2s} - \frac{3}{2\left(s-\frac{2}{3}\right)} \end{aligned}$$

Taking inverse Laplace transform on both sides, we get

$$y = t + \frac{3}{2} - \frac{3}{2}e^{\frac{2t}{3}} \quad \dots(6)$$

Substituting  $\bar{y}$  in (3), we get

$$\begin{aligned} 3s\bar{x} - \frac{1}{s^2} - \frac{3}{2s} + \frac{3}{2\left(s-\frac{2}{3}\right)} &= \frac{2}{s^2} \Rightarrow 3s\bar{x} = \frac{3}{s^2} + \frac{3}{2s} - \frac{3}{2\left(s-\frac{2}{3}\right)} \\ \Rightarrow \bar{x} &= \frac{1}{s^3} + \frac{1}{2s^2} - \frac{1}{2s\left(s-\frac{2}{3}\right)} \quad \Rightarrow \bar{x} = \frac{1}{s^3} + \frac{1}{2s^2} - \frac{3}{4}\left(\frac{1}{s-\frac{2}{3}} - \frac{1}{s}\right) \end{aligned}$$

Taking inverse Laplace transform on both sides, we get

$$x = \frac{t^2}{2} + \frac{t}{2} - \frac{3}{4}e^{\frac{2t}{3}} + \frac{3}{4} \quad \dots(7)$$

Equation (6) and (7) when taken together, give the complete solution.

**Ans.**

**Example 63.** Solve the simultaneous equations:

$$\frac{dx}{dt} - y = e^t,$$

$$\frac{dy}{dt} + x = \sin t, \text{ given } x(0) = 1, y(0) = 0, \quad (\text{U.P., II Semester, Summer 2006})$$

$$\text{Solution. } \frac{dx}{dt} - y = e^t \quad \dots(1) \quad \frac{dy}{dt} + x = \sin t \quad \dots(2)$$

Taking Laplace transform of (1), we get

$$[s\bar{x} - x(0)] - \bar{y} = \frac{1}{s-1}$$

$$\text{i.e., } s\bar{x} - 1 - \bar{y} = \frac{1}{s-1} \quad [\because x(0) = 1]$$

$$s\bar{x} - \bar{y} = 1 + \frac{1}{s-1}$$

$$s\bar{x} - \bar{y} = \frac{s}{s-1} \quad \dots(3)$$

Taking Laplace Transform of (2), we get

$$[s\bar{y} - y(0)] + \bar{x} = \frac{1}{s^2+1} \quad [y(0) = 0]$$

$$\bar{x} + s \bar{y} = \frac{1}{s^2 + 1} \quad \dots (4)$$

Solving (3) and (4) for  $\bar{x}$  and  $\bar{y}$ , we have

$$\bar{x} = \frac{s^2}{(s-1)(s^2+1)} + \frac{1}{(s^2+1)^2} = \frac{1}{2} \left[ \frac{1}{s-1} + \frac{s}{s^2+1} + \frac{1}{s^2+1} \right] + \frac{1}{(s^2+1)^2} \quad \dots (5)$$

$$\text{and } \bar{y} = \frac{s}{(s^2+1)^2} - \frac{s}{(s-1)(s^2+1)} = \frac{s}{(s^2+1)^2} - \frac{1}{2} \left[ \frac{1}{s-1} - \frac{s}{s^2+1} + \frac{1}{s^2+1} \right] \quad \dots (6)$$

Taking Inverse Laplace Transform of (5), we get

$$\begin{aligned} x &= \frac{1}{2} L^{-1} \left[ \frac{1}{s-1} + \frac{s}{s^2+1} + \frac{1}{s^2+1} \right] + L^{-1} \left[ \frac{1}{(s^2+1)^2} \right] \\ &= \frac{1}{2} [e^t + \cos t + \sin t] + \frac{1}{2} (\sin t - t \cos t) \left[ \because L^{-1} \left[ \frac{1}{(s^2+a^2)^2} \right] = \frac{1}{2a^2} (\sin at - at \cos at) \right] \\ &= \frac{1}{2} [e^t + \cos t + 2 \sin t - t \cos t] \end{aligned}$$

Taking Inverse Laplace Transform of (6), we get

$$\begin{aligned} y &= L^{-1} \left[ \frac{s}{(s^2+1)^2} \right] - \frac{1}{2} L^{-1} \left[ \frac{1}{s-1} - \frac{s}{s^2+1} + \frac{1}{s^2+1} \right] \\ &= \frac{1}{2} t \sin t - \frac{1}{2} [e^t - \cos t + \sin t] \left[ \because L^{-1} \left[ \frac{s}{(s^2+a^2)^2} \right] = \frac{1}{2a^2} t \sin at \right] \\ &= \frac{1}{2} [t \sin t - e^t + \cos t - \sin t] \end{aligned}$$

$$\text{Hence, } x = \frac{1}{2} (e^t + \cos t + 2 \sin t - t \cos t)$$

$$y = \frac{1}{2} (t \sin t - e^t + \cos t - \sin t) \quad \text{Ans.} \quad [i = 0 \text{ at } t = 0]$$

**Example 64.** Use Laplace transform to solve:

$$\frac{dx}{dt} + y = \sin t, \quad \frac{dy}{dt} + x = \cos t$$

given that  $x = 2$ ,  $y = 0$  at  $t = 0$ .

[U.P., II Semester, 2004]

**Solution.** Here, we have

$$\frac{dx}{dt} + y = \sin t \quad \dots (1)$$

$$\frac{dy}{dt} + x = \cos t \quad \dots (2)$$

Taking Laplace transform of (1) and (2), we get

$$s\bar{x} - x(0) + \bar{y} = \frac{1}{s^2 + 1} \Rightarrow s\bar{x} + \bar{y} = \frac{1}{s^2 + 1} + 2 \quad \dots (3)$$

$$\text{and } s\bar{y} - y(0) + \bar{x} = \frac{s}{s^2 + 1} \Rightarrow \bar{x} + s\bar{y} = \frac{s}{s^2 + 1} \quad \dots (4)$$

Solving (3) and (4) for  $\bar{x}$  and  $\bar{y}$ , we get

$$\begin{aligned} \bar{x} &= \frac{2s}{s^2 - 1} \text{ and } \bar{y} = \frac{1}{1+s^2} + \frac{2}{1-s^2} \\ \bar{x} &= \frac{1}{s+1} + \frac{1}{s-1} \end{aligned} \quad \dots (5)$$

and  $\bar{y} = \frac{1}{1+s^2} + \frac{1}{s+1} - \frac{1}{s-1}$  ... (6) (By partial fractions)

Taking Inverse Laplace transform on both sides of (5) and (6), we get

$$x = e^{-t} + e^t$$

and  $y = \sin t + e^{-t} - e^t$  Ans.

**Example 65.** The co-ordinates  $(x, y)$  of a particle moving along a plane curve at any time  $t$  are given by

$$\frac{dy}{dt} + 2x = \sin 2t, \quad \frac{dx}{dt} - 2y = \cos 2t; \quad (t > 0)$$

It is given that at  $t = 0$ ,  $x = 1$  and  $y = 0$ . Show using transforms that the particle moves along the curve  $4x^2 + 4xy + 5y^2 = 4$ . [U.P. II Semester 2003]

**Solution.** Here, we have

$$\begin{cases} \frac{dy}{dt} + 2x = \sin 2t \\ \frac{dx}{dt} - 2y = \cos 2t \end{cases} \Rightarrow \begin{cases} 2x + Dy = \sin 2t \\ Dx - 2y = \cos 2t, \end{cases} \quad \dots(1) \quad \dots(2)$$

Taking Laplace transform of (1) on both sides, we get

$$2\bar{x} + s\bar{y} - y(0) = \frac{2}{s^2 + 4} \quad \text{where } \bar{x} = L(x) \text{ and } \bar{y} = L(y)$$

$$2\bar{x} + s\bar{y} = \frac{2}{s^2 + 4} \quad \dots(3) \quad [\because y(0) = 0]$$

Again, taking Laplace transform of equation (2) on both sides, we get

$$s\bar{x} - x(0) - 2\bar{y} = \frac{s}{s^2 + 4}, \quad \text{where } \bar{x} = L(x) \text{ and } \bar{y} = L(y)$$

$$\Rightarrow s\bar{x} - 2\bar{y} = \frac{s}{s^2 + 4} + 1 \quad \dots(4) \quad [\because x(0) = 0]$$

Multiplying equation (3) by 2 and equation (4) by s and then adding, we get

$$s\bar{x} + s^2\bar{x} = \frac{4}{s^2 + 4} + \frac{s^2}{s^2 + 4} + s$$

$$(4 + s^2)\bar{x} = 1 + s$$

$$\bar{x} = \frac{1+s}{4+s^2} = \frac{1}{s^2+4} + \frac{s}{s^2+4} \quad \dots(5)$$

Taking Inverse Laplace transform of (5), we get

$$x = \frac{1}{2} \sin 2t + \cos 2t \quad \dots(6)$$

Again, multiplying (3) by s and (4) by 2 then subtracting equation (6) from (3), we get

$$s^2\bar{y} + 4\bar{y} = \frac{2s}{s^2 + 4} - \frac{2s}{s^2 + 4} - 2$$

$$\Rightarrow \bar{y} = \frac{-2}{s^2 + 4} \quad \dots(7)$$

Taking Inverse Laplace transform of (7), we get  $y = -\sin 2t$

Now,

$$4x^2 = 4 \left[ \frac{1}{4} \sin^2 2t + \cos^2 2t + \sin 2t \cos 2t \right]$$

$$5y^2 = 5 \sin^2 2t$$

$$\begin{aligned}
 4xy &= 4 \left[ \left( \frac{1}{2} \sin 2t + \cos 2t \right) \cdot (-\sin 2t) \right] \\
 &= -(2\sin^2 2t + 4 \sin 2t \cos 2t) \\
 \therefore 4x^2 + 5y^2 + 4xy &= 4 \sin^2 2t + 4 \cos^2 2t = 4
 \end{aligned}
 \quad \text{Ans.}$$

**Example 66.** Solve the following simultaneous differential equations by Laplace transform

$$\frac{dx}{dt} + 4 \frac{dy}{dt} - y = 0; \quad \frac{dx}{dt} + 2y = e^{-t}$$

with conditions

$$x(0) = y(0) = 0.$$

[U.P., II Semester, 2008]

**Solution.** Here, we have

$$\frac{dx}{dt} + 4 \frac{dy}{dt} - y = 0 \quad \dots(1)$$

$$\text{and} \quad \frac{dx}{dt} + 2y = e^{-t} \quad \dots(2)$$

Taking Laplace transform on both sides of equation (1), we get

$$\begin{aligned}
 L(x') + 4L(y') - L(y) &= L(0) \\
 \Rightarrow s\bar{x} - x(0) + 4[s\bar{y} - y(0)] - \bar{y} &= 0 \\
 \Rightarrow s\bar{x} + (4s - 1)\bar{y} &= 0 \quad \dots(3)
 \end{aligned}$$

Again, taking Laplace transform on both sides of equation (2), we get

$$\begin{aligned}
 L(x') + 2L(y) &= L(e^{-t}) \\
 \Rightarrow s\bar{x} - x(0) + 2\bar{y} &= \frac{1}{s+1} \quad \Rightarrow s\bar{x} + 2\bar{y} = \frac{1}{s+1} \quad \dots(4)
 \end{aligned}$$

Subtracting (4) from (3), we get

$$\begin{aligned}
 (4s - 3)\bar{y} &= -\frac{1}{s+1} \\
 \bar{y} &= -\frac{1}{(s+1)(4s-3)} = -\frac{1}{7} \left( \frac{-1}{s+1} + \frac{1}{s-3/4} \right) = \frac{1}{7} \left( \frac{1}{s+1} - \frac{1}{s-3/4} \right) \quad \dots(5)
 \end{aligned}$$

Taking inverse Laplace transform on both sides of (5), we get

$$y = \frac{1}{7} \left( e^{-t} - e^{\frac{3t}{4}} \right) \quad \dots(6)$$

Substituting  $\bar{y}$  in (4), we get

$$\begin{aligned}
 s\bar{x} + \frac{2}{7} \left( \frac{1}{s+1} - \frac{1}{s-3/4} \right) &= \frac{1}{s+1} \\
 \Rightarrow s\bar{x} &= \frac{5}{7(s+1)} + \frac{2}{7(s-3/4)} \\
 \Rightarrow \bar{x} &= \frac{5}{7s(s+1)} + \frac{2}{7s(s-3/4)} = \frac{5}{7} \left( \frac{1}{s} - \frac{1}{s+1} \right) + \frac{8}{21} \left( \frac{1}{s-3/4} - \frac{1}{s} \right) \\
 &= \frac{1}{3s} - \frac{5}{7(s+1)} + \frac{8}{21(s-3/4)} \quad \dots(7)
 \end{aligned}$$

Taking Inverse Laplace transform on both sides of (7), we get

$$x = \frac{1}{3} - \frac{5}{7}e^{-t} + \frac{8}{21}e^{\frac{3t}{4}} \quad \text{Ans.}$$

**Example 67.** Using Laplace Transformation, solve

$$\begin{aligned} (D - 2)x - (D + 1)y &= 6e^{3t} \\ (2D - 3)x + (D - 3)y &= 6e^{3t} \end{aligned} \quad \dots (1)$$

Given  $x = 3, y = 0$  when  $t = 0$ .

(U.P., II Semester Summer 2001)

**Solution.** Taking Laplace transformation of the given equations, we get

$$\begin{aligned} &\left[ \begin{array}{l} L Dx - 2Lx - LDy - Ly = 6Le^{3t} \\ 2L Dx - 3Lx + LDy - 3Ly = 6Le^{3t} \end{array} \right] \\ \Rightarrow &\left[ \begin{array}{l} s\bar{x} - x(0) - 2\bar{x} - s\bar{y} + y(0) - \bar{y} = 6\frac{1}{s-3} \\ 2s\bar{x} - 2x(0) - 3\bar{x} + s\bar{y} - y(0) - 3\bar{y} = \frac{6}{s-3} \end{array} \right] \\ \Rightarrow &\left[ \begin{array}{l} (s-2)\bar{x} - (s+1)\bar{y} - 3 = \frac{6}{s-3} \\ (2s-3)\bar{x} + (s-3)\bar{y} - 6 = \frac{6}{s-3} \end{array} \right] \Rightarrow \left[ \begin{array}{l} (s-2)\bar{x} - (s+1)\bar{y} = \frac{3s-3}{s-3} \\ (2s-3)\bar{x} + (s-3)\bar{y} = \frac{6s-12}{s-3} \end{array} \right] \\ \Rightarrow &\left[ \begin{array}{l} (s-3)(s-2)\bar{x} - (s-3)(s+1)\bar{y} = 3s-3 \\ (s+1)(2s-3)\bar{x} + (s+1)(s-3)\bar{y} = \frac{(s+1)(6s-12)}{s-3} \end{array} \right] \text{on adding, we get:} \\ &(3s^2 - 6s + 3)x = 3(s-1) + \frac{6(s^2 - s - 2)}{s-3} \Rightarrow \bar{x} = \frac{3(s-1)}{3(s-1)^2} + \frac{6(s^2 - s - 2)}{3(s-1)^2(s-3)} \\ &x = L^{-1} \left[ \frac{1}{s-1} + \frac{2}{(s-1)^2} + \frac{2}{s-3} \right] = e^t + 2te^t + 2e^{3t} \end{aligned}$$

Putting the value of  $x$  in (1), we get

$$\begin{aligned} &(D - 2)(e^t + 2te^t + 2e^{3t}) - (D + 1)y = 6e^{3t} \\ \Rightarrow &e^t + 2te^t + 2e^t + 6e^{3t} - 2e^t - 4te^t - 4e^{3t} - (D + 1)y = 6e^{3t} \\ \Rightarrow &(D + 1)y = e^t - 2te^t - 4e^{3t} \end{aligned} \quad \dots (2)$$

Taking Laplace transform of (2), we get

$$\begin{aligned} &s\bar{y} - y(0) + \bar{y} = \frac{1}{s-1} - \frac{2}{(s-1)^2} - \frac{4}{s-3} \\ \Rightarrow &(s+1)\bar{y} = \frac{1}{s-1} - \frac{2}{(s-1)^2} - \frac{4}{s-3} \quad [\because y(0) = 0] \\ \Rightarrow &\bar{y} = \frac{1}{s^2 - 1} - \frac{2}{(s+1)(s-1)^2} - \frac{4}{(s+1)(s-3)} \\ &= \frac{1}{s^2 - 1} - \frac{\frac{1}{2}}{s+1} + \frac{\frac{1}{2}}{s-1} - \frac{1}{(s-1)^2} + \frac{1}{s+1} - \frac{1}{s-3} \\ \Rightarrow &\bar{y} = \frac{1}{s^2 - 1} + \frac{\frac{1}{2}}{s+1} + \frac{\frac{1}{2}}{s-1} - \frac{1}{(s-1)^2} - \frac{1}{s-3} \\ \Rightarrow &y = L^{-1} \left[ \frac{1}{s^2 - 1} + \frac{1}{2} \frac{1}{s+1} + \frac{1}{2} \frac{1}{s-1} - \frac{1}{s-3} - \frac{1}{(s-1)^2} \right] \end{aligned}$$

$$\Rightarrow \begin{aligned} y &= \sinh t + \frac{1}{2} e^{-t} + \frac{1}{2} e^t - e^{3t} - te^t \\ y &= \sinh t + \cosh t - e^{3t} - te^t \end{aligned} \quad \text{Ans.}$$

**Example 68.** Solve the simultaneous equations

$$\begin{aligned} (D^2 - 3)x - 4y &= 0 \\ x + (D^2 + 1)y &= 0 \end{aligned}$$

for  $t > 0$ , given that  $x = y = \frac{dy}{dt} = 0$  and  $\frac{dx}{dt} = 2$  at  $t = 0$ . [U.P., II Semester, 2004]

**Solution.** Here, we have

$$(D^2 - 3)x - 4y = 0 \quad \dots(1)$$

$$x + (D^2 + 1)y = 0 \quad \dots(2)$$

Taking Laplace transform of (1) and (2), we get

$$s^2 \bar{x} - sx(0) - x'(0) - 3\bar{x} - 4\bar{y} = 0$$

$$\text{i.e.,} \quad (s^2 - 3)\bar{x} - 4\bar{y} = 2 \quad \dots(3) [\because x(0) = 0, x'(0) = 2]$$

$$\text{and } \bar{x} + s^2 \bar{y} - sy(0) - y'(0) + \bar{y} = 0$$

$$\text{i.e.,} \quad \bar{x} + (s^2 + 1)\bar{y} = 0 \quad \dots(4) [\because y(0) = 0, y'(0) = 0]$$

Solving (3) and (4) for  $\bar{x}$  and  $\bar{y}$ , we get

$$\bar{x} = \frac{2(s^2 + 1)}{(s^2 - 1)^2} = \frac{1}{(s - 1)^2} + \frac{1}{(s + 1)^2} \quad \dots(5)$$

$$\text{and} \quad \bar{y} = -\frac{2}{(s^2 - 1)^2} = -\frac{1}{2} \left[ \frac{1}{s+1} - \frac{1}{s-1} - \frac{1}{(s+1)^2} + \frac{1}{(s-1)^2} \right] \quad \dots(6)$$

Taking Inverse Laplace transform of both sides of (5) and (6), we get

$$x = L^{-1} \left[ \frac{1}{(s-1)^2} + \frac{1}{(s+1)^2} \right] = te^t + te^{-t} = 2t \left( \frac{e^t + e^{-t}}{2} \right) = 2t \cosh t$$

$$\begin{aligned} \text{and} \quad y &= -\frac{1}{2} L^{-1} \left( \frac{1}{s+1} - \frac{1}{s-1} - \frac{1}{(s+1)^2} + \frac{1}{(s-1)^2} \right) \\ &= -\frac{1}{2} (e^{-t} - e^t - te^{-t} + te^t) = \frac{e^t - e^{-t}}{2} - t \left( \frac{e^t - e^{-t}}{2} \right) = (1-t) \sinh t \end{aligned}$$

Hence,

$$x = 2t \cosh t, y = (1-t) \sinh t. \quad \text{Ans.}$$

### EXERCISE 43.11

**Solve the following:**

$$1. \quad \frac{dx}{dt} + 4y = 0, \quad \frac{dy}{dt} - 9x = 0. \quad \text{Given } x = 2 \text{ and } y = 1 \text{ at } t = 0.$$

$$\text{Ans. } x = -\frac{2}{3} \sin 6t + 2 \cos 6t, y = \cos 6t + 3 \sin 6t$$

$$2. \quad 4 \frac{dy}{dt} + \frac{dx}{dt} + 3y = 0, \quad 3 \frac{dx}{dt} + 2x + \frac{dy}{dt} = 1 \quad \text{under the condition } x = y = 0 \text{ at } t = 0.$$

$$\text{Ans. } x = \frac{1}{2} - \frac{1}{5} e^{-t} - \frac{3}{10} e^{-\frac{6}{11}t}, y = \frac{1}{5} e^{-t} - \frac{1}{5} e^{-\frac{6}{11}t}$$

3.  $\frac{dx}{dt} + 5x - 2y = t, \frac{dy}{dt} + 2x + y = 0$  being given  $x = y = 0$  when  $t = 0$ .

**Ans.**  $x = -\frac{1}{27}(1+6t)e^{-3t} + \frac{1}{27}(1+3t), y = -\frac{2}{27}(2+3t)e^{-3t} - \frac{2t}{9} + \frac{4}{27}$

### 43.15 SOLUTION OF PARTIAL DIFFERENTIAL EQUATION BY LAPLACE TRANSFORM

**Example 69.** Solve the differential equation using Laplace transform method:

$$\frac{\partial y}{\partial t} = 3 \frac{\partial^2 y}{\partial t^2} \quad \text{where} \quad y\left(\frac{\pi}{2}, t\right) = 0, \left(\frac{\partial y}{\partial x}\right)_{x=0} = 0 \quad \text{and } y(x, 0) = 30 \cos 5x.$$

(U.P., II Semester Summer 2005)

**Solution.** Given equation is

$$\frac{\partial y}{\partial t} = 3 \frac{\partial^2 y}{\partial t^2}$$

Taking Laplace transform of both sides, we get

$$sL\{y\} - y(x, 0) = 3 \frac{d^2}{dx^2} L\{y\}, \quad [\text{Let } L\{y\} = \bar{y}]$$

$$s \bar{y} - y(x, 0) = 3 \frac{d^2 \bar{y}}{dx^2}$$

$$3 \frac{d^2 \bar{y}}{dx^2} - s \bar{y} = -30 \cos 5x$$

$$\left(D^2 - \frac{s}{3}\right) \bar{y} = -10 \cos 5x$$

A.E. is

$$m^2 - \frac{s}{3} = 0 \quad \Rightarrow \quad m = \pm \sqrt{\frac{s}{3}}$$

$$C.F. = C_1 e^{x\sqrt{s/3}} + C_2 e^{-x\sqrt{s/3}}$$

$$P.I. = \frac{1}{\left(D^2 - \frac{s}{3}\right)} (-10 \cos 5x)$$

$$P.I. = \frac{30 \cos 5x}{75 + s}$$

Thus

$$\bar{y} = C_1 e^{-x\sqrt{s/3}} + C_2 e^{x\sqrt{s/3}} + \frac{30 \cos 5x}{75 + s} \quad \dots (1)$$

$$\frac{\partial y}{\partial x} = 0 \quad \text{when} \quad x = 0$$

$$\Rightarrow L\left\{\frac{\partial y}{\partial x}\right\} = 0 \quad \text{at} \quad x = 0$$

$$\Rightarrow \frac{d\bar{y}}{dx} = 0 \quad \text{at} \quad x = 0$$

$$\text{Again, } y\left(\frac{\pi}{2}, t\right) = 0 \quad \Rightarrow \quad L\left\{y\left(\frac{\pi}{2}, t\right)\right\} = 0 \quad \Rightarrow \quad \bar{y}\left(\frac{\pi}{2}, s\right) = 0$$

$$\frac{d\bar{y}}{dx} = \sqrt{\frac{s}{3}} \left[ A e^{x\sqrt{s/3}} - B e^{-x\sqrt{s/3}} - \frac{150 \sin 5x}{75 + s} \right]$$

$$\text{Putting} \quad \frac{d\bar{y}}{dx} = 0 \quad \text{at} \quad x = 0$$

$$0 = \sqrt{\frac{s}{3}} [A - B] \Rightarrow A = B$$

Equation (1) becomes,

$$\bar{y} = A \left[ e^{x\sqrt{s/3}} + e^{-x\sqrt{s/3}} \right] + \frac{30 \cos 5x}{75 + s} \quad \dots (2)$$

Subjecting this to the condition

$$\begin{aligned} \bar{y}\left(\frac{\pi}{2}, s\right) &= 0 \\ 0 &= A \left[ e^{\frac{\pi\sqrt{s/3}}{2}} + e^{-\frac{\pi\sqrt{s/3}}{2}} \right] + \frac{30 \cos(5\pi/2)}{75 + s} \\ 24 \cosh\left[\frac{\pi}{2} \sqrt{\frac{s}{3}}\right] &= 0 \Rightarrow A = 0 \end{aligned}$$

From equation (2),  $\bar{y} = \frac{30 \cos 5x}{75 + s}$ , taking inverse Laplace, we get

$$y = 30e^{-75t} \cos 5x \quad \text{Ans.}$$

### EXERCISE 43.12

Solve the following differential equation using Laplace transform method:

1.  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$  if  $u(x, 0) = \sin \pi x$  Ans.  $u = \sin \pi x \cdot e^{-p^2 t}$

2.  $\frac{\partial u}{\partial t} = 4 \frac{\partial^2 u}{\partial x^2}$  if  $u(x, 0) = 4x - \frac{1}{2}x^2$  Ans.  $u = \left(4x - \frac{x^2}{2}\right) e^{-p^2 t}$

3.  $\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}$  if  $u(x, 0) = \frac{1}{2}x(1-x)$

Ans.  $u = \frac{x}{2}(1-x) \cos pt + C_2 \sin pt (C_3 \cos px + C_4 \sin px)$

4.  $16 \frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}$  if  $u(x, 0) = x^2(5-x)$

Ans.  $u = x^2(5-x) \cos pt + C_4 \sin pt \left(C_1 \cos \frac{px}{4} + C_2 \sin \frac{px}{4}\right)$

5.  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$  if  $u(x, 0) = \begin{cases} 2x, & \text{when } 0 \leq x \leq \frac{1}{2} \\ 2(1-x), & \text{when } \frac{1}{2} \leq x \leq 1 \end{cases}$

## Z - TRANSFORMS

---

---

### 44.1 INTRODUCTION

Z-transform plays an important role in discrete analysis. Its role in discrete analysis is the same as that of Laplace and Fourier transforms in continuous system. Communication is one of the field whose development is based on discrete analysis. Difference equations are also based on discrete system and their solutions and analysis are carried out by Z- transform.

### 44.2 SEQUENCE

Sequence  $\{f(k)\}$  is an ordered list of real or complex numbers.

### 44.3 REPRESENTATION OF A SEQUENCE

#### First Method.

The elementary way is to list all the members of the sequence such as

$$\{f(k)\} = \{15, 10, 7, 4, 1, -1, 0, 3, 6\}$$

↑

The symbol ↑ is used to denote the term in zero position i.e.,  $k = 0$ ,  $k$  is an index of position of a term in the sequence.

$$\{g(k)\} = \{15, 10, 7, 4, 1, -1, 0, 3, 6\}$$

↑

Two sequences  $\{f(k)\}$  and  $\{g(k)\}$  have the same terms but these sequences are not identically the same as the zeroth term of those sequences are different.

In case the symbol ↑ is not given then left hand end term is considered as the term corresponding to  $k = 0$ .

In sequence  $\{8, 6, 3, -1, 0, 1, 4, 5\}$   
the zero<sup>th</sup> term is 8, the left hand end term.

#### Second Method.

The second way of specifying the sequence is to define the general term of the sequence  $\{f(k)\}$  as function of  $k$ .

For example,

$$f(k) = \frac{1}{3^k}$$

This sequence represents  $\left\{ \dots, \frac{1}{3^{-3}}, \frac{1}{3^{-2}}, \frac{1}{3^{-1}}, 1, \frac{1}{3}, \frac{1}{3^2}, \frac{1}{3^3}, \dots \right\}$

↑  
 $k = 0$

$$\text{If } f(k) = \frac{1}{3^k}, -4 \leq k \leq 3 \quad \left\{ \frac{1}{3^{-4}}, \frac{1}{3^{-3}}, \frac{1}{3^{-2}}, \frac{1}{3^{-1}}, 1, \frac{1}{3^1}, \frac{1}{3^2}, \frac{1}{3^3} \right\}$$

#### 44.4 BASIC OPERATIONS ON SEQUENCES

Let  $\{f(k)\}$  and  $\{g(k)\}$  be two sequences having same number of terms.

**Addition.**  $\{f(k)\} + \{g(k)\} = \{f(k) + g(k)\}$

**Multiplication.** Let  $a$  be a scalar, then  $a \{f(k)\} = \{af(k)\}$

**Linearity.**  $a \{f(k)\} + b \{g(k)\} = \{af(k) + bg(k)\}$

#### EXERCISE 44.1

1. Write down the term corresponding to  $k = 2$

$$(6, 7, 5, 1, 0, 4, 6, 8, 10)$$

↑

**Ans.** 8

2. Write down the term corresponding to  $k = -3$ .

$$(20, 16, 14, 13, 12, 10, 5, 1, 0)$$

↑

**Ans.** 14

3. Write down the sequence  $\{f(k)\}$  where  $f(k) = \frac{1}{2^k}$  **Ans.**  $\left\{ \dots, \frac{1}{2^{-3}}, \frac{1}{2^{-2}}, \frac{1}{2^{-1}}, 1, \frac{1}{2^1}, \frac{1}{2^2}, \frac{1}{2^3}, \dots \right\}$

4. Write down the sequence  $\{f(k)\}$  where  $f(k) = \frac{1}{4^k}, -3 \leq k \leq 4$

$$\text{Ans. } \left\{ \frac{1}{4^{-3}}, \frac{1}{4^{-2}}, \frac{1}{4^{-1}}, 1, \frac{1}{4^1}, \frac{1}{4^2}, \frac{1}{4^3}, \frac{1}{4^4} \right\}$$

5. Write down the sequence  $\frac{1}{2} \{f(k)\}$ , where  $f(k) = \frac{1}{3^k}$

$$\text{Ans. } \left\{ \frac{27}{2}, \frac{9}{2}, \frac{3}{2}, \frac{1}{2}, \frac{1}{6}, \frac{1}{18}, \frac{1}{54}, \dots \right\}$$

6. What sequence is generated when  $f(k) = \begin{cases} 0 & , k < 0 \\ \cos \frac{k}{2}, & k \geq 0 \end{cases}$

$$\text{Ans. } \left\{ \dots, 0, 0, 1, \cos \frac{1}{2}, \cos 1, \cos \frac{3}{2}, \dots \right\}$$

7. Write the sequence  $\frac{1}{3} \{f(k)\} + \frac{1}{4} \{g(k)\} = \{F(k)\}$ . Where  $f(k) = \frac{1}{3^k}, g(k)$

$$= \begin{cases} 0, & k < 0 \\ 4, & k \geq 0 \end{cases}$$

$$\text{Ans. } \{F(k)\} = \begin{cases} \frac{1}{3^{k+1}} & , k < 0 \\ \frac{1}{3^{k+1}} + 1, & k \geq 0 \end{cases}$$

#### 44.5 Z-TRANSFORM

**Definition.** The Z-transform of a sequence  $\{f(k)\}$  is denoted as  $Z[\{f(k)\}]$ .

$$\text{It is defined as } Z[\{f(k)\}] = F(z) = \sum_{k=-\infty}^{\infty} f(k)z^{-k} = \sum_{k=-\infty}^{\infty} \frac{f(k)}{z^k}$$

where 1. Z is a complex number.

2. Z is an operator of Z-transform.

3. F(z) is the Z transform of  $\{f(k)\}$ .

**Example 1.** If  $f(k) = \{15, 10, 7, 4, 1, -1, 0, 3, 6\}$ , then

↑

$$Z[\{f(k)\}] = F(z) = 15z^3 + 10z^2 + 7z + 4 + \frac{1}{z} - \frac{1}{z^2} + 0 + \frac{3}{z^4} + \frac{6}{z^5}$$

**Example 2.** If  $g(k) = \{15, 10, 7, 4, 1, -1, 0, 3, 6\}$

↑

$$Z[\{g(k)\}] = F(z) = 15z^7 + 10z^6 + 7z^5 + 4z^4 + z^3 - z^2 + 0 + 3 + \frac{6}{z}$$

**Example 3.** The Z-transform of the sequence  $\{8, 6, 3, -1, 0, 14, 5\}$  is

$$8 + \frac{6}{z} + \frac{3}{z^2} - \frac{1}{z^3} + 0 + \frac{14}{z^5} + \frac{5}{z^6}$$

**Example 4.** If  $f(k) = \frac{1}{3^k}$  then  $Z[\{f(k)\}] = \dots + 27z^3 + 9z^2 + 3z + 1 + \frac{1}{3z} + \frac{1}{9z^2} + \frac{1}{27z^3} + \dots$

**Example 5.** If  $f(k) = \frac{1}{3^k}$ ,  $-4 \leq k \leq 3$ , then

$$Z[\{f(k)\}] = 81z^4 + 27z^3 + 9z^2 + 3z + 1 + \frac{1}{3z} + \frac{1}{9z^2} + \frac{1}{27z^3}$$

**Example 6.** Find Z-transform of the sequence  $\left\{\frac{1}{2^k}\right\} -4 \leq k \leq 4$

$$\text{Solution. } F(z) = \sum_{k=-4}^4 \frac{1}{2^k} z^{-k} = 16z^4 + 8z^3 + 4z^2 + 2z + 1 + \frac{1}{2z} + \frac{1}{4z^2} + \frac{1}{8z^3} + \frac{1}{16z^4}$$

Ans.

**Example 7.** Find Z-transform of the sequence  $\{a^k\}$ ,  $k \geq 0$ .

$$\text{Solution. } F(z) = \sum_{k=0}^{\infty} a^k z^{-k} = 1 + \frac{a}{z} + \frac{a^2}{z^2} + \frac{a^3}{z^3} + \dots$$

This is a Geometrical series whose sum  $= \frac{a}{1-r} = \frac{1}{1-\frac{a}{z}} = \frac{z}{z-a}$

Ans.

#### 44.6 PROPERTIES OF Z-TRANSFORMS

**Linearity.**

**Theorem 1:** If  $\{f(k)\}$  and  $\{g(k)\}$  are such that they can be added and  $a$  and  $b$  are constants, then

$$Z\{af(k) + bg(k)\} = aZ[\{f(k)\}] + bZ[\{g(k)\}]$$

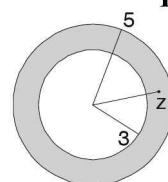

**Proof.**  $Z[\{af(k) + bg(k)\}] = \sum_{k=-\infty}^{\infty} [af(k) + bg(k)] z^{-k}$  [By definition]

$$\begin{aligned} &= \sum_{k=-\infty}^{\infty} [af(k)z^{-k} + bg(k)z^{-k}] = a \sum_{k=-\infty}^{\infty} f(k)z^{-k} + b \sum_{k=-\infty}^{\infty} g(k)z^{-k} \\ &= aZ[\{f(k)\}] + bZ[\{g(k)\}] \end{aligned}$$

**Proved.**

**Example 8.** Find the Z transform of  $\{f(k)\}$ , where

$$f(k) = \begin{cases} 5^k, & k < 0 \\ 3^k, & k \geq 0 \end{cases}$$

$$\begin{aligned}
 \textbf{Solution.} \quad Z[\{f(k)\}] &= \sum_{k=-\infty}^{-1} 5^k z^{-k} + \sum_{k=0}^{\infty} 3^k z^{-k} \\
 &= [.... + 5^{-3} z^3 + 5^{-2} z^2 + 5^{-1} z^1] + \left[ 1 + \frac{3}{z^{-1}} + \frac{9}{z^{-2}} + \frac{27}{z^{-3}} + \dots \right] \quad [\text{G.P.}] \\
 &= \frac{5^{-1} z}{1 - 5^{-1} z} + \frac{1}{1 - \frac{3}{z^{-1}}} = \frac{z}{5-z} + \frac{z}{z-3} \quad \left[ S = \frac{a}{1-r} \right] \\
 &= \frac{z^2 - 3z + 5z - z^2}{(5-z)(z-3)} = \frac{-2z}{z^2 - 8z + 15}, \quad \left| \frac{z}{5} \right| < 1, \quad \left| \frac{3}{z} \right| < 1
 \end{aligned}$$

Two series are convergent in annulus. Here  $3 < |z|$  and  $|z| < 5$ .

**Ans.**

**Example 9.** Find the Z-transform of  $\{a^{[k]}\}$

**Solution.**  $Z\left[\left\{a^{|k|}\right\}\right] = \sum_{k=-\infty}^{\infty} a^{|k|} z^{-k} = \sum_{k=-\infty}^{-1} a^{-k} z^{-k} + \sum_{k=0}^{\infty} a^k z^{-k}$   
 $= [ \dots + a^3 z^3 + a^2 z^2 + az ] + [ 1 + az^{-1} + a^2 z^{-2} + a^3 z^{-3} + \dots ]$

These are two G.P. and sum of G.P. =  $\frac{a}{1-r}$

$$= \frac{az}{1-az} + \frac{1}{1-az^{-1}}, \quad |az| < 1 \text{ and } |az^{-1}| < 1$$

$$= \frac{az}{1-az} + \frac{z}{z-a} = \frac{az(z-a) + z(1-az)}{(1-az)(z-a)} = \frac{az^2 - a^2z + z - az^2}{(1-az)(z-a)} = \frac{z - a^2z}{(1-az)(z-a)}$$

Ans.

**Example 10.** Find the Z-transform of  $\left\{ \left( \frac{1}{2} \right)^{|k|} \right\}$ .

**Solution.**  $Z\left[\left\{\left(\frac{1}{2}\right)^{|k|}\right\}\right] = \sum_{-\infty}^{\infty} \left(\frac{1}{2}\right)^{|k|} z^{-k} = \sum_{k=-\infty}^{-1} \left(\frac{1}{2}\right)^{-k} z^{-k} + \sum_{k=0}^{\infty} \left(\frac{1}{2}\right)^{-k} z^{-k}$

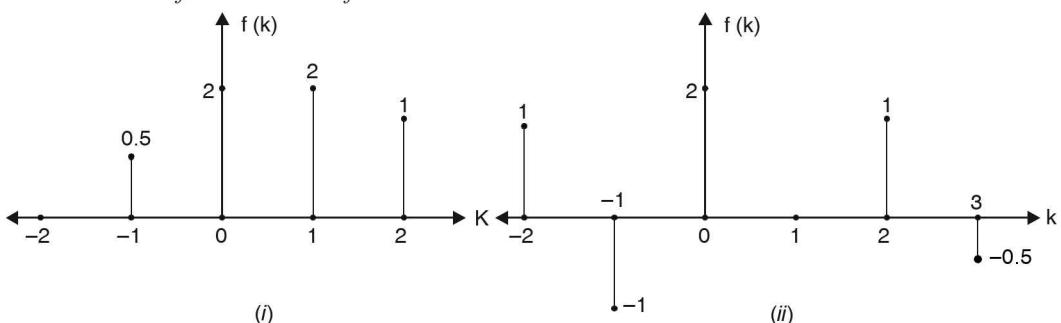

$$= \left( \dots + \frac{z^4}{16} + \frac{z^3}{8} + \frac{z^2}{4} + \frac{z}{2} \right) + \left( 1 + \frac{1}{2z} + \frac{1}{4z^2} + \frac{1}{8z^3} + \dots \right)$$

These infinite series are G.P., and sum of a G.P. =  $\frac{a}{1-r}$

$$= \frac{\frac{z}{2}}{1 - \frac{z}{2}} + \frac{1}{1 - \frac{1}{2z}} = \frac{z}{2-z} + \frac{2z}{2z-1} = \frac{2z^2 - z + 4z - 2z^2}{(2-z)(2z-1)} = \frac{3z}{(2-z)(2z-1)}$$

Ans.

**Example 11.** Express the signals shown below in terms of unit impulse functions and hence find the Z-transform.

**Solution.** (i)  $f(k) = 0.5 \delta(k+1) + 2 \delta(k) + 2 \delta(k-1) + \delta(k-2)$

$$(ii) f(k) = \delta(k+2) - \delta(k+1) + 2 \delta(k) + \delta(k-2) - 0.5 \delta(k-3)$$

**Example 12.** Find the Z-transform of unit impulse

$$\delta(k) = \begin{cases} 1, & k=0 \\ 0, & k \neq 0 \end{cases}$$

**Solution.**  $Z[\{f(k)\}] = \sum_{k=-\infty}^{\infty} \delta(k)z^{-k} = [....0+0+1+0+0....] = 1$

**Ans.**

**Example 13.** Find the Z-transform of discrete unit step

$$U(k) = \begin{cases} 0, & k < 0 \\ 1, & k \geq 0 \end{cases}$$

**Solution.**  $Z[\{U(k)\}] = \sum_{k=0}^{\infty} U(k)z^{-k} = [1+z^{-1}+z^{-2}+z^{-3}+\dots]$

$$= \frac{1}{1-z^{-1}} = \frac{1}{1-\frac{1}{z}} = \frac{z}{z-1} \quad [\text{This is G.P., its sum is } \frac{a}{1-r}] \quad \text{Ans.}$$

**Example 14.** Find the Z-transform of  $\sin \alpha k$ ,  $k \geq 0$

**Solution.**  $Z[\{\sin \alpha k\}] = \sum_{k=0}^{\infty} \sin \alpha k z^{-k} = \sum_{k=0}^{\infty} \frac{e^{i\alpha k} - e^{-i\alpha k}}{2i} z^{-k}$

$$= \frac{1}{2i} \sum_{k=0}^{\infty} e^{i\alpha k} z^{-k} - \frac{1}{2i} \sum_{k=0}^{\infty} e^{-i\alpha k} z^{-k} = \frac{1}{2i} \sum_{k=0}^{\infty} (e^{i\alpha} z^{-1})^k - \frac{1}{2i} \sum_{k=0}^{\infty} (e^{-i\alpha} z^{-1})^k$$

$$= \frac{1}{2i} \left[ 1 + (e^{i\alpha} z^{-1}) + (e^{i\alpha} z^{-1})^2 + \dots \right] - \frac{1}{2i} \left[ 1 + (e^{-i\alpha} z^{-1}) + (e^{-i\alpha} z^{-1})^2 + \dots \right]$$

These infinite series are G.P. and sum of a G.P.  $= \frac{a}{1-r}$

$$= \frac{1}{2i} \frac{1}{1-e^{i\alpha} z^{-1}} - \frac{1}{2i} \frac{1}{1-e^{-i\alpha} z^{-1}} = \frac{1}{2i} \frac{z}{z-e^{i\alpha}} - \frac{1}{2i} \frac{z}{z-e^{-i\alpha}}$$

$$= \frac{1}{2i} \left[ \frac{z}{z-e^{i\alpha}} - \frac{z}{z-e^{-i\alpha}} \right] = \frac{1}{2i} \frac{z(z-e^{-i\alpha}) - z(z-e^{i\alpha})}{(z-e^{i\alpha})(z-e^{-i\alpha})}$$

$$= \frac{1}{2i} \frac{z(e^{i\alpha} - e^{-i\alpha})}{z^2 - z(e^{i\alpha} + e^{-i\alpha}) + 1} = \frac{z \sin \alpha}{z^2 - 2z \cos \alpha + 1} \quad \text{Ans.}$$

**Example 15.** Find the Z-transform of  $c^k \cosh \alpha k$ .  $(k \geq 0)$ .

**Solution.**  $Z[\{c^k \cosh \alpha k\}] = \sum_{k=0}^{\infty} (c^k \cosh \alpha k) z^{-k} = \sum_{k=0}^{\infty} \frac{c^k}{2} (e^{\alpha k} + e^{-\alpha k}) z^{-k}$

$$= \frac{1}{2} \sum_{k=0}^{\infty} (ce^{\alpha} z^{-1})^k + \frac{1}{2} \sum_{k=0}^{\infty} (ce^{-\alpha} z^{-1})^k$$

$$= \frac{1}{2} \left[ 1 + (ce^{\alpha} z^{-1}) + (ce^{\alpha} z^{-1})^2 + \dots \right] + \frac{1}{2} \left[ 1 + (ce^{-\alpha} z^{-1}) + (ce^{-\alpha} z^{-1})^2 + \dots \right] \left[ |z| > |ce^{\alpha}|, |z| > |ce^{-\alpha}| \right]$$

$$\begin{aligned}
&= \frac{1}{2} \frac{1}{1-ce^\alpha z^{-1}} + \frac{1}{2} \frac{1}{1-ce^{-\alpha} z^{-1}} = \frac{1}{2} \frac{1-ce^{-\alpha} z^{-1} + 1-ce^\alpha z^{-1}}{(1-ce^\alpha z^{-1})(1-ce^{-\alpha} z^{-1})} \\
&= \frac{1-c(\frac{e^\alpha + e^{-\alpha}}{2})z^{-1}}{1+c^2 z^{-2} - ce^\alpha z^{-1} - ce^{-\alpha} z^{-1}} = \frac{1-(c \cosh \alpha)z^{-1}}{1+c^2 z^{-2} - 2cz^{-1} \cosh \alpha} \quad (\text{Multiply by } z^2) \\
&= \frac{z(z-c \cosh \alpha)}{z^2 + c^2 - 2cz \cosh \alpha} \quad \text{Ans.}
\end{aligned}$$

**Corollary.** If  $c = 1$ , then

$$Z[\{\cosh \alpha k\}] = \frac{z(z-\cosh \alpha)}{z^2 - 2z \cosh \alpha + 1}$$

**Example 16.** Find the Z-transform of  $\cosh\left(\frac{k\pi}{2} + \alpha\right)$  (U.P., III Semester, 2008)

$$\begin{aligned}
\text{Solution.} \quad F(z) &= \sum_{k=0}^{\infty} \cosh\left(\frac{k\pi}{2} + \alpha\right) z^{-k} = \sum_{k=0}^{\infty} \frac{e^{\frac{k\pi}{2}+\alpha} + e^{-\frac{k\pi}{2}+\alpha}}{2} z^{-k} \\
&= \frac{1}{2} \sum_{k=0}^{\infty} e^{\frac{k\pi}{2}+\alpha} z^{-k} + \frac{1}{2} \sum_{k=0}^{\infty} e^{-\frac{k\pi}{2}-\alpha} z^{-k} = \frac{1}{2} e^{\alpha} \sum_{k=0}^{\infty} \left(e^{\frac{\pi}{2} z^{-1}}\right)^k + \frac{1}{2} e^{-\alpha} \sum_{k=0}^{\infty} \left(e^{-\frac{\pi}{2} z^{-1}}\right)^k \\
&= \frac{1}{2} e^{\alpha} \left[ 1 + \left(e^{\frac{\pi}{2} z^{-1}}\right) + \left(e^{\frac{\pi}{2} z^{-1}}\right)^2 + \dots \right] + \frac{1}{2} e^{-\alpha} \left[ 1 + \left(e^{-\frac{\pi}{2} z^{-1}}\right) + \left(e^{-\frac{\pi}{2} z^{-1}}\right)^2 + \dots \right] \\
&\quad (\text{Sum of geometrical series } = \frac{a}{1-r}) \\
&= \frac{1}{2} e^{\alpha} \frac{1}{1-e^{\frac{\pi}{2} z^{-1}}} + \frac{1}{2} e^{-\alpha} \frac{1}{1-e^{-\frac{\pi}{2} z^{-1}}} = \frac{1}{2} \frac{e^{\alpha} \left(1-e^{-\frac{\pi}{2} z^{-1}}\right) + e^{-\alpha} \left(1-e^{\frac{\pi}{2} z^{-1}}\right)}{\left(1-e^{\frac{\pi}{2} z^{-1}}\right)\left(1-e^{-\frac{\pi}{2} z^{-1}}\right)} \\
&= \frac{\frac{e^{\alpha} + e^{-\alpha}}{2} - \frac{e^{\frac{\alpha-\pi}{2}} + e^{-\frac{\alpha+\pi}{2}}}{2} z^{-1}}{1-e^{\frac{\pi}{2} z^{-1}} - e^{-\frac{\pi}{2} z^{-1}} + z^{-2}} = \frac{\cosh \alpha - \cosh\left(\alpha - \frac{\pi}{2}\right) z^{-1}}{1 - \left(2 \cosh \frac{\pi}{2}\right) z^{-1} + z^{-2}} = \frac{z^2 \cosh \alpha - z \cosh\left(\frac{\pi}{2} - \alpha\right)}{z^2 - 2z \cosh \frac{\pi}{2} + 1}
\end{aligned}$$

Ans.

**Example 17.** Find Z-transform of  $\sin(3k+5)$ .

$$\begin{aligned}
\text{Solution.} \quad F(z) &= \sum_{k=0}^{\infty} \sin(3k+5) z^{-k} = \sum_{k=0}^{\infty} \frac{e^{i(3k+5)} - e^{-i(3k+5)}}{2i} z^{-k} \\
&= \frac{1}{2i} \sum_{k=0}^{\infty} e^{i(3k+5)} z^{-k} - \frac{1}{2i} \sum_{k=0}^{\infty} e^{-i(3k+5)} z^{-k} = \frac{1}{2i} e^{i5} \sum_{k=0}^{\infty} (e^{3i} z^{-1})^k - \frac{1}{2i} e^{-5i} \sum_{k=0}^{\infty} (e^{-3i} z^{-1})^k \\
&= \frac{1}{2i} e^{5i} [1 + (e^{3i} z^{-1}) + (e^{3i} z^{-1})^2 + \dots] - \frac{1}{2i} e^{-5i} [1 + (e^{-3i} z^{-1}) + (e^{-3i} z^{-1})^2 + \dots]
\end{aligned}$$

$$\begin{aligned}
&= \frac{e^{i5}}{2i} \frac{1}{1-e^{-3i}z^{-1}} - \frac{1}{2i} e^{-5i} \frac{1}{1-e^{-3i}z^{-1}} \quad \left[ S = \frac{a}{1-r} \right] \\
&= \frac{1}{2i} \frac{e^{i5}(1-e^{-3i}z^{-1}) - e^{-5i}(1-e^{-3i}z^{-1})}{(1-e^{-3i}z^{-1})(1-e^{-3i}z^{-1})} = \frac{1}{2i} \frac{(e^{i5}-e^{-5i}) - e^{2i}z^{-1} + e^{-2i}z^{-1}}{1-e^{-3i}z^{-1} - e^{-3i}z^{-1} + z^{-2}} \\
&= \frac{\frac{e^{i5}-e^{-5i}}{2i} - z^{-1} \frac{e^{2i}-e^{-2i}}{2i}}{1-(e^{3i}+e^{-3i})z^{-1} + z^{-2}} = \frac{\sin 5 - z^{-1} \sin 2}{1-(2\cos 3)z^{-1} + z^{-2}} \\
&= \frac{z^2 \sin 5 - z \sin 2}{z^2 - 2z \cos 3 + 1} \quad |z| > 1 \quad \text{Ans.}
\end{aligned}$$

**Example 18.** Find the Z-transform of  $c^k \cos \alpha k$ ,  $k \geq 0$ . (U.P., III Semester, Dec. 2004)

**Solution.**  $F(z) = \sum_{k=0}^{\infty} [c^k \cos \alpha k] z^{-k}$

$$\begin{aligned}
&= \sum_{k=0}^{\infty} c^k \left[ \frac{e^{i\alpha k} + e^{-i\alpha k}}{2} \right] z^{-k} = \sum_{k=0}^{\infty} \left( \frac{1}{2} c^k e^{i\alpha k} \right) z^{-k} + \sum_{k=0}^{\infty} \left( \frac{1}{2} c^k e^{-i\alpha k} \right) z^{-k} \\
&= \frac{1}{2} \sum_{k=0}^{\infty} (ce^{i\alpha} z^{-1})^k + \frac{1}{2} \sum_{k=0}^{\infty} (ce^{-i\alpha} z^{-1})^k \quad ("C_r = "C_{n-r}) \\
&= \frac{1}{2} \left[ 1 + (ce^{i\alpha} z^{-1}) + (ce^{i\alpha} z^{-1})^2 + \dots \right] + \frac{1}{2} \left[ 1 + (ce^{-i\alpha} z^{-1}) + (ce^{-i\alpha} z^{-1})^2 + \dots \right]
\end{aligned}$$

This is a Geometric series whose sum is  $\frac{a}{1-r}$

$$\begin{aligned}
&= \frac{1}{2} \left[ \frac{1}{1-ce^{i\alpha} z^{-1}} \right] + \frac{1}{2} \left[ \frac{1}{1-ce^{-i\alpha} z^{-1}} \right], \quad [|z| > |c|] \\
&= \frac{1}{2} \frac{1-ce^{-i\alpha} z^{-1} + 1-ce^{i\alpha} z^{-1}}{(1-ce^{i\alpha} z^{-1})(1-ce^{-i\alpha} z^{-1})} = \frac{1}{2} \frac{2-c(e^{i\alpha} + e^{-i\alpha})z^{-1}}{1-ce^{-i\alpha} z^{-1} - ce^{i\alpha} z^{-1} + c^2 z^{-2}} \\
&= \frac{1-c \cos \alpha \cdot z^{-1}}{1-2cz^{-1} \cos \alpha + c^2 z^{-2}} \quad [|z| > |c|] \\
&= \frac{z^2 - cz \cos \alpha}{z^2 - 2cz \cos \alpha + c^2} \quad \text{Ans.}
\end{aligned}$$

**Corollary.** If  $c = 1$ , then

$$Z[\{\cos \alpha k\}] = \frac{z^2 - z \cos \alpha}{z^2 - 2z \cos \alpha + 1}$$

**Example 19.** Find the Z-transform of  $\left\{ \cos \left( \frac{k\pi}{8} + \alpha \right) \right\}$ .

**Solution.**  $Z \left[ \left\{ \cos \left( \frac{k\pi}{8} + \alpha \right) \right\} \right] = \sum \cos \left( \frac{k\pi}{8} + \alpha \right) z^{-k} = \sum \left\{ \cos \frac{k\pi}{8} \cos \alpha - \sin \frac{k\pi}{8} \sin \alpha \right\} z^{-k}$

$$\begin{aligned}
&= \sum \cos \frac{k\pi}{8} \cos \alpha z^{-k} - \sum \sin \frac{k\pi}{8} \sin \alpha z^{-k} = \cos \alpha \sum \cos \frac{k\pi}{8} z^{-k} - \sin \alpha \sum \sin \frac{k\pi}{8} z^{-k}
\end{aligned}$$

$$\begin{aligned}
 &= \cos \alpha \frac{z^2 - z \cos \frac{\pi}{8}}{z^2 - 2z \cos \frac{\pi}{8} + 1} - \sin \alpha \frac{z \sin \frac{\pi}{8}}{z^2 - 2z \cos \frac{\pi}{8} + 1} \\
 &= \frac{(z^2 - z \cos \frac{\pi}{8}) \cos \alpha - z \sin \frac{\pi}{8} \sin \alpha}{z^2 - 2z \cos \frac{\pi}{8} + 1} = \frac{z^2 \cos \alpha - z[\cos \frac{\pi}{8} \cos \alpha + \sin \frac{\pi}{8} \sin \alpha]}{z^2 - 2z \cos \frac{\pi}{8} + 1} \\
 &= \frac{z^2 \cos \alpha - z \cos(\frac{\pi}{8} - \alpha)}{z^2 - 2z \cos \frac{\pi}{8} + 1} \quad \text{[See Example 14, 18]}
 \end{aligned}$$

Ans.

**Example 20.** Find the Z-transform of  $\{{}^n C_k\}$  ( $0 \leq k \leq n$ ).

**Solution.**  $Z\left[\left\{{}^n C_k\right\}\right] = \sum_{k=0}^n {}^n C_k z^{-k} = 1 + {}^n C_1 z^{-1} + {}^n C_2 z^{-2} + {}^n C_3 z^{-3} + \dots + {}^n C_n z^{-n}$

$$= (1 + z^{-1})^n \quad (\text{This is the expansion of Binomial theorem.}) \quad \text{Ans.}$$

**Example 21.** Find Z-transform of  $\{{}^{k+n} C_n\}$

**Solution.**  $Z\left[\left\{{}^{k+n} C_n\right\}\right] = \sum_{k=0}^{\infty} {}^{k+n} C_n z^{-k} \quad \binom{k+n > n}{k > 0}$

$$\begin{aligned}
 &= \sum_{k=0}^{\infty} {}^{k+n} C_k z^{-k} \quad ({}^n C_r = {}^n C_{n-r}) \\
 &= 1 + {}^{n+1} C_1 z^{-1} + {}^{n+2} C_2 z^{-2} + {}^{n+3} C_3 z^{-3} + \dots \\
 &= 1 + (n+1)z^{-1} + \frac{(n+2)(n+1)}{2!} z^{-2} + \frac{(n+3)(n+2)(n+1)}{3!} (z^{-3}) + \dots \\
 &= 1 + (-n-1)(-z^{-1}) + \frac{(-n-1)(-n-2)}{2!} (-z^{-1})^2 + \frac{(-n-1)(-n-2)(-n-3)}{3!} (-z^{-1})^3 + \dots
 \end{aligned}$$

This is the expansion of Binomial theorem.

$$= (1 - z^{-1})^{-n-1} = (1 - z^{-1})^{-(n+1)} \quad \text{Ans.}$$

**Example 22.** Find the Z-transform of  $\{{}^{k+n} C_n a^k\}$ .

**Solution.**  $Z\left[\left\{{}^{k+n} C_n a^k\right\}\right] = \sum_{k=0}^{\infty} {}^{k+n} C_n a^k z^{-k} = \sum_{k=0}^{\infty} {}^{k+n} C_k a^k z^{-k} \quad ({}^n C_r = {}^n C_{n-r})$

$$\begin{aligned}
 &= \sum_{k=0}^{\infty} {}^{k+n} C_k (az^{-1})^k, \quad |z| > |a| \\
 &= (1 - az^{-1})^{-(n+1)} \quad (\text{See Example 21})
 \end{aligned}$$

**Corollary.** If  $n = 1$

$$Z\left[\left\{{}^{k+1} C_1 a^k\right\}\right] = (1 - az^{-1})^{-2} = \frac{z^2}{(z - a)^2}$$

If  $n = 2$

$$Z\left[\left\{{}^{k+2} C_2 a^k\right\}\right] = (1 - az^{-1})^{-3} = \frac{z^3}{(z - a)^3}$$

If  $n \rightarrow n-1$

$$Z\left[\left\{ {}_{n-1}^{k+n-1} C_n a^k \right\}\right] = (1 - az^{-1})^{-(n-1+1)} = (1 - az^{-1})^{-n} = \frac{z^n}{(z-a)^n} \quad \text{Ans.}$$

**Example 23.** Find the Z-transform of  $\left\{ \frac{a^k}{k!} \right\}$ .  $(k \geq 0)$

**Solution.**  $Z\left[\left\{ \frac{a^k}{k!} \right\}\right] = \sum_{k=0}^{\infty} \frac{a^k}{k!} z^{-k} = \sum_{k=0}^{\infty} \frac{(az^{-1})^k}{k!} = 1 + \frac{az^{-1}}{1!} + \frac{(az^{-1})^2}{2!} + \frac{(az^{-1})^3}{3!} + \dots$

This is exponential series.

$$= e^{az^{-1}} = e^{\frac{a}{z}} \quad \text{Ans.}$$

**Example 24.** Find the Z-transform of  $f(k) = \frac{1}{(k+1)!}, k \geq 0$ . (Q. Bank U.P., III Sem. 2002)

**Solution.**  $Z\left[\frac{1}{(k+1)!}\right] = \sum_{k=0}^{\infty} \frac{1}{(k+1)!} z^{-k} = 1 + \frac{1}{2!} z^{-1} + \frac{1}{3!} z^{-2} + \dots$   
 $= z \left[ z^{-1} + \frac{1}{2!} z^{-2} + \frac{1}{3!} z^{-3} + \dots \right] = z \left[ 1 + z^{-1} + \frac{1}{2!} z^{-2} + \frac{1}{3!} z^{-3} \dots \dots - 1 \right]$   
 $= z (e^{z^{-1}} - 1) = z (e^{\frac{1}{z}} - 1) \quad \text{Ans.}$

**Example 25.** Find the Z-transform of

$$(i) u(k-1) \quad (ii) 4k \delta(k-1); k \geq 0 \quad (iii) \delta(k-n); k \geq 0$$

**Solution.**

$$(i) Z\{f(k)\} = Z u(k-1) = \sum_{k=1}^{\infty} 1 \cdot z^{-k} = \frac{1}{z} + \frac{1}{z^2} + \frac{1}{z^3} + \dots = \frac{1}{z} \left( 1 + \frac{1}{z} + \frac{1}{z^2} + \dots \right) [u(k-1) = 1]$$

This infinite series is a G.P., whose sum is  $\frac{a}{1-r}$   
 $= \frac{1}{z} \frac{1}{\left(1 - \frac{1}{z}\right)} \quad \left[ \text{if } \left| \frac{1}{z} \right| < 1 \right]$   
 $= \frac{1}{z-1} \text{ if } |z| > 1$

$$(ii) Z\{f(k)\} = Z\{4^k \delta(k-1)\} = \sum_{k=0}^{\infty} 4^k \delta(k-1) z^{-k} = \frac{4}{z}. \quad [\delta(k-1) \Rightarrow k=1]$$

$$(iii) Z\{f(k)\} = Z[\delta(k-n)] = \sum_{k=0}^{\infty} \delta(k-n) z^{-k} = \frac{1}{z^n}, n \text{ is (+)ve integer.} [\delta(k-n) \Rightarrow k=n]$$

**Example 26.** Determine the Z-transform of

$$f(k) = \delta(k+1) + 3\delta(k) + 6\delta(k-3) - \delta(k-4)$$

**Solution.** By linearity property, we have

$$\begin{aligned} F(z) &= Z\{f(k)\} = Z\{\delta(k+1)\} + 3 Z\{\delta(k)\} + 6 Z\{\delta(k-3)\} - Z\{\delta(k-4)\} \\ &\quad [\delta(k+1) \Rightarrow k=-1, \delta(k) \Rightarrow k=0, \delta(k-3) \Rightarrow k=3, \delta(k-4) \Rightarrow k=4] \\ &= z + 3 + 6z^{-3} - z^{-4} \quad \text{Ans.} \end{aligned}$$

## EXERCISE 44.2

Find the Z-transform of the following for ( $k \geq 0$ ) :

1.  $2^k$

Ans.  $\frac{z}{z-2}$ ,  $|z| > 2$

2.  $\sin 2k$

Ans.  $\frac{z \sin 2}{z^2 - 2z \cos 2 + 1}$

3.  $\sin \alpha k$ ,

Ans.  $\frac{z \sin \alpha}{z^2 - 2z \cos \alpha + 1}$

4.  $\sinh \frac{k\pi}{2}$

Ans.  $\frac{z \sinh \frac{\pi}{2}}{z^2 - 2z \cosh \frac{\pi}{2} + 1}$

5.  $\sin(3k + 5)$

Ans.  $\frac{z^2 \sin 5 - z \sin 2}{z^2 - 2z \cos 3 + 1}$ ,  $|z| > 1$

6.  $\sin\left(\frac{k\pi}{2} + \alpha\right)$

Ans.  $\frac{z^2 \sin \alpha + z \cos \alpha}{z^2 + 1}$ ,  $|z| > 1$

7.  $c^k \sinh \alpha k$

Ans.  $\frac{cz \sinh \alpha}{z^2 - 2cz \cosh \alpha + 1}$

8.  $\cos \alpha k$

Ans.  $\frac{z(z - \cos \alpha)}{z^2 - 2z \cos \alpha + 1}$

9.  $\cos\left(\frac{k\pi}{2} + \frac{\pi}{4}\right)$  Ans.  $\frac{z^2 - z}{\sqrt{2}(z^2 + 1)}$

10.  $\cos\left(\frac{k\pi}{8} + \alpha\right)$

Ans.  $\frac{z^2 \cos \alpha - z \cos\left(\frac{\pi}{8} - \alpha\right)}{z^2 - 2z \cos \frac{\pi}{8} + 1}$

11.  $\cosh \alpha k$  Ans.  $\frac{z(z - \cosh \alpha)}{z^2 - 2z \cosh \alpha + 1}$

12.  $a \cos \alpha k + b \sin \alpha k$

Ans.  $\frac{a - z^{-1}(a \cos \alpha - b \sin \alpha)}{1 - 2z^{-1} \cos \alpha + z^{-2}}$ ,  $|z| > 1$

13.  $\frac{a^k}{k!}$

Ans.  $\frac{a}{e^z}$

14.  $\frac{1}{k}$ ,  $k > 0$  Ans.  $-\log(1 - z^{-1})$

15.  $a^k$ ,  $k < 0$

Ans.  $\frac{-1}{(1 - az^{-1})}$

16.  $2^{|k|}$  Ans.  $\frac{-3z}{(1 - 2z)(z - 2)}$

17.  $f(k) = \begin{cases} 1, & \text{for } k \geq 0 \\ 0, & \text{for } k < 0 \end{cases}$

Ans.  $\frac{z}{z-1}$ ,  $|z| > 1$

## 44.7 CHANGE OF SCALE

**Theorem.** If  $Z[\{f(k)\}] = F(z)$  then  $Z[\{a^k f(k)\}] = F\left(\frac{z}{a}\right)$

**Proof.**  $F(z) = Z[\{f(k)\}] = \sum_{k=-\infty}^{\infty} f(k)z^{-k}$

Substituting  $\frac{z}{a}$  for  $z$ , we get  $F\left(\frac{z}{a}\right) = \sum_{k=-\infty}^{\infty} f(k)\left(\frac{z}{a}\right)^{-k}$  ... (1)

But  $Z[\{a^k f(k)\}] = \sum_{k=-\infty}^{\infty} a^k f(k)z^{-k} = \sum_{k=-\infty}^{\infty} f(k)\left(\frac{z}{a}\right)^{-k}$  ... (2)

From (1) and (2), we get  $Z[\{a^k f(k)\}] = F\left(\frac{z}{a}\right)$

**Proved.**

**Example 27.** Find the Z-transform of  $a^k$ ,  $k \geq 0$ .

**Solution.** We know that

$$Z[\{1\}] = \frac{z}{z-1}$$

(See example 13)

For the given sequence, by the scale change formula the Z-transform

$$Z[\{a^k \cdot 1\}] = \frac{\frac{z}{a}}{\frac{z}{a} - 1} = \frac{z}{z-a} \quad \text{Ans.}$$

**Example 28.** Find the Z-transform of  $c^k \sin \alpha k$ ,  $k \geq 0$ .

**Solution.** We know that

$$Z[\{\sin \alpha k\}] = \frac{z \sin \alpha}{z^2 - 2z \cos \alpha + 1} \quad \text{(See example 14)}$$

By applying the formula of change of scale, we get

$$Z[\{c^k \sin \alpha k\}] = \frac{\frac{z \sin \alpha}{c}}{\left(\frac{z}{c}\right)^2 - 2\left(\frac{z}{c}\right)\cos \alpha + 1} = \frac{cz \sin \alpha}{z^2 - 2cz \cos \alpha + c^2} \quad \text{Ans.}$$

#### 44.8 SHIFTING PROPERTY

**Theorem.** If  $Z[\{f(k)\}] = F(z)$ ,

then  $Z[\{f(k \pm n)\}] = z^{\pm n}F(z)$

$$\text{Proof. } Z[\{f(k \pm n)\}] = \sum_{k=-\infty}^{\infty} f(k \pm n)z^{-k} = z^{\pm n} \sum_{k=-\infty}^{\infty} f(k \pm n)z^{-(k \pm n)} \quad (r = k \pm n)$$

$$= z^{\pm n} \sum_{k=-\infty}^{\infty} f(r)z^{-r} = z^{\pm n}F(z) \quad \text{Proved.}$$

$$\text{Case I. } Z[\{f(k+n)\}] = f(k+n)z^{-k}, \quad k \geq 0 = z^n \sum_{k=0}^{\infty} f(k+n)z^{-(k+n)}$$

Put  $r = k + n$

$$\begin{aligned} &= z^n \sum_{r=n}^{\infty} f(r)z^{-r} = z^n \sum_{r=0}^{\infty} f(r)z^{-r} - z^n \sum_{r=0}^{n-1} f(r)z^{-r} = z^n F(z) - z^n \sum_{r=0}^{n-1} f(r)z^{-r} \\ &= z^n F(z) - \sum_{r=0}^{n-1} f(r)z^{n-r} = z^n F(z) - \sum_{r=0}^{n-1} f(r)z^{n-r} \quad \text{Ans.} \end{aligned}$$

$$\text{Case II. } Z[\{f(k-n)\}] = \sum_{k=0}^{\infty} f(k-n)z^{-k} = z^{-n} \sum_{k=0}^{\infty} f(k-n)z^{-(k-n)}, \quad k \geq 0$$

Put  $r = k - n$

$$\begin{aligned} &= z^{-n} \sum_{r=-n}^{\infty} f(r)z^{-r} \\ &= z^{-n} \sum_{r=0}^{\infty} f(r)z^{-r} + z^n \sum_{r=-n}^{-1} f(r)z^{-r} = 2^{-n} F(z) + \sum_{r=-n}^{-1} f(r)z^{-n-r} \quad \text{Put } r = -m \\ &= z^{-n} F(z) + \sum_{m=1}^n f(-m)z^{-n+m} \quad \text{Ans.} \end{aligned}$$

**Corollary 1.** If  $\{f(k)\}$  is causal sequence, then

$$Z[\{f(k-n)\}] = z^{-n} F(z)$$

Since  $f(-1) = f(-2) = f(-3) = \dots = f(-n) = 0$

**Corollary 2.** For causal sequence

$$Z[\{f(k-1)\}] = z^{-1}F(z) \text{ as } f(-1) = 0$$

$$Z[\{f(k+1)\}] = zF(z) - zf(0)$$

$$Z[\{f(k+2)\}] = z^2F(z) - z^2f(0) - zf(1)$$

#### 44.9 INVERSE Z-TRANSFORM

Finding the sequence  $\{f(k)\}$  from  $F(z)$  is defined as inverse Z-transform. It is denoted as

$$Z^{-1}F(z) = \{f(k)\}$$

$Z^{-1}$  is the inverse Z-transform.

#### 44.10 THEOREM

If  $\{f(k)\} = F(z)$ ,  $\{g(k)\} = G(z)$ ,  $a$  and  $b$  are constants,

then  $Z^{-1}[aF(z) + bG(z)] = aZ^{-1}[F(z)] + bZ^{-1}[G(z)]$

**Proof.** We know that

$$Z[\{af(k) + bg(k)\}] = aZ[\{f(k)\}] + bZ[\{g(k)\}] = aF(z) + bG(z)$$

$$\therefore Z^{-1}[aF(z) + bG(z)] = \{af(k) + bg(k)\} = a\{f(k)\} + b\{g(k)\}$$

$$= aZ^{-1}[F(z)] + bZ^{-1}[G(z)]$$

**Proved.**

**Example 29.** Find the inverse Z-transform of  $\frac{1}{z-2}$

**Solution.**  $F(z) = \frac{1}{z-2}$

**Case I.** If  $\left|\frac{2}{z}\right| < 1$ ,  $F(z) = \frac{1}{z} \frac{1}{1-2z^{-1}} = z^{-1}(1-2z^{-1})^{-1} = z^{-1}[1 + 2z^{-1} + 2^2z^{-2} + \dots]$   
 $= z^{-1} + 2z^{-2} + 2^2z^{-3} + \dots$   
 $\{f(k)\} = \{2^{k-1}\}, \quad k \geq 1$

**Case II.** If  $\left|\frac{z}{2}\right| < 1$   
 $F(z) = \frac{1}{z-2} = -\frac{1}{2} \frac{1}{1-\frac{z}{2}} = -\frac{1}{2} \left(1 - \frac{z}{2}\right)^{-1} = -\frac{1}{2} \left[1 + \frac{z}{2} + \frac{z^2}{2^2} + \dots\right]$   
 $\{f(k)\} = \{-2^{k-1}\}, \quad k \leq 0$

**Note.** The inverse Z-transform can only be settled when region of convergence (ROC) is given.

#### 44.11 SOLUTION OF DIFFERENCE EQUATIONS

**Example 30.** Solve the difference equation

$$y_{k+1} - 2y_{k-1} = 0, \quad k \geq 1, \quad y_{(0)} = 1$$

**Solution.**  $y_{k+1} - 2y_{k-1} = 0 \quad \dots(1)$

Taking the Z-transform of both sides of (1), we get

$$Z[y_{k+1} - 2y_{k-1}] = 0$$

$$Z[y_{k+1}] - 2Z[y_{k-1}] = 0$$

$$zY(z) - y_0 z - 2Y(z) = 0 \quad (y_0 = 1)$$

$$(z-2)Y(z) - z = 0$$

$$Y(z) = \frac{z}{z-2}$$

$$\begin{aligned} \{y_{(k)}\} &= Z^{-1}\left[\frac{z}{z-2}\right] = Z^{-1}\left[\frac{1}{1-2z^{-1}}\right] \\ &= Z^{-1}[1-2z^{-1}]^{-1} = 1 + 2z^{-1} + (2z^{-1})^2 + \dots = \{2^k\}, \quad k \geq 0 \quad \text{Ans.} \end{aligned}$$

#### 44.12 MULTIPLICATION BY K

**Theorem.** If  $Z[\{f(k)\}] = F(z)$ , then  $Z[\{kf(k)\}] = -z \frac{d}{dz} F(z)$

$$\begin{aligned} \text{Proof. } Z[\{kf(k)\}] &= \sum_{k=-\infty}^{\infty} kf(k)z^{-k} = -z \sum_{k=-\infty}^{\infty} -kf(k)z^{-k-1} = -z \sum_{k=-\infty}^{\infty} f(k)(-kz^{-k-1}) \\ &= -z \sum_{k=-\infty}^{\infty} f(k) \frac{d}{dz}(z^{-k}) = -z \frac{d}{dz} \sum_{k=-\infty}^{\infty} f(k)z^{-k} = -z \frac{d}{dz} F(z) \quad \text{Proved.} \end{aligned}$$

$$\text{In general } Z[\{k^n f(k)\}] = \left(-z \frac{d}{dz}\right)^n F(z)$$

**Corollary 1.** If  $f(k) = 1$  then  $Z[\{1\}] = (1 - z^{-1})^{-1}$ ,  $k \geq 0$

Putting these values in the above theorem, we get

$$Z[\{k\}] = -z \frac{d}{dz} (1 - z^{-1})^{-1} = z(1 - z^{-1})^{-2} \left(\frac{1}{z^2}\right) = z^{-1}(1 - z^{-1})^{-2} \quad \text{Ans.}$$

**Corollary 2.** If  $f(k) = 1$ , then  $Z[\{1\}] = (1 - z^{-1})^{-1} = \frac{z}{z-1}$  and  $n = 2$

$$\begin{aligned} Z[\{k^2\}] &= \left(-z \frac{d}{dz}\right)^2 \frac{z}{z-1} = \left(-z \frac{d}{dz}\right) \left(-z \frac{d}{dz}\right) \frac{z}{z-1} \\ &= -z \frac{d}{dz} \left[ -z \frac{(z-1).1 - z.1}{(z-1)^2} \right] = -z \frac{d}{dz} \left[ \frac{z}{(z-1)^2} \right] = -z \frac{(z-1)^2.1 - z.2(z-1)}{(z-1)^4} = -z \frac{z-1-2z}{(z-1)^3} \\ &= -z \frac{-z-1}{(z-1)^3} = \frac{z^2+z}{(z-1)^3} = \frac{z(z+1)}{(z-1)^3} \quad \text{Ans.} \end{aligned}$$

#### 44.13 DIVISION BY K

**Theorem.** If  $Z[\{f(k)\}] = F(z)$ , then  $Z\left[\left\{\frac{f(k)}{k}\right\}\right] = -\int^z z^{-1}F(z)dz$

$$\begin{aligned} \text{Proof. } Z\left[\left\{\frac{f(k)}{k}\right\}\right] &= \sum_{k=-\infty}^{\infty} \frac{f(k)}{k} z^{-k} \\ &= \sum_{k=-\infty}^{\infty} f(k) \left(\frac{1}{k} z^{-k}\right) = - \sum_{k=-\infty}^{\infty} f(k) \int^z z^{-k-1} dz \\ &= - \int^z \sum_{k=-\infty}^{\infty} f(k) z^{-k-1} dz = - \int^z z^{-1} \sum_{k=-\infty}^{\infty} f(k) z^{-k} dz = - \int^z z^{-1} F(z) dz \\ Z\left[\left\{\frac{f(k)}{k}\right\}\right] &= - \int^z z^{-1} F(z) dz \end{aligned}$$

#### 44.14 INITIAL VALUE

**Theorem.** If  $Z[\{f(k)\}] = F(z)$ ,  $k \geq 0$

then

$$f(0) = \lim_{z \rightarrow \infty} F(z).$$

**Proof.**  $Z[\{f(k)\}] = \sum_{k=0}^{\infty} f(k)z^{-k} = F(z)$

$$f(0) + f(1)z^{-1} + f(2)z^{-2} + \dots = F(z)$$

Taking the limit,  $z \rightarrow \infty$ , we get

$$f(0) = \lim_{z \rightarrow \infty} F(z)$$

**Proved.**

#### 44.15 FINAL VALUE

**Theorem.**  $\lim_{k \rightarrow \infty} f(k) = \lim_{z \rightarrow 1} (z-1)F(z)$

**Proof.**  $Z[\{f(k+1) - f(k)\}] = \sum_{k=0}^{\infty} [f(k+1) - f(k)]z^{-k}$

$$zF(z) - f(0) - F(z) = \lim_{n \rightarrow \infty} \sum_{k=0}^n [f(k+1) - f(k)]z^{-k}$$

$$\lim_{z \rightarrow 1} (z-1)F(z) = f(0) + \lim_{z \rightarrow 1} \lim_{n \rightarrow \infty} \sum_{k=0}^n [f(k+1) - f(k)]z^{-k}$$

By changing the order of limits, we get

$$\begin{aligned} \lim_{z \rightarrow 1} (z-1)F(z) &= f(0) + \lim_{n \rightarrow \infty} \sum_{k=0}^n \lim_{z \rightarrow 1} [f(k+1) - f(k)]z^{-k} \\ &= \lim_{n \rightarrow \infty} \left[ f(0) + \sum_{k=0}^n \{f(k+1) - f(k)\} \right] \\ &= \lim_{n \rightarrow \infty} [f(0) - f(0) + f(1) - f(1) + f(2) - f(2) + \dots + f(n+1) - f(n)] \\ &= \lim_{n \rightarrow \infty} f(n+1) = \lim_{n \rightarrow \infty} f(n) = \lim_{k \rightarrow \infty} f(k) \end{aligned}$$

#### 44.16 PARTIAL SUM

**Theorem.** If  $Z[\{f(k)\}] = F(z)$ , then  $Z\left[\left\{\sum_{n=-\infty}^k f(n)\right\}\right] = \frac{F(z)}{1-z^{-1}}$

**Proof.** Let  $\{g(k)\}$  be a sequence such that  $g(k) = \sum_{n=-\infty}^k f(n)$

We are required to find  $Z[\{g(k)\}]$ ,

$$\text{We know that } g(k) - g(k-1) = \sum_{n=-\infty}^k f(n) - \sum_{n=-\infty}^{k-1} f(n) = -f(k)$$

$$Z[\{g(k)\} - \{g(k-1)\}] = Z[\{f(k)\}]$$

$$Z[\{g(k)\}] - Z[\{g(k-1)\}] = F(z)$$

$$G(z) - z^{-1}G(z) = F(z)$$

$$\sum_{n=-\infty}^k f(n) = G(z) = \frac{F(z)}{1-z^{-1}}$$

**Proved.**

#### 44.17 CONVOLUTION

Let two sequences be  $\{f(k)\}$  and  $\{g(k)\}$  and the convolution of  $\{f(k)\}$  and  $\{g(k)\}$  be  $\{h(k)\}$  and denoted as

$$\begin{aligned}
 \{h(k)\} &= \{f(k)\} * \{g(k)\} \\
 \text{where } \{h(k)\} &= \sum_{n=-\infty}^{\infty} f(n)g(k-n) \\
 &= \sum_{n=-\infty}^{\infty} g(n)f(k-n) = \{g(k)\} * \{f(k)\}
 \end{aligned} \quad \dots(1)$$

**Proof.** Z-transform of (1) is

$$\begin{aligned}
 Z\{h(k)\} &= \sum_{k=-\infty}^{\infty} \left( \sum_{n=-\infty}^{\infty} f(n)g(k-n) \right) z^{-k} = \sum_{n=-\infty}^{\infty} \sum_{k=-\infty}^{\infty} f(n)g(k-n)z^{-k} \\
 &= \sum_{n=-\infty}^{\infty} f(n)z^{-n} \sum_{k=-\infty}^{\infty} g(k-n)z^{-(k-n)} = \left[ \sum_{n=-\infty}^{\infty} f(n)z^{-n} \right] G(z) = F(z)G(z)
 \end{aligned}$$

**Note.** Region of convergence of  $H(z)$  is the common region of convergence of  $F(z)$  and  $G(z)$ .

#### 44.18 CONVOLUTION PROPERTY OF CASUAL SEQUENCE

$$\begin{aligned}
 F(z) &= \{f(0) + f(1)z^{-1} + f(2)z^{-2} + f(3)z^{-3} + \dots\} \\
 \text{and } G(z) &= \{g(0) + g(1)z^{-1} + g(2)z^{-2} + g(3)z^{-3} + \dots\}
 \end{aligned}$$

Now

$$\begin{aligned}
 F(z)G(z) &= \{f(0) + f(1)z^{-1} + f(2)z^{-2} + f(3)z^{-3} + \dots \\
 &\quad \{g(0) + g(1)z^{-1} + g(2)z^{-2} + g(3)z^{-3} + \dots\} \\
 &= f(0)g(0) + \{f(1)g(0) + f(0)g(1)\}z^{-1} + \\
 &\quad \{f(0)g(2) + f(1)g(1) + f(2)g(0)\}z^{-2} + \dots \\
 &= h(0) + h(1)z^{-1} + h(2)z^{-2} + \dots = Z\{h(k)\} \\
 Z\{h(k)\} &= Z\{f(k)\} * \{g(k)\} \quad \text{Proved.}
 \end{aligned}$$

**Example 31.** Evaluate the Z-transform of the sequence

$$\{f(k)\} = \sum_{k=0}^{\infty} 2^k \sum_{k=0}^{\infty} 3^k$$

$$\text{Solution. } Z\left[\left\{2^k\right\}\right] = 1 + 2z^{-1} + 2^2z^{-2} + 2^3z^{-3} + \dots = \frac{1}{1-2z^{-1}}$$

$$\text{Similarly, } Z\left[\left\{3^k\right\}\right] = \frac{1}{1-3z^{-1}}$$

$$Z\left[\left\{f(k)\right\}\right] = Z\left\{2^k\right\}\left\{3^k\right\} = \frac{1}{1-2z^{-1}} \cdot \frac{1}{1-3z^{-1}} = \frac{1}{(1-2z^{-1})(1-3z^{-1})} \quad \text{Ans.}$$

#### EXERCISE 44.3

Find the Z-transform of the following for ( $k > 0$ ) :

$$1. e^{\alpha k} \quad \text{Ans. } \frac{1}{1-z^{-1}e^{\alpha k}} \quad 2. \sin 5k \quad \text{Ans. } \frac{z \sin 5}{z^2 - 2z \cos 5 + 1}$$

$$3. \cos 3k \quad \text{Ans. } \frac{z(z - \cos 3)}{z^2 - 2z \cos 3 + 1} \quad 4. \sinh 7k \quad \text{Ans. } \frac{z \sinh 7}{z^2 - 2z \cosh 7 + 1}$$

$$5. \cosh 9k \quad \text{Ans. } \frac{z(z - \cosh 9)}{z^2 - 2z \cosh 9 + 1} \quad 6. \sin(5k + 3) \quad \text{Ans. } \frac{z^2 \sin 3 + z \sin 2}{z^2 - 2z \cos 5 + 1}$$

7.  $\cos\left(\frac{k\pi}{3} + 5\right)$  Ans.  $\frac{z^2 \cos 5 - z \cos(\frac{\pi}{3} - 5)}{z^2 - 2z \cos \frac{\pi}{3} + 1}$

8.  $\cos\left(\frac{k\pi}{5} + 6\right)$  Ans.  $\frac{z^2 \cosh 6 - z \cosh(\frac{\pi}{5} - 6)}{z^2 - 2z \cos \frac{\pi}{5} + 1}$  9.  $3^k \cosh 5k$  Ans.  $\frac{z(z - 3 \cosh 5)}{z^2 - 2z \cosh 5 + 9}$

#### 44.20 INVERSE OF Z-TRANSFORM BY DIVISION

From Z-transform  $F(z)$ , we find the sequence  $\{f(k)\}$  if  $F(z)$  is a rational function of  $z$ . Region of convergence must be given.

##### 1. By Direct Division

**Example 32.** Find  $Z^{-1}\left[\frac{1}{z-2}\right]$

**Solution. Case I.**  $|z| > 2$

$$\begin{aligned} \frac{1}{z-2} &= \frac{1}{z} + \frac{2}{z^2} + \frac{4}{z^3} \\ &\quad \boxed{1} \\ &\quad \boxed{1 - \frac{2}{z}} \\ &\quad \boxed{\frac{2}{z}} \\ &\quad \boxed{\frac{2}{z} - \frac{4}{z^2}} \\ &\quad \boxed{\frac{4}{z^2}} \\ &\quad \boxed{\frac{4}{z^2} - \frac{8}{z^3}} \\ &\quad \boxed{8} \end{aligned}$$

$$\begin{aligned} \frac{1}{z-2} &= \frac{1}{z} + \frac{2}{z^2} + \frac{4}{z^3} + \frac{8}{z^4} + \dots \\ &= z^{-1} + 2z^{-2} + 4z^{-3} + 8z^{-4} + \dots + 2^{k-1}z^{-k} + \dots \\ &= \{2^{k-1}\} z^{-k} \end{aligned}$$

$$Z^{-1}\left[\frac{1}{z-2}\right] = \{2^{k-1}\} \quad \text{Ans.}$$

**Case II.**  $|z| < 2$

$$\begin{array}{r} -\frac{1}{2} - \frac{z}{4} - \frac{z^2}{8} - \frac{z^3}{16} \\ -2 + z \\ \boxed{1} \\ 1 - \frac{z}{2} \\ \hline \frac{z}{2} \\ \frac{z}{2} - \frac{z^2}{4} \\ \hline \frac{z^2}{4} \\ \frac{z^2}{4} - \frac{z^3}{8} \\ \hline 4 \boxed{\frac{8}{z^3}} \\ \frac{8}{z^3} - \frac{z^4}{16} \\ \hline \frac{z^4}{16} \\ \boxed{16} \end{array}$$

$$\begin{aligned} \frac{1}{z-2} &= -\frac{1}{2} - \frac{z}{4} - \frac{z^2}{8} - \frac{z^3}{16} - \dots \\ &= -\frac{1}{2} \left[ 1 + \frac{z}{2} + \frac{z^2}{2^2} + \frac{z^3}{2^3} + \dots + \frac{z^k}{2^k} + \dots \right] \\ &= -\frac{1}{2} - \frac{z}{2^2} - \frac{z^2}{2^3} - \frac{z^3}{2^4} - \dots - \frac{z^k}{2^{k+1}} - \dots = \{2^{-k-1}\} z^k \\ Z^{-1}\left[\frac{1}{z-2}\right] &= \{2^{-k-1}\} \quad \text{Ans.} \end{aligned}$$

### 44.21 BY BINOMIAL EXPANSION AND PARTIAL FRACTION

**Example 33.** Find the inverse Z-transform of  $\frac{4z}{z-a}$

$$(i) |z| > |a| \quad (ii) |z| < |a|$$

**Solution. Case I.**  $|z| > |a|$

$$\begin{aligned} \frac{4z}{z-a} &= \frac{4z}{z} \frac{1}{1-\frac{a}{z}} = 4 \left(1 - \frac{a}{z}\right)^{-1} = 4 \left[1 + \frac{a}{z} + \frac{a^2}{z^2} + \frac{a^3}{z^3} + \dots\right] \\ &= 4 + 4a z^{-1} + 4a^2 z^{-2} + 4a^3 z^{-3} + \dots + 4a^k z^{-k} + \dots = \{4a^k\} z^{-k} \end{aligned}$$

$$Z^{-1}\left(\frac{4z}{z-a}\right) = \{4a^k\} \quad \text{Ans.}$$

**Case II.**  $|z| < |a|$

$$\begin{aligned} \frac{4z}{z-a} &= -\frac{1}{a} \frac{z}{\left(1 - \frac{z}{a}\right)} = \frac{-z}{a} \left(1 - \frac{z}{a}\right)^{-1} \\ &= -\frac{z}{a} \left[1 + \frac{z}{a} + \frac{z^2}{a^2} + \frac{z^3}{a^3} + \dots\right] = -\frac{z}{a} - \frac{z^2}{a^2} - \frac{z^3}{a^3} - \frac{z^4}{a^4} - \dots \end{aligned}$$

$$\{f(k)\} = \left\{ \dots -\frac{1}{a^4}, -\frac{1}{a^3}, -\frac{1}{a^2}, -\frac{1}{a} \right\} \quad \text{Ans.}$$

#### EXERCISE 44.4

Find the inverse of the Z-transform of the following :

$$1. \frac{z^2}{(z-\frac{1}{4})(z-\frac{1}{5})}, \quad |z| < \frac{1}{5} \quad \text{Ans. } 4\left(\frac{1}{5}\right)^k - 5\left(\frac{1}{4}\right)^k$$

$$2. \frac{z}{(z-\frac{1}{4})(z-\frac{1}{5})}, \quad |z| > \frac{1}{4} \quad \text{Ans. } 20\left[\left(\frac{1}{4}\right)^k - \left(\frac{1}{5}\right)^k\right]U(k)$$

$$3. \frac{z^3}{\left(z-\frac{1}{2}\right)^2(z-1)}, \quad |z| < \frac{1}{2} \quad \text{Ans. } -4(1)^k + (k+3)\left(\frac{1}{2}\right)^k, (k < 0)$$

$$4. \frac{z+1}{z^2-2z+1}, \quad |z| > 1 \quad \text{Ans. } (2k+1)U(k)$$

### 44.22 INVERSE OF Z-TRANSFORM BY PARTIAL FRACTIONS

Let  $f(z) = \frac{R(z)}{D(z)}$  [If the degree of Numerator < the degree of Denominator.]

and  $F(z) = Q(z) + \frac{R(z)}{D(z)}$  [If the degree of Numerator > the degree of Denominator.]

$\frac{R(z)}{D(z)}$  is then expressed into partial fractions.

We convert  $\frac{F(z)}{z}$  into partial fractions and not that of  $F(z)$ .

$$\text{Let } \frac{F(z)}{z} = \frac{A}{z-a} + \frac{B}{z-b} + \frac{C}{z-c} + \frac{D}{(z-c)^2} + \frac{E}{(z-c)^3} + \frac{Mz+N}{z^2+pz+q}$$

$$\text{then } F(z) = A \frac{z}{z-a} + B \frac{z}{z-b} + C \frac{z}{z-c} + D \frac{z}{(z-c)^2} + E \frac{z}{(z-c)^3} + \frac{z(Mz+N)}{z^2+pz+q}$$

$$\begin{aligned} Z^{-1}F(z) &= AZ^{-1}\frac{z}{z-a} + BZ^{-1}\frac{z}{z-b} + CZ^{-1}\frac{z}{z-c} + DZ^{-1}\frac{z}{(z-c)^2} \\ &\quad + EZ^{-1}\frac{z}{(z-c)^3} + Z^{-1}\frac{z(Mz+N)}{z^2+pz+q} \end{aligned}$$

### (i) Linear non-repeated factor

Let the linear non-repeated factor be  $\frac{z}{z-a}$ .

$$Z^{-1}\left(\frac{z}{z-a}\right) = Z^{-1}\frac{1}{1-\frac{az}{z}} = \{a^k\} \quad \text{If } |z| > |a|$$

$$Z^{-1}\left(\frac{z}{z-a}\right) = -Z^{-1}\frac{\frac{a}{z}}{1-\frac{z}{a}} = \{-a^k\}, \quad k < 0, \quad \text{If } |z| < |a|$$

### (ii) Linear repeated factor

Let the linear repeated factor be  $\frac{z}{(z-b)^r}$ .  $r \geq 2, |z| > |b|$

$$\begin{aligned} Z^{-1}\frac{z}{(z-b)^r} &= Z^{-1}\left[z^{-(r-1)}\frac{z^r}{(z-b)^r}\right] \\ &= \frac{(k+2-r)(k+3-r)\dots kU(k-r+1)b^{(k-r+1)}}{(r-1)!} \end{aligned}$$

$$Z^{-1}\frac{z}{(z-b)^r} = -\frac{(k+2-r)(k+3-r)\dots kb^{k-r+1}}{(r-1)!} U(-k-r-1), \quad \text{If } |z| < |b|$$

### (iii) Quadratic non-repeated factor

Let the quadratic non-repeated factor be

$$\frac{Mz^2+Nz}{z^2+pz+q} \dots \quad \text{... (1)} \quad \text{If } |z| > 0$$

$$\text{Compare (1) with } Z[\{c^k \cos \alpha k\}] = \frac{z^2 - cz \cos \alpha}{z^2 - 2cz \cos \alpha + c^2}$$

$$p = -2c \cos \alpha, q = c^2$$

$$\text{or with } Z[\{c^k \cosh \alpha k\}] = \frac{z^2 - cz \cosh \alpha}{z^2 - 2cz \cosh \alpha + c^2}$$

$$\text{or } p = 2c \cosh \alpha, \quad q = c^2$$

$$\frac{p}{-2c} = \cos \alpha \Rightarrow \left| \frac{p}{2c} \right| < 1 \text{ or } > 1, \quad c \text{ is given by } (-2c \cos \alpha) \text{ and } \alpha \text{ by } (-2c \cosh \alpha)$$

$$\text{Case I. If } \left| \frac{p}{2c} \right| < 1$$

$$\begin{aligned}\frac{Mz^2 + Nz}{z^2 + pz + q} &= \frac{Mz(z - c \cos \alpha) + \frac{Mc \cos \alpha + N}{c \sin \alpha} (cz \sin \alpha)}{z^2 - 2cz \cos \alpha + c^2} \\ &= \frac{M(z^2 - cz \cos \alpha)}{z^2 - 2cz \cos \alpha + c^2} + \frac{\frac{Mc \cos \alpha + N}{c \sin \alpha}}{z^2 - 2cz \cos \alpha + c^2} \cdot \frac{cz \sin \alpha}{z^2 - 2cz \cos \alpha + c^2} \\ Z^{-1} \frac{Mz^2 + Nz}{z^2 + pz + q} &= M\{c^k \cos \alpha k\} + \left( \frac{\frac{Mc \cos \alpha + N}{c \sin \alpha}}{z^2 - 2cz \cos \alpha + c^2} \right) [c^k \sin \alpha k]\end{aligned}$$

**Case II.** If  $\left| \frac{p}{2c} \right| > 1$

$$\begin{aligned}\frac{Mz^2 + Nz}{z^2 + pz + q} &= \frac{Mz(z - c \cosh \alpha) + \frac{Mc \cosh \alpha + N}{c \sinh \alpha} (cz \sinh \alpha)}{z^2 - 2cz \cosh \alpha + c^2} \\ &= \frac{Mz(z - c \cosh \alpha)}{z^2 - 2cz \cosh \alpha + c^2} + \frac{\frac{Mc \cosh \alpha + N}{c \sinh \alpha}}{z^2 - 2cz \cosh \alpha + c^2} \cdot \frac{cz \sinh \alpha}{z^2 - 2cz \cosh \alpha + c^2} \\ &= \frac{M(z^2 - cz \cosh \alpha)}{z^2 - 2cz \cosh \alpha + c^2} + \frac{\frac{Mc \cosh \alpha + N}{c \sinh \alpha}}{z^2 - 2cz \cosh \alpha + c^2} \cdot \frac{cz \sinh \alpha}{z^2 - 2cz \cosh \alpha + c^2} \\ \text{Similarly, } Z^{-1} \left[ \frac{Mz^2 + Nz}{z^2 + pz + q} \right] &= M\{c^k \cosh \alpha k\} + \frac{\frac{Mc \cosh \alpha + N}{c \sinh \alpha}}{z^2 - 2cz \cosh \alpha + c^2} [c^k \sinh \alpha]\end{aligned}$$

**Example 34.** Find the inverse Z-transform of  $\frac{1}{(z-3)(z-2)}$

(i)  $|z| < 2$       (ii)  $2 < |z| < 3$       (iii)  $|z| > 3$

**Solution.**  $F(z) = \frac{1}{(z-3)(z-2)} = \frac{1}{z-3} - \frac{1}{z-2}$

**Case (i).**  $|z| < 2$

$$\begin{aligned}F(z) &= -\frac{1}{3} \frac{1}{1-\frac{z}{3}} + \frac{1}{2} \frac{1}{1-\frac{z}{2}} = -\frac{1}{3} \left( 1 - \frac{z}{3} \right)^{-1} + \frac{1}{2} \left( 1 - \frac{z}{2} \right)^{-1} \\ &= -\frac{1}{3} \left( 1 + \frac{z}{3} + \frac{z^2}{3^2} + \frac{z^3}{3^3} + \dots \right) + \frac{1}{2} \left[ 1 + \frac{z}{2} + \frac{z^2}{2^2} + \frac{z^3}{2^3} + \dots \right] \\ &= -\frac{1}{3} - \frac{z}{3^2} - \frac{z^2}{3^3} - \frac{z^3}{3^4} - \dots + \frac{1}{2} + \frac{z}{2^2} + \frac{z^2}{2^3} + \frac{z^3}{2^4} + \dots\end{aligned}$$

**Case (ii).**  $2 < |z| < 3$

$$\begin{aligned}F(z) &= -\frac{1}{3} \frac{1}{1-\frac{z}{3}} - \frac{1}{z} \frac{1}{1-\frac{2}{z}} = -\frac{1}{3} \left[ 1 - \frac{z}{3} \right]^{-1} - \frac{1}{z} \left[ 1 - \frac{2}{z} \right]^{-1} \\ &= -\frac{1}{3} \left( 1 + \frac{z}{3} + \frac{z^2}{3^2} + \frac{z^3}{3^3} + \dots \right) - \frac{1}{z} \left[ 1 + \frac{2}{z} + \frac{2^2}{z^2} + \frac{2^3}{z^3} + \dots \right] \\ &= -\frac{1}{3} - \frac{z}{3^2} - \frac{z^2}{3^3} - \frac{z^3}{3^4} - \dots - \frac{1}{z} - \frac{2}{z^2} - \frac{2^2}{z^3} - \frac{2^3}{z^4} - \dots \\ &= \dots - \frac{z^3}{3^4} - \frac{z^2}{3^3} - \frac{z}{3^2} - \frac{1}{3} - \frac{1}{z} - \frac{2}{z^2} - \frac{2^2}{z^3} - \frac{2^3}{z^4} - \dots \\ &= \dots - \frac{z^3}{3^4} - \frac{z^2}{3^3} - \frac{z}{3^2} - \frac{1}{3} - z^{-1} - 2z^{-2} - 2^2 z^{-3} - 2^3 z^{-4} - \dots\end{aligned}$$

**Ans.**

$$\Rightarrow f(k) = \{-2^{k-1}\}, \quad k > 0$$

$$\Rightarrow f(k) = \{-3^{k-1}\}, \quad k \leq 0$$

**Ans.****Case (iii).**  $|z| > 3$ 

$$\begin{aligned} F(z) &= \frac{1}{z} \frac{1}{1-\frac{3}{z}} - \frac{1}{z} \frac{1}{1-\frac{2}{z}} = \frac{1}{z} \left(1 - \frac{3}{z}\right)^{-1} - \frac{1}{z} \left(1 - \frac{2}{z}\right)^{-1} \\ &= \frac{1}{z} \left[1 + \frac{3}{z} + \frac{3^2}{z^2} + \frac{3^3}{z^3} + \dots\right] - \frac{1}{z} \left[1 + \frac{2}{z} + \frac{2^2}{z^2} + \frac{2^3}{z^3} + \dots\right] \\ &= \frac{1}{z} + \frac{3}{z^2} + \frac{3^2}{z^3} + \frac{3^3}{z^4} + \dots - \frac{1}{z} - \frac{2}{z^2} - \frac{2^2}{z^3} - \frac{2^3}{z^4} + \dots \\ &= \{3^{k-1} - 2^{k-1}\} z^k, \quad k \geq 1 \\ &= 0 \quad , \quad k \leq 1 \end{aligned}$$

**Ans.****Example 35.** Find the inverse of Z-transform of  $\frac{1}{(z-5)^3}$ ,  $|z| > 5$ 

**Solution.**  $F(z) = \frac{1}{(z-5)^3} = \frac{1}{z^3} \frac{1}{\left(1 - \frac{5}{z}\right)^3} = \frac{1}{z^3} (1 - 5z^{-1})^{-3}$

$$= z^{-3} [1 + 15z^{-1} + 6(5z^{-1})^2 + 10(5z^{-1})^3 + \dots + \frac{(n+1)(n+2)}{2} (5z^{-1})^n + \dots]$$

$$= z^{-3} \left\{ \frac{(k+1)(k+2)}{2} 5^k \right\} z^{-k} = \left\{ \frac{(k+1)(k+2)}{2} 5^k \right\} z^{-k-3}$$

Replacing  $k$  by  $k-3$  we get

$$= \left\{ \frac{(k-3+1)(k-3+2)}{2} 5^{k-3} \right\} z^{-k} = \left\{ \frac{(k-2)(k-1)}{2} 5^{k-3} \right\} z^{-k}$$

$$Z^{-1}F(z) = f(k) = \begin{cases} \frac{(k-2)(k-1)}{2} 5^{k-3} & , \quad k \geq 3 \\ 0 & , \quad k < 3 \end{cases}$$

**Ans.****Example 36.** Obtain  $Z^{-1} \frac{1}{(z-\frac{1}{2})(z-\frac{1}{3})}$ . When (i)  $\frac{1}{3} < |z| < \frac{1}{2}$  (ii)  $\frac{1}{2} < |z|$ 

**Solution.**  $F(z) = \frac{1}{(z-\frac{1}{2})(z-\frac{1}{3})} = 6 \left[ \frac{1}{(z-\frac{1}{2})} - \frac{1}{(z-\frac{1}{3})} \right] = \frac{6}{z-\frac{1}{2}} - \frac{6}{z-\frac{1}{3}}$

$$(i) \frac{1}{3} < |z| < \frac{1}{2}, \quad F(z) = \frac{6}{-\frac{1}{2}(1-2z)} - \frac{1}{z} \frac{6}{(1-\frac{1}{3}z^{-1})} = -12(1-2z)^{-1} - \frac{6}{z} (1-\frac{1}{3}z^{-1})^{-1}$$

$$= -12[1 + (2z) + (2z)^2 + (2z)^3 + \dots] - \frac{6}{z} \left(1 + \frac{1}{3z} + \frac{1}{(3z)^2} + \frac{1}{(3z)^3} + \dots\right)$$

$$= -12(2z)^k - \frac{6}{z} \left(\frac{1}{3z}\right)^k = -12(2z)^k - 6 \left(\frac{1}{3^k z^{k+1}}\right)$$

$$f(k) = -\frac{6}{3^{k-1}}, \quad \text{if } k > 0$$

$$f(k) = -12 \cdot 2^k, \quad \text{if } k < 0$$

$$\begin{aligned}
 & (ii) \quad \frac{1}{2} < |z| \\
 F(z) &= \frac{6}{z - \frac{1}{2}} - \frac{6}{z - \frac{1}{3}} = \frac{1}{z} \frac{6}{(1 - \frac{1}{2z})} - \frac{1}{z} \frac{6}{(1 - \frac{1}{3z})} = 6z^{-1} \left(1 - \frac{1}{2} z^{-1}\right)^{-1} - 6z^{-1} \left(1 - \frac{1}{3} z^{-1}\right)^{-1} \\
 &= 6z^{-1} \left[1 + \frac{1}{2} z^{-1} + \left(\frac{1}{2}\right)^2 z^{-2} + \left(\frac{1}{2}\right)^3 z^{-3} + \dots\right] - 6z^{-1} \left[1 + \frac{1}{3} z^{-1} + \left(\frac{1}{3}\right)^2 z^{-2} + \left(\frac{1}{3}\right)^3 z^{-3} + \dots\right] \\
 &= 6 \left[z^{-1} + \frac{1}{2} z^{-2} + \left(\frac{1}{2}\right)^2 z^{-3} + \left(\frac{1}{2}\right)^3 z^{-4} + \dots\right] - 6 \left[z^{-1} + \frac{1}{3} z^{-2} + \left(\frac{1}{3}\right)^2 z^{-3} + \left(\frac{1}{3}\right)^3 z^{-4} + \dots\right] \\
 &= 6 \left\{ \frac{1}{2^{k+1}} \right\} z^{-k} - 6 \left\{ \frac{1}{3^{k+1}} \right\} z^{-k} \Rightarrow Z^{-1}F(z) = f(k) = 6 \left[ \frac{1}{2^{k-1}} - \frac{1}{3^{k-1}} \right], \quad k \geq 1
 \end{aligned}$$

**Ans.**

**Example 37.** Obtain  $Z^{-1} \frac{2z^2 - 10z + 13}{(z-3)^2(z-2)}$ , when  $2 < |z| < 3$

**Solution.** Let  $\frac{2z^2 - 10z + 13}{(z-3)^2(z-2)} = \frac{A}{(z-3)^2} + \frac{B}{z-3} + \frac{C}{z-2}$

Converting into partial fractions, we get

$$\begin{aligned}
 &= \frac{1}{(z-3)^2} + \frac{1}{z-3} + \frac{1}{z-2} \\
 &= \frac{1}{9} \frac{1}{\left(1 - \frac{z}{3}\right)^2} - \frac{1}{3} \frac{1}{1 - \frac{z}{3}} + \frac{1}{z} \frac{1}{1 - \frac{2}{z}} = \frac{1}{9} \left(1 - \frac{z}{3}\right)^{-2} - \frac{1}{3} \left(1 - \frac{z}{3}\right)^{-1} + \frac{1}{z} \left(1 - \frac{2}{z}\right)^{-1} \\
 &= \frac{1}{9} \left[1 + \frac{2z}{3} + \frac{3z^2}{9} + \frac{4z^3}{27} + \dots\right] - \frac{1}{3} \left[1 + \frac{z}{3} + \frac{z^2}{9} + \frac{z^3}{27} + \dots\right] + \frac{1}{z} \left[1 + \frac{2}{z} + \frac{4}{z^2} + \frac{8}{z^3} + \dots\right] \\
 &= \frac{1}{3^2} + \frac{2z}{3^3} + \frac{3z^2}{3^4} + \frac{4z^3}{3^5} \dots - \frac{1}{3} - \frac{z}{3^2} - \frac{z^2}{3^3} - \frac{z^3}{3^4} - \dots + \frac{1}{z} + \frac{2}{z^2} + \frac{4}{z^3} + \frac{8}{z^4} + \dots \\
 &= \{2^{k-1}\} z^{-k}, \quad k \geq 1 \quad \dots(1)
 \end{aligned}$$

$$= \left[ \frac{k+1}{3^{k+2}} - \frac{1}{3^{k+1}} \right] z^k, \quad k < 0 \quad \text{or} = \frac{-k-2}{3^{-k+2}}, \quad k \leq 0 \quad \dots(2)$$

Hence,  $Z^{-1}[F(z)] = 2^{k-1}$  if  $k \geq 1$ , and  $Z^{-1}[F(z)] = -(k+2)3^{k-2}$ ,  $k \leq 0$

**Ans.**

**Example 38.** Find  $Z^{-1} \frac{3z^2 + 4z}{z^2 - z + 1}$   $|z| > 1$ .

**Solution.** Let  $c^2 = 1 \Rightarrow c = \pm 1$

If  $c = 1$ ,  $\left| \frac{p}{2c} \right| = \left| \frac{-1}{2 \times 1} \right| = \frac{1}{2} < 1$

So  $-1 = -2c \cos \alpha$  or  $-1 = -2 \times 1 \times \cos \alpha \Rightarrow \cos \alpha = \frac{1}{2}$

$$\alpha = \frac{\pi}{3}, \quad \sin \alpha = \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2}$$

$$\frac{3z^2 + 4z}{z^2 - z + 1} = \frac{3z(z - c \cos \alpha) + \frac{(3c \cos \alpha + 4)}{c \sin \alpha} cz \sin \alpha}{z^2 - 2cz \cos \alpha + c^2}$$

$$\frac{3z^2 + 4z}{z^2 - z + 1} = \frac{3z(z - c \cos \alpha)}{z^2 - 2cz \cos \alpha + c^2} + \frac{\frac{3c \cos \alpha + 4}{c \sin \alpha} cz \sin \alpha}{z^2 - 2cz \cos \alpha + c^2}$$

Putting the values of  $c$  and  $\alpha$ , in the coefficient of  $cz \sin \alpha$ , we get

$$\begin{aligned} & \frac{3 \times 1 \times \frac{1}{2} + 4}{\frac{1 \times \sqrt{3}}{2}} cz \sin \alpha \\ &= \frac{3z(z - c \cos \alpha)}{z^2 - 2cz \cos \alpha + c^2} + \frac{\frac{11}{\sqrt{3}} c^k \sin \alpha k}{z^2 - 2cz \cos \alpha + c^2} \\ Z^{-1} \left[ \frac{3z^2 + 4z}{z^2 - z + 1} \right] &= \left[ \left\{ 3c^k \cos \alpha k \right\} + \left\{ \frac{11}{\sqrt{3}} c^k \sin \alpha k \right\} \right] U_k \end{aligned}$$

Putting the values of  $c$  and  $\alpha$ , we get

$$\begin{aligned} Z^{-1} \left[ \frac{3z^2 + 4z}{z^2 - z + 1} \right] &= \left[ 3(1)^k \left\{ \cos \frac{\pi}{3} k \right\} + \frac{11}{3} (1)^k \left\{ \sin \frac{\pi}{3} k \right\} \right] U_k \\ &= \left[ 3 \left\{ \cos \frac{\pi k}{3} \right\} + \frac{11}{\sqrt{3}} \left\{ \sin \frac{\pi}{3} k \right\} \right] U_k \end{aligned} \quad \text{Ans.}$$

**Example 39.** Obtain  $Z^{-1} \frac{2z^2 + 3z}{z^2 + z + \frac{1}{9}}$   $\left( |z| > \frac{1}{3} \right)$

**Solution.**  $c^2 = \frac{1}{9} \Rightarrow c = \pm \frac{1}{3}$ ,  $p = 1$

If  $c = -\frac{1}{3}$ ,  $\left| \frac{p}{2c} \right| = \left| \frac{1}{2 \times -\frac{1}{3}} \right| = \frac{3}{2} > 1$

Hence,  $1 = -2c \cosh \alpha \quad \text{or} \quad 1 = -2 \left( -\frac{1}{3} \right) \cosh \alpha$

or  $\cosh \alpha = \frac{3}{2}$ ,  $\sinh \alpha = \frac{\sqrt{5}}{2}$   $(\cosh^2 \alpha - \sinh^2 \alpha = 1)$

$$\frac{2z^2 + 3z}{z^2 + z + \frac{1}{9}} = \frac{2z(z - c \cosh \alpha) + \frac{(2c \cosh \alpha + 3)}{c \sinh \alpha} cz \sinh \alpha}{z^2 - 2cz \cosh \alpha + c^2}$$

Putting the values of  $c$  and  $\alpha$  in the coefficient of  $cz \sin \alpha$ , we get

$$\begin{aligned} & \left[ 2 \left( -\frac{1}{3} \right) \left( \frac{3}{2} \right) + 3 \right] cz \sinh \alpha \\ &= 2 \frac{z(z - c \cosh \alpha)}{z^2 - 2cz \cosh \alpha + c^2} + \frac{-\frac{1}{3} \times \frac{\sqrt{5}}{2}}{z^2 - 2cz \cosh \alpha + c^2} \\ &= 2 \frac{z(z - c \cosh \alpha)}{z^2 - 2cz \cosh \alpha + c^2} + \left( \frac{\frac{-1+3}{-\sqrt{5}}}{6} \right) cz \sinh \alpha \\ &= 2 \frac{z(z - c \cosh \alpha)}{z^2 - 2cz \cosh \alpha + c^2} + \frac{2}{\sqrt{5}} \frac{cz \sinh \alpha}{z^2 - 2cz \cosh \alpha + c^2} - \frac{12}{\sqrt{5}} \frac{cz \sinh \alpha}{z^2 - 2cz \cosh \alpha + c^2} \end{aligned}$$

$$Z^{-1} \frac{2z^2 + 3z}{z^2 + z + \frac{1}{9}} = 2 \left( -\frac{1}{3} \right)^k \cosh \alpha k - \frac{12}{\sqrt{5}} \left( -\frac{1}{3} \right)^k \sinh \alpha, \quad k \geq 0$$

where  $\cosh \alpha = 3/2$ .

**Ans.**

### EXERCISE 44.5

Evaluate inverse Z-transform of the following:

1.  $\frac{z}{3-z}, \quad |z| < 3$

**Ans.**  $\{3^k\}, k < 0$

2.  $\frac{2z^2 - 5z}{(z-2)(z-3)}, \quad |z| > 3$

**Ans.**  $\{2^k + 3^k\}, k \geq 0$

3.  $\frac{z}{z - e^\alpha}$

**Ans.**  $\{e^{k\alpha}\}$

4.  $\frac{z^3}{z^3 - 27}, \quad |z| > 3$

**Ans.**  $\{f(k)\} = \{3^k\} = 0, \text{ for } k = 0, 3, 6, 9$

5.  $\frac{2z}{(z-2)^2}, \quad |z| > 2$

**Ans.**  $\{k 2^k\}, k \geq 0$

6.  $\frac{z^2 + z \cos \alpha}{z^2 - 2z \cos \alpha + 1}, \quad |z| > 1$

**Ans.**  $\{\cos \alpha k\}, k \geq 0$

7.  $-\log(1 - 2z^{-1}), \quad |z| > 2$

**Ans.**  $\left\{ \frac{2^k}{k} \right\}, k \geq 1$

8.  $\frac{4z}{4z+1} + \frac{5z}{5z+1}, \quad \frac{1}{5} < |z| < \frac{1}{4}$

**Ans.**  $f(k) = \begin{cases} -\left(-\frac{1}{4}\right)^k, & k < 0 \\ \left(\frac{1}{5}\right)^k, & k \geq 0 \end{cases}$

9.  $\frac{z(z^2 + 4z + 1)}{(z-1)^4}, \quad |z| > 1$

**Ans.**  $\{k^3\}$

10.  $\frac{ze^{-a}}{(z - e^{-a})^2}, \quad |z| > |e^{-a}|$

**Ans.**  $\{k e^{-ak}\}$

11.  $\frac{ze^{-a} \sin b}{z^2 - 2e^{-a}z \cos b + e^{-2a}}, \quad |z| > |e^{-a}|$

**Ans.**  $\{e^{-ak} \sin bk\}$

12.  $\frac{z(z - e^{-a} \cos b)}{z^2 - 2e^{-a}z \cos b + e^{-2a}}$

**Ans.**  $\{e^{-ak} \cos bk\}$

13.  $\frac{z^2 \sin \beta + \frac{z}{\sqrt{2}}(\cos \beta - \sin \beta)}{z^2 - \sqrt{2}z + 1}, \quad |z| > 1$

**Ans.**  $\left\{ \sin\left(\frac{k\pi}{4} + \beta\right) \right\}, \quad k \geq 0$

14.  $\frac{z(z+a)}{(z-a)^3}, \quad |z| > a$

**Ans.**  $\{k^2 a^{k-1} U(k-1)\}, k \geq 0$

15.  $\frac{15z}{(4-z)(4z-1)}, \quad \frac{1}{4} < |z| < 4$

**Ans.**  $\left\{ \left(\frac{1}{4}\right)^{|k|} \right\}$

### 44.23 INVERSION OF Z-TRANSFORM BY RESIDUE METHOD

Take the contour  $c$  such that all the poles of the function  $z$  lie within the contour.

Then by Residue Method

$$f(k) = \Sigma \text{Residue of } z^{k-1} F(z) \text{ at its poles.}$$

where Residue for simple pole  $z = z_i$  is  $\left[ (z - z_i) z^{k-1} F(z) \right]_{z=z_i}$

Residue of order  $r$  at the pole  $z = z_i$

$$\left[ \frac{1}{(r-1)!} \frac{d^{r-1}}{dz^{r-1}} (z - z_i)^r z^{k-1} F(z) \right]_{z=z_i}$$

**Example 40.** Obtain  $Z^{-1} \frac{z}{(z-2)(z-3)}$

**Solution.** The poles are determined by

$$(z-2)(z-3) = 0 \Rightarrow z = 2, 3$$

There are two poles. Let us consider the contour  $|z| > 3$ .

$$\text{Residue at } (z=2) = \left[ (z-2) z^{k-1} \frac{z}{(z-2)(z-3)} \right]_{z=2} = \left[ \frac{z^k}{z-3} \right]_{z=2} = \frac{2^k}{-1}$$

$$\text{Residue at } (z=3) = \left[ (z-3) z^{k-1} \frac{z}{(z-2)(z-3)} \right]_{z=3} = \left[ \frac{z^k}{z-2} \right]_{z=3} = \frac{3^k}{1}$$

Hence,  $f(k) = \text{Sum of the residues} = 3^k - 2^k$ .

**Ans.**

**Example 41.** Obtain  $Z^{-1} \frac{3z^2 - 18z + 26}{(z-2)(z-3)(z-4)}$

**Solution.** The poles are determined by  $(z-2)(z-3)(z-4) = 0 \Rightarrow z = 2, 3, 4$ .

There are three poles. Let us consider the contour  $|z| > 4$ .

$$\begin{aligned} \text{Residue at } (z=2) &= \left[ \frac{(z-2) z^{k-1} [3z^2 - 18z + 26]}{(z-2)(z-3)(z-4)} \right]_{z=2} \\ &= \left[ \frac{3z^{k+1} - 18z^k + 26z^{k-1}}{(z-3)(z-4)} \right]_{z=2} = \frac{3 \cdot 2^{k+1} - 18 \cdot 2^k + 26 \cdot 2^{k-1}}{(-1)(-2)} \\ &= 3 \cdot 2^k - 9 \cdot 2^k + 13 \cdot 2^{k-1} = -6 \cdot 2^k + 13 \cdot 2^{k-1} = -12 \cdot 2^{k-1} + 13 \cdot 2^{k-1} = 2^{k-1} \end{aligned}$$

$$\begin{aligned} \text{Residue at } (z=3) &= \left[ \frac{(z-3) z^{k-1} [3z^2 - 18z + 26]}{(z-2)(z-3)(z-4)} \right]_{z=3} = \left[ \frac{3z^{k+1} - 18z^k + 26z^{k-1}}{(z-2)(z-4)} \right]_{z=3} \\ &= \frac{3 \cdot 3^{k+1} - 18 \cdot 3^k + 26 \cdot 3^{k-1}}{1(-1)} = -3 \cdot 3^{k+1} + 18 \cdot 3^k - 26 \cdot 3^{k-1} \\ &= -27 \cdot 3^{k-1} + 54 \cdot 3^{k-1} - 26 \cdot 3^{k-1} = 3^{k-1} \end{aligned}$$

$$\begin{aligned} \text{Residue at } (z=4) &= \left[ (z-4) \frac{z^{k-1} [3z^2 - 18z + 26]}{(z-2)(z-3)(z-4)} \right]_{z=4} = \left[ \frac{3z^{k+1} - 18z^k + 26z^{k-1}}{(z-2)(z-3)} \right]_{z=4} \\ &= \frac{3 \cdot 4^{k+1} - 18 \cdot 4^k + 26 \cdot 4^{k-1}}{(2)(1)} = \frac{3}{2} \cdot 4^{k+1} - 9 \cdot 4^k + 13 \cdot 4^{k-1} \\ &= 24 \cdot 4^{k-1} - 36 \cdot 4^{k-1} + 13 \cdot 4^{k-1} = 4^{k-1} \end{aligned}$$

Hence  $f(k) = \text{Sum of the residues} = 2^{k-1} + 3^{k-1} - 4^{k-1}, k > 0$

**Ans.**

**Example 42.** Obtain  $Z^{-1} \frac{z(3z^2 - 6z + 4)}{(z-1)^2(z-2)}$

**Solution.** The poles are determined by  $(z-1)^2(z-2) = 0 \Rightarrow z = 1, 1, 2$

There are two poles, simple pole at  $z = 2$  and pole of order 2 at  $z = 1$ . Let us consider the contour  $|z| > 2$ .

$$\begin{aligned} \text{Residue at } (z=2) \text{ is } & \left[ \frac{(z-2)z^{k-1} \cdot z[3z^2 - 6z + 4]}{(z-1)^2(z-2)} \right]_{z=2} = \left[ \frac{3z^{k+2} - 6z^{k+1} + 4z^k}{(z-1)^2} \right]_{z=2} \\ & = 3 \cdot 2^{k+2} - 6 \cdot 2^{k+1} + 4 \cdot 2^k = 12 \cdot 2^k - 12 \cdot 2^k + 4 \cdot 2^k = 4 \cdot 2^k = 2^{k+2} \\ \text{Residue at } (z=1) & = \frac{d}{dz} \left[ (z-1)^2 \frac{z^{k-1} \cdot z(3z^2 - 6z + 4)}{(z-1)^2(z-2)} \right]_{z=1} = \frac{d}{dz} \left[ \frac{3z^{k+2} - 6z^{k+1} + 4z^k}{z-2} \right]_{z=1} \\ & = \left[ \frac{(z-2)[3(k+2)z^{k+1} - 6(k+1)z^k + 4kz^{k-1}] - (3z^{k+2} - 6z^{k+1} + 4z^k) \cdot 1}{(z-2)^2} \right]_{z=1} \\ & = -\{(3k+6) - 6k - 6 + 4k\} - \{3 - 6 + 4\} \\ & = -3k - 6 + 6k + 6 - 4k - 3 + 6 - 4 = -k - 1 \\ f(k) & = \text{Sum of the residues} = [2^{k+2} - k - 1]U(k) \end{aligned}$$

Ans.

**Example 43.** Find  $Z^{-1} \frac{9z^3}{(3z-1)^2(z-2)}$

**Solution.** The poles are determined by putting the denominator equal to zero, i.e.,

$$(3z-1)^2(z-2) = 0 \Rightarrow z = \frac{1}{3}, \frac{1}{3}, 2$$

There are two poles i.e., one simple pole at  $z = 2$  and second pole of order 2 at  $z = \frac{1}{3}$ .

Let us consider the contour  $|z| > 2$ .

$$\begin{aligned} \text{Residue at } (z=2) & = \left[ (z-2)z^{k-1} \cdot \frac{9z^3}{(3z-1)^2(z-2)} \right]_{z=2} = \left[ \frac{9z^{k+2}}{(3z-1)^2} \right]_{z=2} = \frac{9 \cdot 2^{k+2}}{25} \\ \text{Residue at } \left( z = \frac{1}{3} \right) & = \frac{d}{dz} \left[ \frac{\left( z - \frac{1}{3} \right)^2 \cdot z^{k-1} \cdot 9z^3}{(3z-1)^2 \cdot (z-2)} \right]_{z=\frac{1}{3}} = \frac{d}{dz} \left[ \frac{9z^{k+2}}{9(z-2)} \right]_{z=\frac{1}{3}} = \frac{d}{dz} \left( \frac{z^{k+2}}{z-2} \right)_{z=\frac{1}{3}} \\ & = \left[ \frac{(z-2)(k+2)z^{k+1} - z^{k+2}}{(z-2)^2} \right]_{z=\frac{1}{3}} = \left[ \frac{(k+2)z^{k+2} - 2(k+2)z^{k+1} - z^{k+2}}{(z-2)^2} \right]_{z=\frac{1}{3}} \\ & = \left[ \frac{z^{k+2}(k+2-1) - 2(k+2)z^{k+1}}{(z-2)^2} \right]_{z=\frac{1}{3}} \\ & = \left[ \frac{(k+1)z^{k+2} - 2(k+2)z^{k+1}}{(z-2)^2} \right]_{z=\frac{1}{3}} = \left[ \frac{z^{k+1}\{(k+1)z - 2(k+2)\}}{(z-2)^2} \right]_{z=\frac{1}{3}} \end{aligned}$$

$$\begin{aligned}
 &= \frac{\left(\frac{1}{3}\right)^{k+1} \left\{ (k+1)\frac{1}{3} - 2(k+2) \right\}}{\frac{25}{9}} = \frac{\left(\frac{1}{3}\right)^{k+1} \cdot 9 \cdot \frac{1}{3} [k+1-6(k+2)]}{25} \\
 &= \left(\frac{1}{3}\right)^k \left( \frac{k+1-6k-12}{25} \right) = \frac{\left(\frac{1}{3}\right)^k (-5k-11)}{25} \\
 \text{Hence, } f(k) = \text{Sum of residues} &= \frac{9}{25} \cdot 2^{k+2} - \left(\frac{1}{3}\right)^k \frac{(5k+11)}{25} \quad \text{Ans.}
 \end{aligned}$$

**Example 44.** Find  $Z^{-1} \frac{z^2}{z^2 + 4}$ ,  $|z| > 2$

**Solution.** The poles are determined by  $z^2 + 4 = 0 \Rightarrow z = \pm 2i$

There are two poles at  $z = 2i$  and  $z = -2i$ .

Let us consider a contour  $|z| > 2$

$$\begin{aligned}
 \text{Residue at } (z = 2i) &= \left[ \frac{(z-2i)z^{k-1}z^2}{z^2 + 4} \right]_{z=2i} = \left[ \frac{z^{k+1}}{z+2i} \right]_{z=2i} = \frac{(2i)^{k+1}}{4i} = 2^{k-1}(i)^k \\
 &= 2^{k-1} \left[ \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \right]^k = 2^{k-1} \left[ \cos \frac{k\pi}{2} + i \sin \frac{k\pi}{2} \right] \\
 \text{Residue at } (z = -2i) &= \left[ (z+2i)z^{k-1} \frac{z^2}{z^2 + 4} \right]_{z=-2i} = \left[ \frac{z^{k+1}}{z-2i} \right]_{z=-2i} = \frac{(-2i)^{k+1}}{-4i} \\
 &= 2^{k-1}(-i)^k = 2^{k-1} \left[ \cos \frac{\pi}{2} - i \sin \frac{\pi}{2} \right]^k = 2^{k-1} \left[ \cos \frac{k\pi}{2} - i \sin \frac{k\pi}{2} \right]
 \end{aligned}$$

$$f(k) = \text{Sum of the residues} = 2^{k-1} \left[ \cos \frac{k\pi}{2} + i \sin \frac{k\pi}{2} \right] + 2^{k-1} \left[ \cos \frac{k\pi}{2} - i \sin \frac{k\pi}{2} \right]$$

$$f(k) = 2^{k-1} \left[ 2 \cos \frac{k\pi}{2} \right] = 2^k \cos \frac{k\pi}{2} \quad \text{Ans.}$$

#### 44.24 CONVOLUTION METHOD

We know that  $Z \{f * g\} = F(z) G(z)$

$$Z^{-1} \{F(z) \cdot G(z)\} = f * g = \sum_{n=0}^k f(n) g(k-n).$$

#### 44.25 INVERSE OF Z-TRANSFORM BY CONVOLUTION METHOD

**Example 45.** Using Convolution theorem, evaluate

$$Z^{-1} \left\{ \frac{z^2}{(z-1)(z-3)} \right\}. \quad (\text{Q. Bank U.P., III Semester 2002})$$

**Solution.** We know that

$$Z^{-1} \{F(z) \cdot G(z)\} = f * g$$

$$\text{Let } F(z) = \frac{z}{z-1} \quad \therefore f(k) = (1)^k$$

$$\begin{aligned}
 G(z) &= \frac{z}{z-3} & \therefore g(k) = (3)^k \\
 \text{Now, } Z^{-1}\{F(z) \cdot G(z)\} &= (1)^k * (3)^k \\
 &= \sum_{n=0}^k 1^n 3^{k-n} = 3^k \sum_{n=0}^k \left(\frac{1}{3}\right)^n & \text{(a G.P.)} \\
 &= 3^k \left\{ \frac{\left(\frac{1}{3}\right)^{k+1} - 1}{\frac{1}{3} - 1} \right\} = \frac{(1)^{k+1} - (3)^{k+1}}{1-3} = \left\{ \frac{1}{2} (3^{k+1} - 1) \right\} & \text{Ans.}
 \end{aligned}$$

#### 44.26 INVERSE OF Z-TRANSFORM BY POWER SERIES METHOD

**Example 46.** Find  $Z^{-1} \left[ \log \frac{z}{z+1} \right]$  by power series method.

$$\begin{aligned}
 \text{Solution. Let } F(z) &= \log \left( \frac{z}{z+1} \right) = \log \left( \frac{1}{1 + \frac{1}{z}} \right) = -\log \left( 1 + \frac{1}{z} \right) \\
 &= -\frac{1}{z} + \frac{1}{2} \left( \frac{1}{z} \right)^2 - \frac{1}{3} \left( \frac{1}{z} \right)^3 + \frac{1}{4} \left( \frac{1}{z} \right)^4 + \dots \\
 &= -\frac{1}{z} + \frac{1}{2z^2} - \frac{1}{3z^3} + \frac{1}{4z^4} + \dots + \frac{(-1)^k}{k z^k} + \dots \\
 f(k) &= Z^{-1}[F(z)] = \begin{cases} 0, & \text{for } k = 0 \\ \frac{(-1)^k}{k}, & \text{othersie} \end{cases} & \text{Ans.}
 \end{aligned}$$

#### EXERCISE 44.6

Find the inverse Z-transform of the following functions by residue method:

1.  $\frac{z}{(z-1)(z-2)}$  Ans.  $2^k - 1, k \geq 0$
2.  $\frac{3z^2 + 2z}{z^2 - 3z + 2}, |z| < 2$  Ans.  $\{-5\} (k \geq 0), -8 (2)^k, k < 0$
3.  $\frac{2z^2 + 3z}{z^2 + z + 1}, |z| > 1$  Ans.  $\left[ 2\{\cos \frac{2\pi k}{3}\} + \frac{4}{\sqrt{3}} \{\sin \frac{2\pi k}{3}\} \right] U(k)$
4.  $\frac{z(z+1)}{(z-1)(z^2 + z + 1)}, |z| > 1$  Ans.  $\frac{2}{3} \left[ 1 - \cos \frac{2\pi k}{3} \right] U(k)$
5.  $\frac{16z^3}{(4z-1)^2 (z-1)}$  Ans.  $\left[ \frac{16}{9} - \frac{1}{9} (3k+7) \left( \frac{1}{4} \right)^k \right] U(k)$
6.  $\frac{z^2}{z^2 + 1}$  Ans.  $\cos \frac{k\pi}{2}$

#### 44.27 DIFFERENCE EQUATION

Difference equation is the equation between the differences of an unknown function.

For example,  $\Delta y_n + 2y_n = 0 \quad (\Delta y_n = y_{n+1} - y_n) \dots (1)$   
 $\Delta^2 y_n + 5\Delta y_n + 6y_n = 0 \dots (2)$

**Second way.** To express the difference equation.

Putting the value of  $\Delta = E - 1$

(1) becomes,  $(E - 1)y_n + 2y_n = 0$   
 $Ey_n + y_n = 0 \dots (3)$

(2) becomes,  $(E - 1)^2 y_n + 5(E - 1)y_n + 6y_n = 0$   
 $\Rightarrow (E^2 - 2E + 1)y_n + 5(E - 1)y_n + 6y_n = 0$   
 $\Rightarrow E^2 y_n + 3Ey_n + 2y_n = 0 \dots (4)$

**Third way**

(3) can be written as  $y_{n+1} + y_n = 0 \quad [Ey_n = y_{n+1}] \dots (5)$

(4) can be written as  $y_{n+2} + 3y_{n+1} + 2y_n = 0 \quad [E^2 y_n = y_{n+2}] \dots (6)$

#### 44.28 ORDER OF A DIFFERENCE EQUATION = HIGHEST POWER OF E

Order of a difference equation is the difference between the largest and the smallest arguments involved in the difference equation, divided by the unit of interval.

Thus the order of (5)  $= \frac{\text{Largest argument} - \text{Smallest argument}}{\text{Unit of interval}} = \frac{(n+1)-n}{1} = 1$

Similarly, order of (6)  $= \frac{n+2-n}{1} = 2$

#### 44.29 DEGREE OF A DIFFERENCE EQUATION

The degree of a difference equation is defined to be the highest power of  $f(x)$ .

#### 44.30 SOLUTION OF A DIFFERENCE EQUATION

A solution of a difference equation is any function which satisfies the given equation. The general solution of a difference equation is defined as the solution which involves as many arbitrary constants as the order of the difference equation.

The particular solution is a solution obtained from the general solution by assigning particular values to periodic constants.

#### 44.31 THEOREM

Prove that  $Z(y_{k+n}) = z^n \left( \bar{y} - y_0 - \frac{y_1}{z} - \dots - \frac{y_{n-1}}{z^{n-1}} \right)$ , where  $Z(y_k) = \bar{y}$

**Proof.** L.H. S.  $= Z(y_{k+n}) = \sum_{k=0}^{\infty} y_{k+n} z^{-k} = z^n \sum_{k=0}^{\infty} y_{k+n} z^{-(n+k)} \dots (1)$

On putting  $m = n + k$  in (1), we get

$$\begin{aligned} Z(y_{k+n}) &= z^n \sum_{m=n}^{\infty} y_m z^{-m} = z^n \left[ \sum_{m=0}^{\infty} y_m z^{-m} - \sum_{m=0}^{n-1} y_m z^{-m} \right] \\ &= z^n \left[ \bar{y} - y_0 - \frac{y_1}{z} - \frac{y_2}{z^2} - \dots - \frac{y_{n-1}}{z^{n-1}} \right] \end{aligned}$$

**Remember**

$$\text{For } n = 1, \quad Z(y_{k+1}) = (z \bar{y} - z y_0); \quad \text{For } n = 2, \quad Z(y_{k+2}) = (z^2 \bar{y} - z^2 y_0 - z y_1)$$

$$\text{For } n = 3, \quad Z(y_{k+3}) = (z^3 \bar{y} - z^3 y_0 - z^2 y_1 - z y_2)$$

**Note.** If  $Z(y_k) = \bar{y}$ , then  $Z(y_{k-n}) = Z^{-n} \bar{y}$

**Example 47.** Solve the difference equation

$$\begin{aligned} & 6y_{k+2} - y_{k+1} - y_k = 0, \quad y(0) = 0, y(1) = 1 \text{ by Z-transform.} \\ \text{Solution.} \quad & 6y_{k+2} - y_{k+1} - y_k = 0 \end{aligned} \quad \dots(1)$$

Taking the Z-transform of both sides of (1), we get

$$\begin{aligned} & Z[6y_{k+2} - y_{k+1} - y_k] = 0 \\ & Z(6y_{k+2}) - Z(y_{k+1}) - Z(y_k) = 0 \\ & 6[z^2 \bar{y} - z^2 y(0) - z y(1)] - [z \bar{y} - z y(0)] - \bar{y} = 0 \end{aligned} \quad \dots(2)$$

On putting the values of  $y(0)$  and  $y(1)$  in (2), we get

$$\begin{aligned} & 6z^2 \bar{y} - 6z - z \bar{y} - \bar{y} = 0 \quad \Rightarrow \quad (6z^2 - z - 1) \bar{y} = 6z \\ & \bar{y} = \frac{6z}{6z^2 - z - 1} = \frac{6z}{(3z+1)(2z-1)} = \frac{z^{-1}}{\left(1 + \frac{z^{-1}}{3}\right)\left(1 - \frac{z^{-1}}{2}\right)} = \frac{\frac{6}{5}}{1 - \frac{z^{-1}}{2}} - \frac{\frac{6}{5}}{1 + \frac{z^{-1}}{3}} \\ & y_k = Z^{-1}\left[\frac{\frac{6}{5}}{1 - \frac{z^{-1}}{2}}\right] - Z^{-1}\left[\frac{\frac{6}{5}}{1 + \frac{z^{-1}}{3}}\right] = \frac{6}{5}\left(\frac{1}{2}\right)^k - \frac{6}{5}\left(-\frac{1}{3}\right)^k = \frac{6}{5}\left[\left(\frac{1}{2}\right)^k - \left(-\frac{1}{3}\right)^k\right] \end{aligned} \quad \text{Ans.}$$

**Example 48.** Solve the difference equation

$$\begin{aligned} & y_{k+3} - 3y_{k+2} + 3y_{k+1} - y_k = U(k) \\ & y(0) = y(1) = y(2) = 0 \quad \text{by Z-transforms.} \end{aligned}$$

$$\text{Solution.} \quad y_{k+3} - 3y_{k+2} + 3y_{k+1} - y_k = U(k) \quad \dots(1)$$

Taking the Z-transform of both sides of (1), we get

$$\begin{aligned} & Z[y_{k+3} - 3y_{k+2} + 3y_{k+1} - y_k] = ZU(k), \\ & \Rightarrow Z[y_{k+3}] - 3Z[y_{k+2}] + 3Z[y_{k+1}] - Z[y_k] = ZU(k) \\ & \Rightarrow [z^3 \bar{y} - z^3 y(0) - z^2 y(1) - z y(2)] - 3[z^2 \bar{y} - z^2 y(0) - z y(1)] \\ & \quad + 3[z \bar{y} - z y(0)] - \bar{y} = ZU(k) \end{aligned}$$

Putting the values of  $y(0) = y(1) = y(2) = 0$  in the above equation, we get

$$\begin{aligned} & z^3 \bar{y} - 3z^2 \bar{y} + 3z \bar{y} - \bar{y} = \frac{1}{1-z^{-1}} \\ & [z^3 - 3z^2 + 3z - 1] \bar{y} = \frac{1}{1-z^{-1}} \Rightarrow (z-1)^3 \bar{y} = \frac{1}{1-z^{-1}} \\ & \bar{y} = \frac{1}{(z-1)^3(1-z^{-1})} = \frac{1}{z^3(1-z^{-1})^3(1-z^{-1})} = z^{-3}(1-z^{-1})^{-4} \end{aligned}$$

$$\begin{aligned}y_k &= \text{coeff. of } z^{-k} \text{ in } z^{-3}(1-z^{-1})^{-4} = \text{coeff. of } z^{-k-3} \text{ in } (1-z^{-1})^{-4} \\&= \frac{(k-2)(k-1)k}{6}, \quad k \geq 3\end{aligned}$$

**Ans.**

**Example 49.** Solve by Z-transform.  $y_{k+1} + \frac{1}{4}y_k = \left(\frac{1}{4}\right)^k, (k \geq 0), y(0) = 0$

$$\text{Solution. } y_{k+1} + \frac{1}{4}y_k = \left(\frac{1}{4}\right)^k \quad \dots (1)$$

Taking Z-transform of both sides of (1), we get

$$\begin{aligned}Z[y_{k+1} + \frac{1}{4}y_k] &= Z\left[\left(\frac{1}{4}\right)^k\right] \\Z[y_{k+1}] + Z\left[\frac{1}{4}y_k\right] &= Z\left[\left(\frac{1}{4}\right)^k\right] \\z\bar{y} - zy(0) + \frac{1}{4}\bar{y} &= \frac{1}{1 - \frac{1}{4}z^{-1}}, \quad |z| > \frac{1}{4} \\z\bar{y} - 0 + \frac{1}{4}\bar{y} &= \frac{1}{1 - \frac{1}{4}z^{-1}} \quad \Rightarrow \quad (z + \frac{1}{4})\bar{y} = \frac{1}{1 - \frac{1}{4}z^{-1}} \\\bar{y} &= \frac{1}{z + \frac{1}{4}} \times \frac{1}{1 - \frac{1}{4}z^{-1}} = \frac{z^{-1}}{1 + \frac{1}{4}z^{-1}} \times \frac{1}{1 - \frac{1}{4}z^{-1}} = \frac{-2}{1 + \frac{1}{4}z^{-1}} + \frac{2}{1 - \frac{1}{4}z^{-1}} \\y_{(k)} &= Z^{-1}\left[\frac{-2}{1 + \frac{1}{4}z^{-1}}\right] + Z^{-1}\left[\frac{2}{1 - \frac{1}{4}z^{-1}}\right] = Z^{-1}\left[-2(1 + \frac{1}{4}z^{-1})^{-1}\right] + Z^{-1}\left[2(1 - \frac{1}{4}z^{-1})^{-1}\right] \\&= -2\left(-\frac{1}{4}\right)^k + 2\left(\frac{1}{4}\right)^k\end{aligned}$$

**Ans.**

**Example 50.** Solve  $y_k + \frac{1}{4}y_{k-1} = U_{(k)} + \frac{1}{3}U_{(k-1)}$

$$\text{Solution. } y_k + \frac{1}{4}y_{k-1} = U_{(k)} + \frac{1}{3}U_{(k-1)} \quad \dots (1)$$

Taking the Z-transform of both sides of (1), we get

$$\begin{aligned}Z[\{y_k\}] + \frac{1}{4}Z[\{y_{k-1}\}] &= Z[\{U_k\}] + \frac{1}{3}[U_{k-1}] \\z\bar{y} + \frac{1}{4}z^{-1}\bar{y} &= \left[1 + \frac{1}{3}z^{-1}\right]U(k), \quad \left[1 + \frac{1}{4}z^{-1}\right]\bar{y} = (1 + \frac{1}{3}z^{-1})U(k) \\\bar{y} &= \frac{1 + \frac{1}{3}z^{-1}}{1 + \frac{1}{4}z^{-1}} = \frac{z + \frac{1}{3}}{z + \frac{1}{4}}\end{aligned}$$

There is only one simple pole at  $z = -\frac{1}{4}$

Let us consider the contour  $|z| > \frac{1}{4}$ .

$$\begin{aligned} \text{Residue at } \left(z = -\frac{1}{4}\right) &= \left[ (z + \frac{1}{4})z^{k-1} \frac{z + \frac{1}{3}}{z + \frac{1}{4}} \right]_{z=-\frac{1}{4}} = \left[ z^k + \frac{z^{k-1}}{3} \right]_{z=-\frac{1}{4}} \\ &= \left( -\frac{1}{4} \right)^k + \frac{1}{3} \left( -\frac{1}{4} \right)^{k-1} = -\frac{1}{4} \left( -\frac{1}{4} \right)^{k-1} + \frac{1}{3} \left( -\frac{1}{4} \right)^{k-1} = \frac{1}{12} \left( -\frac{1}{4} \right)^{k-1} \\ \text{Hence, } y_k &= \text{Residue} = \frac{1}{12} \left( -\frac{1}{4} \right)^{k-1} \end{aligned}$$

**Example 51.** Solve  $y_k + \frac{1}{25}y_{k-2} = \left(\frac{1}{5}\right)^k \cos \frac{k\pi}{2}$  ( $k \geq 0$ ) by residue method.

$$\text{Solution. } y_k + \frac{1}{25}y_{k-2} = \left(\frac{1}{5}\right)^k \cos \frac{k\pi}{2} \quad \dots (1)$$

Taking Z-transform of both sides of (1), we obtain

$$\begin{aligned} Z \left[ y_k + \frac{1}{25}y_{k-2} \right] &= Z \left( \frac{1}{5} \right)^k \cos \frac{k\pi}{2} \quad \Rightarrow \quad \bar{y} + \frac{1}{25}z^{-2}\bar{y} = \frac{z^2}{z^2 + \frac{1}{25}} \\ \Rightarrow \quad \left[ 1 + \frac{1}{25}z^{-2} \right] \bar{y} &= \frac{z^2}{z^2 + \frac{1}{25}} \quad \Rightarrow \quad \bar{y} = \frac{z^2}{\left( 1 + \frac{1}{25}z^{-2} \right) \left( z^2 + \frac{1}{25} \right)} = \frac{z^4}{\left( z^2 + \frac{1}{25} \right)^2} \end{aligned}$$

There are two poles of second order at  $z = \frac{i}{5}$  and  $z = -\frac{i}{5}$

Let us consider a contour  $|z| > \left|\frac{1}{5}\right|$

$$\begin{aligned} \text{Residue at } \left(z = \frac{i}{5}\right) &= \left[ \frac{d}{dz} \left( z - \frac{i}{5} \right)^2 \frac{z^{k-1}z^4}{(z^2 + \frac{1}{25})^2} \right]_{z=\frac{i}{5}} = \left[ \frac{d}{dz} \frac{z^{k+3}}{(z + \frac{i}{5})^2} \right]_{z=\frac{i}{5}} \\ &= \left[ \frac{(z + \frac{i}{5})^2(k+3)z^{k+2} - z^{k+3}2(z + \frac{i}{5})}{(z + \frac{i}{5})^4} \right]_{z=\frac{i}{5}} = \left[ \frac{(z + \frac{i}{5})(k+3)z^{k+2} - 2z^{k+3}}{(z + \frac{i}{5})^3} \right]_{z=\frac{i}{5}} \\ &= \frac{\left( \frac{2i}{5} \right)(k+3)\left( \frac{i}{5} \right)^{k+2} - 2\left( \frac{i}{5} \right)^{k+3}}{\left( \frac{2i}{5} \right)^3} = \left( \frac{5}{2i} \right)^3 [(2k+6)\left( \frac{i}{5} \right)^{k+3} - 2\left( \frac{i}{5} \right)^{k+3}] \end{aligned}$$

$$\begin{aligned}
 &= \left( \frac{5}{2i} \right)^3 \left[ (2k+4) \left( \frac{i}{5} \right)^{k+3} \right] = \left( \frac{1}{8} \right) (2k+4) \left( \frac{i}{5} \right)^k = \frac{1}{4} (k+2) \left( \frac{1}{5} \right)^k [\cos \frac{\pi}{2} + i \sin \frac{\pi}{2}]^k \\
 &= \frac{1}{4} (k+2) \left( \frac{1}{5} \right)^k \left[ \cos \frac{k\pi}{2} + i \sin \frac{k\pi}{2} \right] \\
 \text{Residue at } z = -\frac{i}{5} &= \frac{1}{4} (k+2) \left( \frac{1}{5} \right)^k \left[ \cos \frac{k\pi}{2} - i \sin \frac{k\pi}{2} \right] \\
 &\quad (i \rightarrow -i) \\
 y_k &= \text{Sum of the residues} \\
 \Rightarrow y_k &= \frac{1}{2} (k+2) \frac{1}{5^k} \cos \frac{k\pi}{2} \quad \text{Ans.}
 \end{aligned}$$

### EXERCISE 44.7

Solve the following difference equations by Z-transform:

1.  $y_k - \frac{5}{6}y_{k-1} + \frac{1}{6}y_{k-2} = U_{(k)}$  Ans.  $y_k = \left[ 3 - 3 \left( \frac{1}{2} \right)^k + \left( \frac{1}{3} \right)^k \right] U(k)$
2.  $6y_{k+2} + 5y_{k+1} - y_k = 6U(k)$  Ans.  $y_k = \left[ \frac{6}{7}(k+1) - \frac{78}{49} + \frac{36}{49} \left( -\frac{1}{6} \right)^k \right] U(k)$
3.  $y_{k+1} - y_{k-1} = U(k), y(0) = 0$  Ans.  $\left[ \frac{k}{2} + \frac{1}{4} \right] U(k)$
4.  $y_{k+1} - 2y_k + y_{k-1} = a^k, a \neq 1$  Ans.  $y_k = \frac{1}{a}(k+1)U(k) - \frac{a}{(a-1)^2}U(k) + \frac{a}{(a-1)^2}a^kU(k) + \frac{1}{1-a}kU(k-1)$
5.  $y_k + \frac{1}{9}y_{k-2} = \left( \frac{1}{3} \right)^k \cos \frac{k\pi}{2}, (k \geq 0)$  Ans.  $y_k = \left( \frac{k+2}{2} \right) \left( \frac{1}{3} \right)^k \cos \frac{k\pi}{2} U(k)$
6.  $y_{k+2} - 3y_{k+1} - 4y_k = 0; y_0 = 3, y_1 = -2$  Ans.  $y_k = \frac{1}{5}(4)^k + \frac{14}{5}(-1)^k$
7.  $y_{k+2} + y_{k+1} - 2y_k = 0; y_0 = 4, y_1 = 0$  Ans.  $y_k = \frac{8}{3} + \frac{4}{3}(-2)^k$
8.  $y_{k+2} - 2y_{k+1} + y_k = k, y_{(0)} = 0, y_{(1)} = 0$  Ans.  $y_k = \frac{k-1}{4} \{ 1 - (-1)^k \}$
9.  $y_{k+2} - 4y_k = 0; y_{(0)} = 0, y_{(1)} = 2$  Ans.  $y_k = 2^{k-1} + (-2)^{k-1}$
10.  $y_{k+2} - 2y_{k+1} + y_k = 2^k, y_{(0)} = 2, y_{(1)} = 1$  Ans.  $y_k = 1 - 2k + 2^k$
11.  $8y_{k+2} - 6y_{k+1} + y_k = 5 \sin \left( \frac{k\pi}{2} \right)$  (U.P. III Semester, Dec. 2006)

(Uttarakhand III Semester, 2008)

## HANKEL TRANSFORM

---

---

### 45.1 HANKEL TRANSFORM

If  $J_n(sx)$  be the Bessel function of the first kind of order  $n$ , then the Hankel transform of a function  $f(x)$ , ( $0 < x < \infty$ ) denoted by  $F(s)$  is defined as  $H(s) = \int_0^\infty f(x) \cdot x J_n(sx) dx$

Here  $x J_n(sx)$  is the *Kernel of the transformation*,

### 45.2 THE FORMULAE USED IN FINDING THE HANKEL TRANSFORMS.

Recurrence relations for Bessel's functions

$$1. x J'_n = n J_n - x J_{n+1}$$

$$2. x J'_n = x J_{n-1} - n J_n$$

$$3. 2J'_n = J_{n-1} - J_{n+1}$$

$$4. 2n J_n = x[J_{n-1} + J_{n+1}]$$

$$5. \frac{d}{dx}(x^{-n} J_n) = -x^{-n} J_{n+1}$$

$$6. \frac{d}{dx}(x^n J_n) = x^n J_{n-1} \quad \text{or} \quad x^n J_n = \int x^n J_{n-1} dx$$

From (6) Recurrence relation we can find the definite Integrals

$$7. \int_0^\infty x^n J_{n-1}(x) dx = [x^n J_n(x)]_0^\infty \quad \dots (7)$$

In (7) we put  $n = 1$  and substitute  $J(x)$  by  $J(sx)$ , we get (8),

$$8. \int_0^\infty x J_0(xs) dx = \left[ \frac{x}{s} J_1(xs) \right]_0^\infty \quad \dots (8)$$

**Example 1.** Evaluate  $\int_0^a x^2 J_1(sx) dx$ .

**Solution.** 
$$\int_0^a x^2 J_1(sx) dx = \left[ \frac{x^2}{s} J_2(sx) \right]_0^a = \frac{a^2}{s} J_2(as)$$
 **Ans.**

**Example 2.** Evaluate  $\int x^3 J_0(sx) dx$

**Solution.** 
$$\int_0^a x^3 J_0(sx) dx = \int_0^a x^2 \cdot \{x J_0(sx)\} dx$$

Integrating by parts we get

$$= \left[ x^2 \cdot \left( \frac{x}{s} J_1(ax) \right) \right]_0^a - \int_0^a (2x) \left\{ \frac{x}{s} J_1(sx) \right\} dx \quad \left[ \int x^n J_{n-1}(x) dx = x^n J_n(x) \right]$$

$$\begin{aligned}
 &= \left[ \frac{x^2}{s} J_1(sx) \right]_0^a - \left[ 2x \cdot \left\{ \frac{x}{s^2} J_2(sx) \right\} \right]_0^a = \frac{a^3}{s} J_1(as) - \frac{2}{s} \int_0^a x^2 J_1(sx) dx \\
 &= \frac{a^3}{s} J_1(as) - \frac{2}{s^2} \left[ x^2 J_2(sx) \right]_0^a = \frac{a^3}{s} J_1(as) - \frac{2a^2}{s^2} J_2(as)
 \end{aligned}
 \quad \text{Ans.}$$

**Example 3.** Evaluate  $\int_0^a x(a^2 - x^2) J_0(sx) dx$

$$\text{Solution. } \int_0^a x(a^2 - x^2) J_0(sx) dx = \int_0^a (a^2 - x^2) \cdot \{x J_0(sx)\} dx$$

Integrating by parts, we get

$$\begin{aligned}
 &= \left[ (a^2 - x^2) \cdot \frac{x}{s} J_1(sx) \right]_0^a - \int_0^a (-2x) \frac{x}{s} J_1(sx) dx \quad \left[ \int x^n J_{n-1}(x) dx = x^n J_n(x) \right] \\
 &= 0 + 2 \int_0^a x \cdot \frac{x}{s} J_1(sx) dx = \frac{2}{s} \int_0^a x^2 J_1(sx) dx \\
 &= \left[ \frac{2}{s} \frac{x^2}{s} J_2(sx) \right]_0^a = \left[ \frac{2x^2}{s^2} J_2(sx) \right]_0^a = \frac{2a^2}{s^2} J_2(as) \\
 &= \frac{2a^2}{s^2} \left[ \frac{2}{as} J_1(as) - J_0(as) \right] = \frac{4a}{s^3} J_1(as) - \frac{2a^2}{s^2} J_0(as)
 \end{aligned}
 \quad \text{Ans.}$$

### 45.3 SOME MORE INTEGRALS INVOLVING EXPONENTIAL FUNCTIONS AND BESEL'S FUNCTION

1.  $\int_0^\infty e^{-ax} J_0(sx) dx = (a^2 + s^2)^{-1/2}$
2.  $\int_0^\infty e^{-ax} J_1(sx) dx = \frac{1}{s} - \frac{a}{s\sqrt{a^2 + s^2}}$
3.  $\int_0^\infty x e^{-ax} J_0(sx) dx = a(a^2 + s^2)^{-3/2}$
4.  $\int_0^\infty x e^{-ax} J_1(sx) dx = s(a^2 + s^2)^{-3/2}$
5.  $\int_0^\infty \frac{e^{-ax}}{x} J_1(sx) dx = \frac{(a^2 + s^2)^{1/2} - a}{s}$
6.  $J_n(x) = \frac{x^n}{2^n (n+1)!} \left[ 1 - \frac{x^2}{1! \cdot 2^2 (n+1)} + \frac{x^4}{2! \cdot 2^2 \cdot 4^2 (n+1)(n+2)} \dots \right]$
7.  $J_{\frac{1}{2}}(x) = \sqrt{\frac{2}{\pi x}} \sin x$
8.  $J_{-\frac{1}{2}}(x) = \sqrt{\frac{2}{\pi x}} \cos x.$

### LINEARITY PROPERTY

**Theorem 1.**  $H \{f(x) + g(x)\} = H \{f(x)\} + H \{g(x)\}$

$$\begin{aligned}
 \text{Proof. } H \{f(x) + g(x)\} &= \int_0^\infty x \{f(x) + g(x)\} J_n(sx) dx \\
 &= \int_0^\infty x f(x) J_n(sx) dx + \int_0^\infty x g(x) J_n(sx) dx \\
 &= H \{f(x)\} + H \{g(x)\}
 \end{aligned}
 \quad \text{Proved.}$$

**Theorem 2.**  $H \{f(ax)\} = a^{-2} H \left( \frac{s}{a} \right)$  (Similarity Theorem)

**Proof.** We know that

$$\begin{aligned}
 H\{f(ax)\} &= \int_0^\infty x f(ax) J_n(sx) dx \\
 &= \int_0^\infty (ax) f(ax) J_n\left(\frac{s}{a} ax\right) d(ax) \cdot \frac{1}{a^2} = \frac{1}{a^2} \int_0^\infty t f(t) J_n\left(\frac{s}{a} t\right) dt \quad (\text{Putting } t = ax) \\
 &= a^{-2} H\left(\frac{s}{a}\right)
 \end{aligned}$$

**Proved.**

**Example 4.** Find the Hankel transform of the function

$$f(x) = \begin{cases} 1 & 0 < x < a, n = 0 \\ 0 & x > a, n = 0 \end{cases}$$

**Solution.** Let  $H(s)$  be the Hankel Transform of  $f(x)$ .

$$\begin{aligned}
 H(s) &= \int_0^\infty f(x) x J_0(sx) dx = \int_0^a 1 \cdot x J_0(sx) dx + \int_a^\infty 0 \cdot x J_0(sx) dx \\
 &= \int_0^a x J_0(sx) dx + 0 = \int_0^a x J_0(sx) dx = \left[ \frac{x}{s} J_1(sx) \right]_0^a = \frac{a}{s} J_1(as) \quad \text{Ans.}
 \end{aligned}$$

**Example 5.** Find the Hankel Transform of the function

$$f(x) = \begin{cases} x^n, & 0 < x < a, n > -1 \\ 0, & x > a, n > -1 \end{cases}$$

**Solution.** Let  $H(s)$  be the Hankel Transform of  $f(x)$ .

$$\begin{aligned}
 H(s) &= \int_0^\infty f(x) x J_n(sx) dx = \int_0^a x^n \cdot x J_n(sx) dx + \int_a^\infty 0 \cdot x J_n(sx) dx \\
 &= \int_0^a x^{n+1} J_n(sx) dx = \left[ \frac{x^{n+1}}{s} J_{n+1}(sx) \right]_0^a = \frac{a^{n+1}}{s} J_{n+1}(as) \quad \text{Ans.}
 \end{aligned}$$

**Example 6.** Find the Hankel Transform

$$f(x) = \begin{cases} a^2 - x^2, & 0 < x < a \quad n = 0 \\ 0, & x > a \quad n = 0 \end{cases}$$

**Solution.** Let  $H(s)$  be the Hankel transform of  $f(x)$ .

$$\begin{aligned}
 H(s) &= \int_0^\infty f(x) x J_n(sx) dx = \int_0^a (a^2 - x^2) \cdot x J_0(sx) dx + \int_a^\infty 0 \cdot x J_0(sx) dx \\
 &= \int_0^a (a^2 - x^2) x J_0(sx) dx = a^2 \int_0^a x J_0(sx) dx - \int_0^a x^3 J_0(sx) dx \quad \dots (1)
 \end{aligned}$$

Let us find out the above two integrals

$$a^2 \int_0^a x J_0(sx) dx = a^2 \left[ \frac{x}{s} J_1(sx) \right]_0^a = a^2 \frac{a}{s} J_1(as) = \frac{a^3}{s} J_1(as) \quad \dots (2)$$

$$\int_0^a x^3 J_0(sx) dx = \frac{4a^3}{s} J_1(as) - \frac{2a^2}{s^2} J_2(as) \quad \dots (3)$$

(See Example 2 on page 1245)

On putting these values from (2) and (3) in (1), we get

$$H(s) = \frac{a^3}{s} J_1(as) - \frac{a^3}{s} J_1(as) + \frac{2a^2}{s^2} J_2(as) = \frac{2a^2}{s^2} J_2(as)$$

$$= \frac{2a^2}{s^2} \left[ \frac{2}{as} J_1(as) - J_0(as) \right] = \frac{4a^2}{s^3} J_1(as) - \frac{2a^2}{s^2} J_0(as)$$

**Example 7.** Find the Hankel transform of  $\frac{e^{-ax}}{x^2}$ ,  $n = 1$ .

**Solution.** Let  $H(s)$  be the Hankel Transform of  $f(x)$

$$\begin{aligned} \text{i.e., } H(s) &= \int_0^\infty f(x) \cdot x \cdot J_n(sx) dx = \int_0^\infty \frac{e^{-ax}}{x^2} \cdot x \cdot J_1(sx) dx \\ &= \int_0^\infty \frac{e^{-ax}}{x} \cdot J_1(sx) dx = \frac{(a^2 + s^2)^{\frac{1}{2}} - a}{s} \end{aligned} \quad \text{Ans.}$$

**Example 8.** Find the Hankel Transform of the function

$$\frac{e^{-ax}}{x}, \quad n = 0$$

**Solution.** Let  $H(s)$  be the Hankel Transform of this function  $f(x)$ .

$$\begin{aligned} \text{i.e. } H(s) &= \int_0^\infty f(x) \cdot x J_n(sx) dx = \int_0^\infty \frac{e^{-ax}}{x} \cdot x J_0(sx) dx \\ &= \int_0^\infty e^{-ax} \cdot J_0(sx) dx = (a^2 + s^2)^{\frac{-1}{2}} \end{aligned} \quad \text{Ans.}$$

**Example 9.** Show that if  $n = 0$ , the Hankel transform

$$H\left\{\frac{\sin ax}{x}\right\} = \begin{cases} 0 & \text{if } s > a \\ \frac{1}{\sqrt{a^2 - s^2}} & \text{if } 0 < s < a \end{cases} \quad (\text{U.P. III Semester, Summer 2002})$$

**Solution.**

$$\begin{aligned} H(s) &= \int_0^\infty f(x) dJ_n(sx) dx \\ H\left\{\frac{\sin ax}{x}\right\} &= \int_0^\infty \frac{\sin ax}{x} \cdot x J_0(sx) dx = \int_0^\infty \sin ax J_0(sx) dx \\ &= \text{Imaginary part of } \int_0^a -e^{-iax} J_0(sx) dx \\ &= \text{Imaginary part of } \left\{ -(i^2 a^2 + s^2)^{\frac{-1}{2}} \right\} \\ H\left(\frac{\sin ax}{x}\right) &= \text{Imaginary part of } \frac{-1}{\sqrt{s^2 - a^2}} \end{aligned}$$

**Case 1.**  $s > a$ ,  $H\left(\frac{\sin ax}{x}\right) = 0$

**Case 2.**  $0 < s < a$

$$\begin{aligned} H\left(\frac{\sin ax}{x}\right) &= \text{Imaginary part of } \frac{-1}{i\sqrt{a^2 - s^2}} \quad 0 < s < a \\ &= \text{Imaginary part of } \frac{i}{\sqrt{a^2 - s^2}} = \frac{1}{\sqrt{a^2 - s^2}} \end{aligned}$$

**Proved.**

**Example 10.** Find the Hankel transform of the function  $\frac{e^{-ax}}{x}$ ,  $n = 1$ .

**Solution.** Let  $H(s)$  be the Hankel Transform of the function  $f(x)$ .

$$\begin{aligned} \text{i.e. } H(s) &= \int_0^\infty f(x) \cdot x J_n(sx) dx = \int_0^\infty \frac{e^{-ax}}{x} \cdot x J_1(sx) (dx) \\ &= \int_0^\infty e^{-ax} \cdot J_1(sx) dx = \frac{1}{s} - \frac{a}{s(s^2 + a^2)^{1/2}} \end{aligned} \quad \text{Ans.}$$

**Example 11.** Find the Hankel Transform of  $e^{-ax}$ .  $n = 0$ .

**Solution.** Let  $H(s)$  be the Hankel transform of  $f(x)$ ,

$$\begin{aligned} H(s) &= \int_0^\infty f(x) \cdot x J_n(x) dx. \\ H(s) &= \int_0^\infty e^{-ax} \cdot x J_0(sx) dx = \frac{a}{(a^2 + s^2)^{3/2}} \end{aligned} \quad \text{Ans.}$$

**Example 12.** Find the Hankel transform of  $e^{-ax}$ ,  $n = 1$ .

**Solution.** Let  $H(s)$  be the Hankel Transform of  $f(x)$ .

$$\begin{aligned} H(s) &= \int_0^\infty f(x) \cdot x J_n(x) dx \\ \text{i.e. } H(s) &= \int_0^\infty e^{-ax} \cdot x J_1(sx) dx = s(a^2 + s^2)^{-3/2} \end{aligned} \quad \text{Ans.}$$

#### 45.4 INVERSION FORMULA FOR HANKEL TRANSFORM

If  $H(s)$  be the Hankel transform of the function  $f(x)$  for  $-\infty < x < \infty$

$$\text{i.e. } H(s) = \int_{-\infty}^\infty f(x) \cdot x J_n(sx) dx$$

$$\text{Then } f(x) = \int_{-\infty}^\infty H(s) \cdot s J_n(sx) ds$$

is said to be the inversion formula for the Hankel transform  $H(s)$  and we may write

$$f(x) = H^{-1}[H(s)]$$

We know that in Fourier transform

$$F(s, t) = \int_{-\infty}^\infty \int_{-\infty}^\infty f(s, y) e^{i(sx+ty)} dy dt \quad \dots(1)$$

$$\text{then } f(x, y) = \frac{1}{4\pi^2} \int_{-\infty}^\infty \int_{-\infty}^\infty F(s, t) e^{i(sx+ty)} ds dt$$

On putting  $x = r \cos \theta$ ,  $y = r \sin \theta$ ,  $(s = p \cos \alpha)$ ,  $t = p \sin \alpha$  in (1), we get

$$F(p, \alpha) = \frac{1}{4\pi^2} \int_0^\infty r dr \int_0^{2\pi} f(r, \theta) e^{ir p \cos(\theta-\alpha)} d\theta \quad \dots(2)$$

$$\text{and } f(r, \theta) = \frac{1}{4\pi^2} \int_0^\infty p dp \int_0^{2\pi} F(p, \alpha) e^{-ip p \cos(\theta-\alpha)} d\alpha \quad \dots(3)$$

On putting  $f(r) e^{-in\theta}$  for  $f(r, \theta)$  in (2), we get

$$F(p, \alpha) = \int_0^\infty f(r) r dr \int_0^{2\pi} e^{i\{-n\theta + pr \cos(\theta-\alpha)\}} d\theta \quad \dots(4)$$

In (4), we put

$$\phi = \alpha - \theta - \frac{\pi}{2}, \text{ we get}$$

$$\begin{aligned} F(p, \alpha) &= \int_0^\infty f(r) r dr \int_0^{2\pi} e^{i\{n(\phi + \frac{\pi}{2} - \alpha) + pr \cos(\phi + \frac{\pi}{2})\}} d\phi \\ &= \int_0^\infty f(r) r dr \cdot e^{in(\frac{\pi}{2} - \alpha)} \int_0^{2\pi} e^{i(n\phi - pr \sin \phi)} d\phi = \int_0^\infty f(r) r dr \cdot 2\pi e^{in(\frac{\pi}{2} - \alpha)} J_n(pr) dr \\ &\quad \therefore J_n(pr) = \frac{1}{2\pi} \int_0^{2\pi} e^{i(n\phi - pr \sin \phi)} d\phi \\ &= 2\pi e^{in(\frac{\pi}{2} - \alpha)} \int_0^\infty f(r) r J_n(pr) dr = 2\pi e^{in(\frac{\pi}{2} - \alpha)} F(p) \end{aligned} \quad \dots (5)$$

Putting

$$f(r, \theta) = f(r) e^{-in\theta} \text{ and using (3) and (5), we have}$$

$$\begin{aligned} f(r) e^{-in\theta} &= \frac{1}{4\pi^2} \int_0^\infty p \cdot dp \int_0^{2\pi} 2\pi e^{in(\frac{\pi}{2} - \alpha)} F(p) e^{-ipr \cos(\theta - \alpha)} d\alpha \\ &= \frac{1}{2\pi} \int_0^\infty p F(p) dp \int_0^{2\pi} e^{i\{n(\frac{\pi}{2} - \alpha) - pr \cos(\theta - \alpha)\}} d\alpha \end{aligned}$$

Substituting

$$\Psi = \theta - \alpha + \frac{\pi}{2},$$

$$\begin{aligned} f(r) e^{-in\theta} &= \frac{1}{2\pi} \int_0^\infty p F(p) dp \int_0^{2\pi} e^{i\{n(\Psi - \theta - pr \cos(\frac{\pi}{2} - \Psi))\}} d\Psi \\ &= \frac{1}{2\pi} \int_0^\infty p F(p) dp e^{-in\theta} \int_0^{2\pi} e^{i(n\Psi - pr \sin \Psi)} d\Psi \\ f(r) &= \frac{1}{2\pi} \int_0^\infty p F(p) dp \cdot 2\pi J_n(pr) dp \\ f(r) &= \int_0^\infty F(s) s J_n(sr) ds \end{aligned}$$

or  $f(x) = \int_0^\infty F(s) s J_n(sx) ds$

This is the required inversion formula.

**Example 13.** Find  $H^{-1}[e^{-as}]$ , when  $n = 0$ .

**Solution.**  $f(x) = \int_0^\infty s H(s) J_0(sx) ds = \int_0^\infty s e^{-as} J_0(sx) ds = \frac{a}{(a^2 + x^2)^{3/2}}$  **Ans.**

**Example 14.** Find  $H^{-1}[s^{-2} e^{-as}]$  when  $n = 1$ .

**Solution.**  $H^{-1}[s^2 e^{-as}] = \int_0^\infty s H(s) J_1(sx) ds = \int_0^\infty s^{-2} e^{-as} s J_1(sx) ds$

$$\begin{aligned} &= \int_0^\infty \frac{1}{s} e^{-as} J_1(sx) ds \\ &= \frac{(a^2 + x^2)^{-\frac{1}{2}} - a}{x} \end{aligned} \quad \text{Ans.}$$

### 45.5 PARSIVAL'S THEOREM FOR HANKEL TRANSFORM

Let  $F(s)$  and  $G(s)$  be the Hankel Transforms of the functions  $f(x)$  and  $g(x)$ . Then

$$\int_0^\infty x \cdot f(x) \cdot g(x) dx = \int_0^\infty s F(s) \cdot G(s) ds$$

**Proof:** On putting the value of  $G(s)$  in  $\int_0^\infty s F(s) \cdot G(s) ds$ , we get

$$\begin{aligned} \int_0^\infty s \cdot F(s) \cdot G(s) ds &= \int_0^\infty s \cdot F(s) ds \int_0^\infty g(x) \cdot x \cdot J_n(sx) dx \\ &= \int_0^\infty x \cdot g(x) dx \int_0^\infty s F(s) \cdot J_n(sx) ds \quad (\text{On changing the order of integration}) \\ &= \int_0^\infty x \cdot g(x) dx \cdot f(x). \end{aligned}$$

**Proved.**

### 45.6 HANKEL TRANSFORMATION OF THE DERIVATIVE OF A FUNCTION

$$H\left\{\frac{df}{dx}\right\}_n = -s \left[ \frac{n+1}{2n} H\{f(x)\}_{n-1} - \frac{n-1}{2n} H_{n+1}\{f(x)\} \right]$$

**Proof.** If  $H(s)$  be the Hankel transformation of order  $n$  of  $f(x)$

i.e.  $H(s) = \int_0^\infty x f(x) J_n(sx) dx$ , then the Hankel transformation of  $\frac{df}{dx}$  is

$$H\left\{\frac{df}{dx}\right\}_n = \int_0^\infty x \frac{df}{dx} J_n(sx) dx$$

On integrating by parts, we get

$$= [x f(x) \cdot J_n(sx)]_0^\infty - \int_0^\infty f(x) \frac{d}{dx} [x J_n(sx)] dx = 0 - \int_0^\infty f(x) [1 \cdot J_n(sx) + xsJ'(sx)] dx \quad \dots(1)$$

Assuming that  $x f(x) \rightarrow 0$  and  $x \rightarrow 0, x \rightarrow \infty$

Putting  $sx J'_n(sx) = sx J_{n-1}(sx) - n J_n(sx)$  in (1), we get

$$\begin{aligned} &= - \int_0^\infty f(x) J_n(sx) dx - \int_0^\infty f(x) \{xs J_{n-1}(sx) - n J_n(sx)\} dx \\ &= (n-1) \int_0^\infty f(x) J_n(sx) dx - s \int_0^\infty x f(x) J_{n-1}(sx) dx \\ &= (n-1) \int_0^\infty f(x) J_n(sx) dx - s H_{n-1}(s) \end{aligned}$$

The recurrence relation (4) is

$$2n J_n(x) = x J_{n-1}(x) + x J_{n+1}(x)$$

On replacing  $x$  by  $sx$ , we get

$$\begin{aligned} 2n J_n(x) &= sx J_{n-1}(x) + sx J_{n+1}(x) \\ 2n \int_0^\infty f(x) J_n(sx) dx &= s \left[ \int_0^\infty x f(x) J_{n-1}(sx) dx + \int_0^\infty sx f(x) J_{n+1}(sx) dx \right] \\ &= s H_{n-1}(s) + s H_{n+1}(s) \\ \Rightarrow \int_0^\infty f(x) J_n(sx) dx &= \frac{s}{2n} H_{n-1}(s) + \frac{s}{2n} H_{n+1}(s) \end{aligned} \quad \dots(2)$$

On putting the value of  $\int_0^\infty f(x) J_n(sx) dx$  from (2) in (1), we get

$$H_n\left\{\frac{df}{dx}\right\} = s \left[ \frac{n-1}{2n} H_{n-1}(s) + \frac{n-1}{2n} H_{n+1}(s) \right] - s H_{n-1}(s)$$

$$H_n\left(\frac{df}{dx}\right) = -s \left[ \frac{n+1}{2n} H_{n-1}(s) - \frac{n-1}{2n} H_{n+1}(s) \right] \quad \dots (3)$$

This is the required formula for the Hankel transform of  $\frac{df}{dx}$ .

**Proved.**

On replacing  $n$  by  $n-1$  in (3), we get

$$H_{n-1}\left(\frac{df}{dx}\right) = -s \left[ \frac{n}{2(n-1)} H_{n-2}(s) - \frac{n-2}{2(n-1)} H_n(s) \right] \quad \dots (4)$$

Putting  $(n+1)$  for  $n$  in (3) we get

$$H_{n+1}\left(\frac{df}{dx}\right) = -s \left[ \frac{n+2}{2(n+1)} H_n(s) - \frac{n}{2(n+1)} H_{n+2}(s) \right] \quad \dots (5)$$

From (3), (4), (5) and replacing  $\frac{df}{dx}$  by  $\frac{d^2f}{dx^2}$ , we have

$$H_n\left(\frac{d^2f}{dx^2}\right) = -s \left[ \frac{n+1}{2n} H_{n-1}\left(\frac{df}{dx}\right) - \frac{n-1}{2n} H_{n+2}\left(\frac{df}{dx}\right) \right] \quad \dots (6)$$

$$= \frac{s^2}{4} \left[ \frac{n+1}{n-1} H_{n-2}(s) - 2 \frac{n^2-3}{n^2-1} H_n(s) + \frac{n-1}{n+1} H_{n+2}(s) \right] \quad \dots (7)$$

**Corollary.** Putting  $n = 1, 2, 3$  in (3), we get

$$H_1\left(\frac{df}{dx}\right) = -s H_0(s)$$

$$H_2\left(\frac{df}{dx}\right) = -s \left( \frac{3}{4} H_1(s) - \frac{1}{4} H_3(s) \right)$$

$$H_3\left(\frac{df}{dx}\right) = -s \left[ \frac{2}{3} H_2(s) - \frac{1}{3} H_4(s) \right]$$

**Example 15.** Find Hankel Transforms of the following

$$(a) \frac{d^2f}{dx^2} \qquad (b) \frac{d^2f}{dx^2} + \frac{1}{x} \frac{df}{dx} \qquad (c) \frac{d^2f}{dx^2} + \frac{1}{x} \frac{df}{dx} - \frac{n^2}{x^2} f$$

**Solution.**

$$(a) H\left\{\frac{d^2f}{dx^2}\right\} = \int_0^\infty \frac{d^2f}{dx^2} \cdot x J_n(sx) dx \text{ Integrating by parts, we get}$$

$$= \left[ \frac{df}{dx} x J_n(sx) \right]_0^\infty - \int_0^\infty \frac{df}{dx} \cdot \frac{d}{dx} [x J_n(sx)] dx$$

Putting  $x f(x) \rightarrow 0$  where  $x \rightarrow 0$  or  $x \rightarrow \infty$

$$H\left\{\frac{d^2f}{dx^2}\right\} = 0 - \int_0^\infty \frac{df}{dx} [J_n(sx) + sx J'_n(sx)] dx$$

$$\int_0^\infty x \frac{d^2f}{dx^2} \cdot J_n(sx) dx = \int_0^\infty x \frac{d^2f}{dx^2} \cdot J_n(sx) dx$$

$$(b) \int_0^\infty x \left[ \frac{d^2f}{dx^2} + \frac{1}{x} \frac{df}{dx} \right] J_n(sx) dx = -s \int_0^\infty \frac{df}{dx} \cdot x J'_n(sx) dx$$

$$= -s [f(x) \cdot x J'_n(sx)]_0^\infty - \int_0^\infty f(x) \frac{d}{dx} \{x J'_n(sx)\} dx = s \int_0^\infty f(x) \frac{d}{dx} \{x J'_n(sx)\} dx$$

$\therefore x f(x) \rightarrow 0$  as  $x \rightarrow 0$  or  $x \rightarrow \infty$

But  $J_n(sx)$  is the solution of Bessel's differential equation, so it satisfies Bessel's equation

$$\begin{aligned}\frac{d}{dx} \left( x \frac{dy}{dx} \right) + \left( 1 - \frac{n^2}{x^2} \right) xy = 0 \\ \frac{d}{dx} \left[ x \frac{dy}{dx} J_n(x) \right] + \left( 1 - \frac{n^2}{x^2} \right) x J_n(x) = 0\end{aligned}$$

On replacing  $x$  by  $sx$  we get

$$\begin{aligned}\frac{1}{s} \frac{d}{dx} [sx J'_n(sx)] &= - \left( s^2 - \frac{n^2}{x^2} \right) \frac{x}{s^2} \\ \frac{d}{dx} [x J'_n(sx)] &= - \left( s^2 - \frac{n^2}{x^2} \right) \frac{x}{s} J_n(sx)\end{aligned}$$

On putting the value of  $\frac{d}{dx} [x J'_n(sx)]$  in (1) we get

$$\begin{aligned}\int_0^\infty \left[ \frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx} \right] x J_n(sx) dx &= -s \int_0^\infty f(x) \left( s^2 - \frac{n^2}{x^2} \right) \frac{x}{s} J_n(sx) dx \\ (\text{c}) \int_0^\infty \left[ \frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx} - \frac{n^2}{x^2} f \right] x J_n(sx) dx &= -s^2 \int_0^\infty f(x) x J_n(sx) dx = -s^2 H(s) \quad \dots (2)\end{aligned}$$

**Deduction I.** On putting  $n = 0$  in (2), we get

$$\int_0^\infty x \left( \frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx} \right) J_0(sx) dx = -s^2 H_0(s)$$

**Deduction II.** On putting  $n = 1$  in (2), we get

$$\int_0^\infty x \left( \frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx} - \frac{f}{x^2} \right) J_1(sx) dx = -s^2 H_1(s)$$

$$\text{or } \int_0^\infty x \frac{df}{dx} J_1(sx) = -s H_0(s) \text{ where } H_0(s) = \int_0^\infty x f(x) J_0(sx) dx$$

**Example 16.** Find  $H \left\{ \frac{\partial}{\partial x} \left( \frac{e^{-ax}}{x} \right) \right\}$  when  $n = 1$

$$\begin{aligned}\text{Solution. } H \left\{ \frac{\partial f}{\partial x} \right\} &= \int_0^\infty x \frac{df}{dx} J_1(sx) dx = -s H_0(s) = -s \int_0^\infty x f(x) J_0(sx) dx \\ &= -s \int_0^\infty x \left( \frac{e^{-ax}}{x} \right) J_0(sx) dx = -s \int_0^\infty e^{-ax} J_0(sx) dx = \frac{-s}{(a^2 + s^2)^{\frac{1}{2}}} \quad \text{Ans.}\end{aligned}$$

**Example 17.** Evaluate  $H \left\{ \frac{\partial^2}{\partial t^2} f(x, t) \right\}$ .

$$\begin{aligned}\text{Solution. } 1 + \left\{ \frac{\partial^2}{\partial t^2} f(x, t) \right\} &= \int_0^\infty x \frac{\partial^2 f}{\partial t^2} J_n(sx) dx = \frac{\partial^2}{\partial t^2} \int_0^\infty x f(x, t) J_n(sx) dx \\ &= \frac{\partial^2}{\partial t^2} H \{f(p, t)\} \quad \text{Ans.}\end{aligned}$$

**Example 18.** Find  $H \left\{ \frac{d^2(e^{-ax})}{dx^2} + \frac{1}{x} \frac{d(e^{-ax})}{dx} \right\}$ , when  $n = 0$ .

$$\begin{aligned}\text{Solution. } H \left\{ \frac{d^2(e^{-ax})}{dx^2} + \frac{1}{x} \frac{d(e^{-ax})}{dx} \right\} &= \int_0^\infty \left\{ \frac{d^2(e^{-ax})}{dx^2} + \frac{1}{x} \frac{d(e^{-ax})}{dx} \right\} x J_0(sx) dx \\ &= -s^2 H_0(s) \\ &= -s^2 \int_0^\infty e^{-ax} J_0(sx) dx = \frac{-s^2}{(a^2 + s^2)^{\frac{1}{2}}} \quad \text{Ans.}\end{aligned}$$

### Application of Hankel Transform to Boundary problems

**Example 19.** The magnetic potential  $V$  for a circular disc of radius  $a$  and strength  $w$ , magnetised parallel to its axis, satisfying Laplace's equation is equal to  $2\pi w$  on the disc itself and vanishes at its exterior points in the plane of the disc. Show that at the points  $(r, z)$ ,  $z > 0$ .

$$V = 2\pi w \int_0^\infty e^{-sz} J_0(sr) J_1(sa) ds.$$

**Solution.** The magnetic potential  $V$  satisfies the Laplace's equation.

$$\frac{\partial^2 V}{\partial r^2} + \frac{1}{r} \frac{\partial V}{\partial r} + \frac{\partial^2 V}{\partial z^2} = 0, \quad \dots (1) \quad 0 < r < \infty$$

Boundary conditions are

$$V = 2\pi w, \quad 0 \leq r < a, z = 0 \quad \text{and} \quad V = 0, \quad r > a, z = 0.$$

Taking Hankel transform of (1), we have

$$\begin{aligned}\int_0^\infty \left( \frac{\partial^2 V}{\partial r^2} + \frac{1}{r} \frac{\partial V}{\partial r} \right) r J_0(sr) dr + \int_0^\infty \frac{\partial^2 V}{\partial z^2} r J_0(sr) dr &= 0 \\ -s^2 H_0(V) + \frac{d^2}{dz^2} H_0(V) &= 0 \quad \text{where } H_0(V) = \int_0^\infty V \cdot r J_0(sr) dr \\ D^2 H_0(V) - s^2 H_0(V) &= 0 \Rightarrow (D^2 - s^2) H_0(V) = 0\end{aligned}$$

Its solution

$$H_0(V) = Ae^{sz} + Be^{-sz} \quad \dots (2)$$

And

$$\begin{aligned}H_0(V)_{z=0} &= \int_0^a (V)_{z=0} \cdot r J_0(sr) dr + \int_a^\infty (V)_{z=0} r J_0(sr) dr \\ &= \int_0^a 2\pi w r J_0(sr) dr + 0 = 2\pi w \int_0^a \frac{1}{s} \frac{d}{dr} (r J_1(sr)) dr \\ &= \frac{2\pi wa}{s} J_1(sa)\end{aligned} \quad \dots (3)$$

Putting the values of  $H_0(V) = 0$  and  $z = \infty$  in (2), we get

$$0 = Ae^{s\infty} \Rightarrow A = 0$$

So (2) reduces to

$$H_0(V) = Be^{-sz} \quad \dots (4)$$

On putting the value of  $H_0(V)$  from (4) and  $z = 0$  in (3), we get  $\frac{2\pi wa}{s} J_1(sa) = B$

On substituting the value of  $B$  in (4), we have  $H_0(V) = \frac{2\pi wa}{s} J_1(sa) e^{-sz}$

By inversion formula, we get  $V(r, z) = 2\pi wa \int_0^\infty e^{-sz} J_0(sr) J_1(as) ds$

**Ans.**

**Example 20.** Find the potential  $V(r, z)$  of a field due to a flat circular disc of unit radius with centre at origin and axis along  $z$ -axis, satisfying the differential equation

$$\frac{\partial^2 V}{\partial r^2} + \frac{1}{r} \frac{\partial V}{\partial r} + \frac{\partial^2 V}{\partial z^2} = 0,$$

$$0 \leq r \leq \infty, \quad z \geq 0 \quad \text{and}$$

$$(i) \quad V = V_0 \quad \text{when } z = 0, \quad 0 \leq r < 1$$

$$(ii) \quad \frac{\partial V}{\partial z} = 0 \quad \text{when } z = 0, \quad r > 1.$$

**Solution.**  $\frac{\partial^2 V}{\partial r^2} + \frac{1}{r} \frac{\partial V}{\partial r} + \frac{\partial^2 V}{\partial z^2} = 0 \quad \dots (1)$

Taking Hankel Transform of (1), we get

$$\begin{aligned} & \int_0^\infty \left( \frac{\partial^2 V}{\partial r^2} + \frac{1}{r} \frac{\partial V}{\partial r} \right) r J_0(sr) dr + \int_0^\infty \frac{\partial^2 V}{\partial z^2} r J_0(sr) dr = 0 \\ \Rightarrow & -s^2 H_0(V) + \frac{\partial^2}{\partial z^2} \int_0^\infty V r J_0(sr) dr = 0 \quad \Rightarrow \quad -s^2 H_0(V) + \frac{\partial^2}{\partial z^2} H_0(V) = 0 \\ \Rightarrow & \frac{d^2 H_0(V)}{dz^2} - s^2 H_0(V) = 0 \quad \Rightarrow \quad (D^2 - s^2) H_0(v) = 0 \end{aligned}$$

$$\text{A.t.} \quad D^2 - s^2 = 0 \quad \Rightarrow \quad D = \pm s$$

$$H_0(V) = A e^{sz} + B e^{-sz} \quad \dots (2)$$

On putting  $z = \infty$ ,  $H_0(v) = 0$  (as  $V = 0$ ) in (2), we get  $0 = A e^{\infty s} + 0 \Rightarrow A = 0$

$$\text{On putting } A = 0 \text{ in (2), we have } H_0(v) = B e^{-sz} \quad \dots (3)$$

Applying inversion formula to get  $V$

$$V(r, z) = \int_0^\infty B(s) e^{-sz} s J_0(sr) ds \quad \dots (4)$$

On putting  $z = 0$  in (4), we have

$$V(r, 0) = \int_0^\infty s B(s) J_0(sr) ds = V_0 \quad 0 \leq r \leq 1$$

On differentiating (4), w.r.t. 'z', we obtain

$$\left( \frac{\partial V}{\partial z} \right) = \int_0^\infty B(s) (-s e^{-sz}) s J_0(sr) ds \quad \dots (5)$$

On putting  $z = 0$  in (5), we get

$$\left( \frac{\partial V}{\partial z} \right)_{z=0} = \int_0^\infty -s^2 B(s) J_0(sr) ds = 0, \quad r > 1 \quad \dots (6)$$

On comparing (4) and (5), we get

$$\int_0^\infty J_0(sr) \frac{\sin s}{s} ds = \frac{\pi}{2}, \quad 0 \leq r \leq 1 \quad \text{and}$$

$$\int_0^\infty J_0(sr) \sin s ds = 0 \quad r > 0$$

$$B(s) = \frac{2}{\pi} V_0 \frac{\sin s}{s}$$

Hence, the required solution is

$$V(r, z) = \frac{2V_0}{\pi} \int_0^\infty e^{-sz} \frac{\sin s}{s} J_0(sr) ds$$

### 45.7 FINITE HANKEL TRANSMISSION FORMATION

If  $f(x)$  be a function satisfying Dirichlet conditions in the interval  $(0, a)$  then the

$$f(x) = \frac{2}{a^2} \sum_{i=0}^{\infty} H(si) \frac{J_n(s_i x)}{[J'_n(sia)]^2}, \text{ where } H_{(si)} = \int_0^a x f(x) J_n(s_i x) dx$$

Where  $si$  is a root of the equation  $J_n(S_i a) = 0$

The upper limit  $a$  is generally converted to 1 by suitable transformation. All the roots of  $J_n(s_i)$  are real and distinct.

#### Particular case

If  $n = 0$  and  $a = 1$ , then  $J'_0(x) = -J_1(x)$

The inversion formula reduces to

$$f(x) = 2 \sum H(si) \frac{J_0(s_i x)}{[J_1(s_i)]^2}$$

Where  $si$  are the roots of  $J_0(si) = 0$

#### General Form

$$f(x) = \sum_{i=0}^{\infty} C_i J_n(s_i x), \quad 0 \leq x \leq a$$

$$\text{where } C_i = \frac{2}{a^2 J_{n+1}^2(s_i a)} \int_0^a x f(x) J_n(s_i x) dx = \frac{2H(si)}{a^2 [J_{n+1}(sia)]^2} = \frac{2H(si)}{a^2 [J'_n(sia)]^2}$$

$$\text{so } f(x) = \frac{2}{a^2} \sum_{i=0}^{\infty} H(si) \frac{J_n(s_i x)}{[J'_n(sia)]^2}$$

If  $a = 1$ , then

$$f(x) = 2 \sum_{i=0}^{\infty} H(si) \frac{J_n(s_i x)}{J_n'^2(s_i)}$$

and

$$\sum J_n(s_i) = 0$$

### 45.8 ANOTHER FORM OF HANKEL TRANSFORM

If origin is not included in the interval and  $f(x)$  satisfies the Dirichlets condition  $0 < b \leq x \leq a$ ,

then

$$[H_n(x) = J_n(x) + iY_n(x)]$$

$$H(six) = \int_a^b x f(x) [J_n(s_i x) Y_n(s_i a) - Y_n(s_i a) J_n(s_i x)] dx$$

Where  $Y_n$  is the Bessel function of order  $n$  of second kind and  $si$  is the root of the equation

$$J_n(s_i a) Y_n(s_i b) - J_n(s_i b) Y_n(s_i a) = 0$$

#### Inversion formula

$$f(x) = \sum \frac{2s_i^2 J_n^2(s_i a) H(s_i)}{J_n^2(s_i b) - J_n^2(s_i a)} [J_n(s_i x) Y_n(s_i b) - J_n(s_i b) Y_n(s_i a)]$$

**Example 21.** Find  $f(x)$  if  $H\{f(x)\} = \frac{c}{s} J_1(sa)$ ,  $s$  being the root of  $J_0(s\alpha)$ .

**Solution.** We know the inversion formula.

$$\begin{aligned} f(x) &= \frac{2}{a^2} \sum_{i=0}^{\infty} H_n(s) \frac{J_n(sx)}{[J'_n(sa)]^2} = \frac{2}{a} \sum \frac{c}{s} J_1(sa) \frac{J_0(sx)}{[J'_0(sa)]^2} \\ &= \frac{2}{a} \sum \frac{c}{s} \frac{J_1(sa) J_0(sx)}{[J_1(sa)]^2} \quad [J'_0(x) = -J_1(x)] \quad = \frac{2}{a^2} \sum \frac{c}{s} \frac{J_n(sx)}{J_1(sa)} \quad \text{Ans.} \end{aligned}$$

**Example 22.** Show that  $\int_0^a x J_0(sx) dx = J_1(as) \cdot \left(\frac{a}{s}\right)$

**Solution.** We know that

$$\frac{d}{dx}[x^n J_n(x)] = x^n J_{n-1}(x) \quad \dots(1) \quad [\text{Recurrence Relation}]$$

Replacing  $x$  by  $sx$  and putting  $n = 1$  in (1), we get

$$\begin{aligned} \frac{1}{s} \frac{d}{dx}[sx J_1(sx)] &= x J_0(sx), \quad \frac{1}{s} \frac{d}{dx}[x J_1(sx)] = x J_0(sx) \\ \text{or} \quad \frac{1}{s} [x J_1(sx)]_0^a &= \int_0^a x J_0(sx) dx \\ \therefore \quad \frac{a}{s} J_1(sa) &= \int_0^a x J_0(sx) dx \quad \text{Proved.} \end{aligned}$$

**Example 23.** Find  $H(x^{n-1})$ ,  $n > 0$  and  $x J_{n-1}(sx)$  is the kernel of the transform.

$$\begin{aligned} \text{Solution.} \quad H(x^{n-1}) &= \int_0^a x^{n-1} \cdot x J_{n-1}(s_i x) dx = \int_0^a x^n J_{n-1}(s_i x) dx \\ &= \frac{1}{s_i} \int_0^a \frac{d}{dx}[x^n J_n(s_i x)] dx = \frac{1}{s_i} [x^n J_n(s_i x)]_0^a = \frac{1}{s_i} a^n J_n(s_i a) \quad \text{Ans.} \end{aligned}$$

**Example 24.** Find  $H[x^n]$ ,  $n > -1$  and  $x J_n(s_i x)$  is the kernel of the transform.

$$\begin{aligned} \text{Solution.} \quad H(x^n) &= \int_0^a x^n x J_n(s_i x) dx = \int_0^a x^{n+1} J_n(s_i x) dx \\ &= \int_0^a \left[ \frac{1}{s_i} \frac{d}{dx} x^{n+1} J_{n+1}(s_i x) \right] dx = \left[ \frac{1}{s_i} x^{n+1} J_{n+1}(s_i x) \right]_0^a = \frac{a^{n+1}}{s_i} J_{n+1}(s_i a) \quad \text{Ans.} \end{aligned}$$

**Example 25.** Show that

$$\int_0^a x^3 J_0(sx) dx = \frac{a^2}{s^2} [2 J_0(sa) + \left( as - \frac{4}{as} \right) J_1(as)]$$

**Solution.** We know that

$$\frac{d}{dx}[x^n J_n(x)] = x^n J_{n-1}(x) \quad \dots(1) \quad (\text{Recurrence Relation})$$

Replacing  $x$  by  $sx$  and putting  $n = 1$  in (1), we get

$$\begin{aligned} \frac{1}{s} \frac{d}{dx}[x J_1(sx)] &= x J_0(sx) \\ \text{Now} \quad \int_0^a x^3 J_0(sx) dx &= \int_0^a x^2 \cdot x J_0(sx) dx = \int_0^a x^2 \left[ \frac{1}{s} \frac{d}{dx}[x J_1(sx)] \right] dx \end{aligned}$$

Integrating by parts, we get

$$\begin{aligned}
 &= \left[ x^2 \cdot \frac{1}{s} x J_1(sx) \right]_0^a - \int_0^a \frac{2x}{s} \cdot x J_1(sx) dx = \frac{a^3}{s} J_1(sa) - \frac{2}{s} \int_0^a x^2 J_1(sx) dx \\
 &= \frac{a^3}{s} J_1(sa) - \frac{2}{s} \int_0^a \frac{1}{s} \left[ \frac{d}{dx} (x^2 J_1(sx)) \right] dx = \frac{a^3}{s} J_1(sa) - \frac{2}{s^2} \left[ x^2 J_2(sx) \right]_0^a \\
 &= \frac{a^3}{s} J_1(sa) - \frac{2a^2}{s^2} J_2(as)
 \end{aligned} \quad \dots (2)$$

$$\text{We also know that } \frac{2n}{x} J_n(x) = J_{n-1}(x) + J_{n+1}(x) \quad (\text{Recurrence Relation}) \dots (3)$$

Replacing  $x$  by  $sa$  and putting  $n = 1$  in (3), we get

$$\begin{aligned}
 \frac{2}{sa} J_1(sa) &= J_0(sa) + J_2(sa) \\
 \Rightarrow J_2(sa) &= \frac{2}{sa} J_1(sa) - J_0(sa)
 \end{aligned}$$

Substituting the value of  $J_2(sa)$  in (2), we get

$$\begin{aligned}
 \int_0^a x^3 J_0(sx) dx &= \frac{a^3}{s} J_1(sa) - \frac{2a^2}{s^2} \left[ \frac{2}{sa} J_1(sa) - J_0(sa) \right] \\
 &= \frac{a^3}{s} J_1(sa) - \frac{4a}{s^3} J_1(sa) + \frac{2a^2}{s^2} J_0(sa) = \left[ \frac{a^3}{s} - \frac{4a}{s^3} \right] J_1(sa) + \frac{2a^2}{s^2} J_0(sa) \\
 &= \frac{a^2}{s^2} \left[ 2J_0(as) + \left( as - \frac{4}{as} \right) J_1(as) \right]
 \end{aligned} \quad \text{Proved.}$$

**Example 26.** Find  $H[1-x^2]$ ,  $x J_0(sx)$  being the kernel.

$$\begin{aligned}
 \text{Solution. } H_0(1-x^2) &= \int_0^a (1-x^2) \cdot x J_0(sx) dx = \int_0^a x J_0(sx) dx - \int_0^a x^3 J_0(sx) dx \\
 &= \left[ \frac{x}{s} J_1(sx) \right]_0^a - \frac{a^2}{s^2} [2J_0(sa) + \left( as - \frac{4}{as} \right) J_1(a)] = \frac{a}{s} J_1(as) - \frac{a^2}{s^2} [2J_0(sa) + (as - \frac{4}{as}) J_1(a)]
 \end{aligned} \quad \text{Ans.}$$

**Example 27.** Prove that the finite Hankel transform of  $\frac{2^{1+n-m}}{m-n} x^n (1-x^2)^{m-n-1}$  is  $s^{n-m} J_m(s)$ , for  $0 \leq x < 1$ .

$$\begin{aligned}
 \text{Solution. We know that } H[f(x)] &= \int_0^a f(x) \cdot x J_n(sx) dx \\
 H\left[ \frac{2^{1+n-m}}{m-n} x^n (1-x^2)^{m-n-1} \right] &= \int_0^1 \frac{2^{1+n-m}}{m-n} x^n (1-x^2)^{m-n-1} \cdot x J_n(sx) dx \\
 &= \int_0^1 \frac{2^{1+n-m}}{m-n} x^n (1-x^2)^{m-n-1} \cdot x \sum_{r=0}^{\infty} \frac{(-1)^r}{[r(n+r+1)]} \left( \frac{sx}{2} \right)^{n+2r} dx \\
 &= \frac{1}{m-n} \sum_{r=0}^{\infty} \frac{(-1)^r s^{n+2r}}{[r(n+r+1)] 2^{-1+m+2r}} \int_0^1 x^{2(n+r)} (1-x^2)^{m-n-1} \cdot x dx
 \end{aligned}$$

[Put  $x^2 = t$ ,  $2x dx = dt$  ]

$$\begin{aligned}
&= \frac{1}{m-n} \sum_{r=0}^{\infty} \frac{(-1)^s s^{n+2r}}{[r n+r+1 2^{m+2r}] \int_0^1 t^{(n+r+1)-1} (1-t)^{(m-n)-1} dt} \\
&= \frac{1}{m-n} \sum_{r=0}^{\infty} \frac{(-1)^r s^{n+2r}}{[r n+r+1 2^{m+2r}] \frac{n+r+1 m-n}{n+r+1+m-n}} \quad \int_0^a t^{m-1} (1-t)^{n-1} dt = \frac{m n}{m+n} \\
&= s^{n-m} \sum_{r=0}^{\infty} \frac{(-1)^r}{m+r+1} \left(\frac{s}{2}\right)^{m+2r} = (s)^{n-m} J_m(s) \quad \text{Proved.}
\end{aligned}$$

**Example 28.** Find  $H_n \left[ \frac{J_n(\alpha x)}{J_n(\alpha)} \right]$ .

**Solution.** We know that  $J_n(\alpha x)$  and  $J_n(sx)$  are the solutions of Bessel's equation.

$$\therefore x^2 \frac{d^2}{dx^2} J_n(\alpha x) + x \frac{d}{dx} J_n(\alpha x) + (\alpha^2 x^2 - n^2) J_n(\alpha x) = 0 \quad \dots (1)$$

$$x^2 \frac{d^2}{dx^2} J_n(sx) + x \frac{d}{dx} J_n(sx) + (s^2 x^2 - n^2) J_n(sx) = 0 \quad \dots (2)$$

Multiplying (1) by  $J_n(sx)$ , (2) by  $J_n(\alpha x)$  and subtracting, we get

$$(\alpha^2 - s^2) x J_n(\alpha x) J_n(sx) = \frac{d}{dx} \left[ x \left\{ J_n(\alpha x) \frac{d}{dx} J_n(sx) - J_n(sx) \frac{d}{dx} J_n(\alpha x) \right\} \right]$$

Integrating with respect to  $x$  from 0 to 1 and using  $J_n(s) = 0$ , we get

$$\begin{aligned}
&(\alpha^2 - s^2) \int_0^1 x J_n(\alpha x) J_n(sx) dx = s \left[ x \left\{ J_n(\alpha x) J'_n(sx) - J_n(sx) J'_n(\alpha x) \right\} \right]_0^1 \\
&\quad = s [J_n(\alpha) J'_n(s) - J_n(s) J'_n(\alpha)] \\
&\quad = s J_n(\alpha) J'_n(s) \quad (J_n(s) = 0) \\
\Rightarrow & \int_0^1 \frac{J_n(\alpha x)}{J_n(\alpha)} \cdot x J_n(sx) dx = \frac{s}{\alpha^2 - s^2} J'_n(s) \\
&\quad H_n \left[ \frac{J_n(\alpha x)}{J_n(\alpha)} \right] = \frac{s}{\alpha^2 - s^2} J'_n(s) \quad \text{Proved.}
\end{aligned}$$

If  $n = 0$ ,

$$\begin{aligned}
H_n \left[ \frac{J_0(\alpha x)}{J_0(\alpha)} \right] &= \frac{s}{\alpha^2 - s^2} J'_0(s) \quad [J'_0(s) = -J_1(s)] \\
&= \frac{-s}{\alpha^2 - s^2} J_1(s). \quad \text{Ans.}
\end{aligned}$$

### EXERCISE 45.1

- Prove that  $H_0 \left[ \frac{a}{(a^2 + x^2)^{3/2}} \right] = e^{-as}$ .
  - Find the Hankel transform of  $1 - x^2$ , taking  $x J_0(sx)$  as the kernel, where  $0 \leq x \leq 1$ . Ans.  $\frac{4}{s^3} J_1(s)$
  - Find the Hankel transform of  $\frac{\cos ax}{x}$  taking  $x J_0(sx)$  as the kernel
- Ans. (i)  $(s^2 - a^2)^{-\frac{1}{2}}$  if  $s > a$ . (ii) 0 if  $s < a$ .

4. Prove that  $H\left\{\frac{\sin ax}{a}\right\}_{n=1} = \frac{a}{s(s^2 - a^2)^{1/2}}, \quad s > a$

5. If  $H\{f(x)\} = \frac{c}{s}J_1(sa)$ , Prove that

$f(x) = \frac{2}{a^2} \sum \frac{c J_0(sx)}{s J_1(as)}$  where sum is taken over all the positive roots of the equation  $J_0(s_i a) = 0$

6. Prove that  $H_n\left(\frac{df}{dx}\right) = \frac{s}{2n}[(n-1)H_{n+1}(f) - (n+1)H_{n-1}(f)]$

and if  $n = 1$ , then  $H_1\left(\frac{df}{dx}\right) = -s H_0(f(x))$

7. Prove that  $H_n\left(\frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx}\right) = \frac{s}{2} \left[ -H_{n-1}\left(\frac{df}{dx}\right) + H_{n+1}\left(\frac{df}{dx}\right) \right]$ , When  $s$  is a root of  $J_n(s) = 0$

8. Prove that  $H_0\left(\frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx}\right) = -s^2 H_0\{f(x)\}$

When  $s$  is a root of  $s J'_n(s) + h J_n(s) = 0$

9. Prove that

$$H_n\left\{\frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx} \left( \frac{n^2}{x^2} f(x) \right) \right\} = -s f(1) J'_n(s) - s^2 H_n\{f(x)\}.$$

10. Find the Hankel Transform of  $\frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx}$  if  $s$  is the root of the equation

$$J_n(sa)Y_n(sb) - J_n(sb)Y_n(sa) = 0.$$

If  $f(a) = 0 = f(b)$ , then deduce that  $H_0\left[\frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx}\right] = -s^2 H_0\{f(x)\}$

11. Find the Hankel transform of  $\frac{d^2 f}{dx^2} + \frac{1}{x} \frac{df}{dx} - \frac{n^2}{x^2} f(x)$  and  $s$  being a root of  $J_n(sa) = 0$

**Ans.**  $-s a f(a) J'_n(as) - P^2 H_n\{f(x)\}$

12. Viscous fluid is contained between two infinitely long concentric circular cylinders of radii  $a$  and  $b$ . The inner cylinder is kept at rest and outer cylinder suddenly starts rotating with uniform angular velocity  $\omega$ . Find the velocity  $v$  of the fluid if the equation of motion is

$$\frac{\partial^2 v}{\partial r^2} + \frac{1}{r} \frac{\partial v}{\partial r} - \frac{v}{r^2} = \frac{1}{v} \frac{\partial v}{\partial t}, \quad a < r < b, t > 0$$

$v$  being Kinematic viscosity.

**Hint:** Take  $f^2(s) = \int_a^b f(r).r B_1(sr) dr, \quad b > a$

where  $B_1(sr) = J_1(sr)Y_1(sa) - Y_1(sr)J_1(sa), Y_1(sr)$  being Bessel's function of second kind of order one, and  $s$  is a positive root of

$$J_1(sb)Y_1(sa) = Y_1(sb)J_1(sa).$$

Multiplying the given equation by  $B_1(sr)$  and integrating w.r.t. ' $r$ ' from  $a$  to  $b$  with boundary conditions  $v = b\omega$  when  $r = b$

$$v = 0 \text{ when } r = a, \quad v = 0 \text{ when } t = 0. \quad \text{Ans. } v = \pi b \omega \sum_p \frac{1 - e^{-vp^2 t}}{J_1^2(sa) - J_1^2(sb)} J_1(sa) J_1(sb) B_1(sr)$$

**HANKEL TRANSFORM**

S. No.	Function $f(x)$	$n$	Hankel Transform $F(s)$
1.	$f(x) = \begin{cases} x^n, & 0 < x < a \\ 0, & x > a \end{cases}$	$n > -1$	$\frac{a^{n+1}}{s} J_{n+1}(sx)$

## HILBERT TRANSFORM

---

---

### 46.1 INTRODUCTION

Method of separating signals is based on Phase selecting which use phase shifts between the pertinent signals to achieve the desired separation.

On shifting the phase angle of all components of a given signal through  $\pm 90^\circ$  degrees, the resulting function of time is called as the Hilbert transform of the signal.

The Hilbert transform of  $f(t)$  is denoted by  $H_i\{f(t)\}$  and is defined as

$$H_i\{f(t)\} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{f(s)ds}{t-s}$$

### LINEARITY PROPERTY

The Hilbert transform of  $f(t)$  is a linear operation.

### Inverse of Hilbert Transform

It is defined as

$$f(t) = -\frac{1}{\pi} \int_{-\infty}^{\infty} \frac{H_i\{f(t)\}}{t-s} ds$$

$f(t)$  and  $H_i\{f(t)\}$  make a Hilbert-transform pair.

### 46.2 ELEMENTARY FUNCTIONS AND THEIR HILBERT TRANSFORM

S.No.	Functions	Hilbert Transforms
1.	$\cos t$	$H_i\{\cos t\} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\sin s}{s-t} ds = -\sin t$
2.	$\sin t$	$H_i\{\sin t\} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\cos s}{s-t} ds = \cos t$
3.	$\frac{\sin t}{t}$	$H_i\left\{\frac{\sin t}{t}\right\} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\frac{\sin s}{s}}{s-t} ds = \frac{\cos t - 1}{t}$
4.	$\frac{1}{1+t^2}$	$H_i\left\{\frac{1}{1+t^2}\right\} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\frac{1}{1+s^2}}{s-t} ds = \frac{-t}{1+t^2}$
5.	$\delta(t)$	$H_i\{\delta(t)\} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\delta(s)}{s-t} ds = -\frac{1}{\pi t}$
6.	$\frac{1}{t}$	$H_i\left\{\frac{1}{t}\right\} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\frac{1}{s}}{s-t} ds = -\pi\delta(t)$

### 46.3 PROPERTIES

This Hilbert transform differs from the Fourier transform in a way that it operates exclusively in the time domain. Some important properties are listed below :

1. The *amplitude spectrum* of a signal  $f(t)$  and its Hilbert transform  $H_i\{f(t)\}$  is the same.

$$H_i\{f(t)\} = \frac{1}{\pi t} * f(t) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{f(s)}{s-t} ds$$

2. *Inverse Transform* :

If  $H_i\{f(t)\}$  is the Hilbert transform of  $f(t)$ , then the inverse Hilbert transform is given below.

$$\text{If } H_i\{f(t)\} = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{f(s)}{s-t} ds, \text{ then}$$

$$f(t) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{H_i\{f(s)\}}{s-t} ds$$

3. *Orthogonality*. A signal  $f(t)$  and its Hilbert transform  $H_i\{f(t)\}$  are orthogonal.

$$\int_{-\infty}^{\infty} f(t) \cdot H_i\{f(t)\} dt = 0$$

### 46.4 APPLICATIONS

1. **Phase selectively** : Hilbert transform is used to realise phase selectivity in the generation of a special kind of modulation (single side band modulation)
2. It gives a mathematical basis to represent band-past signals.

## FIRST ORDER LAGRANGE'S LINEAR PARTIAL DIFFERENTIAL EQUATIONS

---

---

### 47.1 PARTIAL DIFFERENTIAL EQUATIONS

Partial differential equations are those equations which contain partial derivatives, independent variables and dependent variables.

The independent variables will be denoted by  $x$  and  $y$  and the dependent variable by  $z$ . The partial differential coefficients are denoted as follows :

$$\frac{\partial z}{\partial x} = p, \quad \frac{\partial z}{\partial y} = q, \quad \frac{\partial^2 z}{\partial x^2} = r, \quad \frac{\partial^2 z}{\partial x \partial y} = s, \quad \frac{\partial^2 z}{\partial y^2} = t$$

### 47.2 ORDER

Order of a partial differential equation is the same as that of the order of the highest differential coefficient in it.

### 47.3 METHOD OF FORMING PARTIAL DIFFERENTIAL EQUATIONS

A partial differential equation is formed by two methods.

- (i) By eliminating arbitrary constants.
- (ii) By eliminating arbitrary functions.

#### (i) Method of elimination of arbitrary constants

**Example 1.** Find the PDE of all sphere whose centre lie on  $z$ -axis and given by equations  $x^2 + y^2 + (z - a)^2 = b^2$ ,  $a$  and  $b$  being constants. (U.P., II Semester, 2009)

**Solution.** We have,  $x^2 + y^2 + (z - a)^2 = b^2$  ... (1)

(1) contains two arbitrary constants  $a$  and  $b$ .

Differentiating (1) partially w.r.t.  $x$ , we get

$$2x + 2(z - a) \frac{\partial z}{\partial x} = 0 \\ \Rightarrow x + (z - a)p = 0 \quad \dots (2)$$

Differentiating (1) partially w.r.t.  $y$ , we get

$$2y + 2(z - a) \frac{\partial z}{\partial y} = 0 \\ \Rightarrow y + (z - a)q = 0 \quad \dots (3)$$

Let us eliminate  $a$  from (2) and (3).

$$\text{From (2)} \quad (z - a) = -\frac{x}{p}$$

Putting this value of  $z - a$  in (3), we get

$$\Rightarrow y - \frac{x}{p} q = 0 \quad \text{Ans.}$$

**(ii) Method of elimination of arbitrary functions**

**Example 2.** Form the partial differential equation from

$$z = f(x^2 - y^2)$$

**Solution.** We have,  $z = f(x^2 - y^2)$  ... (1)

Differentiating (1) w.r.t.  $x$  and  $y$ , we get

$$p = \frac{\partial z}{\partial x} = f'(x^2 - y^2) 2x \quad \dots (2)$$

$$q = \frac{\partial z}{\partial y} = f'(x^2 - y^2) (-2y) \quad \dots (3)$$

$$\begin{aligned} \text{Dividing (2) by (3), we get} \quad & \frac{p}{q} = \frac{-x}{y} \Rightarrow py = -qx \\ \Rightarrow \quad & yp + xq = 0 \quad \text{Ans.} \end{aligned}$$

### EXERCISE 47.1

Form the partial differential equations from:

- |   |  |
|---|--|
| 1. $z = (x + a)(y + b)$                     | <b>Ans.</b> $pq = z$                               |
| 2. $(x - h)^2 + (y - k)^2 + z^2 = a^2$      | <b>Ans.</b> $z^2(p^2 + q^2 + 1) = a^2$             |
| 3. $2z = (ax + y)^2 + b$                    | <b>Ans.</b> $p x + q y = q^2$                      |
| 4. $a x^2 + b y^2 + z^2 = 1$                | <b>Ans.</b> $z(p x + q y) = z^2 - 1$               |
| 5. $x^2 + y^2 = (z - c)^2 \tan^2 \alpha$    | <b>Ans.</b> $yp - xq = 0$                          |
| 6. $z = f(x^2 + y^2)$                       | <b>Ans.</b> $yp - xq = 0$                          |
| 7. $2z = \frac{x^2}{a^2} + \frac{y^2}{b^2}$ | (A.M.I.E., Winter 2001) <b>Ans.</b> $2z = xp + yq$ |
| 8. $f(x + y + z, x^2 + y^2 + z^2) = 0$      | <b>Ans.</b> $(y - z)p + (z - x)q = x - y$          |

### 47.4 SOLUTION OF EQUATION BY DIRECT INTEGRATION

**Example 3.** Solve  $\frac{\partial^3 z}{\partial x^2 \partial y} = \cos(2x + 3y)$

**Solution.** We have,  $\frac{\partial^3 z}{\partial x^2 \partial y} = \cos(2x + 3y)$

Integrating w.r.t. 'x', we get  $\frac{\partial^2 z}{\partial x \partial y} = \frac{1}{2} \sin(2x + 3y) + f(y)$

Again, integrating w.r.t.  $x$ , we get  $\frac{\partial z}{\partial y} = -\frac{1}{4} \cos(2x + 3y) + x \int f(y) dx + g(y)$

$$= -\frac{1}{4} \cos(2x + 3y) + x \phi(y) + g(y)$$

Integrating w.r.t. 'y', we get  $z = -\frac{1}{12} \sin(2x + 3y) + x \int \phi(y) dy + \int g(y) dy$

$$z = -\frac{1}{12} \sin(2x + 3y) + x\phi_1(y) + \phi_2(y)$$

**Ans.**

**Example 4.** Solve  $\frac{\partial^2 z}{\partial x \partial y} = x^2 y$

subject to the conditions  $z(x, 0) = x^2$  and  $z(1, y) = \cos y$ .

**Solution.** We have,  $\frac{\partial}{\partial x} \left( \frac{\partial z}{\partial y} \right) = x^2 y$

On integrating w.r.t.  $x$ , we obtain

$$\frac{\partial z}{\partial y} = \frac{x^3}{3} y + f(y)$$

Integrating w.r.t.  $y$ , we obtain

$$\begin{aligned} z &= \frac{x^3}{3} \cdot \frac{y^2}{2} + \int f(y) dy + g(x) \quad [F(y) = \int f(y) dy] \\ \Rightarrow z &= \frac{x^3 y^2}{6} + F(y) + g(x) \end{aligned} \quad \dots (1)$$

**Condition 1 :** Putting  $z = x^2$  and  $y = 0$  in (1), we get

$$x^2 = 0 + F(0) + g(x)$$

Putting the value of  $g(x)$  in (1), we get

$$z = \frac{x^3 y^2}{6} + F(y) + x^2 - F(0) \quad \dots (2)$$

**Condition 2 :**  $z(1, y) = \cos y$

Putting  $x = 1$  and  $z = \cos y$  in (2), we get

$$\cos y = \frac{y^2}{6} + F(y) + 1 - F(0) \Rightarrow F(y) = \cos y - \frac{1}{6} y^2 - 1 + F(0)$$

Putting the value of  $F(y)$  in (2), we get

$$\begin{aligned} z &= \frac{1}{6} x^3 y^2 + \cos y - \frac{1}{6} y^2 - 1 + F(0) + x^2 - F(0) \\ \Rightarrow z &= \frac{1}{6} x^3 y^2 + \cos y - \frac{1}{6} y^2 - 1 + x^2 \end{aligned} \quad \text{Ans.}$$

## EXERCISE 47.2

**Solve the following:**

$$1. \frac{\partial^2 z}{\partial x \partial y} = xy^2$$

$$\text{Ans. } z = \frac{x^2 y^3}{6} + f(y) + \phi(x)$$

$$2. \frac{\partial^2 z}{\partial x \partial y} = e^y \cos x$$

$$\text{Ans. } z = e^y \sin x + f(y) + \phi(x)$$

$$3. \frac{\partial^2 z}{\partial x \partial y} = \frac{y}{x} + 2$$

$$\text{Ans. } z = \frac{y^2}{2} \log x + 2xy + f(y) + \phi(x)$$

4.  $\frac{\partial^2 z}{\partial x^2} = a^2 z$ , when  $x = 0$ ,  $\frac{\partial z}{\partial x} = a \sin y$  and  $\frac{\partial z}{\partial y} = 0$       **Ans.**  $z = \sin x + e^y \cos x$

5.  $\frac{\partial^2 z}{\partial x \partial y} = \sin x \sin y$  if  $\frac{\partial z}{\partial y} = -2 \sin y$  and  $z = 0$ , when  $x = 0$ .

**Choose the correct answer:**

6. The solution of the partial differential equation  $\frac{\partial^2 z}{\partial y^2} = \sin(xy)$  is

(a)  $z = -x^2 \sin(xy) + yf(x) + g(x)$

(b)  $z = -x^2 \sin(xy) - xf(x) + g(x)$

(c)  $z = -y^2 \sin(xy) + yf(x) + g(x)$

(d)  $z = -x - 2 \sin(xy) + xf(x) + g(x)$

(AMIETE, June 2009)

**Ans. (d)**

## 47.5 LAGRANGE'S LINEAR EQUATION IS AN EQUATION OF THE TYPE

$$Pp + Qq = R$$

where  $P, Q, R$  are the functions of  $x, y, z$  and  $p = \frac{\partial z}{\partial x}$ ,  $q = \frac{\partial z}{\partial y}$

$$Pp + Qq = R$$

... (1)

This form of the equation is obtained by eliminating an arbitrary function  $f$  from

$$f(u, v) = 0$$

... (2)

where  $u, v$  are functions of  $x, y, z$ .

Differentiating (2) partially w.r.t. to  $x$  and  $y$ .

$$\frac{\partial f}{\partial u} \left( \frac{\partial u}{\partial x} + \frac{\partial u}{\partial z} \frac{\partial z}{\partial x} \right) + \frac{\partial f}{\partial v} \left( \frac{\partial v}{\partial x} + \frac{\partial v}{\partial z} \frac{\partial z}{\partial x} \right) = 0 \quad \dots (3)$$

and

$$\frac{\partial f}{\partial u} \left( \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} \frac{\partial z}{\partial y} \right) + \frac{\partial f}{\partial v} \left( \frac{\partial v}{\partial y} + \frac{\partial v}{\partial z} \frac{\partial z}{\partial y} \right) = 0 \quad \dots (4)$$

Let us eliminate  $\frac{\partial f}{\partial u}$  and  $\frac{\partial f}{\partial v}$  from (3) and (4).

$$\text{From (3), } \frac{\partial f}{\partial u} \left[ \frac{\partial u}{\partial x} + \frac{\partial u}{\partial z} p \right] = - \frac{\partial f}{\partial v} \left[ \frac{\partial v}{\partial x} + \frac{\partial v}{\partial z} p \right] \quad \dots (5)$$

$$\text{From (4), } \frac{\partial f}{\partial u} \left[ \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} q \right] = - \frac{\partial f}{\partial v} \left[ \frac{\partial v}{\partial y} + \frac{\partial v}{\partial z} q \right] \quad \dots (6)$$

Dividing (5) by (6), we get

$$\begin{aligned} & \frac{\frac{\partial u}{\partial x} + \frac{\partial u}{\partial z} \cdot p}{\frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} \cdot q} = \frac{\frac{\partial v}{\partial x} + \frac{\partial v}{\partial z} \cdot p}{\frac{\partial v}{\partial y} + \frac{\partial v}{\partial z} \cdot q} \\ \Rightarrow & \left[ \frac{\frac{\partial u}{\partial x}}{\partial x} + \frac{\frac{\partial u}{\partial z}}{\partial z} \cdot p \right] \left[ \frac{\frac{\partial v}{\partial y}}{\partial y} + \frac{\frac{\partial v}{\partial z}}{\partial z} \cdot q \right] = \left[ \frac{\frac{\partial u}{\partial y}}{\partial y} + \frac{\frac{\partial u}{\partial z}}{\partial z} \cdot q \right] \left[ \frac{\frac{\partial v}{\partial x}}{\partial x} + \frac{\frac{\partial v}{\partial z}}{\partial z} \cdot p \right] \\ & \frac{\frac{\partial u}{\partial x}}{\partial x} \times \frac{\frac{\partial v}{\partial y}}{\partial y} + \frac{\frac{\partial u}{\partial x}}{\partial x} \times \frac{\frac{\partial v}{\partial z}}{\partial z} \cdot q + \frac{\frac{\partial u}{\partial z}}{\partial z} \times \frac{\frac{\partial v}{\partial y}}{\partial y} + \frac{\frac{\partial u}{\partial z}}{\partial z} \times \frac{\frac{\partial v}{\partial z}}{\partial z} \cdot pq \\ & = \frac{\frac{\partial u}{\partial y}}{\partial y} \times \frac{\frac{\partial v}{\partial x}}{\partial x} + \frac{\frac{\partial u}{\partial y}}{\partial y} \times \frac{\frac{\partial v}{\partial z}}{\partial z} \cdot p + \frac{\frac{\partial u}{\partial z}}{\partial z} \times \frac{\frac{\partial v}{\partial x}}{\partial x} + \frac{\frac{\partial u}{\partial z}}{\partial z} \times \frac{\frac{\partial v}{\partial z}}{\partial z} \cdot pq \end{aligned}$$

$$\Rightarrow \left[ \frac{\partial u}{\partial y} \times \frac{\partial v}{\partial z} - \frac{\partial u}{\partial z} \times \frac{\partial v}{\partial y} \right] p + \left[ \frac{\partial u}{\partial z} \times \frac{\partial v}{\partial x} - \frac{\partial u}{\partial x} \times \frac{\partial v}{\partial z} \right] q = \frac{\partial u}{\partial x} \times \frac{\partial v}{\partial y} - \frac{\partial u}{\partial y} \times \frac{\partial v}{\partial x} \quad \dots (7)$$

If (1) and (7) are the same, then the coefficients of  $p, q$  are equal.

$$P = \frac{\partial u}{\partial y} \times \frac{\partial v}{\partial z} - \frac{\partial u}{\partial z} \times \frac{\partial v}{\partial y}, \quad Q = \frac{\partial u}{\partial z} \times \frac{\partial v}{\partial x} - \frac{\partial u}{\partial x} \times \frac{\partial v}{\partial z} \quad \dots (8)$$

$$R = \frac{\partial u}{\partial x} \times \frac{\partial v}{\partial y} - \frac{\partial u}{\partial y} \times \frac{\partial v}{\partial x}$$

Now suppose  $u = c_1$  and  $v = c_2$  are two solutions, where  $c_1, c_2$  are constants.

Differentiating  $u = c_1$  and  $v = c_2$

$$\frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz = 0 \quad \dots (9)$$

$$\text{and} \quad \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy + \frac{\partial v}{\partial z} dz = 0 \quad \dots (10)$$

Solving (9) and (10), we get

$$\frac{dx}{\frac{\partial u}{\partial y} \times \frac{\partial v}{\partial z} - \frac{\partial u}{\partial z} \times \frac{\partial v}{\partial y}} = \frac{dy}{\frac{\partial u}{\partial z} \times \frac{\partial v}{\partial x} - \frac{\partial u}{\partial x} \times \frac{\partial v}{\partial z}} = \frac{dz}{\frac{\partial u}{\partial x} \times \frac{\partial v}{\partial y} - \frac{\partial u}{\partial y} \times \frac{\partial v}{\partial x}} \quad \dots (11)$$

$$\text{From (8) and (11), we have } \frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R}$$

Solutions of these equations are  $u = c_1$  and  $v = c_2$

$\therefore f(u, v) = 0$  is the required solution of (1).

#### 47.6 WORKING RULE TO SOLVE $Pp + Qq = R$

**Step 1.** Write down the auxiliary equations  $\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R}$

**Step 2.** Solve the above auxiliary equations.

Let the two solutions be  $u = c_1$  and  $v = c_2$ .

**Step 3.** Then  $f(u, v) = 0$  or  $u = \phi(v)$  is the required solution of

$$Pp + Qq = R.$$

**Example 5.** Solve the following partial differential equation

$$yq - xp = z, \quad \text{where } p = \frac{\partial z}{\partial x}, q = \frac{\partial z}{\partial y}.$$

**Solution.** We have,  $yq - xp = z$

Here the auxiliary equations are

$$\begin{aligned} \frac{dx}{-x} &= \frac{dy}{y} = \frac{dz}{z} \\ -\log x &= \log y - \log a \quad (\text{From first two equations}) \\ x y &= a \\ \log y &= \log z + \log b \quad (\text{From last two equations}) \end{aligned} \quad \dots (1)$$

$$\frac{y}{z} = b \quad \dots (2)$$

From (1) and (2) we get the solution

$$f\left(xy, \frac{y}{z}\right) = 0. \quad \text{Ans.}$$

**Example 6.** Solve  $y^2 p - xyq = x(z - 2y)$ .

(A.M.I.E., Summer 2001)

**Solution.** We have,  $y^2 p - xyq = x(z - 2y)$

$$\text{The auxiliary equations are } \frac{dx}{y^2} = \frac{dy}{-xy} = \frac{dz}{x(z-2y)} \quad \dots (1)$$

Considering first two members of the equations

$$\frac{dx}{y} = \frac{dy}{-x} \Rightarrow x \, dx = -y \, dy$$

$$\text{Integrating } \frac{x^2}{2} = -\frac{y^2}{2} + \frac{C_1}{2} \Rightarrow x^2 + y^2 = C_1 \quad \dots (2)$$

$$\text{From last two equations of (1), we have } -\frac{dy}{y} = \frac{dz}{z-2y}$$

$$\Rightarrow -z \, dy + 2y \, dy = y \, dz \Rightarrow 2y \, dy = y \, dz + z \, dy$$

$$\text{On integration, we get } y^2 = yz + C_2$$

$$y^2 - yz = C_2 \quad \dots (3)$$

$$\text{From (2) and (3), we have } x^2 + y^2 = f(y^2 - yz)$$

**Ans.**

**Example 7.** Solve  $(x^2 - yz) p + (y^2 - zx) q = z^2 - xy$

(U.P., II Semester, 2010, A.M.I.E., Summer 2001)

$$\text{Solution. } (x^2 - yz) p + (y^2 - zx) q = z^2 - xy \quad \dots (1)$$

The auxiliary equations are

$$\begin{aligned} & \frac{dx}{x^2 - yz} = \frac{dy}{y^2 - zx} = \frac{dz}{z^2 - xy} \\ \Rightarrow & \frac{dx - dy}{x^2 - yz - y^2 + zx} = \frac{dy - dz}{y^2 - zx - z^2 + xy} = \frac{dz - dx}{z^2 - xy - x^2 + yz} \\ \Rightarrow & \frac{dx - dy}{(x-y)(x+y+z)} = \frac{dy - dz}{(y-z)(x+y+z)} = \frac{dz - dx}{(z-x)(x+y+z)} \\ \Rightarrow & \frac{dx - dy}{x-y} = \frac{dy - dz}{y-z} = \frac{dz - dx}{z-x} \quad \dots (2) \end{aligned}$$

Integrating first two members of (2), we have

$$\log(x-y) = \log(y-z) + \log c_1$$

$$\log \frac{x-y}{y-z} = \log c_1 \Rightarrow \frac{x-y}{y-z} = c_1 \quad \dots (3)$$

$$\text{Similarly from last two members of (2), we have } \frac{y-z}{z-x} = c_2 \quad \dots (4)$$

From (3) and (4), the required solution is

$$f\left[\frac{x-y}{y-z}, \frac{y-z}{z-x}\right] = 0 \quad \text{Ans.}$$

## 47.7 METHOD OF MULTIPLIERS

Let the auxiliary equations be  $\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R}$

$l, m, n$  may be constants or functions of  $x, y, z$  then, we have

$$\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R} = \frac{l dx + m dy + n dz}{lP + mQ + nR}$$

$l, m, n$  are chosen in such a way that

$$lP + mQ + nR = 0$$

Thus

$$l dx + m dy + n dz = 0$$

Solve this differential equation, if the solution is  $u = c_1$ .

Similarly, choose another set of multipliers  $(l_1, m_1, n_1)$  and if the second solution is  $v = c_2$ .

$\therefore$  Required solution is  $f(u, v) = 0$ .

**Example 8.** Solve

$$(mz - ny) \frac{\partial z}{\partial x} + (nx - lz) \frac{\partial z}{\partial y} = l y - mx. \quad (\text{A.M.I.E. Winter 2001})$$

**Solution.** We have,  $(mz - ny) \frac{\partial z}{\partial x} + (nx - lz) \frac{\partial z}{\partial y} = l y - mx$

Here, the auxiliary equations, are  $\frac{dx}{mz - ny} = \frac{dy}{nx - lz} = \frac{dz}{ly - mx}$

Using multipliers  $x, y, z$ , we get

$$\text{each fraction} = \frac{x dx + y dy + z dz}{x(mz - ny) + y(nx - lz) + z.ly - mx) = \frac{x dx + y dy + z dz}{0}}$$

$$\therefore x dx + y dy + z dz = 0$$

which on integration gives

$$x^2 + y^2 + z^2 = c_1 \quad \dots (1)$$

Again using multipliers,  $l, m, n$ , we get

$$\text{each fraction} = \frac{l dx + m dy + n dz}{l(mz - ny) + m(nx - lz) + n.ly - mx) = \frac{l dx + m dy + n dz}{0}}$$

$$\therefore l dx + m dy + n dz = 0$$

which on integration gives

$$lx + my + nz = c_2 \quad \dots (2)$$

Hence from (1) and (2), the required solution is

$$x^2 + y^2 + z^2 = f(lx + my + nz) \quad \text{Ans.}$$

**Example 9.** Solve the partial differential equation  $x(y^2 + z) p - y(x^2 + z) q = z(x^2 - y^2)$

where,  $p = \frac{\partial z}{\partial x}$  and  $q = \frac{\partial z}{\partial y}$ . (U.P., II Semester, 2008)

**Solution.** Lagrange's subsidiary equations are

$$\frac{dx}{x(y^2 + z)} = \frac{dy}{-y(x^2 + z)} = \frac{dz}{z(x^2 - y^2)} \quad \dots (1)$$

Using  $x, y, -1$  as multipliers, we get

$$\text{each fraction} = \frac{x dx + y dy - dz}{x^2(y^2 + z) - y^2(x^2 + z) - z(x^2 - y^2)} = \frac{x dx + y dy - dz}{0}$$

$$\therefore x dx + y dy - dz = 0$$

Integrating, we get

$$\begin{aligned} \frac{x^2}{2} + \frac{y^2}{2} - z &= \frac{C_1}{2} \\ \Rightarrow x^2 + y^2 - 2z &= C_1 \end{aligned} \quad \dots (2)$$

Again, using  $\frac{1}{x}$ ,  $\frac{1}{y}$  and  $\frac{1}{z}$  as multipliers, we get

$$\text{each fraction} = \frac{\frac{1}{x}dx + \frac{1}{y}dy + \frac{1}{z}dz}{y^2 + z - x^2 - z + x^2 - y^2} = \frac{\frac{1}{x}dx + \frac{1}{y}dy + \frac{1}{z}dz}{0}$$

$$\therefore \frac{1}{x}dx + \frac{1}{y}dy + \frac{1}{z}dz = 0$$

Integrating, we get

$$\log x + \log y + \log z = \log C_2 \Rightarrow xyz = C_2 \quad \dots(3)$$

Hence the general solution is

$$\phi(x^2 + y^2 - 2z, xyz) = 0 \quad \text{Ans.}$$

**Example 10.** Find the general solution of

$$x(z^2 - y^2) \frac{\partial z}{\partial x} + y(x^2 - z^2) \frac{\partial z}{\partial y} = z(y^2 - x^2) \quad (\text{AMIETE, Dec. 2009})$$

$$\text{Solution. } x(z^2 - y^2) \frac{\partial z}{\partial x} + y(x^2 - z^2) \frac{\partial z}{\partial y} = z(y^2 - x^2) \quad \dots(1)$$

$\therefore$  The auxiliary simultaneous equations are

$$\frac{dx}{x(z^2 - y^2)} = \frac{dy}{y(x^2 - z^2)} = \frac{dz}{z(y^2 - x^2)} \quad \dots(2)$$

Using multipliers  $x, y, z$ , we get

$$\text{Each term of (2)} = \frac{x dx + y dy + z dz}{x^2(z^2 - y^2) + y^2(x^2 - z^2) + z^2(y^2 - x^2)} = \frac{x dx + y dy + z dz}{0}$$

$$\therefore x dx + y dy + z dz = 0 \quad \dots(3)$$

On integration  $x^2 + y^2 + z^2 = C_1$

Again (2) can be written as

$$\begin{aligned} \frac{dx}{x^2 - y^2} &= \frac{dy}{x^2 - z^2} = \frac{dz}{y^2 - x^2} = \frac{dx + dy + dz}{x(z^2 - y^2) + y(x^2 - z^2) + z(y^2 - x^2)} \\ &= \frac{dx + dy + dz}{0} \Rightarrow \frac{dx + dy + dz}{x} = 0 \end{aligned} \quad \dots(4)$$

On integration, we get

$$\begin{aligned} \Rightarrow \log x + \log y + \log z &= \log C_2 \\ \log x y z &= \log C_2 \Rightarrow x y z = C_2 \end{aligned} \quad \dots(5)$$

From (3) and (5), the general solution is

$$xyz = f(x^2 + y^2 + z^2) \quad \text{Ans.}$$

**Example 11.** Solve the partial differential equation

$$\frac{y-z}{yz} p + \frac{z-x}{zx} q = \frac{x-y}{xy} \quad (\text{AMIETE, June 2010, 2009})$$

$$\text{Solution. We have, } \frac{y-z}{yz} p + \frac{z-x}{zx} q = \frac{x-y}{xy}$$

Multiplying by  $xyz$ , we get

$$\begin{aligned} x(y-z)p + y(z-x)q &= z(x-y) \\ \frac{dx}{x(y-z)} &= \frac{dy}{y(z-x)} = \frac{dz}{z(x-y)} = \frac{dx+dy+dz}{x(y-z)+y(z-x)+z(x-y)} \quad \dots (1) \\ &= \frac{dx+dy+dz}{0} \\ \therefore dx+dy+dz &= 0 \end{aligned}$$

Which on integration gives

$$x+y+z = a \quad \dots (2)$$

Again (1) can be written as

$$\frac{dx}{x} = \frac{dy}{y} = \frac{dz}{z} = \frac{dx+dy+dz}{x+y+z} = \frac{dx+dy+dz}{(y-z)+(z-x)+(x-y)} = \frac{dx+dy+dz}{0} \Rightarrow \frac{dx}{x} + \frac{dy}{y} + \frac{dz}{z} = 0$$

On integration, we get

$$\log x + \log y + \log z = \log b \Rightarrow \log xyz = \log b \Rightarrow xyz = b \quad \dots (3)$$

From (2) and (3) the general solution is

$$xyz = f(x+y+z) \quad \text{Ans.}$$

**Example 12.** Solve  $(x^2 - y^2 - z^2)p + 2xyq = 2xz$ . (A.M.I.E., Summer 2004, 2000)

**Solution.** We have,  $(x^2 - y^2 - z^2)p + 2xyq = 2xz$  ... (1)

$$\text{Here the auxiliary equations are } \frac{dx}{x^2 - y^2 - z^2} = \frac{dy}{2xy} = \frac{dz}{2xz} \quad \dots (2)$$

$$\text{From the last two members of (2), we have } \frac{dy}{y} = \frac{dz}{z}$$

which on integration gives

$$\begin{aligned} \log y &= \log z + \log a \Rightarrow \log \frac{y}{z} = \log a \\ \Rightarrow \frac{y}{z} &= a \quad \dots (3) \end{aligned}$$

Using multipliers  $x, y, z$ , we have

$$\begin{aligned} \frac{dx}{x^2 - y^2 - z^2} &= \frac{dy}{2xy} = \frac{dz}{2xz} = \frac{x \, dx + y \, dy + z \, dz}{x(x^2 + y^2 + z^2)} \\ \frac{2x \, dx + 2y \, dy + 2z \, dz}{(x^2 + y^2 + z^2)} &= \frac{dz}{z} \end{aligned}$$

which on integration gives

$$\begin{aligned} \log(x^2 + y^2 + z^2) &= \log z + \log b \\ \frac{x^2 + y^2 + z^2}{z} &= b \quad \dots (4) \end{aligned}$$

Hence from (3) and (4), the required solution is  $x^2 + y^2 + z^2 = z f\left(\frac{y}{z}\right)$  **Ans.**

**Example 13.** Solve the differential equation

$$x^2 \frac{\partial z}{\partial x} + y^2 \frac{\partial z}{\partial y} = (x+y)z$$

**Solution.** We have,  $x^2 \frac{\partial z}{\partial x} + y^2 \frac{\partial z}{\partial y} = (x+y)z$  ... (1)

The auxiliary equations of (1) are

$$\frac{dx}{x^2} = \frac{dy}{y^2} = \frac{dz}{(x+y)z} \quad \dots (2)$$

Take first two members of (2) and integrate them

$$\begin{aligned} -\frac{1}{x} &= -\frac{1}{y} + c \\ \frac{1}{x} - \frac{1}{y} &= c_1 \end{aligned} \quad \dots (3)$$

(2) can be written as

$$\begin{aligned} \frac{dx}{x} &= \frac{dy}{y} = \frac{dz}{x+y} = \frac{dx}{x} + \frac{dy}{y} - \frac{dz}{z} \\ \Rightarrow \quad \frac{dx}{x} + \frac{dy}{y} - \frac{dz}{z} &= 0 \end{aligned}$$

On integration, we get  
 $\Rightarrow \log x + \log y - \log z = \log c_2$

$$\Rightarrow \log \frac{xy}{z} = \log c_2 \quad \Rightarrow \quad \frac{xy}{z} = c_2 \quad \dots (4)$$

From (3) and (4), we have  $f\left[\frac{1}{x} - \frac{1}{y}, \frac{xy}{z}\right] = 0$ . Ans.

**Example 14.** Find the general solution of  $x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} + t \frac{\partial z}{\partial t} = xyt$

**Solution.** The auxiliary equations are  $\frac{dx}{x} = \frac{dy}{y} = \frac{dt}{t} = \frac{dz}{xyt}$  ... (1)

Taking the first two members and integrating, we get

$$\begin{aligned} \log x &= \log y + \log a = \log ay \\ \Rightarrow \quad x &= ay, \quad i.e. \quad x/y = a \end{aligned} \quad \dots (2)$$

Similarly, from the 2nd and 3rd members  $\frac{t}{y} = b$  ... (3)

Multiplying the equation (1) by  $xyt$ , we get

$$dz = \frac{tyd x}{1} = \frac{txd y}{1} = \frac{xyd t}{1} = \frac{tyd x + txd y + xydt}{3}$$

Integrating, we get

$$z = \frac{1}{3}xyt + c \Rightarrow z - \frac{1}{3}xyt = c \quad \dots (4)$$

From (2), (3) and (4) the solution is  $z - \frac{1}{3}xyt = f\left(\frac{y}{x}\right) + \phi\left(\frac{t}{y}\right)$  Ans.

**Example 15.** Solve  $(y+z)p - (x+z)q = x-y$  (AMIETE, June 2010)

**Solution.**  $(y+z)p - (x+z)q = x-y$  ... (1)

$\therefore$  The auxiliary equations are

$$\frac{dx}{y+z} = \frac{dy}{-(x+z)} = \frac{dz}{x-y} \quad \dots (2)$$

$$\Rightarrow \frac{dx}{y+z} = \frac{dy}{-(x+z)} = \frac{dz}{x-y} = \frac{dx+dy+dz}{y+z-(x+z)+x-y}$$

$$\Rightarrow \frac{dx}{y+z} = \frac{dy}{-(x+z)} = \frac{dz}{x-y} = \frac{dx+dy+dz}{0}$$

Thus, we have  $dx + dy + dz = 0$

Which on integration gives  $x + y + z = c_1$  ... (3)

Using multipliers  $x, y, -z$  for (2), we get

$$\begin{aligned} \frac{dx}{y+z} &= \frac{dy}{-(x+z)} = \frac{dz}{x-y} = \frac{x dx + y dy - z dz}{x(y+z) - y(x+z) - z(x-y)} \\ \Rightarrow \frac{dx}{y+z} &= \frac{dy}{-(x+z)} = \frac{dz}{x-y} = \frac{x dx + y dy - z dz}{0} \end{aligned}$$

Integrating  $x dx + y dy - z dz = 0$ , we get

$$\frac{x^2}{2} + \frac{y^2}{2} - \frac{z^2}{2} = c_2 \Rightarrow x^2 + y^2 - z^2 = 2c_2 \quad \dots (4)$$

From (3) and (4), we get the required solution  $f(x+y+z, x^2+y^2-z^2) = 0$  **Ans.**

**Example 16.** Solve  $z p + yq = x$ .

**Solution.** The auxiliary equations are  $\frac{dx}{z} = \frac{dy}{y} = \frac{dz}{x}$  ... (1)  
 $(i) \quad (ii) \quad (iii)$

From (i) and (iii)

$$\begin{aligned} \frac{dx}{z} &= \frac{dz}{x} \Rightarrow x \cdot dx = z \cdot dz \\ \Rightarrow \frac{x^2}{2} &= \frac{z^2}{2} - \frac{c_1}{2} \Rightarrow x^2 = z^2 - c_1 \quad \dots (2) \\ \Rightarrow z &= \sqrt{x^2 + c_1} \end{aligned}$$

Putting the value of  $z$  in (1), we get

$$\frac{dx}{\sqrt{x^2 + c_1}} = \frac{dy}{y}, \quad \sinh^{-1} \frac{x}{\sqrt{c_1}} = \log y + c_2 \quad \dots (3)$$

From (2) and (3), the required solution is

$$f(z^2 - x^2) = \sinh^{-1} \frac{x}{\sqrt{c_1}} - \log y \quad \text{Ans.}$$

**Example 17.** Solve  $px(z-2y^2) = (z-qy)(z-y^2-2x^3)$ . *(A.M.I.E., Summer 2000)*

**Solution.**  $px(z-2y^2) = (z-qy)(z-y^2-2x^3)$

$$\Rightarrow px(z-2y^2) + qy(z-y^2-2x^3) = z(z-y^2-2x^3) \quad \dots (1)$$

Here the auxiliary equations are

$$\frac{dx}{x(z-2y^2)} = \frac{dy}{y(z-y^2-2x^3)} = \frac{dz}{z(z-y^2-2x^3)} \quad \dots (2)$$

From the last two members of (2), we have  $\frac{dy}{y} = \frac{dz}{z}$

which gives on integration

$$\log y = \log z + \log a \Rightarrow y = a z \quad \dots (3)$$

From the first and third members of (2), we have

$$\begin{aligned}
 & \frac{dx}{x(z-2y^2)} = \frac{dz}{z(z-y^2-2x^3)} \\
 \Rightarrow & \frac{dx}{x(z-2a^2z^2)} = \frac{dz}{z(z-a^2z^2-2x^3)} \quad [\text{Using (3), } y = az] \\
 & \frac{dx}{x(1-2a^2z)} = \frac{dz}{z-a^2z^2-2x^3} \\
 \Rightarrow & z dx - a^2z^2 dx - 2x^3 dx = x dz - 2a^2 x z dz \\
 \Rightarrow & (x dz - z dx) - a^2 (2 x z dz - z^2 dx) + 2x^3 dx = 0 \\
 \Rightarrow & \frac{x dz - z dx}{x^2} - a^2 \frac{(2 x z dz - z^2 dx)}{x^2} + 2 x dx = 0
 \end{aligned}$$

On integrating, we have  $\frac{z}{x} - a^2 \frac{z^2}{x} + x^2 = b$  ... (4)

From (3) and (4), we have the required solution

$$\frac{y}{z} = f\left(\frac{z}{x} - \frac{a^2 z^2}{x} + x^2\right) \quad \text{Ans.}$$

### EXERCISE 47.3

Solve the following partial differential equations:

1.  $p \tan x + q \tan y = \tan z$  Ans.  $f\left(\frac{\sin x}{\sin y}, \frac{\sin y}{\sin z}\right) = 0$
2.  $(y-z)p + (x-y)q = z-x$  Ans.  $f(x+y+z, x^2+2yz) = 0$
3.  $(y+zx)p - (x+yz)q = x^2 - y^2$  Ans.  $f(x^2+y^2-z^2) = (x-y)^2 - (z+1)^2$
4.  $zx \frac{\partial z}{\partial x} - zy \frac{\partial z}{\partial y} = y^2 - x^2$  Ans.  $f(x^2+y^2+z^2, xy) = 0$
5.  $pz - qz = z^2 + (x+y)^2$  Ans.  $[z^2 + (x+y)^2] e^{-2x} = f(x+y)$
6.  $p + q + 2xz = 0$  Ans.  $f(x-y) = x^2 + \log z$
7.  $x^2 p + y^2 q + z^2 = 0$  Ans.  $f\left(\frac{1}{y} - \frac{1}{x}, \frac{1}{y} + \frac{1}{z}\right) = 0$
8.  $(x^2 + y^2)p + 2xyq = (x+y)z$  (A.M.I.E., Summer 2000) Ans.  $f\left(\frac{x+y}{z}, \frac{2y}{x^2-y^2}\right) = 0$
9.  $\frac{\partial z}{\partial x} - 2 \frac{\partial z}{\partial y} = 2x - e^y + 1$  Ans.  $f(2x+y) = z - \frac{(2x+1)^2}{4} - \frac{e^y}{2}$
10.  $p + 3q = 5z + \tan(y-3x)$  Ans.  $f(y-3x) = \frac{e^{5x}}{5z + \tan(y-3x)}$
11.  $xp - yq + x^2 - y^2 = 0$  Ans.  $f(xy) = \frac{x^2}{2} + \frac{y^2}{2} + z$
12.  $(x+y)\left(\frac{\partial z}{\partial x} + \frac{\partial z}{\partial y}\right) = z-1$  Ans.  $f(x-y) = \frac{x+y}{(z-1)^2}$
13.  $(x^3 + 3xy^2)\frac{\partial z}{\partial x} + (y^3 + 3x^2y)\frac{\partial z}{\partial y} = 2(x^2 + y^2)z$  (A.M.I.E.T.E., Summer 2000) Ans.  $f\left(\frac{xy}{z^2}\right) = \frac{4xy}{(x^2 - y^2)^2}$

14.  $(z^2 - 2yz - y^2)p + (xy + zx)q = xy - zx$  (A.M.I.E.T.E., Dec. 2010)

**Ans.**  $f(z^2 - 2yz - y^2, x^2 + y^2 + z^2) = 0$

15. Find the solution of the equation  $\frac{x\partial z}{\partial y} - \frac{y\partial z}{\partial x} = 0$ , which passes through the curve  $z = 1, x^2 + y^2 = 4$

**Ans.**  $f(x^2 + y^2 - 4, z - 1) = 0$

**Indicate True or False for the following statements**

16. With usual symbols, the P.D.E.  $u_{xx} + u^2 u_{yy} = f(xy)$  is non-linear in ' $u$ ' and is of second order.

(U.P., II Semester, 2009) **Ans.** True

17. Solution of the P.D.E.  $\frac{\partial^2 z}{\partial x \partial y} = xy^2$  is  $z = \frac{x^2 y^3}{6} + f(y) + \phi(x)$  **Ans.** True

## 47.8 PARTIAL DIFFERENTIAL EQUATIONS NON-LINEAR IN $p$ AND $q$ .

We give below the methods of solving non-linear partial differential equations in certain standard form only.

**Type I.** Equation of the type  $f(p, q) = 0$  i.e., equations containing  $p$  and  $q$  only.

**Method.** Let the required solution be

$$z = ax + by + c \quad \dots (1)$$

$$\frac{\partial z}{\partial x} = a, \frac{\partial z}{\partial y} = b.$$

On putting these values in  $f(p, q) = 0$

we get  $f(a, b) = 0$ ,

From this, find the value of  $b$  in terms of  $a$  and substitute the value of  $b$  in (1), that will be the required solution.

**Example 18.** Solve  $p^2 + q^2 = 1$  ... (1)

**Solution.** Let  $z = ax + by + c$  ... (2)

$$p = \frac{\partial z}{\partial x} = a \quad \text{and} \quad q = \frac{\partial z}{\partial y} = b$$

On substituting the values of  $p$  and  $q$  in (1), we have

$$\therefore a^2 + b^2 = 1 \Rightarrow b = \sqrt{1 - a^2}$$

Putting the value of  $b$  in (2), we get

$$z = ax + \sqrt{1 - a^2} y + c \quad \text{Ans.}$$

**Example 19.** Solve  $x^2 p^2 + y^2 q^2 = z^2$  (MDU, May 2010, R.G.P.V. Bhopal, Feb. 2008)

**Solution.** This equation can be transformed in the above type.

$$\frac{x^2}{z^2} p^2 + \frac{y^2}{z^2} q^2 = 1 \Rightarrow \left( \frac{x}{z} \frac{\partial z}{\partial x} \right)^2 + \left( \frac{y}{z} \frac{\partial z}{\partial y} \right)^2 = 1$$

$$\left( \frac{\frac{\partial z}{\partial x}}{x} \right)^2 + \left( \frac{\frac{\partial z}{\partial y}}{y} \right)^2 = 1 \quad \dots (1)$$

$$\text{Let } \frac{\partial z}{z} = \partial Z, \quad \frac{\partial x}{x} = \partial X, \quad \frac{\partial y}{y} = \partial Y$$

$$\therefore \log z = Z, \quad \log x = X, \quad \log y = Y$$

$\therefore$  (1) can be written as

$$\left(\frac{\partial Z}{\partial X}\right)^2 + \left(\frac{\partial Z}{\partial Y}\right)^2 = 1$$

or  $P^2 + Q^2 = 1$

... (2)

Let the required solution be

$$Z = aX + bY + c$$

$$P = \frac{\partial Z}{\partial X} = a, \quad Q = \frac{\partial Z}{\partial Y} = b$$

From (2) we have

$$a^2 + b^2 = 1 \Rightarrow b = \sqrt{1 - a^2}$$

$$\therefore Z = aX + \sqrt{1 - a^2} Y + c$$

$$\Rightarrow \log z = a \log x + \sqrt{1 - a^2} \log y + c \quad \text{Ans.}$$

**Example 20.** Solve  $(x+y)(p+q)^2 + (x-y)(p-q)^2 = 1$  *(R.G.P.V. Bhopal, II Semester, June 2006)*

**Solution.** We have,

$$(x+y)(p+q)^2 + (x-y)(p-q)^2 = 1 \quad \dots (1)$$

$$\text{Put } x+y = U^2 \Rightarrow 2U \frac{\partial U}{\partial x} = 1 \text{ and } 2U \frac{\partial U}{\partial y} = 1$$

$$\Rightarrow \frac{\partial U}{\partial x} = \frac{1}{2U} \text{ and } \frac{\partial U}{\partial y} = \frac{1}{2U}$$

$$\text{And } x-y = V^2 \Rightarrow 2V \frac{\partial V}{\partial x} = 1 \text{ and } 2V \frac{\partial V}{\partial y} = -1 \Rightarrow \frac{\partial V}{\partial x} = \frac{1}{2V} \text{ and } \frac{\partial V}{\partial y} = -\frac{1}{2V}$$

$$\text{Also, } p = \frac{\partial z}{\partial x} = \frac{\partial z}{\partial U} \cdot \frac{\partial U}{\partial x} + \frac{\partial z}{\partial V} \cdot \frac{\partial V}{\partial x} \Rightarrow p = \frac{1}{2U} \cdot \frac{\partial z}{\partial U} + \frac{1}{2V} \cdot \frac{\partial z}{\partial V} \quad \dots (2)$$

$$\text{and } q = \frac{\partial z}{\partial y} = \frac{\partial z}{\partial U} \cdot \frac{\partial U}{\partial y} + \frac{\partial z}{\partial V} \cdot \frac{\partial V}{\partial y} \Rightarrow q = \frac{1}{2U} \cdot \frac{\partial z}{\partial U} - \frac{1}{2V} \cdot \frac{\partial z}{\partial V} \quad \dots (3)$$

$$(2) + (3), p+q = \frac{1}{U} \frac{\partial z}{\partial U}, \quad (2) - (3), p-q = \frac{1}{V} \frac{\partial z}{\partial V}$$

On putting the values of  $(x+y)$ ,  $(x-y)$ ,  $(p+q)$ ,  $(p-q)$  in (1), we get

$$U^2 \left( \frac{1}{U} \frac{\partial z}{\partial U} \right)^2 + V^2 \left( \frac{1}{V} \frac{\partial z}{\partial V} \right)^2 = 1, \quad \left( \frac{\partial z}{\partial U} \right)^2 + \left( \frac{\partial z}{\partial V} \right)^2 = 1$$

The complete integral is

$$z = aU + \sqrt{1 - a^2} V + C \quad [z = ax + by + c]$$

$$\text{Hence, } z = a\sqrt{x+y} + \sqrt{1 - a^2} \sqrt{x-y} + C \quad \text{Ans.}$$

#### EXERCISE 47.4

Solve the following parital differential equations

$$1. pq = 1 \quad \text{Ans. } z = ax + \frac{1}{a} y + c \quad 2. \sqrt{p} + \sqrt{q} = 1 \quad \text{Ans. } z = ax + (1 - \sqrt{a})^2 y + c$$

$$3. p^2 - q^2 = 1 \quad \text{Ans. } z = ax + \sqrt{(a^2 - 1)} y + c \quad 4. \quad pq + p + q = 0 \quad \text{Ans. } z = ax - \frac{a}{1+a} y + c$$

**Type II. Equation of the type**

$$z = px + qy + f(p, q)$$

Its solution is  $z = ax + by + f(a, b)$

**Example 21.** Solve  $z = px + qy + p^2 + q^2$

**Solution.**

$$\begin{aligned} z &= px + qy + p^2 + q^2, \\ \text{Its solution is } z &= ax + by + a^2 + b^2 \end{aligned}$$

$[p = a, q = b]$

**Ans.**

**Example 22.** Solve  $z = px + qy + 2\sqrt{pq}$

**Solution.**

$$z = px + qy + 2\sqrt{pq}$$

Its solution is

$$z = ax + by + 2\sqrt{ab}$$

**Ans.**

**Type III.** Equation of the type  $f(z, p, q) = 0$  i.e. equations not containing  $x$  and  $y$ .

Let  $z$  be a function of  $u$  where

$$u = x + ay.$$

$$\frac{\partial u}{\partial x} = 1 \quad \text{and} \quad \frac{\partial u}{\partial y} = a$$

$$\text{Then } p = \frac{\partial z}{\partial x} = \frac{\partial z}{\partial u} \cdot \frac{\partial u}{\partial x} = \frac{\partial z}{\partial u}; \quad q = \frac{\partial z}{\partial y} = \frac{\partial z}{\partial u} \frac{\partial u}{\partial y} = \frac{\partial z}{\partial u} (a)$$

On putting the values of  $p$  and  $q$  in the given equation  $f(z, p, q) = 0$ , it becomes  $f\left(z, \frac{\partial z}{\partial u}, a \frac{\partial z}{\partial u}\right) = 0$  which is an ordinary differential equation of the first order.

**Example 23.** Solve

$$\begin{aligned} p(1+q) &= qz && (\text{MDU, May 2005}) \\ \text{Solution.} \quad p(1+q) &= qz && \dots (1) \end{aligned}$$

Let

$$u = x + ay \Rightarrow \frac{\partial u}{\partial x} = 1, \frac{\partial u}{\partial y} = a$$

$$p = \frac{\partial z}{\partial x} = \frac{\partial z}{\partial u} \frac{\partial u}{\partial x} = \frac{dz}{du} \quad \text{and} \quad q = \frac{\partial z}{\partial y} = \frac{\partial z}{\partial u} \frac{\partial u}{\partial y} = a \frac{dz}{du}$$

(1) becomes

$$\frac{dz}{du} \left(1 + a \frac{dz}{du}\right) = a \frac{dz}{du} z \Rightarrow 1 + a \frac{dz}{du} = az$$

$$a \frac{dz}{du} = az - 1 \Rightarrow \frac{dz}{du} = \frac{az - 1}{a}$$

$$\Rightarrow \frac{du}{dz} = \frac{a}{az - 1} \Rightarrow du = \frac{adz}{az - 1}$$

$$u = \log(az - 1) + \log c$$

$$x + ay = \log c(az - 1)$$

**Ans.**

**Example 24.** Solve  $z^2(p^2 + q^2) = x^2 + y^2$ , where  $p = \frac{\partial z}{\partial x}$  and  $q = \frac{\partial z}{\partial y}$

(MDU, May, 2006, R.G.P.V, Bhopal June 2009, 2008, 2003)

**Solution.**

$$z^2(p^2 + q^2) = x^2 + y^2$$

The equation can be written as:

$$\left(z \frac{\partial z}{\partial x}\right)^2 + \left(z \frac{\partial z}{\partial y}\right)^2 = x^2 + y^2 \quad \dots (1)$$

Let  $zdz = dZ$  so that

$$Z = \frac{1}{2}z^2$$

Now,

$$\frac{\partial Z}{\partial x} = \frac{\partial Z}{\partial z} \cdot \frac{\partial z}{\partial x} = z \frac{\partial z}{\partial x} \quad \text{and} \quad \frac{\partial Z}{\partial y} = \frac{\partial Z}{\partial z} \cdot \frac{\partial z}{\partial y} = z \frac{\partial z}{\partial y}$$

Therefore, equation (1) becomes

$$\left(\frac{\partial Z}{\partial x}\right)^2 + \left(\frac{\partial Z}{\partial y}\right)^2 = x^2 + y^2$$

$$P^2 + Q^2 = x^2 + y^2, \text{ where } P = \frac{\partial Z}{\partial x} \text{ and } Q = \frac{\partial Z}{\partial y}$$

Or  $P^2 - x^2 = y^2 - Q^2$  which is of the form  $f_1(x, P) = f_2(y, Q)$

Let  $P^2 - x^2 = y^2 - Q^2 = a$  then  $P = \sqrt{x^2 + a}$  and  $Q = \sqrt{y^2 - a}$

Substituting these values of  $P$  and  $Q$  in

$$dZ = Pdx + Qdy, \text{ we get}$$

$$dZ = \sqrt{x^2 + a} dx + \sqrt{y^2 - a} dy$$

$$\text{Integrating } Z = \frac{1}{2}x\sqrt{x^2 + a} + \frac{a}{2} \log(x + \sqrt{x^2 + a}) + \frac{1}{2}y\sqrt{y^2 - a} - \frac{a}{2} \log(y + \sqrt{y^2 - a}) + b$$

$$\Rightarrow z^2 = x\sqrt{x^2 + a} + y\sqrt{y^2 - a} + a \log \frac{x + \sqrt{x^2 + a}}{y + \sqrt{y^2 - a}} + c \quad (\text{where } c = 2b, Z = \frac{1}{2}z^2) \quad \text{Ans.}$$

**Example 25.** Solve  $p(1 + q^2) = q(z - a)$ .

**Solution.** Let  $u = x + by$

$$\text{so that } p = \frac{dz}{du} \quad \text{and} \quad q = b \frac{dz}{du}$$

Substituting these values of  $p$  and  $q$  in the given equation, we have

$$\begin{aligned} \frac{dz}{du} \left[ 1 + b^2 \left( \frac{dz}{du} \right)^2 \right] &= b \frac{dz}{du} (z - a) \\ 1 + b^2 \left( \frac{dz}{du} \right)^2 &= b(z - a) \Rightarrow b^2 \left( \frac{dz}{du} \right)^2 = bz - ab - 1 \\ \frac{dz}{du} &= \frac{1}{b} \sqrt{bz - ab - 1}, \quad \int \frac{b \, dz}{\sqrt{bz - ab - 1}} = \int du + c \\ 2 \sqrt{bz - ab - 1} &= u + c \\ 4(bz - ab - 1) &= (u + c)^2 \\ 4(bz - ab - 1) &= (x + by + cy)^2 \end{aligned} \quad \text{Ans.}$$

**Example 26.** Solve  $z^2(p^2x^2 + q^2) = 1$

(MDU, May 2007, R.G.P.V., Bhopal, II Semester, June 2005)

$$\text{Solution.} \quad z^2(p^2x^2 + q^2) = 1 \quad \dots(1)$$

$$\begin{aligned} \Rightarrow z^2 \left[ \left( x \frac{\partial z}{\partial x} \right)^2 + \left( y \frac{\partial z}{\partial y} \right)^2 \right] &= 1 \quad \Rightarrow z^2 \left[ \left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 \right] = \frac{1}{x^2} \\ \Rightarrow z^2 \left[ \left( \frac{\partial z}{\partial X} \right)^2 + \left( \frac{\partial z}{\partial Y} \right)^2 \right] &= 1 \end{aligned} \quad \dots(2)$$

$$\text{where } \frac{\partial x}{x} = \partial X \Rightarrow \log x = X, \quad \text{Let } u = X + ay$$

$$\frac{\partial z}{\partial X} = \frac{dz}{du} \quad \text{and} \quad \frac{\partial z}{\partial Y} = a \frac{dz}{du}$$

Then (2) becomes

$$\begin{aligned}
 z^2 \left[ \left( \frac{dz}{du} \right)^2 + \left( a \frac{dz}{du} \right)^2 \right] &= 1 \Rightarrow \left( \frac{dz}{du} \right)^2 + a^2 \left( \frac{dz}{du} \right)^2 = \frac{1}{z^2} \\
 \Rightarrow \left( \frac{dz}{du} \right)^2 &= \frac{1}{z^2 (1+a^2)} \Rightarrow \frac{dz}{du} = \frac{1}{z \sqrt{1+a^2}} \Rightarrow z dz = \frac{du}{\sqrt{1+a^2}} \\
 \Rightarrow \int z dz &= \int \frac{du}{\sqrt{1+a^2}} + c \Rightarrow \frac{z^2}{2} = \frac{u}{\sqrt{1+a^2}} + c \\
 \sqrt{1+a^2} \frac{z^2}{2} &= u + c \sqrt{1+a^2} = X + ay + c \sqrt{1+a^2} \\
 \Rightarrow \sqrt{1+a^2} \frac{z^2}{2} &= \log x + ay + c \sqrt{1+a^2} \quad \text{Ans.}
 \end{aligned}$$

### EXERCISE 47.5

Solve the following partial differential equations:

$$1. z^2 (p^2 + q^2 + 1) = 1 \quad \text{Ans. } (1-z^2)^{\frac{1}{2}} = -\frac{x+ay}{\sqrt{1+a^2}} + c$$

$$2. 1 + q^2 = q(z-a) \quad \text{Ans. } \frac{x+by}{b} + \frac{1}{4}(z-a)^2 = \frac{1}{4}(z-a)\sqrt{(z-a)^2 - 2^2} + y \cosh^{-1}\left(\frac{z-a}{2}\right)$$

$$3. x^2 p^2 + y^2 q^2 = z \quad \text{Ans. } 2\sqrt{z} = \frac{\log x + a \log y}{\sqrt{1+a^2}} + c$$

#### Type IV. Equation of the type

$$f_1(x, p) = f_2(y, q)$$

In these equations,  $z$  is absent and the terms containing  $x$  and  $p$  can be written on one side and the terms containing  $y$  and  $q$  can be written on the other side.

**Method.** Let  $f_1(x, p) = f_2(y, q) = a$

$$f_1(x, p) = a, \text{ solve it for } p.$$

$$f_2(y, q) = a, \text{ solve it for } q.$$

$$\text{Since } dz = \frac{\partial z}{\partial x} dx + \frac{\partial z}{\partial y} dy \Rightarrow dz = p dx + q dy$$

$$\Rightarrow dz = F_1(x) dx + F_2(y) dy \Rightarrow z = \int F_1(x) dx + \int F_2(y) dy + c$$

**Example 27.** Solve  $p - x^2 = q + y^2$

$$\begin{aligned}
 \text{Solution.} \quad p - x^2 &= q + y^2 = c & (\text{say}) \\
 i.e. \quad p &= x^2 + c \quad \text{and} \quad q = c - y^2
 \end{aligned}$$

Putting these values of  $p$  and  $q$  in

$$dz = p dx + q dy = (x^2 + c) dx + (c - y^2) dy$$

$$z = \left( \frac{x^3}{3} + cx \right) + \left( cy - \frac{y^3}{3} \right) + c_1 \quad \text{Ans.}$$

**Example 28.** Solve  $p^2 + q^2 = z^2 (x + y)$

$$\begin{aligned}
 \text{Solution} \quad p^2 + q^2 &= z^2 (x + y) \Rightarrow \left( \frac{p}{z} \right)^2 + \left( \frac{q}{z} \right)^2 = (x + y)
 \end{aligned}$$

$$\Rightarrow \left( \frac{1}{z} \frac{\partial z}{\partial x} \right)^2 + \left( \frac{1}{z} \frac{\partial z}{\partial y} \right)^2 = x + y \quad \Rightarrow \left( \frac{\partial z}{\partial x} \right)^2 + \left( \frac{\partial z}{\partial y} \right)^2 = x + y$$

$$\begin{aligned} \Rightarrow & \left( \frac{\partial Z}{\partial x} \right)^2 + \left( \frac{\partial Z}{\partial y} \right)^2 = x + y \quad \Rightarrow \quad \frac{\partial z}{z} = \partial Z \text{ or } \log z = Z \\ \Rightarrow & P^2 + Q^2 = x + y \quad \Rightarrow \quad P^2 - x = y - Q^2 = a \\ & P^2 - x = a \quad \Rightarrow \quad P = \sqrt{a+x} \\ & y - Q^2 = a \quad \Rightarrow \quad Q = \sqrt{y-a} \end{aligned}$$

Therefore, the equation  $dZ = \frac{\partial Z}{\partial x} dx + \frac{\partial Z}{\partial y} dy$

$$dZ = P dx + Q dy$$

gives

$$dZ = \sqrt{a+x} dx + \sqrt{y-a} dy$$

$$Z = \int \sqrt{a+x} dx + \int \sqrt{y-a} dy + c$$

$$\Rightarrow \log z = \frac{2}{3}(a+x)^{\frac{3}{2}} + \frac{2}{3}(y-a)^{\frac{3}{2}} + c \quad \text{Ans.}$$

### EXERCISE 47.6

Solve the following partial differential equations:

1.  $q - p + x - y = 0$  (MDU, May 2010) Ans.  $2z = (x+a)^2 + (y+a)^2 + b$

2.  $\sqrt{p} + \sqrt{q} = 2x$  Ans.  $z = \frac{1}{6}(2x-a)^3 + a^2y + b$

3.  $q = xp + p^2$  Ans.  $z = -\frac{x^2}{4} + \left\{ \frac{x\sqrt{x^2+4a}}{4} + a \log(x + \sqrt{x^2+4a}) \right\} + ay + b$

4.  $z(p^2 - q^2) = x - y$  Ans.  $z^{\frac{3}{2}} = (x+a)^{\frac{3}{2}} + (y+a)^{\frac{3}{2}} + b$

5.  $p^2 - q^2 = x - y$  (MDU, May 2010) Ans.  $z = \frac{2}{3}(x+c)^{\frac{3}{2}} + \frac{2}{3}(y+c)^{\frac{3}{2}} + b$

Tick ✓ the correct answer.

6. The partial differential equation from  $z = (a+x)^2 + y$  is

(i)  $z = \frac{1}{4}\left(\frac{\partial z}{\partial x}\right)^2 + y$  (ii)  $z = \frac{1}{4}\left(\frac{\partial z}{\partial y}\right)^2 + y$  (iii)  $z = \left(\frac{\partial z}{\partial x}\right)^2 + y$  (iv)  $z = \left(\frac{\partial z}{\partial y}\right)^2 + y$  Ans. (i)

7. The solution of  $xp + yq = z$  is

(i)  $f(x, y) = 0$  (ii)  $f\left(\frac{x}{y}, \frac{y}{z}\right) = 0$  (iii)  $f(xy, yz) = 0$  (iv)  $f(x^2, y^2) = 0$  Ans. (ii)

8. The solution of  $p + q = z$  is

(i)  $f(x+y, y+\log z) = 0$  (ii)  $f(xy, y\log z) = 0$   
 (iii)  $f(x-y, y-\log z) = 0$  (iv) None of these Ans. (iii)

9. The solution of  $(y-z)p + (z-x)q = x-y$  is

(i)  $f(x+y+z) = xyz$  (ii)  $f(x^2 + y^2 + z^2) = xyz$   
 (iii)  $f(x^2 + y^2 + z^2, x^2y^2z^2) = 0$  (iv)  $f(x+y+z) = x^2 + y^2 z^2$  Ans. (iv)

### 47.9 CHARPIT'S METHOD

General method for solving partial differential equation with two independent variables.

**Solution.** Let the general partial differential equation be

$$f(x, y, z, p, q) = 0 \quad \dots (1)$$

Since  $z$  depends on  $x, y$ , we have

$$\begin{aligned} dz &= \frac{\partial z}{\partial x} dx + \frac{\partial z}{\partial y} dy \\ dz &= pdx + qdy \end{aligned} \quad \dots (2)$$

The main thing in Charpit's method is to find another relation between the variables  $x, y, z$  and  $p, q$ . Let the relation be

$$\phi(x, y, z, p, q) = 0 \quad \dots (3)$$

On solving (1) and (3), we get the values of  $p$  and  $q$ .

These values of  $p$  and  $q$  when substituted in (2), it becomes integrable.

To determine  $\phi$ , (1) and (3) are differentiated w.r.t.  $x$  and  $y$  giving

$$\left. \begin{aligned} \frac{\partial f}{\partial x} + \frac{\partial f}{\partial z} p + \frac{\partial f}{\partial p} \frac{\partial p}{\partial x} + \frac{\partial f}{\partial q} \frac{\partial q}{\partial x} &= 0 \\ \frac{\partial \phi}{\partial x} + \frac{\partial \phi}{\partial z} p + \frac{\partial \phi}{\partial p} \frac{\partial p}{\partial x} + \frac{\partial \phi}{\partial q} \frac{\partial q}{\partial x} &= 0 \\ \frac{\partial f}{\partial y} + \frac{\partial f}{\partial z} p + \frac{\partial f}{\partial p} \frac{\partial p}{\partial y} + \frac{\partial f}{\partial q} \frac{\partial q}{\partial y} &= 0 \\ \frac{\partial \phi}{\partial y} + \frac{\partial \phi}{\partial z} p + \frac{\partial \phi}{\partial p} \frac{\partial p}{\partial y} + \frac{\partial \phi}{\partial q} \frac{\partial q}{\partial y} &= 0 \end{aligned} \right\} \begin{array}{l} \text{w.r.t. } x, \text{ (First pair)} \\ \text{w.r.t. } y, \text{ (Second pair)} \end{array}$$

Eliminating  $\frac{\partial p}{\partial x}$  between the equation of first pair, we have

$$\begin{aligned} -\frac{\partial p}{\partial y} &= \frac{\frac{\partial f}{\partial x} + \frac{\partial f}{\partial z} p + \frac{\partial f}{\partial q} \frac{\partial q}{\partial x}}{\frac{\partial f}{\partial p}} = \frac{\frac{\partial \phi}{\partial x} + \frac{\partial \phi}{\partial z} p + \frac{\partial \phi}{\partial q} \frac{\partial q}{\partial x}}{\frac{\partial \phi}{\partial p}} \\ \Rightarrow \left( \frac{\partial f}{\partial x} \frac{\partial \phi}{\partial p} - \frac{\partial \phi}{\partial x} \frac{\partial f}{\partial p} \right) + p \left( \frac{\partial f}{\partial z} \frac{\partial \phi}{\partial p} - \frac{\partial \phi}{\partial z} \frac{\partial f}{\partial p} \right) + \frac{\partial q}{\partial x} \left( \frac{\partial f}{\partial q} \frac{\partial \phi}{\partial p} - \frac{\partial \phi}{\partial q} \frac{\partial f}{\partial p} \right) &= 0 \end{aligned} \quad \dots (4)$$

On eliminating  $\frac{\partial q}{\partial y}$  between the equations of second pair, we have

$$\left( \frac{\partial f}{\partial y} \frac{\partial \phi}{\partial q} - \frac{\partial \phi}{\partial y} \frac{\partial f}{\partial q} \right) + q \left( \frac{\partial f}{\partial z} \frac{\partial \phi}{\partial q} - \frac{\partial \phi}{\partial z} \frac{\partial f}{\partial q} \right) + \frac{\partial p}{\partial y} \left( \frac{\partial f}{\partial p} \frac{\partial \phi}{\partial q} - \frac{\partial \phi}{\partial p} \frac{\partial f}{\partial q} \right) = 0 \quad \dots (5)$$

Adding (4) and (5) and keeping in view the relation  $\frac{\partial p}{\partial y} = \frac{\partial^2 z}{\partial x \partial y} = \frac{\partial q}{\partial x}$ , the terms of the last brackets of (4) and (5) cancel. On rearranging, we get

$$\begin{aligned} \frac{\partial \phi}{\partial f} \left( \frac{\partial f}{\partial x} + p \frac{\partial f}{\partial z} \right) + \frac{\partial \phi}{\partial q} \left( \frac{\partial f}{\partial y} + q \frac{\partial f}{\partial z} \right) + \frac{\partial \phi}{\partial z} \left( -p \frac{\partial f}{\partial p} - q \frac{\partial f}{\partial q} \right) + \left( -\frac{\partial f}{\partial p} \right) \frac{\partial \phi}{\partial x} + \left( -\frac{\partial f}{\partial q} \right) \frac{\partial \phi}{\partial y} &= 0 \\ \Rightarrow \left( -\frac{\partial f}{\partial q} \right) \left( \frac{\partial \phi}{\partial x} \right) + \left( -\frac{\partial f}{\partial q} \right) \frac{\partial \phi}{\partial y} + \left( -p \frac{\partial f}{\partial p} - q \frac{\partial f}{\partial q} \right) \frac{\partial \phi}{\partial z} + \left( \frac{\partial f}{\partial x} + p \frac{\partial f}{\partial z} \right) \frac{\partial \phi}{\partial p} + \left( \frac{\partial f}{\partial y} + q \frac{\partial f}{\partial z} \right) \frac{\partial \phi}{\partial q} &= 0 \end{aligned} \quad \dots (6)$$

Equation (6) is a Lagrange's linear equation of the first order with  $x, y, z, p, q$  as independent variables and  $\phi$  as dependent variable. Its subsidiary equations are

$$\frac{dx}{\frac{\partial f}{\partial p}} = \frac{dy}{\frac{\partial f}{\partial q}} = \frac{dz}{-p \frac{\partial f}{\partial p} - q \frac{\partial f}{\partial q}} = \frac{dp}{\frac{\partial f}{\partial x} + p \frac{\partial f}{\partial z}} = \frac{dq}{\frac{\partial f}{\partial y} + q \frac{\partial f}{\partial z}} = \frac{d\phi}{0} \quad \dots (7)$$

(Commit to memory)

Any of the integrals of (7) satisfies (6). Such an integral involving  $p$  or  $q$  or both may be taken as assumed relation (3). However, we should choose the simplest integral involving  $p$  and  $q$  derived from (7). This relation and equation (1) gives the values  $p$  and  $q$ . The values of  $p$  and  $q$  are substituted in (2). On integration new equation (2) gives the solution of (1).

**Example 29.** Solve  $px + qy = pq$

**Solution.**  $f(x, y, z, p, q) = 0$  is  $px + qy - pq = 0 \quad \dots (1)$

$$\frac{\partial f}{\partial x} = p, \quad \frac{\partial f}{\partial y} = q, \quad \frac{\partial f}{\partial z} = 0, \quad \frac{\partial f}{\partial p} = x - q, \quad \frac{\partial f}{\partial q} = y - p$$

Charpit's equations are

$$\begin{aligned} \frac{dx}{-\frac{\partial f}{\partial p}} &= \frac{dy}{-\frac{\partial f}{\partial q}} = \frac{dz}{-p \frac{\partial f}{\partial p} - q \frac{\partial f}{\partial q}} = \frac{dp}{\frac{\partial f}{\partial x} + p \frac{\partial f}{\partial z}} = \frac{dq}{\frac{\partial f}{\partial y} + q \frac{\partial f}{\partial z}} = \frac{d\phi}{0} \\ \frac{dx}{-(x - q)} &= \frac{dy}{-(y - p)} = \frac{dz}{-p(x - q) - q(y - p)} = \frac{dp}{p} = \frac{dq}{q} = \frac{d\phi}{0} \end{aligned}$$

We have to choose the simplest integral involving  $p$  and  $q$

$$\Rightarrow \frac{dp}{p} = \frac{dq}{q} \Rightarrow \log p = \log q + \log a \Rightarrow p = aq$$

Putting for  $p$  in the given equation (1), we get

$$q(ax + y) = aq^2 \quad \therefore q = \frac{y + ax}{a}$$

$$\therefore p = aq = y + ax$$

$$\text{Now } dz = pdx + qdy \quad \dots (2)$$

Putting for  $p$  and  $q$  in (2), we get

$$dz = (y + ax) dx + \frac{y + ax}{a} dy$$

$$adz = (y + ax) dx + (y + ax) dy$$

$$adz = (y + ax)(adx + dy)$$

$$\text{Integrating } az = \frac{(y + ax)^2}{2} + b \quad \text{Ans.}$$

**Example 30.** Solve  $(p^2 + q^2)y = qz \quad \dots (1)$

(MDU, Dec. 2007, R.G.P.V. Bhopal, II Semester, June 2007)

**Solution.**  $f(x, y, z, p, q) = 0$  is  $(p^2 + q^2)y - qz = 0$

$$\frac{\partial f}{\partial x} = 0, \quad \frac{\partial f}{\partial y} = p^2 + q^2, \quad \frac{\partial f}{\partial z} = -q, \quad \frac{\partial f}{\partial p} = 2py, \quad \frac{\partial f}{\partial q} = 2qy - z$$

Now, Charpit's equations are

$$\frac{dx}{-\frac{\partial f}{\partial p}} = \frac{dy}{-\frac{\partial f}{\partial q}} = \frac{dz}{-p \frac{\partial f}{\partial p} - q \frac{\partial f}{\partial q}} = \frac{dp}{\frac{\partial f}{\partial x} + p \frac{\partial f}{\partial z}} = \frac{dq}{\frac{\partial f}{\partial y} + q \frac{\partial f}{\partial z}}$$

$$\Rightarrow \frac{dx}{-2py} = \frac{dy}{-2q+z} = \frac{dz}{-2p^2y - 2q^2y + qz} = \frac{dp}{-pq} = \frac{dq}{p^2 + q^2 - q^2} = \frac{d\phi}{0}$$

We have to choose the simplest integral involving  $p$  and  $q$

$$\frac{dp}{-pq} = \frac{dq}{p^2} \Rightarrow -\frac{dp}{q} = \frac{dq}{p} \Rightarrow pdp + qdq = 0$$

Integrating  $p^2 + q^2 = a^2$  (say)

Putting for  $p^2 + q^2$  in the equation (1), we get

$$a^2y = qz \Rightarrow q = \frac{a^2y}{z} \text{ so } p = \sqrt{a^2 - q^2} = \sqrt{a^2 - \frac{a^4y^2}{z^2}}$$

$$\Rightarrow p = \frac{a}{z} \sqrt{z^2 - a^2y^2}$$

$$\text{Now } dz = pdx + qdy$$

Putting for  $p$  and  $q$  in (2), we get

$$dz = \frac{a}{z} \sqrt{z^2 - a^2y^2} dx + \frac{a^2y}{z} dy \Rightarrow zdz = a\sqrt{z^2 - a^2y^2} dx + a^2ydy$$

$$\frac{zdz - a^2ydy}{\sqrt{z^2 - a^2y^2}} = a dx$$

Integrating, we get

$$\frac{1}{2} \frac{2}{1} \sqrt{z^2 - a^2y^2} = ax + b \quad (\text{Put } z^2 - a^2y^2 = t)$$

$$\text{On squaring, } z^2 - a^2y^2 = (ax + b)^2$$

**Ans.**

**Example 31.** Solve  $2z + p^2 + qy + 2y^2 = 0$

(MDU, Dec. 2006, R.G.P.V. Bhopal, II Semester, June 2006)

**Solution.** Here, we have

Let

$$f = 2z + p^2 + qy + 2y^2 = 0 \quad \dots (1)$$

$\Rightarrow$

$$\frac{\partial f}{\partial x} = 0, \frac{\partial f}{\partial z} = 2, \text{ and } \frac{\partial f}{\partial p} = 2p \quad \dots (2)$$

Charpit's equations are

$$\frac{dx}{-\frac{\partial f}{\partial p}} = \frac{dy}{-\frac{\partial f}{\partial q}} = \frac{dz}{-p \frac{\partial f}{\partial p} - q \frac{\partial f}{\partial q}} = \frac{dp}{\frac{\partial f}{\partial x} + p \frac{\partial f}{\partial z}} = \frac{dq}{\frac{\partial f}{\partial y} + q \frac{\partial f}{\partial z}} = \frac{d\phi}{0}$$

Here, we take

$$\frac{dp}{\frac{\partial f}{\partial x} + p \frac{\partial f}{\partial z}} = \frac{dx}{-\frac{\partial f}{\partial p}} \quad \dots (3)$$

Putting the values of  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial z}$  and  $\frac{\partial f}{\partial p}$  from (2) in (3), we get

$$\frac{dp}{0 + 2p} = \frac{dx}{-2p} \quad \dots (4)$$

$$dp + dx = 0 \Rightarrow p + x = a \Rightarrow p = a - x$$

On putting  $p = a - x$  in (1), we get

$$2z + (a - x)^2 + qy + 2y^2 = 0$$

$$q = -\frac{2z + (a - x)^2 + 2y^2}{y} \quad \dots (5)$$

Putting for  $p$  from (4) and for  $q$  from (5) in  $dz = pdx + qdy$ , we get

$$\begin{aligned} dz &= (a-x) dx - \frac{2z + (a-x)^2 + 2y^2}{y} dy \\ \Rightarrow dz - (a-x)dx + y dy &= -\frac{[2z + (a-x)^2 + y^2]}{y} dy \\ \frac{2[dz - (a-x)dx + ydy]}{2z + (a-x)^2 + y^2} &= -\frac{2}{y} dy \end{aligned}$$

In the L.H.S. the numerator is the differential coefficient of denominator.  
Hence integrating, we get

$$\begin{aligned} \log\{2z + (a-x)^2 + y^2\} &= \log y^{-2} + \log b \quad \Rightarrow \quad 2z + (a-x)^2 + y^2 = \frac{b}{y^2} \\ \therefore 2z &= \frac{b}{y^2} - (a-x)^2 - y^2 \quad \text{Ans.} \end{aligned}$$

**Example 32.** Solve by using the charpits method

$$p^2 + qy = z \quad (\text{MDU, Dec., 2005})$$

**Solution.**  $f(x, y, z, p, q) = 0$  is  $p^2 + qy - z = 0$

$$\frac{\partial f}{\partial x} = 0, \quad \frac{\partial f}{\partial y} = q, \quad \frac{\partial f}{\partial z} = -1, \quad \frac{\partial f}{\partial p} = 2p, \quad \frac{\partial f}{\partial q} = y$$

The subsidiary equations are

$$\frac{dx}{2p} = \frac{dy}{y} = \frac{dz}{2p^2 + qy} = \frac{-dp}{-p} = \frac{-dp}{q + q(-1)}$$

$$\frac{dx}{2p} = \frac{dy}{y} = \frac{dz}{2p^2 + qy} = \frac{dp}{p} = \frac{dq}{0}$$

$$dq = 0 \quad \Rightarrow \quad q = a \quad \text{and} \quad p = \sqrt{z - ay}$$

Substitute the value of  $p$  and  $q$  in  $dz = pdx + qdy$ , we get

$$dz = \sqrt{z - ay} dx + ady$$

$$\frac{dz - ady}{\sqrt{z - ay}} = dx$$

$$\frac{\sqrt{z - ay}}{\frac{1}{2}} = x + b, \quad 2\sqrt{z - ay} = x + b$$

$$4(z - ay) = (x + b)^2 \quad \Rightarrow \quad z - ay = \frac{(x + b)^2}{4}$$

$$\boxed{z = ay + \frac{x^2 + b^2 + 2xb}{4}}$$

Ans.

**Example 33.** Solve  $2(z + xp + yq) = yp^2$  (MDU, Dec., 2008, RGPV, II Sem., Feb., 2006)

**Solution.** Here, we have

$$f = 2(z + xp + yq) - yp^2$$

Forming the auxiliary equations

$$\begin{aligned} \frac{dx}{2x - 2yp} &= \frac{dy}{2y} = \frac{dz}{2xp - 2yp^2 + 2qy} = \frac{dp}{-(2p + 2p)} = \frac{dq}{-(2q - p^2 + 2q)} \\ \Rightarrow \frac{dx}{x - yp} &= \frac{dy}{y} = \frac{dz}{xp - yp^2 + yq} = \frac{dp}{-2p} = \frac{dq}{-\left(2q - \frac{p^2}{2}\right)} \end{aligned}$$

Using second & fourth

$$\frac{dy}{y} = \frac{dp}{-2p} \Rightarrow \log y = -\frac{1}{2} \log p \Rightarrow -2 \log y = \log p \Rightarrow p = ay^{-2} = \frac{a}{y^2}$$

Substituting the value of  $p$  in given PDE, we get

$$\begin{aligned} 2z + 2x\left(\frac{a}{y^2}\right) + 2yq &= y\left(\frac{a}{y^2}\right)^2 \\ \Rightarrow 2yq &= y\left(\frac{a}{y^2}\right)^2 - 2z - 2x\left(\frac{a}{y^2}\right) \Rightarrow q = \frac{a^2}{2y^4} - \frac{z}{y} - \frac{ax}{y^3} \\ \text{Now, } dz &= pdx + qdy \\ \Rightarrow dz &= \frac{a}{y^2} dx + \left(\frac{a^2}{2y^4} - \frac{z}{y} - \frac{ax}{y^3}\right) dy \end{aligned}$$

Regrouping the forms, we get

$$\left(\frac{ydz + zdy}{y}\right) = \left(\frac{ay dx - ax dy}{y^3}\right) + \frac{a^2}{2y^4} dy$$

Multiplying throughout by  $y$ , we get

$$\begin{aligned} y dz + z dy &= a \frac{y dx - x dy}{y^2} + \frac{a^2}{2y^3} dy \\ d(yz) &= ad \left(\frac{x}{y}\right) + \frac{a^2}{2} \frac{dy}{y^3} \end{aligned}$$

On integration, we get

$$yz = a \frac{x}{y} + \frac{a^2}{2} \left( \frac{1}{-2y^2} \right) + b \Rightarrow z = \frac{ax}{y^2} - \frac{a^2}{4y^3} + \frac{b}{y} \quad \text{Ans.}$$

### EXERCISE 47.7

Solve the following partial differential equations:

1.  $z = p \cdot q$

**Ans.**  $2\sqrt{az} = ax + y + \sqrt{ab}$

2.  $(p + q)(px + qy) - 1 = 0$

**Ans.**  $z\sqrt{(1+a)} = 2\sqrt{(ax+y)} + b$

3.  $z = px + qy + p^2 + q^2$

**Ans.**  $z = ax + by + a^2 + b^2$

4.  $z = p^2x + q^2y$

(MDU, May, 2005)

**Ans.**  $(1+a)z = [\sqrt{ax} + \sqrt{(b+y)}]^2$

5.  $z = pq xy$

(MDU, May, 2008)

**Ans.**  $z = ax^b y^{1/b}$

6.  $pxy + pq + qy = yz$

**Ans.**  $\log(z - ax) = y - a \log(a + y) + b$

7.  $q + xp = p^2$

(R.G.P.V. Bhopal, Dec., 2001) **Ans.**  $z = axe^{-y} - \frac{1}{2}a^2 e^{-2y} + b$

8.  $q = px^2 + q^2$

**Ans.**  $z = a \log x + \left( \frac{1 \pm \sqrt{1-4a}}{2} \right) y + b$

9.  $2xz - px^2 - 2qxy + pq = 0$  (MDU, Dec., 2009, Rajasthan, 2006) **Ans.**  $z = ay + b(x^2 - a)$

## LINEAR PARTIAL DIFFERENTIAL EQUATIONS WITH CONSTANT COEFFICIENTS OF 2ND ORDER

---

---

### 48.1 LINEAR HOMOGENEOUS PARTIAL DIFFERENTIAL EQUATIONS OF $n$ TH ORDER WITH CONSTANT COEFFICIENTS

An equation of the type

$$a_0 \frac{\partial^n z}{\partial x^n} + a_1 \frac{\partial^n z}{\partial x^{n-1} \partial y} + \dots + a_n \frac{\partial^n z}{\partial y^n} = F(x, y) \quad \dots (1)$$

is called a homogeneous linear partial differential equation of  $n$ th order with constant coefficients. It is called homogeneous because all the terms contain derivatives of the same order.

Putting  $\frac{\partial}{\partial x} = D$  and  $\frac{\partial}{\partial y} = D'$  in (1), we get

$$(a_0 D^n + a_1 D^{n-1} D' + \dots + a_n D'^n)z = F(x, y)$$

$$\Rightarrow f(D, D')z = F(x, y)$$

### 48.2 RULES FOR FINDING THE COMPLEMENTARY FUNCTION

Consider the equation

$$a_0 \frac{\partial^2 z}{\partial x^2} + a_1 \frac{\partial^2 z}{\partial x \partial y} + a_2 \frac{\partial^2 z}{\partial y^2} = 0 \Rightarrow (a_0 D^2 + a_1 DD' + a_2 D'^2)z = 0$$

**Step 1 :** Put  $D = m$  and  $D' = 1$

$$a_0 m^2 + a_1 m + a_2 = 0$$

This is the auxiliary equation.

**Step 2 :** Solve the auxiliary equation.

**Case 1.** If the roots of the auxiliary equation are real and different; say  $m_1, m_2$ .

Then C.F. =  $f_1(y + m_1 x) + f_2(y + m_2 x)$

$$\text{Theory: } (D - m_1 D')(D - m_2 D')z = 0 \quad \dots (1)$$

(1) will be satisfied by the solution of

$$(D - m_2 D')z = 0 \Rightarrow p - m_2 q = 0 \quad \dots (2)$$

This is a Lagrange's linear equation. Its subsidiary equations are

$$\frac{dx}{1} = \frac{dy}{-m_2} = \frac{dz}{0} \Rightarrow y + m_2 x = C_1 \text{ and } z = C_2$$

$\therefore$  Solution of (2) is  $z = f_2(y + m_2 x)$   
 Similarly the solution of  $(D - m_1 D') z = 0$  is

$$z = f_1(y + m_1 x)$$

Hence the complete solution of (1) is

$$z = f_1(y + m_1 x) + f_2(y + m_2 x)$$

**Case 2.** If the roots are equal; say  $m$

Then

$$C.F. = f_1(y + mx) + x f_2(y + mx)$$

**Theory:**

$$(D - m D')(D - m D')z = 0 \quad \dots(1)$$

Let

$$(D - m D')z = u \quad \dots(2)$$

(1) becomes

$$(D - m D')u = 0 \quad \dots(3)$$

Solution of (3) is

$$u = f(y + mx)$$

(2) becomes  $(D - m D')z = f(y + mx) \Rightarrow p - mq = f(y + mx)$

This is Lagrange's equation and its subsidiary equations are

$$\frac{dx}{1} = \frac{dy}{-m} = \frac{dz}{f(y + mx)}$$

(i)      (ii)      (iii)

From (i) and (ii),  $y + mx = C_1$  and  $dz = f(y + mx) dx$

$$dz = f(C_1) dx \Rightarrow z = f(y + mx).x + f_1(y + mx)$$

S. No.	Roots of A.E.	C.F.
1.	$m_1, m_2, m_3$ (different)	$f_1(y + m_1 x) + f_2(y + m_2 x) + f_3(y + m_3 x)$
2.	$m_1, m_2, m_3$ $\left[ \begin{matrix} m_2 = m_1 \\ m_3 \neq m_1 \end{matrix} \right]$	$f_1(y + m_1 x) + x f_2(y + m_1 x) + f_3(y + m_3 x)$
3.	$m_1, m_2, m_3$ $m_1 = m_2 = m_3$	$f_1(y + m_1 x) + x f_2(y + m_1 x) + x^2 f_3(y + m_1 x)$

**Example 1.** Solve  $(D^3 - 4D^2 D' + 3DD'^2)z = 0$ .

**Solution.**  $(D^3 - 4D^2 D' + 3DD'^2)z = 0. \quad [D = m, D' = 1]$

Its auxiliary equation is  $m^3 - 4m^2 + 3m = 0$

$$m(m^2 - 4m + 3) = 0$$

$$m(m-1)(m-3) = 0 \Rightarrow m = 0, 1, 3$$

The required solution is

$$z = f_1(y) + f_2(y + x) + f_3(y + 3x) \quad \text{Ans.}$$

**Example 2.** Solve  $\frac{\partial^2 z}{\partial x^2} - 4 \frac{\partial^2 z}{\partial x \partial y} + 4 \frac{\partial^2 z}{\partial y^2} = 0$ .

**Solution.**  $(D^2 - 4DD' + 4D'^2)z = 0$

Its auxiliary equation is  $m^2 - 4m + 4 = 0$

[ $D = m, D' = 1$ ]

$$\Rightarrow (m-2)^2 = 0 \Rightarrow m = 2, 2$$

The required solution is

$$z = f_1(y+2x) + x f_2(y+2x)$$

**Ans.**

**Example 3.** Solve the linear partial differential equation

$$\frac{\partial^4 z}{\partial x^4} - 2 \frac{\partial^4 z}{\partial x^3 \partial y} + 2 \frac{\partial^4 z}{\partial x \partial y^3} - \frac{\partial^4 z}{\partial y^4} = 0. \quad (Q.Bank U.P. II semester 2002)$$

**Solution.** Here, we have

$$(D^4 - 2D^3D' + 2DD'^3 - D'^4) z = 0, \text{ where } D \equiv \frac{\partial}{\partial x} \text{ and } D' \equiv \frac{\partial}{\partial y}$$

Auxiliary equation is

$$\begin{aligned} & m^4 - 2m^3 + 2m^2 - 1 = 0 \\ & m^3(m-1) - m^2(m-1) - m(m-1) + 1(m-1) = 0 \\ \Rightarrow & (m^3 - m^2 - m + 1)(m-1) = 0 \\ \Rightarrow & (m+1)(m-1)^3 = 0 \\ \Rightarrow & m = -1, 1, 1, 1 \\ \therefore & z = f_1(y-x) + f_2(y+x) + x f_3(y+x) + x^2 f_4(y+x) \text{ Ans.} \end{aligned}$$

**Example 4.** Solve the linear partial differential equation  $\frac{\partial^4 z}{\partial x^4} + \frac{\partial^4 z}{\partial y^4} = 0$ .

**Solution.**  $(D^4 + D'^4) z = 0$

$$\begin{aligned} \text{Auxiliary equation is } & m^4 + 1 = 0 \\ \Rightarrow & m^4 + 1 + 2m^2 = 2m^2 \end{aligned}$$

$$\Rightarrow (m^2 + 1)^2 - (m\sqrt{2})^2 = 0$$

$$\Rightarrow (m^2 + \sqrt{2}m + 1)(m^2 - \sqrt{2}m + 1) = 0$$

so that  $m^2 + \sqrt{2}m + 1 = 0$  or  $m^2 - \sqrt{2}m + 1 = 0$

$$\Rightarrow m = \frac{-1+i}{\sqrt{2}}, \frac{1+i}{\sqrt{2}}, \frac{-1-i}{\sqrt{2}}, \frac{1-i}{\sqrt{2}},$$

$$\begin{aligned} \text{Hence } z = & f_1 \left\{ y + \left( \frac{-1+i}{\sqrt{2}} \right) x \right\} + f_2 \left\{ y + \left( \frac{1+i}{\sqrt{2}} \right) x \right\} \\ & + f_3 \left\{ y + \left( \frac{-1-i}{\sqrt{2}} \right) x \right\} + f_4 \left\{ y + \left( \frac{1-i}{\sqrt{2}} \right) x \right\} \text{ Ans.} \end{aligned}$$

### EXERCISE 48.1

Solve the following equations:

$$1. \frac{\partial^2 z}{\partial x^2} + 4 \frac{\partial^2 z}{\partial x \partial y} - 5 \frac{\partial^2 z}{\partial y^2} = 0 \quad \text{Ans. } z = f_1(y+x) + f_2(y-5x)$$

$$2. 2 \frac{\partial^2 z}{\partial x^2} + 5 \frac{\partial^2 z}{\partial x \partial y} + 2 \frac{\partial^2 z}{\partial y^2} = 0 \quad \text{Ans. } z = f_1(2y-x) + f_2(y-2x)$$

3.  $(D^3 - 6D^2D' + 11DD'^2 - 6D'^3)z = 0 \quad \text{Ans. } z = f_1(y+x) + f_2(y+2x) + f_3(y+3x)$
4.  $\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = 0 \quad \text{Ans. } z = f_1(y+x) + xf_2(y+x)$
5.  $(D^3 - 6D^2D' + 12DD'^2 - 8D'^3)z = 0 \quad \text{Ans. } z = f_1(y+2x) + xf_2(y+2x) + x^2f_3(y+2x)$
6.  $\frac{\partial^4 z}{\partial x^4} - \frac{\partial^4 z}{\partial y^4} = 0 \quad \text{Ans. } z = f_1(y+x) + f_2(y-x) + f_3(y+ix) + f_4(y-ix)$
7.  $\frac{\partial^3 z}{\partial x^3} - 4 \frac{\partial^3 z}{\partial x^2 \partial y} + 4 \frac{\partial^3 z}{\partial x \partial y^2} = 0 \quad \text{Ans. } z = f_1(y) + f_2(y+2x) + xf_3(y+2x)$
8.  $\frac{\partial^3 z}{\partial x^3} - 7 \frac{\partial^3 z}{\partial x \partial y^2} + 6 \frac{\partial^3 z}{\partial y^3} = 0 \quad \text{Ans. } z = f_1(y+x) + f_2(y+2x) + f_3(y-3x)$
9.  $\frac{\partial^4 z}{\partial x^4} + \frac{\partial^4 z}{\partial y^4} = 2 \frac{\partial^4 z}{\partial x^2 \partial y^2} \quad \text{Ans. } z = f_1(y-x) + xf_2(y-2x) + f_3(y+x) + xf_4(y+x)$

### 48.3 GENERAL RULES FOR FINDING THE PARTICULAR INTEGRAL

Given partial differential equation is

$$f(D, D')z = F(x, y)$$

$$\text{P.I.} = \frac{1}{f(D, D')}F(x, y)$$

If  $f(D, D')$  is a homogeneous function of  $D$  and  $D'$  of degree  $n$  and R.H.S. function  $\phi(ax + by)$ ,  $e^{(ax+by)}$ ,  $ax + by$ ,  $\sin(ax + by)$ . Then the particular integral

$$\text{P.I.} = \frac{1}{F(D, D')} \phi(ax + by)$$

$$\text{P.I. of } \frac{1}{F(D, D')} F(x, y) = \frac{1}{F(a, b)} \int \int \int \cdots \int \phi(u) du \, du \dots du \text{ (n times), where } u = ax + by$$

#### GENERAL RULE

Integrate  $\phi(u)$  w.r.t.  $u$ ,  $n$  times and after integration replace  $u$  by  $ax + by$ .

#### Case of failure:

To find P.I.

The given equation is

$$F(D, D')z = \phi(ax + by) \text{ and } F(a, b) = 0$$

**Procedure:** Let  $F(D, D')$  is a homogeneous function of degree  $n$ .

Differentiating  $F(D, D')$  partially w.r.t  $D$  and multiply L.H.S by  $x$ , we get

$$x \frac{1}{\frac{\partial}{\partial D} F(D, D')} \phi(ax + by)$$

If  $F(a, b)$  is again zero.

Differentiate it second time and multiply by  $x$  to get  $x^2 \frac{1}{\frac{\partial^2}{\partial D^2} F(D, D')} \phi(ax + by)$

If  $F(a, b) \neq 0$  then stop.

If  $F(a, b) = 0$ , then repeat the above procedure. After  $m$  times differentiating and multiplying  $x$  by  $m$  times, we get

$$\text{Let } F(a, b) \neq 0, \text{ then } \left[ \text{Put } \frac{\partial^m}{\partial D^m} F(D, D') = \psi(D, D') \right]$$

$$\text{P.I.} = x^m \frac{1}{(a, b)} \phi(ax + by)$$

### SHORT FORMULAE:

We can find P.I. of function on the R.H.S. of the form  $e^{ax+by}$ ,  $\sin(ax + by)$ ,  $\cos(ax + by)$  either by general formula or by the short formula given below:

(i) When

$$F(x, y) = e^{ax+by}$$

$$\text{P.I.} = \frac{1}{f(D, D')} e^{ax+by} = \frac{e^{ax+by}}{f(a, b)} \quad [\text{Put } D = a, D' = b]$$

**Theory,**

$$De^{ax+by} = ae^{ax+by}, D'e^{ax+by} = be^{ax+by}$$

$$D^2 e^{ax+by} = a^2 e^{ax+by}, DD' e^{ax+by} = ab e^{ax+by}, D'^2 e^{ax+by} = b^2 e^{ax+by}$$

$$\therefore (D^2 + k_1 DD' + k_2 D'^2) e^{ax+by} = (a^2 + k_1 ab + k_2 b^2) e^{ax+by}$$

i.e.,

$$\boxed{f(D, D') e^{ax+by} = f(a, b) e^{ax+by}}$$

$$\Rightarrow \frac{1}{f(D, D')} f(D, D') e^{ax+by} = \frac{1}{f(a, b)} f(a, b) e^{ax+by}$$

$$\Rightarrow \boxed{\frac{1}{f(D, D')} e^{ax+by} = \frac{1}{f(a, b)} e^{ax+by}}$$

(ii) When

$$F(x, y) = \sin(ax + by) \quad \text{or} \quad F(x, y) = \cos(ax + by)$$

$$\text{P.I.} = \frac{1}{f(D^2, DD', D'^2)} \sin(ax + by) = \frac{1}{f(-a^2, -ab, -b^2)} \sin(ax + by)$$

Put

$$D^2 = -a^2, \quad DD' = -ab, \quad D'^2 = -b^2$$

$$\text{P.I.} = \frac{1}{f(D^2, DD', D'^2)} \cos(ax + by) = \frac{1}{f(-a^2, -ab, -b^2)} \cos(ax + by)$$

**Theory.**  $D^2 \sin(ax + by) = -a^2 \sin(ax + by)$

$$DD' \sin(ax + by) = -ab \sin(ax + by)$$

$$D'^2 \sin(ax + by) = -b^2 \sin(ax + by)$$

$$f(D^2, DD', D'^2) \sin(ax + by) = f(-a^2, -ab, -b^2) \sin(ax + by)$$

$$\Rightarrow \frac{1}{f(D^2, DD', D'^2)} f(D^2, DD', D'^2) \sin(ax + by)$$

$$= \frac{1}{f(D^2, DD', D'^2)} f(-a^2, -ab, -b^2) \sin(ax + by)$$

$$\boxed{\frac{1}{f(-a^2, -ab, -b^2)} \sin(ax + by) = \frac{1}{f(D^2, DD', D'^2)} \sin(ax + by)}$$

**Case 1.** When R.H.S. =  $e^{ax+by}$

**Example 5.** Solve:  $\frac{\partial^3 z}{\partial x^3} - 3 \frac{\partial^3 z}{\partial x^2 \partial y} + 4 \frac{\partial^3 z}{\partial y^3} = e^{x+2y}$  (U.P. II Semester, June 2007)

**Solution.**  $\frac{\partial^3 z}{\partial x^3} - 3 \frac{\partial^3 z}{\partial x^2 \partial y} + 4 \frac{\partial^3 z}{\partial y^3} = e^{x+2y}$

Given equation in symbolic form is

$$(D^3 - 3D^2 D' + 4D'^3)z = e^{x+2y}$$

Its A.E. is  $m^3 - 3m^2 + 4 = 0 \Rightarrow m = -1, 2, 2.$

∴ C.F. =  $f_1(y-x) + f_2(y+2x) + xf_3(y+2x)$

$$\text{P.I.} = \frac{1}{D^3 - 3D^2 D' + 4D'^3} e^{x+2y}$$

$$\text{Put } D = 1, D' = 2 \quad = \frac{1}{1-6+32} e^{x+2y} = \frac{e^{x+2y}}{27}$$

Hence, complete solution is

$$z = f_1(y-x) + f_2(y+2x) + xf_3(y+2x) + \frac{e^{x+2y}}{27} \quad \text{Ans.}$$

## EXERCISE 48.2

Solve the following equations:

$$1. \frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial y^2} = e^{x+2y}$$

$$\text{Ans. } z = f_1(y+x) + f_2(y-x) - \frac{e^{x+2y}}{3}$$

$$2. \frac{\partial^2 z}{\partial x^2} - 5 \frac{\partial^2 z}{\partial x \partial y} + 6 \frac{\partial^2 z}{\partial y^2} = e^{x+y}$$

$$\text{Ans. } z = f_1(y+2x) + f_2(y+3x) + \frac{1}{2} e^{x+y}$$

$$3. \frac{\partial^2 z}{\partial x^2} - 4 \frac{\partial^2 z}{\partial x \partial y} + 4 \frac{\partial^2 z}{\partial y^2} = e^{2x+y}$$

$$\text{Ans. } z = f_1(y+2x) + xf_2(y+2x) + \frac{x^2}{2} e^{2x+y}$$

$$4. \frac{\partial^2 z}{\partial x^2} - 7 \frac{\partial^2 z}{\partial x \partial y} + 12 \frac{\partial^2 z}{\partial y^2} = e^{x-y}$$

$$\text{Ans. } z = f_1(y+3x) + f_2(y+4x) + \frac{1}{20} e^{x-y}$$

$$5. \frac{\partial^3 z}{\partial x^3} - 2 \frac{\partial^3 z}{\partial x^2 \partial y} = 2e^{2x-y}$$

$$\text{Ans. } z = f_1(y) + xf_2(y) + f_3(y+2x) + \frac{1}{8} e^{2x-y}$$

$$6. (D^2 - 2DD' + D'^2)z = e^{x+2y}$$

$$\text{Ans. } z = f_1(y+x) + xf_2(y+x) + e^{x+2y}$$

$$7. \frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial y^2} - 2 \frac{\partial z}{\partial x} + 2 \frac{\partial z}{\partial y} = e^{2x+3y}$$

$$\text{Ans. } z = f_1(y+x) + e^{2x} f_2(y-x) - \frac{1}{3} e^{2x+3y}$$

$$8. \frac{\partial^2 z}{\partial x^2} - 5 \frac{\partial^2 z}{\partial x \partial y} + 6 \frac{\partial^2 z}{\partial y^2} = \exp(3x - 2y)$$

$$\text{Ans. } z = f_1(y+2x) + f_2(y+3x) + \frac{1}{63} e^{3x-2y}$$

**Case II.** When R.H.S. =  $\sin(ax + by)$  or  $\cos(ax + by)$

**Example 6.** Solve the linear partial differential equation

$$\frac{\partial^2 z}{\partial x^2} + 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = \sin(2x + 3y) \quad (\text{U.P. II Semester Summer 2006})$$

**Solution.** We have,

$$\frac{\partial^2 z}{\partial x^2} + 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = \sin(2x + 3y)$$

$$(D^2 + 2DD' + D'^2)z = \sin(2x + 3y) \quad \text{where } D = \frac{\partial}{\partial x} \text{ and } D' = \frac{\partial}{\partial y}$$

Put

$$D = m, \quad D' = 1$$

The auxiliary equation is

$$\begin{aligned} m^2 + 2m + 1 &= 0 \\ \Rightarrow (m+1)^2 &= 0 \Rightarrow m = -1, -1 \Rightarrow \text{C.F.} = f_1(y-x) + xf_2(y-x) \\ \text{P.I.} &= \frac{1}{D^2 + 2DD' + D'^2} \sin(2x + 3y) = \frac{1}{-4 + 2(-6) - 9} \sin(2x + 3y) \\ &= \frac{1}{-25} \sin(2x + 3y) \quad \left[ \begin{array}{l} D^2 = -2^2 = -4 \\ D'^2 = -3^2 = -9 \\ DD' = -2 \times 3 = -6 \end{array} \right] \end{aligned}$$

Hence, the complete solution is

$$\begin{aligned} z &= \text{C.F.} + \text{P.I.} \\ \Rightarrow z &= f_1(y-x) + xf_2(y-x) + \frac{1}{-25} \sin(2x + 3y) \\ \Rightarrow z &= f_1(y-x) + xf_2(y-x) - \frac{1}{25} \sin(2x + 3y) \quad \text{Ans.} \end{aligned}$$

**Example 7.** Solve  $(D+1)(D+D'-1)z = \sin(x+2y)$  (U.P. II Semester, 2010)

**Solution.** C.F. =  $e^{-x}\phi(y) + e^x\phi_2(y-x)$

$$\begin{aligned} \text{P.I.} &= \frac{1}{(D+1)(D+D'-1)} \sin(x+2y) = \frac{1}{D^2 + DD' + D' - 1} \sin(x+2y) \\ &= \frac{1}{-1 + (-2) + D' - 1} \sin(x+2y) = \frac{1}{D' - 4} \sin(x+2y) \\ &= \frac{D' + 4}{(D'^2 - 16)} \sin(x+2y) = \frac{D' + 4}{(-4 - 16)} \sin(x+2y) \\ &= -\frac{1}{20}(D' + 4) \sin(x+2y) = -\frac{1}{20}[D' \sin(x+2y) + 4 \sin(x+2y)] \\ &= -\frac{1}{20}[2 \cos(x+2y) + 4 \sin(x+2y)] \end{aligned}$$

Hence, the solution is

$$z = e^{-x}\phi(y) + e^x\phi_2(y-x) - \frac{1}{10}[\cos(x+2y) + 2 \sin(x+2y)] \quad \text{Ans.}$$

**Example 8.** Solve  $\frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial x \partial y} = \sin x \cos 2y$  (U.P., II Semester, June, 2010, 2008)

**Solution.** We have,  $\frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial x \partial y} = \sin x \cos 2y$

The given equation can be written in the form

$$(D^2 - DD')z = \sin x \cos 2y \text{ where } D = \frac{\partial}{\partial x}, D' = \frac{\partial}{\partial y}$$

Writing  $D = m$  and  $D' = 1$ , the auxiliary equation is

$$m^2 - m = 0 \Rightarrow m(m-1) = 0 \Rightarrow m = 0, 1$$

$$\therefore \text{C.F.} = f_1(y) + f_2(y+x)$$

$$\begin{aligned} \text{P.I.} &= \frac{1}{D^2 - DD'} \sin x \cos 2y = \frac{1}{D^2 - DD'} \frac{1}{2} [\sin(x+2y) + \sin(x-2y)] \\ &= \frac{1}{2} \frac{1}{D^2 - DD'} \sin(x+2y) + \frac{1}{2} \frac{1}{D^2 - DD'} \sin(x-2y) \end{aligned}$$

Put  $D^2 = -1, DD' = -2$  in the first integral and  $D^2 = -1, DD' = 2$  in the second integral.

$$= \frac{1}{2} \left[ \frac{\sin(x+2y)}{-1-(-2)} \right] + \frac{1}{2} \left[ \frac{\sin(x-2y)}{-1-(2)} \right] = \frac{1}{2} \sin(x+2y) - \frac{1}{6} \sin(x-2y)$$

Hence the complete solution is  $z = \text{C.F.} + \text{P.I.}$

$$\text{i.e., } z = f_1(y) + f_2(y+x) + \frac{1}{2} \sin(x+2y) - \frac{1}{6} \sin(x-2y) \quad \text{Ans.}$$

**Example 9.** Solve the partial differential equation :

$$\frac{\partial^2 z}{\partial x^2} - 3 \frac{\partial^2 z}{\partial x \partial y} + 2 \frac{\partial^2 z}{\partial y^2} = e^{2x-y} + e^{x+y} + \cos(x+2y) \quad (\text{U.P. II Semester Summer 2006})$$

**Solution.** Given equation is

$$\frac{\partial^2 z}{\partial x^2} - 3 \frac{\partial^2 z}{\partial x \partial y} + 2 \frac{\partial^2 z}{\partial y^2} = e^{2x-y} + e^{x+y} + \cos(x+2y)$$

Given equation can be written as :

$$(D^2 - 3DD' + 2D'^2)z = e^{2x-y} + e^{x+y} + \cos(x+2y)$$

The auxiliary equation is

$$\begin{aligned} m^2 - 3m + 2 &= 0, \Rightarrow m^2 - 2m - m + 2 = 0 \Rightarrow m(m-2) - 1(m-2) = 0 \\ (m-1)(m-2) &= 0 \quad m = 1, 2 \end{aligned}$$

$$\text{Hence, C.F.} = \phi_1(y+x) + \phi_2(y+2x)$$

$$\text{Now P.I.} = \frac{1}{(D-D')(D-2D')} \{e^{2x-y} + e^{x+y} + \cos(x+2y)\}$$

$$\begin{aligned} &= \frac{1}{(D-D')(D-2D')} e^{2x-y} + \frac{1}{(D-D')(D-2D')} e^{x+y} + \frac{1}{(D-D')(D-2D')} \cos(x+2y) \\ &= I_1 + I_2 + I_3 \end{aligned}$$

Let  $I_1 = \frac{1}{(D - D')(D - 2D')} e^{2x-y}$  (Replacing  $D$  by 2 and  $D'$  by -1.)

$$= \frac{1}{(2+1)(2+2)} e^{2x-y} = \frac{1}{12} e^{2x-y}$$

Now,  $I_2 = \frac{1}{(D - D')(D - 2D')} e^{x+y}$ , (Replacing  $D$  by 1 and  $D'$  by 1)

$$= \frac{1}{(D - D')(-1)} e^{x+y} = -\frac{1}{(D - D')} e^{x+y} = -x \frac{1}{1} e^{x+y} = -x e^{x+y}$$

Now,  $I_3 = \frac{1}{(D - D')(D - 2D')} \cos(x + 2y) = \frac{1}{D^2 - 3DD' + 2D'^2} \cos(x + 2y)$   
 $= \frac{1}{-1 - 3(-2) + 2(-4)} \cos(x + 2y)$  (Replacing  $D^2$  by -1;  $DD'$  by -2;  $D'^2$  by -4)

$$= \frac{1}{-1 + 6 - 8} \cos(x + 2y) = -\frac{1}{3} \cos(x + 2y)$$

P.I. =  $I_1 + I_2 + I_3$

Thus required P.I. =  $\frac{1}{12} e^{2x-y} - xe^{x+y} - \frac{1}{3} \cos(x + 2y)$

Hence, the complete solution is

$$z = C.F. + P.I.$$

$$= \phi_1(y+x) + \phi_2(y+2x) + \frac{1}{12} e^{2x-y} - xe^{x+y} - \frac{1}{3} \cos(x + 2y) \quad \text{Ans.}$$

**Example 10.** Solve the P.D.E.  $\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = \sin x$ . (U.P II Semester 2009, 2004)

**Solution.** Here, we have

$$\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = \sin x$$

$$\Rightarrow (D^2 - 2 DD' + D'^2) z = \sin x$$

Its auxiliary equation is  $(m^2 - 2m + 1) = 0 \Rightarrow (m - 1)^2 = 0 \Rightarrow m = 1, 1$

$$C.F. = f_1(x + y) + x f_2(x + y)$$

$$P.I. = \frac{1}{D^2 - 2DD' + D'^2} \sin x = \left[ \frac{1}{-1 - 0 + 0} \right] \sin x = -\sin x \quad \begin{cases} D = 1 \\ D' = 0 \end{cases}$$

Hence, the complete solution is

$$z = C.F. + P.I. = f_1(x + y) + x f_2(x + y) - \sin x \quad \text{Ans.}$$

### EXERCISE 48.3

Solve the following equations :

1.  $[2D^2 - 5DD' + 2D'^2]z = 5 \sin(2x + y)$  Ans.  $z = f_1(y + 2x) + f_2(2y + x) - \frac{5}{3}x \cos(2x + y)$

2.  $\frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial x \partial y} = \cos(x + 2y)$  Ans.  $z = f_1(y) + f_2(y + x) + \cos(x + 2y)$

3.  $(D^2 - DD')z = \cos x \cos 2y$  Ans.  $z = f_1(y) + f_2(y + x) + \frac{1}{2} \cos(x + 2y) - \frac{1}{6} \cos(x - 2y)$

4.  $r - 2s = \sin x \cos 2y$

**Ans.**  $z = f_1(y) + f_2(y + 2x) + \frac{1}{15}(\sin x \cos 2y) + 4 \sin 2y \cos x$

5.  $(D^2 + D'^2)z = \cos mx \cdot \cos ny$

**Ans.**  $z = f_1(y + ix) + f_2(y - ix) - \frac{\cos mx \cdot \cos ny}{(m^2 + n^2)}$

6.  $(D^3 - 7DD'^2 - 6D'^3)z = \sin(x + 2y) + e^{3x+y}$

**Ans.**  $z = f_1(y - x) + f_2(y - 2x) + f_3(y + 3x) - \frac{1}{75} \cos(x + 2y) + \frac{x}{20} e^{3x+y}$

7.  $(D^2 - DD')z = \cos 2y (\sin x + \cos x)$

(U.P; II Semester, 2003)

**Ans.**  $z = f_1(y) + f_2(y + x) + \frac{1}{2} [\sin(x + 2y) + \cos(x + 2y)] - \frac{1}{6} [\sin(x - 2y) + \cos(x - 2y)]$

**Case III.** When R.H.S. =  $\phi(ax + by)$  polynomial

**Example 11.** Solve  $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial x \partial y} - 6 \frac{\partial^2 z}{\partial y^2} = x + y$ .

**Solution.** With  $D = \frac{\partial}{\partial x}$ ,  $D' = \frac{\partial}{\partial y}$ , the given equation can be written in the form

$$(D^2 + DD' - 6D'^2)z = x + y$$

Writing  $D = m$  and  $D' = 1$ , the auxiliary equation is  $m^2 + m - 6 = 0$

$$\Rightarrow (m+3)(m-2) = 0 \Rightarrow m = -3, 2$$

$$\therefore \text{C.F.} = f_1(y - 3x) + f_2(y + 2x)$$

$$\therefore \text{P.I.} = \frac{1}{D^2 + DD' - 6D'^2}(x + y) = \frac{1}{(1)^2 + (1)(1) - 6(1)^2} \int \int u \, du \, du \quad [\text{where } u = x + y]$$

$$= \frac{1}{-4} \frac{u^3}{6} = -\frac{u^3}{24} = \frac{(x + y)^3}{-24}$$

The complete solution is  $z = f_1(y - 3x) + f_2(y + 2x) - \frac{(x + y)^3}{24}$

**Ans.**

**Example 12.** Solve :  $(D^2 + 2DD' - 8D'^2)z = \sqrt{2x + 3y}$

**Solution.** Here, we have

$$(D^2 + 2DD' - 8D'^2)z = \sqrt{2x + 3y}$$

$$\text{A.E. is } m^2 + 2m - 8 = 0 \Rightarrow (m+4)(m-2) = 0 \Rightarrow m = 2, m = -4$$

$$\text{C.F.} = f_1(y + 2x) + f_2(y - 4x)$$

$$\text{P.I.} = \frac{1}{D^2 + 2DD' - 8D'^2} \sqrt{2x + 3y} = \frac{1}{D^2 + 2DD' - 8D'^2} (2x + 3y)^{\frac{1}{2}}$$

$$= \frac{1}{(2)^2 + 2(2)(3) - 8(3)^2} \int \int u^{\frac{1}{2}} \, du \, du, \quad \text{where } u = 2x + 3y$$

$$= \frac{1}{-56} \frac{u^{5/2}}{\frac{3}{2} \cdot \frac{5}{2}} = -\frac{1}{56} \left[ \frac{4}{15} (2x + 3y)^{\frac{5}{2}} \right] = -\frac{1}{210} (2x + 3y)^{\frac{5}{2}}$$

Hence, the complete solution = C.F. + P.I.

$$= f_1(y + 2x) + f_2(y - 4x) - \frac{1}{210} (2x + 3y)^{\frac{5}{2}}$$

**Ans.**

**Example 13.** Solve  $(D^3 - 3D^2D' - 4DD'^2 + 12D'^3)z = \sin(y + 2x)$ .

**Solution.** Here, we have

$$(D^3 - 3D^2D' - 4DD'^2 + 12D'^3)z = 0 \quad \dots(1)$$

Putting  $D = m$  and  $D' = 1$  in (1); we get

$$\text{A.E. is } m^3 - 3m^2 - 4m + 12 = 0$$

$$\Rightarrow m^2(m - 3) - 4(m - 3) = 0$$

$$\Rightarrow (m^2 - 4)(m - 3) = 0 \Rightarrow m = \pm 2, 3$$

$$\therefore \text{C.F.} = f_1(y + 2x) + f_2(y - 2x) + f_3(y + 3x)$$

$$\text{P.I.} = \frac{1}{D^3 - 3D^2D' - 4DD'^2 + 12D'^3} \sin(y + 2x)$$

$$= \frac{1}{2^3 - 3(2)^2(1) - 4(2)(1)^2 + 12(1)^3} \int \int \sin u \, du \, du \, du \quad \left( \begin{array}{l} \text{where } u = y + 2x \\ \text{case of failure} \end{array} \right)$$

$$= x \frac{1}{3D^2 - 6DD' - 4D'^2} \int \int \sin u \, du \, du = \frac{x}{3(2)^2 - 6(2)(1) - 4(1)^2} (-\sin u)$$

$$= \frac{x}{4} \sin(y + 2x)$$

Complete solution is  $z = \text{C.F.} + \text{P.I.} = f_1(y + 2x) + f_2(y - 2x) + f_3(y + 3x) + \frac{x}{4} \sin(y + 2x)$

**Example 14.** Solve :  $(4D^2 - 4DD' + D'^2)z = 16 \log(x + 2y)$

**Solution.** Here, we have  $(4D^2 - 4DD' + D'^2)z = 16 \log(x + 2y)$

Auxiliary equation is

$$4m^2 - 4m + 1 = 0 \Rightarrow (2m - 1)^2 = 0 \Rightarrow m = \frac{1}{2}, \frac{1}{2}$$

$$\text{C.F.} = f_1\left(y + \frac{x}{2}\right) + x f_2\left(y + \frac{x}{2}\right)$$

$$\text{P.I.} = \frac{1}{4D^2 - 4DD' + D'^2} 16 \log(x + 2y)$$

$$= \frac{1}{4(1)^2 - 4(1)(2) + (2)^2} 16 \int \int \log u \, du \, du, \text{ where } u = x + 2y \quad (\text{case of failure})$$

$$= x \frac{1}{8D - 4D'} 16 \int \log u \, du = x \frac{1}{8(1) - 4(2)} 16 \log u \quad (\text{case of failure})$$

$$= 16x^2 \left(\frac{1}{8}\right) \log u = 16 \frac{x^2}{8} \log(x + 2y) = 2x^2 \log(x + 2y)$$

The complete solution = C.F. + P.I.

$$= f_1\left(y + \frac{x}{2}\right) + x f_2\left(y + \frac{x}{2}\right) + 2x^2 \log(x + 2y) \quad \text{Ans.}$$

#### EXERCISE 48.4

Solve the following equations

$$1. \quad \frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial y^2} = x - y$$

$$\text{Ans. } z = f_1(y - x) + f_2(y + x) + \frac{x^3}{6} - \frac{x^2 y}{2}$$

$$2. \quad \frac{\partial^2 z}{\partial x^2} + 3 \frac{\partial^2 z}{\partial x \partial y} - 4 \frac{\partial^2 z}{\partial y^2} = x + \sin y$$

$$\text{Ans. } z = f_1(y + x) + f_2(y - 4x) + \frac{x^3}{6} + \frac{1}{4} \sin y$$

$$3. \frac{\partial^3 z}{\partial x^2 \partial y} - 2 \frac{\partial^3 z}{\partial x \partial y^2} + \frac{\partial^3 z}{\partial y^3} = \frac{1}{x^2}$$

**Ans.**  $z = f_1(x) + f_2(y+x) + xf_3(y+x) - y \log x$

$$4. (D^3 - 4D^2 D' + 5DD'^2 - 2D'^3)z = e^{y+2x} + (y+x)^{\frac{1}{2}}$$

$$\text{Ans. } z = f_1(y+x) + xf_2(y+x) + f_3(y+2x) + xe^{y+x} - \frac{x^2}{3}(y+x)^{\frac{3}{2}}$$

$$5. \frac{\partial^3 z}{\partial x^3} - 4 \frac{\partial^3 z}{\partial x^2 \partial y} + 4 \frac{\partial^3 z}{\partial x \partial y^2} = 2 \sin(3x+2y)$$

$$\text{Ans. } z = f_1(y+2x) + f_2(2y+x) - \frac{5}{3}x \cos(2x+y)$$

$$6. \frac{\partial^2 z}{\partial x^2} - 4 \frac{\partial^2 z}{\partial x \partial y} + 3 \frac{\partial^2 z}{\partial y^2} = \sqrt{x+3y}$$

$$\text{Ans. } z = f_1(y+x) + f_2(y+3x) + \frac{1}{60}(x+3y)^{\frac{5}{2}}$$

**Case IV.** When  $F(x, y) = x^m y^n$

$$P.I. = \frac{1}{f(D, D')} x^m y^n = [f(D, D')]^{-1} x^m y^n$$

(a) If  $m > n$ , then  $\frac{1}{f(D, D')}$  is expanded in the powers of  $\frac{D'}{D}$ .

(b) If  $m < n$ , then  $\frac{1}{f(D, D')}$  is expanded in the powers of  $\frac{D}{D'}$ .

**Example 15.** Solve :  $(D^2 + D'^2)z = x^2 y^2$

**Solution.** Here, we have

$$(D^2 + D'^2)z = x^2 y^2$$

Putting  $D = m$  and  $D' = 1$ , we get the A.E. as

$$m^2 + 1 = 0 \Rightarrow m^2 = -1 \Rightarrow m = \pm i.$$

$$\therefore C.F. = f_1(y+ix) + f_2(y-ix)$$

$$\begin{aligned} P.I. &= \frac{1}{D^2 + D'^2} (x^2 y^2) = \frac{1}{D^2} \cdot \frac{1}{\left(1 + \frac{D'^2}{D^2}\right)} (x^2 y^2) = \frac{1}{D^2} \left(1 + \frac{D'^2}{D^2}\right)^{-1} (x^2 y^2) \\ &= \frac{1}{D^2} \left(1 - \frac{D'^2}{D^2}\right) (x^2 y^2) = \frac{1}{D^2} (x^2 y^2) - \frac{D'^2}{D^4} (x^2 y^2) = \frac{x^4}{12} y^2 - \frac{1}{D^4} (2x^2) \\ &= \frac{x^4}{12} y^2 - 2 \cdot \frac{x^6}{3 \cdot 4 \cdot 5 \cdot 6} = \frac{1}{180} (15x^4 y^2 - x^6) \end{aligned}$$

Thus, the complete solution is

$$z = f_1(y+ix) + f_2(y-ix) + \frac{1}{180} (15x^4 y^2 - x^6) \quad \text{Ans.}$$

$$\text{Example 16. Solve : } \frac{\partial^3 z}{\partial x^3} - \frac{\partial^3 z}{\partial y^3} = x^3 y^3$$

(Q. Bank U.P. 2002)

$$\text{Solution. Here, we have } \frac{\partial^3 z}{\partial x^3} - \frac{\partial^3 z}{\partial y^3} = x^3 y^3 \Rightarrow (D^3 - D'^3)z = x^3 y^3$$

Putting  $D = m$  and  $D' = 1$  in above, we have

$$A.E. \text{ is } m^3 - 1 = 0 \Rightarrow m = 1, w, w^2$$

Where  $w$  is one of the cube roots of unity.

$$\therefore C.F. = f_1(y+x) + f_2(y+wx) + f_3(y+w^2x)$$

$$\begin{aligned}
 P.I. &= \frac{1}{D^3 - D'^3} (x^3 y^3) = \frac{1}{D^3 \left(1 - \frac{D'^3}{D^3}\right)} x^3 y^3 \\
 &= \frac{1}{D^3} \cdot \left(1 - \frac{D'^3}{D^3}\right)^{-1} (x^3 y^3) = \frac{1}{D^3} \left(1 + \frac{D'^3}{D^3}\right) (x^3 y^3) \\
 &= \frac{1}{D^3} \left[ x^3 y^3 + \frac{1}{D^3} D'^3 (x^3 y^3) \right] = \frac{1}{D^3} \left[ x^3 y^3 + \frac{1}{D^3} (6x^3) \right] \\
 &= \frac{1}{D^3} (x^3 y^3) + \frac{1}{D^6} (6x^3) = \frac{x^6 y^3}{6 \cdot 5 \cdot 4} + \frac{6x^9}{4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9} = \frac{x^6 y^3}{120} + \frac{x^9}{10080}
 \end{aligned}$$

Hence, the complete solution is

$$z = C.F. + P.I. = f_1(y + x) + f_2(y + wx) + f_3(y + w^2x) + \frac{x^6 y^3}{120} + \frac{x^9}{10080} \quad \text{Ans.}$$

$$\text{Example 17. Solve } \frac{\partial^2 z}{\partial x^2} + 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = x^2 + xy + y^2$$

$$\text{Solution. Here, we have } \frac{\partial^2 z}{\partial x^2} + 2 \frac{\partial^2 z}{\partial x \partial y} + \frac{\partial^2 z}{\partial y^2} = x^2 + xy + y^2$$

$$\text{A.E. is } m^2 + 2m + 1 = 0 \Rightarrow (m + 1)^2 = 0 \quad \Rightarrow \quad m = -1, -1$$

$$C.F. = f_1(y - x) + xf_2(y - x)$$

$$\begin{aligned}
 P.I. &= \frac{1}{D^2 + 2DD' + D'^2} (x^2 + xy + y^2) = \frac{1}{D^2} \frac{1}{\left(1 + \frac{2D'}{D} + \frac{D'^2}{D^2}\right)} (x^2 + xy + y^2) \\
 &= \frac{1}{D^2} \left(1 + \frac{2D'}{D} + \frac{D'^2}{D^2}\right)^{-1} (x^2 + xy + y^2) \\
 &= \frac{1}{D^2} \left(1 - \frac{2D'}{D} - \frac{D'^2}{D^2} + \frac{4D'^2}{D^2} + \dots\right) (x^2 + xy + y^2) \\
 &= \left(\frac{1}{D^2} - \frac{2D'}{D^3} + \frac{3D'^2}{D^4}\right) (x^2 + xy + y^2) \\
 &= \frac{1}{D^2} (x^2 + xy + y^2) - \frac{2D'}{D^3} (x^2 + xy + y^2) + \frac{3D'^2}{D^4} (x^2 + xy + y^2) \\
 &= \left(\frac{x^4}{12} + \frac{x^3 y}{6} + \frac{x^2 y^2}{2}\right) - \left(\frac{2}{D^3}\right) (x + 2y) + \frac{3}{D^4} (2) \\
 &= \frac{x^4}{12} + \frac{x^3 y}{6} + \frac{x^2 y^2}{2} - \frac{x^4}{12} - \frac{2x^3 y}{3} + \frac{6x^4}{2 \cdot 3 \cdot 4} \\
 &= \frac{x^4}{12} + \frac{x^3 y}{6} + \frac{x^2 y^2}{2} - \frac{x^4}{12} - \frac{2x^3 y}{3} + \frac{x^4}{4} = \frac{x^4}{4} - \frac{1}{2} x^3 y + \frac{x^2 y^2}{2}
 \end{aligned}$$

Hence, the complete solution is

$$z = f_1(y - x) + xf_2(y - x) + \frac{x^4}{4} - \frac{x^3 y}{2} + \frac{x^2 y^2}{2} \quad \text{Ans.}$$

**EXERCISE 48.5**

**Solve the following equations :**

1.  $\frac{\partial^2 z}{\partial x^2} + 3 \frac{\partial^2 z}{\partial x \partial y} + 2 \frac{\partial^2 z}{\partial y^2} = 12xy$  (A.M.I.E., Winter 2001) **Ans.**  $z = f_1(y-x) + f_2(y-2x) + 2x^3y - \frac{3x^4}{2}$

2.  $\frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial x \partial y} - 6 \frac{\partial^2 z}{\partial y^2} = xy$  **Ans.**  $z = f_1(y-2x) + f_2(y+3x) + \frac{x^3y}{6} + \frac{x^4}{24}$

3.  $\frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial y^2} - 3 \frac{\partial z}{\partial x} + 3 \frac{\partial z}{\partial y} = xy + e^{x+2y}$  (Uttarakhand, June 2009, U.P. III Semester, Summer 2002)

**Ans.**  $z = f_1(y+x) + e^{3x}f_2(y-x) - \frac{1}{3} \left( \frac{x^2y}{2} + \frac{x^3}{6} + \frac{x^2}{3} + \frac{xy}{3} + \frac{2x}{9} \right) - xe^{x+2y}$

4.  $(D^3 - 3D^2D')z = x^2y$  **Ans.**  $z = \phi_1(y+x) + \phi_2(y-x) + \frac{1}{12}e^{2x-y} - xe^{x+y} - \frac{1}{3}\cos(x+2y)$

5.  $\frac{\partial^3 z}{\partial x^3} - 2 \frac{\partial^3 z}{\partial x^2 \partial y} = 2e^{2x} + 3x^2y$  **Ans.**  $z = f_1(y) + xf_2(y) + f_3(y+2x) + \frac{1}{60}(15e^{2x} + 3x^5y + x^6)$

6.  $(D^2 - 6DD' + 9D'^2)z = 12x^2 + 36xy$  **Ans.**  $z = f_1(y+3x) + xf_2(y+3x) + 6x^3y + 10x^4$

7.  $(D^2 - D'^2 + D + 3D' - 2)z = e^{x-y} - x^2y$

**Ans.**  $z = e^{-2x}f_1(y+x) + e^xf_2(y-x) - \frac{1}{4}e^{x-y} + \frac{1}{2} \left( x^2y + xy + \frac{3}{2}x^2 + \frac{3y}{2} + 3x + \frac{21}{4} \right)$

**48.4 P.I. OF ANY FUNCTION**

If the function on the R.H.S. of the P.D.E. is not of the form given previous cases

$$\text{P.I.} = \frac{1}{F(D, D')} \phi(x, y)$$

$F(D, D')$  is factorized to get

$$F(D, D') = (D - m_1 D')(D - m_2 D') \dots (D - m_n D')$$

$$\text{P.I.} = \frac{1}{(D - m_1 D)(D - m_2 D') \dots (D - m_n D')} \phi(x, y)$$

Let us consider

$$\text{P.I.} = \frac{1}{D - m_1 D'} \phi(x, y) \quad (\text{Taking only one term})$$

$$\Rightarrow p - m_1 q = \phi(x, y)$$

Subsidiary equations are (Lagrange's equations)

$$\frac{dx}{1} = \frac{dy}{-m_1} = \frac{dz}{\phi(x, y)}$$

From the first two

$$\frac{dy}{1} + m_1 dx = 0 \Rightarrow y + m_1 x = c$$

From the first and last equations, we get

$$dz = \phi(x, y)dx = \phi(x, c - m_1 x) dx$$

$$\Rightarrow z = \int \phi(x, c - m_1 x) dx$$

$$\text{P.I.} = \frac{1}{D - mD'} F(x, y) = \int \phi(x, c - mx) dx$$

where  $c$  is replaced by  $y + mx$  after integration.

Similarly we repeat the above method to get P.I.

**Case V.** When R.H.S. = Any function

**Example 18.** Solve  $(D^2 - DD' - 2D'^2)z = (y-1)e^x$

**Solution.**  $(D^2 - DD' - 2D'^2)z = (y-1)e^x$

$$\text{A.E. is } m^2 - m - 2 = 0$$

$$(m-2)(m+1) = 0 \Rightarrow m = 2, -1$$

$$\text{C.F.} = f_1(y+2x) + f_2(y-x)$$

$$\begin{aligned}\text{P.I.} &= \frac{1}{D^2 - DD' - 2D'^2}(y-1)e^x \\ &= \frac{1}{(D+D')(D-2D')}(y-1)e^x = \frac{1}{D+D'} \int [(c-2x-1)e^x dx] \quad [\text{Put } y = c-2x] \\ &= \frac{1}{D+D'} [(c-2x-1)e^x + 2e^x] = \frac{1}{D+D'} [ce^x - 2xe^x + e^x] \quad [\text{Put } c = y+2x] \\ &= \frac{1}{D+D'} [(y+2x)e^x - 2xe^x + e^x] = \frac{1}{D+D'} [ye^x + e^x] \\ &= \int [(c+x)e^x + e^x] dx \quad [\text{Put } y = c+x] \\ &= (c+x)e^x - e^x + e^x \quad [\text{Put } c = y-x] \\ &= ce^x + xe^x = (y-x)e^x + xe^x = ye^x\end{aligned}$$

Hence, complete solution is

$$\therefore z = f_1(y+2x) + f_2(y-x) + ye^x$$

**Ans.**

**Example 19.** Solve  $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial x \partial y} - 6 \frac{\partial^2 z}{\partial y^2} = y \cos x$ .

(R.G.P.V., Bhopal, June 2009, Feb. 2008, June 2006, 2004, Dec. 2002)

**Solution.** We have,  $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial x \partial y} - 6 \frac{\partial^2 z}{\partial y^2} = y \cos x$

$$\Rightarrow (D^2 + DD' - 6D'^2)z = y \cos x$$

Its auxiliary equation is

$$m^2 + m - 6 = 0 \Rightarrow (m+3)(m-2) = 0 \Rightarrow m = 2, -3$$

$$\therefore \text{C.F.} = f_1(y+2x) + f_2(y-3x)$$

$$\begin{aligned}\text{P.I.} &= \frac{1}{D^2 + DD' - 6D'^2} y \cos x = \frac{1}{(D-2D')(D+3D')} y \cos x \\ &= \frac{1}{D-2D'} \int (c+3x) \cos x dx \quad [\text{Put } y = c+3x] \\ &= \frac{1}{D-2D'} [(c+3x)\sin x + 3\cos x] = \frac{1}{D-2D'} [y \sin x + 3\cos x] \quad [\text{Put } c+3x=y] \\ &= \int [(c-2x)\sin x + 3\cos x] dx \quad [\text{Put } y = c-2x] \\ &= (c-2x)(-\cos x) - 2\sin x + 3\sin x = -y \cos x + \sin x \quad [\text{Put } c-2x=y]\end{aligned}$$

Hence, the complete solution is

$$z = f_1(y+2x) + f_2(y-3x) + \sin x - y \cos x$$

**Ans.**

**Example. 20.** Solve:  $(D^2 + D D' - 6 D'^2) z = x^2 \sin(x+y)$

**Solution.** Here, we have

$$(D^2 + D D' - 6 D'^2) z = x^2 \sin(x+y)$$

Putting  $D = m$  and  $D' = 1$ , we have

$$\text{A.E. is } m^2 + m - 6 = 0 \Rightarrow (m+3)(m-2) = 0 \Rightarrow m = 2, -3$$

$$\text{C.F.} = f_1(y+2x) + f_2(y-3x)$$

$$\text{P.I.} = \frac{1}{D^2 + D D' - 6 D'^2} [x^2 \sin(x+y)] = \frac{1}{(D-2D')(D+3D')} [x^2 \sin(x+y)].$$

$$\text{Let } \frac{1}{D+3D'} [x^2 \sin(x+y)] = u \Rightarrow (D+3D') u = x^2 \sin(x+y)$$

$$\begin{aligned} u &= \int x^2 \sin(x+c+3x) dx = \int x^2 \sin(4x+c) dx \quad [y=c+3x] \\ &= x^2 \left( \frac{-\cos(4x+c)}{4} \right) - (2x) \left( \frac{-\sin(4x+c)}{16} \right) + 2 \frac{\cos(4x+c)}{64} \\ &= \left[ \frac{-x^2}{4} + \frac{1}{32} \right] \cos(4x+c) + \frac{x}{8} \sin(4x+c) \end{aligned} \quad \dots(1)$$

On eliminating  $c$ , we put  $c = y - 3x$  in (1) and get

$$\begin{aligned} u &= \left( \frac{-x^2}{4} + \frac{1}{32} \right) \cos(4x+y-3x) + \frac{x}{8} \sin(4x+y-3x) \\ &= \left( \frac{-x^2}{4} + \frac{1}{32} \right) \cos(x+y) + \frac{x}{8} \sin(x+y) \end{aligned}$$

$$\begin{aligned} \text{P.I.} &= \frac{1}{(D-2D')(D+3D')} x^2 \sin(x+y) = \frac{1}{(D-2D')} u \\ &= \frac{1}{D-2D'} \left[ \left( \frac{-x^2}{4} + \frac{1}{32} \right) \cos(x+y) + \frac{x}{8} \sin(x+y) \right] \\ &= \int \left[ \left( \frac{-x^2}{4} + \frac{1}{32} \right) \cos(x+c-2x) + \frac{x}{8} \sin(x+c-2x) \right] dx \quad (y=c-2x) \\ &= \int \left[ \left( \frac{-x^2}{4} + \frac{1}{32} \right) \cos(c-x) + \frac{x}{8} \sin(c-x) \right] dx \\ &= \left( \frac{-x^2}{4} + \frac{1}{32} \right) \{ -\sin(c-x) \} - \left( \frac{-x}{2} \right) [(-\cos(c-x))] \\ &\quad + \left( \frac{-1}{2} \right) \sin(c-x) + \frac{x}{8} \cos(c-x) - \frac{1}{8} [-\sin(c-x)] \\ &= \left( \frac{x^2}{4} - \frac{1}{32} - \frac{1}{2} + \frac{1}{8} \right) \sin(c-x) + \left( \frac{-x}{2} + \frac{x}{8} \right) \cos(c-x) \\ &= \left( \frac{x^2}{4} - \frac{13}{32} \right) \sin(c-x) - \frac{3x}{8} \cos(c-x) \end{aligned} \quad \dots(2)(c=2x+y)$$

On eliminating  $c$ , we put  $c = 2x + y$  in (2) and get

$$\begin{aligned} \text{P.I.} &= \left( \frac{x^2}{4} - \frac{13}{32} \right) \sin(2x + y - x) - \frac{3x}{8} \cos(2x + y - x) \\ &= \left( \frac{x^2}{4} - \frac{13}{32} \right) \sin(x + y) - \frac{3x}{8} \cos(x + y) \end{aligned}$$

The complete solution = C.F. + P.I.

$$z = f_1(y + 2x) + f_2(y - 3x) + \left( \frac{x^2}{4} - \frac{13}{32} \right) \sin(x + y) - \frac{3x}{8} \cos(x + y) \quad \text{Ans.}$$

$$\text{Example 21. Solve : } (r - 4 D') = \frac{4x}{y^2} - \frac{y}{x^2}$$

**Solution.** Here, we have

$$(D^2 - 4 D'^2) z = \frac{4x}{y^2} - \frac{y}{x^2}$$

$$\text{A.E. is } m^2 - 4 = 0 \Rightarrow (m+2)(m-2) = 0 \Rightarrow m = 2, -2$$

$$\text{C.F.} = f_1(y + 2x) + f_2(y - 2x)$$

$$\text{P.I.} = \frac{1}{D^2 - 4 D'^2} \left( \frac{4x}{y^2} - \frac{y}{x^2} \right) = \frac{1}{(D+2 D')(D-2 D')} \left( \frac{4x}{y^2} - \frac{y}{x^2} \right)$$

$$\text{Let } u = \frac{1}{D-2 D'} \left( \frac{4x}{y^2} - \frac{y}{x^2} \right)$$

$$\Rightarrow (D-2 D') u = \left( \frac{4x}{y^2} - \frac{y}{x^2} \right) \Rightarrow u = \int \left[ \frac{4x}{(c-2x)^2} - \frac{c-2x}{x^2} \right] dx \quad [y = c - 2x]$$

$$= \int \left[ \frac{-2(c-2x) + 2c}{(c-2x)^2} - \frac{c}{x^2} + \frac{2}{x} \right] dx = \int \left[ \frac{-2}{(c-2x)} + \frac{2c}{(c-2x)^2} - \frac{c}{x^2} + \frac{2}{x} \right] dx$$

$$= \log(c-2x) + \frac{c}{c-2x} + \frac{c}{x} + 2 \log x$$

On eliminating  $c$ , replace  $c$  by  $2x + y$  and have

$$u = \log(2x + y - 2x) + \frac{2x + y}{2x + y - 2x} + \frac{2x + y}{x} + 2 \log x$$

$$= \log y + \frac{2x + y}{y} + 2 + \frac{y}{x} + 2 \log x$$

$$\text{Now P.I.} = \frac{1}{(D+2 D')(D-2 D')} \left( \frac{4x}{y^2} - \frac{y}{x^2} \right) = \frac{1}{(D+2 D')} u$$

$$= \frac{1}{D+2 D'} \left[ \log y + \frac{2x + y}{y} + 2 + \frac{y}{x} + 2 \log x \right]$$

$$= \int \left[ \log(c+2x) + \frac{2x+c+2x}{c+2x} + 2 + \frac{c+2x}{x} + 2 \log x \right] dx \quad [y = c + 2x]$$

$$= \int \left[ \log(c+2x) + \frac{2x}{c+2x} + 1 + 2 + \frac{c}{x} + 2 + 2 \log x \right] dx$$

$$\begin{aligned}
&= \int \left[ \log(c+2x) + \frac{2x+c-c}{2x+c} + 5 + \frac{c}{x} + 2 \log x \right] dx \\
&= \int \left[ \log(c+2x) + 1 - \frac{c}{2x+c} + 5 + \frac{c}{x} + 1 \cdot \log x^2 dx \right] \\
&= \left[ x \log(c+2x) - \int x \frac{1}{c+2x} 2 dx + 6x - \frac{c}{2} \log(c+2x) \right. \\
&\quad \left. + c \log x + x \log x^2 - \int \frac{2x}{x^2} \cdot x dx \right] \\
&= x \log(c+2x) - \int \frac{c+2x-c}{c+2x} dx + 6x - \frac{c}{2} \log(c+2x) \\
&\quad + c \log x + x \log x^2 - \int 2 dx \\
&= x \log(c+2x) - x + \frac{c}{2} \log(c+2x) + 6x - \frac{c}{2} \log(c+2x) \\
&\quad + c \log x + x \log x^2 - 2x \\
&= x \log(c+2x) + 3x + c \log x + x \log x^2
\end{aligned}$$

On eliminating  $c$ , replacing  $c$  by  $y - 2x$  and have

$$\begin{aligned}
&= x \log(y - 2x + 2x) + 3x + (y - 2x) \log x + x \log x^2 \\
&= x \log y + 3x + y \log x - 2x \log x + x \log x^2 \\
&= x \log y + 3x + y \log x - x \log x^2 + x \log x^2 \\
&= x \log y + 3x + y \log x
\end{aligned}$$

Hence, the complete solution is

$$y = C.F + P.I. = f_1(y + 2x) + f_2(y - 2x) + x \log y + 3x + y \log x \quad \text{Ans.}$$

**Example 22.** Solve :  $[D^3 + D^2 D' - D D'^2 - D'^3] z = e^x \cos 2y$

**Solution.** We have

$$[D^3 + D^2 D' - D D'^2 - D'^3] z = e^x \cos 2y$$

$$\text{A.E. is } m^3 + m^2 - m - 1 = 0 \Rightarrow (m+1)^2(m-1) = 0 \Rightarrow m = 1, -1, -1$$

$$\text{C.F.} = f_1(y+x) + f_2(y-x) + x f_3(y-x)$$

$$\text{P. I.} = \frac{1}{D^3 + D^2 D' - D D'^2 - D'^3} e^x \cos 2y = \frac{1}{(D+D')^2 (D-D')} e^x \cos 2y$$

$$\text{Let } u = \frac{1}{D-D'} e^x \cos 2y \quad (y = c - x)$$

$$= \int e^x \cos 2(c-x) dx = \frac{e^x}{1+4} [\cos 2(c-x) - 2 \sin(c-x)] \quad \dots (1)$$

On eliminating  $c$ , replace  $c$  by  $x + y$  in (1), and have

$$u = \frac{e^x}{5} [\cos 2(x+y-x) - 2 \sin(x+y-x)] = \frac{e^x}{5} [\cos 2y - 2 \sin 2y]$$

$$\begin{aligned}
\text{Now } & \left[ \frac{1}{(D+D')(D-D')} \right] e^x \cos 2y = \frac{1}{(D+D')} u \\
&= \frac{1}{D+D'} \left[ \frac{e^x}{5} (\cos 2y - 2 \sin 2y) \right] \quad (y = c + x)
\end{aligned}$$

$$\begin{aligned}
&= \int \left[ \frac{e^x}{5} \{ \cos(2c+2x) - 2 \sin(2c+2x) \} \right] dx \\
&= \int \frac{e^x}{5} \cos(2c+2x) dx - 2 \int \frac{e^x}{5} \sin(2c+2x) dx \\
&= \frac{e^x}{5(1+4)} [\cos(2c+2x) + 2 \sin(2c+2x)] - \frac{2e^x}{5(1+4)} [\sin(2c+2x) - 2 \cos(2c+2x)] \\
&= \frac{e^x}{25} [\cos(2c+2x) + 2 \sin(2c+2x) - 2 \sin(2c+2x) + 4 \cos(2c+2x)] \\
&= \frac{e^x}{25} [5 \cos(2c+2x)] = \frac{e^x}{5} \cos(2c+2x)
\end{aligned}$$

On eliminating  $c$ , replace  $c$  by  $y-x$  and have

$$\begin{aligned}
&= \frac{e^x}{5} \cos(2y-2x+2x) = \frac{e^x}{5} \cos 2y \\
\text{P.I. } &= \frac{1}{(D+D')} \left( \frac{1}{D+D'} \frac{1}{D-D'} \right) (e^x \cos 2y) = \frac{1}{D+D'} \frac{e^x}{5} \cos 2y \quad (y=c+x) \\
&= \int \frac{e^x}{5} \cos 2(c+x) dx = \frac{e^x}{5(1+4)} [\cos 2(c+x) + 2 \sin 2(c+x)]
\end{aligned}$$

On eliminating  $c$ , replace  $c$  by  $(y-x)$  and get

$$= \frac{e^x}{25} [\cos 2(y-x+x) + 2 \sin 2(y-x+x)] = \frac{e^x}{25} [\cos 2y + 2 \sin 2y]$$

The complete solution is  $z = C.F. + P.I.$

$$= f_1(y+x) + f_2(y-x) + x f_3(y-x) + \frac{e^x}{25} (\cos 2y + 2 \sin 2y) \quad \text{Ans.}$$

### EXERCISE 48.6

Solve the following equations:

1.  $(D-D')(D+2D')z = (y+1)e^x$  Ans.  $z = f_1(y+x) + f_2(y-2x) + ye^x$
2.  $\frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial y^2} = \tan^3 x \tan y - \tan x \tan^3 y$  Ans.  $z = f_1(y+x) + f_2(x-y) + \frac{1}{2} \tan x \tan y$
3.  $(D^2 - DD' - 2D'^2)z = (2x^2 + xy - y^2) \sin xy - \cos xy$  Ans.  $z = f_1(y+2x) + f_2(y-x) + \sin xy$
4.  $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial x \partial y} - 2 \frac{\partial^2 z}{\partial y^2} = (y-1)e^x$  (Q. Bank, U.P. 2002)
5.  $(D^2 - 6D D' + 9D'^2)z = 12x^2 + 36xy$  Ans.  $z = f_1(y+x) + f_2(y-2x) + (y-2)e^x$   
Ans.  $z = f_1(y+3x) + \bar{x}f_2(y+3x) + 10x^4 + 6x^3y$

### 48.5 NON-HOMOGENEOUS LINEAR EQUATIONS

The linear differential equations which are not homogeneous are called Non-homogeneous Linear Equations.

For example,  $3 \frac{\partial^2 z}{\partial x^2} + 2 \frac{\partial^2 z}{\partial x \partial y} + 4 \frac{\partial^2 z}{\partial y^2} + 5 \frac{\partial z}{\partial x} + \frac{\partial z}{\partial y} + z = 0$

$$f(D, D') = f_1(x, y)$$

Its solution,  $z = C.F. + P.I.$

**Complementary Function:** Let the non-homogeneous equation be

$$(D - mD' - a)z = 0 \quad \text{or} \quad \frac{\partial z}{\partial x} - m \frac{\partial z}{\partial y} - az = 0$$

$$p - mq = az$$

The Lagrange's subsidiary equations are  $\frac{dx}{1} = \frac{dy}{-m} = \frac{dz}{az}$

From first two relations, we have  $-mdx = dy$

$$dy + m dx = 0 \Rightarrow y + mx = c_1 \quad \dots (1)$$

and from first and third relation, we have

$$dx = \frac{dz}{az} \Rightarrow x = \frac{1}{a} \log z + c_2 \Rightarrow z = c_3 e^{ax} \quad \dots (2)$$

From (1) and (2), we have  $z = e^{ax} \phi(y + mx)$

Similarly the solution of  $(D - mD' - a)^2 z = 0$  is

$$z = e^{ax} \phi_1(y + mx) + x e^{ax} \phi_2(y + mx)$$

#### 48.6 IF THE EQUATION IS OF THE FORM

$$(\alpha D + \beta D' + \gamma) z = 0 \Rightarrow \alpha p + \beta q = -\gamma z$$

It is of Lagrange's form.

Lagrange's subsidiary equations are  $\frac{dx}{\alpha} = \frac{dy}{\beta} = \frac{dz}{-\gamma z}$

From first two, we have  $\alpha y - \beta x = C_1$

From first and last, we have  $\frac{dz}{z} = -\frac{\gamma}{\alpha} dx$

$$\Rightarrow \log z = -\frac{\gamma}{\alpha} x + \log c_2 \Rightarrow z = e^{-\frac{\gamma}{\alpha} x} = \phi(C_1) e^{-\frac{\gamma}{\alpha} x} \Rightarrow z = e^{-\frac{\gamma}{\alpha} x} = \varphi(\alpha y - \beta x)$$

where  $\varphi$  is an arbitrary function.

**Example 23.** Solve  $(D + D' - 2)(D + 4D' - 3)z = 0$

**Solution.** The equation can be rewritten as

$$\{D - (-D)' - 2\} \{D - (-4D') - 3\} z = 0$$

Hence the solution is  $z = e^{2x} \phi_1(y - mx) + e^{3x} \phi_2(y - 4mx)$

**Ans.**

**Example 24.** Solve  $(D + 3D' + 4)^2 z = 0$

**Solution.** The equation is rewritten as  $[D - (-3D') - (-4^2)]z = 0$

Hence the solution is  $z = e^{-4x} \phi_1(y - 3x) + x e^{-4x} \phi_2(y - 3x)$

**Ans.**

**Example 25.** Solve  $r + 2s + t + 2p + 2q + z = 0$

**Solution.** The equation is rewritten as

$$(D^2 + 2DD' + D'^2 + 2D + 2D' + 1) z = 0$$

$$\Rightarrow [(D + D')^2 + 2(D + D') + 1]z = 0$$

$$\Rightarrow (D + D' + 1)^2 z = 0$$

$$\Rightarrow [D - (-D') - (-1)]^2 z = 0$$

Hence the solution is

$$z = e^{-x} \phi_1(y-x) + x e^{-x} \phi_2(y-x)$$

**Ans.**

**Example 26.** Solve  $r - t + p - q = 0$

**Solution.** The equation is rewritten as

$$\begin{aligned} & (D^2 - D'^2 + D - D')z = 0 \\ \Rightarrow & [(D - D')(D + D') + 1(D - D')]z = 0 \\ \Rightarrow & (D - D')(D + D' + 1)z = 0 \end{aligned}$$

Hence the solution is

$$z = \phi_1(y+x) + e^{-x} \phi_2(y-x)$$

**Ans.**

### EXERCISE 48.7

**Solve the following equations:**

- |  |   |
|--|---|
| 1. $(D - D')(D + D' - 3)z = 0$             | <b>Ans.</b> $z = \phi_1(y+x) + e^{3x} \phi_2(y-x)$              |
| 2. $(D - D' - 1)(D - D' - 2)z = 0$         | <b>Ans.</b> $z = e^x \phi_1(y+x) + e^{2x} \phi_2(y+x)$          |
| 3. $(D + D' - 1)(D + 2D' - 2)z = 0$        | <b>Ans.</b> $z = e^x \phi_1(y-x) + e^{2x} \phi_2(y-2x)$         |
| 4. $(D^2 + DD' + D' - 1)z = 0$             | <b>Ans.</b> $z = e^{-x} \phi_1(y) + e^x \phi_2(y-x)$            |
| 5. $(D^2 - DD' - 2D'^2 + 2D + 2D')z = 0$   | <b>Ans.</b> $z = \phi_1(y-x) + e^{-2x} \phi_2(y+2x)$            |
| 6. $[D^2 - D'^2 + D + 3D' - 2]z = 0$       | <b>Ans.</b> $z = e^{-2x} \phi_1(y+x) + e^x \phi_2(y-x)$         |
| 7. $(D^2 - a^2 D'^2 + 2abD + 2ab D')z = 0$ | <b>Ans.</b> $z = \phi_1(y-ax) + e^{-2abx} \phi_2(y+ax)$         |
| 8. $t + s + q = 0$                         | <b>Ans.</b> $z = \phi_1(x) + e^{-x} \phi_2(y-x)$                |
| 9. $(D + D' - 1)(D + 2D' - 3)z = 0$        | <b>Ans.</b> $z = e^x \phi_1(y-x) + e^{3x} \phi_2(y-2x)$         |
| 10. $(D - 2D' + 5)^2 z = 0$                | <b>Ans.</b> $z = e^{-5x} \phi_1(y+2x) + x e^{-5x} \phi_2(y+2x)$ |

### Particular Integral

$$\text{Case I. } \frac{1}{F(D, D')} e^{ax+by} = \frac{1}{F(a, b)} e^{ax+by}$$

**Example 27.** Solve  $(D - D' - 2)(D - D' - 3)z = e^{3x-2y}$

**Solution.** The complementary function is

$$\text{C.F.} = e^{2x} \phi_1(y+x) + e^{3x} \phi_2(y+x).$$

$$\text{P.I.} = \frac{1}{(D - D' - 2)(D - D' - 3)} e^{3x-2y} = \frac{1}{[3 - (-2) - 2][3 - (-2) - 3]} e^{3x-2y} = \frac{1}{6} e^{3x-2y}$$

Hence, the complete solution is

$$z = e^{2x} \phi_1(y+x) + e^{3x} \phi_2(y+x) + \frac{1}{6} e^{3x-2y} \quad \text{Ans.}$$

$$\text{Case II. } \frac{1}{F(D^2, DD', D'^2)} \sin(ax+by) = \frac{1}{F(-a^2, -ab, -b^2)} \sin(ax+by)$$

$$\text{Case III. } \frac{1}{F(D, D')} x^m y^n = [F(D, D')^{-1}] x^m y^n$$

**Example 28.** Solve  $[D^2 - D'^2 + D + 3D' - 2]z = x^2 y$

**Solution.**  $(D - D' + 2)(D + D' - 1)z = 0$

$$\text{C.F.} = e^{-2x}\phi_1(y+x) + e^x\phi_2(y-x)$$

$$\begin{aligned} \text{P.I.} &= \frac{1}{(D - D' + 2)(D + D' - 1)} x^2 y \\ &= \frac{1}{D^2 - D'^2 + D + 3D' - 2} x^2 y = -\frac{1}{2} \left[ \frac{1}{1 - \frac{3D'}{2} - \frac{D}{2} + \frac{D'^2}{2} - \frac{D^2}{2}} \right] x^2 y \\ &= -\frac{1}{2} [1 - \frac{1}{2}(3D' + D - D'^2 + D^2)]^{-1} x^2 y \\ &= -\frac{1}{2} [1 + \frac{1}{2}(3D' + D - D'^2 + D^2) + \frac{1}{4}(3D' + D - D'^2 + D^2)^2 \\ &\quad + \frac{1}{8}(3D' + D - D'^2 + D^2)^3 + \dots] x^2 y \\ &= -\frac{1}{2} [1 + \frac{1}{2}(3D' + D - D'^2 + D^2) + \frac{1}{4}(9D'^2 + D^2 + 6DD' + 6D^2D') + \frac{1}{8}(9D^2D') + \dots] x^2 y \\ &= -\frac{1}{2} [x^2 y + \frac{1}{2}(3x^2 + 2xy - 0 + 2y) + \frac{1}{4}(0 + 2y + 12x + 12) + \frac{1}{8}(18)] \\ &= -\frac{1}{2} \left[ x^2 y + \frac{3x^2}{2} + xy + y + \frac{y}{2} + 3x + 3 + \frac{9}{4} \right] = -\frac{1}{2} \left[ x^2 y + \frac{3x^2}{2} + xy + \frac{3y}{2} + 3x + \frac{21}{4} \right] \end{aligned}$$

Hence, the complete solution is

$$z = e^{-2x}\phi_1(y+x) + e^x\phi_2(y-x) - \frac{1}{2} \left[ x^2 y + \frac{3x^2}{2} + xy + \frac{3y}{2} + 3x + \frac{21}{4} \right] \quad \text{Ans.}$$

$$\text{Case IV.} \quad \frac{1}{F(D, D')} [e^{ax+by}\phi(x, y)] = e^{ax+by} \frac{1}{F(D+a, D'+b)} \phi(x, y)$$

**Example 29.** Solve  $(D - 3D' - 2)^2 z = 2e^{2x} \sin(y + 3x)$

**Solution.** A.E. is  $(D - 3D' - 2)^2 = 0$

$$\begin{aligned} \text{C.F.} &= e^{2x}\phi_1(y+3x) + xe^{2x}\phi_2(y+3x) \\ \text{P.I.} &= \frac{1}{(D - 3D' - 2)^2} 2e^{2x} \cdot \sin(y+3x) \\ &= 2e^{2x} \frac{1}{(D+2-3D'^2-2)^2} \sin(y+3x) = 2e^{2x} \frac{1}{(D-3D')^2} \sin(y+3x) \\ &= 2e^{2x} \frac{1}{D^2 + 9D'^2 - 60D'} \sin(y+3x) \\ &\quad [D^2 + 9D'^2 - 60D' = -9 - 9 - 6(-3) = 0] \\ &= 2e^{2x} \cdot x \frac{1}{2(D-3D')} \sin(y+3x) \quad (\text{As denominator becomes zero}) \\ &= 2x^2 e^{2x} \frac{1}{2} \sin(y+3x) \quad (\text{Again differentiate}) \\ &= x^2 e^{2x} \sin(y+3x) \end{aligned}$$

Hence, the complete solution is

$$z = e^{2x}\phi_1(y+3x) + xe^{2x}\phi_2(y+3x) + x^2e^{2x} \sin(y+3x) \quad \text{Ans.}$$

**Example 30.** Solve  $(D^2 + DD' - 6D'^2)z = x^2 \sin(x+y)$

**Solution.**  $(D^2 + DD' - 6D'^2)z = x^2 \sin(x+y)$

For complementary function

$$(D^2 + DD' - 6D'^2) = 0 \text{ or } (D - 2D')(D + 3D') = 0$$

$$\text{C.F.} = \phi_1(y+2x) + \phi_2(y-3x)$$

$$\text{P.I.} = \frac{1}{D^2 + DD' - 6D'^2} x^2 \sin(x+y)$$

$$= \text{Imaginary part of } \frac{1}{D^2 + DD' - 6D'^2} x^2 [\cos(x+y) + i \sin(x+y)]$$

$$= \text{Imaginary part of } \frac{1}{D^2 + DD' - 6D'^2} x^2 e^{i(x+y)}$$

$$= \text{Imaginary part of } e^{iy} \frac{1}{D^2 + Di - 6(i)^2} x^2 e^{ix}$$

$$= \text{Imaginary part of } e^{i(x+y)} \frac{1}{(D+i)^2 + (D+i)i + 6} x^2$$

$$= \text{Imaginary part of } e^{i(x+y)} \frac{1}{D^2 + 3iD + 4} x^2$$

$$= \text{Imaginary part of } \frac{e^{i(x+y)}}{4} \frac{1}{1 + \frac{3iD}{4} + \frac{D^2}{4}} x^2$$

$$= \text{Imaginary part of } \frac{e^{i(x+y)}}{4} \left[ 1 + \frac{3iD}{4} + \frac{D^2}{4} \right]^{-1} x^2$$

$$= \text{Imaginary part of } \frac{e^{i(x+y)}}{4} \left[ 1 - \frac{3iD}{4} - \frac{D^2}{4} - \frac{9D^2}{16} \dots \right] x^2$$

$$= \text{Imaginary part of } \frac{e^{i(x+y)}}{4} \left[ x^2 - \frac{3ix}{2} - \frac{2}{4} - \frac{9}{16}(2) \right]$$

$$= \text{Imaginary part of } \frac{1}{4} [\cos(x+y) + i \sin(x+y)] \left[ x^2 - \frac{3ix}{2} - \frac{13}{8} \right]$$

$$= \frac{1}{4} \left[ \sin(x+y) \left( x^2 - \frac{13}{8} \right) - \frac{3}{2} x \cos(x+y) \right]$$

$$= \frac{1}{4} \sin(x+y) \left( x^2 - \frac{13}{8} \right) - \frac{3x}{8} \cos(x+y)$$

Hence, the complete solution is

$$z = \phi_1(y+2x) + \phi_2(y-3x) + \frac{1}{4} \sin(x+y) \left( x^2 - \frac{13}{8} \right) - \frac{3x}{8} \cos(x+y) \quad \text{Ans.}$$

**EXERCISE 48.8**

Solve the following equations:

1.  $[D^2 + 2DD' + D'^2 - 2D - 2D']z = 0$

**Ans.**  $z = \phi_1(x-y) + e^{2x}\phi_2(x-y)$

2.  $(D^2 - D'^2 - 3D + 3D')z = e^{x-2y}$

**Ans.**  $z = \phi_1(y+x) + e^{3x}\phi_2(y-x) - \frac{1}{12}e^{x-2y}$

3.  $(D - D' - 1)(D + D' - 2)z = e^{2x-y}$

**Ans.**  $z = e^x\phi_1(x+y) + e^{2x}\phi_2(y-x) - \frac{1}{2}e^{2x-y}$

4.  $(D^2 - D'^2 - 3D + 3D')z = e^{x+2y}$

**Ans.**  $z = \phi_1(y+x) + e^{3x}\phi_1(x-y) - xe^{x+2y}$

5.  $(D + D')(D + D' - 2)z = \sin(x + 2y)$

**Ans.**  $z = \phi_1(y-x) + e^{2x}(y-x) + \frac{1}{117}[6\cos(x+2y) - 9\sin(x+2y)]$

6.  $(D^2 - DD' - 2D)z = \cos(3x + 4y)$  **Ans.**  $z = \phi_1(y) + e^{2x}\phi_1(y+x) + \frac{1}{15}[\cos(3x+4y) - 2\sin(3x+4y)]$

7.  $(DD' + D - D' - 1)z = xy$

**Ans.**  $z = e^{-y}\phi_1(x) + e^x\phi_2(y) - (xy + y - x - 1)$

8.  $(D + D' - 1)(D + 2D' - 3)z = 4 + 3x + 6y$

**Ans.**  $z = e^x\phi_1(x-y) + e^{3x}\phi_2(2x-y) + 6 + x + 2y$

9.  $D(D + D' - 1)(D + 3D' - 2)z = x^2 - 4xy + 2y^2$

**Ans.**  $z = \phi_1(y) + e^x\phi_2(x-y) + e^{2x}\phi_3(3x-y) + \frac{1}{2}\left[\frac{x^3}{3} - 2x^2y + 2xy^2 - \frac{7}{2}x^2 + 4xy + \frac{x}{2}\right]$

10.  $(D - D' + 2)(D + D' - 1)z = e^{x-y} - x^2y$

**Ans.**  $z = e^{2y}\phi_1(x+y) + e^x\phi_2(x-y) - \frac{e^{x-y}}{4} + \frac{1}{2}\left[x^2y + xy + \frac{3x^2}{2} + \frac{3}{2}y + 3x + \frac{21}{4}\right]$

11.  $(D^2 - DD' - 2D'^2 + 2D' + 2D)z = e^{2x+3y} + \sin(2x+y) + xy$

**Ans.**  $z = \phi_1(x-y) + e^y\phi_2(2x+y) - \frac{1}{10}e^{2x+3y} - \frac{1}{6}\cos(2x+y) + \frac{x}{24}(6xy - 6y + 9x - 2x^2 - 12)$

**48.7 MONGE'S METHOD**

Let the equation be

$$Rr + Ss + Tt = V \quad \dots (1)$$

where  $R, S, T, V$  are functions of  $x, y, z, p$  and  $q$ .

$$r = \frac{\partial^2 f}{\partial x^2}, \quad s = \frac{\partial^2 f}{\partial x \partial y}, \quad t = \frac{\partial^2 f}{\partial y^2}$$

We have  $dp = \frac{\partial p}{\partial x}dx + \frac{\partial p}{\partial y}dy = rdx + sdy$  ... (2)

and  $dq = \frac{\partial q}{\partial x}dx + \frac{\partial q}{\partial y}dy = sdx + tdy$  ... (3)

From (2) and (3),  $r = \frac{dp - sdy}{dx}$  and  $t = \frac{dq - sdx}{dy}$

Putting for  $r$  and  $t$  in (1), we get

$$\begin{aligned} R\left(\frac{dp - sdy}{dx}\right) + Ss + T\left(\frac{dq - sdx}{dy}\right) &= V \\ \Rightarrow Rdpdy + Tdqdx - Vdxdy - s(Rdy^2 - Sdxdy + Tdx^2) &= 0 \end{aligned} \quad \dots (4)$$

Equation (4) is satisfied if

$$Rdpdy + Tdqdx - Vdxdy = 0 \quad \dots (5)$$

$$Rdy^2 - Sdxdy + Tdx^2 = 0 \quad \dots (6)$$

Equations (5) and (6) are called **Monge's equations**.

Since (6) can be factorised into two equations.

$$dy - m_1 dx = 0 \text{ and } dy - m_2 dx = 0$$

Now combine  $dy - m_1 dx = 0$  and equation (5). If need be, we may also use the relation  $dz = p \cdot dx + q \cdot dy$  while solving (5) and (6). The solution leads to two integrals

$$u(x, y, z, p, q) = a \text{ and } V(x, y, z, p, q) = b$$

Then we get a relation between  $u$  and  $v$ .

$$V = f_1(u) \quad \dots (7)$$

Equation (7) is further integrated by methods of first order equations.

**Note.** If the intermediate solution is of the form  $Pr + Qq = R$ , then we use lagrange's equation.

**Example 31.** Solve  $r = a^2 t$ .

**Solution.** We have  $dp = rdx + sdy$  and  $dq = sdx + tdy$  which gives

$$r = \frac{dp - sdy}{dx} \text{ and } t = \frac{dq - sdx}{dy}$$

Putting these values of  $r$  and  $t$  in  $r = a^2 t$ , we get

$$\frac{dp - sdy}{dx} = a^2 \frac{dq - sdx}{dy} \Rightarrow dp dy - a^2 dx dq - s(dy^2 - a^2 dx^2) = 0$$

Thus, the Monges' equations are  $dpdy - a^2 dxdq = 0$  ... (1)

$$dy^2 - a^2 dx^2 = 0 \quad \dots (2)$$

(2) can be resolved into factors

$$dy - adx = 0 \quad \dots (3)$$

$$\text{and} \quad dy + adx = 0 \quad \dots (4)$$

Combining (3) with (1), we get

$$dp(adx) - a^2 dx dq = 0 \text{ or } dp - adq = 0 \quad \dots (5)$$

(3) and (5) on integration give respectively

$$\text{and} \quad \begin{aligned} y - ax &= A \\ p - aq &= B \end{aligned} \Rightarrow p - aq = f_1(y - ax) \quad \dots (6)$$

Similarly combining (4) and (1)

$$p + aq = f_2(y + ax) \quad \dots (7)$$

Adding and subtracting (6) and (7), we get

$$p = \frac{1}{2}[f_1(y - ax) + f_2(y + ax)], q = \frac{1}{2a}[f_2(y + ax) - f_1(y - ax)]$$

Substituting these values in  $dz = pdx + qdy$

$$\begin{aligned}
 dz &= \frac{1}{2}[f_1(y - ax) + f_2(y + ax)]dx + \frac{1}{2a}[f_2(y + ax) - f_1(y - ax)]dy \\
 dz &= \frac{1}{2a}(dy + adx)f_2(y + ax) - \frac{1}{2a}(dy - adx)f_1(y - ax) \\
 \text{Integrating, } z &= \frac{1}{2a}\phi_1(y + ax) - \frac{1}{2a}\phi_2(y - ax) \\
 \Rightarrow z &= F_1(y + ax) + F_2(y - ax)
 \end{aligned}$$

**Ans.**

**Example 32.** Solve  $r - t \cos^2 x + p \tan x = 0$

**Solution.**  $r = \frac{dp - sdy}{dx}$  and  $t = \frac{dq - sdx}{dy}$

Putting for  $r$  and  $t$  in the given equation, we get

$$\begin{aligned}
 \frac{dp - sdy}{dx} - \frac{dq - sdx}{dy} \cos^2 x + p \tan x &= 0 \\
 \Rightarrow dp dy - sdy^2 - dx dp \cos^2 x + sdx^2 \cos^2 x + p dx dy \tan x &= 0 \\
 \Rightarrow dp dy - dx dq \cos^2 x + p dx dy \tan x - s(dy^2 - dx^2 \cos^2 x) &= 0
 \end{aligned}$$

Monge's equations are

$$dp dy - dx dq \cos^2 x + p dx dy \tan x = 0 \quad \dots(1)$$

$$dy^2 - dx^2 \cos^2 x = 0 \quad \dots(2)$$

Eq. (2) is factorised  $(dy + dx \cos x)(dy - dx \cos x) = 0$

$$dy - dx \cos x = 0 \quad \dots(3)$$

$$dy + dx \cos x = 0 \quad \dots(4)$$

Integrating (3) and (4), we get

$$y - \sin x = A \quad \dots(5)$$

$$y + \sin x = B. \quad \dots(6)$$

Combining (3) and (1), we get

$$dp - dq \cos x + p \tan x dx = 0$$

$$\Rightarrow (dp \sec x + p \sec x \tan x dx) - dq = 0$$

$$\text{Integrating } p \sec x - q = B \quad \dots(7)$$

Combining (5) and (7), we have

$$p \sec x - q = f_1(y - \sin x) \quad \dots(8)$$

In combining (6) and (7), we get

$$p \sec x + q = f_2(y + \sin x) \quad \dots(9)$$

From (5) and (9)

$$p = \frac{1}{2} \cos x [f_1(y - \sin x) + f_2(y + \sin x)] \text{ and } q = \frac{1}{2} [f_2(y + \sin x) - f_1(y - \sin x)]$$

Putting for  $p$  and  $q$  in  $dz = pdx + qdy$ , we get

$$\begin{aligned}
 dz &= \frac{1}{2} \cos x [f_1(y - \sin x) + f_2(y + \sin x)]dx + \frac{1}{2} [f_2(y + \sin x) - f_1(y - \sin x)]dy \\
 \Rightarrow dz &= \frac{1}{2} f_2(y + \sin x)[dy + \cos x dx] - \frac{1}{2} f_1(y - \sin x)[dy - \cos x dx]
 \end{aligned}$$

$$\text{Integrating we get } z = \frac{1}{2} F_2(y + \sin x) + F_1(y - \sin x)$$

**Ans.**

## 48.8 CLASSIFICATION OF PARTIAL DIFFERENTIAL EQUATIONS

(U.P., II Semester, June 2007)

In practical problems, the following types of equations are generally used :

$$(i) \text{ Wave equation: } \frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}$$

$$(ii) \text{ One-dimensional heat flow: } \frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial y^2}$$

$$(iii) \text{ Two-dimensional heat flow: } \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

$$(iv) \text{ Radio equations: } -\frac{\partial V}{\partial x} = L \frac{\partial I}{\partial t}, -\frac{\partial I}{\partial x} = C \frac{\partial V}{\partial t}$$

$$\text{Consider the Equation. } A \frac{\partial^2 u}{\partial x^2} + B \frac{\partial^2 u}{\partial x \partial y} + C \frac{\partial^2 u}{\partial y^2} + F(x, y, u, p, q) = 0 \quad \dots(1)$$

Where A, B, C may be constants or functions of x and y. Now the equation (1) is

1. Parabolic; if  $B^2 - 4AC = 0$

2. Elliptic; if  $B^2 - 4AC < 0$

3. Hyperbolic; if  $B^2 - 4AC > 0$

**1. Parabolic Equation.** The one-dimensional heat conduction equation

$$\frac{\partial u}{\partial t} = C^2 \frac{\partial^2 u}{\partial x^2} \text{ is an example of parabolic partial differential equation e.g.}$$

One dimensional heat flow equation  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$  is parabolic type.

**2. Elliptic Equations**

The following are the examples of elliptic equations.

Two dimensional heat flow equation in steady state given by  $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = 0$  is elliptic in nature.

$$(i) \text{ Laplace equation: } \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

$$(ii) \text{ Poisson equation: } \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y)$$

Laplace equation arises in study-state flow and potential problems.

Poisson equations arises in fluid mechanics electricity and magnetism and torsion problems.

**3. Hyperbolic Equations**

$$\text{The wave equation } \frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}$$

is the simplest example of hyperbolic partial differential equation.

**Remark 1.** If A, B, C in (1) are constants, then nature of equation (1) will be the same for all values of x and y.

**Remark 2.** If A, B, C are functions of x and y in (1), then nature of equation (1) will not for all values of x and y.

**Example 33.** Classify the following equations.

$$(a) 2 \frac{\partial^2 u}{\partial x^2} + 4 \frac{\partial^2 u}{\partial x \partial y} + 3 \frac{\partial^2 u}{\partial y^2} = 0 \quad (Q. Bank U.P. II Semester 2002)$$

$$(b) \frac{\partial^2 u}{\partial x^2} + 4 \frac{\partial^2 u}{\partial x \partial y} + 4 \frac{\partial^2 u}{\partial y^2} = 0 \quad (c) 2 \frac{\partial^2 u}{\partial x^2} + 6 \frac{\partial^2 u}{\partial x \partial y} + 3 \frac{\partial^2 u}{\partial y^2} = 0$$

**Solution.** (a)  $A = 2, B = 4, C = 3$

$$B^2 - 4AC = (4)^2 - 4(2)(3) < 0 \quad \text{Ans. Elliptic}$$

(b)  $A = 1, B = 4, C = 4$

$$B^2 - 4AC = (4)^2 - 4(1)(4) = 0 \quad \text{Ans. Parabolic}$$

(c)  $A = 2, B = 6, C = 3$

$$B^2 - 4AC = (6)^2 - 4(2)(3) = +12 > 0 \quad \text{Ans. Hyperbolic}$$

**Example 34.** Determine whether the following equations are hyperbolic, parabolic and elliptic?

$$(a) x^2 \frac{\partial^2 u}{\partial t^2} - \frac{\partial^2 u}{\partial x^2} = u \quad (b) t \frac{\partial^2 u}{\partial t^2} + 2 \frac{\partial^2 u}{\partial x \partial t} + x \frac{\partial^2 u}{\partial x^2} + \frac{\partial u}{\partial x} = 0$$

$$(c) x \frac{\partial^2 u}{\partial t^2} + t \frac{\partial^2 u}{\partial x \partial t} + \frac{\partial^2 u}{\partial t^2} = 0$$

**Solution.** (a) Here  $A = x^2, B = 0, C = -1$

$$\text{Now, } B^2 - 4AC = (0)^2 - 4x^2(-1) = 4x^2$$

$\therefore$  It is hyperbolic if  $4x^2 > 0$  i.e.,  $x > 0$

parabolic if  $4x^2 = 0$  i.e.,  $x = 0$

Since  $4x^2$  being a square, cannot be negative hence it cannot be elliptic.

(b) Here  $A = t, B = 2, C = x$

$$\text{Now, } B^2 - 4AC = 4 - 4tx$$

It is hyperbolic if  $4 - 4tx > 0$  i.e.,  $tx < 1$

elliptic if  $4 - 4tx < 0$  i.e.,  $tx > 1$

and parabolic if  $4 - 4tx = 0$  i.e.,  $tx = 1$ .

(c) Here  $A = x, B = t, C = 1$

$$\text{Now, } B^2 - 4AC = (t)^2 - 4(x)(1) = t^2 - 4x$$

$\therefore$  It is hyperbolic if  $t^2 - 4x > 0$  i.e.,  $t^2 > 4x$

elliptic if  $t^2 - 4x < 0$  i.e.,  $t^2 < 4x$

and parabolic if  $t^2 - 4x = 0$  i.e.,  $t^2 = 4x$ . Ans.

**Example 35.** Classify the partial differential equation

$$\frac{\partial^2 u}{\partial t^2} + t \frac{\partial^2 u}{\partial x \partial t} + x \frac{\partial^2 u}{\partial x^2} + 2 \frac{\partial u}{\partial t} + \frac{\partial u}{\partial x} + 6u = 0 \quad (Q. Bank U.P. II Semester 2002)$$

**Solution.** We have,

$$\frac{\partial^2 u}{\partial t^2} + t \frac{\partial^2 u}{\partial x \partial t} + x \frac{\partial^2 u}{\partial x^2} + 2 \frac{\partial u}{\partial t} + \frac{\partial u}{\partial x} + 6u = 0$$

Here  $A = 1, B = t, C = x$

$$\text{Now, } B^2 - 4AC = t^2 - 4(1)(x) = t^2 - 4x$$

The equation is elliptic if  $t^2 - 4x < 0$ .

The equation is parabolic if  $t^2 - 4x = 0$ .

The equation is hyperbolic if  $t^2 - 4x > 0$ .

**Ans.**

**Example 36.** Classify the partial differential equation

$$x^2 \frac{\partial^2 u}{\partial t^2} + 3 \frac{\partial^2 u}{\partial x \partial t} + x \frac{\partial^2 u}{\partial x^2} + 17 \frac{\partial u}{\partial t} = 100u \quad (\text{Q. Bank U.P. II Semester 2002})$$

**Solution.** We have,

$$x^2 \frac{\partial^2 u}{\partial t^2} + 3 \frac{\partial^2 u}{\partial x \partial t} + x \frac{\partial^2 u}{\partial x^2} + 17 \frac{\partial u}{\partial t} = 100u$$

Here  $A = x^2$ ,  $B = 3$ ,  $C = x$

Now,  $B^2 - 4AC = (3)^2 - 4x^2 \cdot x = 9 - 4x^3$

The equation is elliptic if  $9 - 4x^3 < 0$ .

The equation is parabolic if  $9 - 4x^3 = 0$ .

The equation is hyperbolic if  $9 - 4x^3 > 0$ .

**Ans.**

**Example 37.** Show that the equation.

$$\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2} \text{ is hyperbolic.}$$

**Solution.** We have,

$$\frac{\partial^2 u}{\partial t^2} - c^2 \frac{\partial^2 u}{\partial x^2} = 0.$$

Here  $A = 1$ ,  $B = 0$ ,  $C = -c^2$

Now,  $B^2 - 4AC = (0)^2 - 4(1)(-c^2) = 4c^2$

Hence,  $B^2 - 4AC > 0$

Thus, the given equation is hyperbolic.

**Proved.**

**Example 38.** Classify the following differential equation as to type in the second quadrant of

$$xy\text{-plane } \sqrt{y^2 + x^2} u_{xx} + 2(x-y) u_{xy} + \sqrt{y^2 + x^2} u_{yy} = 0$$

**Solution.** Here  $A = \sqrt{y^2 + x^2}$ ,  $B = 2(x-y)$ ,  $C = \sqrt{y^2 + x^2}$

Now,  $B^2 - 4AC = 4(x-y)^2 - 4(y^2 + x^2) = -8xy$

In second quadrant,  $y$  is positive while  $x$  is -ve.

$$\Rightarrow B^2 - 4AC = +ve > 0$$

Hence, differential equation is hyperbolic.

**Ans.**

**Example 39.** Match the column for the items of the Left side to that of right side :

A second order P.D.E. in the function ' $u$ ' of two independent variables  $x, y$  given with usual symbols  $Au_{xx} + Bu_{xy} + Cu_{yy} + F(u) = 0$  then

(i) Hyperbolic (a)  $B^2 - 4AC = 0$

(ii) Parabolic (b)  $B^2 - 4AC < 0$

(iii) Elliptic (c)  $B^2 - 4AC > 0$

(iv) Not classifies (d)  $A = B = C = 0$

(U.P., II Semester, June 2009)

**Solution.**

(i) Hyperbolic (c)  $B^2 - 4AC > 0$

**Ans.**

## **EXERCISE 48.9**

**Classify the following partial differential equations:**

$$1. \quad 9\frac{\partial^2 u}{\partial x^2} - 6\frac{\partial^2 u}{\partial x \partial t} + \frac{\partial^2 u}{\partial t^2} = 0 \quad \text{Ans. Parabolic} \quad 2. \quad 3\frac{\partial^2 z}{\partial x^2} + 2\frac{\partial^2 z}{\partial x \partial y} + 4\frac{\partial^2 z}{\partial y^2} = 0 \quad \text{Ans. Elliptic}$$

$$3. \quad 2\frac{\partial^2 z}{\partial x^2} - 6\frac{\partial^2 z}{\partial x \partial y} + 3\frac{\partial^2 z}{\partial y^2} = 0 \quad \text{Ans. Hyperbolic} \quad 4. \quad t\frac{\partial^2 u}{\partial t^2} + 3\frac{\partial^2 u}{\partial x \partial t} + x\frac{\partial^2 u}{\partial x^2} + 17\frac{\partial u}{\partial x} = 0$$

**Ans.** Hyperbolic if  $xt < \frac{9}{4}$ , parabolic if  $xt = \frac{9}{4}$ , elliptic if  $xt > \frac{9}{4}$

5.  $\frac{\partial^2 z}{\partial x^2} = \frac{\partial x}{\partial y}$  (U.P., II Semester, Summer 2003) Ans. Parabolic 6.  $\frac{\partial^2 z}{\partial x^2} = \frac{\partial^2 z}{\partial y^2}$  Ans. Hyperbolic

7.  $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = 0$  (U.P., II Semester, 2010) Ans. Elliptic

Choose the correct answer:

8. The complementary function of  $r - 7s + 6t = e^{x+y}$  is :  
 (i)  $f_1(y-x) + f_2(y-6x)$       (ii)  $f_1(y+x) + f_2(y+6x)$   
 (iii)  $f_1(y+2x) + f_2(y-2x)$       (iv)  $f_1(y+3x) + f_2(y-4x)$       Ans. (ii)

(RGPV Bhopal, II Semester, Feb. 2006)

## APPLICATIONS OF PARTIAL DIFFERENTIAL EQUATIONS

---

### 49.1 INTRODUCTION

In applied mathematics, the partial differential equations generally arise from the mathematical formulation of physical problems. Subject to certain given conditions, called boundary conditions solving such an equation is known as solving a boundary value problem.

The method of solution of such equations differs from that used in the case of ordinary differential equations. We first find out the general solution of the ordinary differential equation and determine the particular solution with the help of given conditions. Here, from the start, we try to find particular solutions of the partial differential equations which satisfy all the boundary conditions. Method of separation of variables is employed to solve the applied partial differential equation.

### 49.2 METHOD OF SEPARATION OF VARIABLES

*(U.P., II Semester, June 2007)*

In this method, we assume that the dependent variable is the product of two functions, each of which involves only one of the independent variables. So two ordinary differential equations are formed.

**Example 1.** Applying the method of separation of variables techniques, find the solution to the P.D.E.

$$3u_x + 2u_y = 0 \dots, \text{ where } u_x = \frac{\partial u}{\partial x}, u_y = \frac{\partial u}{\partial y}.$$

**Solution :** Here we have

$$\frac{3 \partial u}{\partial x} + \frac{2 \partial u}{\partial y} = 0 \quad \dots(1)$$

Let  $u = X(x) Y(y)$  ... (2)

Where  $X$  is a function of  $x$  only and  $Y$  is a function of  $y$  only.

On differentiating (2) partially w.r.t.  $x$ , we get

$$\frac{\partial u}{\partial x} = \frac{\partial X}{\partial x} \cdot Y \quad \dots(3)$$

On differentiating (2) partially w.r.t.  $y$ , we get

$$\frac{\partial u}{\partial y} = X \cdot \frac{\partial Y}{\partial y} \quad \dots(4)$$

Putting the values of  $\frac{\partial u}{\partial x}$  and  $\frac{\partial u}{\partial y}$  from (3) and (4) in (1), we get

$$3 \frac{\partial X}{\partial x} \cdot Y + 2 X \frac{\partial Y}{\partial y} = 0 \quad \dots(5)$$

Dividing (5) by  $XY$ , we get

$$\frac{3}{X} \frac{\partial X}{\partial x} + \frac{2}{Y} \frac{\partial Y}{\partial y} = 0$$

R.H.S is constant for L.H.S,  
So we take both equations  
are equal to  $k$  (constant)

$$\Rightarrow \frac{3}{X} \frac{\partial X}{\partial x} = -\frac{2}{Y} \frac{\partial Y}{\partial y} = k \Rightarrow \frac{3}{X} \frac{\partial X}{\partial x} = k \text{ and } -\frac{2}{Y} \frac{\partial Y}{\partial y} = k$$

$$\Rightarrow \frac{\partial X}{X} = \frac{k}{3} dx \text{ and } \frac{\partial Y}{Y} = -\frac{k}{2} dy \Rightarrow \log X = \frac{k}{3} x + c_1 \text{ and } \log Y = -\frac{k}{2} y + c_2$$

$$\Rightarrow X = e^{\frac{k}{3}x + c_1} \text{ and } Y = e^{-\frac{k}{2}y + c_2}$$

Putting the values of  $X$  and  $Y$  in (2), we get

$$u = e^{\frac{k}{3}x + c_1} e^{-\frac{k}{2}y + c_2} = e^{k\left(\frac{x}{3} - \frac{y}{2}\right) + c_1 + c_2} = e^{k\left(\frac{x}{3} - \frac{y}{2}\right)} \cdot e^{c_1 + c_2}$$

Hence  $u = A e^{k\left(\frac{x}{3} - \frac{y}{2}\right)}$  [where  $A = e^{c_1 + c_2}$ ] Ans.

**Example 2.** Solve the following equation  $\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial z}{\partial x} + \frac{\partial z}{\partial y} = 0$  by the method of separation of variables.

(AMIETE, June 2009, U.P., II Semester, Summer 2009, 2005)

**Solution.** Given equation is

$$\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial z}{\partial x} + \frac{\partial z}{\partial y} = 0 \quad \dots (1)$$

Let

$$z = X(x) Y(y) \quad \dots (2)$$

where  $X$  is a function of  $x$  only and  $Y$  is a function of  $y$  only.

$$\begin{aligned} \frac{\partial z}{\partial x} &= Y \frac{dX}{dx}, & \frac{\partial^2 z}{\partial x^2} &= Y \frac{d^2 X}{dx^2} \\ \frac{\partial z}{\partial y} &= X \frac{dY}{dy} \end{aligned}$$

Putting all values in equation (1), we get  $Y \frac{d^2 X}{dx^2} - 2Y \frac{dX}{dx} + X \frac{dY}{dy} = 0$

Dividing by  $XY$ , we have  $\frac{1}{X} \frac{d^2 X}{dx^2} - \frac{2}{X} \frac{dX}{dx} + \frac{1}{Y} \frac{dY}{dy} = 0$

Separating the variables, we have  $\frac{1}{X} \frac{d^2 X}{dx^2} - \frac{2}{X} \frac{dX}{dx} = -\frac{1}{Y} \frac{dY}{dy} = K$  (let)

where  $K$  is a constant.

$$\begin{array}{c|c} \frac{1}{X} \frac{d^2 X}{dx^2} - \frac{2}{X} \frac{dX}{dx} = K & -\frac{1}{Y} \frac{dY}{dy} = K \\ \frac{d^2 X}{dx^2} - 2 \frac{dX}{dx} = KX & \frac{dY}{dy} + KY = 0 \\ \Rightarrow (D^2 - 2D - K)X = 0 & (D + K)Y = 0 \end{array}$$

$$\begin{aligned}
 \text{A. E. is } & m^2 - 2m - K = 0 \\
 \Rightarrow & m = \frac{2 \pm \sqrt{4 + 4K}}{2} \\
 \Rightarrow & m = 1 \pm \sqrt{1+K} \\
 \text{Thus } & X = C_1 e^{(1+\sqrt{1+K})x} + C_2 e^{(1-\sqrt{1+K})x}
 \end{aligned}
 \quad \left| \quad \begin{aligned}
 \text{A.E. is } & m + K = 0 \Rightarrow m = -K \\
 \Rightarrow & Y = C_3 e^{-Ky} \quad \dots(3)
 \end{aligned} \right.$$

... (4)

Putting the values of  $X$  and  $Y$  from (3) and (4) in (2), we get

$$z = \left\{ C_1 e^{(1+\sqrt{1+K})x} + C_2 e^{(1-\sqrt{1+K})x} \right\} C_3 e^{-Ky} \quad \text{Ans.}$$

**Example 3.** Using the method of separation of variables, solve

$$\frac{\partial u}{\partial x} = 2 \frac{\partial u}{\partial t} + u$$

where  $u(x, 0) = 6e^{-3x}$  (U.P. II Semester summer 2006, A.M.I.E.T.E., Summer 2002)

$$\text{Solution. } \frac{\partial u}{\partial x} = 2 \frac{\partial u}{\partial t} + u \quad \dots(1)$$

$$\text{Let } u = X(x)T(t) \quad \dots(2)$$

where  $X$  is a function of  $x$  only and  $T$  is a function of  $t$  only.

Putting the value of  $u$  in (1), we get

$$\frac{\partial(XT)}{\partial x} = 2 \frac{\partial}{\partial t}(XT) + XT, \quad T \frac{dX}{dx} = 2X \frac{dT}{dt} + XT$$

On separating the variables, we get

$$\begin{aligned}
 \frac{1}{X} \frac{dX}{dx} &= \frac{2}{T} \frac{dT}{dt} + 1 = C && [\text{On dividing by } XT] \\
 \frac{1}{X} \frac{dX}{dx} &= C && \frac{2}{T} \frac{dT}{dt} + 1 = C \\
 \Rightarrow \frac{dX}{dx} &= CX && \Rightarrow \frac{dT}{dt} + \frac{T}{2} = \frac{CT}{2} \\
 \Rightarrow DX - CX &= 0 && \Rightarrow DT - \left( \frac{C}{2} - \frac{1}{2} \right)T = 0 \\
 \Rightarrow (D - C)X &= 0 && \text{A.E. is } m - \left( \frac{C}{2} - \frac{1}{2} \right) = 0 \Rightarrow m = \frac{1}{2}(C - 1) \\
 \text{A.E. is } m - C &= 0 \Rightarrow m = C && \Rightarrow T = be^{\frac{1}{2}(c-1)t} \\
 \Rightarrow X &= ae^{cx} &&
 \end{aligned}$$

Putting the values of  $X$  and  $T$  in (2), we have

$$\begin{aligned}
 u &= ae^{cx} \cdot be^{\frac{1}{2}(c-1)t} \\
 \Rightarrow u &= ab e^{cx + \frac{1}{2}(c-1)t} \quad \dots(3)
 \end{aligned}$$

On putting  $t = 0$  and  $u = 6e^{-3x}$  in (3), we get

$$6e^{-3x} = abe^{cx} \Rightarrow ab = 6 \text{ and } c = -3$$

Putting the values of  $ab$  and  $c$  in (3), we have

$$u = 6e^{-\frac{3x+1}{2}(-3-1)t}$$

$$u = 6e^{-3x-2t}$$

**Ans.**

which is the required solution.

**Example 4.** Solve the following equation by the method of separation of variables

$$\frac{\partial^2 u}{\partial x \partial t} = e^{-t} \cos x$$

given that  $u = 0$  when  $t = 0$  and  $\frac{\partial u}{\partial t} = 0$  when  $x = 0$ . [U.P. II Semester, (SUM) 2008]

**Solution.** Let  $u = XT$  ... (1)

where  $X$  is a function of  $x$  only and  $T$  is a function of  $t$  only.

Then,  $\frac{\partial u}{\partial t} = \frac{\partial}{\partial t}(XT) = X \frac{dT}{dt}$

$$\therefore \frac{\partial^2 u}{\partial x \partial t} = \frac{\partial}{\partial x} \left( X \frac{dT}{dt} \right) = \frac{dT}{dt} \cdot \frac{dX}{dx} \quad \dots(2)$$

Substituting the value  $\frac{\partial^2 u}{\partial x \partial t}$  from (2) in the given equation, we get

$$\frac{dT}{dt} \frac{dX}{dx} = e^{-t} \cos x$$

Separating the variables, we get

$$e^t \frac{dT}{dt} = \frac{\cos x}{\left( \frac{dX}{dx} \right)} = -p^2 \text{ (say)} \quad \dots(3)$$

Now,  $e^t \frac{dT}{dt} = -p^2 \quad \text{Also,} \quad \frac{dX}{dx} = -\frac{1}{p^2} \cos x$

$$\Rightarrow dT = -p^2 e^{-t} dt \quad dX = -\frac{1}{p^2} \cos x dx$$

On integration, we get

$$T = p^2 e^{-t} + c_1 \quad \dots(4) \quad X = -\frac{1}{p^2} \sin x + c_2 \quad \dots(5)$$

Putting the values of  $X$  and  $T$  from (4) and (5) in (1), we get

$$u = XT = \left( -\frac{1}{p^2} \sin x + c_2 \right) (p^2 e^{-t} + c_1) \quad \dots(6)$$

On putting  $u = 0$  and  $t = 0$  in (6), we get

$$0 = \left( -\frac{1}{p^2} \sin x + c_2 \right) (p^2 + c_1)$$

$$\Rightarrow p^2 + c_1 = 0 \Rightarrow c_1 = -p^2$$

Differentiating (6) w.r.t. "t", we get

$$\frac{\partial u}{\partial t} = \left( -\frac{1}{p^2} \sin x + c_2 \right) (-p^2 e^{-t}) \quad \dots(7)$$

Putting  $\frac{\partial u}{\partial t} = 0$  when  $x = 0$  in (7), we get  
 $0 = c_2 (-p^2 e^{-t})$   
 $\Rightarrow c_2 = 0$   
Substituting the values of  $c_1 = -p^2$  and  $c_2 = 0$  in (6), we get  
 $u = -\frac{1}{p^2} \sin x (p^2 e^{-t} - p^2)$   
 $= (1 - e^{-1}) \sin x$

**Ans.**

**Example 5.** Solve the P.D.E. by separation of variables method,  
 $u_{xx} = u_y + 2u$ ,  $u(0, y) = 0$

$$\frac{\partial}{\partial x} u(0, y) = 1 + e^{-3y}. \quad (\text{U.P. II Semester, 2010, 2009})$$

**Solution.** Let  $u = XY$  ... (1)

where  $X$  is a function of  $x$  only and  $Y$  is a function of  $y$  only.

On differentiating, we get

$$\frac{\partial u}{\partial y} = \frac{\partial}{\partial y}(XY) = X \frac{dY}{dy} = XY' \text{ and}$$

$$\frac{\partial u}{\partial x} = \frac{\partial}{\partial x}(XY) = Y \frac{dX}{dx} \text{ and } \frac{\partial^2 u}{\partial x^2} = \frac{\partial}{\partial x} \left[ Y \frac{dX}{dx} \right] = Y \frac{d^2 X}{dx^2}$$

Putting the values of  $u_{xx}$  and  $u_y$  and  $u$  in the given equation, we get

$$YX'' = XY' + 2XY$$

On separating the variables, we

$$\begin{aligned} \frac{X''}{X} &= \frac{Y' + 2Y}{Y} \\ \Rightarrow \frac{X''}{X} &= \frac{Y'}{Y} + 2 = k \text{ (say)} \quad \dots(2) \\ (i) \quad \frac{X''}{X} &= k \\ \Rightarrow X'' - kX &= 0 \quad \Rightarrow \begin{cases} \frac{Y'}{Y} + 2 = k \\ \frac{Y'}{Y} = k - 2 \\ \frac{dY}{Y} = (k - 2) dy \\ \log Y = (k - 2)y + \log C_3 \\ Y = C_3 e^{(k-2)y} \end{cases} \\ A.E. \text{ is} \quad m^2 - k &= 0 \Rightarrow m = \pm \sqrt{k} \quad \Rightarrow \\ \therefore X &= C_1 e^{\sqrt{k}x} + C_2 e^{-\sqrt{k}x} \quad \Rightarrow \\ \therefore & \end{aligned}$$

On putting the values of  $X$  and  $Y$  in (1), we get

$$u = (C_1 e^{\sqrt{k}x} + C_2 e^{-\sqrt{k}x}) C_3 e^{(k-2)y} \quad \dots(3)$$

On putting  $x = 0$  and  $u = 0$  in (3), we get

$$\begin{aligned} 0 &= (C_1 + C_2) C_3 e^{(k-2)y} \quad (C_3 e^{(k-2)y} \neq 0) \quad \dots(4) \\ \Rightarrow C_1 + C_2 &= 0 \Rightarrow C_2 = -C_1 \end{aligned}$$

On putting  $C_2 = -C_1$  in (4), we get

$$u = \sum C_1 C_3 (e^{\sqrt{k}x} - e^{-\sqrt{k}x}) e^{(k-2)y} \quad \dots(5)$$

On differentiating (5), w.r.t.  $x$ , we get

$$\frac{\partial u}{\partial x} = \sum C_1 C_3 \sqrt{k} (e^{\sqrt{k}x} + e^{-\sqrt{k}x}) e^{(k-2)y} \quad \dots(6)$$

On putting  $x = 0$  and  $\frac{\partial u}{\partial x} = 1 + e^{-3y}$  in (6), we get

$$1 + e^{-3y} = \sum C_1 C_3 \sqrt{k} (2) e^{(k-2)y} = \sum_{n=1}^{\infty} b_n e^{(k-2)y}$$

$$1 + e^{-3y} = \sum C_1 C_3 \sqrt{k} (2) e^{(k-2)y} = b_1 e^{(k-2)y} + b_2 e^{(k-2)y} + b_3 e^{(k-2)y} + \dots$$

Comparing the coefficients, we get

$$b_1 = 1, k - 2 = 0 \Rightarrow k = 2$$

Again comparing, we get

$$2C_1 C_3 \sqrt{k} = 1, \Rightarrow C_1 C_3 = \frac{1}{2\sqrt{k}} = \frac{1}{2\sqrt{2}} \quad (\because k = 2)$$

Again comparing  $b_3$  on both the sides, we get

$$b_3 = -1, k - 2 = -3 \Rightarrow k = -1$$

Again comparing  $b_3$ , we get

$$2C_1 C_3 \sqrt{k} = 1 \Rightarrow C_1 C_3 = \frac{1}{2\sqrt{k}} = \frac{1}{2\sqrt{-1}} = \frac{1}{2i} \quad (\because k = -1)$$

$$\text{Hence, } u(x, y) = \frac{1}{2\sqrt{2}} (e^{\sqrt{2}x} - e^{-\sqrt{2}x}) + \frac{1}{2i} (e^{ix} - e^{-ix}) e^{-3y}$$

$$u(x, y) = \frac{1}{\sqrt{2}} \sinh \sqrt{2} x + e^{-3y} \sin x. \quad \text{Ans.}$$

### EXERCISE 49.1

Using the method of separation of variables, find the solution of the following equations

$$1. \quad 2x \frac{\partial z}{\partial x} - 3y \frac{\partial z}{\partial y} = 0 \quad \text{Ans. } z = cx^{\frac{k}{2}} y^{\frac{k}{3}}$$

$$2. \quad \frac{\partial u}{\partial x} + u = \frac{\partial u}{\partial t} \text{ if } u = 4e^{-3x} \text{ when } t = 0 \quad \text{Ans. } u = 4e^{-3x-2t}$$

$$3. \quad 4 \frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} = 3u \text{ and } u = e^{-5y} \text{ when } x = 0 \text{ (AMIETE, June 2010)} \quad \text{Ans. } u = e^{2x-5y}$$

$$4. \quad 4 \frac{\partial u}{\partial t} + \frac{\partial u}{\partial x} = 3u, u = 3e^{-x} - e^{-5x} \text{ at } t = 0 \text{ (A.M.I.E.T.E., Winter 2000)} \quad \text{Ans. } u = 3e^{t-x} - e^{2t-5x}$$

$$5. \quad 3 \frac{\partial u}{\partial x} + 2 \frac{\partial u}{\partial y} = 0; u(x, 0) = 4e^{-x} \text{ (A.M.I.E.T.E., Summer 2000)} \quad \text{Ans. } u = 4e^{-x+3/2} y$$

$$6. \quad \frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} = 2(x+y)u \text{ (AMIETE, June 2010)} \quad \text{Ans. } u = ce^{x^2+y^2+k(x-y)}$$

$$7. \quad \frac{\partial u}{\partial t} = 4 \frac{\partial^2 u}{\partial x^2} \text{ if } u(x, 0) = 4x - \frac{1}{2} x^2 \quad \text{Ans. } u = \left(4x - \frac{x^2}{2}\right) e^{-p^2 t}$$

$$8. \quad \frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2} \text{ if } u(x, 0) = \sin \pi x \quad \text{Ans. } u = \sin \pi x e^{-pl}$$

$$9. \quad \frac{\partial^2 u}{\partial x^2} = \frac{\partial u}{\partial t} \text{ if } u(x, 0) = x^2(25 - x^2) \quad \text{Ans. } u = x^2(25 - x^2) e^{-p^2 t}$$

10.  $\frac{\partial^2 z}{\partial x^2} - 2 \frac{\partial z}{\partial x} - \frac{\partial z}{\partial y} = 0$

**Ans.**  $z = c_1 e^{[1+\sqrt{1+p}]x+p^2y} + c_2 e^{[1-\sqrt{1+p}]x+p^2y}$

11.  $\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}$  If  $u(x, 0) = \frac{1}{2}x(1-x)$

**Ans.**  $u = \frac{x}{2}(1-x)\cos pt + c_2 \sin pt(c_3 \cos px + c_4 \sin px)$

12.  $16 \frac{\partial^2 u}{\partial x^2} = \frac{\partial^2 u}{\partial t^2}$  if  $u(x, 0) = x^2(5-x)$

**Ans.**  $u = x^2(5-x)\cos pt + c_4 \sin pt \left( c_1 \cos \frac{px}{4} + c_2 \sin \frac{px}{4} \right)$

13.  $\frac{\partial^2 u}{\partial x^2} = \frac{\partial u}{\partial y} + 2u$  if  $u = 0$  and  $\frac{\partial u}{\partial x} = 1 + e^{-3y}$  when  $x = 0$ .

**Ans.**  $u = \frac{1}{2\sqrt{2}}(e^{\sqrt{2}x} - e^{-\sqrt{2}x}) + \frac{1}{2i}(e^{ix} - e^{-ix})e^{-3y}$

14.  $\frac{\partial u}{\partial x} = 2 \frac{\partial u}{\partial y} + u$ ,  $u(x, 0) = 4e^{-3x}$  (A.M.I.E.T.E., Summer 2001)

**Ans.**  $u = 4e^{-(3x+2y)}$

15.  $\frac{\partial u}{\partial x} - 2 \frac{\partial u}{\partial y} = u$ , given that  $u(x, 0) = 3e^{-5x} + 2e^{-3x}$

(A.M.I.E.T.E., Summer 2001)

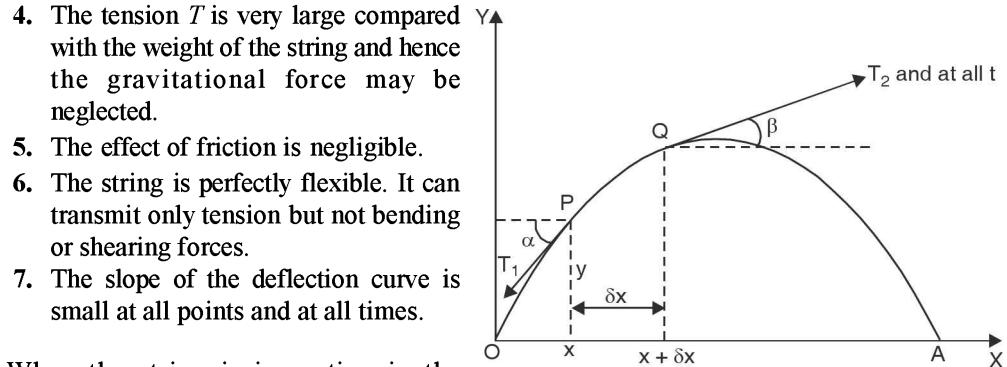

**Ans.**  $u = 3e^{-5x-3y} + 2e^{-3x-2y}$

### 49.3 EQUATION OF VIBRATING STRING

(AMIETE, June 2010, U.P. II Semester, June 2007)

Let us consider small transverse vibrations of an elastic string of length  $l$ , which is stretched and then fixed at its two ends. Now we will study the transverse vibration of the string when no external forces act on it. Take an end of the string as the origin and the string in the equilibrium position as the  $x$ -axis and the line through the origin and perpendicular to the  $x$ -axis as the  $y$ -axis. We make the following assumptions:

1. The motion takes place entirely in one plane. This plane is chosen as the  $xy$  plane.
2. In this plane, each particle of the string moves in a direction perpendicular to the equilibrium position of the string.
3. The tension  $T$  caused by stretching the string before fixing it at the end points is constant at all times at all points of the deflected string.
4. The tension  $T$  is very large compared with the weight of the string and hence the gravitational force may be neglected.
5. The effect of friction is negligible.
6. The string is perfectly flexible. It can transmit only tension but not bending or shearing forces.
7. The slope of the deflection curve is small at all points and at all times.

When the string is in motion in the  $xy$ -plane, the displacement  $y$  of any point of the string is a function of  $x$  and time  $t$ . Let  $P(x, y)$  and  $Q(x + \delta x, y + \delta y)$  be two neighbouring points on the string. Let  $\alpha$  and  $\beta$  be the inclinations made by the tangents at  $P$  and  $Q$  respectively with the  $x$ -axis. The tension  $T_1$  at  $P$  and tension  $T_2$  at  $Q$  are tangential. Let  $m$  be the mass per unit length of the string which is homogeneous. Consider the motion of the infinitesimal element  $PQ$  of the string. The vertical component of the force to which this element is subjected to is

$$m\delta s \frac{\partial^2 y}{\partial t^2} = T_2 \sin \beta - T_1 \sin \alpha \quad \dots(1)$$

Since, there is no motion in the horizontal direction,

$$\frac{T_1}{T} \cos \alpha = \frac{T_2}{T} \cos \beta = T \text{ (constant)} \quad \dots(2)$$

Dividing (1) by  $T$ , we get

$$\begin{aligned} \frac{m\delta s}{T} \frac{\partial^2 y}{\partial t^2} &= \frac{T_2 \sin \beta}{T} - \frac{T_1 \sin \alpha}{T} \\ \frac{m\delta s}{T} \frac{\partial^2 y}{\partial t^2} &= \frac{T_2 \sin \beta}{T_2 \cos \beta} - \frac{T_1 \sin \alpha}{T_1 \cos \alpha} \quad \left[ \begin{array}{l} T = T_1 \cos \alpha \\ T = T_2 \cos \beta \end{array} \right] \\ \Rightarrow \frac{m\delta s}{T} \frac{\partial^2 y}{\partial t^2} &= \tan \beta - \tan \alpha \quad \Rightarrow \frac{\partial^2 y}{\partial t^2} = \frac{T}{m\delta s} (\tan \beta - \tan \alpha) \\ \text{Slope } \tan \alpha &= \left( \frac{\partial y}{\partial x} \right)_x \text{ at } P \text{ and slope } \tan \beta = \left( \frac{\partial y}{\partial x} \right)_{x+\delta x} \text{ at } Q. \\ \frac{\partial^2 y}{\partial t^2} &= \frac{T}{m\delta x} \left[ \left( \frac{\partial y}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial y}{\partial x} \right)_x \right] \quad \Rightarrow \frac{\partial^2 y}{\partial t^2} = \frac{T}{m} \left[ \frac{\left( \frac{\partial y}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial y}{\partial x} \right)_x}{\delta x} \right] \end{aligned}$$

On taking limit as  $\delta x \rightarrow 0$ , we have

$$\frac{\partial^2 y}{\partial t^2} = \frac{T}{m} \frac{\partial^2 y}{\partial x^2}, \quad \boxed{\frac{\partial^2 y}{\partial t^2} = a^2 \frac{\partial^2 y}{\partial x^2}} \quad \left( \text{Take } a^2 = \frac{T}{m} \right)$$

**Note.** The partial differential equation is known as one-dimensional wave equation, because the motion is only in vertical direction (Transverse vibration) not in horizontal direction.

**Boundary conditions.**

$$\text{At } O, x = 0 \text{ and } y = 0, \quad \frac{\partial y}{\partial t} = 0 \text{ as } t = 0 \quad \text{At } A, x = 1 \text{ and } y = 0,$$

**Example 6.** Solve completely the equation  $\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2}$ , representing the vibrations of a string of length  $l$ , fixed at both ends, given that  $y(0, t) = 0, y(l, t) = 0, y(x, 0) = f(x)$  and  $\frac{\partial}{\partial t} y(x, 0) = 0, 0 < x < l$ .

(U.P. II Semester summer 2005)

**Solution.** Here,

$$\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2} \quad \dots(1)$$

$$\text{Let } y = X(x) T(t) \quad \dots(2)$$

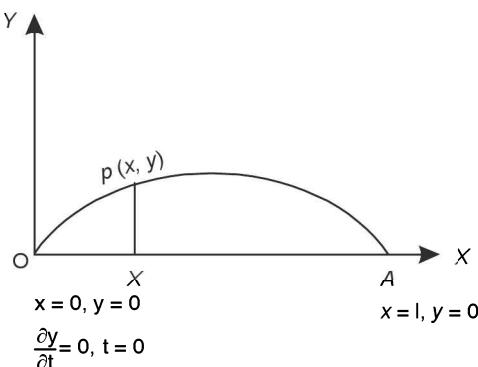

$$\frac{\partial^2 y}{\partial t^2} = X \frac{d^2 T}{dt^2}$$

$$\frac{\partial^2 y}{\partial x^2} = T \frac{d^2 X}{dx^2}$$

$$\text{Equation (1) becomes } X \frac{d^2 T}{dt^2} = c^2 T \frac{d^2 X}{dx^2}$$

Separating the variables,

$$\frac{1}{X} \frac{d^2 X}{dx^2} = \frac{1}{c^2 T} \frac{d^2 T}{dt^2} = -p^2 \text{ (let)}$$

$\text{If } \frac{1}{X} \frac{d^2X}{dx^2} = -p^2$ $\Rightarrow \frac{d^2X}{dx^2} = -Xp^2$ $\Rightarrow \frac{d^2X}{dx^2} + Xp^2 = 0$ $\Rightarrow (D^2 + p^2) X = 0$ <p>A.E. is <math>m^2 + p^2 = 0 \Rightarrow m = \pm pi</math></p> $X = (C_1 \cos px + C_2 \sin px)$	$\text{If } \frac{1}{c^2T} \frac{\partial^2 T}{\partial t^2} = -p^2$ $\Rightarrow (D^2 + p^2 c^2) T = 0$ <p>A.E. is <math>m^2 + p^2 c^2 = 0</math></p> $\Rightarrow m^2 = -p^2 c^2 \Rightarrow m = \pm pci$ $T = (C_3 \cos pct + C_4 \sin pct)$
---	---

Putting the values of  $X$  and  $T$  in (2), we get

$$y = (C_1 \cos px + C_2 \sin px) (C_3 \cos pct + C_4 \sin pct) \quad \dots(3)$$

Now applying the boundary condition

$$x = 0 \text{ and } y = 0$$

Putting these values in (3), we get

$$0 = C_1 (C_3 \cos pct + C_4 \sin pct) \Rightarrow C_1 = 0$$

$$\text{Equation (3) becomes, } y = C_2 \sin px (C_3 \cos pct + C_4 \sin pct) \quad \dots(4)$$

Putting  $x = l$  and  $y = 0$  in (4), we get

$$0 = C_2 \sin pl (C_3 \cos pct + C_4 \sin pct) \Rightarrow \sin pl = 0 = \sin n\pi$$

$$\Rightarrow pl = n\pi \Rightarrow p = \frac{n\pi}{l}$$

On putting  $p = \frac{n\pi}{l}$ , (4) becomes

$$y = C_2 \sin \frac{n\pi x}{l} \left( C_3 \cos \frac{n\pi ct}{l} + C_4 \sin \frac{n\pi ct}{l} \right) \quad \dots(5)$$

On differentiating (5) w.r.t.  $t$ , we get

$$\frac{\partial y}{\partial t} = C_2 \sin \frac{n\pi x}{l} \left( -\frac{n\pi c}{l} C_3 \sin \frac{n\pi ct}{l} + \frac{n\pi c}{l} C_4 \cos \frac{n\pi ct}{l} \right) \quad \dots(6)$$

On putting  $\frac{\partial y}{\partial t} = 0$  and  $t = 0$  in (6), we get

$$0 = C_2 \sin \frac{n\pi x}{l} \cdot \frac{n\pi c}{l} C_4 \Rightarrow C_4 = 0$$

On putting  $C_4 = 0$ , (5) becomes

$$y = C_2 C_3 \sin \frac{n\pi x}{l} \cos \frac{n\pi ct}{l} \quad [\text{let } C_2 C_3 = b_n] \quad \dots(7)$$

Now applying  $y = f(x)$  and  $t = 0$ , (7) becomes  $f(x) = b_n \sin \frac{n\pi x}{l}$

$$C_2 C_3 \text{ can be calculated using Fourier sine series as } b_n = \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx$$

Thus, required solution for the given equation is

$$y = b_n \sin \frac{n\pi x}{l} \cos \frac{n\pi ct}{l}$$

where  $b_n$  is given by equation (8)

**Ans.**

**Example. 7.** A tightly stretched string with fixed end points  $x = 0$  and  $x = \pi$  is initially at rest in its equilibrium position. If it is set vibrating by giving to each of its points an initial velocity.

$$\left( \frac{\partial y}{\partial t} \right)_{t=0} = 0.03 \sin x - 0.04 \sin 3x$$

then find the displacement  $y(x,t)$  at any point of string at any time  $t$ .

**Solution.** Here we have equation for vibration of a string  $\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2}$

Its solution is

$$y(x,t) = (c_1 \cos pxt + c_2 \sin pxt)(c_3 \cos px + c_4 \sin px) \quad \dots(1)$$

[See Example 6 on previous page 1324]

Putting  $x = 0$  and  $y = 0$  in (1), we get

$$0 = (c_1 \cos pxt + c_2 \sin pxt)(c_3)$$

$$\Rightarrow c_3 = 0$$

Putting  $c_3 = 0$  in (1), we have

$$y = (c_1 \cos pxt + c_2 \sin pxt)(c_4 \sin px) \quad \dots(2)$$

Putting  $x = \pi$  and  $y = 0$  in (2), we get

$$0 = (c_1 \cos pxt + c_2 \sin pxt)c_4 \sin p\pi$$

$$\Rightarrow 0 = \sin p\pi$$

and  $\sin n\pi = \sin p\pi \Rightarrow p = n$

Putting  $p = n$  in (2), we get

$$y = (c_1 \cos nct + c_2 \sin nct)(c_4 \sin nx) \quad \dots(3)$$

Putting  $t = 0, y = 0$  in (3), we get

$$0 = (c_1 + 0)c_4 \sin nx \quad (\sin nx = 0 \text{ since } \sin nx \text{ is a part of } X)$$

$$\Rightarrow c_1 = 0$$

On putting  $c_1 = 0$  in (3), we get

$$y = (c_2 \sin nct)(c_4 \sin nx)$$

General equation is

$$(c_2 c_4 = b_n)$$

$$y = \sum_{n=1}^{\infty} b_n \sin nct \sin nx \quad \dots(4)$$

Differentiating (4) w.r.t. ' $t$ ', we get

$$\frac{\partial y}{\partial t} = \sum_{n=1}^{\infty} b_n nc \cos nct \sin nx \quad \dots(5)$$

On putting  $\frac{\partial y}{\partial t} = 0.03 \sin x - 0.04 \sin 3x$  and  $t = 0$  in (5) we get

$$0.03 \sin x - 0.04 \sin 3x = \sum_{n=1}^{\infty} b_n nc \sin nx$$

$$\Rightarrow 0.03 \sin x - 0.04 \sin 3x = cb_1 \sin x + 2cb_2 \sin 2x + 3cb_3 \sin 3x + \dots$$

Comparing the coefficient, we get

$$0.03 = cb_1 \Rightarrow b_1 = \frac{0.03}{c}$$

$$0 = 2cb_2 \Rightarrow b_2 = 0$$

$$-0.04 = 3cb_3 \Rightarrow b_3 = \frac{-0.04}{3c} = \frac{-0.0133}{c}$$

Putting the values of  $b_1, b_2, b_3 \dots$  in (4), we get

$$y = \frac{0.03}{c} \sin ct \sin x - \frac{0.0133}{c} \sin 3ct \sin 3x$$

Hence

$$y = \frac{1}{c} [0.03 \sin ct \sin x - 0.0133 \sin 3x]$$

**Ans.**

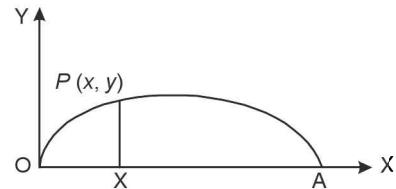

**Example 8.** A string is stretched and fastened to two points  $l$  apart. Motion is started by displacing the string in the form  $y = a \sin \frac{\pi x}{l}$  from which it is released at a time  $t = 0$ . Show that the displacement of any point at a distance  $x$  from one end at time  $t$  is given by

$$y(x, t) = a \sin\left(\frac{\pi x}{l}\right) \cos\left(\frac{\pi c t}{l}\right)$$

(A.M.I.E.T.E., Winter 2003, U.P., II Semester, 2004, 2009)

**Solution.** Consider an elastic string tightly stretched between two points  $O$  and  $A$ . Let  $O$  be the origin and  $OA$  as  $x$ -axis. On giving a small displacement to the string, perpendicular to its length (parallel to the  $y$ -axis). Let  $y$  be the displacement at the point  $P(x, y)$  at any time. The wave equation.

$$\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2}$$

where  $c$  is a constant. The vibration of the string is given by:

$$\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2} \quad \dots (1)$$

As the end points of the string are fixed, for all time,

$$y(0, t) = 0 \quad \dots (2)$$

and  $y(l, t) = 0 \quad \dots (3)$

Since the initial transverse velocity of any point of the string is zero, therefore,

$$\left( \frac{\partial y}{\partial t} \right)_{t=0} = 0 \quad \dots (4)$$

Also  $y(x, 0) = a \sin \frac{\pi x}{l} \quad \dots (5)$

Now we have to solve (1), subject to the above boundary conditions. Since the vibration of the string is periodic, therefore, the solution of (1) is of the form

$$y(x, t) = (C_1 \cos px + C_2 \sin px)(C_3 \cos cpt + C_4 \sin cpt) \quad \dots (6)$$

On putting  $x = 0$  and  $y = 0$  in (6), we get

$$0 = C_1 (C_3 \cos cpt + C_4 \sin cpt) \Rightarrow C_1 = 0$$

On putting  $C_1 = 0$  in (6), we get

$$y(x, t) = C_2 \sin px (C_3 \cos cpt + C_4 \sin cpt) \quad \dots (7)$$

On differentiating (7) w.r.t.  $t$ , we get

$$\frac{\partial y}{\partial t} = C_2 \sin px [C_3 (-cp \sin cpt) + C_4 (cp \cos cpt)] \quad \dots (8)$$

On putting  $\frac{dy}{dt} = 0$  and  $t = 0$  in (8), we get

$$0 = C_2 \sin px (C_4 cp) \Rightarrow C_2 C_4 cp = 0$$

If  $C_2 = 0$ , (7) will lead to the trivial solution  $y(x, t) = 0$ .

Thus, the only possibility is that  $C_4 = 0$

On putting  $C_4 = 0$  in (7), we get

$$y(x, t) = C_2 C_3 \sin px \cos cpt \quad \dots (9)$$

On putting  $x = l$  and  $y = 0$  in (9), we get

$$0 = C_2 C_3 \sin pl \cos cpt, \text{ for all } t.$$

Since  $C_2$  and  $C_3 \neq 0$ , we have  $\sin pl = 0 \therefore pl = n\pi \Rightarrow p = \frac{n\pi}{l}$ , where  $n$  is an integer.

On putting the value of  $p$  in (9), we get

$$y(x, t) = C_2 C_3 \sin \frac{n\pi x}{l} \cos \frac{n\pi c t}{l} \quad \dots (10)$$

On putting  $t = 0$  and  $y = a \sin \frac{\pi x}{l}$  in (10), we get

$$a \sin \frac{\pi x}{l} = C_2 C_3 \sin \frac{n\pi x}{l}$$

which will be satisfied by taking  $C_2 C_3 = a$  and  $n = 1$   
Hence the required solution is

$$y(x, t) = a \sin \frac{\pi x}{l} \cos \frac{\pi c t}{l} \quad \text{Proved.}$$

**Example 9.** The vibrations of an elastic string is governed by the partial differential equation

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}$$

The length of the string is  $\pi$  and the ends are fixed. The initial velocity is zero and the initial deflection is  $u(x, 0) = 2(\sin x + \sin 3x)$ . Find the deflection  $u(x, t)$  of the vibrating string for  $t > 0$ .

**Solution.**  $\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}$

Solution of the given differential equation is

$$\Rightarrow u = (c_1 \cos pt + c_2 \sin pt)(c_3 \cos px + c_4 \sin px) \quad \dots (1)$$

On putting  $x = 0, u = 0$  in (1), we get

$$0 = (c_1 \cos pt + c_2 \sin pt)c_3 \quad \Rightarrow c_3 = 0$$

On putting  $c_3 = 0$  in (1), it reduces

$$u = (c_1 \cos pt + c_2 \sin pt)c_4 \sin px \quad \dots (2)$$

On putting  $x = \pi$  and  $u = 0$  in (2), we have

$$\begin{aligned} 0 &= (c_1 \cos pt + c_2 \sin pt)c_4 \sin p\pi \\ \sin p\pi &= 0 = \sin n\pi \quad n = 1, 2, 3, 4 \\ \therefore p\pi &= n\pi \quad \text{or} \quad p = n \end{aligned}$$

On substituting the value of  $p$  in (2), we get

$$u = (c_1 \cos nt + c_2 \sin nt)c_4 \sin nx \quad \dots (3)$$

On differentiating (3) w.r.t. "t", we get

$$\frac{\partial u}{\partial t} = (-c_1 n \sin nt + c_2 n \cos nt)c_4 \sin nx \quad \dots (4)$$

On putting  $\frac{\partial u}{\partial t} = 0, t = 0$  in (4), we have

$$0 = (c_2 n)(c_4 \sin nx) \Rightarrow c_2 = 0$$

On putting  $c_2 = 0$ , (3) becomes

$$u = (c_1 \cos nt)(c_4 \sin nx)$$

$$u = c_1 c_4 \cos nt \sin nx = \sum b_n \cos nt \sin nx \quad [\because b_n = c_1 c_4] \quad \dots(5)$$

On putting  $u = 2(\sin x + \sin 3x)$  and  $t = 0$  in (5), we have

$$2(\sin x + \sin 3x) = b_1 \sin x + b_2 \sin 2x + b_3 \sin 3x + \dots$$

Comparing the coefficient of sin on both side, we have

$$b_1 = 2, \quad b_2 = 0 \quad \text{and} \quad b_3 = 2$$

On Substituting the values of  $b_1, b_2, b_3$  in (5), we get

$$u = 2 [\cos t \sin x + \cos 3t \sin 3x]$$

Ans.

**Example 10.** A tightly stretched string with fixed end points  $x = 0$  and  $x = l$  is initially in a

position given by  $y = y_0 \sin^3 \left( \frac{\pi x}{l} \right)$ . If it is released from rest from this position, find the displacement  $y(x, t)$ .

**Solution.** Let the equation to the vibrating string be

$$\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2} \quad \dots(1)$$

Here the initial conditions are

$$y(0, t) = 0, \quad y(l, t) = 0$$

$$\frac{\partial y}{\partial t} = 0 \quad \text{at } t = 0, \quad y(x, 0) = y_0 \sin^3 \frac{\pi x}{l} = \frac{y_0}{4} \left[ 3 \sin \frac{\pi x}{l} - \sin \frac{3\pi x}{l} \right]$$

The solution of (1) is of the form

$$y = (c_1 \cos px + c_2 \sin px)(c_3 \cos pct + c_4 \sin pct) \quad \dots(2)$$

On putting  $x = 0$  and  $y = 0$  in (2), we get

$$0 = c_1 (c_3 \cos pct + c_4 \sin pct) \Rightarrow c_1 = 0$$

On putting  $c_1 = 0$  in (2), we get

$$y = c_2 \sin px (c_3 \cos pct + c_4 \sin pct) \quad \dots(3)$$

On putting  $x = l$  and  $y = 0$  in (3), we get

$$0 = c_2 \sin pl (c_3 \cos pct + c_4 \sin pct)$$

$$\therefore \sin pl = 0 = \sin n\pi \quad \text{or} \quad pl = n\pi, \quad \text{or} \quad p = \frac{n\pi}{l}, \quad \text{where } n = 0, 1, 2, 3, \dots$$

On putting the value of  $p$  in (3), we get

$$y = c_2 \sin \frac{n\pi x}{l} \left( c_3 \cos \frac{n\pi ct}{l} + c_4 \sin \frac{n\pi ct}{l} \right) \quad \dots(4)$$

On differentiating (4), w.r.t.  $t$ , we get

$$\frac{\partial y}{\partial t} = c_2 \sin \frac{n\pi x}{l} \left( -\frac{n\pi c}{l} c_3 \sin \frac{n\pi c}{l} t + c_4 \frac{n\pi c}{l} \cos \frac{n\pi c}{l} t \right)$$

On putting  $\frac{\partial y}{\partial t} = 0$  and  $t = 0$  in (4), we have

$$0 = c_2 \sin \frac{n\pi x}{l} c_4 \frac{n\pi c}{l} \Rightarrow c_4 = 0$$

On putting  $c_4 = 0$  in (4), we get

$$y = c_2 c_3 \sin \frac{n\pi x}{l} \cos \frac{n\pi ct}{l}$$

$$y = b_n \sin \frac{n\pi x}{l} \cos \frac{n\pi c}{l} t \quad (b_n = c_2 c_3)$$

General solution is

$$y = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l} \cos \frac{n\pi c}{l} t \quad \dots(5)$$

On putting  $t = 0$  and  $y = \frac{y_0}{4} \left[ 3 \sin \frac{\pi x}{l} - \sin \frac{3\pi x}{l} \right]$  in (5), we have

$$\frac{y_0}{4} \left( 3 \sin \frac{\pi x}{l} - \sin \frac{3\pi x}{l} \right) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}$$

$$\Rightarrow \frac{y_0}{4} \left( 3 \sin \frac{\pi x}{l} - \sin \frac{3\pi x}{l} \right) = b_1 \sin \frac{\pi x}{l} + b_2 \sin \frac{2\pi x}{l} + b_3 \sin \frac{3\pi x}{l} + \dots$$

On equating the coefficients of sin on both the sides, we get

$$b_1 = \frac{3y_0}{4}, \quad b_3 = -\frac{y_0}{4}$$

and all others  $b$ 's are zero.

Hence (5) becomes

$$y = \frac{y_0}{4} \left( 3 \sin \frac{\pi x}{l} \cos \frac{c\pi t}{l} - \sin \frac{3\pi x}{l} \cos \frac{3c\pi t}{l} \right) \quad \text{Ans.}$$

**Example 11.** A string is stretched and fastened to two points  $l$  apart. Motion is started by displacing the string into the form  $y = k(lx - x^2)$  from which it is released at time  $t = 0$ . Find the displacement of any point on the string at a distance  $x$  from one end at time  $t$ .

(U.P., III Semester, Summer 2002; A.M.I.E.T.E., Summer 2000)

**Solution.** The vibration of the string is given by

$$\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2} \quad \dots (1)$$

As the end points of the string are fixed for all time,

$$y(0, t) = 0 \quad \dots (2)$$

and

$$y(l, t) = 0 \quad \dots (3)$$

since the initial transverse velocity of any point of the string is zero, therefore,

$$\left( \frac{\partial y}{\partial t} \right)_{t=0} = 0 \quad \dots (4)$$

and

$$y(x, 0) = k(lx - x^2) \quad \dots (5)$$

Solution of (1) is  $y = (c_1 \cos px + c_2 \sin px)(c_3 \cos c pt + c_4 \sin cpt)$  ... (6)

On putting  $x = 0$  and  $y = 0$  in (6), we get

$$0 = c_1 (c_3 \cos c pt + c_4 \sin cpt) \Rightarrow c_1 = 0$$

On putting  $c_1 = 0$  in (6), we get

$$y = c_2 \sin px (c_3 \cos cpt + c_4 \sin cpt) \quad \dots (7)$$

On differentiating (7) w.r.t.  $t$ , we get

$$\frac{\partial y}{\partial t} = c_2 \sin px (-c_3 cp \sin cpt + c_4 cp \cos cpt) \quad \dots (8)$$

On putting  $\left( \frac{\partial y}{\partial t} \right) = 0$  and  $t = 0$  in (8), we get

$$0 = c_2 \sin px (c_4 cp) \Rightarrow c_4 = 0 \text{ since } c_2 \neq 0$$

On putting  $c_4 = 0$  in (7), we get

$$y = c_2 \sin px (c_3 \cos cpt)$$

$$y = c_2 c_3 \sin px \cos cpt \quad \dots (9)$$

On putting  $x = l$  and  $y = 0$  in equation (9), we get

$$0 = c_2 c_3 \sin pl \cos cpt \text{ or } 0 = \sin pl$$

$$\Rightarrow \sin n\pi = \sin pl \text{ or } pl = n\pi, \quad p = \frac{n\pi}{l} \quad \text{where } n = 1, 2, 3, \dots$$

On putting  $p = \frac{n\pi}{l}$ , equation (9) becomes

$$\Rightarrow y = b_n \sin \frac{n\pi x}{l} \cos \frac{n\pi c}{l} t \quad [c_2 c_3 = b_n]$$

We can have any number of solutions by taking different integral values of  $n$  and the complete solution will be the sum of these solutions. Thus,

$$y(x, t) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l} \cos \frac{n\pi c}{l} t \quad \dots (10)$$

On putting  $t = 0$  and  $y = k(lx - x^2)$  in (10), we get

$$k(lx - x^2) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l} \quad \dots (11)$$

Now it is clear that (11) represents the expansion of  $f(x)$  in the form of a Fourier sine series and consequently

$$\begin{aligned} b_n &= \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx \\ b_n &= \frac{2}{l} \int_0^l k(lx - x^2) \sin \frac{n\pi x}{l} dx \\ &= \frac{2k}{l} \left[ (lx - x^2) \left( -\cos \frac{n\pi x}{l} \right) \Big|_0^l - (l - 2x) \left( -\sin \frac{n\pi x}{l} \right) \Big|_0^l + (-2) \left( \cos \frac{n\pi x}{l} \right) \Big|_0^l \right] \\ &= \frac{2k}{l} \left[ (-1)^{n+1} \frac{2l^3}{n^3 \pi^3} + \frac{2l^3}{n^3 \pi^3} \right] = \frac{8l^2 k}{n^3 \pi^3} \text{ when } n \text{ is odd.} \\ &= 0, \text{ when } n \text{ is even} \end{aligned} \quad \dots (12)$$

Putting the value of  $b_n$  in (10), we get

$$y = \sum_{n=1}^{\infty} \frac{8l^2 k}{n^3 \pi^3} \sin \frac{n\pi x}{l} \cos \frac{n\pi c}{l} t, \text{ when } n \text{ is odd.} \quad \text{Ans.}$$

**Example 12.** A string is stretched between the fixed points  $(0, 0)$  and  $(l, 0)$  and released at rest from the initial deflection given by

$$f(x) = \begin{cases} \frac{2kx}{l} & \text{when } 0 < x < \frac{l}{2} \\ \frac{2k}{l}(l - x) & \text{when } \frac{l}{2} < x < l \end{cases}$$

Find the deflection of the string at any time  $t$ .

**Solution.** As we have done in the example 16 (see equation 16)

$$y(x, t) = \sum_{n=1}^{\infty} b_n \cos \frac{n\pi c t}{l} \sin \frac{n\pi x}{l} \quad \dots (1)$$

$$b_n = \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx$$

$$\begin{aligned}
 b_n &= \frac{2}{l} \left[ \int_0^{l/2} \frac{2kx}{l} \sin \frac{n\pi x}{l} dx + \int_{l/2}^l \frac{2k}{l} (l-x) \sin \frac{n\pi x}{l} dx \right] \\
 &= \frac{4k}{l^2} \left[ x \left( -\frac{l}{n\pi} \cos \frac{n\pi x}{l} \right) - 1 \left( -\frac{l^2}{n\pi^2} \sin \frac{n\pi x}{l} \right) \right]_0^l \\
 &\quad + \frac{4k}{l^2} \left[ (l-x) \left( -\frac{l}{n\pi} \cos \frac{n\pi x}{l} \right) - (-1) \left( \frac{-l^2}{n^2\pi^2} \sin \frac{n\pi x}{l} \right) \right]_l^l \\
 &= \frac{4k}{l^2} \left[ -\frac{l}{2} \frac{l}{n\pi} \cos \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] + \frac{4k}{l^2} \left[ \frac{l}{2} \frac{l}{n\pi} \cos \frac{n\pi}{2} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] \\
 &= \frac{8k}{l^2} \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{2} = \frac{8k}{n^2\pi^2} \sin \frac{n\pi}{2}
 \end{aligned}$$

On putting the value of  $b_n$  in (1) we get

$$y = \sum_{n=1}^{\infty} \frac{8k}{n^2\pi^2} \sin \frac{n\pi}{2} \cos \frac{n\pi ct}{l} \sin \frac{n\pi x}{l}$$

**Ans.**

**Example 13.** A taut string of length  $2l$  is fastened at both ends. The mid point of the string is taken to a height  $b$  and then released from the rest in that position. Find the displacement of the string.

**Solution.** Taking an end as origin, the boundary conditions are

$$y(0, t) = 0, \quad t \geq 0 \quad \dots (1)$$

$$y(2l, t) = 0, \quad t \geq 0 \quad \dots (2)$$

$$\left( \frac{\partial y}{\partial t} \right)_{t=0} = 0,$$

$OA$  passes through  $(0, 0)$  and  $(l, b)$

$$\frac{b}{l}x, \quad 0 \leq x \leq l, \quad \Rightarrow \quad y = \frac{bx}{l}$$

$$\begin{aligned}
 \text{Equation of } OA \text{ is } y(x, 0) &= -\frac{b}{l}(x-2l), \quad l \leq x \leq 2l \quad \dots (3) \quad \left[ y - y_1 = \frac{y_2 - y_1}{x_2 - x_1} (x - x_1) \right] \\
 &\quad \left( \text{Equation of } AB, y - 0 = \frac{b-0}{l-2l} (x-2l) \right)
 \end{aligned}$$

$$\text{Equation of the vibrating string is } \frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2} \quad \dots (4)$$

Starting with the solution of (4), we get

$$y(x, t) = (c_1 \cos px + c_2 \sin px)(c_3 \cos pvt + c_4 \sin pvt) \quad \dots (5)$$

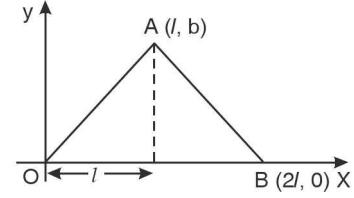

On putting  $x = 0, y = 0$  in (5), we get

$$0 = c_1 (c_3 \cos pvt + c_4 \sin pvt) \Rightarrow c_1 = 0$$

On putting  $c_1 = 0$  in (5), we get

$$y(x, t) = c_2 \sin px (c_3 \cos pvt + c_4 \sin pvt) \quad \dots (6)$$

On putting  $y = 0, x = 2l$  in (6), we get

$$0 = c_2 \sin p(2l) (c_3 \cos pct + c_4 \sin pct) \Rightarrow \sin 2pl = 0 = \sin n\pi \Rightarrow 2pl = n\pi, p = \frac{n\pi}{2l}$$

Substituting the value of  $p$  in (6), we have

$$y(x, t) = c_2 \sin \frac{n\pi}{2l} x \left( c_3 \cos \frac{n\pi ct}{2l} + c_4 \sin \frac{n\pi ct}{2l} \right) \quad \dots (7)$$

On differentiating (7) w.r.t.,  $t$ , we get

$$\frac{\partial y}{\partial t} = c_2 \sin \frac{n\pi x}{2l} \left[ -c_3 \frac{n\pi c}{2l} \sin \frac{n\pi ct}{2l} + c_4 \frac{n\pi c}{2l} \cos \frac{n\pi ct}{2l} \right] \quad \dots (8)$$

Putting  $\left(\frac{\partial y}{\partial t}\right) = 0, t = 0$  in (8), we get

$$0 = c_2 \sin \frac{n\pi x}{2l} \left[ 0 + c_4 \frac{n\pi c}{2l} \right] \Rightarrow c_4 = 0$$

Putting  $c_4 = 0$  in (7), we have

$$y(x, t) = \left( c_2 \sin \frac{n\pi x}{2l} \right) \left( c_3 \cos \frac{n\pi ct}{2l} \right)$$

General solution is

$$y(x, t) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{2l} \cos \frac{n\pi ct}{2l} \quad (c_2 c_3 = b_n) \quad \dots (9)$$

$$\Rightarrow f(x) = \begin{cases} \frac{bx}{l}, & 0 \leq x \leq l \\ \frac{-b}{l}(x - 2l), & l \leq x \leq 2l \end{cases}$$

$$\begin{aligned} b_n &= \frac{2}{2l} \int_0^{2l} f(x) \sin \frac{n\pi x}{2l} dx = \frac{1}{l} \int_0^l f(x) \sin \frac{n\pi x}{2l} dx + \frac{1}{l} \int_l^{2l} f(x) \sin \frac{n\pi x}{2l} dx \\ &= \frac{1}{l} \int_0^l \frac{bx}{l} \sin \frac{n\pi x}{2l} dx + \frac{1}{l} \int_l^{2l} \frac{-b}{l}(x - 2l) \sin \frac{n\pi x}{2l} dx \\ &= \frac{1}{l} \left[ \frac{bx}{l} \frac{2l}{n\pi} \left( -\cos \frac{n\pi x}{2l} \right) - \frac{b}{l} \left( -\frac{4l^2}{n^2\pi^2} \sin \frac{n\pi x}{2l} \right) \right]_0^l \\ &\quad + \frac{1}{l} \left[ \frac{-b}{l} (x - 2l) \left( -\frac{2l}{n\pi} \cos \frac{n\pi x}{2l} \right) - \left( -\frac{b}{l} \right) - \frac{4l^2}{n^2\pi^2} \sin \frac{n\pi x}{2l} \right]_l^{2l} \\ &= \frac{b}{l^2} \left[ \frac{-2l^2}{n\pi} \cos \frac{n\pi}{2} + \frac{4l^2}{n^2\pi^2} \sin \frac{n\pi}{2} + \frac{2l^2}{n\pi} \cos \frac{n\pi}{2} + \frac{4l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] \\ &= \frac{b}{l^2} \left[ \frac{8l^2}{n^2\pi^2} \sin \frac{n\pi}{2} \right] = \frac{8b}{n^2\pi^2} \sin \frac{n\pi}{2} = 0 \text{ for } n \text{ even} = \frac{8b}{n^2\pi^2} \sin \frac{n\pi}{2} \text{ for } n \text{ odd.} \end{aligned}$$

Substituting the value of  $b_n$  in (9), we get

$$y(x, t) = \frac{8b}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{(2n-1)^2} \sin(2n-1) \frac{\pi}{2} \sin \frac{(2n-1)\pi x}{2l} \cos \frac{(2n-1)\pi ct}{2l} \quad \text{Ans.}$$

**Example 14.** The points of trisection of a string are pulled aside through the same distance on opposite sides of the position of equilibrium and the string is released from rest. Derive an expression for the displacement of the string at subsequent time and show that the mid-point of the string always remains at rest.

**Solution.** Let the string  $OA$  ( $l$ ) be trisected at  $B$  and  $C$ . Initially the string is held in the form  $OB'C'A$ , where  $BB' = CC' = a$

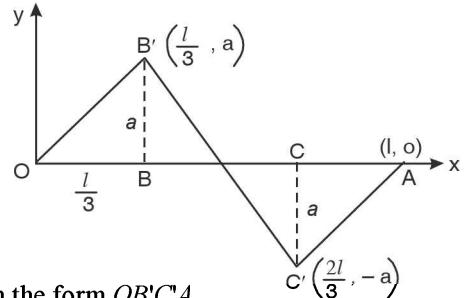

The equation of vibrating string is

$$\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2} \quad \dots (1)$$

Boundary conditions are

$$y(0, t) = 0, y(l, t) = 0, \left(\frac{\partial y}{\partial t}\right)_{t=0} = 0$$

Fourth condition is that at  $t = 0$ , the string rests in the form  $OB'C'A$ .

$$\text{Equation of } OB' \text{ is } y = \frac{a}{l/3}x \Rightarrow y = \frac{3a}{l}x \quad (y = mx)$$

$$\text{Equation of } B'C' \text{ is } y - a = \frac{a+a}{l-2l} \left(x - \frac{l}{3}\right) \quad \left[ y - y_1 = \frac{y_2 - y_1}{x_2 - x_1} (x - x_1) \right]$$

$$\text{i.e., } y - a = \frac{2a}{-l} \left(x - \frac{l}{3}\right) \Rightarrow y - a = -\frac{6a}{l} \left(x - \frac{l}{3}\right)$$

$$\Rightarrow y = a - \frac{6ax}{l} + 2a \Rightarrow y = 3a - \frac{6ax}{l} \Rightarrow y = \frac{3a}{l}(l - 2x)$$

$$\text{Equation of } C'A \text{ is } y - 0 = \frac{-a - 0}{\frac{2l}{3} - l} (x - l) \Rightarrow y = \frac{3a}{l}(x - l)$$

Hence fourth condition is

$$f(x) = \begin{cases} \frac{3a}{l}x, & 0 \leq x \leq \frac{l}{3} \\ \frac{3a}{l}(l - 2x), & \frac{l}{3} \leq x \leq \frac{2l}{3} \\ \frac{3a}{l}(x - l), & \frac{2l}{3} \leq x \leq l \end{cases}$$

General solution of (1) is

$$y(x, t) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l} \cos \frac{n\pi ct}{l} \quad \dots (2)$$

On putting  $t = 0$  in (2), we get

$$y(x, 0) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}$$

We have to find the value of  $b_n$  by Fourier half range formula.

$$\begin{aligned} b_n &= \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx \\ &= \frac{2}{l} \left[ \int_0^{\frac{l}{3}} \frac{3ax}{l} \sin \frac{n\pi x}{l} dx + \int_{\frac{l}{3}}^{\frac{2l}{3}} \frac{3a}{l} (l - 2x) \sin \frac{n\pi x}{l} dx + \int_{\frac{2l}{3}}^l \frac{3a}{l} (x - l) \sin \frac{n\pi x}{l} dx \right] \\ &= \frac{6a}{l^2} \left[ x \left( -\frac{l}{n\pi} \cos \frac{n\pi x}{l} \right) - (l) \left( -\frac{l^2}{n^2 \pi^2} \sin \frac{n\pi x}{l} \right) \right]_{\frac{l}{3}}^l + \frac{6a}{l^2} \left[ (l - 2x) \left( \frac{-l}{n\pi} \cos \frac{n\pi x}{l} \right) \right. \\ &\quad \left. - (-2) \left( \frac{-l^2}{n^2 \pi^2} \sin \frac{n\pi x}{l} \right) \right]_{\frac{l}{3}}^{\frac{2l}{3}} + \frac{6a}{l^2} \left[ (x - l) \left( \frac{-l}{n\pi} \cos \frac{n\pi x}{l} \right) - (l) \left( \frac{-l^2}{n^2 \pi^2} \sin \frac{n\pi x}{l} \right) \right]_{\frac{2l}{3}}^l \end{aligned}$$

$$\begin{aligned}
&= \frac{6a}{l^2} \left[ \left( -\frac{l^2}{3n\pi} \cos \frac{n\pi}{3} + \frac{l^2}{n^2\pi^2} \sin \frac{n\pi}{3} \right) + \frac{l^2}{3n\pi} \cos \frac{2n\pi}{3} - \frac{2l^2}{n^2\pi^2} \sin \frac{2n\pi}{3} \right. \\
&\quad \left. + \frac{l^2}{3n\pi} \cos \frac{n\pi}{3} + \frac{2l^2}{n^2\pi^2} \sin \frac{n\pi}{3} - \left( \frac{l^2}{3n\pi} \cos \frac{2n\pi}{3} + \frac{l^2}{n^2\pi^2} \sin \frac{2n\pi}{3} \right) \right] \\
&= \frac{6a}{l^2} \cdot \frac{3l^2}{n^2\pi^2} \left( \sin \frac{n\pi}{3} - \sin \frac{2n\pi}{3} \right) \\
&= \frac{18a}{n^2\pi^2} \sin \frac{n\pi}{3} [1 + (-1)^n] \quad \left[ \sin \frac{2n\pi}{3} = \sin \left( n\pi - \frac{n\pi}{3} \right) = -(-1)^n \sin \frac{n\pi}{3} \right] \\
&= 0, \quad \text{when } n \text{ is odd} \\
&= \frac{36a}{n^2\pi^2} \sin \frac{n\pi}{3}, \quad \text{when } n \text{ is even}
\end{aligned}$$

On substituting the value of  $b_n$  in (2), we get

$$y(x, t) = \sum_{n=2}^{\infty} \frac{36a}{n^2\pi^2} \sin \frac{n\pi}{3} \sin \frac{n\pi x}{l} \cos \frac{n\pi ct}{l} \quad \dots(3) \quad (n \text{ is even}) \quad \text{Ans.}$$

Putting  $x = \frac{l}{2}$  in equation (3), we get

$$y\left(\frac{l}{2}, t\right) = \frac{36a}{n^2\pi^2} \sin \frac{n\pi}{3} \sin \frac{n\pi}{2} \cos \frac{n\pi ct}{l} = 0 \quad \left[ \begin{array}{l} \sin \frac{n\pi}{2} = 0 \\ \text{as } n \text{ is even} \end{array} \right]$$

Hence, mid-point of the string is always at rest.

**Proved.**

#### 49.4 SOLUTION OF WAVE EQUATION BY D'ALEMBERT'S METHOD

$$\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2} \quad \dots(1)$$

Let us introduce the two new independent variables  $u = x + ct$ ,  $v = x - ct$   
So that  $y$  becomes a function of  $u$  and  $v$ . Then,

$$\begin{aligned}
\frac{\partial y}{\partial x} &= \frac{\partial y}{\partial u} \frac{\partial u}{\partial x} + \frac{\partial y}{\partial v} \frac{\partial v}{\partial x} = \frac{\partial y}{\partial u}(1) + \frac{\partial y}{\partial v}(1) = \frac{\partial y}{\partial u} + \frac{\partial y}{\partial v} \\
\frac{\partial}{\partial x} &\equiv \frac{\partial}{\partial u} + \frac{\partial}{\partial v} \\
\frac{\partial^2 y}{\partial x^2} &= \frac{\partial}{\partial x} \left( \frac{\partial y}{\partial x} \right) = \left( \frac{\partial}{\partial u} + \frac{\partial}{\partial v} \right) \left( \frac{\partial y}{\partial u} + \frac{\partial y}{\partial v} \right) \\
&= \frac{\partial}{\partial u} \left( \frac{\partial y}{\partial u} + \frac{\partial y}{\partial v} \right) + \frac{\partial}{\partial v} \left( \frac{\partial y}{\partial u} + \frac{\partial y}{\partial v} \right) = \frac{\partial^2 y}{\partial u^2} + 2 \frac{\partial^2 y}{\partial u \partial v} + \frac{\partial^2 y}{\partial v^2} \quad \dots(2)
\end{aligned}$$

$$\frac{\partial y}{\partial t} = \frac{\partial y}{\partial u} \frac{\partial u}{\partial t} + \frac{\partial y}{\partial v} \frac{\partial v}{\partial t} = \frac{\partial y}{\partial u} c + \frac{\partial y}{\partial v} (-c) = c \left( \frac{\partial y}{\partial u} - \frac{\partial y}{\partial v} \right) \quad \left[ \because \frac{\partial u}{\partial t} = c, \frac{\partial v}{\partial t} = -c \right]$$

$$\begin{aligned}
\frac{\partial}{\partial t} &\equiv c \left( \frac{\partial}{\partial u} - \frac{\partial}{\partial v} \right) \\
\frac{\partial^2 y}{\partial t^2} &= \frac{\partial}{\partial t} \left( \frac{\partial y}{\partial t} \right) = c \left( \frac{\partial}{\partial u} - \frac{\partial}{\partial v} \right) c \left( \frac{\partial y}{\partial u} - \frac{\partial y}{\partial v} \right) = c^2 \left( \frac{\partial^2 y}{\partial u^2} - 2 \frac{\partial^2 y}{\partial u \partial v} + \frac{\partial^2 y}{\partial v^2} \right) \quad \dots(3)
\end{aligned}$$

Substituting the values of  $\frac{\partial^2 y}{\partial x^2}$  and  $\frac{\partial^2 y}{\partial t^2}$  from (2) and (3) in (1), we get

$$c^2 \left( \frac{\partial^2 y}{\partial u^2} - 2 \frac{\partial^2 y}{\partial u \partial v} + \frac{\partial^2 y}{\partial v^2} \right) = c^2 \left( \frac{\partial^2 y}{\partial u^2} + 2 \frac{\partial^2 y}{\partial u \partial v} + \frac{\partial^2 y}{\partial v^2} \right) \Rightarrow \frac{\partial^2 y}{\partial u \partial v} = 0 \quad \dots (4)$$

Integrating (4) w.r.t.  $v$ , we get  $\frac{\partial y}{\partial u} = f(u)$  ... (5)

where  $f(u)$  is constant in respect of  $v$ . Again integrating (5) w.r.t. ' $u$ ' we get

$$y = \int f(u) du + \psi(v)$$

where  $\psi(v)$  is constant in respect of  $u$

$$\begin{aligned} y &= \phi(u) + \psi(v) && \text{where } \phi(u) = \int f(u) du \\ \Rightarrow y(x, t) &= \phi(x+ct) + \psi(x-ct) && \dots (6) \end{aligned}$$

This is D'Alembert's solution of wave equation (1)

To determine  $\phi, \psi$ , let us apply initial conditions,  $y(x, 0) = f(x)$  and  $\frac{\partial y}{\partial t} = 0$  when  $t = 0$ .

Differentiating (6) w.r.t. ' $t$ ', we get

$$\frac{\partial y}{\partial t} = c\phi'(x+ct) - c\psi'(x-ct) \quad \dots (7)$$

Putting  $\frac{\partial y}{\partial t} = 0$ , and  $t = 0$  in (7) we get  $0 = c\phi'(x) - c\psi'(x)$

$$\Rightarrow \phi'(x) = \psi'(x) \text{ or } \phi(x) = \psi(x) + b \quad \dots (8)$$

Again substituting  $y = f(x)$  and  $t = 0$  in (6), we get

$$f(x) = \phi(x) + \psi(x) \text{ or } f(x) = [\psi(x) + b] + \psi(x) \quad [\text{Using (8)}]$$

$$\Rightarrow f(x) = 2\psi(x) + b$$

So that  $\psi(x) = \frac{1}{2}[f(x) - b]$  and  $\phi(x) = \frac{1}{2}[f(x) + b]$

On putting the values of  $\phi(x+ct)$  and  $\psi(x-ct)$  in (6), we get

$$\begin{aligned} y(x, t) &= \frac{1}{2}[f(x+ct) + b] + \frac{1}{2}[f(x-ct) - b] \\ \Rightarrow y(x, t) &= \frac{1}{2}[f(x+ct) + f(x-ct)] \quad \text{Ans.} \end{aligned}$$

## EXERCISE 49.2

- A tightly stretched string with fixed end points  $x = 0$  and  $x = l$  is initially at rest in its equilibrium position. If it is set vibrating by giving to each of its points a velocity  $\lambda x(l-x)$ , find the displacement of the string at any distance  $x$  from one end at any time  $t$ .

**Ans.**  $y = \frac{8\lambda l^3}{c\pi^4} \sum_{n=1}^{\infty} \frac{1}{(2n-1)^4} \sin \frac{(2n-1)\pi x}{l} \sin \frac{(2n-1)\pi ct}{l}$

- A tightly stretched string of length  $l$  fastened at both ends, is disturbed from the position of equilibrium imparting to each of its points an initial velocity of magnitude  $f(x)$ . Show that the solution of the problem.

$$u(x, t) = \frac{2}{l} \sum_{n=1}^{\infty} \left[ \int_0^1 f(x) \sin \frac{n\pi}{l} x dx \right] \sin \frac{n\pi x}{l} \cos \frac{n\pi at}{l}$$

- Find the solution of the equation  $\frac{\partial^2 y}{\partial x^2} = \frac{1}{c^2} \frac{\partial^2 y}{\partial t^2}$  subject to the boundary conditions

$$y(0, t) = 0, y(l, t) = 0, y(x, 0) = \phi(x), \frac{\partial y}{\partial t}(x, 0) = \psi(x) \quad \text{Ans. } y = \phi(x) \cos \frac{n\pi ct}{l} + \frac{l\psi(x)}{n\pi c} \cdot \frac{\sin \frac{n\pi ct}{l}}{\sin \frac{n\pi x}{l}}$$

4. The vibration of an elastic string of length  $l$  are governed by the one-dimensional wave equation

$$\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}. \text{ The string is fixed at the ends.}$$

$$u(0,t) = 0 = u(l,t) \text{ for all } t. \text{ The initial deflection is } u(x,0) = \begin{cases} x, & 0 < x < \frac{l}{2} \\ l-x, & \frac{l}{2} \leq x \leq l \end{cases}$$

and the initial velocity is zero. Find the deflection of the string at any instant of time.

$$(A.M.I.E.T.E., Summer 2001) \text{ Ans. } \frac{4l}{\pi^2} \sum_{n=1}^{\infty} \frac{\sin \frac{n\pi}{2}}{n^2} \sin \frac{n\pi x}{l} \cos \frac{n\pi ct}{l}$$

5. A tightly stretched violin string of length  $l$  is fixed at both ends and is plucked at  $x = \frac{l}{3}$  and assumes initially the shape of a triangle of height  $a$ . Find the displacement  $y$  at any distance  $x$  and any time  $t$

after the string is released from rest.

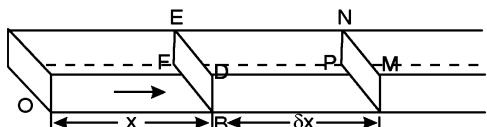

$$\text{Ans. } y(x,t) = \frac{9a}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{n^2} \sin \frac{n\pi}{3} \cos \frac{n\pi ct}{l} \sin \frac{n\pi x}{l}$$

## 49.5 ONE DIMENSIONAL HEAT FLOW

In this article, we shall consider the flow of heat and the accompanying variation of temperature with position and with time in conducting solids the following empirical laws are taken as the basis of investigation.

1. Heat flows from a higher to lower temperature.
2. The amount of heat required to produce a given temperature change in a body is proportional to the mass of the body and to the temperature change. This constant of proportionality is known as the specific heat ( $c$ ) of the conducting material.
3. The rate at which heat flows through an area is proportional to the area and to the temperature gradient normal to the area. This constant of proportionality is known as the thermal conductivity ( $k$ ) of the material.

Consider a bar or rod of homogeneous material of density  $\rho(\text{gr/cm}^3)$  and having a constant cross-sectional area  $A (\text{cm}^2)$ . We suppose that the sides of the bar are insulated and the loss of heat from the sides by conduction or radiations is negligible.

Take an end of the bar as the origin and the direction of heat flow as the positive  $x$ -axis.

Let  $c$  be the specific heat and  $k$  the thermal conductivity of the material.

Consider an element between two parallel sections  $BDEF$  and  $LMNP$  at distances  $x$  and  $x + \delta x$  from the origin  $O$ , the sections being perpendicular to the  $x$ -axis. The mass of the element  $= A \rho \delta x$ .

Let  $u(x, t)$  be the temperature at a distance  $x$  at time  $t$ . By the second law stated above, the rate of increase of heat in the element  $= A \rho \delta x c \frac{\partial u}{\partial t}$ . If  $R_1$  and  $R_2$  are respectively the rates (cal/sec) of inflow and outflow, for the sections  $x = x$  and  $x = x + \delta x$ , then

$$R_1 = -kA \left( \frac{\partial u}{\partial x} \right)_x$$

and  $R_2 = -kA \left( \frac{\partial u}{\partial x} \right)_{x+\delta x}$  the negative sign being due to the fact that heat flows from higher to lower

temperature.

$\left( \text{i.e., } \frac{\partial u}{\partial x} \text{ is negative} \right)$

Equating the rates of increase of heat from the two empirical laws.

$$\begin{aligned} A\rho c \delta x \cdot \frac{\partial u}{\partial t} &= R_1 - R_2 = kA \left[ \left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x \right] \\ \therefore \frac{\partial u}{\partial t} &= \frac{k}{\rho c} \left[ \frac{\left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x}{\delta x} \right] \end{aligned}$$

Taking the limit as  $\delta x \rightarrow 0$  i.e. when  $x + \delta x \rightarrow x$ .

$$\begin{aligned} \frac{\partial u}{\partial t} &= \frac{k}{\rho c} \underset{\delta x \rightarrow 0}{\text{Lt}} \left[ \frac{\left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x}{\delta x} \right] = \frac{k}{\rho c} \frac{\partial}{\partial x} \left( \frac{\partial u}{\partial x} \right) \\ \text{i.e., } \frac{\partial u}{\partial t} &= \frac{k}{\rho c} \frac{\partial^2 u}{\partial x^2} \end{aligned}$$

$\frac{k}{\rho c}$  is called the *diffusivity* ( $\text{cm}^2/\text{sec.}$ ) of the substance. If we denote it by  $c^2$ , the above equation takes the form

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$$

**Example 15.** Solve by the method of separation of variables solve the P.D.E.

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$$

**Solution.** Here, we have

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2} \quad \dots(1)$$

Let

$$u = XT \quad \dots(2)$$

where  $X$  is the function of  $x$  only and  $T$  is the function of  $t$  only.

Differentiating (2) partially w.r.t.  $t$ , we get

$$\frac{\partial u}{\partial t} = \frac{\partial}{\partial t}(XT) = X \frac{dT}{dt}$$

$$\text{and } \frac{\partial^2 u}{\partial x^2} = C^2 \frac{\partial^2}{\partial x^2}(XT) = \frac{\partial}{\partial x} \left( \frac{\partial}{\partial x} XT \right) = \frac{\partial}{\partial x} \left( T \frac{dX}{dx} \right) = T \frac{d^2 X}{dx^2}$$

Putting the values of  $\frac{\partial u}{\partial t}$  and  $\frac{\partial^2 u}{\partial x^2}$  in (1), we get

$$X \frac{dT}{dt} = c^2 T \frac{d^2 X}{dx^2}$$

Separating the variables, we get

$$\frac{1}{c^2} \frac{\frac{dT}{dt}}{T} = \frac{\frac{d^2 X}{dx^2}}{X}$$

$$\begin{array}{l}
 \text{L.H.S. is constant for } x \text{ so we take } \frac{1}{c^2} \frac{dT}{T} = -p^2 \\
 \text{R.H.S is constant for } t \text{ so we take } \frac{d^2X}{dx^2} = -p^2 \\
 \therefore \frac{1}{c^2} \frac{dT}{T} = \frac{\frac{d^2X}{dx^2}}{X} = -p^2 \\
 \frac{1}{c^2} \frac{dT}{T} = -p^2 \\
 \frac{dT}{dt} = -p^2 c^2 T \\
 DT = -p^2 c^2 T \\
 A.E. \text{ is } m = -p^2 c^2 \\
 \Rightarrow T = c_1 e^{-c^2 p^2 t} \\
 \left. \begin{array}{l} \frac{d^2X}{dx^2} = -p^2 \\ X = c_2 \cos px + c_3 \sin px \end{array} \right| \\
 A.E. \text{ is } m^2 = -p^2 \\
 \Rightarrow m = ip \\
 X = c_2 \cos px + c_3 \sin px
 \end{array}$$

Putting the values of  $T$  and  $X$  in (1), we get

$$u = c_1 e^{-c^2 p^2 t} (c_2 \cos px + c_3 \sin px) \quad \text{Ans.}$$

**Example 16.** Find the temperature in a bar of length 2 whose ends kept at zero and lateral

surface insulated if the initial temperature is  $\sin \frac{\pi x}{2} + 3 \sin \frac{5\pi x}{2}$ .

[U.P. II Sem., 2007; U.P. II Semester, 2009]

**Solution.** Here, we have

One-dimensional heat flow equation is

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$$

Its solution is

$$u(x, t) = (c_1 \cos px + c_2 \sin px) c_3 e^{-c^2 p^2 t} \quad \dots(1)$$

Putting  $x = 0, u = 0$  in (1), we get

$$0 = c_1 c_3 e^{-c^2 p^2 t} \quad (\text{given})$$

$\Rightarrow$  Putting  $c_1 = 0$  in (1), we get

$$u = c_2 c_3 \sin px e^{-c^2 p^2 t} \quad \dots(2)$$

Putting  $x = 2, u = 0$  in (2), we get

$$0 = c_2 c_3 \sin 2p e^{-c^2 p^2 t} \quad (\text{given})$$

$$\Rightarrow \sin 2p = 0 = \sin n\pi$$

$$\Rightarrow p = \frac{n\pi}{2}, n \in \mathbb{I}$$

Putting the value of  $P$  in (2), we get

$$u = b_n \sin \frac{n\pi x}{2} e^{-\frac{n^2 \pi^2 c^2 t}{4}} \quad (c_2 c_3 = b_n)$$

$$u = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{2} e^{-\frac{n^2 \pi^2 c^2 t}{4}} \quad \dots(3) \text{ (General solution)}$$

Putting  $t = 0$  and  $u = \sin \frac{\pi x}{2} + 3 \sin \frac{5\pi x}{2}$  in (3), we get

$$\begin{aligned}\sin\left(\frac{\pi x}{2}\right) + 3 \sin\left(\frac{5\pi x}{2}\right) &= \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{2} \\ &= b_1 \sin\left(\frac{\pi x}{2}\right) + b_2 \sin\left(\frac{2\pi x}{2}\right) + \dots + b_5 \sin\left(\frac{5\pi x}{2}\right) + \dots \quad \dots (4)\end{aligned}$$

On equating the coefficients of both sides, we get

$$b_1 = 1 \text{ and } b_5 = 3$$

On putting the values of  $b_1$  and  $b_5$  in (4), we get

$$\text{Hence, } u = \sin\left(\frac{\pi x}{2}\right) e^{-\pi^2 c^2 t/4} + 3 \sin\left(\frac{5\pi x}{2}\right) e^{-25\pi^2 c^2 t/4}. \quad \text{Ans.}$$

**Example 17.** Solve the equation  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$  with boundary condition  $u(x, 0) = 3 \sin n\pi x$ ,  $u(0, t)$ ,  $u(l, t) = 0$  where  $0 < x < l$ . (Q.Bank U.P. 2002)

**Solution.** Here, we have  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$

Its solution is  $u = -c_1 e^{-p^2 t} (c_2 \cos px + c_3 \sin px)$  ... (1)

Putting  $x = 0$ , and  $u = 0$  in (1), we get (given)

$$0 = c_1 c_2 e^{-p^2 t} \Rightarrow c_2 = 0$$

Putting the value of  $c_2$  in (1), we get  $u = c_1 c_3 e^{-p^2 t} \sin px$  ... (2)

Putting  $x = l$  and  $u = 0$  in (2), we get (given)

$$\begin{aligned}0 &= c_1 c_3 e^{-p^2 t} \sin pl \\ \Rightarrow \sin pl &= 0 \Rightarrow pl = n\pi \Rightarrow p = \frac{n\pi}{l}\end{aligned}$$

Putting the value of  $p$  in (2), we get

$$\begin{aligned}u(x, t) &= c_1 c_3 e^{-\frac{n^2 \pi^2}{l^2} t} \sin \frac{n\pi x}{l} = b_n e^{-\frac{n^2 \pi^2}{l^2} t} \sin \frac{n\pi x}{l} \quad (b_n = c_1 c_3) \\ u &= \sum_{n=1}^{\infty} b_n e^{-\frac{n^2 \pi^2 t}{l^2}} \sin \frac{n\pi x}{l} \quad \dots (3) \text{ (general solution)}$$

On putting  $t = 0$  and  $u = 3 \sin n\pi x$  in (3), we get

$$3 \sin n\pi x = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}. \quad \dots (4)$$

Equating the coefficients, we get  $b_n = 3$ ,  $l = 1$ .

On putting the value of  $b_n$  and  $l$  in (3), we get  $u = 3 \sum_{n=1}^{\infty} e^{-n^2 \pi^2 t} \sin n\pi x$  Ans.

**Example 18.** A rod of length  $l$  with insulated sides is initially at a uniform temperature  $u$ . Its ends are suddenly cooled to  $0^\circ\text{C}$  and are kept at that temperature. Prove that the temperature function  $u(x, t)$  is given by

$$u(x, t) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l} \cdot e^{-\frac{c^2 \pi^2 n^2 t}{l^2}}$$

where  $b_n$  is determined from the equation

$$b_n = \frac{2}{l} \int_0^l u_0(x) \sin \frac{n\pi x}{l} dx$$

**Solution.** Let heat flow along a bar of uniform cross-section, in the direction perpendicular to the cross-section. Take one end of the bar as origin and the direction of heat flow is along  $x$ -axis.

Let the temperature of the bar at any time  $t$  at a point  $x$  distance from the origin be  $u(x, t)$ .

Then the equation of one dimensional heat flow is  $\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$ . ... (1)

Let us assume that  $u = XT$ , where  $X$  is a function of  $x$  alone and  $T$  that of  $t$  alone.

$$\therefore \frac{\partial u}{\partial t} = X \frac{dT}{dt} \quad \text{and} \quad \frac{\partial^2 u}{\partial x^2} = T \frac{d^2 X}{dx^2}$$

Substituting these values in (1), we get  $X \frac{dT}{dt} = c^2 T \frac{d^2 X}{dx^2}$

$$\Rightarrow \frac{1}{c^2 T} \frac{dT}{dt} = \frac{1}{X} \frac{d^2 X}{dx^2} = -p^2 \text{ (constant)} \quad \dots (2)$$

$$\begin{array}{ll} \frac{1}{c^2 T} \frac{dT}{dt} = -p^2 & \left| \begin{array}{l} \frac{1}{X} \frac{d^2 X}{dx^2} = -p^2 \\ \frac{d^2 X}{dx^2} + p^2 X = 0 \end{array} \right. \\ \frac{dT}{dt} + p^2 c^2 T = 0 & \Rightarrow D^2 X + p^2 X = 0 \\ \Rightarrow DT + p^2 c^2 T = 0 & \Rightarrow (D^2 + p^2) X = 0 \\ \Rightarrow (D + p^2 c^2) T = 0 & \text{A.E. is } m^2 + p^2 = 0 \\ \text{A.E. is } m + p^2 c^2 = 0 & \Rightarrow m = \pm ip \\ \Rightarrow m = -p^2 c^2 & \Rightarrow X = c_2 \cos px + c_3 \sin px \\ \Rightarrow T = c_1 e^{-p^2 c^2 t} & \end{array}$$

$$\therefore u = XT \Rightarrow u = c_1 e^{-p^2 c^2 t} (c_2 \cos px + c_3 \sin px) \quad \dots (3)$$

Putting  $x = 0, u = 0$  in (3), we get

$$0 = c_1 e^{-p^2 c^2 t} (c_2) \Rightarrow c_2 = 0 \quad [\text{since } c_1 \neq 0]$$

$$(3) \text{ becomes } u = c_1 e^{-p^2 c^2 t} c_3 \sin px \quad \dots (4)$$

Again putting  $x = l, u = 0$  in (4), we get

$$0 = c_1 e^{-p^2 c^2 t} c_3 \sin pl \Rightarrow \sin pl = 0 = \sin n\pi \Rightarrow pl = n\pi$$

$$\Rightarrow p = \frac{n\pi}{l}, \quad n \text{ is any integer}$$

$$\text{Hence (4) becomes } u = c_1 c_3 e^{\frac{-n^2 c^2 \pi^2 t}{l^2}} \sin \frac{n\pi x}{l} = b_n e^{\frac{-n^2 c^2 \pi^2 t}{l^2}} \sin \frac{n\pi}{l} x, \quad b_n = c_1 c_3$$

This equation satisfies the given conditions for all integral values of  $n$ . Hence taking  $n = 1, 2, 3, \dots$ , the most general solution is

$$\begin{aligned} u &= \sum_{n=1}^{\infty} b_n e^{\frac{-n^2 c^2 \pi^2 t}{l^2}} \sin \frac{n\pi}{l} x \\ b_n &= \frac{2}{l} \int_0^l u_0 \sin \frac{n\pi x}{l} dx = \frac{2}{l} u_0 \left[ -\frac{l}{n\pi} \cos \frac{n\pi x}{l} \right]_0^l \\ &= \frac{2}{l} u_0 \left[ -\frac{l}{n\pi} (\cos n\pi - \cos 0) \right] = -\frac{2u_0}{n\pi} [(-1)^n - 1] \end{aligned}$$

$$\Rightarrow b_n = \begin{cases} 0, & \text{if } n \text{ is even} \\ \frac{4u_0}{n\pi}, & \text{if } n \text{ is odd} \end{cases}$$

Hence the temperature function

$$\begin{aligned} u(x, t) &= \frac{4u_0}{\pi} \sum_{n=1, 3, 5, \dots}^{\infty} \frac{1}{n} \sin \frac{n\pi x}{l} e^{-\frac{c^2 n^2 \pi^2 t}{l^2}} \\ &= \frac{4u_0}{\pi} \sum_{n=1}^{\infty} \frac{1}{2n-1} \sin \frac{(2n-1)\pi x}{l} e^{-\frac{c^2 (2n-1)^2 \pi^2 t}{l^2}} \end{aligned}$$

**Example 19.** Determine the solution of one dimensional heat equation

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$$

Subject to the boundary conditions  $u(0, t) = 0$ ,  $u(l, t) = 0$  ( $t > 0$ ) and the initial condition  $u(x, 0) = x$ ,  $l$  being the length of the bar. (U.P. II Semester Summer 2006)

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2} \quad \dots (1)$$

Boundary conditions are

$$\begin{aligned} u(0, t) &= 0 \\ u(l, t) &= 0 \quad (t > 0) \\ u(x, 0) &= x \end{aligned}$$

On solving (1), we get

$$u = c_1 e^{-p^2 c^2 t} (c_2 \cos px + c_3 \sin px) \quad \dots (2)$$

Putting  $x = 0$  and  $u = 0$  in (2), we get

$$0 = c_1 e^{-p^2 c^2 t} (c_2) \Rightarrow c_2 = 0$$

Putting  $c_2 = 0$  in (2), we get

$$u = c_1 e^{-p^2 c^2 t} c_3 \sin px \quad \dots (3)$$

Again putting  $x = l$ ,  $u = 0$  in (3), we get

$$\begin{aligned} 0 &= c_1 e^{-p^2 c^2 t} c_3 \sin pl \\ \Rightarrow \sin pl &= 0 = \sin n\pi \Rightarrow pl = n\pi \\ \Rightarrow p &= \frac{n\pi}{l}, \quad n \text{ is any integer} \end{aligned}$$

$$\text{Hence, (3) becomes } u = c_1 c_3 e^{-\frac{n^2 c^2 \pi^2 t}{l^2}} \sin \frac{n\pi x}{l} = b_n e^{-\frac{n^2 c^2 \pi^2 t}{l^2}} \sin \frac{n\pi x}{l} \quad \dots (4)$$

On putting  $t = 0$  and  $u = x$  in (4), we get

$$x = b_n \sin \frac{n\pi}{l} x$$

General solution is

$$x = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi}{l} x$$

$$\begin{aligned} \text{Now, } b_n &= \frac{2}{l} \int_0^l x \sin \frac{n\pi x}{l} dx = \frac{2}{l} \left[ x \cdot \frac{l}{n\pi} \left( -\cos \frac{n\pi x}{l} \right) - (1) \left( \frac{-l^2}{n^2 \pi^2} \sin \frac{n\pi x}{l} \right) \right]_0^l \\ &= \frac{2}{l} \left[ \left( l \cdot \frac{l}{n\pi} (-\cos n\pi) + \frac{l^2}{n^2 \pi^2} \sin n\pi \right) - 0 \right] = \frac{2}{l} \left[ -\frac{l^2}{n\pi} (-1)^n \right] = (-1)^{n+1} \frac{2l}{n\pi} \end{aligned}$$

Putting the value of  $b_n$  in (4), we get

$$u = \frac{2l}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} \sin \frac{n\pi x}{l} e^{-\frac{n^2 c^2 \pi^2 t}{l^2}}$$

Ans.

**Example 20.** An insulated rod of length  $l$  has its ends A and B maintained at  $0^\circ\text{C}$  and  $100^\circ\text{C}$  respectively until steady state conditions prevail. If B is suddenly reduced to  $0^\circ\text{C}$  and maintained at  $0^\circ\text{C}$ , find the temperature at a distance  $x$  from A at time  $t$ .

(U.P. II Semester Summer, 2004, 2005, AMIE, Summer 2004)

**Solution.** The initial temperature of the rod can be written as :

$$u(x, t) = 0 + \frac{100}{l} x = \frac{100}{l} x$$

While in steady state, the temperature distribution can be written as

$$u(x, t) = 0 + \frac{0}{l} x = 0$$

To find  $u$  in the intermediate period, calculating time from the instant when the end temperature were changed.

$$u = u_1(x) + u_2(x)$$

where  $u_2(x)$  is temperature after a sufficient long time and  $u_1(x, t)$  is the transient temperature distribution tending to zero as  $t \rightarrow \infty$ . Hence  $u_2(x) = 0$ .

Also  $u_1(x, t)$  satisfies one dimensional heat flow

$$C^2 \frac{\partial^2 u}{\partial x^2} = \frac{\partial u}{\partial t}$$

Thus

$$u = (C_1 \cos px + C_2 \sin px) e^{-c^2 p^2 t} \quad \dots (1)$$

On putting  $x = 0, u = 0$  in (1), we get

$$0 = C_1 e^{-c^2 p^2 t} \Rightarrow C_1 = 0$$

On putting  $C_1 = 0$  in (1), we get

$$u = C_2 \sin px e^{-c^2 p^2 t} \quad \dots (2)$$

On putting  $x = l, u = 0$  in (2), we get

$$0 = C_2 \sin pl e^{-c^2 p^2 t} \Rightarrow \sin pl = 0 = \sin n\pi$$

$$\Rightarrow pl = n\pi \Rightarrow p = \frac{n\pi}{l}$$

On putting the value of  $p$  in (2), we get

$$u = C_2 \sin \frac{n\pi x}{l} e^{-\frac{n^2 \pi^2 c^2 t}{l^2}} \quad \dots (3)$$

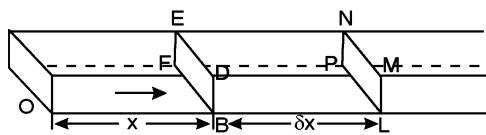

On putting  $t = 0, u = \frac{100}{l} x$  in (3), we get

$$\frac{100}{l} x = C_2 \sin \frac{n\pi x}{l}$$

$$C_2 = \frac{2}{l} \int_0^l \frac{100}{l} x \cdot \sin \frac{n\pi x}{l} dx$$

$$C_2 = \frac{200}{l^2} \int_0^l x \sin \frac{n\pi x}{l} dx$$

$$C_2 = \frac{200}{l^2} \left[ -\frac{xl}{n\pi} \cos \frac{n\pi x}{l} - (-1) \frac{l^2}{n^2 \pi^2} \sin \frac{n\pi x}{l} \right]_0^l$$

$$C_2 = \frac{200}{l^2} \left[ \frac{-l^2}{n\pi} \cos n\pi \right]$$

$$\Rightarrow C_2 = -\frac{200}{n\pi} (-1)^n$$

On putting the value of  $C_2$  in (3), we get

$$u = -\frac{200}{n\pi} (-1)^n \sin \frac{n\pi x}{l} e^{-\frac{n^2\pi^2 c^2}{l^2} t}$$

$$\Rightarrow u = (-1)^{n+1} \cdot \frac{200}{n\pi} \sin \frac{n\pi x}{l} e^{-\frac{n^2\pi^2 c^2}{l^2} t}$$

**Ans.**

**Example 21.** The ends A and B of a rod 20 cm long have the temperatures at  $30^\circ C$  and at  $80^\circ C$  until steady state prevails. The temperature of the ends are changed to  $40^\circ C$  and  $60^\circ C$  respectively. Find the temperature distribution in the rod at time  $t$ .

**Solution.** The initial temperature distribution in the rod is

$$u_1(x, t) = 30 + \frac{80-30}{20} x = 30 + \frac{50}{20} x \text{ i.e., } u_1(x, t) = 30 + \frac{5}{2} x$$

and the final distribution (i.e. in steady state) is

$$u_2(x) = 40 + \frac{60-40}{2} x = 40 + \frac{20}{20} x = 40 + x$$

To get  $u$  in the intermediate period, reckoning time from the instant when the end temperature were changed, we assumed

$$u = u_1(x, t) + u_2(x)$$

where  $u_2(x)$  is the steady state temperature distribution in the rod (i.e., temperature after a sufficiently long time) and  $u_1(x, t)$  is the transient temperature distribution which tends to zero as  $t$  increases.

Thus

$$u_2(x) = 40 + x$$

Now  $u_1(x, t)$  satisfies the one-dimensional heat-flow equation  $c^2 \frac{\partial^2 u}{\partial x^2} = \frac{\partial u}{\partial t}$

Hence its solution is  $(a_k \cos kx + b_k \sin kx) e^{-c^2 k^2 t}$   
Hence  $u$  is of the form

$$u = 40 + x + \sum (a_k \cos kx + b_k \sin kx) e^{-c^2 k^2 t}$$

Since

$$u = 40^\circ \text{ when } x = 0 \text{ and } u = 60^\circ \text{ when } x = 20, \text{ we get}$$

$$a_k = 0, \text{ and } k = \frac{n\pi}{20}$$

Hence

$$u = 40 + x + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{20} e^{-c^2 \left(\frac{n\pi}{20}\right)^2 t} \quad \dots(1)$$

Using the initial conditions i.e.,

$$u = 30 + \frac{5}{2} x \text{ when } t = 0, \text{ we get}$$

$$30 + \frac{5}{2} x = 40 + x + \sum b_n \sin \frac{n\pi x}{20} \Rightarrow \frac{3}{2} x - 10 = \sum b_n \sin \frac{n\pi x}{20}$$

Hence

$$b_n = \frac{2}{20} \int_0^{20} \left( \frac{3}{2} x - 10 \right) \sin \frac{n\pi x}{20} dx$$

$$\Rightarrow = \frac{1}{10} \left[ \left( \frac{3x}{2} - 10 \right) \left( -\frac{20}{n\pi} \cos \frac{n\pi x}{20} \right) - \frac{3}{2} \left( -\frac{400}{n^2\pi^2} \sin \frac{n\pi x}{20} \right) \right]_0^{20}$$

$$= \frac{1}{10} \left[ -20 \left( \frac{20}{n\pi} \right) (-1)^n - (-10) \left( -\frac{20}{n\pi} \right) \right] = -\frac{20}{n\pi} [2(-1)^n + 1]$$

Putting this value of  $b_n$  in (1), we get

$$\therefore u = 40 + x - \frac{20}{\pi} \sum \left[ \left( \frac{2(-1)^n + 1}{n} \right) \sin \frac{n\pi x}{20} e^{-\left(\frac{n\pi}{20}\right)^2 t} \right] \quad \text{Ans.}$$

### EXERCISE 49.3

1. The equation  $\frac{\partial u}{\partial t} = \mu \frac{\partial^2 u}{\partial x^2}$  refers to the conduction of heat along a bar, without radiation, show that if

$$u = Ae^{-gx} \sin(nt - gx), \text{ where } A, g \text{ and } n \text{ are positive constants, then } g = \sqrt{\frac{n}{2\mu}}$$

2. Solve  $\frac{\partial u}{\partial t} = a^2 \frac{\partial^2 u}{\partial x^2}$  under the conditions

$$u'(0, t) = 0 \quad t > 0, \quad u'(\pi, t) = 0, \quad u(x, 0) = x^2, 0 < x < \pi$$

$$\text{Ans. } u(x, t) = \frac{\pi^2}{3} + 4 \sum_{n=1}^{\infty} \frac{(-1)^n}{n^2} \cos nx e^{-a^2 n^2 t}$$

3. A uniform rod of length ' $a$ ' whose surface is thermally insulated is initially at temperature  $0 = 0_0$ . At time  $t = 0$ , one end is suddenly cooled to  $0 = 0$  and subsequently maintained at this temperature, the other end remains thermally insulated. Find the temperature  $\theta(x, t)$ .

$$\text{Ans. } \theta(x, t) = \frac{40_0}{\pi} \sum_{n=1}^{\infty} \frac{\sin(2n+1)\pi x}{2a} e^{-\frac{(2n+1)^2 \pi^2 c^2 t}{4a^2}}$$

4. Solve  $\frac{\partial U}{\partial t} = a^2 \frac{\partial^2 U}{\partial x^2}$  under the conditions

$$(i) U \neq \infty \text{ if } t \rightarrow \infty; \quad (ii) U(0, t) = U(\pi, t) = 0; \quad (iii) U(x, 0) = \pi x - x^2$$

$$\text{Ans. } u = \frac{8}{\pi} \sum_{n=1}^{\infty} \frac{\sin(2n-1)x}{(2n-1)^3} e^{-a^2 (2n-1)^2 t}$$

5. The temperature distribution in a bar of length  $\pi$ , which is perfectly insulated at the ends  $x = 0$  and  $x = \pi$  is governed by the partial differential equation  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$ . Assuming the initial temperature as  $u(x, 0) = f(x) = \cos 2x$ , find the temperature distribution at any instant of time. **Ans.**  $u = e^{-4t} \cos 2x$

6. The heat flow in a bar of length 10 cm of homogeneous material is governed by the partial differential equation  $u_t = c^2 u_{xx}$ . The ends of the bar are kept at temperature  $0^\circ\text{C}$ , and the initial temperature is  $f(x) = x(10 - x)$ . Find the temperature in the bar at any instant of time.

$$\text{Ans. } u(x, t) = \frac{800}{\pi^3} \sum_{n=1}^{\infty} \frac{1}{(2n-1)^3} \sin \frac{(2n-1)\pi x}{10} e^{-\left[\frac{(2n-1)^2 \pi^2 c^2 t}{100}\right]}$$

7. Find the temperature  $u(x, t)$  in a bar of length  $\pi$  which is perfectly insulated everywhere including the ends  $x = 0$  and  $x = \pi$ . This leads to the conditions  $\frac{\partial u}{\partial x}(0, t) = 0, \frac{\partial u}{\partial x}(\pi, t) = 0$ . Further the initial conditions are as given below:

$$u(x, 0) = \begin{cases} x, & 0 < x < \pi/2 \\ \pi x, & \pi/2 \leq x < \pi \end{cases} \quad \text{Find the solution by the separation of variables.}$$

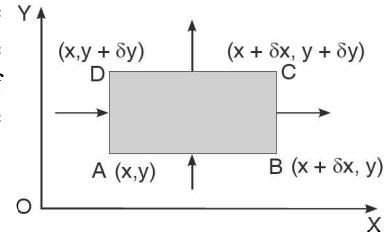

### 49.6 TWO DIMENSIONAL HEAT FLOW

When the heat-flow is along curves instead of along straight lines, all the curves lying in parallel planes, then the flow is called two-dimensional. Let us consider now the flow of heat in a metal-plate in the  $xoy$  plane. Let the plate be of uniform thickness  $h$ , density  $\rho$ , thermal

conductivity  $k$  and the specific heat  $C$ . Since the flow is two dimensional, the temperature at any point of the plate is independent of the  $z$ -coordinate. The heat-flow lies in the  $xoy$  plane and is zero along the direction normal to the  $xoy$  plane.

Now, consider a rectangular element  $ABCD$  of the plate with sides  $\delta x$  and  $\delta y$ , the edges being parallel to the coordinates axes, as shown in the figure. Then the quantity of heat entering the element  $ABCD$  per sec. through the surface  $AB$  is

$$= -k \left( \frac{\partial u}{\partial y} \right)_y \delta x \cdot h.$$

Similarly the quantity of heat entering the element  $ABCD$  per sec. through the surface  $AD$  is

$$= -k \left( \frac{\partial u}{\partial x} \right)_x \delta y \cdot h.$$

The amount of heat which flows out through the surfaces  $BC$  and  $CD$  are

$$-k \left( \frac{\partial u}{\partial x} \right)_{x+\delta x} \delta y \cdot h \text{ and } -k \left( \frac{\partial u}{\partial y} \right)_{y+\delta y} \delta x \cdot h \text{ respectively.}$$

Therefore the total gain of heat by the rectangular element  $ABCD$  per sec.

= inflow – outflow.

$$\begin{aligned} &= kh \left[ \left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x \right] \delta y + \left[ \left( \frac{\partial u}{\partial y} \right)_{y+\delta y} - \left( \frac{\partial u}{\partial y} \right)_y \right] \delta x \\ &= kh \delta x \delta y \left[ \frac{\left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x}{\delta x} + \frac{\left( \frac{\partial u}{\partial y} \right)_{y+\delta y} - \left( \frac{\partial u}{\partial y} \right)_y}{\delta y} \right] \end{aligned} \quad \dots(1)$$

The rate of gain of heat by the element  $ABCD$  is also given by

$$\rho \delta x \delta y h c \cdot \frac{\partial u}{\partial t} \quad \dots(2)$$

Equating the two-expressions for gain of heat per sec. from (1) and (2), we have

$$\begin{aligned} \rho \delta x \delta y h c \cdot \frac{\partial u}{\partial t} &= hk \delta x \delta y \left[ \frac{\left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x}{\delta x} + \frac{\left( \frac{\partial u}{\partial y} \right)_{y+\delta y} - \left( \frac{\partial u}{\partial y} \right)_y}{\delta y} \right] \\ i.e., \quad \frac{\partial u}{\partial t} &= \frac{k}{\rho c} \left[ \frac{\left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x}{\delta x} + \frac{\left( \frac{\partial u}{\partial y} \right)_{y+\delta y} - \left( \frac{\partial u}{\partial y} \right)_y}{\delta y} \right] \end{aligned}$$

Taking the limit as  $\delta x \rightarrow 0$ ,  $\delta y \rightarrow 0$ , the above equation reduces to  $\frac{\partial u}{\partial t} = \frac{k}{\rho c} \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right)$

Putting  $\alpha^2 = \frac{k}{\rho c}$  as before, the equation becomes,

$$\frac{\partial u}{\partial t} = \alpha^2 \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) \quad \dots(3)$$

The equation (3) gives the temperature distribution of the plate in the transit state.

In the steady-state,  $u$  is independent of  $t$ , so that  $\frac{\partial u}{\partial t} = 0$ . Hence the temperature distribution of the plate in the steady-state is  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$ .

**Example 22.** Solve  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$  which satisfies the conditions

$$u(0, y) = u(l, y) = u(x, 0) = 0$$

and  $u(x, a) = \sin \frac{n\pi x}{l}$  (U.P., II Semester, 2004)

**Solution.** Consider the heat flow in a metal plate of uniform thickness, in the directions parallel to length and breadth of the plate. There is no heat flow along the normal to the plane of the rectangle.

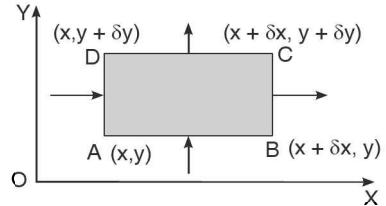

Let  $u(x, y)$  be the temperature at any point  $(x, y)$  of the plate at time  $t$  is given by

$$\frac{\partial u}{\partial t} = c^2 \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) \quad \dots (1)$$

In the steady state,  $u$  does not change with  $t$ .

$$\therefore \frac{\partial u}{\partial t} = 0$$

$$(1) \text{ becomes } \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

This is called Laplace equation in two dimensions.

Let  $u = X(x)Y(y)$  ... (2)

Putting the values of  $\frac{\partial^2 u}{\partial x^2}$  and  $\frac{\partial^2 u}{\partial y^2}$  in (1), we have

$$X''Y + XY'' = 0 \quad \dots (3)$$

$$\Rightarrow \frac{X''}{X} = -\frac{Y''}{Y} = -p^2 \text{ (say)}$$

$$D^2 X = -p^2 X \quad D^2 Y = p^2 Y$$

$$\begin{aligned} &\Rightarrow D^2 X + p^2 X = 0 && \Rightarrow D^2 Y - p^2 Y = 0 \\ &\Rightarrow (D^2 + p^2)X = 0 && \Rightarrow (D^2 - p^2)Y = 0 \\ \text{A.E. is } &m^2 + p^2 = 0 && \text{A.E. is } m^2 - p^2 = 0 \\ &\Rightarrow m^2 = -p^2 && \Rightarrow m^2 = p^2 \\ &\Rightarrow m = \pm ip && \Rightarrow m = \pm p \end{aligned}$$

$$X = c_1 \cos px + c_2 \sin px$$

$$Y = c_3 e^{py} + c_4 e^{-py}$$

Putting the values of  $X$  and  $Y$  in (2), we have

$$u = (c_1 \cos px + c_2 \sin px)(c_3 e^{py} + c_4 e^{-py}) \quad \dots (4)$$

Putting  $x = 0, u = 0$  in (4), we have

$$\begin{aligned} 0 &= c_1(c_3 e^{py} + c_4 e^{-py}) \\ \therefore c_1 &= 0 \end{aligned}$$

$$(4) \text{ is reduced to } u = c_2 \sin px(c_3 e^{py} + c_4 e^{-py}) \quad \dots (5)$$

On putting  $x = l, u = 0$  in (5), we have

$$0 = c_2 \sin pl(c_3 e^{py} + c_4 e^{-py})$$

$$c_2 \neq 0 \quad \therefore \sin pl = 0 = \sin n\pi \Rightarrow pl = n\pi \Rightarrow p = \frac{n\pi}{l}$$

$$\text{Now (5) becomes } u = c_2 \sin \frac{n\pi x}{l} \left( c_3 e^{\frac{n\pi y}{l}} + c_4 e^{-\frac{n\pi y}{l}} \right) \quad \dots (6)$$

On putting  $u = 0$  and  $y = 0$  in (6), we have

$$\begin{aligned} 0 &= c_2 \sin \frac{n\pi x}{l} (c_3 + c_4) \\ \Rightarrow c_3 + c_4 &= 0 \quad \Rightarrow c_3 = -c_4 \\ (5) \text{ becomes } u &= c_2 c_3 \sin \frac{n\pi x}{l} \left( e^{\frac{n\pi y}{l}} - e^{-\frac{n\pi y}{l}} \right) \quad \dots (7) \end{aligned}$$

On putting  $y = a$  and  $u = \sin \frac{n\pi x}{l}$  in (7), we have

$$\sin \frac{n\pi x}{l} = c_2 c_3 \sin \frac{n\pi x}{l} \left( e^{\frac{n\pi a}{l}} - e^{-\frac{n\pi a}{l}} \right) \text{ i.e. } c_2 c_3 = \frac{1}{e^{\frac{n\pi a}{l}} - e^{-\frac{n\pi a}{l}}}$$

Putting this value in (7), we have

$$u = \sin \frac{n\pi x}{l} \frac{e^{\frac{n\pi y}{l}} - e^{-\frac{n\pi y}{l}}}{e^{\frac{n\pi a}{l}} - e^{-\frac{n\pi a}{l}}} \quad \text{or} \quad u = \sin \frac{n\pi x}{l} \frac{\sinh \frac{n\pi y}{l}}{\sinh \frac{n\pi a}{l}} \quad \text{Ans.}$$

**Example 23.** A rectangular plate with insulated surfaces is 10 cm wide and so long compared to its width that it may be considered infinite in length without introducing an appreciable error. If the temperature along the short edge  $y = 0$  is given by

$$\begin{aligned} u(x, 0) &= 20x, & 0 < x \leq 5 \\ &= 20(10 - x), & 5 < x < 10 \end{aligned}$$

while the two long edges  $x = 0$  and  $x = 10$  as well as the other short edges are kept at  $0^\circ\text{C}$ .

Find the steady state temperature at any point  $(x, y)$  of the plate.

**Solution.** In the steady state, the temperature  $u(x, y)$  at any point  $p(x, y)$  satisfy the equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \quad \dots (1)$$

The boundary conditions are

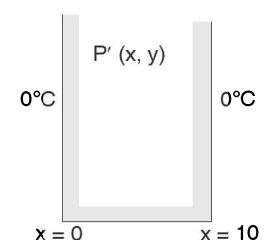

$$u(0, y) = 0 \text{ for all values of } y \quad \dots (2)$$

$$u(10, y) = 0 \text{ for all values of } y \quad \dots (3)$$

$$u(x, \infty) = 0 \text{ for all values of } x \quad \dots (4)$$

$$u(x, 0) = 20x, \quad 0 < x \leq 5 \quad \dots (5)$$

$$= 20(10 - x), \quad 5 < x < 10 \quad \dots (5)$$

Now three possible solutions of (1) are

$$u = (C_1 e^{px} + C_2 e^{-px})(C_3 \cos py + C_4 \sin py) \quad \dots (6)$$

$$u = (C_5 \cos px + C_6 \sin px)(C_7 e^{py} + C_8 e^{-py}) \quad \dots (7)$$

$$u = (C_9 x + C_{10})(C_{11} y + C_{12}) \quad \dots (8)$$

Of these, we have to choose that solution which is consistent with the physical nature of the problem. The solution (6) and (8) cannot satisfy the condition (2), (3) and (4). Thus, only possible solution is (7) i.e., of the form.

$$u(x, y) = (C_1 \cos px + C_2 \sin px)(C_3 e^{py} + C_4 e^{-py}) \quad \dots (9)$$

By (2),  $u(0, y) = C_1(C_3 e^{py} + C_4 e^{-py}) = 0$  for all values of  $y$

$$\therefore C_1 = 0$$

$$\therefore (9) \text{ reduces to } u(x, y) = C_2 \sin px(C_3 e^{py} + C_4 e^{-py}) \quad \dots (10)$$

$$\text{By (3), } u(10, y) = C_2 \sin 10p(C_3 e^{py} + C_4 e^{-py}) = 0, C_2 \neq 0$$

$$\therefore \sin 10p = 0 = \sin n\pi \Rightarrow 10p = n\pi \Rightarrow p = \frac{n\pi}{10}$$

Also to satisfy the condition (4) i.e.  $u = 0$  as  $y \rightarrow \infty$

$$C_3 = 0$$

Hence (10) takes the form  $u(x, y) = C_2 C_4 \sin px e^{-py}$

$$\text{or } u(x, y) = b_n \sin px e^{-py} \text{ where } b_n = C_2 C_4$$

$\therefore$  The most general solution that satisfies (2), (3) and (4) is of the form

$$u(x, y) = \sum_{n=1}^{\infty} b_n \sin px e^{-py} \quad \dots (11)$$

$$\text{Putting } y = 0, u(x, 0) = \sum_{n=1}^{\infty} b_n \sin px, \text{ where } p = \frac{n\pi}{10}$$

This requires the expansion of  $u$  in Fourier series in the interval  $x = 0$  and  $x = 5$  and from  $x = 5$  to  $x = 10$ .

$$\begin{aligned} b_n &= \frac{2}{10} \int_0^5 20x \sin px dx + \frac{2}{10} \int_5^{10} 20(10-x) \sin px dx \\ b_n &= 4 \int_0^5 x \sin px dx + 4 \int_5^{10} (10-x) \sin px dx \\ &= 4 \left[ x \left( \frac{-\cos px}{p} \right) - (-1) \left( \frac{-\sin px}{p^2} \right) \right]_0^5 + 4 \left[ (10-x) \left( \frac{-\cos px}{p} \right) - (-1) \left( \frac{-\sin px}{p^2} \right) \right]_5^{10} \\ &= 4 \left[ \frac{-5 \cos 5p}{p} + \frac{\sin 5p}{p^2} \right] + 4 \left[ 0 - \frac{\sin 10p}{p^2} + \frac{5 \cos 5p}{p} + \frac{\sin 5p}{p^2} \right] \\ &= 4 \left[ \frac{2 \sin 5p}{p^2} - \frac{\sin 10p}{p^2} \right] \quad \left( p = \frac{n\pi}{10} \right) \\ &= 4 \left[ \frac{2 \sin 5 \cdot \frac{n\pi}{10}}{\frac{n^2 \pi^2}{100}} - \frac{\sin 10 \cdot \frac{n\pi}{10}}{\frac{n^2 \pi^2}{100}} \right] = \frac{800}{n^2 \pi^2} \sin \frac{n\pi}{2} - \frac{400}{n^2 \pi^2} \sin n\pi \end{aligned}$$

$$\begin{aligned}
 &= \frac{800}{n^2\pi^2} \sin \frac{n\pi}{2} = 0, \text{ if } n \text{ is even.} \\
 &= \pm \frac{800}{n^2\pi^2}, \quad \text{if } n \text{ is odd.} \\
 \Rightarrow b_n &= \frac{(-1)^{n+1} 800}{(2n-1)^2 \pi^2}
 \end{aligned}$$

On putting the value of  $b_n$  in (11) the temperature at any point  $(x, y)$  is given by

$$u(x, y) = \frac{800}{\pi^2} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{(2n-1)^2} \sin \frac{(2n-1)\pi x}{10} e^{-\frac{(2n-1)\pi y}{10}} \quad \text{Ans.}$$

**Example 24.** A thin rectangular plate whose surface is impervious to heat flow has  $t = 0$  an arbitrary distribution of temperature  $f(x, y)$ . Its four edges  $x = 0, x = a, y = 0, y = b$  are kept at zero temperature. Determine the temperature at a point of the plate as  $t$  increases.

(U.P. III Semester, summer 2002)

**Solution.** The partial differential equation of two dimensional heat conduction problem is

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = \frac{1}{c^2} \frac{\partial u}{\partial t} \quad \dots (1)$$

The boundary conditions are  $u(0, y) = u(a, y) = u(x, 0) = u(x, b)$  and the initial condition is  $u(x, y) = f(x, y)$

Let the solution be  $u = X Y T$ .

On putting the values of the derivatives in (1), we get

$$YT \frac{d^2 X}{dx^2} + XT \frac{d^2 Y}{dy^2} = \frac{XY}{c^2} \frac{dT}{dt}$$

Separating the variables, we get, (dividing by  $XYT$ )

$$\frac{1}{X} \frac{d^2 X}{dx^2} + \frac{1}{Y} \frac{d^2 Y}{dy^2} = \frac{1}{c^2 T} \frac{dT}{dt}$$

Since  $X$  is function of independent variable  $x$  alone,  $Y$  of  $y$  alone and  $T$  of  $t$  alone, there are three possibilities.

1.  $\frac{1}{X} \frac{d^2 X}{dx^2} = 0, \quad \frac{1}{Y} \frac{d^2 Y}{dy^2} = 0, \quad \frac{1}{c^2 T} \frac{dT}{dt} = 0$
2.  $\frac{1}{X} \frac{d^2 X}{dx^2} = K_1^2, \quad \frac{1}{Y} \frac{d^2 Y}{dy^2} = K_2^2, \quad \frac{1}{c^2 T} \frac{dT}{dt} = k^2$
3.  $\frac{1}{X} \frac{d^2 X}{dx^2} = -K_1^2, \quad \frac{1}{Y} \frac{d^2 Y}{dy^2} = -K_2^2, \quad \frac{1}{c^2 T} \frac{dT}{dt} = -K^2$

$$K^2 = K_1^2 + K_2^2 \quad \dots (A)$$

Out of these three solutions, we have to choose that solution which is consistent with the physical nature of the problem. Accordingly third solution is accepted here.

Then

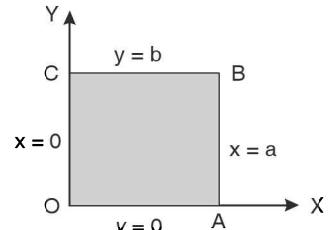

$$Y = A \cos K_1 x + B \sin K_1 x$$

$$T = E e^{-C^2 kt}$$

$$u = XYT$$

$$u = (A \cos K_1 x + B \sin K_1 x)(C \cos K_2 y + D \sin K_2 y).E e^{-C^2 kt} \quad \dots (1)$$

Now we apply boundary conditions

On putting  $u = 0$  and  $x = 0$  in (1), we get

$$0 = A(C \cos K_2 y + D \sin K_2 y) E e^{-C^2 kt} \Rightarrow A = 0$$

On putting the value of  $A$  in (1), it reduces to

$$\begin{aligned} u &= (B \sin K_1 x)(C \cos K_2 y + D \sin K_2 y) E e^{-C^2 kt} \\ \Rightarrow u &= (B_1 \sin K_1 x)(C \cos K_2 y + D \sin K_2 y) e^{-C^2 kt} \quad \dots (2) \\ &\quad (B_1 = B.E) \end{aligned}$$

On putting  $u = 0$  and  $x = a$  in (2), we get

$$\begin{aligned} 0 &= (B_1 \sin K_1 a)(C \cos K_2 y + D \sin K_2 y) e^{-C^2 kt} \\ \Rightarrow 0 &= B_1 \sin K_1 a \Rightarrow \sin K_1 a = 0 = \sin n\pi \Rightarrow K_1 a = n\pi \Rightarrow K_1 = \frac{n\pi}{a} \end{aligned}$$

On putting the value of  $K_1$  in (2), we have

$$u = \left( B_1 \sin \frac{n\pi}{a} x \right) (C \cos K_2 y + D \sin K_2 y) e^{-C^2 kt} \quad \dots (3)$$

On putting  $u = 0$ ,  $y = 0$  in (3), we obtain

$$0 = \left( B_1 \sin \frac{n\pi}{a} x \right) (C) e^{-C^2 kt} \Rightarrow C = 0$$

On substituting the value of  $C$  in (3), we have

$$u = \left( B_1 \sin \frac{n\pi x}{a} \right) (D \sin K_2 y) e^{-C^2 kt} \quad \dots (4)$$

On substituting  $u = 0$  and  $y = b$  in (4), we have

$$0 = \left( B_1 \sin \frac{n\pi x}{a} \right) (D \sin K_2 b) e^{-C^2 kt} \Rightarrow \sin K_2 b = 0 = \sin m\pi \Rightarrow K_2 = \frac{m\pi}{b}$$

On putting the value of  $K_2$  in (4), we have

$$u = \left( B_1 \sin \frac{n\pi x}{a} \right) \left( D \sin \frac{m\pi y}{b} \right) e^{-C^2 kt} \quad \dots (5)$$

$$u = A_{mn} \sin \frac{n\pi x}{a} \sin \frac{m\pi y}{b} e^{-C^2 kt}, \quad (B_1 D = A_{mn})$$

$$\text{But from (A), } K^2 = K_1^2 + K_2^2 = \pi^2 \left( \frac{n^2}{a^2} + \frac{m^2}{b^2} \right)$$

$$\Rightarrow K_{mn}^2 = \pi^2 \left( \frac{n^2}{a^2} + \frac{m^2}{b^2} \right)$$

By using  $K_{mn}$ , (5) becomes

$$u = \sum_{n=1}^{\infty} \sum_{m=1}^{\infty} A_{mn} \sin \frac{n\pi x}{a} \sin \frac{m\pi y}{b} e^{-C^2 k_{mn} t}$$

On applying the initial condition  $u = f(x, y)$ ,  $t = 0$

$$f(x, y) = \sum_{n=1}^{\infty} \sum_{m=1}^{\infty} A_{mn} \sin \frac{n\pi x}{a} \sin \frac{m\pi y}{b}$$

Which is the double Fourier sine series of  $f(x, y)$

$$\text{Where } A_{mn} = \frac{2}{a} \int_{x=0}^a \int_{y=0}^b \sin \frac{n\pi x}{a} \sin \frac{m\pi y}{b} f(x, y) dx dy \quad \text{Ans.}$$

**Example 25.** A rectangular plate with insulated surface is 8 cm wide and so long compared to its width that it may be considered infinite in length without introducing an appreciable. If the temperature along one short edge  $y = 0$  is given by

$$u(x, 0) = 100 \sin \frac{\pi x}{8}, 0 < x < 8$$

While the two long edges  $x = 0$  and  $x = 8$  as well as the other short edge are kept at  $0^\circ\text{C}$ , show that the steady state temperature at any plate is given by

$$u(x, y) = 100e^{-\frac{\pi y}{8}} \sin \frac{\pi x}{8}.$$

**Soution.** Here, we have

Two dimensional heat flow equation in steady state is given by

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

Its solution is  $u(x, y) = (c_1 \cos px + c_2 \sin px)(c_3 e^{py} + c_4 e^{-py})$

Putting  $x = 0$  and  $u = 0$  in (1), we get

...(1)  
(given)

$$0 = c_1(c_3 e^{py} + c_4 e^{-py})$$

$$\Rightarrow c_1 = 0$$

Putting the value of  $c_1$  in (1), we get

$$u = c_2 \sin px(c_3 e^{py} + c_4 e^{-py})$$

Again putting  $x = 8$  and  $u = 0$  in (2), we get

...(2)  
(given)

$$0 = c_2 \sin 8p(c_3 e^{py} + c_4 e^{-py})$$

$$\Rightarrow$$

$$\sin 8p = 0 = \sin n\pi \Rightarrow p = \frac{n\pi}{8} (n \in I)$$

Putting the value of  $p$  in (2), we get

$$u(x, y) = c_2 \sin \frac{n\pi x}{8} (c_3 e^{\frac{n\pi y}{8}} + c_4 e^{-\frac{n\pi y}{8}}) \quad \dots (3)$$

Putting  $y = \infty$  and  $u = 0$  in (3), we get (given)

$$0 = c_2 \sin \frac{n\pi x}{8} c_3 e^{\frac{n\pi y}{8}}$$

$$\Rightarrow c_3 = 0$$

Putting  $c_3 = 0$  in (3), we get

$$u = c_2 c_4 \sin \frac{n\pi x}{8} e^{-\frac{n\pi y}{8}}$$

$$u = b_n \sin \frac{n\pi x}{8} e^{-\frac{n\pi y}{8}} \quad \dots (4)$$

Putting  $y = 0$  and  $u = 100 \sin \frac{\pi x}{8}$  in (4), we get

(given)

$$100 \sin \frac{\pi x}{8} = b_n \sin \frac{n\pi x}{8}$$

$$\Rightarrow b_n = 100,$$

Putting the value of  $b_n$  in (4), we get

$$u = 100 \sin \left( \frac{\pi x}{8} \right) e^{-\frac{n\pi y}{8}}$$

**Proved.**

**Example 26.** Solve  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0, 0 < x < \pi, 0 < y < \pi$ , which satisfies the conditions :

$$u(0, y) = u(\pi, y) = u(x, \pi) = 0 \text{ and } u(x, 0) = \sin^2 x. \quad (\text{Q.Bank U.P. II Semester 2002})$$

**Solution.** Here, we have

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

Its solution is  $u(x, y) = (c_1 \cos px + c_2 \sin px)(c_3 e^{py} + c_4 e^{-py})$  ... (1)  
 Putting  $x = 0$  and  $u = 0$  in (1), we get (given)

$$\begin{aligned} 0 &= c_1(c_3 e^{py} + c_4 e^{-py}) \\ \Rightarrow c_1 &= 0 \end{aligned}$$

Putting the value of  $c_1$  in (1), we get

$$u(x, y) = c_2 \sin px(c_3 e^{py} + c_4 e^{-py}) \quad \dots (2)$$

Putting  $x = \pi$  and  $u = 0$  in (2), we get (given)

$$\begin{aligned} 0 &= c_2 \sin p\pi(c_3 e^{py} + c_4 e^{-py}) \\ \Rightarrow \sin p\pi &= 0 = \sin n\pi \end{aligned}$$

$\Rightarrow p = n$   
 Putting  $p = n$  in (2), we get  $u = c_2 \sin nx(c_3 e^{ny} + c_4 e^{-ny}) = \sin nx(A e^{ny} + B e^{-ny})$  ... (3) ( $c_2 c_3 = A$  and  $c_2 c_4 = B$ )

Putting  $u = 0$  and  $y = \pi$  in (3), we get (given)

$$\begin{aligned} 0 &= \sin nx(A e^{n\pi} + B e^{-n\pi}) \\ \Rightarrow 0 &= A e^{n\pi} + B e^{-n\pi} \\ \Rightarrow A e^{n\pi} &= -B e^{-n\pi} = -\frac{1}{2} b \Rightarrow A = -\frac{1}{2} b e^{-n\pi} \text{ and } B = \frac{1}{2} b e^{n\pi} \end{aligned}$$

On putting the values of A and B in (3), we get

$$\begin{aligned} u &= \sin nx \left[ -\frac{1}{2} b e^{-n\pi} e^{ny} + \frac{1}{2} b e^{n\pi} e^{-ny} \right] \\ &= \frac{1}{2} b [e^{n(\pi-y)} - e^{-n(\pi-y)}] \sin nx \\ &= b \sinh n(\pi-y) \sin nx. \end{aligned}$$

$$u = \sum_{n=1}^{\infty} b_n \sinh n(\pi-y) \sin nx \quad \dots (4) \text{ (General solution)}$$

Putting  $y = 0$  and  $u = \sin^2 x$  in (4), we get (given)

$$\sin^2 x = \sum_{n=1}^{\infty} b_n \sinh n\pi \sin nx$$

$$\begin{aligned} \text{Here } b_n \sinh n\pi &= \frac{2}{\pi} \int_0^\pi \sin^2 x \sin nx dx = \frac{1}{\pi} \int_0^\pi (1 - \cos 2x) \sin nx dx \\ &= \frac{1}{\pi} \int_0^\pi \left[ \sin nx - \frac{1}{2} \{ \sin(n+2)x + \sin(n-2)x \} \right] dx \end{aligned}$$

$$\begin{aligned} &= \frac{1}{\pi} \left[ \frac{-\cos nx}{n} + \frac{\cos(n+2)x}{2(n+2)} + \frac{\cos(n-2)x}{2(n-2)} \right]_0^\pi \\ &= \frac{1}{\pi} \left[ \frac{-\cos n\pi}{n} + \frac{\cos(n+2)\pi}{2(n+2)} + \frac{\cos(n-2)\pi}{2(n-2)} + \frac{1}{n} - \frac{1}{2(n+2)} - \frac{1}{2(n-2)} \right] \\ &= \frac{1}{\pi} \left[ \left( \frac{(-1)^n}{n} + \frac{(-1)^{n+2}}{2(n+2)} + \frac{(-1)^{n-2}}{2(n-2)} \right) + \left( \frac{1}{n} - \frac{1}{2(n+2)} - \frac{1}{2(n-2)} \right) \right] \\ &= \frac{1}{2\pi} \left[ \left( \frac{1}{n+2} + \frac{1}{n-2} - \frac{2}{n} \right) \{(-1)^n - 1\} \right], \text{ where } n \neq 2 \end{aligned}$$

$$b_n \sinh n\pi = \frac{-8}{\pi n(n^2 - 4)}, \text{ when } n \text{ is odd} \quad \dots (5)$$

$$b_n \sinh \pi = 0, \text{ when } n \text{ is even and } \neq 2$$

Now, we have to find out  $b^2 \sinh 2\pi$ .

$$\begin{aligned} b^2 \sinh 2\pi &= \frac{2}{\pi} \int_0^\pi \sin^2 x \sin 2x dx \\ &= \frac{1}{\pi} \int_0^\pi (1 - \cos 2x) \sin 2x dx = \frac{1}{\pi} \int_0^\pi \left( \sin 2x - \frac{1}{2} \sin 4x \right) dx = \left( \frac{-\cos 2x}{2} + \frac{1}{8} \cos 4x \right)_0^\pi = 0 \\ &\Rightarrow b^2 = 0 \end{aligned} \quad \dots (6)$$

On putting the value of  $b_n$  from (5) in (4), we get

$$u = \frac{-8}{\pi} \sum_{n=1,3,5,\dots}^{\infty} \frac{\sin nx \sinh n(\pi - y)}{n(n^2 - 4) \sin hn\pi} \quad \text{Ans.}$$

#### EXERCISE 49.4

1. Find by the method of separation of variables, a particular solution of the equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = \theta$$

that tends to zero as  $x$  tends to infinity and is equal to  $2 \cos y$  when  $x = 0$ . **Ans.**  $u = 2e^{-x} \cos y$

2. Solve the equation:  $u_{xx} + u_{yy} = \theta$

$$u(0, y) = u(\pi, y) = 0 \text{ for all } y,$$

$$u(x, 0) = k, \quad 0 < x < \pi$$

$$\lim u(x, y) = 0 \quad 0 < x < \pi$$

$$y \rightarrow \infty \quad \text{Ans. } u(x, y) = \sum_{n=1}^{\infty} b_n \sin nx e^{-ny}, \quad k = \sum_{n=1}^{\infty} b_n \sin nx$$

3. A infinitely long uniform plate is bounded by two parallel edges and an end at right angles to them.

The breadth is  $\pi$ . This end is maintained at a temperature  $u_0$  at all points and other edges are at zero temperature. Determine the temperature at any point of the plate in the steady state.

$$\text{Ans. } u(x, y) = \frac{4u_0}{\pi} \left[ e^{-y} \sin x + \frac{1}{3} e^{-3y} \sin 3x + \frac{1}{5} e^{-5y} \sin 5x + \dots \right]$$

4. Solve  $\frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial y^2} = \theta$ , given that

(i)  $V = \theta$  when  $x = 0$  and  $x = c$ ; (ii)  $V \rightarrow \theta$  as  $y \rightarrow \infty$ ; (iii)  $V = V_0$  when  $y = 0$ .

$$\text{Ans. } V(x, y) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{c} e^{-\frac{n\pi y}{c}}, \quad V_0 = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{c}$$

5. The steady state temperature distribution in a thin plate bounded by the lines  $x = 0$ ,  $x = a$ ,  $y = 0$  and  $y = \infty$ , is governed by the partial differential equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = \theta.$$

Obtain the steady state temperature distribution under the conditions

$$u(\theta, y) = \theta, \quad u(a, y) = \theta, \quad u(x, \infty) = \theta$$

$$u(x, 0) = x, \quad 0 \leq x \leq a/2$$

$$= a - x, \quad a/2 \leq x \leq a$$

$$\text{Ans. } u(x, y) = \sum_{n=1}^{\infty} \frac{4a}{n^2 \pi^2} \sin \frac{n\pi}{2} \sin \frac{n\pi x}{a} e^{-\frac{n\pi y}{a}}$$

6. An infinitely long plane uniform plate is bounded by two parallel edges and an end at right angles to them. The breadth is  $\pi$ . This end is maintained at temperature  $u_0$  at all points and the other edges are at zero temperature. Determine the temperature at any point of the plate in the steady state.

$$\text{Ans. } u(x, y) = \frac{4u_0}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin nx e^{-ny}.$$

### 49.7 EQUATION OF HEAT FLOW IN TWO DIMENSIONS IN POLAR COORDINATES

Equation of heat flow in two dimension in polar coordinates.

Consider a sheet of conducting material of uniform density  $\rho$ , uniform thickness  $h$ , thermal conductivity  $k$  and specific heat  $c$ . Let  $O$ , the pole and  $OX$ , the initial line, be taken on the plane of sheet. As we are dealing with two dimensional heat-flow, the temperature function  $u(r, \theta, t)$  at point  $(r, \theta)$  of the plate is a function of  $r, \theta$  and time  $t$ .

Consider an element of the sheet included between the circles  $r = r$ ,  $r = r + \delta r$  and the straight lines  $\theta = \theta$  and  $\theta = \theta + \delta\theta$  through the pole. Heat-flow directions are assumed to be positive in the positive directions associated with  $r$  and  $\theta$ . The mass of the element  $ABCD = \rho h(r\delta r\delta\theta)$

Let  $\delta u$  denote the temperature rise in the element during a short interval of time  $\delta t$  succeeding the time  $t$ .

$\therefore$  Rate of increase of heat content in the element

$$= \lim_{\delta t \rightarrow 0} \rho h(r\delta r\delta\theta)c \frac{\delta u}{\delta t} = \rho h c r \delta r \delta\theta \frac{\partial u}{\partial t} \quad \dots (1)$$

If  $R_1, R_2, R_3, R_4$  are the roots of flow of heat across the sides of the element through the edges  $AB, CD, AD$  and  $BC$  respectively, then

$$\begin{aligned} R_1 &= -k \left( \frac{1}{r} \frac{\partial u}{\partial \theta} \right)_{\theta} h \delta r, & R_2 &= -k \left( \frac{1}{r} \frac{\partial u}{\partial \theta} \right)_{\theta+\delta\theta} h \delta r \\ R_3 &= -k \left( \frac{\partial u}{\partial r} \right)_r h r \delta\theta, & R_4 &= -k \left( \frac{\partial u}{\partial r} \right)_{r+\delta r} h (r + \delta r) \delta\theta \end{aligned}$$

The rate of increase of heat in the element =  $R_1 - R_2 + R_3 - R_4$  which is equal to the expression in (1)

$$\therefore \rho h c r \delta r \delta\theta \frac{\partial u}{\partial t} = kh \left[ \left\{ \left( \frac{1}{r} \frac{\partial u}{\partial \theta} \right)_{\theta+\delta\theta} - \left( \frac{1}{r} \frac{\partial u}{\partial \theta} \right)_{\theta} \right\} \delta r + \left\{ \left( \frac{\partial u}{\partial r} \right)_{r+\delta r} - \left( \frac{\partial u}{\partial r} \right)_r \right\} r \delta\theta + \delta r \delta\theta \left( \frac{\partial u}{\partial r} \right)_{r+\delta r} \right]$$

Dividing by  $\delta r \delta\theta h r \rho c$ ,

$$\frac{\partial u}{\partial t} = \frac{k}{\rho c} \left[ \frac{1}{r^2} \left\{ \left( \frac{\partial u}{\partial \theta} \right)_{\theta+\delta\theta} - \left( \frac{\partial u}{\partial \theta} \right)_{\theta} \right\} \delta\theta + \frac{\left( \frac{\partial u}{\partial r} \right)_{r+\delta r} - \left( \frac{\partial u}{\partial r} \right)_r}{\delta r} + \frac{1}{r} \left( \frac{\partial u}{\partial r} \right)_{r+\delta r} (r + \delta r) \right]$$

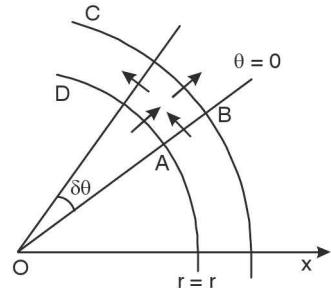

Taking the limit as  $\delta\theta, \delta r \rightarrow 0$ ,

$$\frac{\partial u}{\partial t} = \frac{k}{\rho c} \left[ \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} + \frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} \right]$$

Therefore the equation of heat-flow in polar coordinates is

$$\frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} = \frac{1}{\alpha^2} \frac{\partial u}{\partial t}$$

$$\text{where } \alpha^2 = \frac{k}{\rho c}$$

In steady-state,  $\frac{\partial u}{\partial t} = 0$ . Hence the equation of heat-flow in steady-state is

$$\nabla^2 u \equiv \frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} = 0$$

**Example 27.** Solve  $\frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} = 0$

by the method of separation of variables.

**Solution.**  $\frac{\partial^2 u}{\partial r^2} + \frac{1}{r} \frac{\partial u}{\partial r} + \frac{1}{r^2} \frac{\partial^2 u}{\partial \theta^2} = 0 \quad \text{or} \quad r^2 \frac{\partial^2 u}{\partial r^2} + r \frac{\partial u}{\partial r} + \frac{\partial^2 u}{\partial \theta^2} = 0 \quad \dots (1)$

Let  $u = R(r)T(\theta)$

$$\frac{\partial u}{\partial r} = \frac{dR}{dr}T(\theta) \quad \text{and} \quad \frac{\partial^2 u}{\partial r^2} = \frac{d^2 R}{dr^2}T(\theta)$$

$$\frac{\partial u}{\partial \theta} = R(r)\frac{dT}{d\theta} \quad \text{and} \quad \frac{\partial^2 u}{\partial \theta^2} = R(r)\frac{d^2 T}{d\theta^2}$$

Putting the values of  $\frac{\partial^2 u}{\partial r^2}$ ,  $\frac{\partial u}{\partial r}$  and  $\frac{\partial^2 u}{\partial \theta^2}$  in (1), we get

$$\begin{aligned} r^2 \frac{d^2 R}{dr^2} T(\theta) + r \frac{dR}{dr} T(\theta) + R(r) \frac{d^2 T}{d\theta^2} &= 0 \\ \left( r^2 \frac{d^2 R}{dr^2} + r \frac{dR}{dr} \right) T + R \frac{d^2 T}{d\theta^2} &= 0 \\ \frac{r^2 \frac{d^2 R}{dr^2} + r \frac{dR}{dr}}{R} &= -\frac{1}{T} \frac{d^2 T}{d\theta^2} = h \quad (\text{say}) \end{aligned} \quad \dots (2)$$

$$r^2 \frac{d^2 R}{dr^2} + r \frac{dR}{dr} - hR = 0 \quad \mid \quad \frac{d^2 T}{d\theta^2} + hT = 0$$

Put  $r = e^z$

$$[D(D-1) + D - h]R = 0 \quad \mid \quad (D^2 + h)T = 0 \quad \dots (4)$$

A.E. is  $m^2 - h = 0 \quad \dots (3)$

$$\Rightarrow m = \pm \sqrt{h}$$

$$R = c_1 e^{\sqrt{h}z} + c_2 e^{-\sqrt{h}z}$$

$$R = c_1 r^{\sqrt{h}} + c_2 r^{-\sqrt{h}}$$

$$u = (c_1 r^{\sqrt{h}} + c_2 r^{-\sqrt{h}}) [c_3 \cos(\sqrt{h}\theta) + c_4 \sin(\sqrt{h}\theta)] \quad \dots (5)$$

**Case 1.** If  $h = k^2$

$$(2) \text{ becomes } u = (c_1 r^k + c_2 r^{-k}) [c_3 \cos(k\theta) + c_4 \sin(k\theta)] \quad \dots (6)$$

**Case 2.** If  $h = 0$

On putting  $h = 0$  in (3), we get

$$D^2 = 0 \Rightarrow D = 0, 0$$

$$R = (c_5 + Zc_6) \Rightarrow R = [c_5 + (\log r) c_6]$$

Again on putting  $h = 0$  in (4), we get

$$D^2 = 0 \Rightarrow D = 0, 0$$

$$T = c_7 + \theta c_8$$

But  $u = R.T. = (c_5 + c_6 \log r)(c_7 + \theta c_8)$

**Case 3.** If  $h = -p^2$

On putting  $h = -p^2$  in (3), we get

$$D^2 + p^2 = 0 \Rightarrow D = \pm ip$$

$$R = c_9 \cos pz + c_{10} \sin (p \log r)$$

Again on putting  $h = -p^2$  in (4), we get

$$D^2 - p^2 = 0 \Rightarrow D = \pm p$$

$$T = c_{11} e^{p\theta} + c_{12} e^{-p\theta}$$

$$u = RT = c_9 \cos (p \log r) + c_{10} \sin (p \log r) (c_{11} e^{p\theta} + c_{12} e^{-p\theta})$$

Then there are three possible solutions

$$\begin{aligned} u &= (c_1 r^k + c_2 r^{-k}) [c_3 \cos(k\theta) + c_4 \sin(k\theta)] = (c_5 + c_6 \log r)(c_7 + c_8 \theta) \\ &= [c_9 \cos(p \log r) + c_{10} \sin(p \log r)][c_{11} e^{p\theta} + c_{12} e^{-p\theta}] \end{aligned}$$

On putting  $c_3 = a \cos \alpha$  and  $c_4 = -a \sin \alpha$  in (6), we get

$$u = (c_1 r^k + c_2 r^{-k}) (a \cos \alpha \cos k\theta - a \sin \alpha \sin k\theta)$$

$$= [(c_1 r^k + c_2 r^{-k}) (a \cos (k\theta + \alpha))]$$

$$= (Ar^k + Br^{-k}) \cos (k\theta + \alpha) \quad \dots(7) \text{ Ans.}$$

**Example 28.** Solve  $\frac{\partial^2 V}{\partial r^2} + \frac{1}{r} \frac{\partial V}{\partial r} + \frac{1}{r^2} \frac{\partial^2 V}{\partial \theta^2} = 0$  with boundary conditions,

(i)  $V$  is finite when  $r \rightarrow 0$

(ii)  $V = \sum c_n \cos n\theta$  on  $r = a$  (U.P. II Sem 2010)

**Solution.** Solution of the given equation is as equation (7) in above example, we have

$$V = \sum (A_n r^n + B_n r^{-n}) \cos (\theta + \alpha) \quad \dots(1)$$

**Case I.** On putting  $r = a$ ,  $V = \sum c_n \cos n\theta$  in (1), we get

$$\sum c_n \cos n\theta = \sum (A_n a^n + B_n a^{-n}) \cos (n\theta + \alpha) \quad \dots(2)$$

On equating the constant terms both the sides of (2), we get

$$\Rightarrow c_n = A_n a^n + B_n a^{-n} \quad \dots(3)$$

**Case II.** When  $r = 0$  and  $V$  is finite

$$\Rightarrow B_n = 0$$

On putting  $B_n = 0$  in (2), we get

$$\sum c_n \cos n\theta = \sum A_n a^n \cos (\theta + \alpha) \quad \dots(4)$$

Comparing the constant terms of (4) on both sides, we get

$$c_n = A_n a^n \Rightarrow A_n = \frac{c_n}{a^n} \quad (\alpha = 0)$$

On putting  $A_n = \frac{c_n}{a^n}$ ,  $B_n = 0$  and  $\alpha = 0$  in (1), we get

$$V = \sum \left( \frac{c_n}{a^n} r^n + 0 \right) \cos (n\theta + 0) \Rightarrow V = \sum c_n \left( \frac{r}{a} \right)^n \cos n\theta \quad \text{Ans.}$$

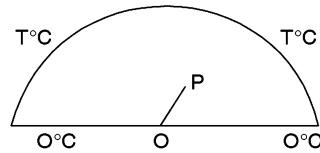

**Example 29.** The diameter of a semicircular plate of radius  $a$  is kept at  $0^\circ\text{C}$  and the temperature at the semicircular boundary is  $T^\circ\text{C}$ . Find the steady state temperature in the plate.

**Solution.** Let the centre  $O$  of the semicircular plate be the pole and the bounding diameter be as the initial line. Let  $u(r, \theta)$  be the steady state temperature at any point  $P(r, \theta)$  and  $u$  satisfies the equation

$$r^2 \frac{\partial^2 u}{\partial r^2} + r \frac{\partial u}{\partial r} + \frac{\partial^2 u}{\partial \theta^2} = 0 \quad \dots(1)$$

The boundary conditions are

- (i)  $u(r, 0) = 0 \quad 0 \leq r \leq a$
- (ii)  $u(r, \pi) = 0 \quad 0 \leq r \leq a$
- (iii)  $u(a, \theta) = T$ .

From conditions (ii) and (iii), we have  $u \rightarrow 0$  as  $r \rightarrow 0$ . Hence the appropriate solution of (1) is as solved in example 27.

$$u = (c_1 r^p + c_2 r^{-p}) (c_3 \cos p\theta + c_4 \sin p\theta) \quad \dots(2)$$

Putting  $u(r, 0) = 0$  in (2), we get

$$0 = (c_1 r^p + c_2 r^{-p}) c_3 \Rightarrow c_3 = 0$$

On putting  $c_3 = 0$  in (2), we get

$$u = (c_1 r^p + c_2 r^{-p}) c_4 \sin p\theta \quad \dots(3)$$

Putting  $u(r, \pi) = 0$  in (3), we get

$$0 = (c_1 r^p + c_2 r^{-p}) c_4 \sin p\pi \Rightarrow \sin p\pi = 0 = \sin n\pi \Rightarrow p\pi = n\pi \Rightarrow p = n$$

On putting  $p = n$  (3) becomes,

$$u = (c_1 r^n + c_2 r^{-n}) c_4 \sin n\theta \quad \dots(4)$$

Since,  $u = 0$  when  $r = 0$   
 $0 = c_2$

(4) becomes,  $u = c_1 c_4 r^n \sin n\theta$

The most general solution of (1) is

$$u(r, \theta) = \sum_{n=1}^{\infty} b_n r^n \sin n\theta \quad (c_1 c_2 = b_n) \quad \dots(5)$$

Putting  $r = a$  and  $u = T$  in (5), we have

$$T = \sum_{n=1}^{\infty} b_n a^n \sin n\theta$$

By Fourier half range series, we get

$$b_n a^n = \frac{2}{\pi} \int_0^\pi T \sin n\theta \, d\theta = \frac{2}{\pi} T \left( \frac{-\cos n\theta}{n} \right)_0^\pi = \frac{2T}{n\pi} [ -(-1)^n + 1 ]$$

$$b_n a^n = 0, \quad \text{when } n \text{ is even,}$$

$$b_n a^n = \frac{4T}{n\pi}, \quad \text{when } n \text{ is odd.}$$

$$\Rightarrow b_n = \frac{4T}{n\pi a^n}$$

Hence, (5) becomes

$$u(r, \theta) = \frac{4T}{\pi} \left[ \frac{r/a}{1} \sin \theta + \frac{(r/a)^3}{3} \sin 3\theta + \frac{(r/a)^5}{5} \sin 5\theta + \dots \right] \quad \text{Ans.}$$

**EXERCISE 49.5**

1. Solve the steady-state temperature equation

$$\frac{\partial^2 T}{\partial r^2} + \frac{1}{r} \frac{\partial T}{\partial r} + \frac{1}{r^2} \frac{\partial^2 T}{\partial \theta^2} = 0; \quad 10 \leq r \leq 20, \quad 0 \leq \theta \leq 2\pi$$

subject to the following conditions:

$$T(10, 0) = 15\cos 0 \text{ and } T(20, \theta) = 30\sin \theta$$

$$\text{Ans. } T(r, 0) = \frac{4T}{\pi} \left[ \frac{r}{a} \sin 0 + \frac{1}{3} \left( \frac{r}{a} \right)^3 \sin 30 + \dots \right]$$

2. A semi-circular plate of radius  $a$  has its circumference kept at temperature  $u(a, 0) = k_0(\pi - 0)$  while the boundary diameter is kept at zero temperature. Find the steady state temperature distribution  $u(r, \theta)$  of the plate assuming the lateral surfaces of the plate to be insulated.

$$\text{Ans. } u(r, 0) = \frac{8k}{\pi} \sum_{n=1}^{\infty} \left( \frac{r}{a} \right)^{2n-1} \frac{\sin(2n-1)\theta}{(2n-1)^3}$$

3. Find the steady state temperature in a circular plate of radius  $a$  which has one half of its circumference at  $\theta^\circ C$  and the other half at  $60^\circ C$ .

$$\text{Ans. } u(r, 0) = 50 - \frac{20\theta}{n} \sum_{n=1}^{\infty} \frac{1}{2n-1} \left( \frac{r}{a} \right)^{2n-1} \sin(2n-1)\theta$$

**49.8 TRANSMISSION LINE EQUATIONS**

$$\frac{\partial^2 V}{\partial x^2} = RC \frac{\partial V}{\partial t}$$

$$\frac{\partial^2 i}{\partial x^2} = RC \frac{\partial i}{\partial t} \text{ are called telegraph equations,}$$

where

$V$  = potential,  $i$  = current,  $C$  = capacitance,  $L$  = inductance

$$\frac{\partial^2 V}{\partial x^2} = LC \frac{\partial^2 V}{\partial t^2}$$

$$\frac{\partial^2 i}{\partial x^2} = LC \frac{\partial^2 i}{\partial t^2}$$

are called radio equations.

**Example 30.** Find the current  $i$  and voltage  $v$  in a transmission line of length  $l$ ,  $t$  seconds after

the ends are suddenly grounded, given that  $i(x, 0) = i_0$ ,  $v(x, 0) = v_0 \sin\left(\frac{\pi x}{l}\right)$  and that  $R$  and  $G$  are negligible.

$$\text{Solution. } \frac{\partial^2 v}{\partial x^2} = LC \frac{\partial^2 v}{\partial t^2}$$

Let  $v = XT$  where  $X$  and  $T$  are the functions of  $x$  and  $t$  respectively.

$$\frac{\partial^2 v}{\partial x^2} = T \frac{d^2 X}{dx^2} \quad \text{and} \quad \frac{\partial^2 v}{\partial t^2} = X \frac{d^2 T}{dt^2}$$

$$T \frac{d^2 X}{dx^2} = LCX \frac{d^2 T}{dt^2}$$

$$\frac{d^2 X}{dx^2} = LC \frac{d^2 T}{dt^2} = -p^2 \text{ say}$$

Since the initial conditions suggest the values of  $v$  and  $i$  are periodic functions,

$$\begin{aligned} \therefore X &= c_1 \cos px + c_2 \sin px \\ T &= c_3 \cos \frac{pt}{\sqrt{LC}} + c_4 \sin \frac{pt}{\sqrt{LC}} \\ \Rightarrow v &= (c_1 \cos px + c_2 \sin px) \left( c_3 \cos \frac{pt}{\sqrt{LC}} + c_4 \sin \frac{pt}{\sqrt{LC}} \right) \quad \dots(1) \\ \text{When } t = 0, \quad v &= v_0 \sin \frac{\pi x}{l} \\ v_0 \sin \frac{\pi x}{l} &= (c_1 \cos px + c_2 \sin px) c_3 \quad \dots(2) \end{aligned}$$

On equating the coefficients, we get

$$c_1 c_3 = 0 \Rightarrow c_1 = 0 \quad \text{and} \quad c_2 c_3 = v_0, \quad p = \frac{\pi}{l}$$

(1) becomes

$$v = \sin \frac{\pi x}{l} \left[ v_0 \cos \frac{\pi t}{l\sqrt{LC}} + c_2 c_4 \sin \frac{\pi t}{l\sqrt{LC}} \right] \quad \dots(3)$$

Now when

$$t = 0, \quad i = i_0 \quad (\text{constant})$$

Hence,

$$\frac{\partial i}{\partial x} = 0$$

$$\frac{\partial i}{\partial x} = \frac{-c \partial v}{\partial t} \quad \therefore \quad \frac{\partial v}{\partial t} = 0 \quad \text{when } t = 0$$

Now

$$\frac{\partial v}{\partial t} = \sin \frac{\pi x}{l} \left( \frac{\pi}{l\sqrt{LC}} \right) \left[ -v_0 \sin \frac{\pi t}{l\sqrt{LC}} + c_2 c_4 \cos \frac{\pi t}{l\sqrt{LC}} \right]$$

... (4)

On putting  $\frac{\partial v}{\partial t} = 0$  and  $t = 0$  in (4), we get  $c_2 c_4 = 0 \Rightarrow c_4 = 0$

(3) is reduced to  $v = v_0 \sin \frac{\pi x}{l} \cos \frac{\pi t}{l\sqrt{LC}}$

$$\frac{\partial v}{\partial x} = \frac{\pi}{l} v_0 \cos \frac{\pi x}{l} \cos \frac{\pi t}{l\sqrt{LC}} = -L \frac{\partial i}{\partial t} \quad \dots(5)$$

$$\frac{\partial v}{\partial t} = -\frac{v_0 \pi}{l\sqrt{LC}} \sin \frac{\pi x}{l} \sin \frac{\pi t}{l\sqrt{LC}} = \frac{-1}{C} \frac{\partial i}{\partial x} \quad \dots(6)$$

Integrating (5) and (6), we get

$$i = -v_0 \sqrt{\frac{C}{L}} \cos \frac{\pi x}{l} \sin \frac{\pi t}{l\sqrt{LC}} + f(x)$$

$$i = -v_0 \sqrt{\frac{C}{L}} \cos \frac{\pi x}{l} \sin \frac{\pi t}{l\sqrt{LC}} + F(t)$$

$\therefore f(x)$  and  $F(t)$  must be constant only, since  $i = i_0$  when  $t = 0$

$$\therefore \text{constant} = i_0 = f(x)$$

$$\text{Hence, } i = i_0 - v_0 \sqrt{\frac{C}{L}} \cos \frac{\pi x}{l} \sin \frac{\pi t}{l\sqrt{LC}}.$$

Ans.

**EXERCISE 49.6**

1. A transmission line 1,000 miles long is initially under steady state condition with potential 1,300 volts at the sending end ( $x = 0$ ) and 1,200 volts at the receiving end ( $x = 1000$ ). The terminal end of the line is suddenly grounded but the potential at the source is kept at 1,300 volts. Assuming the inductance and leakage to be negligible, find the potential  $v(x, t)$ , if it satisfies the equation  $v_t = (1/RC)v_{xx}$ .

$$\text{Ans. } v(x, y) = \sum_1^{\infty} b_n \sin nx e^{-ny} \text{ and } k = \sum_1^{\infty} b_n \sin nx$$

2. Obtain a solution of the telegraph equation

$$\frac{\partial^2 e}{\partial x^2} = RC \frac{\partial e}{\partial t}$$

suitable for the case when  $e$  decays with the time and when there is a steady fall of potential from  $e_0$  to 0 along the line of length  $l$  initially and the sending end is suddenly earthed.

$$\text{Ans. } e(x, t) = \frac{2e_0}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{n\pi x}{l} e^{\frac{-n^2 \pi^2 l}{CRt^2}}$$

**49.9 LAPLACE EQUATION**

Laplace equation is used to solve engineering problems and its theory is called potential theory. Its solutions are known as harmonic functions.

**Example 31.** Solve the Laplace equation  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$  in a rectangle in the  $xy$ -plane with

$u(x, 0) = 0$ ,  $u(x, b) = 0$ ,  $u(0, y) = 0$  and  $u(a, y) = f(y)$  parallel to  $y$ -axis. [U.P.T.U. 2010, 2008]

**Solution.** Here, the Laplace equation is

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \quad \dots(1)$$

Let

$$u = XY$$

Where  $X$  is a function of  $x$  only  $Y$  is a function of  $y$  only.

$$\frac{\partial u}{\partial x} = \frac{\partial(XY)}{\partial x} = Y \frac{\partial X}{\partial x}$$

$$\frac{\partial^2 u}{\partial x^2} = \frac{\partial}{\partial x} \left( \frac{\partial u}{\partial x} \right) = \frac{\partial}{\partial x} \left( Y \frac{\partial X}{\partial x} \right) = Y \frac{\partial^2 X}{\partial x^2}$$

$$\frac{\partial u}{\partial y} = \frac{\partial(XY)}{\partial y} = X \frac{\partial Y}{\partial y}$$

$$\frac{\partial^2 u}{\partial y^2} = \frac{\partial}{\partial y} \left( \frac{\partial u}{\partial y} \right) = \frac{\partial}{\partial y} \left( X \frac{\partial Y}{\partial y} \right) = X \frac{\partial^2 Y}{\partial y^2}$$

Putting the values of  $\frac{\partial^2 u}{\partial x^2}$  and  $\frac{\partial^2 u}{\partial y^2}$  in (1), we get

$$Y \frac{\partial^2 u}{\partial x^2} + X \frac{\partial^2 u}{\partial y^2} = 0 \text{ or } YX'' + XY'' = 0$$

On dividing by  $XY$  and separating the variables, we get

$$\frac{Y''}{Y} = -\frac{X''}{X}$$

**Case I.** If

$$\frac{Y''}{Y} = -\frac{X''}{X} = p^2 \text{(say)}$$

$\frac{Y''}{Y} = p^2$ $Y'' - p^2 Y = 0$ A.E. is $m^2 - p^2 = 0 \Rightarrow m = \pm p$ $Y = c_1 e^{py} + c_2 e^{-py} \dots (2)$	$-\frac{X''}{X} = p^2$ $\Rightarrow X'' + p^2 X = 0$ A.E. is $m^2 + p^2 = 0 \Rightarrow m = \pm ip$ $X = c_3 \cos px + c_4 \sin px \dots (3)$
---	--

Putting  $y = 0$  and  $Y = 0$  in (2), we get

$$c_1 + c_2 = 0 \Rightarrow c_2 = -c_1$$

On putting  $y = b$  and  $Y = 0$ , we get

$$\begin{aligned} c_1 e^{pb} + c_2 e^{-pb} &= 0 \\ c_1 (e^{pb} - e^{-pb}) &= 0 \\ c_1 &= 0 & [c_1 = c_2 = 0] \\ \Rightarrow Y &= 0 \\ \text{But } u &= XY & [Y = 0] \\ &= X(0) = 0, \text{ which is not possible} \end{aligned}$$

**Case II.** If

$$\frac{Y''}{Y} = -\frac{X''}{X} = 0 \text{ (say)}$$

$\frac{Y''}{Y} = 0$ $Y' = 0 \Rightarrow Y = c_5 + c_6 y \dots (4)$	$-\frac{X''}{X} = 0$ $X'' = 0 \Rightarrow X = c_7 + c_8 x$
---	---

Putting  $y = 0$ ,  $Y = 0$  in (4), we get

$$0 = c_5$$

Putting  $y = b$ ,  $Y = 0$  in (4), we get

$$\begin{aligned} 0 &= c_6 b \Rightarrow c_6 = 0 \\ \Rightarrow Y &= 0 \\ u &= XY & [Y = 0] \\ &= X(0) = 0, \text{ which is not possible.} \end{aligned}$$

**Case III.** If

$$\frac{Y''}{Y} = -\frac{X''}{X} = -p^2$$

$(i) \quad \frac{Y''}{Y} = -p^2$ $\Rightarrow Y'' + p^2 Y = 0$ A.E. is $m^2 + p^2 = 0 \Rightarrow m = \pm pi$ $Y = c_9 \cos py + c_{10} \sin py \dots (5)$	$-\frac{X''}{X} = -p^2$ $\Rightarrow X'' - p^2 X = 0$ A.E. is $m^2 - p^2 = 0 \Rightarrow m = \pm p$ $X = c_{11} e^{px} + c_{12} e^{-px}$
---	---

On putting  $y = 0$ ,  $Y = 0$  in (5), we get

$$c_9 = 0$$

Putting  $y = b$  and  $Y = 0$  in (5), we get

$$\begin{aligned} 0 &= c_9 \cos pb + c_{10} \sin pb. \\ c_{10} \sin pb &= 0 \quad (\because c_9 = 0) \\ \sin pb &= 0 \\ \text{and } \sin n\pi &= 0 \end{aligned}$$

$$\Rightarrow pb = n\pi \Rightarrow p = \frac{n\pi}{b}$$

Putting  $c_9 = 0$ ,  $p = \frac{n\pi}{b}$  in (5), we get

$$\begin{aligned} Y &= c_{10} \sin \frac{n\pi y}{b} \\ u &= XY \\ u &= c_{10} \sin \frac{n\pi y}{b} \left( c_{11} e^{\frac{n\pi x}{b}} + c_{12} e^{-\frac{n\pi x}{b}} \right) \end{aligned} \quad \dots (6)$$

Putting  $x = 0$  and  $u = 0$  in (6), we get

$$\begin{aligned} 0 &= c_{10} \sin \frac{n\pi y}{b} (c_{11} + c_{12}) \\ c_{11} + c_{12} &= 0 \Rightarrow c_{12} = -c_{11} \\ \text{Putting the value of } c_{12} = -c_{11} \text{ in (6), we get} \\ u &= c_{10} c_{11} \sin \frac{n\pi y}{b} \left( e^{\frac{n\pi x}{b}} - e^{-\frac{n\pi x}{b}} \right) \\ u &= 2c_{10} c_{11} \sin \frac{n\pi y}{b} \sinh \frac{n\pi x}{b} \\ u &= b_n \sin \frac{n\pi y}{b} \sinh \frac{n\pi x}{b} \quad (b_n = 2 c_{10} c_{11}) \\ u &= \sum_{n=1}^{\infty} b_n \sin \frac{n\pi y}{b} \sinh \frac{n\pi x}{b} \quad \dots (7) \text{ (General solution)} \end{aligned}$$

Putting  $x = a$  and  $u = f(y)$  in (7), we get

$$u = f(y) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi y}{b} \sinh \frac{n\pi x}{b} \quad \text{Ans.}$$

We also know that

$$\begin{aligned} \left( \sin \frac{n\pi a}{b} \right) b_n &= \frac{2}{b} \int_0^b f(y) \sin \frac{n\pi y}{b} dy \\ b_n &= \frac{2}{b \sinh \left( \frac{n\pi a}{b} \right)} \int_0^b f(y) \sin \frac{n\pi y}{b} dy. \end{aligned}$$

**Example 32.** Find the deflection  $u(x, y, t)$  of the square membrane sin with  $a = b = c = 1$ , if the initial velocity is zero and the initial deflection  $f(x, y) = A \sin \pi x 2\pi y$ .

(Q.Bank U.P.T.U. 2001)

**Solution.** Here, the equation of the vibrations of the square membrane

$$\frac{\partial^2 u}{\partial t^2} = c^2 \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) \quad \dots (1)$$

Let

$$u = XYT \quad \dots (2)$$

Where  $X$  is function of  $x$  only,  $Y$  is a function of  $y$  only, and  $T$  is a function of  $t$  only.

$$\begin{aligned} \frac{\partial^2 u}{\partial t^2} &= \frac{\partial^2}{\partial t^2} (XYT) = XY \frac{d^2 T}{dt^2} \\ \frac{\partial^2 u}{\partial x^2} &= \frac{\partial^2}{\partial x^2} (XYT) = YT \frac{d^2 X}{dx^2} \\ \frac{\partial^2 u}{\partial y^2} &= \frac{\partial^2}{\partial y^2} (XYT) = XT \frac{d^2 Y}{dy^2} \end{aligned}$$

On putting the values of  $\frac{\partial^2 u}{\partial t^2}$ ,  $\frac{\partial^2 u}{\partial x^2}$  and  $\frac{\partial^2 u}{\partial y^2}$  in (1), we get

$$XY \frac{d^2 T}{dy^2} = c^2 \left( YT \frac{d^2 X}{dx^2} + XT \frac{d^2 Y}{dy^2} \right)$$

On dividing by  $c^2 XYT$ , we get

$$\frac{\frac{d^2 T}{dt^2}}{\frac{c^2 T}{X}} = \frac{\frac{d^2 X}{dx^2}}{X} + \frac{\frac{d^2 Y}{dy^2}}{Y}$$

This will be true only when each member is a constant. Choosing suitably, we have

$$\begin{array}{l|l|l} \frac{d^2 X}{dx^2} = -k^2, \quad \frac{d^2 Y}{dy^2} = -l^2 & \Rightarrow \quad \frac{d^2 T}{dt^2} = -(k^2 + l^2) \\ \frac{d^2 X}{dx^2} + k^2 X = 0 & \frac{d^2 Y}{dy^2} + l^2 Y = 0 & \frac{d^2 T}{dt^2} + (k^2 + l^2)c^2 T = 0 \\ A.E. \text{ is } m^2 + k^2 = 0 & A.E. \text{ is } m^2 + l^2 = 0 & A.E. \text{ is } m^2 + (k^2 + l^2)c^2 = 0 \\ \Rightarrow m = ik, m = -ik & \Rightarrow m = il, m = -il & m = \sqrt{k^2 + l^2} c, m = -i\sqrt{k^2 + l^2} c \end{array}$$

$$X = c_1 \cos kx + c_2 \sin kx \quad Y = c_3 \cos ly + c_4 \sin ly \quad T = c_5 \cos \sqrt{k^2 + l^2} ct + c_6 \sin \sqrt{k^2 + l^2} ct.$$

Putting the values of  $X$ ,  $Y$  and  $T$  in (2), we get

$$u = (c_1 \cos kx + c_2 \sin kx)(c_3 \cos ly + c_4 \sin ly)[c_5 \cos \sqrt{k^2 + l^2} ct + c_6 \sin \sqrt{k^2 + l^2} ct] \dots (3)$$

(given)

On putting  $x = 0$  and  $u = 0$  in (3), we get

$$0 = c_1(c_3 \cos ly + c_4 \sin ly)[c_5 \cos \sqrt{k^2 + l^2} ct + c_6 \sin \sqrt{k^2 + l^2} ct] \dots (4)$$

$$\Rightarrow c_1 = 0$$

On putting  $c_1 = 0$  in (3), we get

$$u = c_2 \sin kx(c_3 \cos ly + c_4 \sin ly)(c_5 \cos \sqrt{k^2 + l^2} ct + c_6 \sin \sqrt{k^2 + l^2} ct) \dots (5)$$

Putting  $x = 1$  and  $u = 0$  in (5), we get

$$u = c_2 \sin m\pi x(c_3 \cos ly + c_4 \sin ly)(c_5 \cos \sqrt{m^2\pi^2 + l^2} ct + c_6 \sin \sqrt{m^2\pi^2 + l^2} ct) \dots (7)$$

Putting  $y = 0$ ,  $u = 0$  in (7), we get

$$0 = c_2 \sin m\pi x c_3(c_5 \cos \sqrt{m^2\pi^2 + l^2} ct + c_6 \sin \sqrt{m^2\pi^2 + l^2} ct) \dots (8)$$

$$\Rightarrow c_3 = 0$$

Putting the value of  $c_3$  in (7), we get

$$u = c_2 c_4 \sin m\pi x \sin ly(c_5 \cos \sqrt{m^2\pi^2 + l^2} ct + c_6 \sin \sqrt{m^2\pi^2 + l^2} ct) \dots (9)$$

Putting  $y = 1$  and  $u = 0$  in (9), we get

$$0 = c_2 c_4 \sin m\pi x \sin l(c_5 \cos \sqrt{m^2\pi^2 + l^2} ct + c_6 \sin \sqrt{m^2\pi^2 + l^2} ct) \dots (6)$$

$$\Rightarrow \sin l = 0 = \sin n\pi \Rightarrow l = n\pi$$

Putting the value  $l = n\pi$  in (9), we get

$$u = c_2 c_4 \sin m\pi x \sin n\pi y(c_5 \cos \sqrt{m^2\pi^2 + n^2\pi^2} ct + c_6 \sin \sqrt{m^2\pi^2 + n^2\pi^2} ct) \dots (10)$$

Putting  $c_2 c_4 c_5 = A_{mn}$ ,  $c_2 c_4 c_6 = B_{mn}$  and  $p = \pi c \sqrt{m^2 + n^2}$  in (10), we get the general solution as

$$u(x, y, t) = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin m\pi x \sin n\pi y (A_{mn} \cos pt + B_{mn} \sin pt) \quad \dots (11) \quad \text{Ans.}$$

### EXERCISE 49.7

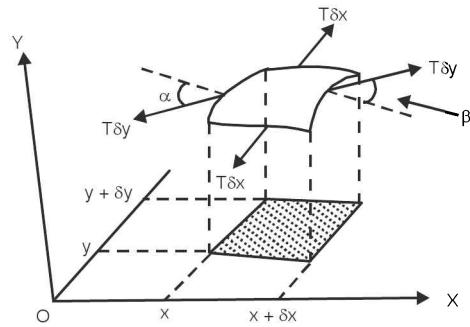

Indicate True or False for the following :

1. The small transverse vibrations of a string are governed by one dimensional heat equation  $y_t = a^2 y_{xx}$ .  
(True/False) (U.P. II Semester, 2009) **Ans. False**
2. Two dimensional steady state heat flow is given by Laplace's equation  $u_t = a^2(u_{xx} + u_{yy})$ .  
(True/False) (U.P. II Semester, 2009) **Ans. False**
3.  $\frac{\partial^2 y}{\partial t^2} = c^2 \frac{\partial^2 y}{\partial x^2}$  is a two-dimensional wave equation. **Ans. True**
4. Radio equations are  $V_{xx} = LCV_n$  and  $I_{xx} = LCI_n$  **Ans. True**
5. The small transverse vibrations of a string are  $y_t^2 = a^2 y_{xx}$ . **Ans. False**

### 49.10 VIBRATING MEMBRANE

Now we will discuss the equation of the vibrations of a tightly stretched membrane. Such as membrane of drum. Let  $T$  be the tension per unit length and  $m$  be the mass per unit area.

Now we want to discuss the forces acting on an element  $\delta x \delta y$  of the membrane. Forces  $T\delta x$  and  $T\delta y$  act on the edges along the tangent to the membrane. Let the small displacement perpendicular to  $xy$ -plane be  $u$ .

$T\delta y$  on the opposite edges of length  $\delta y$  make angles  $\alpha$  and  $\beta$  to the horizontal.

Thus Vertical component

$$\begin{aligned} &= T\delta y \sin \beta - T\delta y \sin \alpha \\ &= T\delta y (\tan \beta - \tan \alpha). \\ &= T\delta y \left[ \left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x \right] = T\delta y \delta x \left[ \frac{\left( \frac{\partial u}{\partial x} \right)_{x+\delta x} - \left( \frac{\partial u}{\partial x} \right)_x}{\delta x} \right] \quad [\tan \alpha = \sin \alpha, \text{ if } \alpha \text{ is very small}] \\ &= T \delta x \delta y \frac{\partial^2 u}{\partial x^2} \text{ upto a first order of approximation.} \end{aligned} \quad \dots\dots(1)$$

Another vertical component of the force  $T\delta x$  acting on the edges of the length  $\delta x$ .

$$= T \delta x \frac{\partial^2 u}{\partial y^2} \delta y \quad \dots\dots(2)$$

Equation of the motion of the element is

$$\frac{d^2 X}{dx^2} k^2 X = 0, \quad \frac{d^2 Y}{dy^2} l^2 Y = 0$$

$$m \delta x \delta y \frac{\partial^2 u}{\partial t^2} = T \left[ \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right] \delta x \delta y$$

$$\frac{\partial^2 u}{\partial t^2} = C^2 \left[ \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right] \text{ where } C^2 = \frac{T}{m} \quad \dots\dots\dots(3)$$

Where  $m$  is the mass per unit area of the membrane.

#### 49.11 SOLUTION OF THE EQUATION OF THE VIBRATING MEMBRANE (RECTANGULAR MEMBRANE):

Let  $u$  be the solution of equation (3) and we assume that

$$u = X(x) \cdot Y(y) \cdot T(t) \quad \dots\dots\dots(4)$$

On differentiating (4), we have

$$\begin{aligned} \frac{\partial^2 u}{\partial x^2} &= Y \cdot T \frac{d^2 X}{dx^2} \\ \frac{\partial^2 u}{\partial y^2} &= X \cdot T \frac{d^2 Y}{dy^2} \\ \frac{\partial^2 u}{\partial t^2} &= X \cdot Y \frac{d^2 T}{dt^2} \end{aligned}$$

Substituting these values in (3), we get

$$XY \frac{d^2 T}{dt^2} = C^2 \left[ \frac{d^2 X}{dx^2} YT + XT \frac{d^2 Y}{dy^2} \right]$$

$$\text{Dividing by } XYTc^2, \text{ we get } \frac{1}{C^2} \frac{d^2 T}{dt^2} = \left[ \frac{1}{X} \frac{d^2 X}{dx^2} + \frac{1}{Y} \frac{d^2 Y}{dy^2} \right] \quad \dots\dots\dots(5)$$

$$\text{Each member is constant } \frac{d^2 X}{dx^2} + k^2 X = 0, \frac{d^2 Y}{dy^2} + l^2 Y = 0$$

$$\text{Putting these values in (5), we get } \frac{d^2 T}{dt^2} + (k^2 + l^2) c^2 T = 0$$

$\begin{aligned} \frac{d^2 X}{dx^2} + k^2 X &= 0 \\ (D^2 + k^2) X &= 0 \\ m^2 + k^2 &= 0 \\ m &= \pm ik \\ X &= c_1 \cos kx + c_2 \sin kx \end{aligned}$	$\begin{aligned} \frac{d^2 Y}{dy^2} + l^2 Y &= 0 \\ (D^2 + l^2) Y &= 0 \\ m^2 + l^2 &= 0 \\ m &= \pm il \\ Y &= c_3 \cos ly + c_4 \sin ly \end{aligned}$	$\begin{aligned} \frac{d^2 T}{dt^2} + (k^2 + l^2) c^2 T &= 0 \\ [D^2 + (k^2 + l^2) c^2] T &= 0 \\ m^2 + [k^2 + l^2] c^2 &= 0 \\ m &= iC \sqrt{k^2 + l^2} \\ T &= c_5 \cos c \sqrt{k^2 + l^2} \\ &\quad + c_6 \sin c \sqrt{k^2 + l^2} \end{aligned}$
--	--	---

Putting the values of  $X, Y, T$  in (4), we get

$$u(x, y, t) = (c_1 \cos kx + c_2 \sin kx) (c_3 \cos ly + c_4 \sin ly) \left[ c_5 \cos \sqrt{(k^2 + l^2)} ct + c_6 \sin \sqrt{(k^2 + l^2)} ct \right] \quad \dots\dots\dots(6)$$

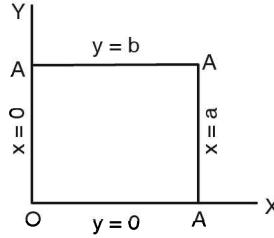

Suppose if the membrane is rectangular and stretched between the lines

$$x = 0, x = a, y = 0, y = b.$$

Then the boundary conditions are

- (i)  $u = 0$ , when  $x = 0$
- (ii)  $u = 0$ , when  $x = a$
- (iii)  $u = 0$ , when  $y = 0$
- (iv)  $u = 0$ , when  $y = b$  for all  $t$ .

On putting  $x = 0$ ,  $u = 0$  in (6), we get

$$0 = c_1(c_3 \cos ly + c_4 \sin ly) \left[ c_5 \cos \sqrt{(k^2 + l^2)} ct + c_6 \sin \sqrt{(k^2 + l^2)} ct \right]$$

$$c_1 = 0$$

On putting  $c_1 = 0$ , (6) becomes

$$u = c_2 \sin kx (c_3 \cos ly + c_4 \sin ly) \left[ c_5 \cos x \sqrt{(k^2 + l^2)} ct + c_6 \sin \sqrt{(k^2 + l^2)} ct \right] \dots\dots(7)$$

On putting  $u = 0$  and  $x = a$  in (7), we get

$$0 = c_2 \sin ka (c_3 \cos ly + c_4 \sin ly) \left[ c_5 \cos \sqrt{(k^2 + l^2)} ct + c_6 \sin \sqrt{(k^2 + l^2)} ct \right]$$

$$\Rightarrow \sin ka = 0 \Rightarrow \sin ka = \sin m\pi \Rightarrow k = \frac{m\pi}{a}$$

On putting the value of  $k$  in (7), we get

$$u = c_2 \sin \frac{m\pi x}{a} [c_3 \cos ly + c_4 \sin ly] \left[ c_5 \cos x \sqrt{\frac{m^2\pi^2}{a^2} + l^2} \cdot ct + c_6 \sin \sqrt{\frac{m^2\pi^2}{a^2} + l^2} \cdot ct \right] \dots\dots(8)$$

Similarly, applying the conditions (iii) and (iv) in (8), we get

$$c_3 = 0 \text{ or } l = \frac{n\pi}{b}, \text{ where } n \text{ is an integer.}$$

(8) becomes,

$$u = c_2 c_4 \sin \frac{m\pi x}{a} \cdot \sin \frac{n\pi y}{b} \left( c_5 \cos x \sqrt{\frac{m^2\pi^2}{a^2} + \frac{n^2\pi^2}{b^2}} ct + c_6 \sin \sqrt{\frac{m^2\pi^2}{a^2} + \frac{n^2\pi^2}{b^2}} ct \right) \dots\dots(9)$$

$$\text{Let } p = c\pi \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$

$$\text{Now, } u = c_2 c_4 \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} (c_5 \cos pt + c_6 \sin pt) \quad [\text{From (9)}]$$

These are the solution of wave equation (1) and are called eigen functions. Choosing the constants  $c_2$  and  $c_4$  so that  $c_2 c_4 = 1$ , we can write the general solution of (1) as

$$u = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} (A_{mn} \cos pt + B_{mn} \sin pt) \quad \dots\dots(10)$$

Differentiating (10) with respect to 't', we get

$$\frac{\partial u}{\partial t} = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} (-p A_{mn} \sin pt + p B_{mn} \cos pt) \quad \dots\dots(11)$$

On putting  $\frac{\partial u}{\partial t} = 0$  when  $t = 0$  in (11), we get

$$0 = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} (p B_{mn} \cos pt) \Rightarrow B_{mn} = 0$$

Also using the condition :  $u = f(x, y)$  when  $t = 0$ , we get

$$f(x, y) = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} A_{mn} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b}$$

This is a double Fourier series. Multiplying both sides by  $\sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b}$  and integrating from  $x = 0$  to  $x = a$  and  $y = 0$  to  $y = b$ , every term on the right except one, all become zero. Thus, we get

$$\int_0^a \int_0^b f(x, y) A_{mn} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} dy dx = \frac{ab}{4} A_{mn}$$

It is the generalised Euler's formula and gives the coefficients in the solution.

On putting the value of  $A_{mn}$ , we get the solution of (1),

**Example 33.** Find the deflection  $u(x, y, t)$  of the square membrane with  $a = b = c = 1$ , if the initial velocity is zero and the initial deflection  $f(x, y) = A \sin \pi x \sin 2\pi y$ .

(U.P. 2001)

**Solution :** The equation of the vibration of the square membrane is

$$\frac{\partial^2 u}{\partial t^2} = c^2 \left( \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right) \quad \dots\dots\dots(1)$$

Boundary conditions are,

$$u(0, y, t) = 0, \quad u(1, y, t) = 0$$

$$u(x, 0, t) = 0, \quad u(x, 1, t) = 0$$

the initial conditions are

$$u(x, y, 0) = f(x, y) = A \sin \pi x \sin 2\pi y \text{ and } \left( \frac{\partial u}{\partial t} \right)_{t=0} = 0$$

Let,  $u$  be the solution of (1) where  $u = XYT$  and  $X$  is function of  $x$  only,  $Y$  is a function of  $y$  only, and  $T$  is a function of  $t$  only.

On differentiating  $u$  partially with respect to  $t, x, y$ , we get

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2}{\partial t^2}(XYT) = XY \frac{d^2 T}{dt^2}$$

$$\frac{\partial^2 u}{\partial x^2} = \frac{\partial^2}{\partial x^2}(XYT) = YT \frac{d^2 X}{dx^2}$$

$$\frac{\partial^2 u}{\partial y^2} = \frac{\partial^2}{\partial y^2}(XYT) = XT \frac{d^2 Y}{dy^2}$$

$$\text{On putting the derivatives in (1), we get } XY \frac{d^2 T}{dt^2} = c^2 \left( YT \frac{d^2 X}{dx^2} + XT \frac{d^2 Y}{dy^2} \right)$$

$$\text{On dividing by } XYTc^2, \text{ we get } \frac{1}{C^2} \frac{1}{T} \frac{d^2 T}{dt^2} = \left( \frac{1}{X} \frac{d^2 X}{dx^2} + \frac{1}{Y} \frac{d^2 Y}{dy^2} \right) \quad \dots\dots\dots(3)$$

Equation (3) holds good when each member is a constant. i.e.  $l$ , and  $k$  are constants.

$$\begin{array}{l|l|l} \frac{1}{X} \frac{d^2 X}{dx^2} = l^2 & \frac{1}{Y} \frac{d^2 Y}{dy^2} = -k^2 & \frac{1}{T} \frac{d^2 T}{dt^2} = (l^2 + k^2) \\ \frac{d^2 X}{dx^2} + l^2 X = 0, & \frac{d^2 Y}{dy^2} + k^2 Y = 0 \text{ and} & \frac{d^2 T}{dt^2} + (l^2 + k^2) c^2 T = 0 \\ \frac{d^2 X}{dx^2} + l^2 X = 0 & \frac{d^2 Y}{dy^2} + k^2 Y = 0 & \frac{d^2 T}{dt^2} + (l^2 + k^2) c^2 T = 0 \end{array}$$

$$\begin{array}{l|l|l}
(D^2 + l^2) X = 0 & (D^2 + k^2) Y = 0 & (D^2 + (l^2 + k^2)) t^2 = 0 \\
\Rightarrow m^2 + l^2 = 0 & m^2 + k^2 = 0 & D = \pm iC\sqrt{l^2 + k^2} \\
m = \pm il & \Rightarrow m = \pm ik & T = c_5 \cos \sqrt{l^2 + k^2} ct + c_6 \sin \sqrt{l^2 + k^2} ct
\end{array}$$

$$X = c_1 \cos kx + c_2 \sin kx \quad Y = c_3 \cos ly + c_4 \sin ly$$

Putting the values of X, Y and T in (2), we get

$$u = (c_1 \cos kx + c_2 \sin kx)(c_3 \cos ly + c_4 \sin ly) \left[ c_5 \cos \sqrt{l^2 + k^2} ct + c_6 \sin \sqrt{l^2 + k^2} ct \right] \dots\dots(4)$$

On putting  $x = 0, u = 0$  in (4), we get

$$0 = c_1(c_3 \cos ly + c_4 \sin ly) \left( c_5 \cos \sqrt{l^2 + k^2} ct + c_6 \sin \sqrt{l^2 + k^2} ct \right) c_1 = 0 \dots\dots(5)$$

On putting  $c_1 = 0$  in (5), we get

$$u = c_2 \sin kx(c_3 \cos ly + c_4 \sin ly) \left( c_5 \cos \sqrt{l^2 + k^2} ct + c_6 \sin \sqrt{l^2 + k^2} ct \right) \dots\dots(6)$$

On putting  $x = 1$  and  $u = 0$  in (6), we have

$$0 = c_2 \sin k(c_3 \cos ly + c_4 \sin ly) \left( c_5 \cos \sqrt{l^2 + k^2} ct + c_6 \sin \sqrt{l^2 + k^2} ct \right)$$

$$\Rightarrow \sin l = 0 \Rightarrow \sin l = \sin m\pi \Rightarrow l = m\pi$$

Putting the value of  $l = m\pi$  in (6), we get

$$u = c_2 \sin m\pi x(c_3 \cos ly + c_4 \sin ly) \left( c_5 \cos \sqrt{k^2 + l^2} ct + c_6 \sin \sqrt{k^2 + l^2} ct \right) \dots\dots(7)$$

Putting  $y = 0$  and  $u = 0$  in (7), we get

$$0 = c_2 \sin m\pi x \cdot c_3 \left( c_5 \cos \sqrt{k^2 + l^2} ct + c_6 \sin \sqrt{k^2 + l^2} \cdot ct \right)$$

On putting  $c_3 = 0$  in (7), we get

$$u = c_2 c_4 \sin m\pi x \sin ly \left( c_5 \cos \sqrt{k^2 + l^2} \cdot ct + c_6 \sin \sqrt{k^2 + l^2} \cdot ct \right) \dots\dots(8)$$

Now on putting  $y = 1$  and  $u = 0$  in (8), we get

$$u = c_2 c_4 \sin m\pi x \sin l \left( c_5 \cos \sqrt{k^2 + l^2} \cdot ct + c_6 \sin \sqrt{k^2 + l^2} \cdot ct \right)$$

$$\Rightarrow \sin l = 0 = \sin n\pi \Rightarrow l = n\pi$$

Putting the value of  $l = n\pi$  in (8), we get

$$u = c_2 c_4 \sin m\pi x \sin n\pi y \left( c_5 \cos \sqrt{m^2\pi^2 + n^2\pi^2} \cdot ct + c_6 \sin \sqrt{m^2\pi^2 + n^2\pi^2} \cdot ct \right) \dots\dots(9)$$

If we put  $p = \pi c \sqrt{m^2 + n^2}$  in (9), we get

$$u = \sin m\pi x \sin n\pi y (A_{mn} \cos pt + B_{mn} \sin pt)$$

The general equation is

$$u = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin m\pi x \sin n\pi y (A_{mn} \cos pt + B_{mn} \sin pt) \dots\dots(10)$$

Differentiating (10) w.r.t 't', we get

$$\frac{\partial u}{\partial t} = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin m\pi x \sin n\pi y (-p A_{mn} \sin pt + p B_{mn} \cos pt) \dots\dots(11)$$

On putting  $\frac{\partial u}{\partial t} = 0$  and  $t = 0$  in (11), we get

$$0 = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin m\pi x \sin n\pi y [pB_{mn}] \quad \dots\dots(12)$$

$$\Rightarrow B_{mn} = 0$$

On putting  $u = A \sin \pi x \sin 2\pi y$  and  $t = 0$  in (12), we get

$$\begin{aligned} A \sin \pi x \sin 2\pi y &= \sum_{n=1}^{\infty} \sum_{m=1}^{\infty} A_{mn} \sin m\pi x \sin n\pi y \\ \Rightarrow A_{mn} &= \frac{2}{1} \times \frac{2}{1} \int_0^1 \int_0^1 A_{mn} \sin \pi x \sin 2\pi y \sin m\pi x \sin n\pi y dx dy \\ \Rightarrow A_{m1} &= A_{m3} = A_{m5} = \dots = 0 \\ \text{But, } A_{m2} &= 4A \int_0^1 \int_0^1 \sin \pi x \sin m\pi x \sin^2 2\pi y dx dy \quad (\text{of } n \text{ is odd}) \\ &= 2A \int_0^1 \int_0^1 \sin \pi x \sin m\pi x (1 - \cos 4\pi y) dx dy \\ &= 2A \int_0^1 \sin \pi x \sin m\pi x \left( y - \frac{\sin 4\pi y}{4\pi} \right)_0^1 dx = 2A \int_0^1 \sin \pi x \sin m\pi x dx \\ \Rightarrow A_{22} &= A_{32} = A_{42} = \dots = 0 \\ A_{12} &= 2A \int_0^1 \sin^2 m\pi x dx = A \int_0^1 (1 - \cos 2\pi x) dx = A \left( x - \frac{\sin 2\pi x}{2\pi} \right)_0^1 = A \end{aligned}$$

$$u = A \sin \pi x \sin 2\pi y \cos pt$$

$$\text{where } p = \pi c \sqrt{m^2 + n^2} = \pi (1) \sqrt{1+4} = \pi \sqrt{5}.$$

$$u = A \cos \pi \sqrt{5} t \sin \pi x \sin 2\pi y.$$

**Ans.**

**Example 34.** Find the deflection  $u(x, y, t)$  of a rectangular membrane,  $0 \leq x \leq a, 0 \leq y \leq b$ , given that its entire boundary is fixed, initial velocity is zero (starts from rest) and initial deflection  $f(x, y) = kxy(a-x)(b-y)$ .

**Solution.** We know from the Article 23.3, equation (10) that

$$u = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} (A_{mn} \cos pt + B_{mn} \sin pt) \quad \dots\dots(1)$$

On differentiating (1), we get

$$\frac{\partial u}{\partial t} = \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} (-PA_{mn} \sin pt + B_{mn} P \cos pt) \quad \dots\dots(2)$$

On putting initial velocity  $\frac{\partial u}{\partial t} = 0, t = 0$  in (2), we have

$$\begin{aligned} 0 &= \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} (PB_{mn} \sin pt) \\ \Rightarrow B_{mn} &= 0 \end{aligned}$$

Putting  $B_{mn} = 0$  in (1) we have

$$u = A_{mn} \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} \cos pt \quad \dots\dots(3)$$

The membrane starts from rest with initial condition is

$$u = kxy(a-x)(b-y), \text{ when } t = 0$$

$$\begin{aligned}
 kxy(a-x)(b-y) &= A_{mn} \sum \sum \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} \\
 A_{mn} &= \frac{4}{ab} \int_0^a \int_0^b f(x, y) \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} dy dx \\
 &= \frac{4}{ab} \int_0^a \int_0^b kxy(a-x)(b-y) \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} dy dx \\
 \frac{ab A_{mn}}{4k} &= \int_0^a \left( x(a-x) \sin \frac{m\pi x}{a} dx \right) \times \left[ \int_0^a y(b-y) \sin \frac{n\pi y}{b} dy \right] \\
 &= I_1 \times I_2 \quad \dots\dots(4) \\
 I_1 &= \int_0^a x(a-x) \sin \frac{m\pi x}{a} dx \\
 &= \int_0^a x(a-x) \frac{a}{mn} \left( -\cos \frac{m\pi n}{a} \right) - (a-2x) \frac{a^2}{m^2 \pi^2} \left( -\sin \frac{m\pi x}{a} \right) + (-2) \frac{a^3}{m^3 \pi^3} \cos \left( \frac{m\pi x}{a} \right) \Big|_0^a \\
 &= 0 - 0 - \frac{2a^3}{m^3 \pi^3} (\cos m\pi - 1)
 \end{aligned}$$

$$\text{Similarly, } I_2 = -\frac{2b^3}{n^3 \pi^3} (\cos n\pi - 1)$$

Putting the values of  $I_1$  and  $I_2$ , we get

$$\begin{aligned}
 \frac{ab}{4k} A_{mn} &= \left[ -\frac{2a^3}{m^3 \pi^3} (\cos m\pi - 1) \right] \left[ -\frac{2b^3}{n^3 \pi^3} (\cos n\pi - 1) \right] \\
 A_{mn} &= \frac{4k}{ab} \left[ -\frac{2a^3}{m^3 \pi^3} \left\{ (-1)^m - 1 \right\} \right] \left[ -\frac{2b^3}{n^3 \pi^3} \left\{ (-1)^n - 1 \right\} \right] = \frac{16a^3 b^3 k}{m^3 n^3 \pi^6} \left[ (-1)^m - 1 \right] \left[ (-1)^n - 1 \right] \\
 &= \begin{cases} \frac{64a^2 b^2 k}{\pi^3 n^3 m^3}, & \text{when } m \text{ and } n \text{ are odd.} \\ 0, & \text{otherwise} \end{cases}
 \end{aligned}$$

The required deflection =  $u(x, y, t)$

$$= \left[ \frac{64a^2 b k}{\pi} \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{1}{m^3} \sin \frac{m\pi x}{a} \right] \times \frac{1}{n^3} \sin \frac{n\pi y}{b}, \text{ where } k^2 \pi^2 \left[ \frac{m^2}{a^2} + \frac{n^2}{b^2} \right]$$

**Ans.**

CHAPTER  
**50**

## **ALGEBRAIC AND TRANSCENDENTAL EQUATIONS**

**(Bisection Method, Regula falsi, Newton Raphson Method)**

---

### **50.1 INTRODUCTION**

In this chapter we will discuss methods of solving polynomial and transcendental equations.

### **50.2 POLYNOMIAL**

An expression of the form

$$P_n(x) = a_0 x^n + a_1 x^{n-1} + a_2 x^{n-2} + \dots + a_{n-1} x + a_n$$

where  $a_0, a_1, \dots, a_n$  are constants,  $n$  is positive integer, is called a polynomial in  $x$  of degree  $n$  provided  $a_0 \neq 0$ .

#### **Zero of a Polynomial**

Any value of  $x$  which makes  $P_n(x) = 0$ , is called the zero of a polynomial  $P_n(x)$ .

#### **Number of zeroes**

Every polynomial  $P_n(x)$  of degree  $n$  has exactly  $n$  zeroes.

#### **Geometrically**

The zero of the polynomial  $P_n(x)$  is the value of  $x$ , where the graph of the  $P_n(x)$  crosses the axis of  $x$ .

### **50.3 POLYNOMIAL EQUATION**

Let  $P_n(x)$  be a polynomial in  $x$  then

$P_n(x) = 0$  is known as polynomial equation.

### **50.4 TRANSCENDENTAL EQUATION**

If a function  $f(x)$  contains some other functions such as trigonometric, logarithmic, exponential etc. then  $f(x) = 0$  is called transcendental equation.

#### **Methods of Solving Equations**

The polynomial equations and the transcendental equation can be solved by the following method:

- |                             |                            |
|-----------------------------|----------------------------|
| (i) Graphical method        | (ii) Bisection method      |
| (iii) Newton-Raphson method | (iv) False position method |
| (v) Secant method           | (vi) Iterative method      |

### 50.5 INITIAL APPROXIMATION

If  $f(x)$  is continuous in the interval  $(a, b)$  and  $f(a)$  and  $f(b)$  have different signs then the equation  $f(x) = 0$  has atleast one root between  $x = a$  and  $x = b$ .

i.e.  $a < \text{Root} < b$ .

Any value between  $a$  and  $b$  is the first approximate root of the given equation  $f(x) = 0$ .

If we have to choose an approximate root out of  $a$  and  $b$  then we have to see whether  $f(b)/f(c)$  is nearer to zero. If  $f(b)$  is nearer to zero then  $b$  is an initial approximate root of the given equation.

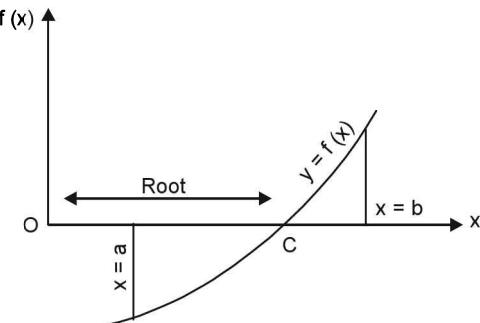

After finding out the initial approximate root then for better approximation we have to apply any one of the above methods.

### 50.6 GRAPHICAL METHOD

There are two ways to solve an equation by graphical method.

#### Working Rule

- Step 1.** Find out the interval  $(a, b)$  in which a root of  $f(x) = 0$  lies.
  - Step 2.** Prepare a table of the values of  $x$  in the interval  $(a, b)$  and corresponding values of  $f(x)$ .
  - Step 3.** Plot these points and pass a smooth curve through them by joining the points.
  - Step 4.** Read the abscissa of the point of intersection of the curve  $y = f(x)$  with  $x$ -axis.
- This is a way to find a rough approximation to the root  $f(x) = 0$ .

#### The other way

- Step 1.** As above.
- Step 2.** Write the equation  $f(x) = 0$  as  $f_1(x) = f_2(x)$  where  $f_2(x)$  contains only terms in  $x$  and constant.
- Step 3.** Draw the graphs of  $y = f_1(x)$  and  $y = f_2(x)$  on the same scale and with respect to the same axis.
- Step 4.** Read the abscissa of the point of the intersection of these two curves  $y = f_1(x)$  and  $y = f_2(x)$ .

This is the initial approximation to root of  $f(x) = 0$ .

**Example 1.** Find graphically the positive root of the equation  $x - 1 = \sin x$

**Solution.** Here, we have

$$x - 1 = \sin x \quad \dots (1)$$

We break the equation (1) into two equations as below

$$y = \sin x \quad \text{and } y = x - 1$$

To draw the graphs of  $y = f_1(x)$  and  $y = f_2(x)$ .

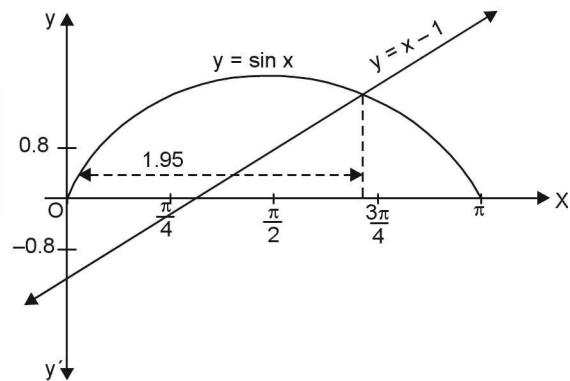

We prepare the following tables

$$y = \sin x$$

$x$	0	$\frac{\pi}{4}$	$\frac{\pi}{2}$	$\frac{3\pi}{4}$	$\pi$
$y = \sin x$	0	0.71	1	0.71	0

$$y = x - 1$$

$x$	0	1	$\frac{3\pi}{4}$
$y = x - 1$	-1	0	1.4

On the same axis and with the same scale construct the graphs of  $y = \sin x$  and  $y = x - 1$ .

From the graph, we get  $x = 1.95$  approximately.

**Ans.**

**Example 2.** Find the approximate value of the smallest root of  $e^{-x} - \sin x = 0$ , by graphical method.

**Solution.** We have,

$$e^{-x} - \sin x = 0 \dots (1)$$

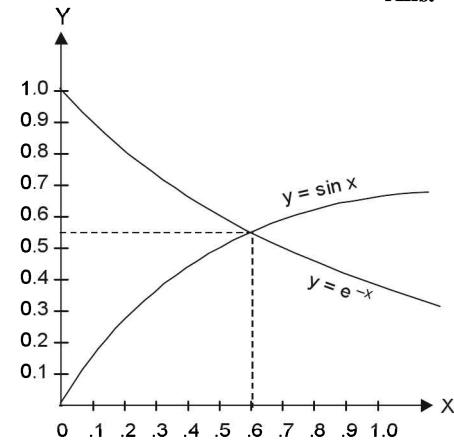

Equation (1) is written in two equations as

$$y = e^{-x} \text{ and } y = \sin x.$$

On the same axis and same scale we draw the graphs of two curves  $y = e^{-x}$  and  $y = \sin x$ . The two curves intersect at  $x = 0.6$ .

Therefore, the approximate smallest positive root is 0.6.

**Ans.**

### 50.7 BISECTION METHOD (BOLZANO METHOD)

If  $f(x)$  is continuous in the interval  $(a, b)$  such that  $f(a)$  and  $f(b)$  are of opposite signs, then  $f(a) \cdot f(b) < 0$

The curve crosses the  $x$ -axis between  $a$  and  $b$  then the first approximation to the root is

$$x_1 = \frac{1}{2}(a+b)$$

$$\begin{array}{c} f(a) = (-ve) \\ \hline a & & & & b \\ & & & & \end{array} \quad f(b) = (+ve)$$

Now there are three cases, if

1.  $f(x_1) = 0$ , then  $x_1$  is the root of  $f(x) = 0$

2.  $f(x_1) < 0$ , then root lies between  $x_1$  and  $b$ . [If  $f(a) = -ve$ ,  $f(b) = +ve$ ]

3.  $f(x_1) > 0$ , then root lies between  $a$  and  $x_1$ .

Suppose  $f(x_1) > 0$ , then  $a < \text{Root} < x_1$

$$\begin{array}{c} f(a) = (-ve) \\ \hline a & & x_1 & & b \\ & & \cdot & & \end{array} \quad \begin{array}{c} \frac{1}{2}(a+b) \\ \hline & & & \end{array} \quad \begin{array}{c} f(b) = (+ve) \\ \hline & & \end{array}$$

**Second approximation to the root is**  $x_2 = \frac{1}{2}(a+x_1)$

Again there are three cases, if

1.  $f(x_2) = 0$ , then  $x_2$  is the root of  $f(x) = 0$ .

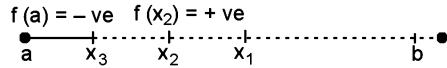

$$\begin{array}{c} f(a) = -ve \\ \hline a & & x_2 & & x_1 & & b \\ & & \cdot & & \cdot & & \end{array} \quad \begin{array}{c} f(x_2) = +ve \\ \hline & & \end{array} \quad \begin{array}{c} f(x_1) = -ve \\ \hline & & \end{array}$$

2.  $f(x_2) < 0$ , then root lies between  $x_2$  and  $x_1$ .

$$\begin{array}{c} & & & & b \\ & & & & \cdot \\ & & & & \end{array}$$

3.  $f(x_2) > 0$ , then root lies between  $a$  and  $x_2$ .

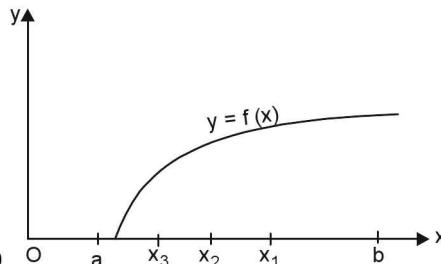

Suppose  $f(x_2) > 0$ .

**Third approximation**  $x_3 = \frac{1}{2}(a+x_2)$

If 1.  $f(x_3) = 0$ , then  $x_3$  is the root of  $f(x) = 0$

2.  $f(x_3) > 0$ , then root lies between  $a$  and  $x_3$   
and so on.

### 50.8 CONVERGENCE OF BISECTION METHOD

The successive approximations  $x_n$  of a root  $x = \alpha$  of the equation  $f(x) = 0$  is said to converge to  $x = \alpha$  with order  $q \geq 1$ .

If  $|x_{n+1} - \alpha| \leq C|x_n - \alpha|^q$

Here,  $q, n > 0$ ,  $n$  and  $C$  is some constant greater than 0.

when  $q = 1$  and  $0 < C < 1$ , then the convergence is said to be of first order and  $C$  is called the rate of convergence.

$$|x_{n+1} - \alpha| \leq C|x_n - \alpha|$$

### 50.9 TO SHOW THAT BISECTION METHOD IS ALWAYS CONVERGES

If  $(p_n, q_n)$  be the interval at  $n$ th step of Bisection and  $\alpha$  being the exact root of the equation  $f(x) = 0$ .

Let  $x_n$  be the  $n$ th approximation of the root of the equation  $f(x) = 0$ . Then initially  $p_1 = a$ , and  $q_1 = b$ .

$$x_1 \text{ is the first approximation} = \frac{p_1 + q_1}{2}$$

$$\text{i.e.}; p_1 < x_1 < q_1$$

Now either the root lies in  $(a, x_1)$ , or  $(x_1, b)$ .

Therefore either  $(p_2, q_2) = [p_1, x_1]$  or  $(p_2, q_2) = [x_1, q_1]$

Either  $p_2 = p_1$ ,  $q_2 = x_1$  or  $p_2 = x_1$ ,  $q_2 = q_1$

$$\Rightarrow p_1 \leq p_2, q_2 \leq q_1$$

Further we have  $x_2 = \left( \frac{p_2 + q_2}{2} \right)$  so that  $p_2 \leq x_2 \leq q_2$  continuing this process we see that

$$x_n = \left( \frac{p_n + q_n}{2} \right)$$

$$p_n \leq x_n \leq q_n$$

$$p_1 < p_2 < \dots < p_n$$

$$\text{and } q_1 > q_2 > \dots > q_n$$

Thus  $(p_1, p_2, \dots, p_n, \dots)$  is a bounded by  $b$  non-decreasing sequence.

$q_1, q_2, \dots, q_n$  is a bounded non increasing converge.

$$\text{Let } \lim_{n \rightarrow \infty} p_n = p \text{ and } \lim_{n \rightarrow \infty} q_n = q$$

But the length of the interval is decreasing at every step so we say that

$$\lim_{n \rightarrow \infty} (q_n - p_n) = 0 \Rightarrow q = p.$$

Also,  $p_n < x_n < q_n \Rightarrow \lim p_n \leq \lim x_n \leq \lim q_n$   
 $\Rightarrow p \leq \lim x_n \leq q \Rightarrow \lim x_n = p = q$  ... (1)

Again as the root lies in the interval  $[p_n, q_n]$ , we have

$$f(p_n) \cdot f(q_n) < 0 \Rightarrow 0 \geq \lim_{n \rightarrow \infty} [f(p_n) \cdot f(q_n)]$$

$$0 \geq f(p) \cdot f(q) \Rightarrow 0 \geq [f(p)]^2 \quad \dots (2)$$

But  $[f(p)]^2 \geq 0$ , being square. So, we get  $f(p) = 0$

$$\Rightarrow p \text{ is a root of the sequence } f(x) = 0 \quad \dots (3)$$

Thus (1) and (2) imply that the sequence  $\langle x_n \rangle$  converges necessarily to a root of the equation  $f(x) = 0$

But  $|x_n - \alpha| \leq \left(\frac{1}{2}\right)^n (b-a)$ , hence, the method shows a linear convergence with a rate  $\left(\frac{1}{2}\right)$ .

So the method is not rapidly converging. But it is useful in the sense that it converges surely.

**Example 3.** Perform five iterations of the bisection method to obtain the smallest positive root of the equation

$$f(x) = x^3 - 5x + 1 = 0$$

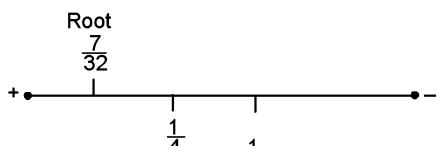

**Solution.** We have,  $f(x) = x^3 - 5x + 1 = 0$

$$f(0) = +1$$

$$f(1) = 1 - 5 + 1 = -3$$

As  $f(0) \cdot f(1) < 0$ , Root  $\frac{7}{32}$

The first approximate root lies between 0 and 1.

$$x_1 = \frac{0+1}{2} = \frac{1}{2}$$

$$f\left(\frac{1}{2}\right) = \frac{1}{8} - \frac{5}{2} + 1 = -1.375$$

As  $f(0) \cdot f\left(\frac{1}{2}\right) < 0$

The second approximate lies between 0 and  $\frac{1}{2}$ .

$$x_2 = \frac{0+\frac{1}{2}}{2} = \frac{1}{4}$$

$$f\left(\frac{1}{4}\right) = \frac{1}{64} - \frac{5}{4} + 1 = -0.234375$$

As  $f(0) \cdot f\left(\frac{1}{4}\right) < 0$

The third approximate root lies between 0 and  $\frac{1}{4}$ .

$$x_3 = \frac{0 + \frac{1}{4}}{2} = \frac{1}{8}$$

$$f\left(\frac{1}{8}\right) = \frac{1}{512} - \frac{5}{8} + 1 = +0.37695$$

As  $f\left(\frac{1}{8}\right) \cdot f\left(\frac{1}{4}\right) < 0$

The fourth approximate root lies between  $\frac{1}{8}$  and  $\frac{1}{4}$ .

$$x_4 = \frac{\frac{1}{8} + \frac{1}{4}}{2} = \frac{3}{16}$$

$$f\left(\frac{3}{16}\right) = \left(\frac{3}{16}\right)^3 - \frac{15}{16} + 1 = +0.06909$$

As  $f\left(\frac{3}{16}\right) \cdot f\left(\frac{1}{4}\right) < 0$

Then  $\frac{3}{16} < \text{root} < \frac{1}{4}$ .

$$x_5 = \frac{\frac{3}{16} + \frac{1}{4}}{2} = \frac{7}{32}, \quad \text{Root} = \frac{7}{32}$$

Ans.

**Example 4.** Find the real root of the equation

$$x \sin x + \cos x = 0$$

between (2, 3), using Bisection method.

**Solution.** Let  $f(x) = x \sin x + \cos x$

$$f(2) = 2 \sin 2 + \cos 2 = 1.4024$$

$$f(3) = 3 \sin 3 + \cos 3 = -0.5666$$

As  $f(2) \cdot f(3) < 0$

$$2 < \text{Root} < 3$$

First approximate root  $= \frac{2+3}{2} = 2.5$

$$f(2.5) = 2.5 \sin 2.5 + \cos 2.5 = 0.6950$$

As  $f(2.5) \cdot f(3) < 0$

$$\text{The second approximate root} = \frac{2.5+3}{2} = 2.75$$

$$f(2.75) = 2.75 \sin 2.75 + \cos 2.75 = 0.1253$$

As  $f(2.75) \cdot f(3) < 0$

$$\text{The third approximate root} = \frac{2.75+3}{2} = 2.875$$

$$f(2.875) = 2.875 \sin 2.875 + \cos 2.875 = -0.2073$$

As  $f(2.875) \cdot f(2.75) < 0$

$$\text{The fourth approximate root} = \frac{2.875+2.75}{2} = 2.8125$$

$$f(2.8125) = 2.8125 \sin 2.8125 + \cos 2.8125 = -0.0374$$

As  $f(2.75) \cdot f(2.8125) < 0$

$$\text{The fifth approximate root} = \frac{2.8125+2.75}{2} = 2.78125$$

$$f(2.78125) = 2.78125 \sin 2.78125 + \cos 2.78125 = 0.0449$$

As  $f(2.78125) \cdot f(2.8125) < 0$

$$\text{The sixth approximate root} = \frac{2.78125 + 2.8125}{2} = 2.796875$$

$$f(2.796875) = 0.0040 \text{ which is nearly zero.}$$

Hence, the root of the given equation is 2.796875

**Ans.**

### EXERCISE 50.1

1. Solve  $x^3 - 9x + 1 = 0$  for the root between  $x = 2$  and  $x = 4$  by the method of Bolzano Method. **Ans.** 2.9375
2. Draw the graph  $y = x^5$  and find the solution graphically of the equation  $x^5 - x - 0.20 = 0$ . **Ans.** -0.2
3. Find the positive root of  $x^3 - x = 1$  correct to four decimal places by Bisection method. **Ans.** 1.3248
4. Draw the graph  $y = x^3$  and  $y = -2x + 20$  and find the approximate solution of the equation  $x^3 + 2x - 20 = 0$  **Ans.** 2.47
5. Find the approximate value of the root  $\tan x = 1.2x$  **Ans.**  $x = 0.71$  radian
6. Approximate the value of  $\pi$  by solving  $\frac{x}{4} - 1 = 0$ , using Bisection method. **Ans.** 3.146
7. Find the positive root of  $x - \cos x = 0$  by Bisection method. **Ans.** 0.7388
8. Find a positive root of the equation  $2x = 3 + \cos x$ , by Bisection method. **Ans.** 1.524
9. Find a positive root of the equation  $e^x = 3x$ , by Bisection method. **Ans.** 0.6190
10. Solve  $e^x + x^4 + x = 2$  by Bisection method. **Ans.** 0.429494

### 50.10 NEWTON – RAPHSON METHOD

(U.P., III Semester Dec. 2009)

Let  $x_0$  be an approximate root of  $f(x) = 0$  and let  $x_1 = x_0 + h$  be the correct root so that  $f(x_0 + h) = 0$

To find  $h$ , we expand  $f(x_0 + h)$  by Taylor's Series

$$f(x_0 + h) = f(x_0) + h f'(x_0) + \frac{h^2}{2!} f''(x_0) + \dots \quad [f(x_0 + h) = 0]$$

$$0 = f(x_0) + h f'(x_0) \quad [\text{Neglecting the second and higher order derivative}]$$

$$h = -\frac{f(x_0)}{f'(x_0)}$$

But  $x_1 = x_0 + h$

$$\text{Putting the value of } h, \text{ we get} \Rightarrow x_1 = x_0 - \frac{f(x_0)}{f'(x_0)}$$

$$x_1 \text{ is better approximation than } x_0. \quad x_2 = x_1 - \frac{f(x_1)}{f'(x_1)}$$

$x_2$  is better approximation than  $x_1$ .

Successive approximations are  $x_3, x_4, \dots, x_{n+1}$ .

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

Which is the Newton - Raphson formula.

- Note 1.** Newton method is the best known procedure for finding the roots of an equation. It is applicable to the solution of all types of equations i.e., algebraic and transcendental and also useful for calculating complex roots.
2. This method is useful in case of large value of  $f'(x)$ . For large  $f'(x)$ ,  $h$  will be small.
  3. This formula converges rapidly. If the initial approximation  $x_0$  is taken very close to the root  $\alpha$ .

Thus proper choice of  $x_0$  is very important for the success of this method.

### 50.11 GEOMETRICAL INTERPRETATION

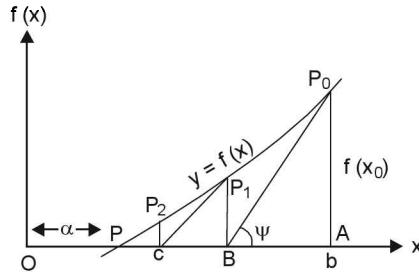

(AMIETE, June 2010)

Let  $P_0 P$  be a curve  $y = f(x)$ .

Slope of the tangent  $P_0 B$  to the curve at the point  $P_0 (x_0, y_0) = f'(x_0)$ .

Tangent  $P_0 B$  cuts the  $x$ -axis at  $B$  i.e.  $(x_1, 0)$ .

$$\begin{aligned} x_1 &= OB \\ &= OA - AB \\ &= x_0 - P_0 A \cot \Psi \\ &= x_0 - \frac{P_0 A}{\tan \Psi} \quad \left[ AN = f(x_0), \frac{BA}{AN} = \cot \Psi \right] \\ &= x_0 - \frac{f(x_0)}{f'(x_0)} \quad (\text{First approximation}) \end{aligned}$$

The tangent to the curve at  $P_1$  (corresponding to  $x_1$ ) cuts the axis at  $C (x_2, 0)$ .

Using  $x_1$  as the starting point, then

$$\text{Similarly } x_2 = x_1 - \frac{f(x_1)}{f'(x_1)}$$

Now  $x_2$  is nearer to  $\alpha$  than  $x_1$  (second approximation).

The process can be repeated and the root  $\alpha$  is approached very fast.

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

### 50.12 CONVERGENCE OF NEWTON – RAPHSON FORMULA

By Newton-Raphson formula

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

$$\text{Let } \phi(x) = x - \frac{f(x)}{f'(x)} = \frac{x f'(x) - f(x)}{f'(x)}$$

On differentiating both sides w.r.t 'x', we get

$$\phi'(x) = \frac{f'(x)[f'(x) + x f''(x) - f'(x)] - [x f'(x) - f(x)] f''(x)}{[f'(x)]^2}$$

$$\Rightarrow \phi'(x) = \frac{[f'(x)]^2 + x f'(x) f''(x) - [f'(x)]^2 - x f'(x) f''(x) + f(x) f''(x)}{[f'(x)]^2}$$

$$\Rightarrow \phi'(x) = \frac{f(x)f''(x)}{[f'(x)]^2}$$

For convergence,  $|\phi'(x)| < 1$

$$\frac{f(x)f''(x)}{[f'(x)]^2} < 1$$

$$f(x)f''(x) < [f'(x)]^2$$

(GBTU, Dec. 2012)

### 50.13 RATE OF CONVERGENCE OF NEWTON - RAPHSON FORMULA

Let  $x_n$  (approximate root) differs from the actual root  $\alpha$  by a small quantity  $h_n$ .

$$\text{So } x_n = \alpha + h_n \quad \dots (1)$$

$$x_{n+1} = \alpha + h_{n+1} \quad \dots (2)$$

By Newton-Raphson Formula

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} \quad \dots (3)$$

Putting the values of  $x_{n+1}$  and  $x_n$  from (1) and (2) in (3), we get

$$\alpha + h_{n+1} = \alpha + h_n - \frac{f(\alpha + h_n)}{f'(\alpha + h_n)} \Rightarrow h_{n+1} = h_n - \frac{f(\alpha + h_n)}{f'(\alpha + h_n)}$$

On expanding  $f(\alpha + h_n)$  and  $f'(\alpha + h_n)$  by Taylor's Series, we get

$$h_{n+1} = h_n - \frac{f(\alpha) + h_n f'(\alpha) + \frac{1}{2!} h_n^2 f''(\alpha) + \dots}{f'(\alpha) + h_n f''(\alpha) + \dots}$$

We know that  $f(\alpha) = 0$ , so

$$\begin{aligned} h_{n+1} &= h_n - \frac{h_n f'(\alpha) + \frac{1}{2} h_n^2 f''(\alpha) + \dots}{f'(\alpha) + h_n f''(\alpha) + \dots} \\ &= \frac{h_n f'(\alpha) + h_n^2 f''(\alpha) - h_n f'(\alpha) - \frac{1}{2} h_n^2 f''(\alpha) + \dots}{f'(\alpha) + h_n f''(\alpha) + \dots} = \frac{\frac{1}{2} h_n^2 f''(\alpha)}{f'(\alpha) + h_n f''(\alpha)} \end{aligned}$$

$$h_{n+1} = h_n^2 \left( \frac{f''(\alpha)}{2f'(\alpha)} \right) \text{ approximately} \quad [f''(\alpha) \text{ neglected}]$$

$$h_{n+1} \propto h_n^2 \quad \left( \frac{f''(\alpha)}{2f'(\alpha)} \text{ constant} \right)$$

- It means that subsequent error  $h_{n+1}$  at each step is proportional to the square of the previous error  $h_n$ . So, the number of correct decimal is approximately doubled at each iteration if  $\frac{f''(\alpha)}{2f'(\alpha)}$  is not too large.
- Convergence is of quadratic order i.e.  $P = 2$ .

### 50.14 ORDER OF CONVERGENCE

$$x_n = \alpha + h_n$$

$$x_{n+1} = \alpha + h_{n+1}$$

$$h_{n+1} = h_n^k$$

$k$  is called the order of convergence.

If  $k = 1$ , the convergence is linear.

If  $k = 2$ , it is quadratic.

### 50.15 WORKING RULE TO SOLVE $f(x) = 0$ BY NEWTON - RAPHSON METHOD

**Step 1.** Choose two close numbers  $b$  and  $c$  such that  $f(b)$  and  $f(c)$  are of opposite signs. then the root  $\alpha$  lies between  $b$  and  $c$ .

**Step 2.** Out of  $f(b)$  and  $f(c)$  choose which is nearer to zero. If  $f(b)$  is nearer to zero then  $b$  is an initial approximate root ( $x_0$ ) of the given equation.

**Step 3.** Apply Newton Raphson formula to find out better approximate root  $x_1$ .

$$x_1 = x_0 - \frac{f(x_0)}{f'(x_0)}$$

Repeat the process to get successive approximation.

**Step 4.** Stop when two approximate roots are equal.

**Example 5.** Find the real root of the following equation, correct to three decimal places, using Newton-Raphson Method. (R.G.P.V., III Semester, June 2007)

$$x^3 - 2x - 5 = 0$$

**Solution.**  $x^3 - 2x - 5 = 0$  ... (1)

Let

$$f(x) = x^3 - 2x - 5$$

$$f(2) = 8 - 4 - 5 = -1$$

$$f(2.5) = (2.5)^3 - 2(2.5) - 5 = +5.625$$

Since  $f(2)$  and  $f(2.5)$  are, of opposite signs, the root of (1) lies between 2 and 2.5;  $f(2)$  is near to zero than  $f(2.5)$ . So 2 is better appropriate root than 2.5.

$$f'(x) = 3x^2 - 2 \Rightarrow f'(2) = 12 - 2 = 10$$

Let 2 be an approximate root of (1). By Newton-Raphson method

$$x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = 2 - \frac{f(2)}{f'(2)} = 2 - \frac{-1}{10} = 2.1$$

$$f(2.1) = (2.1)^3 - 2(2.1) - 5 = 9.261 - 4.2 - 5 = 0.061$$

$$f'(2.1) = 3(2.1)^2 - 2 = 11.23$$

$$x_2 = 2.1 - \frac{f(2.1)}{f'(2.1)} = 2.1 - \frac{0.061}{11.23} = 2.1 - 0.00543 = 2.09457$$

$$\begin{aligned} f(2.09457) &= (2.09457)^3 - 2(2.09457) - 5 \\ &= 9.1893 - 4.18914 - 5 = 0.00016 \end{aligned}$$

$$f'(2.09457) = 3(2.09457)^2 - 2 = 13.16167 - 2 = 11.16167$$

$$x_3 = 2.09457 - \frac{f(2.09457)}{f'(2.09457)} = 2.09457 - \frac{0.00016}{11.16167} = 2.09457 - 0.000014 = 2.09456$$

As  $x_3 = x_2$  correct upto four places of decimal.

Hence, the root of the given equation is 2.0945 correct upto four places of decimal. **Ans.**

**Example 6.** Derive the Newton-Raphson formula for finding a root of a non-linear equation. Find a root of  $f(x) = x^3 + 2x^2 + 10x - 20 = 0$

up to 10 iterations. (U.P., III Semester, Dec. 2009)

**Solution.** For derivation of the formula see Art. 50.10 on page 1378.

$$\text{Newton-Raphson Formula } x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

$$f(x) = x^3 + 2x^2 + 10x - 20 \quad \dots (1) \quad \Rightarrow f'(x) = 3x^2 + 4x + 10$$

$$f(1) = 1^3 + 2(1)^2 + 10(1) - 20 = 1 + 2 + 10 - 20 = -7$$

$$f(2) = 2^3 + 2(2)^2 + 10(2) - 20 = 8 + 8 + 20 - 20 = 16$$

Since  $f(1)$  and  $f(2)$  are of opposite signs, so the root of (1) lies between 1 and 2.

As  $f(1)$  is near to zero than  $f(2)$ . So, 1 is better approximate root than 2.

$$f'(1) = 3(1)^2 + 4(1) + 10 = 3 + 4 + 10 = 17$$

$$x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} \quad (\text{Newton-Raphson formula})$$

#### First Iteration

$$x_1 = x_0 - \frac{f(1)}{f'(1)} = 1 - \frac{-7}{17} = \frac{24}{17} \quad \left| \quad f\left(\frac{24}{17}\right) = 0.9175656 \right.$$

#### Second Iteration

$$x_2 = x_1 - \frac{f(x_1)}{f'(x_1)} = \frac{24}{17} - \frac{f\left(\frac{24}{17}\right)}{f'\left(\frac{24}{17}\right)} = 1.4117647 - \frac{0.9175656}{21.6262976} \quad \left| \quad f'\left(\frac{24}{17}\right) = 21.6262976 \right.$$

$$= 1.4117647 - 0.04242823 = 1.36933647$$

#### Third Iteration

$$x_3 = x_2 - \frac{f(x_2)}{f'(x_2)} = 1.36933647 - \frac{f(1.36933647)}{f'(1.36933647)}$$

$$= 1.36933647 - \frac{0.01114811}{21.1025930}$$

$$= 1.36933647 - 0.00052828 = 1.36880819$$

#### Fourth Iteration

$$x_4 = x_3 - \frac{f(x_3)}{f'(x_3)} = 1.36880819 - \frac{f(1.36880819)}{f'(1.36880819)}$$

$$= 1.36880819 - \frac{0.00000173}{21.09614034} = 1.36880819 - 0.00000008$$

$$= 1.36880811$$

#### Fifth Iteration

$$x_5 = x_4 - \frac{f(x_4)}{f'(x_4)} = 1.36880811 - \frac{f(1.36880811)}{f'(1.36880811)}$$

$$= 1.36880811 - \frac{0.00000005}{21.09618937} = 1.36880811 - 0.000000000$$

$$= 1.36880811$$

The root of the given equation is 1.36880811 correct upto eighth decimal place after fifth iteration. For the accuracy more than 8 decimal places, we can iterate further. **Ans.**

**Example 7.** Find the real root of the equation  $x^4 - x - 9 = 0$  by Newton-Raphson Method, correct to three places of decimal.

(R.G.P.V., Bhopal, III Semester, June 2006)

**Solution.**  $f(x) = x^4 - x - 9 = 0, \quad f'(x) = 4x^3 - 1$

$$f(0) = -9$$

$$f(1) = 1^4 - 1 - 9 = 1 - 1 - 9 = -9, f(2) = 2^4 - 2 - 9 = 16 - 2 - 9 = 5$$

As  $f(2)$  is nearer to zero we take 2 as an approximate root of  $f(x)$ .

$$f'(2) = 4(2)^3 - 1 = 4 \times 8 - 1 = 32 - 1 = 31$$

By Newton-Raphson method

$$\begin{aligned}
 x_1 &= x_0 - \frac{f(x_0)}{f'(x_0)} \\
 x_1 &= 2 - \frac{f(2)}{f'(2)} = 2 - \frac{5}{31} = 1.8387 \\
 f(1.8387) &= (1.8387)^4 - 1.8387 - 9 = 11.4299 - 1.8387 - 9 = 0.5912 \\
 f'(1.8387) &= 4(1.8387)^3 - 1 = 23.8652 \\
 x_2 &= 1.8387 - \frac{f(1.8387)}{f'(1.8387)} = 1.8387 - \frac{0.5912}{23.8652} = 1.8387 - 0.02477 \\
 &= 1.8139 \\
 f(1.8139) &= (1.8139)^4 - 1.8139 - 9 = 0.01173 \\
 f'(1.8139) &= 4(1.8139)^3 - 1 = 22.8726 \\
 x_3 &= 1.8139 - \frac{f(1.8139)}{f'(1.8139)} = 1.8139 - \frac{0.01173}{22.8726} \\
 &= 1.8139 - 0.0005 = 1.8134 \\
 f(1.8134) &= (1.8134)^4 - 1.8134 - 9 = 10.8137 - 1.8134 - 9 = 0.0003 \\
 f'(1.8134) &= 4(1.8134)^3 - 1 = 22.8529 \\
 x_4 &= 1.8134 - \frac{f(1.8134)}{f'(1.8134)} = 1.8134 - \frac{0.0003}{22.8529} = 1.8134 - 0.000013 \\
 x_4 &= 1.8134
 \end{aligned}$$

As  $x_3$  and  $x_4$  are equal, so root = 1.8134

Hence, real root of the given equation is 1.8134

**Ans.**

**Example 8.** By using Newton-Raphson's Method, find the root of  $x^4 - x - 10 = 0$ , which is near to  $x = 2$  correct to three places of decimal.

(GBTU, Dec. 2012, R.G.P.V., Bhopal, III Semester, June 2008, Dec. 2003)

**Solution.**

$$\begin{aligned}
 f(x) &= x^4 - x - 10, & f'(x) &= 4x^3 - 1 \\
 f(2) &= 16 - 2 - 10 = 4 \\
 f'(2) &= 32 - 1 = 31
 \end{aligned}$$

By Newton-Raphson's method

$$\begin{aligned}
 x_1 &= x_0 - \frac{f(x_0)}{f'(x_0)} = 2 - \frac{f(2)}{f'(2)} = 2 - \frac{4}{31} = 2 - 0.129 = 1.871 \\
 f(1.871) &= (1.871)^4 - 1.871 - 10 = 12.2545 - 1.871 - 10 = 0.3835 \\
 f'(1.871) &= 4(1.871)^3 - 1 = 4 \times 6.5497 - 1 = 25.1988 \\
 x_2 &= 1.871 - \frac{f(1.871)}{f'(1.871)} = 1.871 - \frac{0.3835}{25.1988} = 1.871 - 0.0152 = 1.8558 \\
 f(1.8558) &= (1.8558)^4 - (1.8558) - 10 = 11.8611 - 11.8558 = 0.0053 \\
 f'(1.8558) &= 4(1.8558)^3 - 1 = 4 \times 6.3914 - 1 = 24.5656 \\
 x_3 &= 1.8558 - \frac{f(1.8558)}{f'(1.8558)} = 1.8558 - \frac{0.0053}{24.5656} = 1.8558 - 0.00022 \\
 &= 1.85558
 \end{aligned}$$

As  $x_2 = x_3$  correct upto three places of decimals, so the correct root of the given equation is 1.856

**Ans.**

**Example 9.** Using Newton – Raphson Method find an iterative scheme to compute the reciprocal of a positive number. (AMIETE, Dec. 2010)

**Solution.** Let  $x$  be the reciprocal of a given positive number  $N$ .

$$x = \frac{1}{N} \text{ or } N - \frac{1}{x} = 0$$

$$f(x) = N - \frac{1}{x} = 0, \quad f'(x) = \frac{1}{x^2}$$

By Newton - Raphson Method

$$\begin{aligned} x_{n+1} &= x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{N - \frac{1}{x_n}}{\frac{1}{x_n^2}} = x_n - x_n^2 \left( N - \frac{1}{x_n} \right) \\ &= x_n - N x_n^2 + x_n = 2x_n - Nx_n^2 = x_n [2 - N x_n] \end{aligned}$$

**Ans.**

**Example 10.** Find the value of  $\frac{1}{18}$  by Newton - Raphson Method. (AMIETE, Dec. 2010)

**Solution.** Let  $x = \frac{1}{18}$

Let  $f(x) = \frac{1}{x} - 18 = 0 \quad \dots (1)$

$\Rightarrow f'(x) = -\frac{1}{x^2}$

Let the approximate root of equation (1) be 0.05

By Newton - Raphson Method

$$x_1 = x_0 (2 - 18x_0) = 0.05 (2 - 18 \times 0.05) = 0.05 (2 - 0.90) = 0.05 \times 1.10 = 0.055$$

$$x_2 = x_1 (2 - 18x_1) = 0.055 (2 - 18 \times 0.055) = 0.055 (2 - 0.99) = 0.055 \times 1.01 = 0.05555$$

$$x_3 = x_2 (2 - 18x_2) = 0.05555 (2 - 18 \times 0.05555) = 0.05555 (1.0001) = 0.05556$$

Hence,  $\frac{1}{18} = 0.0556$  approximately. **Ans.**

**Example 11.** Using Newton-Raphson method find an iterative scheme to compute the cube root of a positive number. (AMIETE, Dec. 2010)

**Solution.** Let  $x$  be the cube root of a given positive number  $N$ .

$$x = \sqrt[3]{N} \text{ or } x^3 = N \text{ or } x^3 - N = 0$$

Let  $f(x) = x^3 - N = 0 \Rightarrow f'(x) = 3x^2$

By Newton-Raphson Method

$$\begin{aligned} x_{n+1} &= x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^3 - N}{3x_n^2} = \frac{3x_n^3 - x_n^3 + N}{3x_n^2} \\ &= \frac{2x_n^3 + N}{3x_n^2} \text{ for } n = 0, 1, 2, \dots \end{aligned}$$

**Ans.**

**Example 12.** Write the Newton-Raphson procedure for finding  $\sqrt[3]{N}$ , where  $N$  is a real number. Use it to find  $\sqrt[3]{18}$  correct to 2 decimals, assuming 2.5 as the initial approximation. (AMIETE, Dec. 2010)

**Solution.** Let  $x = \sqrt[3]{18} \Rightarrow x^3 = N \Rightarrow x^3 - N = 0$

Let  $f(x) = x^3 - N = 0 \Rightarrow f'(x) = 3x^2$

By Newton-Raphson Method,

$$\begin{aligned}x_{n+1} &= x_n - \frac{f(x_n)}{f'(x_n)} \\x_{n+1} &= x_n - \frac{x_n^3 - N}{3x_n^2} = \frac{2x_n^3 + N}{3x_n^2}, \quad n = 0, 1, 2, \dots \quad \dots (1)\end{aligned}$$

Putting  $N = 18$ ,  $x_0 = \text{app. cube root of } 18 = 2.5$  in (1), we get

$$x_1 = \frac{2(2.5)^3 + 18}{3 \times (2.5)^2} = 2.62667$$

Repeat this method.

**Ans.**

**Example 13.** Find an iterative formula to find  $\sqrt{N}$  (where  $N$  is a positive number) and hence find

(a)  $\sqrt{5}$ , correct to 5 decimal places.

(b) Find  $\sqrt{24}$ . (A.M.I.E., Summer 2001, 2000)

**Solution.** Let  $x$  be the square root of a given positive number  $N$ .

$$x = \frac{1}{(N)^{\frac{1}{2}}} \Rightarrow x^2 = N \Rightarrow x^2 - N = 0$$

Let  $f(x) = x^2 - N = 0 \Rightarrow f'(x) = 2x$

By Newton-Raphson Method

$$\begin{aligned}x_{n+1} &= x_n - \frac{f(x_n)}{f'(x_n)} \\x_{n+1} &= x_n - \frac{x_n^2 - N}{2x_n} = \frac{2x_n^2 - x_n^2 + N}{2x_n} = \frac{x_n^2 + N}{2x_n} \\x_{n+1} &= \frac{x_n^2 + N}{2x_n}; \quad n = 0, \dots \quad \text{This is the iterative formula to find } \sqrt{N}.\end{aligned}$$

Let  $N = 5$ ,  $x_0 = \text{app. root of } 5 = 2$ .

$$x_1 = \frac{(2)^2 + 5}{2 \times 2} = 2.25,$$

$$x_2 = \frac{(2.25)^2 + 5}{2 \times 2.25} = 2.23611 \quad \text{Ans.}$$

(b)  $N = 24$ ,  $x_0 = \text{app. root of } 24 = 5$

$$x_1 = \frac{(5)^2 + 24}{2 \times 5} = 4.9, \quad x_2 = \frac{(4.9)^2 + 24}{2 \times 4.9} = 4.899$$

$$x_3 = \frac{(4.899)^2 + 24}{2 \times 4.899} = 4.89898 \quad \text{Ans.}$$

**Example 14.** By iteration method find the value of  $(48)^{1/3}$ , correct to three decimal places. (R.G.P.V., Bhopal, III Semester Dec. 2003)

**Solution.** Let  $x = \sqrt[3]{N} \Rightarrow x^3 = N \Rightarrow x^3 - N = 0$

Let  $f(x) = x^3 - N = 0 \Rightarrow f'(x) = 3x^2$

By Newton-Raphson Method

$$\begin{aligned}x_{n+1} &= x_n - \frac{f(x_n)}{f'(x_n)} \\x_{n+1} &= x_n - \frac{x_n^3 - N}{3x_n^2}, \quad n = 0, 1, 2, \dots \quad \Rightarrow \quad x_{n+1} = \frac{3x_n^3 - x_n^3 + N}{3x_n^2} \\&\Rightarrow x_{n+1} = \frac{2x_n^3 + N}{3x_n^2}, \quad n = 0, 1, 2, \dots \quad \dots (1)\end{aligned}$$

Putting

 $N = 48$ ,  $x_0$  = Approximate root of 48 = 3.5 in (1), we get

$$x_1 = \frac{2(3.5)^3 + 48}{3(3.5)^2} = \frac{133.75}{36.75} = 3.6395$$

$$x_2 = \frac{2(3.6395)^3 + 48}{3(3.6395)^2} = \frac{144.4173}{39.7379} = 3.6342$$

$$x_3 = \frac{2(3.6342)^3 + 48}{3(3.6342)^2} = \frac{143.9967}{39.6222} = 3.6342$$

As  $x_2 = x_3$  so  $\frac{1}{(48)^3} = 3.6342$  is correct upto 4 decimal places.

Hence,  $\frac{1}{(48)^3} = 3.6342$

**Ans.**

**Example 15.** An iterative method for finding  $\sqrt{N}$ , where  $N$  is a real number can be written

as  $x_{n+1} = \frac{1}{2} x_n \left[ \left( 3 - \frac{x_n^2}{N} \right) + \frac{3}{4} \left( 1 - \frac{x_n^2}{N} \right)^2 \right]$ . Find the rate of convergence of the method.

**Solution.** Let  $x = \sqrt{N}$ ,  $x^2 - N = 0$ ,  $f(x) = x^2 - N$

Let the correct root be  $\alpha$ .

$$\alpha^2 = N$$

Let  $x_n$  be the approximate value of  $\alpha$  and the error in  $x_n$  be  $h_n$ , then

$$x_n = \alpha + h_n \text{ and } x_{n+1} = \alpha + h_{n+1}$$

Here the given formula is

$$x_{n+1} = \frac{1}{2} x_n \left[ \left( 3 - \frac{x_n^2}{N} \right) + \frac{3}{4} \left( 1 - \frac{x_n^2}{N} \right)^2 \right] \quad \dots (1)$$

Putting the values of  $x_n$ ,  $x_{n+1}$ ,  $N$  in (1), we get

$$\begin{aligned} \alpha + h_{n+1} &= \frac{1}{2} (\alpha + h_n) \left[ \left( 3 - \frac{(\alpha + h_n)^2}{\alpha^2} \right) + \frac{3}{4} \left( 1 - \frac{(\alpha + h_n)^2}{\alpha^2} \right)^2 \right] \\ &= \frac{1}{2} (\alpha + h_n) \left[ 3 - \frac{\alpha^2}{\alpha^2} \left( 1 + \frac{h_n}{\alpha} \right)^2 \right] + \frac{3}{4} \left[ 1 - \frac{\alpha^2}{\alpha^2} \left( 1 + \frac{h_n}{\alpha} \right)^2 \right] \\ &= \frac{1}{2} (\alpha + h_n) \left[ \left( 3 - 1 - \frac{2h_n}{\alpha} - \frac{h_n^2}{\alpha^2} \right) + \frac{3}{4} \left( 1 - 1 - \frac{2h_n}{\alpha} - \frac{h_n^2}{\alpha^2} \right)^2 \right] \\ &= \frac{1}{2} (\alpha + h_n) \left[ 2 - \frac{2h_n}{\alpha} - \frac{h_n^2}{\alpha^2} + \frac{3}{4} \left( \frac{-2h_n}{\alpha} - \frac{h_n^2}{\alpha^2} \right)^2 \right] \\ &= \frac{1}{2} (\alpha + h_n) \left[ 2 - \frac{2h_n}{\alpha} - \frac{h_n^2}{\alpha^2} + \frac{3}{4} \left( \frac{4h_n^2}{\alpha^2} + \frac{h_n^4}{\alpha^4} + \frac{4h_n^3}{\alpha^3} \right) \right] \\ &= \frac{1}{2} (\alpha + h_n) \left[ 2 - \frac{2h_n}{\alpha} - \frac{h_n^2}{\alpha^2} + \frac{3h_n^2}{\alpha^2} + \frac{3h_n^4}{4\alpha^4} + \frac{3h_n^3}{\alpha^3} \right] \\ &= \frac{1}{2} (\alpha + h_n) \left[ 2 - \frac{2h_n}{\alpha} + \frac{2h_n^2}{\alpha^2} + \frac{3h_n^3}{\alpha^3} + \frac{3h_n^4}{4\alpha^4} \right] \end{aligned}$$

$$\begin{aligned}
 &= \alpha - h_n + \frac{h_n^2}{\alpha} + \frac{3}{2} \frac{h_n^3}{\alpha^2} + \frac{3}{8} \frac{h_n^4}{\alpha^3} + h_n - \frac{h_n^2}{\alpha} + \frac{h_n^3}{\alpha^2} + \frac{3}{2} \frac{h_n^4}{\alpha^3} + \frac{3}{8} \frac{h_n^5}{\alpha^4} \\
 h_{n+1} &= \frac{5}{2} \frac{h_n^3}{\alpha^2} + \frac{15}{8} \frac{h_n^4}{\alpha^3} + \frac{3}{8} \frac{h_n^5}{\alpha^4} \\
 h_{n+1} &= h_n^3 \left( \frac{5}{2\alpha^2} \right) \text{ approximately (Neglecting } h_n^4 \text{ and its higher powers)} \\
 h_{n+1} &\propto h_n^3 \quad \left( \frac{5}{2\alpha^2} = \text{constant} \right)
 \end{aligned}$$

The rate of convergence is cubic. Here convergence is of order 3.

**Ans.**

**Example 16.** Apply Newton - Raphson Method to solve

$$3x - \cos x - 1 = 0$$

(R.G.P.V., Bhopal, III Semester, Dec. 2006, June 2004, Dec. 2002)

**Solution.** Let

$$\begin{aligned}
 f(x) &= 3x - \cos x - 1 = 0, \quad f'(x) = 3 + \sin x \\
 f(0) &= 0 - 1 - 1 = -2 \\
 f(0.6) &= 1.8 - \cos 0.6 - 1 = -0.0253 \\
 f(1) &= 3 - \cos 1 - 1 = 1.4597
 \end{aligned}$$

As  $f(0.6)$  is nearer to zero, than  $f(1)$ , so we take first approximate root as 0.6.

By Newton - Raphson Method

$$\begin{aligned}
 x_{n+1} &= x_n - \frac{f(x_n)}{f'(x_n)} \\
 x_1 &= x - \frac{3x - \cos x - 1}{3 + \sin x} = 0.6 - \frac{3(0.6) - \cos 0.6 - 1}{3 + \sin 0.6} = 0.6071 \\
 x_2 &= 0.6071 - \frac{3(0.6071) - \cos 0.6071 - 1}{3 + \sin 0.6071} = 0.6071
 \end{aligned}$$

Since

$x_2 = x_1$ , therefore the real root of the given equation is 0.6071.

**Ans.**

**Example 17.** Using Newton's iterative method, find the real root of  $x \log_{10} x = 1.2$  correct to five decimal places.

(UP III Semester, June 2011, R.G.P.V., Bhopal, III Semester, June 2005, Dec. 2004)

**Solution.** Let

$$f(x) = x \log_{10} x - 1.2$$

$$f(1) = -1.2 = \text{ve},$$

$$f(2) = 2 \log_{10} 2 - 1.2 = -0.59794 = \text{ve}$$

and

$$f(3) = 3 \log_{10} 3 - 1.2 = 1.4314 - 1.2 = 0.23136 = \text{+ve}$$

$$f(2) \cdot f(3) < 0$$

So, a root of  $f(x) = 0$  lies between 2 and 3.

Let us take

$$x_0 = 2.$$

$$\text{Also, } f'(x) = \log_{10} x + x \cdot \frac{1}{x} \log_{10} e = \log_{10} x + 0.43429$$

$\therefore$  Newton's iteration formula gives

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n \log_{10} x_n - 1.2}{\log_{10} x_n + 0.43429} = \frac{x_n \log_{10} x_n + 0.43429 x_n - x_n \log_{10} x_n + 1.2}{\log_{10} x_n + 0.43429}$$

$$= \frac{0.43429x_n + 1.2}{\log_{10} x_n + 0.43429} \quad \dots (1)$$

Putting  $x_0 = 2$ , the first approximation is

$$\begin{aligned} x_1 &= \frac{0.43429 \times x_0 + 1.2}{\log_{10} x_0 + 0.43429} = \frac{0.43429 \times 2 + 1.2}{\log_{10} 2 + 0.43429} \\ &= \frac{0.86858 + 1.2}{0.30103 + 0.43429} = 2.81 \end{aligned}$$

Similarly putting  $n = 1, 2, 3, 4$  in (1), we get

$$\begin{aligned} x_2 &= \frac{0.43429 \times 2.81 + 1.2}{\log_{10} 2.81 + 0.43429} = 2.741 \\ x_3 &= \frac{0.43429 \times 2.741 + 1.2}{\log_{10} 2.741 + 0.43429} = 2.74065 \\ x_4 &= \frac{0.43429 \times 2.74065 + 1.2}{\log_{10} 2.74065 + 0.43429} = 2.74065 \end{aligned}$$

Clearly,

$$x_3 = x_4$$

Hence, the required root is 2.74065 correct to five decimal places.

**Ans.**

## EXERCISE 50.2

1. Using Newton-Raphson Method, find the root that lies in (0,1) of the equation  $x^3 - 6x + 4 = 0$ , correct to 4 decimal places.

[Hint: Take  $\alpha_0 = 1$ ]

**Ans.** 0.73205

2. Using Newton-Raphson Method, find one negative root of  $3x^3 + 8x^2 + 8x + 5 = 0$

[Hint: Root of  $f(-x)$ ]

**Ans.** -1.67

3. Solve:  $x^3 - 3x + 1 = 0$  (R.G.P.V., Bhopal, III Semester, Dec. 2007) **Ans.** 1.532

4. Find the real root to four decimals of the equation  $x^6 - x^4 - x^3 - 1 = 0$  lying between (1, 2).

**Ans.** 1.4036

5. Evaluate  $\sqrt[4]{12}$  to four decimal places by Newton's Iterative method. **Ans.** 3.4641

6. Derive the formula  $x_{n+1} = \frac{1}{3} \left[ 2x_n + \frac{a}{x_n^2} \right]$  used for computing successive approximation for cube root of the number  $a$ .

Use it to obtain  $\sqrt[3]{25.7}$  correct to three places of decimal.

**Ans.** 2.951

7. The value of  $N^{1/5}$ ,  $N > 0$  is to be determined numerically. Construct the Newton-Raphson scheme to find the required root. Apply it to find  $(29)^{1/5}$ , correct to three decimal places, starting with the initial approximation as 2.0. **Ans.** 1.961

8. What do you mean by convergence of the method and its importance in numerical analysis? (R.G.P.V., Bhopal, III Semester, June 2003)

9. Find by the Newton's method, correct to 6 places of decimal the root of the equation  $x \log_{10} x = 4.772393$  (R.G.P.V., Bhopal, III Semester, June 2005, Dec. 2004) **Ans.** 6.089114

10. Find by Newton-Raphson method a root of the equation

$$x \sin x + \cos x = 0$$

which is near  $x = \pi$ . (AMIEETE, June 2009)

**Ans.** 2.7985

11. Find by Newton-Raphson method a root of the equation

$$e^x = x^3 + \cos 25x \text{ which is near } x = 4.5$$

**Ans.** 4.545

12. Show that the modified Newton-Raphson method

$$x_{n+1} = x_n - \frac{2f(x_n)}{f'(x_n)}$$

gives a quadratic convergence when the equation  $f(x) = 0$  has a pair of

double root in the neighbourhood  $x = x_n$ .

13. Solve the equation  $\log x = \cos x$  to five decimal places by Newton Raphson method. **Ans.** 1.30295

14. Solve  $\tan x = 1.2 x$ .

**Ans.** 0.71

15. Find a positive root of  $2(x-3) = \log_{10} x$ .

**Ans.** 3.256

Choose the correct alternative :

16. If  $f(x) = 0$  is an algebraic equation then Newton-Raphson method is given by :

$$x_{n+1} = x_n - \frac{f(x_n)}{?}$$

(R.G.P.V., Bhopal, III Semester, June 2007)

(a)  $f(x_{n-1})$       (b)  $f'(x_{n-1})$       (c)  $f'(x_n)$       (d)  $f''(x_n)$       **Ans.** (c)

17. The order of convergence in Newton-Raphson method is :

(a) 2      (b) 3      (c) 0      (d) 1      **Ans.** (a)

(R.G.P.V., Bhopal, III Semester, Dec. 2006)

18. Newton's iterative formula to find the value of  $\sqrt{N}$  is

(a)  $x_{n+1} = \frac{1}{2} \left( x_n + \frac{1}{N x_n} \right)$       (b)  $x_{n+1} = x_n (2 - N x_n)$       **Ans.** (c)

(c)  $x_{n+1} = \frac{1}{2} \left( x_n + \frac{N}{x_n} \right)$       (d)  $x_{n+1} = \frac{x_n^2 + N}{x_n}$  (R.G.P.V., Bhopal, III Semester, Dec. 2007)

## 50.16 REGULA - FALSI METHOD OR FALSE POSITION METHOD

The oldest method for computing the real root of a numerical equation is the method of false position, or “(Regula falsi)”.

Let the root lie between  $a$  and  $b$ . These numbers  $a$  and  $b$  should be as close - together as possible. Since the root lies between  $a$  and  $b$ , the graph of  $y = f(x)$  must cross the  $x$ - axis between  $x = a$  and  $x = b$ , and  $f(a)$  and  $f(b)$  must have opposite signs.

Now since any portion of a smooth curve is practically straight line for a short distance, it is legitimate to assume that change in  $f(x)$  is proportional to change in  $x$  over a short interval. The method of False position is based on this principle, for it assumes that the graph of  $y = f(x)$  is a straight line between the points  $(x_1, y_1)$  and  $(x_2, y_2)$ , these points being on opposite sides of  $x$ -axis.

## 50.17 RULE OF FALSE POSITION (REGULA FALSI)

Let  $f(x) = 0$

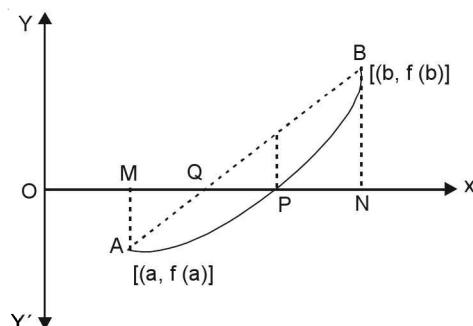

Let  $y = f(x)$  be represented by the curve  $AB$ .

The curve  $AB$  cuts the  $x$ -axis at  $P$ .

The real root of (1) is  $OP$ .

The false position of the curve  $AB$  is taken as the chord  $AB$ . The chord  $AB$  cuts the  $x$ -axis at  $Q$ . The approximate root of  $f(x) = 0$  is  $OQ$ .

By this method, we find  $OQ$ .

Let  $A [a, f(a)], B [b, f(b)]$  be the extremities of the chord  $AB$ .

The equation of the chord  $AB$  is

$$y - f(a) = \frac{f(b) - f(a)}{b - a} (x - a) \quad (\text{Two points form})$$

To find  $OQ$ , put  $y = 0$

$$\begin{aligned} 0 - f(a) &= \frac{f(b) - f(a)}{b - a} (x - a) \\ (x - a) &= \frac{-(b - a)f(a)}{f(b) - f(a)} \\ \Rightarrow x &= a + \frac{(a - b)f(a)}{f(b) - f(a)} = \frac{af(b) - af(a) + af(a) - bf(a)}{f(b) - f(a)} \\ x &= \boxed{\frac{af(b) - bf(a)}{f(b) - f(a)}} \end{aligned}$$

Repeat the above rule.

### 50.18 RATE OF CONVERGENCE OF FALSE POSITION METHOD

$$\text{Let } f(x) = 0 \quad \dots (1)$$

and  $\alpha$  is the root of (1).

If  $x_n$  be the approximate value of  $\alpha$  and  $h_n$  be error of  $x_n$  at the  $n$ th stage.

$$\begin{aligned} x_n &= \alpha + h_n & [h_{n+1} = \text{Error at } (n+1) \text{ th stage}] \\ x_{n+1} &= \alpha + h_{n+1} \text{ and } x_{n+2} = \alpha + h_{n+2} \end{aligned}$$

By False position method

$$x_{n+2} = \frac{x_n f(x_{n+1}) - x_{n+1} f(x_n)}{f(x_{n+1}) - f(x_n)} \quad \dots (2)$$

Putting the values of  $x_n$ ,  $x_{n+1}$  and  $x_{n+2}$ , we get

$$\alpha + h_{n+2} = \frac{(\alpha + h_n) f(\alpha + h_{n+1}) - (\alpha + h_{n+1}) f(\alpha + h_n)}{f(\alpha + h_{n+1}) - f(\alpha + h_n)}$$

On removing the brackets and arranging the terms on R.H.S., we get

$$= \frac{\alpha [f(\alpha + h_{n+1}) - f(\alpha + h_n)] + h_n f(\alpha + h_{n+1}) - h_{n+1} f(\alpha + h_n)}{f(\alpha + h_{n+1}) - f(\alpha + h_n)}$$

$$\alpha + h_{n+2} = \alpha + \frac{h_n f(\alpha + h_{n+1}) - h_{n+1} f(\alpha + h_n)}{f(\alpha + h_{n+1}) - f(\alpha + h_n)}$$

$$h_{n+2} = \frac{h_n f(\alpha + h_{n+1}) - h_{n+1} f(\alpha + h_n)}{f(\alpha + h_{n+1}) - f(\alpha + h_n)}$$

Expanding by Taylor's series

$$\begin{aligned} &h_n \left[ f(\alpha) + h_{n+1} f'(\alpha) + \frac{h_{n+1}^2}{2!} f''(\alpha) + \dots \right] - h_{n+1} \left[ f(\alpha) + h_n f'(\alpha) + \frac{h_n^2}{2!} f''(\alpha) + \dots \right] \\ &= \left[ f(\alpha) + h_{n+1} f'(\alpha) + \frac{h_{n+1}^2}{2!} f''(\alpha) + \dots \right] - \left[ f(\alpha) + h_n f'(\alpha) + \frac{h_n^2}{2!} f''(\alpha) + \dots \right] \end{aligned}$$

$$\begin{aligned}
h_{n+2} &= \frac{h_n \left[ 0 + h_{n+1} f'(\alpha) + \frac{h_{n+1}^2}{2!} f''(\alpha) + \dots \right] - h_{n+1} \left[ 0 + h_n f'(\alpha) + \frac{h_n^2}{2!} f''(\alpha) + \dots \right]}{\left[ 0 + h_{n+1} f'(\alpha) + \frac{h_{n+1}^2}{2!} f''(\alpha) + \dots \right] - \left[ 0 + h_n f'(\alpha) + \frac{h_n^2}{2!} f''(\alpha) + \dots \right]} \\
&= \frac{h_n h_{n+1} f'(\alpha) + h_n \frac{h_{n+1}^2}{2!} f''(\alpha) - h_{n+1} h_n f'(\alpha) - h_{n+1} \frac{h_n^2}{2!} f''(\alpha) + \dots}{h_{n+1} f'(\alpha) + \frac{h_{n+1}^2}{2!} f''(\alpha) - h_n f'(\alpha) - \frac{h_n^2}{2!} f''(\alpha) + \dots} \\
&= \frac{\frac{h_n h_{n+1}^2}{2} f''(\alpha) - \frac{h_{n+1} h_n^2}{2} f''(\alpha)}{h_{n+1} f'(\alpha) - h_n f'(\alpha)} \quad (\text{Ignoring terms of higher powers of } h) \\
&= \frac{\frac{h_n h_{n+1}}{2} [h_{n+1} - h_n] f''(\alpha)}{[h_{n+1} - h_n] f'(\alpha)} = h_n h_{n+1} \frac{f''(\alpha)}{2 f'(\alpha)} \\
h_{n+2} &= h_n h_{n+1} (c) \quad \dots (1) \quad \left[ \text{Put } \frac{f''(\alpha)}{2 f'(\alpha)} = \text{constant} = c \right]
\end{aligned}$$

To find the rate of convergence  $k$  such that

$$h_{n+1} = A h_n^k \quad [\text{A = constant of proportionality}] \quad \dots (2)$$

$$\Rightarrow h_{n+1}^{\frac{1}{k}} = A^{\frac{1}{k}} h_n$$

$$\Rightarrow h_n = A^{-\frac{1}{k}} h_{n+1}^{\frac{1}{k}} \quad \dots (3)$$

$$\text{Again, } h_{n+2} = A h_{n+1}^k \quad \dots (4)$$

Putting the values of  $h_n$  and  $h_{n+2}$  from (3) and (4) in (1), we get

$$A h_{n+1}^k = A^{-\frac{1}{k}} h_{n+1}^{\frac{1}{k}} [h_{n+1} (c)]$$

$$A h_{n+1}^k = A^{-\frac{1}{k}} h_{n+1}^{\frac{1}{k}+1} (c)$$

$$h_{n+1}^k = A^{-\left(\frac{1}{k}+1\right)} h_{n+1}^{\frac{1}{k}+1} c$$

Comparing the powers of  $h_{n+1}$  on both sides, we get

$$k = \frac{1}{k} + 1$$

$$k^2 - k - 1 = 0$$

$$k = \frac{1 \pm \sqrt{1+4}}{2} \Rightarrow k = \frac{1 \pm \sqrt{5}}{2} = \frac{1+2.2361}{2} \quad (\text{Ignoring - ve sign})$$

$$\Rightarrow k = \frac{3.2361}{2} = 1.618$$

Putting the value of  $k$  in (2), we get  $h_{n+1} = A h_n^{1.618}$

The rate of convergence in False position method is 1.618.

**Ans.**

**Example 18.** Find an approximate value of the root of the equation  $x^3 + x - 1 = 0$  near  $x = 1$ , using the method of false position (regula falsi) two times.

**Solution.**  $f(x) = x^3 + x - 1 = 0$

$$f(1) = 1 + 1 - 1 = +1$$

$$f(0.5) = (0.5)^3 + (0.5) - 1 = -0.375, \quad f(1) \cdot f(0.5) < 0$$

The root lies between 0.5 and 1.

Let

$$a = 0.5 \text{ and } b = 1$$

$$\begin{aligned} x_1 &= \frac{af(b) - bf(a)}{f(b) - f(a)} \Rightarrow x_1 = \frac{0.5f(1) - 1f(0.5)}{f(1) - f(0.5)} \\ &= \frac{0.5(1) - 1(-0.375)}{1 + 0.375} = 0.6364 \end{aligned}$$

Now

$$f(0.6364) = (0.6364)^3 + 0.6364 - 1 = -0.1059$$

$$\text{and } f(1) = 1$$

$\therefore$  Root lies between 0.6364 and 1.

$$a = 0.6364, \quad b = 1$$

$$\begin{aligned} x_2 &= \frac{0.6364f(1) - 1f(0.6364)}{f(1) - f(0.6364)} = \frac{0.6364 - 1(-0.1059)}{1 + 0.1059} \\ &= 0.6712 \end{aligned}$$

Now,

$$f(0.6712) = -0.0264 \text{ and } f(1) = 1$$

$$a = 0.6712 \text{ and } b = 1 \quad [f(0.6712) \cdot f(1) < 0]$$

$$\begin{aligned} x_3 &= \frac{0.6712f(1) - 1f(0.6712)}{f(1) - f(0.6712)} = \frac{0.6712 - (-0.0264)}{1 - (-0.0264)} \\ &= 0.6797 \end{aligned}$$

**Ans.**

**Example 19.** find a positive root of  $x^3 - 4x + 1 = 0$  by the method of false position.

(R.G.P.V., Bhopal, III Semester, June 2007)

**Solution.**

$$\text{Let } f(x) = x^3 - 4x + 1 = 0, \quad f'(x) = 3x^2 - 4$$

$$f(0) = 1, \quad f'(0) = -4$$

$$f(1) = 1 - 4 + 1 = -2$$

Since  $f(0)$  and  $f(1)$  are of opposite signs, so the root lies between 0 and 1.

By False position method

$$\begin{aligned} x &= \frac{af(b) - bf(a)}{f(b) - f(a)} \\ x_1 &= \frac{0f(1) - 1f(0)}{f(1) - f(0)} = \frac{-1}{-2 - (-1)} = \frac{1}{3} \\ f\left(\frac{1}{3}\right) &= \left(\frac{1}{3}\right)^3 - 4\left(\frac{1}{3}\right) + 1 = \frac{1}{27} - \frac{4}{3} + 1 = \frac{-8}{27} \end{aligned}$$

Since  $f\left(\frac{1}{3}\right)$  and  $f(0)$  are of opposite signs, so the root lies between  $\frac{1}{3}$  and 0.

$$x_2 = \frac{\frac{1}{3}f(0) - 0f\left(\frac{1}{3}\right)}{f(0) - f\left(\frac{1}{3}\right)} = \frac{\frac{1}{3}(1) - 0}{1 - \left(\frac{-8}{27}\right)} = \frac{9}{35}$$

$$f\left(\frac{9}{35}\right) = \left(\frac{9}{35}\right)^3 - 4\left(\frac{9}{35}\right) + 1 = \frac{729}{42875} - \frac{36}{35} + 1 = -\frac{496}{42875}$$

Since,  $f\left(\frac{9}{35}\right)$  and  $f(0)$  are of opposite signs, so the root lies between  $\frac{9}{35}$  and 0.

$$x_3 = \frac{\frac{9}{35}f(0) - 0f\left(\frac{9}{35}\right)}{f(0) - f\left(\frac{9}{35}\right)} = \frac{\frac{9}{35}(1) - 0}{1 - \left(-\frac{496}{42875}\right)} = \frac{1225}{4819}$$

Since  $\left(x_2 = \frac{9}{35} = 0.2571\right) = \left(x_3 = \frac{1225}{4819} = 0.2542\right)$  correct upto two decimal places,

so the root of the given equation is 0.25

Ans.

**Example 20.** Find the root of the equation  $x^3 - 5x - 7 = 0$  which lies between 2 and 3 by the method of false position. (R.G.P.V., Bhopal, III Semester, June 2005)

**Solution.** Here, we have

Let

$$f(x) = x^3 - 5x - 7 = 0$$

$$f(2) = 8 - 10 - 7 = -9$$

$$f(3) = 27 - 15 - 7 = +5$$

As  $f(2)$  and  $f(3)$  are of opposite signs, so the root lies between 2 and 3.

$$x_1 = \frac{af(b) - bf(a)}{f(b) - f(a)}$$

$$x_1 = \frac{2f(3) - 3f(2)}{f(3) - f(2)} = \frac{2(5) - 3(-9)}{5 - (-9)} = \frac{37}{14} = 2.6429$$

$$f(2.6429) = (2.6429)^3 - 5(2.6429) - 7 = -1.7541$$

Now,  $f(2.6429) = -1.7541$  and  $f(3) = 5$

∴ Root lies between 2.6429 and 3.

$$a = 2.6429, b = 3$$

$$x_2 = \frac{2.6429f(3) - 3f(2.6429)}{f(3) - f(2.6429)} = \frac{2.6429(5) - 3(-1.7541)}{5 - (-1.7541)} = \frac{18.4768}{6.7541} = 2.7356$$

Now,  $f(2.7356) = (2.7356)^3 - 5(2.7356) - 7 = -0.2061$

and  $f(3) = 5$

∴ Root lies between 2.7356 and 3.

$$a = 2.7356 \quad \text{and } b = 3$$

$$x_3 = \frac{2.7356f(3) - 3f(2.7356)}{f(3) - f(2.7356)} = \frac{2.7356(5) - 3(-0.2061)}{5 - (-0.2061)} = \frac{14.2963}{5.2061} = 2.7461$$

$$f(2.7461) = (2.7461)^3 - 5(2.7461) - 7 = -0.02198$$

Now,  $f(2.7461) = -0.02198$  and  $f(3) = +5$

∴ Root lies between 2.7461 and 3.

$$a = 2.7461 \text{ and } b = 3$$

$$x_4 = \frac{2.7461f(3) - 3f(2.7461)}{f(3) - f(2.7461)} = \frac{2.7461(5) - 3(-0.02198)}{5 - (-0.02198)} = \frac{13.79644}{5.02198} = 2.7472$$

Hence, the root of the given equation is 2.7472.

Ans.

**Example 21.** Find by the method of regula falsi a root of the equation  $x^3 + x^2 - 3x - 3 = 0$  lying between 1 and 2. (R.G.P.V., Bhopal, III Semester, June 2005)

**Solution.**

$$f(x) = x^3 + x^2 - 3x - 3 = 0$$

$$f(1) = 1 + 1 - 3 - 3 = -4 = -ve$$

$$f(2) = 8 + 4 - 6 - 3 = +3 = +ve$$

The root lies between 1 and 2 as  $f(1)$  is  $-ve$  and  $f(2)$  is  $+ve$ .

By Regula Falsi method

$$x_1 = \frac{1f(2)-2f(1)}{f(2)-f(1)} = \frac{1 \times 3 - 2 \times (-4)}{3 - (-4)} = \frac{11}{7} = 1.571$$

$$\begin{aligned} f(1.571) &= (1.571)^3 + (1.571)^2 - 3(1.571) - 3 \\ &= 3.877 + 2.468 - 4.713 - 3 = -1.368 = -ve \end{aligned}$$

The root lies between 1.571 and 2 as  $f(1.571)$  is  $-ve$  and  $f(2)$  is  $+ve$ .

$$x_2 = \frac{1.571f(2)-2f(1.571)}{f(2)-f(1.571)} = \frac{1.571 \times 3 - 2 \times (-1.368)}{3 - (-1.368)} = \frac{4.713 + 2.736}{4.368} = 1.705$$

$$\begin{aligned} f(1.705) &= (1.705)^3 + (1.705)^2 - 3(1.705) - 3 \\ &= 4.956 + 2.907 - 5.115 - 3 = -0.252 = -ve. \end{aligned}$$

The root lies between 1.705 and 2 as  $f(1.705)$  is  $-ve$  and  $f(2)$  is  $+ve$ .

$$x_3 = \frac{1.705f(2)-2f(1.705)}{f(2)-f(1.705)} = \frac{1.705 \times 3 - 2 \times (-0.252)}{3 - (-0.252)} = 1.728$$

**Ans.**

**Example 22.** Find the real root of the equation  $x \log_{10} x = 1.2$  by the method of false position (i.e. Regula falsi method) correct to four decimal places.

(R.G.P.V., Bhopal, III Semester, Dec. 2007, 2002)

**Solution.** Let  $f(x) = x \log_{10} x - 1.2$

$$\text{Here } f(2) = 2 \log_{10} 2 - 1.2 = -0.59794;$$

$$f(3) = 3 \log_{10} 3 - 1.2 = 0.23136$$

$\therefore$  One root lies between 2 and 3.

Taking  $a = 2$ ,  $b = 3$ ,  $f(2) = -0.59794$ ,  $f(3) = 0.23136$

By method of false position, we have

$$x_1 = \frac{af(b) - bf(a)}{f(b) - f(a)}$$

$$x_1 = \frac{2f(3) - 3f(2)}{f(3) - f(2)} = \frac{2(0.23136) - 3(-0.59794)}{(0.23136) - (-0.59794)} = 2.72102$$

$$f(2.72102) = (2.72102) \log_{10} 2.72102 - 1.2 = -0.01709$$

Since,  $f(2.72102)$  and  $f(3)$  are of opposite sign, so the root lies between 2.72102 and 3.

$$x_2 = \frac{2.72102f(3) - 3f(2.72102)}{f(3) - f(2.72102)} = \frac{2.72102(0.23136) - 3(-0.01709)}{0.23136 - (-0.01709)} = 2.74021$$

Now,  $f(2.74021) = -0.00038$ .

Since  $f(2.74021)f(3) < 0$ , so the root lies between 2.74021 and 3.

$$x_3 = \frac{2.74021f(3) - 3f(2.74021)}{f(3) - f(2.74021)} = \frac{2.74021(0.23136) - 3(-0.00038)}{(0.23136) - (-0.00038)} = 2.74064$$

Again  $f(2.74064) = -0.00001$  and  $f(3) = 0.23136$

Since  $f(2.7406) f(3) < 0$ , so the root lies between 2.74064 and 3.

$$x_4 = \frac{2.74064 f(3) - 3 f(2.74064)}{f(3) - f(2.74064)} = \frac{2.74064(0.23136) - 3(-0.00001)}{0.23136 - (-0.00001)} = 2.74065$$

Hence, the root correct to four decimal places is 2.7407.

**Ans.**

### EXERCISE 50.3

Solve the following equations by Regula falsi method :

1.  $x^3 - 2x - 5 = 0$  **Ans.** 2.0946
2.  $x^3 - 10x^2 + 40x - 35 = 0$  **Ans.** 1.1875
3.  $x^3 - 9x + 1 = 0$  (Root between 2 & 3) **Ans.** 2.9428
4.  $x^3 - 3x + 1 = 0$  **Ans.** 1.532 (*R.G.P.V., Bhopal, III Semester, Dec. 2001*)
5. Use the method of false position to find the root of the equation  $x^3 - 18 = 0$ , given that it lies between 2 and 3. Write down three steps of the procedure. **Ans.** 2.621
6. Find the root of the equation  $\tan x + \tanh x = 0$  which lies in the interval (1.6, 3.0) correct to four significant digits using any one of the numerical methods. **Ans.** 2.365 app.
7.  $2x - \log x = 6$  **Ans.** 3.257
8.  $xe^x = \cos x$  **Ans.** 0.5177
9.  $xe^x = \sin x$  **Ans.** -0.134
10.  $xe^x = 2$  **Ans.** 0.853
11.  $x \sin x + \cos x = 0$  (near  $x = \pi$ ) **Ans.** 2.7985
12.  $x = \tan x$  near  $x = 4.5$  **Ans.** 4.43464
13. Regular-Falsi method requires \_\_\_\_\_ initial approximation to the root.  
 (a) 1      (b) 2      (c) 3      (d) None of above (*AMIETE, Dec. 2010*) **Ans.** (b)

### 50.19 SECANT METHOD (CHORD METHOD)

This method is quite similar to that of False position method and it is improved method over Regula Falsi method. Here it is not necessary to fulfill the condition  $f(x_1) f(x_2) < 0$ .

Here the graph of  $f(x)$  is approximated by a secant line (Chord). The root may or may not lie in the interval  $[a, b]$

$$\begin{aligned} \frac{af(b) - bf(a)}{f(b) - f(a)} &= x_1 \\ \frac{bf(x_1) - x_1 f(b)}{f(x_1) - f(b)} &= x_2 \\ \frac{x_1 f(x_2) - x_2 f(x_1)}{f(x_2) - f(x_1)} &= x_3 \end{aligned}$$

Apply the formula in the following way

I Time	$\left[ \begin{array}{c} a \\ b \end{array} \right]$	II Time
III Time	$\left[ \begin{array}{c} x_1 \\ x_2 \end{array} \right]$	IV Time
V Time	$\left[ \begin{array}{c} x_3 \\ x_4 \end{array} \right]$	and so on

If  $f(x_{n-1}) = f(x_n)$  then the method fails. But the rate of convergence in secant method is greater than that of Regula Falsi.

**Example 23.** Given the equation  $x^4 - x - 10 = 0$ , determine the initial approximations for finding its smallest positive root. Use these to find the root correct to three decimal places with Secant method.

**Solution.** Let  $f(x) = x^4 - x - 10 = 0$

$$\text{Here } f(1) = 1 - 1 - 10 = -10, \quad a = 1$$

$$f(2) = 16 - 2 - 10 = +4, \quad b = 2$$

By Secant Method

$$x_1 = \frac{af(b) - bf(a)}{f(b) - f(a)}$$

$$x_1 = \frac{1f(2) - 2f(1)}{f(2) - f(1)} = \frac{1(4) - 2(-10)}{4 - (-10)} = \frac{24}{14} = \frac{12}{7} = 1.71429$$

$$f(1.71429) = (1.71429)^4 - (1.71429) - 10 = 8.63649 - 1.71429 - 10 = -3.0778$$

Taking  $a = 2, b = 1.71429,$

$$x_2 = \frac{1.71429f(2) - 2f(1.71429)}{f(2) - f(1.71429)} = \frac{1.71429(4) - 2(-3.0778)}{(4) - (-3.0778)} = \frac{13.01276}{7.0778} = 1.83853$$

$$f(1.83853) = (1.83853)^4 - (1.83853) - 10 = -0.41283$$

Taking  $a = 1.71429, b = 1.83853,$

$$x_3 = \frac{1.83853f(1.71429) - 1.71429f(1.83853)}{f(1.71429) - f(1.83853)}$$

$$= \frac{1.83853(-3.0778) - 1.71429(-0.41283)}{-3.0778 - (-0.41283)} = \frac{-4.95092}{-2.66497} = 1.85778$$

$$f(1.85778) = (1.85778)^4 - (1.85778) - 10 = 0.05401$$

Taking  $a = 1.83853, b = 1.85778$

$$x_5 = \frac{1.85778f(1.83853) - 1.83853f(1.85778)}{f(1.83853) - f(1.85778)}$$

$$= \frac{1.85778(-0.41283) - 1.83853(0.05401)}{(-0.41283) - 0.05401} = \frac{-0.86625}{-0.46684} = 1.85561$$

$$f(1.85561) = (1.85561)^4 - (1.85561) - 10 = 11.85623 - 1.85561 - 10 = 0.00062$$

Taking  $a = 1.85778$  and  $b = 1.85561,$

$$x_6 = \frac{1.85561f(1.85778) - 1.85778f(1.85561)}{f(1.85778) - f(1.85561)}$$

$$= \frac{1.85561(0.05401) - 1.85778(0.00062)}{0.05401 - 0.00062} = \frac{0.099064}{0.05339} = 1.85558$$

$$x_5 = x_6$$

Hence, the root of the given equation is 1.8556

Ans.

**Example 24.** Two approximations to a real root of the equation  $\cos x - x^2 - x = 0$  are  $-1.5$  and  $-1.4$ . Use two iterations of the Secant method to find the root (use four decimals arithmetic).

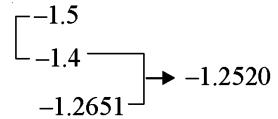

**Solution.** Here,  $a = -1.5, \quad b = -1.4$

$$f(a) = f(-1.5) = \cos(-1.5) - (-1.5)^2 + 1.5 = -0.6793$$

$$f(b) = f(-1.4) = \cos(-1.4) - (-1.4)^2 + 1.4 = -0.3900$$

By Secant method

$$\begin{aligned}
 x_1 &= \frac{a f(b) - b f(a)}{f(b) - f(a)} \\
 x_1 &= \frac{-1.5 f(-1.4) - (-1.4) f(-1.5)}{f(-1.4) - f(-1.5)} \\
 &= \frac{-1.5(-0.3900) - (-1.4)(-0.6793)}{(-0.3900) - (-0.6793)} \\
 &= \frac{0.5850 - 0.9510}{0.2893} = \frac{-0.3660}{0.2893} = -1.2651 \\
 f(x_2) &= f(-1.2651) = \cos(-1.2651) - (-1.2651)^2 + 1.2651 = -0.0344
 \end{aligned}$$

Taking  $a = -1.4$ ,  $b = -1.2651$

$$\begin{aligned}
 x_2 &= \frac{-1.4 f(-1.2651) - (-1.2651) f(-1.4)}{f(-1.2651) - f(-1.4)} = \frac{-1.4(-0.0344) - (-1.2651)(-0.3900)}{(-0.0344) - (-0.3900)} \\
 &= \frac{0.04816 - 0.4934}{0.3556} = \frac{-0.44524}{0.3556} = -1.2520
 \end{aligned}$$

Hence, the root of the given equation is  $-1.2520$

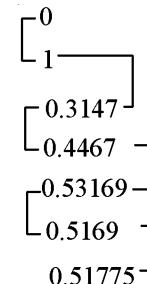

**Ans.**

**Example 25.** Find the root of the equation  $x e^x = \cos x$  using Secant method to four decimal places.

**Solution.** Let  $f(x) = \cos x - x e^x = 0$

Taking the initial approximate root  $a = 0$ ,  $b = 1$

$$\begin{aligned}
 f(0) &= 1 - 0 = +1, \quad a = 0, \quad b = 1 \\
 f(1) &= \cos 1 - e = 0.5403 - 2.7183 = -2.178
 \end{aligned}$$

By Secant method

$$\begin{aligned}
 x_1 &= \frac{a f(b) - b f(a)}{f(b) - f(a)} = \frac{(0) f(1) - 1 f(0)}{f(1) - f(0)} \\
 x_1 &= \frac{0(-2.178) - 1(1)}{-2.178 - 1} = \frac{-1}{-3.178} = 0.3147
 \end{aligned}$$

Taking  $a = 1$ ,  $b = 0.3147$ ,

$$x_2 = \frac{1 f(0.3147) - (0.3147) f(1)}{f(0.3147) - f(1)} = \frac{0.5198 - (0.3147)(-2.178)}{0.5198 - (-2.178)} = 0.4467$$

Taking  $a = 0.3147$ ,  $b = 0.4467$

$$\begin{aligned}
 x_3 &= \frac{0.3147 f(0.4467) - 0.4467 f(0.3147)}{f(0.4467) - f(0.3147)} \\
 &= \frac{0.3147(0.2036) - 0.4467(0.5198)}{0.2036 - (0.5198)} = 0.53169
 \end{aligned}$$

Similarly,  $x_4 = 0.5169$ ,  $x_5 = 0.51775$ ,  $x_6 = 0.51776$

Hence, the correct root is 0.5178 correct to four places of decimal.

**Ans.**

**EXERCISE 50.4**

Solve the following equations by secant method correct to three decimal places:

- |  |                     |                       |                          |
|--|---------------------|-----------------------|--------------------------|
| 1. $x^3 + x^2 + x + 7 = 0$                         | <b>Ans.</b> - 2.063 | 2. $x^3 - 4x - 9 = 0$ | <b>Ans.</b> 2.707        |
| 3. $x^5 - x^4 - x^3 - 1 = 0$                       | <b>Ans.</b> 1.737   | 4. $x e^x = 1$        | <b>Ans.</b> 0.567        |
| 5. The rate of convergence of the Secant method is |                     |                       |                          |
| (a) 1.84   | (b) 2               | (c) 1.5               | (d) 1.62 <b>Ans.</b> (a) |

**50.20 ITERATION METHOD**

Consider the equation  $f(x) = 0$  ... (1)

We rewrite the equation in the form

$$x = \phi(x) \quad \dots (2)$$

Let us draw two curves

$$y = x \text{ and } y = \phi(x)$$

The point of intersection of two curves is the root of (1).

Let  $x = x_0$  be an initial approximate root, then first approximation  $x_1$  is found by

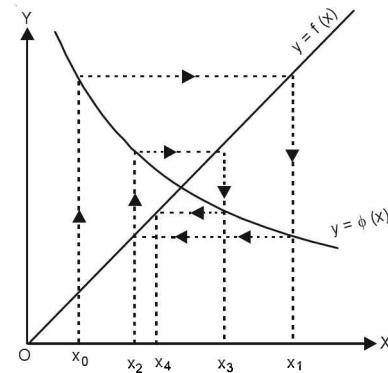

$$x_1 = \phi(x_0)$$

Now taking  $x_1$  as initial value,  $x_2$  second approximation is given by

$$x_2 = \phi(x_1) \text{ and so on.}$$

$$x_{n+1} = \phi(x_n)$$

This is also known as successive approximation method.

**50.21 TEST FOR CONVERGENCE**

For convergence it is convenient to identify an interval that contains the root and for which  $\phi'(x)$  has small magnitude.

$$x = \phi(x)$$

$$\alpha = \phi(\alpha) \quad \dots (1)$$

$$x_n = f(x_{n-1}) \quad \dots (2)$$

Subtracting (1) from (2), we have

$$x_n - \alpha = \phi(x_{n-1}) - \phi(\alpha) \quad \dots (3)$$

By Mean value theorem

$$\frac{\phi(x_{n-1}) - \phi(\alpha)}{x_{n-1} - \alpha} = \phi'(\xi), \text{ where } x_{n-1} < \xi < \alpha \quad \dots (4)$$

Substituting the value of  $\phi(x_{n-1}) - \phi(\alpha)$  from (4) in (3), we get

$$x_n - \alpha = (x_{n-1} - \alpha) \phi'(\xi)$$

$$|x_n - \alpha| \leq k |x_{n-1} - \alpha| \quad [\text{If } \phi'(x_i) \leq k < 1 \text{ for all } i] \quad \dots (5)$$

$$\text{Similarly, } |x_{n-1} - \alpha| \leq k |x_{n-2} - \alpha| \quad \dots (6)$$

Putting the value of  $|x_{n-1} - \alpha|$  from (6) in (5), we have

$$|x_n - \alpha| \leq k^2 |x_{n-2} - \alpha|$$

.....

$$|x_n - \alpha| \leq k^n |x_0 - \alpha|$$

$$|x_n - \alpha| = 0 \quad \left[ \lim_{n \rightarrow \infty} k^n = 0 \right]$$

So, the approximation converges by this method.

**Note.** 1. The rate of convergence is more if the value of  $\phi'(x)$  is smaller.

2. For real roots, the method is very useful.

**Remember.** The equation  $f(x) = 0$  is written as  $x = \phi(x)$ .

This form  $x = \phi(x)$  can be chosen in many ways. We have to choose  $\phi(x)$  in such a way that initial approximation  $x_0$  should satisfy the condition  $|\phi'(x_0)| < 1$ .

Then  $x_0, x_1, x_2, \dots, x_n$  converge to the root  $\alpha$  of the equation  $f(x) = 0$ .

**Example 26.** Apply the iterative method to find the real roots of  $x^3 + x^2 - 1 = 0$ , assuming the initial approximation is as  $x_0 = 0.8$ .

**Solution.** Let  $f(x) = x^3 + x^2 - 1 = 0$  ... (1)

Equation (1) can be written as  $x = \phi(x)$  in many ways

$$\begin{aligned} \text{i.e. (i)} \quad x^3 &= 1 - x^2 \Rightarrow x = (1-x^2)^{\frac{1}{3}}, \quad \text{Here } \phi(x) = (1-x^2)^{\frac{1}{3}} \\ \Rightarrow \phi'(x) &= \frac{1}{3}(1-x^2)^{-\frac{2}{3}}(-2x) \Rightarrow |\phi'(0.8)| = 1.05 > 1, \end{aligned}$$

Which does not satisfy the condition.

$$\text{(ii)} \quad x^2 = 1 - x^3 \Rightarrow x = (1-x^3)^{\frac{1}{2}}.$$

$$\text{Here } \phi(x) = (1-x^3)^{\frac{1}{2}}$$

$$\Rightarrow \phi'(x) = \frac{1}{2}(1-x^3)^{-\frac{1}{2}}(-3x^2) \Rightarrow |\phi'(0.8)| = 1.37 > 1$$

Again it also does not satisfy the condition.

$$\text{(iii)} \quad x^3 + x^2 - 1 = 0 \Rightarrow x^2(x+1) = 1 \Rightarrow x^2 = \frac{1}{1+x} \Rightarrow x = \frac{1}{\sqrt{1+x}}$$

$$\text{Here, } \phi(x) = \frac{1}{\sqrt{1+x}}$$

$$\Rightarrow \phi'(x) = -\frac{1}{2}(1+x)^{-\frac{3}{2}} \Rightarrow |\phi'(0.8)| = 0.2 < 1$$

Which satisfies the condition.

By Iterative method

$$x = \phi(x) \Rightarrow x = \frac{1}{\sqrt{1+x}} \quad \dots (2)$$

On putting the initial approximation  $x_0 = 0.8$  in (2), we get

$$x_1 = \frac{1}{\sqrt{1+0.8}} = 0.7454$$

Again putting  $x_1 = 0.7454$  in (2), we have

$$x_2 = \frac{1}{\sqrt{1+0.7454}} = 0.7569$$

Similarly, putting the successive values of  $x$  (approximate root) in (2), we obtain

$$x_3 = \frac{1}{\sqrt{1+0.7569}} = 0.7544$$

$$x_4 = \frac{1}{\sqrt{1+0.7544}} = 0.7550, \quad x_5 = \frac{1}{\sqrt{1+0.7550}} = 0.7549$$

$$x_6 = \frac{1}{\sqrt{1+0.7549}} = 0.7549 \quad x_7 = \frac{1}{\sqrt{1+0.7549}} = 0.7549$$

Since  $x_6 = x_7$ , so the correct root of the given equation is 0.7549

**Ans.**

**Example 27.** Find a real root of  $2x - \log_{10} x = 7$  correct to three decimal places using iteration method. (R.G.P.V., Bhopal, III Semester, Dec. 2006)

**Solution.** The given equation is

$$2x - \log_{10} x = 7$$

which can be written as

$$x = \frac{1}{2} (\log_{10} x + 7)$$

$$\text{Here, } \phi(x) = \frac{1}{2} (\log_{10} x + 7) \quad \dots (1)$$

$$\text{Let } x_0 = 3.8$$

Putting the value of  $x = 3.8$  in (1), we get

$$x_1 = \frac{1}{2} (\log_{10} 3.8 + 7) = 3.79$$

On putting  $x = 3.79$  in (1), we get

$$x_2 = \frac{1}{2} (\log_{10} 3.79 + 7) = 3.7893$$

Again putting  $x = 3.7893$  in (1), we get

$$x_3 = \frac{1}{2} (\log_{10} 3.7893 + 7) = 3.7893$$

Since  $x_2 = x_3$ , the root of the given equation is 3.7893. **Ans.**

**Example 28.** Apply iterative scheme method to find the real root of  $x e^x = 1$ , correct to three decimals, assuming the initial approximation as  $x_0 = 0.5$ .

**Solution.**

The condition for the convergence of the iterative scheme is

$$|\phi'(x_k)| < 1.$$

$$\text{Here } x e^x = 1 \Rightarrow x = e^{-x} \quad \dots (1)$$

$$\Rightarrow \phi(x) = e^{-x}$$

Putting  $x = 0.5$  in (1), we get

$$x_1 = e^{-0.5} = 0.6065$$

Again putting  $x = 0.6065$  in (1), we have

$$x_2 = e^{-0.6065} = 0.5453$$

Similarly putting the successive values of  $x$  in (1), we get

$$x_3 = e^{-0.5453} = 0.5797$$

$$x_4 = e^{-0.5797} = 0.5601$$

$$x_5 = e^{-0.5601} = 0.5712$$

$$x_6 = e^{-0.5712} = 0.5648$$

$$x_7 = e^{-0.5648} = 0.5685$$

$$x_8 = e^{-0.5685} = 0.5664$$

$$\begin{cases} \phi'(x) = -e^{-x} \\ \phi'(0.5) = -e^{-0.5} \\ \quad = -0.6065 \\ |\phi'(0.5)| < 1 \end{cases}$$

$$x_9 = e^{-0.5664} = 0.5676$$

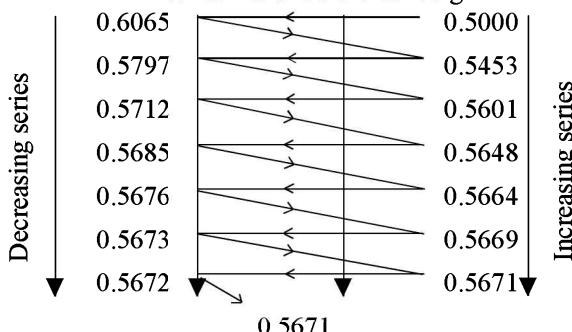

$$x_{10} = e^{-0.5676} = 0.5669$$

$$x_{11} = e^{-0.5669} = 0.5673$$

$$x_{12} = e^{-0.5673} = 0.5671$$

$$x_{13} = e^{-0.5671} = 0.5672$$

The above iterates are written to show the convergence of the iterates.

**Ans.**

**Example 29.** The number of positive real roots of the equation  $e^x = 2 \sin x$

- (a) zero      (b) 1      (c) 2      (d) infinitely many

**Solution.**  $e^x - 2 \sin x = 0$  ... (1)  
 (+ ve) (- ve)

On putting positive value of  $x$  in (1) we get one change in sign from +ve to -ve, so there is only one real positive root

**Ans. (b)**

### EXERCISE 50.5

Solve the following equations by Iteration method :

1.  $1 + \log x = \frac{x}{2}$  **Ans.** 5.36

2.  $\sin x = \frac{x+1}{x-1}$  [Hint. Approximate root = - 5.5] **Ans.** - 5.5174

3.  $e^{-x} - \sin x = 0$  **Ans.** 0.61413

4. Use the method of iteration to find a root, near 2 of the equation  $x^3 = x^2 + x - 1$ . Carry out 5 iterations. **Ans.** 0.8408

5.  $x^3 + x^2 - 100 = 0$  **Ans.** 4.3311      6.  $x = \frac{1}{2} + \sin x$  **Ans.** 1.4973

7.  $\tan x = x$  **Ans.** 4.4346      8. Find  $\sqrt{30}$  by using iterative process. **Ans.** 5.47722

# CHAPTER 51

# **SIMULTANEOUS LINEAR EQUATIONS**

## **(Crout Method, Gauss Seidel Method)**

## 51.1 INTRODUCTION

We have already solved simultaneous equations of two or three unknowns. When the number of unknowns in simultaneous equations is large, then it becomes tedious to solve them by the known methods. Simultaneous equations of large number of unknowns are very important in the field of science and engineering. Now, we will use the following methods to solve such simultaneous equations.

## 1. Direct method

## 2. Iterative method

- (a) Jacobi method
  - (b) Gauss-seidel method

## 51.2 GAUSS ELIMINATION METHOD

In this method the unknowns of equations below are eliminated and the system is reduced to an upper triangular system. The unknowns are obtained by back substitution.

Let a system of simultaneous equations in  $n$  unknowns  $x_1, x_2, \dots, x_n$  be

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1 \quad \dots (1)$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2 \quad \dots (2)$$

$z_1 \quad 1 \quad z_2 \quad z \quad \dots \quad z_n \quad n \quad z$

.....

$$a - x + a - x + \dots + a - x = b$$

**Method to solve the above equations**

**Step 1.** We eliminate  $x_1$  from 2nd, 3rd ...

$$+ a_{12} x_2 + \dots + a_{1n} x_n = b_1$$

$$a'_1 x_1 + \dots + a'_n x_n = b'_1$$

$$a' - x + \dots + a' - x = b'$$

**Step 2.** We again eliminate  $x_1$  from 3rd, 4th ...  $n$ th equation with the help of second equation

$$q_1 x_1 + q_2 x_2 + q_3 x_3 + \dots + q_n x_n = b.$$

$$a_{12}x_2 + a_{13}x_3 + \dots + a_{1n}x_n = b_1 \\ a'_1x_1 + a'_2x_2 + \dots + a'_nx_n = b_1'$$

$$a_{23}'' x_3 + \dots + a_{2n}'' x_n = b_2''$$

$$\dots \dots \dots \dots \dots$$

$$a''_{n3}x_3 + \dots + a''_{nn}x_n = b''_n$$

In the third step we will eliminate  $x_3$  and in fourth step  $x_4$  and so on.

Finally the system of equations will be of the following form.

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{22}x_2 + \dots + a'_{2n}x_n &= b'_2 \end{aligned}$$

$$\dots \dots \dots$$

$$c_{nn}x_n = d_n$$

The given system is reduced to the above form i.e. triangular form.

### Backward Substitution

We first find out the value of  $x_n$  from the last equation, then substitute the value of  $x_n$  in the  $(n-1)$ th equation to get the value of  $x_{n-1}$ . Again substitute the value of  $x_{n-1}$  in  $(n-2)$ th equation to get the value of  $x_{n-2}$ . By this backward substitution we can find the values of all the unknowns.

**Example 1.** Solve the following equations by using Gauss-elimination method :

$$\begin{aligned} 2x_1 + 4x_2 + x_3 &= 3 \\ 3x_1 + 2x_2 - 2x_3 &= -2 \\ x_1 - x_2 + x_3 &= 6 \end{aligned}$$

(R.G.P.V. Bhopal, III Semester, June 2006)

**Solution.** Third equation is written as first equation, the system becomes as

$$x_1 - x_2 + x_3 = 6 \quad \dots (1)$$

$$2x_1 + 4x_2 + x_3 = 3 \quad \dots (2)$$

$$3x_1 + 2x_2 - 2x_3 = -2 \quad \dots (3)$$

**Step 1.** Subtracting 2 (1) from (2), and 3 (1) from (3), we get

$$x_1 - x_2 + x_3 = 6 \quad \dots (1)$$

$$6x_2 - x_3 = -9 \quad \dots (4)$$

$$5x_2 - 5x_3 = -20 \quad \dots (5)$$

**Step 2.** Operate  $\frac{6}{5}(5) - (4)$

$$x_1 - x_2 + x_3 = 6 \quad \dots (1)$$

$$6x_2 - x_3 = -9 \quad \dots (6)$$

$$-5x_3 = -15 \quad \dots (7)$$

**Step 3.** Backward substitution

$$\text{From (7), } x_3 = \frac{-15}{-5} = 3$$

$$\text{From (6), } 6x_2 - 3 = -9 \Rightarrow 6x_2 = -6 \Rightarrow x_2 = -1$$

$$\text{From (1), } x_1 - (-1) + 3 = 6 \Rightarrow x_1 = 6 - 3 - 1 = 2$$

$$\text{Hence, } x_1 = 2, x_2 = -1, x_3 = 3$$

**Ans.**

### EXERCISE 51.1

Solve the following system by Gauss elimination method.

$$1. \quad x - y + z = 1, \quad -3x + 2y - 3z = -6, \quad 2x - 5y + 4z = 5$$

$$\text{Ans. } x = -2, y = 3, z = 6$$

$$2. \quad x + 10y + z = 12, \quad x + y + 10z = 12, \quad 10x + y + z = 12$$

$$\text{Ans. } x = 1, y = 1, z = 1$$

3.  $x - 2y + 9z = 8, \quad 2x - 8y + z = -5, \quad 3x + y - z = 3$  **Ans.**  $x = 1, y = 1, z = 1$   
 4.  $x + 3y + 10z = 23.89, \quad 2x + 17y + 4z = 34.84, \quad 28x + 4y - z = 31.88$

**Ans.**  $x = 0.99, y = 1.50, z = 1.84$

5.  $2x + 6y - z = -11.98, \quad 5x - y + z = 11.01, \quad 4x - y + 3z = 10.01$  **Ans.**  $x = 1.64, y = -2.49, z = 0.32$

(R.G.P.V. Bhopal, III Semester, Dec. 2007)

6.  $x_1 + 2x_2 + 3x_3 + 4x_4 = 32, \quad 2x_1 - x_2 + 2x_3 - x_4 = 3, \quad 3x_1 + 2x_2 + 4x_3 - x_4 = 17.7$   
 $8x_1 + 7x_2 + 8x_3 - 5x_4 = 30$

### 51.3 GAUSS- JORDAN METHOD

This is modification of the Gauss elimination method.

By this method we eliminate unknowns not only from the equations below but also from the equations above. In this way the system is reduced to a diagonal matrix.

Finally each equation consists of only one unknown and thus, we get the solution. Here, the labour of backward substitution for finding the unknowns is saved.

Gauss-Jordan method is modification of Gauss elimination method.

**Example 2.** Apply Gauss-Jordan method to solve the equations :

$$\begin{aligned} x + y + z &= 9 \\ 2x - 3y + 4z &= 13 \\ 3x + 4y + 5z &= 40 \end{aligned}$$

(R.G.P.V. Bhopal, III Semester, Dec. 2007)

**Solution.** The following system of linear equations can be written in matrix form:

By using Gauss Jordan method we have

$$\begin{aligned} \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 9 \\ 2 & -3 & 4 & 13 \\ 3 & 4 & 5 & 40 \end{array} \right] &\Rightarrow \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 9 \\ 0 & -5 & 2 & -5 \\ 0 & 1 & 2 & 13 \end{array} \right] R_2 \rightarrow R_2 - 2R_1 \\ \Rightarrow \left[ \begin{array}{ccc|c} 1 & 1 & 1 & 9 \\ 0 & -5 & 2 & -5 \\ 0 & 0 & \frac{12}{5} & 12 \end{array} \right] R_3 \rightarrow R_3 + \frac{1}{5}R_2 &\Rightarrow \left[ \begin{array}{ccc|c} 1 & 0 & \frac{7}{5} & 8 \\ 0 & -5 & 2 & -5 \\ 0 & 0 & \frac{12}{5} & 12 \end{array} \right] R_1 \rightarrow R_1 - \frac{7}{12}R_3 \\ \Rightarrow \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 1 \\ 0 & -5 & 0 & -15 \\ 0 & 0 & \frac{12}{5} & 12 \end{array} \right] R_2 \rightarrow R_2 - \frac{5}{6}R_3 &\Rightarrow \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 3 \\ 0 & 0 & 1 & 5 \end{array} \right] R_2 \rightarrow -\frac{1}{5}R_2 \\ &\Rightarrow \left[ \begin{array}{ccc|c} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 3 \\ 0 & 0 & 1 & 5 \end{array} \right] R_3 \rightarrow \frac{5}{12}R_3 \end{aligned}$$

Hence,  $x = 1, y = 3, z = 5$

### EXERCISE 51.2

Solve the following system by Gauss Jordan method.

1.  $2x - 6y + 8z = 24, \quad 5x + 4y - 3z = 2, \quad 3x + y + 2z = 16$  **Ans.**  $x = 1, y = 3, z = 5$   
 2.  $x + 2y + z = 8, \quad 2x + 3y + 4z = 20, \quad 4x + 3y + 2z = 16$  **Ans.**  $x = 1, y = 2, z = 3$   
 3.  $3x + 4y + 5z = 18, \quad 2x - y + 8z = 13, \quad 5x - 2y + 7z = 20$  **Ans.**  $x = 3, y = 1, z = 1$

4.  $2x - y + 3z = 9, \quad x + y + z = 6, \quad x - y + z = 2 \quad \text{Ans. } x = 1, \quad y = 2, \quad z = 3$   
 5.  $10x + y + 2z = 13, \quad 3x + 10y + z = 14, \quad 2x + 3y + 10z = 15 \quad \text{Ans. } x = 1, \quad y = 1, \quad z = 1$   
 $(R.G.P.V., Bhopal, III Semester, June 2002)$   
 6.  $2x_1 + 2x_2 + x_3 = 6, \quad 4x_1 + 2x_2 + 3x_3 = 4, \quad x_1 + x_2 + x_3 = 0 \quad \text{Ans. } x_1 = 5, \quad x_2 = 1, \quad x_3 = -6$   
 $(R.G.P.V., Bhopal, M.C.A. June 2001)$

## 51.4 FACTORISATION OF A MATRIX

A square matrix A can be factorized into the lower triangular and Upper triangular matrices

$$A = LU$$

If all the principal minors of A are non singular

$$a_{11} \neq 0, \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} \neq 0, \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \neq 0$$

$$\begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

or

$$\begin{bmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{bmatrix} \begin{bmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

$$\begin{bmatrix} 1 & \frac{1}{2} & \frac{1}{3} \\ \frac{1}{2} & \frac{1}{3} & \frac{1}{4} \\ \frac{1}{3} & \frac{1}{4} & \frac{1}{5} \end{bmatrix}$$

**Example 3.** Obtain the LU decomposition of the matrix

$$\text{Solution. Let } \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & \frac{1}{2} & \frac{1}{3} \\ \frac{1}{2} & \frac{1}{3} & \frac{1}{4} \\ \frac{1}{3} & \frac{1}{4} & \frac{1}{5} \end{bmatrix}$$

$$\begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12} + l_{22} & l_{21}u_{13} + l_{22}u_{23} \\ l_{31} & l_{31}u_{12} + l_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} \end{bmatrix} = \begin{bmatrix} 1 & \frac{1}{2} & \frac{1}{3} \\ \frac{1}{2} & \frac{1}{3} & \frac{1}{4} \\ \frac{1}{3} & \frac{1}{4} & \frac{1}{5} \end{bmatrix}$$

Equating the corresponding elements of equal matrices, we get

$$\begin{aligned} l_{11} &= 1 & l_{11}u_{12} &= \frac{1}{2} & l_{11}u_{13} &= \frac{1}{3} \\ l_{21} &= \frac{1}{2} & l_{21}u_{12} + l_{22} &= \frac{1}{3} & l_{21}u_{13} + l_{22}u_{23} &= \frac{1}{4} \end{aligned}$$

$$l_{31} = \frac{1}{3} \quad l_{31} u_{12} + l_{32} = \frac{1}{4} \quad l_{31} u_{13} + l_{32} u_{23} + l_{33} = \frac{1}{5}$$

We solve the above equations in the following order

### First Column / Row

$$l_{11} = 1, \quad l_{21} = \frac{1}{2}, \quad l_{31} = \frac{1}{3}$$

**First Row / Column**  $l_{11} u_{12} = \frac{1}{2} \Rightarrow (1) u_{12} = \frac{1}{2} \Rightarrow u_{12} = \frac{1}{2}$

$$l_{11} u_{13} = \frac{1}{3} \Rightarrow (1) u_{13} = \frac{1}{3} \Rightarrow u_{13} = \frac{1}{3}$$

**Second Column/Row**  $l_{21} u_{12} + l_{22} = \frac{1}{3} \Rightarrow \left(\frac{1}{2}\right)\left(\frac{1}{2}\right) + l_{22} = \frac{1}{3} \Rightarrow l_{22} = \frac{1}{12}$

$$l_{31} u_{12} + l_{32} = \frac{1}{4} \Rightarrow \left(\frac{1}{3}\right)\left(\frac{1}{2}\right) + l_{32} = \frac{1}{4} \Rightarrow l_{32} = \frac{1}{12}$$

**Second Row/Column**  $l_{21} u_{13} + l_{22} u_{23} = \frac{1}{4} \Rightarrow \left(\frac{1}{2}\right)\left(\frac{1}{3}\right) + \left(\frac{1}{12}\right)u_{23} = \frac{1}{4} \Rightarrow u_{23} = 1$

**Third column /Row**  $l_{31} u_{13} + l_{32} u_{23} + l_{33} = \frac{1}{5}$

$$\Rightarrow \left(\frac{1}{3}\right)\left(\frac{1}{3}\right) + \left(\frac{1}{12}\right)(1) + l_{33} = \frac{1}{5} \Rightarrow l_{33} = \frac{1}{180}$$

On substituting the values of  $l_{rs}$  and  $u_{rs}$  in (1), we get

$$\begin{bmatrix} 1 & 0 & 0 \\ \frac{1}{2} & \frac{1}{12} & 0 \\ \frac{1}{3} & \frac{1}{12} & \frac{1}{180} \end{bmatrix} \begin{bmatrix} 1 & \frac{1}{2} & \frac{1}{3} \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & \frac{1}{2} & \frac{1}{3} \\ \frac{1}{2} & \frac{1}{3} & \frac{1}{4} \\ \frac{1}{3} & \frac{1}{4} & \frac{1}{5} \end{bmatrix}$$

### 51.5 CROUTS – TRIANGULARISATION METHOD

This method is also called as decomposition method. The coefficients matrix A of the system  $AX = B$  is decomposed or factorised as the product of lower triangular matrix L and an upper triangular matrix U. This method is based on the fact that every square matrix A is the product of a lower triangular matrix and an upper triangular matrix.

#### Method

Consider the following equations :

$$\begin{aligned} a_{11} x_1 + a_{12} x_2 + a_{13} x_3 &= b_1 \\ a_{21} x_1 + a_{22} x_2 + a_{23} x_3 &= b_2 \\ a_{31} x_1 + a_{32} x_2 + a_{33} x_3 &= b_3 \end{aligned}$$

These equations are written in the matrix form as

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} \quad \dots (1)$$

$$AX = B$$

Now, let  $A = LU$

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} \dots (2)$$

Multiplying the matrices on R.H.S., we get

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} = \begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12} + l_{22} & l_{21}u_{13} + l_{22}u_{23} \\ l_{31} & l_{31}u_{12} + l_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} \end{bmatrix}$$

Equating corresponding elements from both sides, we get

$$\begin{array}{lcl} l_{11} = a_{11} & l_{11}u_{12} = a_{12} & l_{11}u_{13} = a_{13} \\ l_{21} = a_{21} & l_{21}u_{12} + l_{22} = a_{22} & l_{21}u_{13} + l_{22}u_{23} = a_{23} \\ l_{31} = a_{31} & l_{31}u_{12} + l_{32} = a_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} = a_{33} \end{array}$$

We solve these equations in the following order

**Step 1.** Solve equations in I column.

**Step 2.** Solve equations in I row.

**Step 3.** Solve equations in II column.

**Step 4.** Solve equations in II row.

**Step 5.** Solve equations in III column.

**Step 6.** Solve equations in III row.

Putting  $LU$  for  $A$  in (1), we have

$$\begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} \dots (3)$$

[We will substitute the values of elements which we get on solving the above equations in (3)]

$$\text{Putting } \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} p \\ q \\ r \end{bmatrix} \dots (4)$$

in (3), we get

$$\begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} p \\ q \\ r \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} \dots (5)$$

On solving equation (5), we get the value of  $p, q, r$ . We substitute the value of  $p, q, r$  in (4).

On solving (4), we get the values of  $x_1, x_2, x_3$ .

**Example 4.** Apply Crout's method (Factorization Method) to solve the equations

$$3x + 2y + 7z = 4; 2x + 3y + z = 5; 3x + 4y + z = 7$$

(R.G.P.V., Bhopal, III Semester, Dec. 2007, June 2005, Dec. 2004)

**Solution.** We have,

$$3x + 2y + 7z = 4$$

$$2x + 3y + z = 5$$

$$3x + 4y + z = 7$$

These equations are written in the matrix form.

$$\begin{array}{c} \left[ \begin{array}{ccc} 3 & 2 & 7 \\ 2 & 3 & 1 \\ 3 & 4 & 1 \end{array} \right] \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 5 \\ 7 \end{bmatrix} \\ \left[ \begin{array}{ccc} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{array} \right] \left[ \begin{array}{ccc} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{array} \right] \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 5 \\ 7 \end{bmatrix} \\ \text{where } \left[ \begin{array}{ccc} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{array} \right] \left[ \begin{array}{ccc} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{array} \right] = \begin{bmatrix} 3 & 2 & 7 \\ 2 & 3 & 1 \\ 3 & 4 & 1 \end{bmatrix} \quad \dots (1) \end{array}$$

$$\left[ \begin{array}{ccc} u_{11} & u_{12} & u_{13} \\ l_{21}u_{11} & l_{21}u_{12} + u_{22} & l_{21}u_{13} + u_{23} \\ l_{31}u_{11} & l_{31}u_{12} + l_{32}u_{22} & l_{31}u_{13} + l_{32}u_{23} + u_{33} \end{array} \right] = \begin{bmatrix} 3 & 2 & 7 \\ 2 & 3 & 1 \\ 3 & 4 & 1 \end{bmatrix} \quad \dots (2)$$

Equating corresponding elements on both sides of (2), we get

(i) First row

$$u_{11} = 3 \quad u_{12} = 2, \quad u_{13} = 7$$

(ii) First column

$$l_{21}u_{11} = 2 \Rightarrow l_{21} = \frac{2}{3}$$

$$l_{31}u_{11} = 3 \Rightarrow l_{31} = \frac{3}{3} = 1$$

(iii) Second row

$$l_{21}u_{12} + u_{22} = 3 \Rightarrow u_{22} = 3 - \left( \frac{2}{3} \right)(2) = 3 - \frac{4}{3} = \frac{5}{3}$$

$$l_{21}u_{13} + u_{23} = 1 \Rightarrow u_{23} = 1 - \left( \frac{2}{3} \right)(7) = 1 - \frac{14}{3} = -\frac{11}{3}$$

(iv) Second column

$$l_{31}u_{12} + l_{32}u_{22} = 4 \Rightarrow (1)(2) + l_{32} \left( \frac{5}{3} \right) = 4 \Rightarrow l_{32} = \frac{3}{5}(4-2)$$

$$\Rightarrow l_{32} = \frac{6}{5}$$

(v) Third row

$$l_{31}u_{13} + l_{32}u_{23} + u_{33} = 1 \Rightarrow (1)(7) + \left( \frac{6}{5} \right) \left( -\frac{11}{3} \right) + u_{33} = 1$$

$$\Rightarrow u_{33} = 1 - 7 + \frac{66}{15} = -\frac{8}{5}$$

Putting the values of the elements in (1), we get

$$\left[ \begin{array}{ccc} 1 & 0 & 0 \\ \frac{2}{3} & 1 & 0 \\ 1 & \frac{6}{5} & 1 \end{array} \right] \left[ \begin{array}{ccc} 3 & 2 & 7 \\ 0 & \frac{5}{3} & -\frac{11}{3} \\ 0 & 0 & -\frac{8}{5} \end{array} \right] \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 5 \\ 7 \end{bmatrix} \quad \dots (3)$$

Writing

$$\begin{bmatrix} 3 & 2 & 7 \\ 0 & \frac{5}{3} & -\frac{11}{3} \\ 0 & 0 & \frac{-8}{5} \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} p \\ q \\ r \end{bmatrix} \quad \dots (4)$$

in (3), we get

$$\begin{bmatrix} 1 & 0 & 0 \\ \frac{2}{3} & 1 & 0 \\ 1 & \frac{6}{5} & 1 \end{bmatrix} \begin{bmatrix} p \\ q \\ r \end{bmatrix} = \begin{bmatrix} 4 \\ 5 \\ 7 \end{bmatrix} \Rightarrow \begin{bmatrix} p \\ \frac{2}{3}p+q \\ p+\frac{6}{5}q+r \end{bmatrix} = \begin{bmatrix} 4 \\ 5 \\ 7 \end{bmatrix}$$

Solving this system, we have

$$p = 4$$

$$\frac{2}{3}p+q = 5 \Rightarrow q = 5 - \frac{8}{3} = \frac{7}{3}$$

$$p + \frac{6}{5}q + r = 7 \Rightarrow r = 7 - 4 - \frac{42}{15} = \frac{1}{5}$$

Putting the values of  $p, q, r$  in (4), we get

$$\begin{bmatrix} 3 & 2 & 7 \\ 0 & \frac{5}{3} & -\frac{11}{3} \\ 0 & 0 & -\frac{8}{5} \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ \frac{7}{3} \\ \frac{1}{5} \end{bmatrix}$$

i.e.

$$3x + 2y + 7z = 4 \quad \dots (5)$$

$$\frac{5}{3}y - \frac{11}{3}z = \frac{7}{3} \quad \dots (6)$$

$$-\frac{8}{5}z = \frac{1}{5} \Rightarrow z = -\frac{1}{8} \quad \dots (7)$$

Putting  $z = -\frac{1}{8}$  in (6), we get

$$y = \frac{9}{8}$$

Putting the values of  $z$  and  $y$  in (5), we get

$$x = \frac{7}{8}$$

Hence, the solution of the given system is

$$x = \frac{7}{8}, y = \frac{9}{8} \text{ and } z = -\frac{1}{8} \quad \text{Ans.}$$

**Example 5.** Solve the following system of equations using the Decomposition method

$$\begin{aligned} x_1 + x_2 - x_3 &= 2 \\ 2x_1 + 3x_2 + 5x_3 &= -3 \\ 3x_1 + 2x_2 - 3x_3 &= 6 \end{aligned}$$

**Solution.**

$$\begin{bmatrix} 1 & 1 & -1 \\ 2 & 3 & 5 \\ 3 & 2 & -3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 2 \\ -3 \\ 6 \end{bmatrix}$$

$$\begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 2 \\ -3 \\ 6 \end{bmatrix}$$

where,  $\begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 1 & -1 \\ 2 & 3 & 5 \\ 3 & 2 & -3 \end{bmatrix}$  ... (1)

On multiplication the matrices of L.H.S., we get

$$\begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12} + l_{22} & l_{21}u_{13} + l_{22}u_{23} \\ l_{31} & l_{31}u_{12} + l_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} \end{bmatrix} = \begin{bmatrix} 1 & 1 & -1 \\ 2 & 3 & 5 \\ 3 & 2 & -3 \end{bmatrix}$$

Equating the corresponding elements of both the matrices, we get

$$\begin{array}{l} l_{11} = 1 \\ l_{21} = 2 \\ l_{31} = 3 \end{array} \quad \begin{array}{l} l_{11}u_{12} = 1 \\ l_{21}u_{12} + l_{22} = 3 \\ l_{31}u_{12} + l_{32} = 2 \end{array} \quad \begin{array}{l} l_{11}u_{13} = -1 \\ l_{21}u_{13} + l_{22}u_{23} = 5 \\ l_{31}u_{13} + l_{32}u_{23} + l_{33} = -3 \end{array}$$

On solving these equations, we get

$$\begin{array}{l} l_{11} = 1 \\ l_{21} = 2 \\ l_{31} = 3 \end{array} \quad \begin{array}{l} u_{12} = 1 \\ l_{22} = 1 \\ l_{32} = -1 \end{array} \quad \begin{array}{l} u_{13} = -1 \\ u_{23} = 7 \\ l_{33} = 7 \end{array}$$

On putting the values of the elements which we have got on solving in (1), we get

$$\begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & -1 & 7 \end{bmatrix} \begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 7 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 2 \\ -3 \\ 6 \end{bmatrix} \quad \dots (2)$$

Put  $\begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 7 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} p \\ q \\ r \end{bmatrix}$  in (2), we have ... (3)

$$\Rightarrow \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & -1 & 7 \end{bmatrix} \begin{bmatrix} p \\ q \\ r \end{bmatrix} = \begin{bmatrix} 2 \\ -3 \\ 6 \end{bmatrix}$$

$$\begin{array}{l} p = 2 \\ 2p + q = -3 \\ 3p - q + 7r = 6 \end{array} \Rightarrow \begin{array}{l} q = -3 - 4 = -7 \\ 7r = 6 - 6 - 7 \end{array}$$

$$3p - q + 7r = 6 \Rightarrow 7r = 6 - 6 - 7 \Rightarrow r = \frac{-7}{7} = -1$$

Substituting the values of  $p, q, r$  in (3), we get

$$\begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 7 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 2 \\ -7 \\ -1 \end{bmatrix}$$

$$\begin{array}{rcl} x_1 + x_2 - x_3 & = & 2 \\ x_2 + 7x_3 & = & -7 \\ x_3 & = & -1 \end{array}$$

By backward substitution, we have

$$\begin{aligned} x_2 &= -7 + 7 = 0 \\ x_1 + 0 + 1 &= 2 \Rightarrow x_1 = 1 \end{aligned}$$

Hence, solution of the system of given equations is

$$x_1 = 1, \quad x_2 = 0, \quad x_3 = -1 \quad \text{Ans.}$$

### EXERCISE 51.3

Solve the following system by Crout's triangularisation method :

1.  $x_1 + 2x_2 + 3x_3 = 14, \quad 2x_1 + 5x_2 + 2x_3 = 18, \quad 3x_1 + 2x_2 + 5x_3 = 22$  Ans.  $x_1 = 1, \quad x_2 = 2, \quad x_3 = 3$
2.  $10x + y + z = 12, \quad 2x + 10y + z = 13, \quad 2x + 2y + 10z = 14$  Ans.  $x = 1, \quad y = 1, \quad z = 1$
3.  $x + y + z = 1, \quad 2x + y - z = 0, \quad 3x + 4y + 5z = 4,$  Ans.  $x = 1, \quad y = -1, \quad z = 1$
4.  $10x + y + 2z = 13, \quad 3x + 10y + z = 14, \quad 2x + 3y + 10z = 15$  Ans.  $x = 1, \quad y = 1, \quad z = 1$
5.  $2x - 6y + 8z = 24, \quad 5x + 4y - 3z = 2, \quad 3x + y + 2z = 16$  Ans.  $x = 1, \quad y = 3, \quad z = 5$

### 51.6 CROUT'S METHOD

It requires less computation than that of Gauss method. This method is explained below : Consider the system :

$$AX = B$$

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} \quad \dots (1)$$

$$\Rightarrow \begin{array}{l} a_{11}x_1 + a_{12}x_2 + a_{13}x_3 = b_1 \\ a_{21}x_1 + a_{22}x_2 + a_{23}x_3 = b_2 \\ a_{31}x_1 + a_{32}x_2 + a_{33}x_3 = b_3 \end{array}$$

$$\text{The augmented matrix of (1) is } \begin{bmatrix} a_{11} & a_{12} & a_{13} & b_1 \\ a_{21} & a_{22} & a_{23} & b_2 \\ a_{31} & a_{32} & a_{33} & b_3 \end{bmatrix} \quad \dots (2)$$

$$\text{Then we consider derived matrix } \begin{bmatrix} a'_{11} & a'_{12} & a'_{13} & b'_1 \\ a'_{21} & a'_{22} & a'_{23} & b'_2 \\ a'_{31} & a'_{32} & a'_{33} & b'_3 \end{bmatrix} \quad \dots (3)$$

Which is determined below :

**Step 1.** To determine the first column :

$$a'_{11} = a_{11}, \quad a'_{21} = a_{21}, \quad a'_{31} = a_{31}$$

**Step 2.** To determine the first row to the right of the first column.

$$a'_{12} = \frac{a_{12}}{a_{11}}, \quad a'_{13} = \frac{a_{13}}{a_{11}},$$

$$b'_1 = \frac{b_1}{a_{11}}$$

except the first element of the first row, other elements of the first row are obtained by dividing the corresponding elements of first row of the matrix (2) by the first element of the first row.

**Step 3.** To determine the elements of second column except  $a'_{21}$ .

$$\begin{aligned} a'_{22} &= a_{22} - a'_{12} \times a'_{21} \\ a'_{32} &= a_{32} - a'_{12} \times a'_{31} \end{aligned}$$

**Step 4.** To determine the elements of second row except  $a'_{21}$ ;  $a'_{22}$ .

$$a'_{23} = \frac{a_{23} - a'_{13} \cdot a'_{21}}{a'_{22}}$$

$$b'_{2} = \frac{b_2 - b'_1 \cdot a'_{21}}{a'_{22}}$$

**Step 5.** To determine the elements of third column except  $a'_{13}$  and  $a'_{33}$ .

$$a'_{33} = a_{33} - a'_{23} \cdot a'_{32} - a'_{13} \cdot a'_{31}$$

**Step 6.** To determine the remaining elements of third row.

$$b'_{3} = \frac{b_3 - b'_2 \cdot a'_{32} - b'_1 \cdot a'_{31}}{a'_{33}}$$

**Step 7.** Solution is

$$\begin{aligned} x_3 &= b'_3 - a'_{23} \cdot x_3 \\ x_2 &= b'_2 - a'_{13} \cdot x_3 - a'_{12} \cdot x_2 \\ x_1 &= b'_1 - a'_{12} \cdot x_2 \end{aligned}$$

**Example 6.** Solve the system

$$\begin{aligned} x_1 + x_2 + x_3 &= 1 \\ 3x_1 + x_2 - 3x_3 &= 5 \\ x_1 - 2x_2 - 5x_3 &= 10 \quad \text{by Crout's method.} \end{aligned}$$

**Solution.** The coefficient matrix is given by

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \\ 3 & 1 & -3 \\ 1 & -2 & -5 \end{bmatrix}$$

The augmented matrix of the coefficient matrix is given by

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 3 & 1 & -3 & 5 \\ 1 & -2 & -5 & 10 \end{bmatrix}$$

$$\begin{bmatrix} a'_{11} & a'_{12} & a'_{13} & b'_1 \\ a'_{21} & a'_{22} & a'_{23} & b'_2 \\ a'_{31} & a'_{32} & a'_{33} & b'_3 \end{bmatrix}$$

where,  $a'_{11} = a_{11}$ ,  $a'_{21} = a_{21}$ ,  $a'_{31} = a_{31}$   
 $\Rightarrow a'_{11} = 1$ ,  $a'_{21} = 3$ ,  $a'_{31} = 1$  ... (1)

$$a'_{12} = \frac{a_{12}}{a_{11}} = \frac{1}{1} = 1, \quad a'_{13} = \frac{a_{13}}{a_{11}} = \frac{1}{1} = 1, \quad b'_1 = \frac{b_1}{a_{11}} = \frac{1}{1} = 1 \quad \dots (2)$$

$$\begin{aligned} a'_{22} &= a_{22} - a'_{12} \cdot a'_{21} = 1 - 1 \times 3 = -2, \\ a'_{32} &= a_{32} - a'_{12} \cdot a'_{31} = -2 - 1 \cdot 1 = -3 \end{aligned} \quad \dots (3)$$

$$a'_{23} = \frac{a_{23} - a'_{13} \cdot a_{21}}{a'_{22}} = \frac{-3 - 1 \times 3}{-2} = 3, \quad b'_2 = \frac{b_2 + b'_1 \cdot a'_{21}}{a'_{22}} = \frac{5 - 1 \times 3}{-2} = -1 \quad \dots (4)$$

$$a'_{33} = a_{33} - a'_{23} \cdot a'_{32} - a'_{13} \cdot a'_{31} = -5 - 3(-3) - (1)(1) = 3 \quad \dots (5)$$

$$b'_3 = \frac{b_3 - b'_2 \cdot a'_{32} - b'_1 \cdot a'_{31}}{a'_{33}} = \frac{10 - (-1)(-3) - 1(1)}{3} = 2 \quad \dots (6)$$

$$\therefore \text{Derived matrix} = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 3 & -2 & 3 & -1 \\ 1 & -3 & 3 & 2 \end{bmatrix}$$

Thus,  $x_3 = b'_3 = 2$ ,  $x_2 = b'_2 - a'_{23}x_3 = -1 - 3 \times 2 = -7$   
and  $x_1 = b'_1 - a'_{13}x_3 - a'_{12}x_2 = 1 - x_3 - x_2 = 1 - 2 + 7 = 6$   
Hence, the solution of given system of equations is

$$x_1 = 6, x_2 = -7, x_3 = 2.$$

Ans.

### 51.7 ITERATIVE METHODS OR INDIRECT METHODS

We start with an approximation to the true solution and by applying the method repeatedly we get better and better approximation till accurate solution is achieved.

There are two iterative methods for solving simultaneous equations.

- (1) Jacobi's method (method of successive correction).
- (2) Gauss-Seidel method (Method of successive correction).

### 51.8 JACOBI'S METHOD

The method is illustrated by taking an example.

$$\left. \begin{array}{l} a_{11}x + a_{12}y + a_{13}z = b_1 \\ a_{21}x + a_{22}y + a_{23}z = b_2 \\ a_{31}x + a_{32}y + a_{33}z = b_3 \end{array} \right\} \dots (1)$$

After division by suitable constants and transposition, the equations can be written as

$$\left. \begin{array}{l} x = c_1 - k_{12}y - k_{13}z \\ y = c_2 - k_{21}x - k_{23}z \\ z = c_3 - k_{31}x - k_{32}y \end{array} \right\} \dots (2)$$

Let us assume  $x = 0, y = 0$  and  $z = 0$  as first approximation, substituting the values of  $x, y, z$  on the right hand side of (2), we get  $x = c_1, y = c_2, z = c_3$ . This is the second approximation to the solution of the equations.

Again substituting these values of  $x, y, z$  in (2) we get a third approximation.

The process is repeated till two successive approximations are equal or nearly equal.

**Note.** Condition for using the iterative methods is that the coefficients in the leading diagonal are large compared to the other. If these are not so, then on interchanging the equation we can make the leading diagonal dominant diagonal.

**Example 7.** Solve by Jacobi's method

$$\begin{aligned} 4x + y + 3z &= 17 \\ x + 5y + z &= 14 \\ 2x - y + 8z &= 12 \end{aligned}$$

**Solution.** The above equations can be written as

$$\left. \begin{array}{l} x = \frac{17}{4} - \frac{y}{4} - \frac{3z}{4} \\ y = \frac{14}{5} - \frac{x}{5} - \frac{z}{5} \\ z = \frac{3}{2} - \frac{x}{4} + \frac{y}{8} \end{array} \right\} \dots (1)$$

On substituting  $x = y = z = 0$  on the right hand side of (1), we get

$$x = \frac{17}{4}, y = \frac{14}{5}, z = \frac{3}{2}$$

Again substituting these values of  $x, y, z$  on R.H.S. of (1), we obtain

$$x = \frac{17}{4} - \frac{7}{10} - \frac{9}{8} = \frac{97}{40}$$

$$y = \frac{14}{5} - \frac{17}{20} - \frac{3}{10} = \frac{33}{20}$$

$$z = \frac{3}{2} - \frac{17}{16} + \frac{7}{20} = \frac{63}{80}$$

Again putting these values on R.H.S. of (1) we get next approximations.

$$x = \frac{17}{4} - \frac{33}{80} - \frac{189}{320} = \frac{1039}{320} = 3.25$$

$$y = \frac{14}{5} - \frac{97}{200} - \frac{63}{400} = \frac{863}{400} = 2.16$$

$$z = \frac{3}{2} - \frac{97}{160} + \frac{33}{160} = \frac{176}{160} = 1.1$$

Substituting, again, the values of  $x, y, z$  on R.H.S. of (1), we get

$$x = \frac{17}{4} - \frac{2.16}{4} - \frac{3(1.1)}{4} = 2.885$$

$$y = \frac{14}{5} - \frac{3.25}{5} - \frac{1.1}{5} = 1.93$$

$$z = \frac{3}{2} - \frac{3.25}{4} + \frac{2.16}{8} = 0.96$$

Repeating the process for  $x = 2.885, y = 1.93, z = 0.96$ , we have

$$x = \frac{17}{4} - \frac{1.93}{4} - \frac{3}{4} \times 0.96 = 4.25 - 0.48 - 0.72 = 3.05$$

$$y = \frac{14}{5} - \frac{2.885}{5} - \frac{0.96}{5} = 2.8 - 0.577 - 0.192 = 2.03$$

$$z = \frac{3}{2} - \frac{2.885}{4} + \frac{1.93}{8} = 1.5 - 0.721 + 0.241 = 1.02$$

This can be written in a table

Iterations	1	2	3	4	5	6
$x = \frac{17}{4} - \frac{y}{4} - \frac{3z}{4}$	0	$\frac{17}{4} = 4.25$	$\frac{97}{40} = 2.425$	$\frac{1039}{320} = 3.25$	2.885	3.05
$y = \frac{14}{5} - \frac{x}{5} - \frac{z}{5}$	0	$\frac{14}{5} = 2.8$	$\frac{33}{20} = 1.65$	$\frac{863}{400} = 2.16$	1.93	2.03
$z = \frac{3}{2} - \frac{x}{4} + \frac{y}{8}$	0	$\frac{3}{2} = 1.5$	$\frac{63}{80} = 0.7875$	$\frac{176}{160} = 1.1$	0.96	1.02

After 6th iteration  $x = 3.05, y = 2.03, z = 1.02$

The actual values are  $x = 3, y = 2, z = 1$

Ans.

### 51.9 GAUSS-SEIDEL METHOD

Gauss-Seidel method is a modification of Jacobi's method. In place of substituting the same set of values in all the three equations (2) of Article 51.8, we use in each step the value obtained in the earlier step.

**Step 1.** First we put  $y = z = 0$  in first of the equation (2) of Article 51.8 and  $x = c_1$ . Then in second equation we put this value of  $x$  i.e.,  $c_1$  and  $z = 0$  and obtain  $y$ . In the third equation we use the values of  $x$  and  $y$  obtained earlier to get  $z$ .

**Step 2.** We repeat the above procedure. In the first equation we put the values of  $y$  and  $z$  obtained in step 1 and redetermine  $x$ . By using the new value of  $x$  and value of  $z$  obtained in step 1 we redetermine  $y$  and so on.

In other words, the latest values of the unknowns are used in each step.

Consider the following equations

$$\begin{aligned} a_1x + b_1y + c_1z &= d_1 \\ a_2x + b_2y + c_2z &= d_2 \\ a_3x + b_3y + c_3z &= d_3 \end{aligned}$$

The above equations can be rewritten as

$$x = \frac{1}{a_1}[d_1 - b_1y - c_1z], \quad y = \frac{1}{b_2}[d_2 - a_2x - c_2z], \quad z = \frac{1}{c_3}[d_3 - a_3x - b_3y]$$

Initial approximations

$$\begin{aligned} x &= x_0, \quad y = y_0, \quad z = z_0 \\ \text{To find } x &= x_1 \end{aligned}$$

$$x_1 = \frac{1}{a_1}[d_1 - b_1y_0 - c_1z_0]$$

$$\text{To find } y = y_1; \text{ put } x = x_1, z = z_0$$

$$y_1 = \frac{1}{b_2}[d_2 - a_2x_1 - c_2z_0]$$

$$\text{To find } z = z_1, \text{ put } x = x_1, y = y_1$$

$$z_1 = \frac{1}{c_3}[d_3 - a_3x_1 - b_3y_1] \text{ and so on.}$$

**Note 1.** The convergence of Gauss Seidel method is twice as fast as in Jocobi's method.

**2.** If the absolute value of largest coefficient is greater than the sum of the absolute value of all the remaining coefficient than the method converges for any initial approximation.

**Example 8.** Describe a method for solving a system of linear equations. Solve the following system of linear equations using Gauss-Seidel method

$$23x_1 + 13x_2 + 3x_3 = 29$$

$$5x_1 + 23x_2 + 7x_3 = 37$$

$$11x_1 + x_2 + 23x_3 = 43$$

(U.P., III Semester, Dec. 2009)

**Solution.** See Art. 51.9 for method.

Here, we have

$$23x_1 + 13x_2 + 3x_3 = 29$$

$$5x_1 + 23x_2 + 7x_3 = 37$$

$$11x_1 + x_2 + 23x_3 = 43$$

Solving each equation of the given system for the unknowns with largest coefficient in terms of the remaining unknowns, we have

$$x_1 = \frac{1}{23} (29 - 13x_2 - 3x_3) \quad \dots (1)$$

$$x_2 = \frac{1}{23} (37 - 5x_1 - 7x_3) \quad \dots (2)$$

$$x_3 = \frac{1}{23} (43 - 11x_1 - x_2) \quad \dots (3)$$

**For first iteration**

Putting  $x_2 = 0, x_3 = 0$  in (1), we get

$$x_1 = \frac{1}{23} [29] = 1.26087$$

Putting  $x_1 = 1.26087, x_3 = 0$  in (2), we get

$$x_2 = \frac{1}{23} [37 - 5(1.26087) - 0] = 1.33459$$

Putting  $x_1 = 1.26087$  and  $x_2 = 1.33459$  in (3), we get

$$\begin{aligned} x_3 &= \frac{1}{23} [43 - 11 \times (1.26087) - 1.33459] \\ &= \frac{1}{23} [43 - 13.86957 - 1.33459] = 1.20851 \end{aligned}$$

**For the second iteration**

Putting  $x_2 = 1.33459$  and  $x_3 = 1.20851$  in (1), we get

$$\begin{aligned} x_1 &= \frac{1}{23} [29 - 13 \times 1.33459 - 3 \times 1.20851] \\ &= \frac{1}{23} [29 - 17.34967 - 3.62553] = 0.34890 \end{aligned}$$

Putting  $x_1 = 0.34890$  and  $x_3 = 1.20851$  in (2), we get

$$\begin{aligned} x_2 &= \frac{1}{23} [37 - 5 \times 0.34890 - 7 \times 1.20851] \\ &= \frac{1}{23} [37 - 1.74450 - 8.45957] = 1.16504 \end{aligned}$$

Putting  $x_1 = 0.34890$  and  $x_2 = 1.16504$  in (3), we get

$$\begin{aligned} x_3 &= \frac{1}{23} [43 - 11 \times 0.34890 - 1.16504] \\ &= \frac{1}{23} [43 - 3.8379 - 1.16504] = 1.65205 \end{aligned}$$

**For the third iteration**

Putting  $x_2 = 1.16504$  and  $x_3 = 1.65205$  in (1), we get

$$\begin{aligned} x_1 &= \frac{1}{23} [29 - 13 \times 1.16504 - 3 \times 1.65205] \\ &= \frac{1}{23} [29 - 15.1502 - 4.95615] = 0.38668 \end{aligned}$$

Putting  $x_1 = 0.38668$  and  $x_3 = 1.65205$  in (2), we get

$$\begin{aligned} x_2 &= \frac{1}{23} [37 - 5 \times 0.38668 - 7 \times 1.65205] \\ &= \frac{1}{23} [37 - 1.9334 - 11.56435] = 1.02184 \end{aligned}$$

Putting  $x_1 = 0.38668$  and  $x_2 = 1.02184$  in (3), we get

$$\begin{aligned}x_3 &= \frac{1}{23} [43 - 11 \times 0.38668 - 1.02184] \\&= \frac{1}{23} [43 - 4.25348 - 1.02184] \\&= 1.640203\end{aligned}$$

**For the fourth iteration**

Putting  $x_2 = 1.02184$  and  $x_3 = 1.640203$  in (1), we get

$$\begin{aligned}x_1 &= \frac{1}{23} [29 - 13 \times 1.02184 - 3 \times 1.640203] \\&= \frac{1}{23} [29 - 13.28392 - 4.89498] = 0.46937\end{aligned}$$

Putting  $x_1 = 0.46937$  and  $x_3 = 1.640203$  in (2), we get

$$\begin{aligned}x_2 &= \frac{1}{23} [37 - 5 \times 0.46937 - 7 \times 1.640203] \\&= \frac{1}{23} [37 - 2.34685 - 11.481421] = 1.007466\end{aligned}$$

Putting  $x_1 = 0.46937$  and  $x_2 = 1.007466$  in (3), we get

$$\begin{aligned}x_3 &= \frac{1}{23} [43 - 11 \times 0.46937 - 1.007466] \\&= \frac{1}{23} [43 - 5.16307 - 1.007466] = 1.601281\end{aligned}$$

**For the fifth iteration**

$$\begin{aligned}x_1 &= \frac{1}{23} [29 - 13 \times 1.007466 - 3 \times 1.601281] = 0.48257 \\x_2 &= \frac{1}{23} [37 - 5 \times 0.48257 - 7 \times 1.601281] = 1.016443 \\x_3 &= \frac{1}{23} [43 - 11 \times 0.48257 - 1.016443] = 1.594578\end{aligned}$$

The following table shows all the iterations

$x_1$	1.26087	0.34890	0.38668	0.46977	0.48257
$x_2$	1.33459	1.16504	1.02184	1.007466	1.016443
$x_3$	1.20851	1.65205	1.640203	1.601167	1.594578

$$x_1 = 0.48257, \quad x_2 = 1.016443, \quad x_3 = 1.594578$$

**Ans.**

**Example 9.** Solve the following system by Gauss-Seidel method :

$$\begin{aligned}27x + 6y - z &= 85 \\6x + 15y + 2z &= 72 \\x + y + 54z &= 110\end{aligned}$$

(R.G.P.V., Bhopal, III Semester, June 2008, Dec. 2002)

**Solution.** We have,

$$\begin{aligned}27x + 6y - z &= 85 \\6x + 15y + 2z &= 72 \\x + y + 54z &= 110\end{aligned}$$

Solving each equation of the given system for the unknown with the largest coefficient in terms of the remaining unknowns, we have

$$x = \frac{1}{27} (85 - 6y + z) \quad \dots (1)$$

$$y = \frac{1}{15} (72 - 6x - 2z) \quad \dots (2)$$

$$z = \frac{1}{54} (110 - x - y) \quad \dots (3)$$

Starting with  $y = 0, z = 0$  and putting  $y = 0, z = 0$  in R.H.S. of equation (1), we get

$$x_1 = \frac{85}{27} = 3.148 = \text{first approximation}$$

Now putting  $x = 3.148, z = 0$  in equation (2), we get

$$y_1 = \frac{1}{15} (72 - 6 \times 3.148) = 3.541 = \text{first approximation}$$

Again putting  $x = 3.148, y = 3.541$  in equation (3), we get

$$z_1 = \frac{1}{54} (110 - 3.148 - 3.541) = 1.913 = \text{first approximation}$$

For the second approximation (iteration), we have

$$x_2 = \frac{1}{27} [85 - 6y^{(1)} + z^{(1)}] = \frac{1}{27} (85 - 6 \times 3.541 + 1.913) = 2.432$$

$$y_2 = \frac{1}{15} [72 - 6x^{(2)} - 2z^{(1)}] = \frac{1}{15} [72 - 6 \times 2.432 - 2 \times 1.913] \\ = 3.572$$

$$z_2 = \frac{1}{54} [110 - x^{(2)} - y^{(2)}] = \frac{1}{54} [110 - 2.432 - 3.572] = 1.926$$

From the third approximation (iteration), we have

$$x_3 = \frac{1}{27} [85 - 6y^{(2)} + z^{(2)}] = \frac{1}{27} [85 - 6 \times 3.572 + 1.926] = 2.426$$

$$y_3 = \frac{1}{15} [72 - 6x^{(3)} - 2z^{(2)}] = \frac{1}{15} [72 - 6 \times 2.426 - 2 \times 1.926] = 3.573$$

$$z_3 = \frac{1}{54} [110 - x^{(3)} - y^{(3)}] = \frac{1}{54} [110 - 2.426 - 3.573] = 1.926$$

Second and third iterations give practically the same values therefore we can stop.

Hence the solution is  $x = 2.426, y = 3.573$  and  $z = 1.926$

Calculated values of  $x, y, z$  are given in the following table.

Iterations	1	2	3
$x = \frac{1}{27} (85 - 6y + z)$	3.148	2.432	2.426
$y = \frac{1}{15} (72 - 6x - 2z)$	3.541	3.572	3.573
$z = \frac{1}{54} (110 - x - y)$	1.913	1.926	1.926

**Ans.**

**Example 10.** Solve the following system :

$$\begin{aligned}10x + 2y + z &= 9 \\2x + 20y - 2z &= -44 \\-2x + 3y + 10z &= 22\end{aligned}$$

by Gauss-Seidel method correct to two places of decimal.

(R.G.P.V., Bhopal, III Semester Dec. 2003)

**Solution.** The given equations can be written as

$$x = 0.9 - 0.2y - 0.1z \quad \dots (1)$$

$$y = -2.2 - 0.1x + 0.1z \quad \dots (2)$$

$$z = 2.2 + 0.2x - 0.3y \quad \dots (3)$$

#### For first iteration

Putting  $y = 0, z = 0$  in (1), we get

$$x_1 = 0.9 - 0 - 0 = 0.9$$

Putting  $x = 0.9, z = 0$  in (2), we get

$$y_1 = -2.2 - 0.1(0.9) + 0.1(0) = -2.29$$

Putting  $x = 0.9, y = -2.29$  in (3), we get

$$z_1 = 2.2 + 0.2(0.9) - 0.3(-2.29) = 3.067$$

#### For the second iteration

Putting  $y = -2.29, z = 3.067$  in (1), we get

$$x_2 = 0.9 - 0.2(-2.29) - 0.1(3.067) = 1.0513$$

Putting  $x = 1.0513, z = 3.067$  in (2), we get

$$y_2 = -2.2 - 0.1(1.0513) + 0.1(3.067) = -1.99843$$

Putting  $x = 1.0513, y = -1.99843$  in (3), we get

$$z_2 = 2.2 + 0.2(1.0513) - 0.3(-1.99843) = 3.00979$$

#### For Third iteration

Putting  $y = -1.99843$  and  $z = 3.00979$  in (1), we get

$$x_3 = 0.9 - 0.2(-1.99843) - 0.1(3.00979) = 0.99871$$

Putting  $x = 0.99871, z = 3.00979$  in (2), we get

$$y_3 = -2.2 - 0.1(0.99871) + 0.1(3.00979) = -1.99889$$

Putting  $x = 0.99871$  and  $y = -1.99889$  in (3), we get

$$z_3 = 2.2 + 0.2(0.99871) - 0.3(-1.99889) = 2.99941$$

#### For fourth iteration

Proceeding as usual, we get

$$\begin{aligned}x_4 &= 0.9 - (0.2)(-1.99889) - (0.1)(2.99941) \\&= 0.99984\end{aligned}$$

$$\begin{aligned}y_4 &= -2.2 - (0.1)(0.99984) + (0.1)(2.99941) \\&= -2.00004\end{aligned}$$

$$\begin{aligned}z_4 &= 2.2 + (0.2)(0.99984) - (0.3)(-2.00004) \\&= 2.99998\end{aligned}$$

Third and fourth iterations are practically same.

Hence, the solution is  $x = 1, y = -2, z = 3$ .

**Ans.**

The following table shows all the iterations

Iterations	1	2	3	4
$x = 0.9 - 0.2y - 0.1z$	0.9	1.0513	0.99871	0.99984
$y = -2.2 - 0.1x + 0.1z$	-2.29	-1.99843	-1.99889	-2.00004
$z = 2.2 + 0.2x - 0.3y$	3.067	3.00979	2.99941	2.99998

**Example 11.** Solve the following equations by Gauss-Seidel method :

$$83x + 11y - 4z = 95$$

$$7x + 52y + 13z = 104$$

$$3x + 8y + 29z = 71 \quad (\text{R.G.P.V., Bhopal, III Semester, Dec. 2003})$$

**Solution.** The given equations can be rewritten as

$$x = \frac{1}{83} [95 - 11y + 4z] \quad \dots (1)$$

$$y = \frac{1}{52} [104 - 7x - 13z] \quad \dots (2)$$

$$z = \frac{1}{29} [71 - 3x - 8y] \quad \dots (3)$$

**For first approximation**

Putting  $y = 0, z = 0$  in (1), we get

$$x_1 = \frac{95}{83} = 1.145$$

Putting  $x = 1.145, z = 0$  in (2), we get

$$y_1 = \frac{1}{52} [104 - 7 \times 1.145 - 13 \times 0] = 1.846$$

Putting  $x = 1.145, y = 1.846$  in (3), we get

$$z_1 = \frac{1}{29} [71 - 3 \times 1.145 - 8 \times 1.846] = 1.821$$

**For second approximation**

Putting  $y = 1.846, z = 1.821$  in (1), we get

$$x_2 = \frac{1}{83} [95 - 11 \times 1.846 + 4 \times 1.821] = 0.988$$

Putting  $x = 0.988, z = 1.821$  in (2), we get

$$y_2 = \frac{1}{52} [104 - 7 \times 0.988 - 13 \times 1.821] = 1.412$$

Putting  $x = 0.988, y = 1.412$  in (3), we get

$$z_2 = \frac{1}{29} [71 - 3 \times 0.988 - 8 \times 1.412] = 1.957$$

**For third approximation**

Putting  $y = 1.412, z = 1.957$  in (1), we get

$$x_3 = \frac{1}{83} [95 - 11 \times 1.412 + 4 \times 1.957] = 1.052$$

Putting  $x = 1.052, z = 1.957$  in (2), we get

$$y_3 = \frac{1}{52} [104 - 7 \times 1.052 - 13 \times 1.957] = 1.369$$

Putting  $x = 1.052, y = 1.369$  in (3), we get

$$z_3 = \frac{1}{29} [71 - 3 \times 1.052 - 8 \times 1.369] = 1.962$$

**For fourth approximation**

Putting  $y = 1.369, z = 1.962$  in (1), we get

$$x_4 = \frac{1}{83} [95 - 11 \times 1.369 + 4 \times 1.962] = 1.058$$

Putting  $x = 1.058$ ,  $z = 1.962$  in (2), we get

$$y_4 = \frac{1}{52} [104 - 7 \times 1.058 - 13 \times 1.962] = 1.367$$

Putting  $x = 1.058$ ,  $y = 1.367$  in (3), we get

$$z_4 = \frac{1}{29} [71 - 3 \times 1.058 - 8 \times 1.367] = 1.962$$

**For fifth approximation**

Putting  $y = 1.367$ ,  $z = 1.962$  in (1), we get

$$x_5 = \frac{1}{83} [95 - 11 \times 1.367 + 4 \times 1.962] = 1.058$$

Putting  $x = 1.058$ ,  $z = 1.962$  in (2), we get

$$y_5 = \frac{1}{52} [104 - 7 \times 1.058 - 13 \times 1.962] = 1.367$$

Putting  $x = 1.058$ ,  $y = 1.367$  in (3), we get

$$z_5 = \frac{1}{29} [71 - 3 \times 1.058 - 8 \times 1.367] = 1.962$$

Thus, fourth and fifth approximations are practically same.

This can be shown in the following table :

Iterations	1	2	3	4	5
$y = \frac{1}{83} (95 - 11y + 4z)$	1.145	0.988	1.052	1.058	1.058
$y = \frac{1}{52} (104 - 7x - 13z)$	1.846	1.412	1.369	1.367	1.367
$z = \frac{1}{29} (71 - 3x - 8y)$	1.821	1.957	1.962	1.962	1.962

Hence, the solution is  $x = 1.058$ ,  $y = 1.367$ ,  $z = 1.962$

**Ans.**

**Example 12.** Solve the system of equations by Gauss-Seidel iterative method :

$$54x + y + z = 110$$

$$2x + 15y + 6z = 72$$

$$-x + 6y + 27z = 85$$

(AMIETE, June 2009, R.G.P.V., Bhopal, III Semester, June 2007)

**Solution.** The given equations can be rewritten as

$$x = \frac{1}{54} [110 - y - z] \quad \dots (1)$$

$$y = \frac{1}{15} [72 - 2x - 6z] \quad \dots (2)$$

$$z = \frac{1}{27} [85 + x - 6y] \quad \dots (3)$$

**For first approximation**

Putting  $y = 0$ ,  $z = 0$  in (1), we get

$$x_1 = \frac{110}{54} = 2.037$$

Putting  $x = 2.037$ ,  $z = 0$  in (2), we get

$$y_1 = \frac{1}{15} [72 - 2(2.037) - 0] = 4.528$$

Putting  $x = 2.037$ ,  $y = 4.528$  in (3), we get

$$z_1 = \frac{1}{27} [85 + 2.037 - 6 \times 4.528] = 2.217$$

#### For second approximation

Putting  $y = 4.528$ ,  $z = 2.217$  in (1), we get

$$x_2 = \frac{1}{54} [110 - 4.528 - 2.217] = 1.912$$

Putting  $x = 1.912$ ,  $z = 2.217$  in (2), we get

$$y_2 = \frac{1}{15} [72 - 2 \times 1.912 - 6 \times 2.217] = 3.658$$

Putting  $x = 1.912$ ,  $y = 3.658$  in (3), we get

$$z_2 = \frac{1}{27} [85 + 1.912 - 6 \times 3.658] = 2.406$$

#### For third approximation

Putting  $y = 3.658$ ,  $z = 2.406$  in (1), we get

$$x_3 = \frac{1}{54} [110 - 3.658 - 2.406] = 1.925$$

Putting  $x = 1.925$ ,  $z = 2.406$  in (2), we get

$$y_3 = \frac{1}{15} [72 - 2 \times 1.925 - 6 \times 2.406] = 3.581$$

Putting  $x = 1.925$ ,  $y = 3.581$  in (3), we get

$$z_3 = \frac{1}{27} [85 + 1.925 - 6 \times 3.581] = 2.424$$

#### For fourth approximation

Putting  $y = 3.581$ ,  $z = 2.424$  in (1), we get

$$x_4 = \frac{1}{54} [110 - 3.581 - 2.424] = 1.926$$

Putting  $x = 1.926$ ,  $z = 2.424$  in (2), we get

$$y_4 = \frac{1}{15} [72 - 2 \times 1.926 - 6 \times 2.424] = 3.574$$

Putting  $x = 1.926$ ,  $y = 3.574$  in (3), we get

$$z_4 = \frac{1}{27} [85 + 1.926 - 6 \times 3.574] = 2.425$$

#### For fifth approximation

Putting  $y = 3.574$ ,  $z = 2.425$  in (1), we get

$$x_5 = \frac{1}{54} [110 - 3.574 - 2.425] = 1.926$$

Putting  $x = 1.926$ ,  $z = 2.425$  in (2), we get

$$y_5 = \frac{1}{15} [72 - 2 \times 1.926 - 6 \times 2.425] = 3.573$$

Putting  $x = 1.926$ ,  $y = 3.573$  in (3), we get

$$z_5 = \frac{1}{27} [85 + 1.926 - 6 \times 3.573] = 2.425$$

Thus, fourth and fifth iterations are practically same.  
The calculated values of  $x, y, z$  are shown in the table :

Iterations	1	2	3	4	5
$x = \frac{1}{54} (110 - y - z)$	2.037	1.912	1.925	1.926	1.926
$y = \frac{1}{15} (72 - 2x - 6z)$	4.528	3.658	3.581	3.574	3.573
$z = \frac{1}{27} (85 + x - 6y)$	2.217	2.406	2.424	2.425	2.425

Hence, the solution is  $x = 1.926$ ,  $y = 3.573$  and  $z = 2.425$ .

**Ans.**

**Example 13.** Solve the equations :

$$\begin{aligned}10x_1 - 2x_2 - x_3 - x_4 &= 3 \\- 2x_1 + 10x_2 - x_3 - x_4 &= 15 \\- x_1 - x_2 + 10x_3 - 2x_4 &= 27 \\- x_1 - x_2 - 2x_3 + 10x_4 &= -9\end{aligned}$$

By Gauss-Seidel iteration method. (R.G.P.V., Bhopal, III Semester, Dec. 2006, June 2004)

**Solution.** The numbers, 10, 10, 10, 10 in the leading diagonal are the largest, so we can apply Gauss-Seidel method to solve the given equations.

The above equations are rewritten as

$$x_1 = \frac{1}{10} (3 + 2x_2 + x_3 + x_4) \quad \dots (1)$$

$$x_2 = \frac{1}{10} (15 + 2x_1 + x_3 + x_4) \quad \dots (2)$$

$$x_3 = \frac{1}{10} (27 + x_1 + x_2 + 2x_4) \quad \dots (3)$$

$$x_4 = \frac{1}{10} (-9 + x_1 + x_2 + 2x_3) \quad \dots (4)$$

**For first Approximation**

Putting  $x_2 = 0$ ,  $x_3 = 0$ ,  $x_4 = 0$  in (1), we get  $x_1 = \frac{3}{10} = 0.3$

Putting  $x_1 = 0.3$ ,  $x_3 = 0$ ,  $x_4 = 0$  in (2), we get  $x_2 = \frac{1}{10} [15 + 2(0.3)] = 1.56$

Putting  $x_1 = 0.3$ ,  $x_2 = 1.56$ ,  $x_4 = 0$  in (3), we get  $x_3 = \frac{1}{10} (27 + 0.3 + 1.56 + 0) = 2.886$

Putting  $x_1 = 0.3$ ,  $x_2 = 1.56$ ,  $x_3 = 2.886$  in (4), we get

$$x_4 = \frac{1}{10} [-9 + 0.3 + 1.56 + 2(2.886)] = -0.137$$

**For Second Approximation**

Putting  $x_2 = 1.56$ ,  $x_3 = 2.886$ ,  $x_4 = -0.137$  in (1), we get

$$x_1 = \frac{1}{10} [3 + 2(1.56) + 2.886 - 0.137] = 0.887$$

Putting  $x_1 = 0.887$ ,  $x_3 = 2.886$ ,  $x_4 = -0.137$  in (2), we get

$$x_2 = \frac{1}{10} [15 + 2(0.887) + 2.886 - 0.137] = 1.952$$

Putting  $x_1 = 0.887$ ,  $x_2 = 1.952$ ,  $x_4 = -0.137$  in (3), we get

$$x_3 = \frac{1}{10} [27 + 0.887 + 1.952 + 2(-0.137)] = 2.957$$

Putting  $x_1 = 0.887$ ,  $x_2 = 1.952$ ,  $x_3 = 2.957$  in (4), we get

$$x_4 = \frac{1}{10} [-9 + 0.887 + 1.952 + 2(2.957)] = -0.025$$

#### For Third Approximation

Putting  $x_2 = 1.952$ ,  $x_3 = 2.957$ ,  $x_4 = -0.025$  in (1), we get

$$x_1 = \frac{1}{10} [3 + 2(1.952) + 2.957 - 0.025] = 0.984$$

Putting  $x_1 = 0.984$ ,  $x_2 = 2.957$ ,  $x_4 = -0.025$  in (2), we get

$$x_2 = \frac{1}{10} [15 + 2(0.984) + 2.957 - 0.025] = 1.990$$

Putting  $x_1 = 0.984$ ,  $x_2 = 1.990$ ,  $x_4 = -0.025$  in (3), we get

$$x_3 = \frac{1}{10} [27 + 0.984 + 1.990 + 2(-0.025)] = 2.992$$

Putting  $x_1 = 0.984$ ,  $x_2 = 1.990$ ,  $x_3 = 2.992$  in (4), we get

$$x_4 = \frac{1}{10} [-9 + 0.984 + 1.990 + 2(2.992)] = -0.004$$

#### For Fourth Approximation

Putting  $x_2 = 1.990$ ,  $x_3 = 2.992$ ,  $x_4 = -0.004$  in (1), we get

$$x_1 = \frac{1}{10} [3 + 2(1.990) + 2.992 - 0.004] = 0.997$$

Putting  $x_1 = 0.997$ ,  $x_3 = 2.992$ ,  $x_4 = -0.004$  in (2), we get

$$x_2 = \frac{1}{10} [15 + 2(0.997) + 2.992 - 0.004] = 1.998$$

Putting  $x_1 = 0.997$ ,  $x_2 = 1.998$ ,  $x_4 = -0.004$  in (3), we get

$$x_3 = \frac{1}{10} [27 + 0.997 + 1.998 + 2(-0.004)] = 2.999$$

Putting  $x_1 = 0.997$ ,  $x_2 = 1.998$ ,  $x_3 = 2.999$  in (4), we get

$$x_4 = \frac{1}{10} [-9 + 0.997 + 1.998 + 2(2.999)] = -0.0007$$

Iterations	1	2	3	4
$x_1 = \frac{1}{10}(3 + 2x_2 + x_3 + x_4)$	0.3	0.887	0.984	0.997
$x_2 = \frac{1}{10}(15 + 2x_1 + x_3 + x_4)$	1.56	1.952	1.990	1.998
$x_3 = \frac{1}{10}(27 + x_1 + x_2 + 2x_4)$	2.886	2.957	2.992	2.999
$x_4 = \frac{1}{10}(-9 + x_1 + x_2 + 2x_3)$	-0.137	-0.025	-0.004	-0.0007

Hence, the solution of the given system of equations is

$$x_1 = 0.997, x_2 = 1.998, x_3 = 2.999, x_4 = -0.0007$$

Exact value of  $x_1 = 1$ ,  $x_2 = 2$ ,  $x_3 = 3$  and  $x_4 = 0$ .

Ans.

**EXERCISE 51.4**

1. Solve by Gauss-Seidel method

$$\begin{aligned} 6x - y - z &= 19, \\ 3x + 4y + z &= 26, \\ x + 2y + 6z &= 22 \end{aligned}$$

**Ans.**  $x = 4, y = 3, z = 2$

2. Use Gauss-Seidel method to solve the system of equations

$$\begin{aligned} 3x + y + z &= 1 \\ x + 3y - z &= 11 \\ x - 2y + 4z &= 21 \end{aligned}$$

**Ans.**  $x = -7, y = 10, z = 12$

3. Solve by Gauss-Seidel method to solve

$$\begin{bmatrix} 3 & 1 & 1 \\ 1 & 2 & 2 \\ 2 & 1 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 4 \\ 3 \\ 4 \end{bmatrix}$$

**Ans.**  $x_1 = 1, x_2 = \frac{1}{2}, x_3 = \frac{1}{2}$

4. Use Gauss-Seidel method to solve

$$\begin{aligned} 4x - y + 2z - 2w &= 7 \\ 3x + 5y - z + 6w &= 5 \\ 2x + 3y - 4z + 2w &= -4 \\ x + 2y + 3z - 4w &= 7 \end{aligned}$$

**Ans.**  $x = 1, y = \frac{1}{2}, z = 2, w = \frac{1}{4}$

5. Use Jacobi's method to solve

$$\begin{aligned} 10x - 2y - 3z &= 205 \\ 2x - 10y + 2z &= -154 \\ 2x + y - 10z &= -120 \end{aligned}$$

**Ans.**  $x = 32, y = 26, z = 21$

upto the end of sixth iteration.

6. Use Jacobi's method to solve

$$\begin{aligned} 5x + 2y + z &= 12 \\ x + 4y + 2z &= 15 \\ x + 2y + 5z &= 20 \end{aligned}$$

**Ans.**  $x = 1.08, y = 1.95, z = 3.16$

upto the end of eighth iteration.

7. Solve Question (6) by Gauss-Seidel method upto fifth iteration **Ans.**  $x = 1, y = 2, z = 3$

8. Solve the following equations by Gauss Seidel method.

$$\begin{aligned} 6x + y + z &= 7 \\ x + 8y + 2z &= 6 \\ 3x + 2y + 10z &= 9 \end{aligned}$$

Initial values are  $x = 0.8, y = 0.4, z = -0.45$ .

**Ans.**  $x = 1, y = \frac{1}{2}, z = \frac{1}{2}$

9. Solve by Gauss-Seidel method, the following system of equtions:

$$\begin{aligned} 28x + 4y - z &= 32 \\ x + 3y + 10z &= 24 \\ 2x + 17y + 4z &= 35 \end{aligned}$$

(AMIETE, Dec. 2009)

**Ans.**  $x = 0.9935, y = 1.5069, z = 1.8485$

CHAPTER  
**52**

## NUMERICAL TECHNIQUE FOR SOLUTION OF ORDINARY DIFFERENTIAL EQUATIONS

---

### 52.1 INTRODUCTION

Differential equations represent a number of problems in the field of engineering and science. The analytical methods of solving differential equations are applicable to a limited type of differential equations. The numerical solutions of the differential equations have become easy for manipulation. These methods are of even greater importance, as the computing machines are now readily available.

### 52.2 SOLUTION OF ORDINARY DIFFERENTIAL EQUATIONS

A number of differential equations cannot be solved by analytical methods. It is, therefore, imperative to solve them by numerical methods. We will discuss the following methods :

- (1) Taylor's series method
- (2) Picard's method
- (3) Runge-Kutta method.

### 52.3 TAYLOR'S SERIES METHOD

Let us consider the first order differential equation

$$\frac{dy}{dx} = f(x, y) \quad \dots (1)$$

under the condition  $y = 0$  for  $x = x_0$ .

**Method.**

On differentiating (1) again and again, we get  $\frac{d^2y}{dx^2}$ ,  $\frac{d^3y}{dx^3}$ ,  $\frac{d^4y}{dx^4}$  etc.

On putting  $x = x_0$  and  $y = 0$  in the above equations we get the values of

$$\frac{dy}{dx}, \frac{d^2y}{dx^2}, \frac{d^3y}{dx^3}, \frac{d^4y}{dx^4}, \dots$$

substituting the values of  $y'$ ,  $y''$ ,  $y'''$ ,  $y''''$  ... in Taylor's series

$$y = y_0 + (x - x_0)[y'(x_0)] + \frac{(x - x_0)^2}{2!}[y''(x_0)] + \frac{(x - x_0)^3}{3!}[y'''(x_0)] + \dots$$

Thus we can obtain a power series for  $y(x)$  in powers of  $(x - x_0)$ .

The method is illustrated by the example.

**Example 1.** Using Taylor's series method obtain the solution of  $\frac{dy}{dx} = 3x + y^2$  and  $y = 1$ , when  $x = 0$ . Find the value of  $y$  for  $x = 0.1$ , correct to four places of decimals.

**Solution.**  $\frac{dy}{dx} = 3x + y^2 \quad \dots(1)$

$$y(0) = 1 \quad \dots(2)$$

Differentiating (1) w.r.t 'x', we get  $\frac{d^2y}{dx^2} = 3 + 2y \frac{dy}{dx} \quad \dots(3)$

$$\frac{d^3y}{dx^3} = 2y \frac{d^2y}{dx^2} + 2\left(\frac{dy}{dx}\right)^2 \quad \dots(4)$$

$$\frac{d^4y}{dx^4} = 2y \frac{d^2y}{dx^2} + 2\left(\frac{dy}{dx}\right)\left(\frac{d^2y}{dx^2}\right) + 4\left(\frac{dy}{dx}\right)\frac{d^2y}{dx^2} \quad \dots(5)$$

and so on      From (1)       $\frac{dy}{dx} = 0 + (1)^2 = 1$

From (3)       $\frac{d^2y}{dx^2} = 3 + 2(1)(1) = 5$

From (4)       $\frac{d^3y}{dx^3} = 2(1)(5) + 2(1)^2 = 12$

From (5)       $\frac{d^4y}{dx^4} = 2(1)(12) + 2(1)(5) + 4(1)(5) = 54$

We know by Taylor's series expansion

$$y = y_0 + (x - x_0)(y')_0 + \frac{(x - x_0)^2}{2!}(y'')_0 + \frac{(x - x_0)^3}{3!}(y''')_0 + \frac{(x - x_0)^4}{4!}(y^{iv})_0 + \dots \quad \dots(6)$$

On substituting the value of  $y(0)$ ,  $y'(0)$ ,  $y''(0)$ ,  $y'''(0)$ ,  $y^{iv}(0)$  etc.in (6) we get

$$y = 1 + x + \frac{x^2}{2!}(5) + \frac{x^3}{3!}(12) + \frac{x^4}{4!}(54) + \dots$$

or       $y(x) = 1 + x + \frac{5}{2}x^2 + 2x^3 + \frac{9}{4}x^4 + \dots$

$$\begin{aligned} y(0.1) &= 1 + 0.1 + \frac{5}{2}(0.01) + 2(0.001) + \frac{9}{4}(0.0001) + \dots \\ &= 1 + 0.1 + 0.025 + 0.002 + 0.000225 = 1.127225 \end{aligned}$$

**Ans.**

**Example 2.** Use Taylor's series method to solve the equation

$$\frac{dy}{dx} = -xy, \quad y(0) = 1$$

**Solution.**  $y' = xy$

$$y'(0) = 0.$$

Differentiating (1) repeatedly, we find

$$y'' = -xy' - y, \quad y''(0) = -1$$

$$y''' = -x y'' - 2y', \quad y'''(0) = 0$$

$$y^{iv} = -x y''' - 3 y'', \quad y^{iv}(0) = 3$$

$$y^v = -xy^v - 4y'', \quad y^v(0) = 0$$

$$y^{vi} = -xy^v - 5y^v, \quad y^{vi}(0) = -15$$

By Taylor's series expansion

$$\begin{aligned}y(x) &= y(0) + \frac{x^2}{1!} y'(0) + \frac{x^2}{2!} y''(0) + \frac{x^3}{3!} y'''(0) + \frac{x^4}{4!} y^{(4)}(0) + \dots \\&= 1 + 0 + \frac{x^2}{2!}(-1) + 0 + \frac{x^4}{4!}(3) + 0 + \frac{x^6}{6!}(-15) + \dots = 1 - \frac{x^2}{2} + \frac{x^4}{8} - \frac{x^6}{48} + \dots\end{aligned}\quad \text{Ans.}$$

**Example 3.** Employ Taylor's series method to obtain approximate value of  $y$  at  $x = 0.2$  for the

differential equation  $\frac{dy}{dx} = 2y + 3e^x$ ,  $y(0) = 0$ . Compare the numerical solution with the exact solution.  
(R.G.P.V. Bhopal, III Semester, June 2004)

**Solution.**  $\frac{dy}{dx} = 2y + 3e^x \quad \dots(1)$

$$y(0) = 0$$

Putting  $x = 0, y = 0$  in (1), we get  $\frac{dy}{dx} = 2(0) + 3e^0 = 3$

Differentiating (1) w.r.t. 'x' and putting  $x = 0, y = 0$  and earlier obtained values of the derivatives, we get

$$x = 0, y = 0$$

$$\left. \begin{array}{l} \frac{d^2y}{dx^2} = 2 \frac{dy}{dx} + 3e^x \\ \frac{d^3y}{dx^3} = 2 \frac{d^2y}{dx^2} + 3e^x \\ \frac{d^4y}{dx^4} = 2 \frac{d^3y}{dx^3} + 3e^x \\ \frac{d^5y}{dx^5} = 2 \frac{d^4y}{dx^4} + 3e^x \end{array} \right| \left. \begin{array}{l} \frac{d^2y}{dx^2} = 2(3) + 3 = 9 \\ \frac{d^3y}{dx^3} = 2(9) + 3 = 21 \\ \frac{d^4y}{dx^4} = 2(21) + 3 = 45 \\ \frac{d^5y}{dx^5} = 2(45) + 3 = 93 \end{array} \right.$$

By Taylor's series expansion

$$y = y_0 + (x - x_0) \left. \frac{dy}{dx} \right|_{x=x_0} + \frac{(x - x_0)^2}{2!} \left. \frac{d^2y}{dx^2} \right|_{x=x_0} + \frac{(x - x_0)^3}{3!} \left. \frac{d^3y}{dx^3} \right|_{x=x_0} + \dots \quad \dots(2)$$

On substituting the values of  $y(0), y'(0), y''(0)$  etc. in (2), we get

$$y = 0 + (x - 0)(3) + \frac{(x - 0)^2}{2}(9) + \frac{(x - 0)^3}{6}(21) + \frac{(x - 0)^4}{24}(45) + \frac{(x - 0)^5}{120}(93) + \dots$$

$$y = 3x + \frac{9}{2}x^2 + \frac{7}{2}x^3 + \frac{15}{8}x^4 + \frac{31}{40}x^5 + \dots \quad \dots(3)$$

**To find the value of  $y$  when  $x = 0.2$**

Putting  $x = 0.2$  in (3), we get

$$\begin{aligned}y(0.2) &= 3(0.2) + \frac{9}{2}(0.2)^2 + \frac{7}{2}(0.2)^3 + \frac{15}{8}(0.2)^4 + \frac{31}{40}(0.2)^5 + \dots \\&= 0.6 + \frac{9}{2}(0.04) + \frac{7}{2}(0.008) + \frac{15}{8}(0.0016) + \frac{31}{40}(0.00032) \\&= 0.6 + 0.18 + 0.028 + 0.003 + 0.000248 = 0.811248.\end{aligned}$$

**To find exact value of  $y$ :**  $\frac{dy}{dx} - 2y = 3e^x$

$$\text{I.F.} = e^{-\int dx} = e^{-2x}$$

$$\text{Solution is } y \cdot e^{-2x} = \int 3e^x \cdot e^{-2x} dx + c = 3 \int e^{-x} dx + c = -3e^{-x} + c \quad \dots(4)$$

Putting  $x = 0, y = 0$  in (4), we get  $0 = -3 + c \Rightarrow c = 3$

On putting  $c = 3$  in (4), we get

$$y \cdot e^{-2x} = -3e^{-x} + 3 \Rightarrow y = -3e^x + 3e^{2x} \quad \dots(5)$$

Putting  $x = 0.2$  in (5), we get

$$\begin{aligned} y(0.2) &= -3e^{0.2} + 3e^{2(0.2)} = -3e^{0.2} + 3e^{0.4} = -3(1.221403) + 3(1.491825) \\ &= -3.664209 + 4.475475 = 0.811266 \end{aligned}$$

Difference between exact value of  $y$  and its approximate value

$$= 0.811266 - 0.811248 = 0.000018 \quad \text{Ans.}$$

### EXERCISE 52.1

Using Taylor's method, solve the following differential equations :

1.  $\frac{dy}{dx} = x + y^2$ , given  $y(0) = 0$ . Ans.  $y = \frac{1}{2}x^2 + \frac{1}{20}x^5 + \dots$
2.  $\frac{d^2y}{dx^2} + xy = 0$ , subject to  $x = 0, y = c$  and  $\frac{dy}{dx} = 0$ . Ans.  $y = c \left( 1 - \frac{x^3}{3!} + \frac{1 \times 4}{6!}x^6 - \frac{1 \times 4 \times 7}{9!}x^9 + \dots \right)$
3.  $\frac{dy}{dx} = x^2y - 1$ , given  $y(0) = 1$ , and find  $y(0.03)$ . Ans.  $y = 1 - x + \frac{x^2}{3} - \frac{x^4}{4} + \dots, 0.97001$
4.  $\frac{dy}{dx} - y^2 - x = 0$ , for  $y(0) = 0$ , find  $y$  when  $x = 0.2$  Ans.  $y = 0.020016$
5. Obtain the linearized form  $T(x, y)$  of the function  $f(x, y) = x^2 - xy + \frac{1}{2}y^2 + 3$  at the function  $f(x, y) = x^2 - xy + \frac{1}{2}y^2 + 3$  at the point  $(3, 2)$  using the Taylor's series expansion. Find the maximum error in magnitude in the approximation  $T(x, y) \approx T(x, y)$  over the rectangle  $R : |x - 3| < 0.1, |y - 2| < 0.1$ .

### 52.4 PICARD'S METHOD OF SUCCESSIVE APPROXIMATIONS

Let us consider the first order differential equation

$$\frac{dy}{dx} = f(x, y) \quad \dots(1)$$

and  $y = y_0$  for  $x = x_0$

**Method.** Integrating (1) between the limits  $x_0$  and  $x$ , we get

$$\begin{aligned} \int_{y_0}^y dy &= \int_{x_0}^x f(x, y) dx \quad \text{or} \quad y = y_0 + \int_{x_0}^x f(x, y) dx \\ y &= y_0 + \int_{x_0}^x f(x, y) dx \end{aligned} \quad \dots(2)$$

Equation (2) is the solution of (1). But (2) contains the unknown  $y$  under the integral sign on right hand side.

On putting  $y_0$  for  $y$  on R.H.S. of (2), we get a first approximation  $y_1$

$$y_1 = y_0 + \int_{x_0}^x f(x, y_0) dx$$

From(3) we get the value of  $y_1$  and we put  $y_1$  for  $y$  on R.H.S.of (2) to get second approximation  $y_2$ ,

$$\text{Thus } y_2 = y_0 + \int_{x_0}^x f(x, y_1) dx$$

Similarly third approximation is  $y_3 = y_0 + \int_{x_0}^x f(x, y_2) dx$  and so on

In this way we get a better approximation each time than the preceding one.

**Note.** This method is used to solve the differential equation if the successive integration can be performed easily.

The method is now illustrated by an example.

**Example 4.** Using Picard's method find a solution of  $\frac{dy}{dx} = 1 + xy$  upto the third approximation,

when  $y(0) = 0$ .

$$\text{Solution. } \frac{dy}{dx} = 1 + xy \quad \dots(1)$$

Integrating (1) w.r.t. 'x' between the limits 0 and  $x$ , we get

$$\int_0^y dy = \int_0^x (1 + xy) dx \quad \text{or} \quad y = \int_0^x (1 + xy) dx \quad \dots(2)$$

On putting  $y(0) = 0$  for  $y$  on R.H.S. of (2) we have

$$y_1 = \int_0^x (1+0) dx \quad \text{or} \quad y_1 = x$$

On substituting  $y_1 = x$  for  $y$  on R.H.S. of (2), we obtain

$$\begin{aligned} y_2 &= \int_0^x (1+x^2) dx = x + \frac{x^3}{3} \\ y_3 &= \int_0^x \left[ 1+x \left( x + \frac{x^3}{3} \right) \right] dx = \int_0^x \left[ 1+x^2 + \frac{x^3}{3} \right] dx \\ y_3 &= x + \frac{x^3}{3} + \frac{x^5}{15}. \end{aligned}$$

**Ans.**

**Example 5.** Use Picard's method to approximate the value of  $y$  when  $x = 0.1$ , given that  $y = 1$

when  $x = 0$  and  $\frac{dy}{dx} = 3x + y^2$  (two approximations). (R.G.P.V. Bhopal, III Semester, June 2003)

**Solution.** We have,

$$\frac{dy}{dx} = 3x + y^2 \quad \dots(1)$$

Integrating (1) w.r.t. 'x', between the limit 0 and  $x$ , we get

$$\int_{y_0}^y dy = \int_{x_0}^x (3x + y_0^2) dx \Rightarrow y = y_0 + \int_{x_0}^x (3x + y_0^2) dx \quad \dots(2)$$

On putting  $y(0) = 1$  for  $y_0$  on R.H.S. of (2), we get

$$\begin{aligned} y_1 &= 1 + \int_0^x (3x+1) dx \Rightarrow y_1 = 1 + x + \frac{3x^2}{2} \\ y_2 &= 1 + \int_0^x (3x+y_1^2) dx \quad \dots(3) \end{aligned}$$

On substituting the value of  $y_1$  on R.H.S. of (3), we get

$$\begin{aligned} y_2 &= 1 + \int_0^x \left[ 3x + \left( 1+x + \frac{3x^2}{2} \right)^2 \right] dx = 1 + \int_0^x \left[ 3x + 1 + x^2 + \frac{9x^4}{4} + 2x + 3x^2 + 3x^3 \right] dx \\ &= 1 + \int_0^x \left( 1 + 5x + 4x^2 + 3x^3 + \frac{9x^4}{4} \right) dx = 1 + x + \frac{5x^2}{2} + \frac{4x^3}{3} + \frac{3x^4}{4} + \frac{9x^5}{20} \end{aligned} \quad \dots(4)$$

Putting the value of  $x = 0.1$  in (4), we get

$$\begin{aligned} &= 1 + 0.1 + \frac{5(0.1)^2}{2} + \frac{4(0.1)^3}{3} + \frac{3(0.1)^4}{4} + \frac{9(0.1)^5}{20} \\ &= 1 + 0.1 + 0.025 + 0.00133 + 0.000075 + 0.0000045 = 1.1264095 \end{aligned}$$

Ans.

**Example 6.** Use Picard's method to solve  $\frac{dy}{dx} = -xy$ ,  $y(0) = 1$

**Solution.**

$$\begin{aligned} y(x) &= y_0 - \int_0^x xy \, dx \\ &= 1 - \int_0^x x(1) \, dx = 1 - \int_0^x x \, dx = 1 - \frac{x^2}{2} \end{aligned}$$

Now using this value of  $y$ , we have

$$\begin{aligned} y &= 1 - \int_0^x x \left( 1 - \frac{x^2}{2} \right) \, dx = 1 - \int_0^x \left( x - \frac{x^3}{2} \right) \, dx = 1 - \frac{x^2}{2} + \frac{x^4}{8} \\ &= 1 - \int_0^x x \left( 1 - \frac{x^2}{2} + \frac{x^4}{8} \right) \, dx = 1 - \int_0^x \left( x - \frac{x^3}{2} + \frac{x^5}{8} \right) \, dx = 1 - \frac{x^2}{2} + \frac{x^4}{8} - \frac{x^6}{48} \end{aligned}$$

Repeating once again we shall obtain

$$y = 1 - \frac{x^2}{2} + \frac{x^4}{8} - \frac{x^6}{48} + \frac{x^8}{384} \quad \text{Ans.}$$

**Example 7.** Use Picard's method to solve the equations

$$\frac{dx}{dt} = -y, \quad \frac{dy}{dt} = x$$

given that  $x = 1$ ,  $y = 0$  when  $t = 0$ .

**Solution.**  $\frac{dx}{dt} = -y$  ... (1)

$$\frac{dy}{dt} = x \quad \dots(2)$$

Integrating (1) w.r.t 't' from  $t = 0$  to  $t$  we get

$$\begin{aligned} [x]_1^x &= - \int_0^t y \, dt \quad \text{or} \quad x - 1 = - \int_0^t y \, dt \\ x &= 1 - \int_0^t y \, dt \end{aligned} \quad \dots(3)$$

Integrating (2), w.r.t., 't' from  $t = 0$  to  $t$ , we get

$$\begin{aligned} [y]_0^y &= \int_0^x x \, dt \quad \text{or} \quad y - 0 = \int_0^t x \, dt \\ y &= \int_0^t x \, dt \end{aligned} \quad \dots(4)$$

Replacing  $y$  by 0 in (3) and  $x$  by 1 in (4), we have

$$x = 1 - \int_0^t 0 \, dt = 1 \quad \text{and} \quad y = \int_0^t 1 \, dt = t$$

$$\begin{aligned}
 x &= 1 - \int_0^t t dt = 1 - \frac{t^2}{2}, \quad y = \int_0^t \left(1 - \frac{t^2}{2}\right) dt = t - \frac{t^3}{6} \\
 x &= 1 - \int_0^t \left(t - \frac{t^3}{6}\right) dt = 1 - \frac{t^2}{2} + \frac{t^4}{24} \\
 y &= \int_0^t \left(t - \frac{t^2}{2} + \frac{t^4}{24}\right) dt = t - \frac{t^3}{6} + \frac{t^5}{120}, \quad \text{Ans.}
 \end{aligned}$$

**EXERCISE 52.2**

Using Picard's method, solve the following:

1.  $\frac{dy}{dx} = x + y^2$ , given  $y(0) = 0$ . (RGPV, Bhopal, June 2008)

**Ans.**  $y = \frac{1}{2}x^2 + \frac{1}{20}x^5 + \frac{1}{160}x^8 + \frac{1}{4400}x^{11}$

2. Apply Picard's iteration method to find approximate solutions to the initial value problem

$$y' = 1 + y^2, y(0) = 0$$

3.  $\frac{dy}{dx} = x - y$ , given  $y(0) = 1$  and find  $y(0.2)$  to five places of decimals.

(RGPV, Bhopal, June 2001, 2000) **Ans.**  $y = 1 - x + x^2 - \frac{x^3}{3} + \frac{x^4}{12} - \frac{x^5}{60} + \frac{x^6}{720}, 0.83746$

4.  $\frac{dy}{dx} = y + x$ , given  $y(0) = 1$ , find  $y(1)$ , **Ans.**  $y = 1 + x + x^2 + \frac{x^3}{3} + \frac{x^4}{12} - \frac{x^5}{60} + \frac{x^6}{120} + 3.434$ .

5.  $\frac{dy}{dx} = x^2 + y^2$  for  $y(0) = 0$ , find  $y(0.4)$ . **Ans.** 0.0214.

6.  $\frac{dy}{dx} = 2y + z, \frac{dz}{dx} = y + 2z$  given  $y(0) = 0, z(0) = 1$

**Ans.**  $y = x + 2x^2 + \frac{13}{6}x^3 + \frac{5}{3}x^4 + \dots, z = 1 + 2x + \frac{5}{2}x^2 + \frac{7}{3}x^3 + \frac{41}{40}x^4 + \dots$

7. Use Picard's method to approximate  $y$  when  $x = 0.1$ , given that  $y = 1$ , when  $x = 0$  and

$$\frac{dy}{dx} = \frac{y-x}{y+x}. \quad (\text{RGPV, Bhopal, III Sem. June 2003}) \quad \text{Ans. } y = 1.0906.$$

**52.5 EULER'S METHOD**

This is purely numerical method for solving the first order differential equations. This is an elementary method and which will demonstrate the procedure underlying these methods. This method should not be used for practical solution.

Consider the differential equation

$$\frac{dy}{dx} = f(x, y) \quad \dots(1)$$

Let  $y = \phi(x)$  be the solution of (1). (2)

Let  $(x_0, y_0), (x_1, y_1) \dots (x_n, y_n), (x_{n+1}, y_{n+1})$  be the points on the curve of (2).  $x_0, x_1, \dots, x_n, x_{n+1}, \dots$  are equispaced at equal interval  $h$ .

$$\begin{aligned}
 y_{n+1} &= \phi(x_{n+1}) && [(x_{n+1}, y_{n+1}) \text{ lies on (2).}] \\
 &= \phi(x_n + h) && (x_{n+1} = x_n + h) \\
 &= \phi(x_n) + h f'(x_n) + \frac{1}{2}h^2 \phi''(x_n) + \dots && \dots(3) \\
 &= \phi(x_n) + h\phi'(x_n) && (h \text{ is very small})
 \end{aligned}$$

$$\begin{aligned}
 &= \phi(x_n) + hf(x_n, y_n) && \left[ \text{since } \frac{dy}{dx} = f(x, y) \right] \\
 y_{n+1} &= y_n + hf(x_n, y_n) && [\text{since } y_n = \phi(x_n) \text{ from (2)}] \quad \dots(4)
 \end{aligned}$$

This formula (4) can be used to find  $y_{n+1}$ , where  $y_n$  is known.

On substituting the value of  $y_0$ , ( $n = 0$ ) in (4) we get  $y_1$ ,

Similarly putting the value of ( $n = 1$ ) in (4), we obtain  $y_2$  and so on.

**Note.** Since we have neglected  $1/2 h^2 \phi''(x_n)$  and higher powers of  $h$  from formula (4) there will be a larger error in  $y_{n+1}$ . Therefore it is not used in practical problems.

### Geometrically

Let  $y = \phi(x)$  be a solution curve  $PQ$ . The ordinate of  $P$  i.e.  $y_n$  is known.

Now we have to find the ordinate  $y_{n+1}$  of any point  $Q$ .

$$\begin{aligned}
 y_{n+1} &= MQ = MR + RQ = PL + RT + TQ && (TQ = \text{Error}) \\
 &= y_n + h \tan \theta = y_n + h \left( \frac{dy}{dx} \right) = y_n + hf(x_n, y_n)
 \end{aligned}$$

**Example 8.** Using Euler's method find an approximate value of  $y$  corresponding to

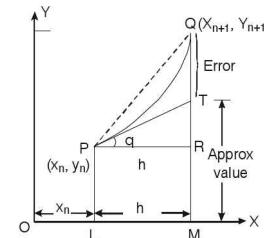

$x = 2$ , given that  $\frac{dy}{dx} = x + 2y$  and  $y = 1$  when  $x = 1$ .

**Solution.**

$$f(x, y) = x + 2y$$

$$y_{n+1} = y_n + hf(x_n, y_n) = y_n + 0.1(x + 2y)$$

**Method:** In column 3 we record the value of  $x + 2y$  and in column 4 we enter the sum of the value of  $y$  and the product of 0.1 with the value of  $x + 2y$ . This value entered in 4th column is transferred to second column for the next calculation.

$x$	$y$	$x + 2y = \frac{dy}{dx}$ old	$y + 0.1 \left( \frac{dy}{dx} \right) = \text{new } y$
1.0	1.00	3.00	$1.0 + 0.1(3) = 1.30$
1.1	1.3	3.70	$1.3 + 0.1(3.7) = 1.67$
1.2	1.67	4.54	$1.67 + 0.1(4.54) = 2.12$
1.3	2.12	5.54	$2.12 + 0.1(5.54) = 2.67$
1.4	2.67	6.74	$2.67 + 0.1(6.74) = 3.34$
1.5	3.34	8.18	$3.34 + 0.1(8.18) = 4.16$
1.6	4.16	9.92	$4.16 + 0.1(9.92) = 5.15$
1.7	5.15	12.00	$5.15 + 0.1(12.0) = 6.35$
1.8	6.35	14.50	$6.35 + 0.1(14.50) = 7.80$
1.9	7.80	17.50	$7.80 + 0.1(17.50) = 9.55$
2.0	9.55		

Thus the required approximate value of  $y = 9.55$

**Ans.**

**EXERCISE 52.3**

1. Using Euler's method, find an approximate value of  $y$  corresponding to  $x = 1$ , given that

$$\frac{dy}{dx} = x + y \text{ and } y = 1 \text{ when } x = 0. \quad \text{Ans. 3.18}$$

2. Using Euler's method, find an approximate value of  $y$  corresponding to  $x = 1.4$ , given  $\frac{dy}{dx} = xy^{1/2}$  and  $y = 1$  when  $x = 1$ .   
 **Ans. 1.49857.**

3. Using Euler's method, find an approximate value of  $y$  corresponding to  $x = 1.6$ , given  $\frac{dy}{dx} = y^2 - \frac{y}{x}$  and  $y = 1$  when  $x = 1$ .   
 **Ans. 1.1351**

4. Using Euler's method to solve the differential equation in six steps

$$\frac{dy}{dx} = x + y; \quad y(0) = 0 \text{ choosing } h = 0.2. \quad (\text{RGPV, Bhopal, III Sem. Dec. 2003}) \quad \text{Ans. } y = 0.785984$$

**52.6 EULER'S MODIFIED FORMULA**

In equation (3) of Art 52.14 the expansion of  $y_{n+1}$  is

$$y_{n+1} = y_n + hf(x_n, y_n) + \frac{1}{2}h^2\phi''(x_n, y_n) + \frac{1}{3}h^3\phi'''(x_n, y_n) + \dots \quad \dots(1)$$

In Euler's formula we omit  $\frac{1}{2}h^2\phi''(x_n, y_n)$  and higher powers of  $h$ .

The error due to this omission is called **Truncation error**.

Now a formula is derived with small error.

Differentiating (1) w.r.t.  $x$  we get

$$\begin{aligned} \left(\frac{dy}{dx}\right)_{n+1} &= \left(\frac{dy}{dx}\right)_n + hf'(x_n, y_n) + \frac{1}{2}h^2\phi'''(x_n, y_n) + \dots \\ \therefore f(x_{n+1}, y_{n+1}) &= f(x_n, y_n) hf'(x_n, y_n)' + \frac{1}{2}h^2\phi'''(x_n, y_n) + \dots \\ &= f(x_n, y_n) + h\phi'''(x_n, y_n) + \frac{1}{2}h^2\phi'''(x_n, y_n) + \dots \end{aligned} \quad \dots(2)$$

Multiplying (2) by  $\frac{h}{2}$  and subtracting from (1) we get

$$y_{n+1} - \frac{1}{2}hf(x_{n+1}, y_{n+1}) = y_n + \frac{h}{2}f(x_n, y_n) - \frac{h^3}{12}\phi'''(x_n, y_n)$$

Neglecting terms containing  $h^3$  and higher powers, we obtain

$$y_{n+1} = y_n + h \left[ \frac{f(x_n, y_n) + f(x_{n+1}, y_{n+1})}{2} \right] \quad \dots(3)$$

Equation (3) is the Euler's modified formula.

But  $f(x_{n+1}, y_{n+1})$  which occurs on the right hand side of equation (3), cannot be calculated since  $y_{n+1}$  is unknown. So first we calculate  $y_{n+1}$  from Euler's first formula.

$$y_{n+1} = y_n + hf(x_n, y_n)$$

Thus for each stage we use the following two formulae.

$$y_{n+1} = y_n + hf(x_n, y_n)$$

$$y_{n+1} = y_n + \frac{h}{2}f(x_n, y_n) (y_{n+1}, y_{n+1})$$

**Example 9.** Apply Euler's modified method to solve  $\frac{dy}{dx} = x + 3y$  subject to  $y(0) = 1$  and hence find an approximate value of  $y$  when  $x = 1$ .

**Solution.**  $f(x,y) = x + 3y$

$$\begin{aligned} y_{n+1} &= y_n + hf(x_n, y_n) \\ y_{n+1} &= y_n + \frac{h}{2} [f(x_n, y_n) + f(x_{n+1}, y_{n+1})] \end{aligned}$$

This gives

$$\begin{aligned} y_{n+1} &= y_n + 0.1(x_n + 3y_n) \\ y_{n+1} &= y_n + 0.05 [x_n + 3y_n] + (x_{n+1} + 3y_{n+1}). \end{aligned}$$

Hence the required value of  $y$  at  $x = 1$  is 21.081.

The exact solution gives  $y = 21.873$  for  $x = 1$ . The error is 0.792 i.e., 3.6%. Ans.

**Procedure.** We calculated  $y_{n+1}$  by Euler's formula i.e.,  $y_{n+1} = y_n + 0.1(x_n + 3y_n)$  and entered in 5th column. In 7th column we record the sum i.e.  $x_{n+1} + 3y_{n+1}$ . Then we computed the value of  $y_{n+1}$  by Euler's modified formula i.e.,

$$y_{n+1} = y_n + \frac{0.1}{2} [(x_n + 3y_n) + (x_{n+1} + 3y_{n+1})]. \text{ and entered in 8th column.}$$

The following table shows the computation work.

$n$	$x_n$	$y_n$	$x_n + 3y_n$	Eulers formula $y_{n+1}$	$x_n + 1$	$x_{n+1} + 3y_{n+1}$	Eulers modified $y_{n+1}$
0	0.0	1	3	1.3	0.1	4	1.35
1	0.1	1.35	4.15	1.765	0.2	5.495	1.832
2	0.2	1.832	5.695	2.402	0.3	7.506	2.492
3	0.3	2.492	7.776	3.270	0.4	10.21	3.391

9	0.9	15.593	47.679	20.361	1.0	62.083	21.081
10	1.0	21.081					

#### EXERCISE 52.4

1. Using Euler's modified formula, find an approximate value of  $y$  when  $x = 0.3$ , given that

$$\frac{dy}{dx} = x + y \text{ and } y = 1 \text{ when } x = 0. \quad (\text{RGPV, Bhopal, III Sem. Dec. 2007}) \quad \text{Ans. } 1.3997$$

2. Using Euler's modified formula, find an approximate value of  $y$  when  $x = 0.06$ , given that

$$\frac{dy}{dx} = x^2 + y \text{ and } y(0) = 1, \text{ taking the interval } 0.02. \quad \text{Ans. } 1.0619$$

3. Using Euler's modified formula, solve  $\frac{dy}{dx} = 1 - 2xy$  given  $y = 0$  at  $x = 0$  from  $x = 0$  to  $0.6$  taking the

interval  $h = 0.2$ . Ans. 0.4748

4. Using Euler's modified method to compute  $y$  for  $x = 0.05$ . Given that  $\frac{dy}{dx} = x + y$  with initial conditions  $x_0 = 0, y_0 = 1$  results correct upto three decimal places. (RGPV, Bhopal, III Sem. Dec. 2002) **Ans.**  $y = 1.0525$

### 52.7 RUNGE'S FORMULA

Euler's modified formula is  $y_{n+1} = y_n + \frac{h}{2} [f(x_n, y_n) + f(x_{n+1}, y_{n+1})]$   
 or  $y_{n+1} = y_n + \frac{h}{2} [f(x_n, y_n) + f(x_n + h, y_n + hf_n)] \quad \dots (1)$

Let  $k_1 = hf(x_n, y_n)$   
 and  $k_2 = hf[x_n + h, y_n + hf(x_n, y_n)] \quad \text{or} \quad k_2 = hf(x_n + h, y_n + k_1)$

Putting the values of  $k_1$  and  $k_2$  in (1) we get

$$y_{n+1} = y_n + \frac{1}{2}(k_1 + k_2) \quad \dots (2)$$

This is known as Runge's formula of order 2.

**Example 10.** Apply Runge's formula of order 2 to find approximate value of  $y$  when  $x = 1.1$ ,

given  $\frac{dy}{dx} = 3x + y^2$  and  $y = 1.2$  when  $x = 1$ . (RGPV, Bhopal, III Sem. June 2005)

**Solution.** Here we have  $x_0 = 1, y_0 = 1.2, h = 0.1$

$$\begin{aligned} f(x, y) &= 3x + y^2, f(x_0, y_0) = 3(1) + (1.2)^2 = 4.44 \\ k_1 &= hf(x_0, y_0) = 0.1 \times 4.44 = 0.444 \\ k_2 &= hf(x_0 + h, y_0 + k_1) = 0.1f(1.1, 1.2 + 0.444) = 0.1f(1.1, 1.644) \\ &= 0.1[3 \times 1.1 + (1.644)^2] = 0.600 \end{aligned}$$

$$\begin{aligned} y_{n+1} &= y_n + \frac{1}{2}(k_1 + k_2) \\ y_1 &= 1.2 + \frac{1}{2}(0.444 + 0.600) = 1.722 \quad \text{Ans.} \end{aligned}$$

### EXERCISE 52.5

- Apply Runge's formula of second order to find approximate value of  $y$  when  $x = 1.1$ , given that  $\frac{dy}{dx} = x - y$  and  $y = 1$  when  $x = 1$ . **Ans.** 1.005
- Apply Runge's formula of second order to find approximate value of  $y$  when  $x = 0.02$ , given that

$$\frac{dy}{dx} = x^2 + y \text{ and } y(0) = 1. \quad \text{Ans. } 1.0202.$$

### 52.8 RUNGE'S FORMULA (THIRD ORDER)

$$y_1 = y_0 + \frac{1}{6}(k_1 + 4k_4 + k_3)$$

where  $k_1 = hf(x_0, y_0), k_2 = hf(x_0 + h, y_0 + k_1)$

$$k_3 = hf(x_0 + h, y_0 + k_2), \quad k_4 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_1}{2}\right)$$

This is the Runge's Formula (third order) with an error of the order  $h^4$ .

**Example 11.** Using Runge 's Formula (third order), solve the differential equation  $\frac{dy}{dx} = x - y$  subject to  $y = 1$  when  $x = 1$ .

**Solution.**  $f(x, y) = x - y$

Here  $h = 0.1$ ,  $x_0 = 1$ ,  $y_0 = 1$

$$k_1 = hf(x_0, y_0) = 0.1(x - y) = 0.1(1 - 1) = 0$$

$$k_2 = hf(x_0 + h, y_0 + k_1) = 0.1f(1.1, 1 + 0) = 0.1(1.1 - 1) = 0.01$$

$$k_3 = hf(x_0 + h, y_0 + k_2) = 0.1f(1.1, 1.01) = 0.1(1.1 - 1.01) = 0.009$$

$$k_4 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_1}{2}\right) = 0.1f\left(1.05, 1 + \frac{0}{2}\right) = 0.1(1.05 - 1) = 0.005$$

$$y_1 = y_0 + \frac{1}{6}(k_1 + 4k_4 + k_3)$$

$$y(0.1) = 1 + \frac{1}{6}(0 + 0.02 + 0.009) = 1 + 0.004833 = 1.004833$$

**Ans.**

## 52.9 RUNGE-KUTTA FORMULA (FOURTH ORDER)

A fourth order Runge's-Kutta Formula for solving the differential equation is

$$y = y_0 + \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4)$$

where

$$k_1 = hf(x_0, y_0), \quad k_2 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_1}{2}\right)$$

$$k_3 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_2}{2}\right), \quad k_4 = hf(x_0 + h, y_0 + k_3)$$

$$y = y_0 + \frac{1}{6}[k_1 + 2k_2 + 2k_3 + k_4]$$

This is known as Runge-Kutta Formula. The error in this formula is of the order  $h^5$ . This method have greater accuracy. No deviatives are required to be tabulated.

It requires only functional values at some selected points on the sub interval.

**Example 12.** Apply Runge-Kutta method to find an approximate value of  $y$  when  $x = 0.2$ , given that

$$\frac{dy}{dx} = x + y, \quad y = 1 \text{ when } x = 0$$

**Solution.** Let  $h = 0.1$

Here  $x_0 = 0$ ,  $y_0 = 1$ ,  $f(x, y) = x + y$

$$\text{Now } k_1 = hf(x_0, y_0) = 0.1(0 + 1) = 0.1$$

$$k_2 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_1}{2}\right) = 0.1f(0 + 0.05, 1 + 0.05) = 0.1[0.05 + 1.05] = 0.11$$

$$k_3 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_2}{2}\right) = 0.1f(0 + 0.05, 1 + 0.055) = 0.1[0.05 + 1.055] = 0.1105$$

$$k_4 = hf(x_0 + h, y_0 + k_3) = 0.1f(0 + 0.1, 1 + 0.1105)$$

$$= 0.1f(0.1, 1.1105) = 0.1(0.1 + 1.1105) = 0.12105$$

According to Runge-Kutta (Fourth order) formula

$$y = y_0 + \frac{1}{6} [k_1 + 2k_2 + 2k_3 + k_4]$$

$$y_{0.1} = 1 + \frac{1}{6} (0.1 + 0.22 + 0.221 + 0.12105) = 1 + \frac{1}{6} (0.66205) = 1.11034$$

**For the second step**

$$x_0 = 0.1, y_0 = 1.11034, h = 0.1$$

$$k_1 = hf(x_0, y_0) = 0.1(0.1 + 1.11034) = 0.121034$$

$$k_2 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_1}{2}\right) = 0.1f(0.1 + 0.05, 1.11034 + 0.060517)$$

$$= 0.1 (0.15 + 1.170857) = 0.1320857$$

$$k_3 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_2}{2}\right) = 0.1f(0.1 + 0.05, 1.11034 + 0.0660428)$$

$$= 0.1 (0.15 + 1.1763828) = 0.13263828$$

$$k_4 = hf(x_0 + h, y_0 + k_3) = 0.1 (0.1 + 0.1, 1.11034 + 0.13263828)$$

$$= 0.1 (0.2 + 1.24297828) = 0.144297828$$

$$y_1 = y_0 + \frac{1}{6} [k_1 + 2k_2 + 2k_3 + k_4]$$

$$= 1.11034 + \frac{1}{6} [0.121034 + 2 \times 0.1320857 + 2 \times 0.13263828 + 0.144297828]$$

$$= 1.11034 + \frac{1}{6} [0.121034 + 0.2641714 + 0.26527656 + 0.144297828]$$

$$= 1.11034 + \frac{1}{6} \times 0.794779788 = 1.11034 + 0.132463298 = 1.242803298 \quad \text{Ans.}$$

**Example 13.** Apply Range-Kutta method of fourth order to solve :

$$10 \frac{dy}{dx} = x^2 + y^2; \quad y(0) = 1 \text{ for } x = 1. \quad (\text{R. G.P.V. Bhopal, III Semester, Dec. 2002})$$

**Solution.** We have,

$$10 \frac{dy}{dx} = x^2 + y^2 \Rightarrow \frac{dy}{dx} = \frac{x^2 + y^2}{10}$$

$$\Rightarrow f(x, y) = \frac{x^2 + y^2}{10}$$

Here, let  $h = 0.1, x_0 = 0, y_0 = 1$ .

$$\text{Now, } k_1 = hf(x_0, y_0) = (0.1)f(0, 1) = (0.1) \left( \frac{0+1}{10} \right) = 0.01$$

$$k_2 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_1}{2}\right) = (0.1)f\left(0 + \frac{0.1}{2}, 1 + \frac{0.01}{2}\right)$$

$$= (0.1)f(0.05, 1.005) = (0.1) \left[ \frac{(0.05)^2 + (1.005)^2}{10} \right] = 0.01012525$$

$$k_3 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_2}{2}\right) = (0.1)f\left(0.05, 1 + \frac{0.01012525}{2}\right)$$

$$= (0.1)f(0.05, 1.00506263) = (0.1) \left[ \frac{(0.05)^2 + (1.00506263)^2}{10} \right] = 0.01012651$$

$$\begin{aligned}
 k_4 &= hf(x_0 + h, y_0 + k_3) = (0.1)f(0.1, 1 + 0.01012651) \\
 &= (0.1)f(0.1, 1.01012651) = (0.1) \left[ \frac{(0.1)^2 + (1.01012651)^2}{10} \right] = 0.010303556 \\
 y_{0.1} &= y_0 + \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\
 &= 1 + \frac{1}{6}[0.01 + 2(0.01012525) + 2(0.01012651) + 0.010303556] \\
 &= 1 + 0.01013451 = 1.01013451
 \end{aligned}$$

Hence,  $y$  at  $x = 0.1$  is 1.01013451.

**Ans.**

**Example 14.** Apply Runge-Kutta method (fourth order), to find an approximate value of  $y$

when  $x = 0.2$ , given that  $\frac{dy}{dx} = x + y^2$  and  $y = 1$  when  $x = 0$ .

(RGPV, Bhopal, III Sem. Dec. 2004, AMIETE, Dec. 2010)

**Solution.** Let  $h = 0.1$ ,

$$\text{Here } x_0 = 0, y_0 = 1, f(x, y) = x + y^2$$

$$\text{Now } k_1 = hf(x_0, y_0) = 0.1(0 + 1) = 0.1$$

$$k_2 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_1}{2}\right) = 0.1f(0 + 0.05, 1 + 0.05) = 0.1[0.05 + (1.05)^2] = 0.11525$$

$$\begin{aligned}
 k_3 &= hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_2}{2}\right) = 0.1f(0 + 0.05, 1 + 0.057625) \\
 &= 0.1[0.05 + (1.057625)^2] = 0.11685
 \end{aligned}$$

$$k_4 = hf(x_0 + h, y_0 + k_3) = 0.1f(0 + 0.1, 1 + 0.11685) = 0.1[0.1 + (0.11685)^2] = 0.13474$$

According to Runge-Kutta (fourth order) formula

$$\begin{aligned}
 y_1 &= y_0 + \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\
 y_{0.1} &= 1 + \frac{1}{6}[0.1 + 2(0.11525) + 2(0.11685) + 0.13474] \\
 y_{0.1} &= 1 + 0.1165 = 1.1165
 \end{aligned}$$

For the second step

$$x_0 = 0.1, y_0 = 1.1165$$

$$k_1 = 0.1(0.1 + 1.2466) = 0.1347$$

$$k_2 = 0.1(0.15 + 1.4014) = 0.1551$$

$$k_3 = 0.1(0.15 + 1.4259) = 0.1576$$

$$k_4 = 0.1(0.2 + 1.6233) = 0.1823$$

$$\begin{aligned}
 y_{0.2} &= y_{0.1} + \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\
 &= 1.1165 + \frac{1}{6}[0.1347 + 2(0.1551) + 2(0.1576) + 0.1823] \\
 &= 1.1165 + 0.1571 = 1.2736
 \end{aligned}$$

**Ans.**

**Example 15.** Use the fourth order Runge-Kutta method to find  $u(0, 2)$ , of the initial value problem  $u' = -2t u^2$ ,  $u(0) = 1$ , using  $h = 0.2$ . (U.P. III Sem., Dec. 2009)

**Solution.**  $h = 0.2$

Here  $t = 0, u = 1, f(t, u) = -2 tu^2$

$$k_1 = hf(t_0, u_0) = 0.2 (-2 tu^2) = 0.2 (0) = 0$$

$$k_2 = hf\left(t_0 + \frac{h}{2}, u_0 + \frac{k_1}{2}\right)$$

$$= 0.2f(0.1, 1 + 0) = 0.2 f(0.1, 1) = 0.2 (-2 \times 0.1 \times 1^2) = -0.04$$

$$k_3 = hf\left(t_0 + \frac{h}{2}, u_0 + \frac{k_2}{2}\right) = 0.2f(0 + 0.1, 1 - 0.02) = 0.2f(0.1, 0.98)$$

$$= 0.2f[-2 \times 0.1 \times (0.98)^2] = -0.2[0.2 \times 0.9604] = -0.038416$$

$$\begin{aligned} k_4 &= hf(t_0 + h, u_0 + k_3) \\ &= 0.2f(0.2, 1 - 0.038416) = 0.2(-2) \times (0.2) \times (0.961584)^2 \\ &= -0.08 \times 0.9246 = -0.073971503 \end{aligned}$$

$$u = u_0 + \frac{1}{6}[k_1 + 2k_2 + 2k_3 + k_4] = 1 + \frac{1}{6}[0 + 2(-0.04) + 2(-0.038416) + (-0.073968)]$$

$$= 1 - \frac{1}{6}[0.08 + 0.076832 + 0.07391503]$$

$$= 1 - \frac{1}{6}(0.2308) = 1 - 0.03847 = 0.961532749$$

**Ans.**

### EXERCISE 52.6

- The initial value problem  $y' = x(y+x) - 2, y(1) = 2$  is given. Find the value of  $y(1.2)$  with  $h = 0.2$  using the Runge-Kutta method of fourth order. **Ans.**  $y(1.2) = 2.3138$
- Use the Runge-Kutta method of fourth order to find  $y(0.8)$  with  $h = 0.2$  for the initial value problem.

$$\frac{dy}{dx} = \sqrt{x+y}, \quad y(0, 4) = 0.41 \quad \text{Ans. } 0.8489912$$

- Find  $y(0.2)$  for the equation

$$\frac{dy}{dx} = -xy, \quad y(0) = 1, \text{ using Runge-Kutta method.}$$

- Apply the Runge-Kutta method to obtain  $y(1.1)$  from the differential equation

$$\frac{dy}{dx} = xy^{1/3}, \quad y(1) = 1, \text{ taking } h = 0.1.$$

- Apply Runge-Kutta (fourth order) formula to find an approximate value of  $y$  when  $x = 1.1$ , given that

$$\frac{dy}{dx} = x - y \text{ and } y = 1 \text{ at } x = 1. \quad \text{Ans. } 1.004837$$

- Using Ringe-Kutta method of fourth order solve  $\frac{dy}{dx} = \frac{y^2 - x^2}{y^2 + x^2}$  with  $y(0) = 1$  at  $x = 0.2$  and  $0.4$ .

(RGPV, Bhopal III Sem. June 2008, 2004) **Ans.**  $y_{1,2} = 1.19600, \quad y_{1,4} = 1.37527$

### 52.10 HIGHER ORDER DIFFERENTIAL EQUATIONS

Let  $\frac{dy}{dx} = f(x, y, z), \frac{dz}{dx} = g(x, y, z), \quad y(x_0) = y_0, \quad z(x_0) = z_0$

Formulae for the application of Runge-Kutta method are as follows :

$$k_1 = hf(x_n, y_n, z_n), \quad m_1 = hg(x_n, y_n, z_n)$$

$$\begin{aligned}
k_2 &= \left( x_n + \frac{h}{2}, y_n + \frac{k_1}{2}, z_n + \frac{m_1}{2} \right) \\
m_2 &= hg \left( x_n + \frac{h}{2}, y_n + \frac{k_1}{2}, z_n + \frac{m_1}{2} \right) \\
k_3 &= hf \left( x_n + \frac{h}{2}, y_n + \frac{k_2}{2}, z_n + \frac{m_2}{2} \right) \\
m_3 &= hg \left( x_n + \frac{h}{2}, y_n + \frac{k_2}{2}, z_n + \frac{m_2}{2} \right) \\
k_4 &= hf(x_n + h, y_n + k_3, z_n + m_3) \\
m_4 &= hg(x_n + h, y_n + k_3, z_n + m_3) \\
x_{n+1} &= x_n + h \\
y_{n+1} &= y_n + \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\
z_{n+1} &= z_n + \frac{1}{6}(m_1 + 2m_2 + 2m_3 + m_4)
\end{aligned}$$

Higher order differential equations are best treated by transforming the given equation into a system of first order simultaneous equations which can be solved by one of the aforesaid methods.

Consider, for example the second order differential equation :

$$\frac{d^2y}{dx^2} = f\left(x, y, \frac{dy}{dx}\right); \quad y(x_0) = y_0, \quad \left.\frac{dy}{dx}\right|_{x=x_0} = y_0'$$

Substituting  $\frac{dy}{dx} = z$ , we get

$$\begin{aligned}
\frac{dz}{dx} &= f(x, y, z) \\
y(x_0) &= y_0, \quad z(x_0) = y_0'
\end{aligned}$$

These constitute the equivalent system of simultaneous equations.

**Example 16.** Use Runge-Kutta method to find  $y(0.2)$  for the equation

$$\frac{d^2y}{dx^2} = x \frac{dy}{dx} - y$$

given that  $y = 1$ ,  $\frac{dy}{dx} = 0$  when  $x = 0$ .

**Solution.** Substituting  $\frac{dy}{dx} = z = f(x, y, z)$

The given equation reduces to  $\frac{d^2y}{dx^2} = xz - y = g(x, y, z)$

The initial conditions are given by  $x = 0, y = 1, z = 0$ .

Also  $h = 0.2$

$$k_1 = hf(x, y, z) = hz = 0.2 \times 0 = 0$$

$$m_1 = hg(x, y, z) = h(xz - y) = 0.2(0 \times 0 - 1) = -0.2$$

$$k_2 = hf\left(x + \frac{h}{2}, y + \frac{k_1}{2}, z + \frac{m_1}{2}\right) = \left(z + \frac{m_1}{2}\right) = 0.2\left(0 - \frac{0.2}{2}\right) = -0.02$$

$$\begin{aligned}
m_2 &= hg\left(x + \frac{h}{2}, y + \frac{k_1}{2}, z + \frac{m_1}{2}\right) = h\left[\left(x + \frac{h}{2}\right)\left(z + \frac{m_1}{2}\right) - \left(y + \frac{k_1}{2}\right)\right] \\
&= 0.2\left[\left(0 + \frac{0.2}{2}\right)\left(0 - \frac{0.02}{2}\right)\left(1 + \frac{0}{2}\right)\right] = 0.2[-0.01 - 1] = -0.202 \\
k_3 &= hf\left(x + \frac{h}{2}, y + \frac{k_2}{2}, z + \frac{m_2}{2}\right) = h\left(z + \frac{m_2}{2}\right) = 0.2\left(0 - \frac{0.202}{2}\right) = -0.0202 \\
m_3 &= hg\left[x + \frac{h}{2}, y + \frac{k_2}{2}, z + \frac{m_2}{2}\right] = h\left[\left(x + \frac{h}{2}\right)\left(z + \frac{m_2}{2}\right) - \left(y + \frac{k_2}{2}\right)\right] \\
&= 0.2\left[\left(0 + \frac{0.2}{2}\right)\left(0 - \frac{0.202}{2}\right) - \left(1 - \frac{0.02}{2}\right)\right] = 0.2[-0.0101 - 0.99] = -0.20002 \\
k_4 &= hf(x + h, y + k_3, z + m_3) = h(z + m_3) = 0.2(0 - 0.20002) = -0.040004 \\
m_4 &= hg(x + h, y + k_3, z + m_3) = h[(x + h)(z + m_3) - (y + k_3)] \\
&= 0.2 [(0.2)(-0.20002) - (1 - 0.0202)] = 0.2 [-0.040004 - 0.9798] = -0.2039608
\end{aligned}$$

This gives, at  $x = 0.2$

$$\begin{aligned}
y(0.2) &= y(0) + \frac{1}{6} [k_1 + 2k_2 + 2k_3 + k_4] = 1 + \frac{1}{6} [0 + 2(-0.02) + 2(-0.0202) + (-0.040004)] \\
&= 1 + \frac{1}{6} (-0.04 - 0.0404 - 0.040004) = 1 + \frac{1}{6} (-0.120404) = 0.97993266 \\
z(0.2) &= z(0) + \frac{1}{6} (m_1 + 2m_2 + 2m_3 + m_4) \\
&= 0 + \frac{1}{6} [-0.2 + 2(-0.202) + 2(-0.20002) - 0.2039608] \\
&= \frac{1}{6} [-0.2 - 0.404 - 0.40004 - 0.2039608] \\
&= \frac{1}{6} (-1.2080008) = -0.201333466
\end{aligned}$$

**Ans.**

### EXERCISE 52.7

1. Find  $y(0.4)$  for the equation  $\frac{dy}{dx} = x^2 + y^2$ ,  $y(0) = 0$  by Picard's method. **Ans.** 0.0214.
2. Use Picard's method to solve  $\frac{dy}{dx} = 2y + z$ ,  $\frac{dz}{dx} = y + 2z$ ; given that  $y(0) = 0$ ,  $z(0) = 1$ .  
**Ans.**  $y = x + 2x^2 + \frac{13}{6}x^3 + \frac{5}{3}x^4 + \dots$   $z = 1 + 2x + \frac{5}{2}x^2 + \frac{7}{3}x^3 + \frac{41}{24}x^4 + \dots$
3. Employ Runge-Kutta method to find  $y$  for  $x = 0.2$  from  $\frac{d^2y}{dx^2} = x\left(\frac{dy}{dx}\right)^2 - y^2$   
given that  $y = 1$ ,  $\frac{dy}{dx} = 0$  for  $x = 0$ . **Ans.**  $y(0.2) = 0.9801$ ;  $y'(0.2) = -0.1970$
4. Describe Runge-Kutta method (4th order) for obtaining solution of initial value problem :  
 $y'' = f(x, y, y')$ ,  $y(x_0) = y_0$ ,  $y'(x_0) = y_0'$
5. State clearly the conditions under which the method is applicable.

## NUMERICAL TECHNIQUES FOR SOLUTION OF PARTIAL DIFFERENTIAL EQUATIONS

---

### 53.1 GENERAL LINEAR PARTIAL DIFFERENTIAL EQUATIONS

General partial differential equation is of the form

$$A(x, y) \frac{\partial^2 u}{\partial x^2} + B(x, y) \frac{\partial^2 u}{\partial x \partial y} + C(x, y) \frac{\partial^2 u}{\partial y^2} + D(x, y) \frac{\partial u}{\partial x} + E(x, y) \frac{\partial u}{\partial y} + F(x, y)u + G(x, y) = 0$$

This equation is called

(i) *Elliptic*, if  $B^2 - 4AC < 0$

e.g.  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$  Laplace Equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y) \quad \text{Poisson's Equation}$$

(ii) *Parabolic*, if  $B^2 - 4AC = 0$

e.g.  $\frac{\partial u}{\partial t} = C^2 \frac{\partial^2 u}{\partial x^2}$

One dimensional heat conduction equation.

(iii) *Hyperbolic*, if  $B^2 - 4AC > 0$

e.g.  $\frac{\partial^2 u}{\partial t^2} = C^2 \frac{\partial^2 u}{\partial x^2}$

**Example 1.** Determine the type of  $x^2 \frac{\partial^2 u}{\partial y^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial x^2} = 0$

(A.M.I.E.T.E., Dec. 2006)

**Solution.** Here,  $A = x^2$ ,  $B = 2xy$ ,  $C = y^2$ .

$B^2 - 4AC = 4x^2 y^2 - 4x^2 y^2 = 0$ . Hence, it is a parabolic equation.

**Ans.**

### 53.2 FINITE-DIFFERENCE APPROXIMATION TO DERIVATIVES

By Taylor formula

$$u(x+h, y) = u(x, y) + \frac{h \partial u}{\partial x} + \frac{1}{2!} h^2 \frac{\partial^2 u}{\partial x^2} + \frac{1}{3!} h^3 \frac{\partial^3 u}{\partial x^3} + \dots \quad (1)$$

$$u(x-h, y) = u(x, y) - h \frac{\partial u}{\partial x} + \frac{1}{2!} h^2 \frac{\partial^2 u}{\partial x^2} - \frac{1}{3!} h^3 \frac{\partial^3 u}{\partial x^3} \quad (2)$$

From (1), neglecting  $h^2$  and higher powers of  $h$ , we get

$$\frac{\partial u}{\partial x} \approx \frac{u(x+h, y) - u(x, y)}{h} \quad (\text{Forward difference formula}) \quad (3)$$

From (2), neglecting  $h^2$  and higher powers of  $h$ , we have

$$\frac{\partial u}{\partial x} \approx \frac{u(x, y) - u(x-h, y)}{h} \quad (\text{Backward difference formula}) \quad (4)$$

Subtracting (2) from (1) and neglecting  $h^3$  and higher power of  $h$  we get

$$u(x+h, y) - u(x-h, y) \approx 2h \frac{\partial u}{\partial x}$$

or  $\frac{\partial u}{\partial x} \approx \frac{1}{2h} [u(x+h, y) - u(x-h, y)]$  (Central difference formula) ... (5)

Similarly,

$$\frac{\partial u}{\partial y} = \frac{u(x, y+k) - u(x, y)}{k} = \frac{u(x, y) - u(x, y-k)}{k} = \frac{u(x, y+k) - u(x, y-k)}{2k} \quad \dots (6)$$

Adding (1) and (2), neglecting  $h^5$  and higher powers of  $h$ , we get

$$u(x+h, y) + u(x-h, y) = 2u(x, y) + h^2 \frac{\partial^2 u}{\partial x^2} \quad \dots (7)$$

Similarly  $\frac{\partial^2 u}{\partial y^2} \approx \frac{1}{k^2} [u(x, y+k) - 2u(x, y) + u(x, y-k)] \quad \dots (8)$

and  $\frac{\partial^2 u}{\partial x \partial y} \approx \frac{1}{4hk} [u(x+h, y+k) - u(x-h, y+k) - u(x+h, y-k) + u(x-h, y-k)] \quad \dots (9)$

The given region (rectangle  $ABCD$ ) is divided into smaller rectangles of sides  $\delta x = h$  and  $\delta y = k$ . The origin is taken at the centre of the rectangle and the coordinate axes are drawn. The rectangle is divided into 36 small rectangles. Here there are 49 mesh-points or lattices or nodal points or grid points. The values of the function  $u$  are  $u_{ij}, u_{i+2,j}, \dots, u_{i,j+2}, u_{i,j+2}, \dots$  at the mesh-points.

Let these values satisfy the given partial differential equation.

At the centre of the rectangle:

Equations (5), (6), (7), (8) and (9) are rewritten on the nodal points as below:

$$\begin{aligned} \frac{\partial u}{\partial x} &= \frac{1}{2h} (u_{i+1,j} - u_{i-1,j}), & \frac{\partial u}{\partial y} &= \frac{1}{2k} (u_{i,j+1} - u_{i,j-1}) \\ \frac{\partial^2 u}{\partial x^2} &= \frac{1}{h^2} (u_{i+1,j} - 2u_{i,j} + u_{i-1,j}) \\ \frac{\partial^2 u}{\partial y^2} &= \frac{1}{k^2} (u_{i,j+1} - 2u_{i,j} + u_{i,j-1}) \\ \frac{\partial^2 u}{\partial x \partial y} &= \frac{1}{4hk} (u_{i+1,j+1} - u_{i+1,j-1} - u_{i-1,j+1} + u_{i-1,j-1}) \end{aligned}$$

### 53.3 SOLUTION OF PARTIAL DIFFERENTIAL EQUATION (LAPLACE EQUATION)

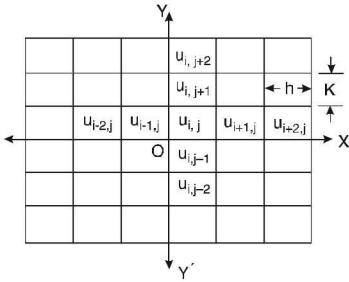

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

On substituting the values of  $\frac{\partial^2 u}{\partial x^2}$  and  $\frac{\partial^2 u}{\partial y^2}$ , we get

$$\frac{1}{h^2} [u(x+h, y) - 2u(x, y) + u(x-h, y)] + \frac{1}{k^2} [u(x, y+k) - 2u(x, y) + u(x, y-k)] = 0$$

For values of  $h = k$  i.e. for square grid of the mesh size  $h$ , the above equation can be written as

$$u(x+h, y) - 2u(x, y) + u(x-h, y) + u(x, y+h) - 2u(x, y) + u(x, y-h) = 0$$

$$u(x, y) = \frac{1}{4} [u(x+h, y) + u(x-h, y) + u(x, y+h) + u(x, y-h)]$$

Denoting any mesh point  $(x, y) = (ih, jh)$  as simply  $i, j$ , the above difference equation can be written as

$$u_i = \frac{1}{4} (u_{i+1,j} + u_{i-1,j} + u_{i,j+1} + u_{i,j-1}) \quad \dots(2)$$

Equation (2) shows that the value of  $u(x, y)$  is the average of its four neighbours to the East, West, North and South. The formula (2) is called the Standard five points formula and is written as

$$u_{i+1,j} + u_{i-1,j} + u_{i,j+1} + u_{i,j-1} - 4u_{i,j} = 0$$

This formula is also known as Liebman's averaging procedure.

A formula similar to the formula (2) is sometimes used with convenience. It is given as

$$u_j = \frac{1}{4} (u_{i+1,j+1} + u_{i+1,j-1} + u_{i-1,j+1} + u_{i-1,j-1}) \quad \dots(3)$$

This is known as *diagonal five-point formula* as these points lie on the diagonals. Although formula (3) is less accurate than formula (2), still it is a good approximation for obtaining as starting values in the iteration procedure.

Whenever possible, Standard five-point formula is preferred in all computations.

**Procedure.** We use the following diagonal five point formula to get the initial value of  $u$  at the centre.

$$U_5 = \frac{1}{4} [b_1 + b_5 + b_9 + b_{13}]$$

Then the approximate values of diagonal interior points  $u_1, u_3, u_7, u_9$  are calculated by the diagonal five-point formula

$$u_1 = \frac{1}{4} [b_1 + b_3 + b_5 + b_{13}], \quad u_3 = \frac{1}{4} [b_3 + b_5 + b_7 + u_5]$$

$$u_7 = \frac{1}{4} [b_{15} + u_5 + b_{11} + b_{13}] \quad u_9 = \frac{1}{4} [u_5 + b_7 + b_9 + b_{11}]$$

The values of the remaining interior points i.e.  $u_2, u_4, u_6$  and  $u_8$  are obtained by the standard five point formula.

$$u_2 = \frac{1}{4} [b_3 + u_3 + u_5 + u_1], \quad u_3 = \frac{1}{4} [u_1 + u_5 + u_7 + u_{15}]$$

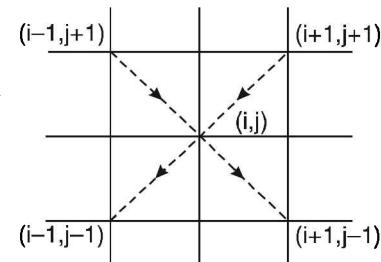

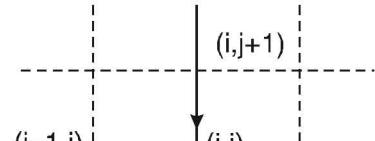

$$u_6 = \frac{1}{4} [u_3 + b_7 + u_9 + u_5] \quad u_8 = \frac{1}{4} [u_5 + u_9 + b_{11} + u_7]$$

Having obtained all values  $u_1, u_2, \dots, u_9$  once, their accuracy can be improved by the repeated application of either Jacobi's iteration formula or Gauss-Seidel iteration formula.

### 53.4 JACOBI'S ITERATION FORMULA

Let  $u_{i,j}^n$  be the  $n$ th iterative value of  $u_{ij}$ . Then Jacobi's iterative procedure is given below.

$$u^{(n+1)j} = \frac{1}{4} [u^{(n)i-1,j} + u^{(n)i+1,j} + u^{(n)i,j-1} + u^{(n)i,j+1}]$$

$b_{13}$	$b_{12}$	$b_{11}$	$b_{10}$	$b_9$	
$b_{14}$	$u_7$	$u_8$	$u_9$	$u_8$	$u_8$
$b_{15}$	$u_4$	$u_5$	$u_6$	$u_7$	$u_7$
$b_{16}$	$u_1$	$u_2$	$u_8$	$u_6$	$u_6$

$b_1, b_2, b_3, b_4, b_5$

### 53.5 GAUSS-SEIDEL METHOD

This method utilises the latest iterative value available and scans the mesh points symmetrically from left to right along successive rows. The formula is given below.

$$u^{(n+1)ij} = \frac{1}{4}[u^{(n+1)i-1,j} + u^{(n)i+1,j} + u^{(n+1)i,j-1} + u^{(n)i,j+1}]$$

### 53.6 SUCCESSIVE OVER-RELAXATION OR S.O.R. METHOD

Gauss-Seidel formula can be written as

$$u^{(n+1)ij} = u^{(n)ij} + \frac{1}{4}[u^{(n+1)i-1,j} + u^{(n)i+1,j} + u^{(n+1)i,j-1} + u^{(n)i,j+1} - 4u^{(n)ij}] = u^{(n)ij} + \frac{1}{4}R_{i,j}$$

It gives the change  $\frac{1}{4}R_{i,j}$  in the value of  $u_{i,j}$  for one Gauss-Seidel iteration. In the S.O.R. method, larger change than this is given to  $u^{(n)ij}$  and the iteration formula is given below:

$$u^{(n+1)ij} = u^{(n)ij} + \frac{1}{4}wR_{i,j} = \frac{1}{4}w[u^{(n+1)i-1,j} + u^{(n)i+1,j} + u^{(n+1)i,j-1} + u^{(n)i,j+1}] + (1-w)u^{(n)ij}$$

Here  $w$  is called the accelerating factor and lies between 1 and 2.

**Example 1.** Solve  $\frac{\partial^2 T}{\partial x^2} + \frac{\partial^2 T}{\partial y^2} = 0$  in the domain of the figure given below by Gauss-Seidel method.

**Solution.**

$$T_1 = \frac{1}{4}[0 + T_2 + T_4 + 0] \quad T_2 = \frac{1}{4}[0 + T_3 + T_5 + T_1] \quad T_3 = \frac{1}{4}[0 + 0 + T_2 + T_6]$$

$$T_4 = \frac{1}{4}[T_1 + T_5 + T_7 + 0] \quad T_5 = \frac{1}{4}[T_2 + T_6 + T_8 + T_4] \quad T_6 = \frac{1}{4}[T_3 + 0 + T_9 + T_5],$$

$$T_7 = \frac{1}{4}[T_4 + T_8 + 1 + 0] \quad T_8 = \frac{1}{4}[T_5 + T_9 + 1 + T_7] \quad T_9 = \frac{1}{4}[T_6 + 0 + 1 + T_8]$$

#### Gauss-Seidel Method

Initial approximations are

$$T_1 = T_2 = T_3 = T_4 = T_5 = T_6 = T_7 = T_8 = T_9 = 0$$

Ten successive iterates are given below:

#### First Iteration

$$T_1^{(n+1)} = \frac{1}{4}[0 + T_4^{(n)} + T_2^{(n)} + 0], \quad T_1^{(1)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0$$

$$T_2^{(n+1)} = \frac{1}{4}[T_1^{(n+1)} + T_5^{(n)} + T_3^{(n)} + 0], \quad T_2^{(1)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0$$

$$T_3^{(n+1)} = \frac{1}{4}[T_2^{(n+1)} + T_6^{(n)} + 0 + 0], \quad T_3^{(1)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0$$

$$T_4^{(n+1)} = \frac{1}{4}[0 + T_7^{(n)} + T_5^{(n)} + T_1^{(n+1)}], \quad T_4^{(1)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0$$

$$T_5^{(n+1)} = \frac{1}{4}[T_4^{(n+1)} + T_8^{(n)} + T_6^{(n)} + T_2^{(n+1)}], \quad T_5^{(1)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0$$

$$T_6^{(n+1)} = \frac{1}{4}[T_5^{(n+1)} + T_9^{(n)} + 0 + T_3^{(n+1)}], \quad T_6^{(1)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0$$

$$T_7^{(n+1)} = \frac{1}{4}[0 + 1 + T_8^{(n)} + T_4^{(n+1)}], \quad T_7^{(1)} = \frac{1}{4}[0 + 1 + 0 + 0] = 0.25$$

$$T_8^{(n+1)} = \frac{1}{4}[T_7^{(n+1)} + 1 + T_9^{(n)} + T_5^{(n+1)}], \quad T_8^{(1)} = \frac{1}{4}[0.25 + 1 + 0 + 0] = 0.312$$

1	1	1	
$T_7$	$T_8$	$T_9$	0
$T_4$	$T_5$	$T_6$	0
$T_1$	$T_2$	$T_3$	0
0	0	0	

$$T_9^{(n+1)} = \frac{1}{4}[T_8^{(n+1)} + 1 + 0 + T_6^{(n+1)}]$$

$$T_9^{(1)} = \frac{1}{4}[0.312 + 1 + 0 + 0] = 0.328$$

**Second Iteration**

$$T_1^{(2)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0,$$

$$T_2^{(2)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0$$

$$T_3^{(2)} = \frac{1}{4}[0 + 0 + 0 + 0] = 0,$$

$$T_4^{(2)} = \frac{1}{4}[0 + 0.25 + 0 + 0] = 0.062$$

$$T_5^{(2)} = \frac{1}{4}[0 + 0.312 + 0 + 0] = 0.078,$$

$$T_6^{(2)} = \frac{1}{4}[0 + 0.328 + 0 + 0] = 0.082$$

$$T_7^{(2)} = \frac{1}{4}[0 + 1 + 0.312 + 0] = 0.328,$$

$$T_8^{(2)} = \frac{1}{4}[0.25 + 1 + 0.328 + 0] = 0.394$$

$$T_9^{(2)} = \frac{1}{4}[0.312 + 1 + 0 + 0] = 0.328$$

**Third Iteration**

$$T_1^{(3)} = \frac{1}{4}[0 + 0.062 + 0 + 0] = 0.016,$$

$$T_2^{(3)} = \frac{1}{4}[0.016 + 0.078 + 0 + 0] = 0.024$$

$$T_3^{(3)} = \frac{1}{4}[0.024 + 0.082 + 0 + 0] = 0.027,$$

$$T_4^{(3)} = \frac{1}{4}[0 + 0.328 + 0.078 + 0.016] = 0.106$$

$$T_5^{(3)} = \frac{1}{4}[0.106 + 0.394 + 0.082 + 0.024] = 0.152,$$

$$T_6^{(3)} = \frac{1}{4}[0.152 + 0.328 + 0 + 0.027] = 0.127$$

$$T_7^{(3)} = \frac{1}{4}[0 + 1 + 0.394 + 0.106] = 0.375$$

$$T_8^{(3)} = \frac{1}{4}[0.375 + 1 + 0.382 + 0.152] = 0.464$$

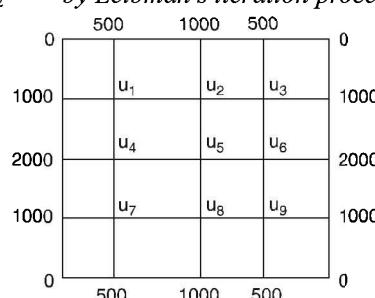

$$T_9^{(3)} = \frac{1}{4}[0.464 + 1 + 0 + 0.127] = 0.398$$

and so on.

Ans.

Iteration	$T_1$	$T_2$	$T_3$	$T_4$	$T_5$	$T_6$	$T_7$	$T_8$	$T_9$
4	0.032	0.053	0.045	0.140	0.196	0.160	0.401	0.499	0.415
5	0.048	0.072	0.058	0.161	0.223	0.174	0.415	0.513	0.422
6	0.058	0.085	0.065	0.174	0.236	0.181	0.422	0.520	0.425
7	0.065	0.092	0.068	0.181	0.244	0.184	0.425	0.524	0.427
8	0.068	0.095	0.070	0.184	0.247	0.186	0.427	0.525	0.428
9	0.070	0.097	0.071	0.186	0.249	0.187	0.428	0.526	0.428

**Example 2.** Solve  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$  by Leibman's iteration process for the domain of the figure given below:

**Solution.** Values given on the figure are symmetrical about middle line.

∴

$$u_1 = u_3 = u_9 = u_7$$

$$u_2 = u_8, u_4 = u_6$$

$$u_5 = \frac{1}{4} (2000 + 2000 + 1000 + 1000) = 1500 \quad (\text{Standard formula})$$

$$u_1 = \frac{1}{4} [0 + 1000 + 1500 + 2000] = 1125 \quad (\text{Diag. formula})$$

Similarly

$$u_1 = u_3 = u_9 = u_7 = 1125$$

$$u_2 = \frac{1}{4} (1000 + 1125 + 1500 + 1125) \approx 1188 \quad (\text{Standard formula})$$

Similarly

$$u_8 = u_2 = 1188$$

$$u_4 = \frac{1}{4} [1125 + 2000 + 1125 + 1500] \approx 1438 \quad (\text{Standard formula})$$

Similarly

$$u_4 = u_6 = 1438$$

So  $u_1 = 1125, u_2 = 1188, u_3 = 1125, u_4 = 1438, u_5 = 1500, u_6 = 1438, u_7 = 1125, u_8 = 1188, u_9 = 1125$

### Gauss-Seidel Method:

$$u^{(n+1)i,j} = \frac{1}{4} [u_{i-1,j}^{(n+1)} + u_{i+1,j}^{(n)} + u^{(n+1)i,j-1} + u^{(n)i,j+1}]$$

$$u_1^{(n+1)} = \frac{1}{4} [1000 + u_2^{(n)} + 500 + u_4^{(n)}] = u_3^{(n+1)} = u_5^{(n+1)} = u_7^{(n+1)}$$

$$u_2^{(n+1)} = \frac{1}{4} [u_1^{(n+1)} + u_3^{(n+1)} + 1000 + u_5^{(n+1)}] = u_8^{(n+1)}$$

$$u_4^{(n+1)} = \frac{1}{4} [2000 + u_5^{(n)} + u_1^{(n+1)} + u_7^{(n+1)}] = u_6^{(n+1)}$$

$$u_5^{(n+1)} = \frac{1}{4} [u_4^{(n+1)} + u_6^{(n+1)} + u_2^{(n+1)} + u_8^{(n+1)}]$$

### First Iteration

$$u_1^{(1)} = \frac{1}{4} [1000 + 1188 + 500 + 1438] \approx 1032 = u_1^{(3)} = u_9^{(1)} = u_7^{(1)}$$

$$u_2^{(1)} = \frac{1}{4} [1032 + 1032 + 1000 + 1500] = 1141 = u_8^{(1)}$$

$$u_4^{(n+1)} = \frac{1}{4} [2000 + 1500 + 1032 + 1032] = 1391 = u_6^{(1)}$$

$$u_5^{(n+1)} = \frac{1}{4} [1091 + 1391 + 1141 + 1141] = 1266$$

### Second Iteration

$$u_1^{(2)} = \frac{1}{4} [1000 + 1141 + 500 + 1391] = 1008 = u_3^{(2)} = u_9^{(2)} = u_7^{(2)}$$

$$u_2^{(2)} = \frac{1}{4} [1008 + 1008 + 1000 + 1266] = 1069 = u_8^{(2)}$$

$$u_4^{(2)} = \frac{1}{4} [2000 + 1266 + 1008 + 1008] = 1321 = u_6^{(2)}$$

$$u_5^{(2)} = \frac{1}{4} [1321 + 1321 + 1069 + 1069] = 1195$$

Similarly

Iteration	$u_1 = u_3 = u_9 = u_7$	$u_2 = u_8$	$u_4 = u_6$	$u_5$
Third	973	1035	1288	1162
Fourth	956	1019	1269	1144
Fifth	947	1010	1260	1135
Sixth	942	1005	1255	1130
Seventh	940	1003	1253	1128
Eighth	939	1002	1252	1127
Ninth	939	1001	1251	1126

Very small difference is in the eighth and ninth iteration

Thus,

$$u_1 = u_3 = u_7 = u_9 = 939$$

$$u_2 = u_8 = 1001,$$

$$u_4 = u_6 = 1251,$$

$$u_5 = 1126$$

Ans.

**Example 3.** Solve  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$  in the domain of the figure given below by

- (a) Jacobi's method, (b) Gauss-Seidel method and
- (c) Successive Over-Relaxation method

**Solution.** (a) Jacobi's Method

$$u_1^{(1)} = \frac{1}{4}[0+0+0+1] = 0.25$$

$$u_2^{(1)} = \frac{1}{4}[0+0+0+1] = 0.25$$

$u_1$	$u_2$	$u_3$	$u_4$
0.25	0.3125	0.5625	0.46875
0.21875	0.17187	0.42187	0.39844
0.14844	0.13672	0.38672	0.38086
0.13086	0.12793	0.37793	0.37646
0.12646	0.12573	0.37573	0.37537

$$u_3^{(1)} = \frac{1}{4}[1+1+0+0] = 0.5$$

$$u_4^{(1)} = \frac{1}{4}[1+1+0+0] = 0.5$$

Seven successive iterates are given below:

$u_1$	$u_2$	$u_3$	$u_4$
0.1875	0.1875	0.4375	0.4375
0.15625	0.15625	0.40625	0.40625
0.14062	0.14062	0.39062	0.39062
0.13281	0.13281	0.38281	0.38281
0.12891	0.12891	0.37891	0.37891
0.12695	0.12695	0.37695	0.37695
0.12598	0.12598	0.37598	0.37518

**(b) Gauss-Seidel Method**

Five successive iterates are given below:

**(c) Successive Over-Relaxation method** Three successive iterates are given below:

$u_1$	$u_2$	$u_3$	$u_4$
0.275	0.35062	0.35062	0.35062
0.16534	0.10683	0.38183	0.37432
0.11785	0.12181	0.37216	0.37341

**53.7 POISSON EQUATION**

$$\nabla^2 u = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y)$$

In this case the standard five-point formula is of the form

$$u_{i-1,j} + u_{i+1,j} + u_{i,j-1} + u_{i,j+1} - 4u_{i,j} = h^2 f(ih, jh)$$

On applying the above formula we get equations. These equations can be solved by Gauss-Seidel iteration method.

**Example 4.** Solve the Poisson's equation  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 8x^2 y^2$  for the square mesh of the figure given below with  $u(x, y) = 0$  on the boundary and mesh length = 1.

**Solution.** Here  $h = 1$

The standard five-point formula for the given equation is

$$u_{i-1,j} + u_{i+1,j} + u_{i,j-1} + u_{i,j+1} - 4u_{i,j} = 8i^2 j^2 \quad \dots(1)$$

For  $u_1$  ( $i = -1, j = +1$ ), equation (1) becomes

$$0 + u_2 + 0 + u_2 - 4u_1 = 8(-1)^2 (1)^2 \text{ or } 4u_1 = 2u_2 - 8 \quad \dots(2)$$

For  $u_2$  ( $i = 0, j = 1$ ), equation (1) becomes

$$u_1 + u_1 + 0 + u_3 - 4u_2 = 0 \text{ or } 4u_2 = 2u_1 + u_3 \quad \dots(3)$$

For  $u_3$  ( $i = 0, j = 0$ ), equation (1) becomes

$$u_2 + u_2 + u_2 - 4u_3 = 0 \text{ or } 4u_3 = 4u_2 \text{ or } u_3 = u_2 \quad \dots(4)$$

Putting  $\frac{2u_1}{3}$  for  $u_3$  in (3), we get  $4u_2 = 2u_1 + u_2$  or  $3u_2 = 2u_1$

Putting  $\frac{2u_1}{3}$  for  $u_2$  in (2), we get

$$4u_1 = \frac{4u_1}{3} - 8 \quad \text{or} \quad 12u_1 = 4u_1 - 24$$

$$8u_1 = -24 \quad \text{or} \quad u_1 = -3$$

$$u_2 = \frac{2u_1}{3} = \left(\frac{2}{3} \times -3\right) = -2, \quad u_3 = u_2 = -2$$

$$u_1 = -3, \quad u_2 = -2, \quad u_3 = -2$$

**Ans.**

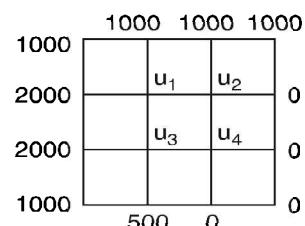

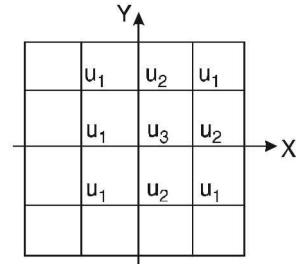

**EXERCISE 53.1**

1. Given the values of  $u(x, y)$  on the boundary of the square in the figure given below, evaluate the function  $u(x, y)$  satisfying the Laplace equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

at pivotal points of this figure.

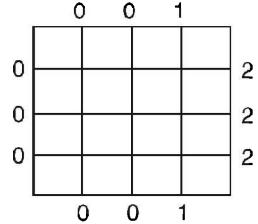

**Ans.**  $u_1 = 1208, \quad u_2 = 792, \quad u_3 = 1042, \quad u_4 = 458,$   
 $u_5 = 0.625, \quad u_6 = 1.25$

2. Solve  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$

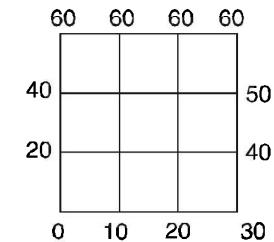

for the square mesh with boundary values as shown in the figure given below. Iterate until the maximum difference between successive values at any point is less than 0.005.

**Ans.**  $u_1 = 10.188, u_2 = 0.5, u_3 = 1.188, u_4 = 0.25,$   
 $u_5 = 0.625, u_6 = 1.25.$

3. Solve  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial t^2} = 0$  within the square given in the figure below.

**Ans.**  $u_1 = 26.66, u_2 = 33.33, u_3 = 43.33, u_4 = 46.66.$

4. Solve  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = -10(x^2 + y^2 + 10)$

over the square with  $x = 0 = y, x = 3 = y$  with

$u = 0$  on the boundary and mesh length = 1. **Ans.**

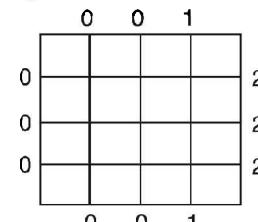

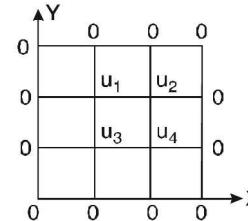

$u_1 = 75, u_2 = 82.5, u_3 = 67.05, u_4 = 75.$

5. Solve  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$  with boundary values as

shown

in the figure given below.

**Ans.**  $u_1 = 10.188, u_2 = 0.5, u_3 = 1.188,$   
 $u_4 = 0.25, u_5 = 0.625, u_6 = 1.25$

### 53.8 HEAT EQUATION (PARABOLIC EQUATION)

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$$

$$\frac{\partial u}{\partial t} = \frac{u(x, t+k) - u(x, t)}{k}$$

$$\frac{\partial^2 u}{\partial x^2} = \frac{u(x+h, t) - 2u(x, t) + u(x-h, t)}{h^2}$$

On putting the values of  $\frac{\partial u}{\partial t}$  and  $\frac{\partial^2 u}{\partial x^2}$  in (1), we get

$$\frac{u(x, t+k) - u(x, t)}{k} = c^2 \frac{u(x+h, t) - 2u(x, t) + u(x-h, t)}{h^2}$$

$$u(x, t+k) = \frac{c^2 k}{h^2} u(x+h, t) - \frac{2c^2 k}{h^2} u(x, t) + u(x, t) + \frac{c^2 k}{h^2} u(x-h, t)$$

or  $u(x, t+k) = au(x+h, t) + (1-2a)u(x, t) + au(x-h, t)$

If  $a = \frac{1}{2}$

$$u(x, t+k) = \frac{1}{2} u(x+h, t) + \frac{1}{2} u(x-h, t) \text{ or } u_{i,j+1} = \frac{1}{2} [u_{i+1,j} + u_{i-1,j}]$$

It means that the value of  $u$  at  $x_i$ , at time  $t$  is the mean of the values of  $u$  at  $x_{i-1}$  and  $x_{i+1}$  at the previous time  $t_j$ .

This relation is known as Bende-Schmidt recurrence relation.

**Example 5.** Find the values of  $u(x, t)$  satisfying the parabolic equation  $\frac{\partial u}{\partial t} = 4 \frac{\partial^2 u}{\partial x^2}$  with boundary conditions  $u(0, t) = 0 = u(8, t)$  and  $u(x, 0) = 4x - \frac{1}{2}x^2$  at the points.  
 $x = i : i = 0, 1, 2, 3, \dots, 7$  and  $t = \frac{1}{8}j : j = 0, 1, 2, 3, \dots, 5$ .

$$\text{Solution. } c^2 = 4, h = 1, k = -\frac{1}{8} \quad a = \frac{c^2 k}{h^2} = \frac{4 \times 1/8}{1} = \frac{1}{2}$$

Then the equation is

$$u_{i,j+1} = \frac{1}{2}(u_{i-1,j} + u_{i+1,j})$$

$$\text{Given } u(0, t) = 0 = u(8, t)$$

$$\text{or } u(0, j) = 0 = u(8, j) \text{ for all values of } j = 1, 2, 3, 4, 5$$

$$\text{and } u(x, 0) = 4x - \frac{1}{2}x^2 \quad u_{i,0} = 4i - \frac{1}{2}i^2$$

$$u_{0,0} = 0, u_{1,0} = 4(1) - \frac{1}{2}(1)^2 = 3.5, \quad u_{2,0} = 4(2) - \frac{1}{2}(2)^2 = 6 \\ u_{3,0} = 7.5, \quad u_{4,0} = 8, \quad u_{5,0} = 7.5, u_{6,0} = 6, u_{7,0} = 3.5.$$

These entries are shown in the following table :

$j \setminus i$	0	1	2	3	4	5	6	7	8
0	0	3.5	6	7.5	8	7.5	6	3.5	0
1	0	3	5.5	7	7.5	7	5.5	3	0
2	0	2.75	5	6.5	7	6.5	5	2.75	0
3	0	2.5	4.625	6	6.5	6	4.625	2.5	0
4	0	2.3125	4.25	5.5625	6	5.5625	4.25	2.3125	0
5	0	2.125	3.9375	5.125	5.5625	5.125	3.9375	2.125	0

Putting  $j = 0$  in (1) we have

$$u_{i,1} = \frac{1}{2}(u_{i-1,0} + u_{i+1,0}) \quad u_{1,1} = \frac{1}{2}(u_{0,0} + u_{2,0}) = \frac{1}{2}(0 + 6) = 3$$

$$u_{2,1} = \frac{1}{2}(u_{1,0} + u_{3,0}) = \frac{1}{2}(3.5 + 7.5) = 5.5 \quad u_{3,1} = \frac{1}{2}(u_{2,0} + u_{4,0}) = \frac{1}{2}(6 + 8) = 7$$

$$u_{4,1} = \frac{1}{2}(u_{3,0} + u_{5,0}) = \frac{1}{2}(7.5 + 7.5) = 7.5 \quad u_{5,1} = \frac{1}{2}(u_{4,0} + u_{6,0}) = \frac{1}{2}(8 + 6) = 7$$

$$u_{6,1} = \frac{1}{2}(u_{5,0} + u_{7,0}) = \frac{1}{2}(7.5 + 3.5) = 5.5 \quad u_{7,1} = \frac{1}{2}(u_{6,0} + u_{8,0}) = \frac{1}{2}(6 + 0) = 3$$

Putting  $j = 1$  in (1), we get

$$u_{i,2} = \frac{1}{2}(u_{i-1,1} + u_{i+1,1}) \quad u_{1,2} = \frac{1}{2}(u_{0,1} + u_{2,0}) = \frac{1}{2}(0 + 5.5) = 2.75$$

$$u_{2,2} = \frac{1}{2}(u_{1,1} + u_{3,1}) = \frac{1}{2}(3 + 7) = 5 \quad u_{3,2} = 6.5, u_{4,2} = 7, u_{5,2} = 6.5, u_{6,2} = 5, u_{7,2} = 2.75$$

Putting  $j = 2$  in (1), we get

$$u_{i,3} = \frac{1}{2}(u_{i-1,2} + u_{i+1,2}) \quad u_{1,3} = \frac{1}{2}(u_{0,2} + u_{2,2}) = \frac{1}{2}(0 + 5) = 2.5$$

$$u_{2,3} = \frac{1}{2}(u_{1,2} + u_{3,2}) = \frac{1}{2}(2.75 + 6.5) = 4.625 \quad u_{3,3} = 6, u_{4,3} = 6.5, u_{5,3} = 6, u_{6,3} = 4.625, u_{7,3} = 2.5$$

Putting  $j = 3$  in (1), we get

$$u_{i,4} = \frac{1}{2}(u_{i-1,3} + u_{i+1,3}) \quad u_{1,4} = \frac{1}{2}(u_{0,3} + u_{2,3}) = \frac{1}{2}(0 + 4.625) = 2.3125$$

$$u_{2,4} = \frac{1}{2}(u_{1,3} + u_{3,2}) = \frac{1}{2}(2.5 + 6) = 4.25$$

$$u_{3,4} = 0.5625, u_{4,4} = 6, u_{5,4} = 5.5625, u_{6,4} = 4.25, u_{7,4} = 2.3125$$

Putting  $j = 4$  in (1), we get

$$u_{i,5} = \frac{1}{2}(u_{i-1,4} + u_{i+1,4}) \quad u_{1,5} = \frac{1}{2}(u_{0,4} + u_{2,4}) = \frac{1}{2}(0 + 4.25) = 2.125$$

$$u_{2,5} = \frac{1}{2}(u_{1,4} + u_{3,4}) = \frac{1}{2}(2.125 + 5.5625) = 3.9375$$

$$u_{3,5} = 5.125, u_{4,5} = 5.625, u_{5,5} = 5.125, u_{6,5} = 3.9375, u_{7,5} = 2.125$$

### 53.9 WAVE EQUATION (HYPERBOLIC EQUATION)

$$\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2} \quad \dots (1)$$

We know that

$$\frac{\partial^2 u}{\partial t^2} = \frac{u(x, t+k) - 2u(x, t) + u(x, t-k)}{k^2} \quad \text{and} \quad \frac{\partial^2 u}{\partial x^2} = \frac{u(x+h, t) - 2u(x, t) + u(x-h, t)}{h^2}$$

Putting the values of  $\frac{\partial^2 u}{\partial t^2}$  and  $\frac{\partial^2 u}{\partial x^2}$  in (1) we have

$$\frac{u(x, t+k) - 2u(x, t) + u(x, t-k)}{k^2} = c^2 \frac{u(x+h, t) - 2u(x, t) + u(x-h, t)}{h^2}$$

$$\text{or } u(x, t+k) - 2u(x, t) + u(x, t-k) = \frac{c^2 k^2}{h^2} [u(x+h, t) - 2u(x, t) + u(x-h, t)]$$

$$\text{or } u_{i,k+1} - 2u_{i,j} + u_{i,j-1} = a^2 c^2 [u_{i+1,j} - 2u_{i,j} + u_{i-1,j}]$$

$$\text{or } u_{i,j+1} = 2(1 - a^2 c^2)u_{i,j} + a^2 c^2 (u_{i-1,j} + u_{i+1,j}) - u_{i,j-1} \quad \dots (2)$$

If  $a^2 c^2 = 1$ , Equation (2) reduces to

$$u_{i,j+1} = u_{i-1,j} + u_{i+1,j} - u_{i,j-1} \quad \dots (3)$$

**Example 6.** Solve  $\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}$  with conditions  $u(0, t) = u(1, t) = 0$ ,  $u(x, 0) = 1/2 x(1-x)$  and  $u(x, 0) = 0$ , taking  $h = k = 0.1$  for  $0 \leq t \leq 0.4$ . Compare your solution with the exact solution  $x = 0.5$  and  $t = 0.3$ .

**Solution.**  $c^2 = 1$ . The difference equation for the given equation is

$$u_{i,j+1} = 2(1 - \alpha^2)u_{i,j} + \alpha^2 (u_{i-1,j} + u_{i+1,j}) - u_{i,j-1} \quad \dots (1)$$

$$\text{where } \alpha = \frac{k}{h} \text{ But } \alpha = \frac{0.1}{0.1} = 1$$

$$\text{Equation (1) reduces to } u_{i,j+1} = u_{i-1,j} + u_{i+1,j} - u_{i,j-1} \quad \dots (2)$$

$u(0,t) = u(1,t) = 0, u_{0,j} = 0$  and  $u_{10,j} = 0$   
*i.e.*, the entries in the first column are zero.

$$\text{since } u(x, 0) = \frac{1}{2}x(1-x) \quad u(i, 0) = \frac{1}{2}i(1-i)$$

$$= 0.045, 0.08, 0.105, 0.120, 0.125, 0.120, 0.105 \text{ for}$$

$$i = 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7 \text{ at } t = 0$$

These are the entries of the fist row. Finally since  $u_x(x, 0) = 0$

$$\therefore \frac{u_{i,j+1} - u_{i,j}}{k} = 0 \text{ for } j = 0 \text{ (} t = 0 \text{)}, \quad u_{i,1} = u_{i,9}$$

Putting  $j = 0$  in equation (2), we get

$$u_{i,1} = u_{i-1,0} + u_{i+1,0} - u_{i,-1} = u_{i-1,0} + u_{i+1,0} - u_{i,1} \quad (u_{i,1} = u_{i,-1})$$

$$2u_{i,1} = u_{i-1,0} + u_{i+1,0}, \quad u_{i,1} = \frac{1}{2}[u_{i-1,0} + u_{i+1,0}]$$

For  $i = 1$   $u_{1,1} = \frac{1}{2}[u_{0,0} + u_{2,0}] = \frac{1}{2}[0 + .080] = 0.040$

For  $i = 2$   $u_{2,1} = \frac{1}{2}[u_{1,0} + u_{3,0}] = \frac{1}{2}[0.045 + 0.105] = 0.075$

For  $i = 3$   $u_{3,1} = [u_{2,0} + u_{4,0}] = \frac{1}{2}[0.08 + 0.120] = 0.100$

For  $i = 4$   $u_{4,1} = \frac{1}{2}[u_{3,0} + u_{5,0}] = \frac{1}{2}[0.105 + 0.125] = 0.115$

For  $i = 5$   $u_{5,1} = \frac{1}{2}[u_{4,0} + u_{6,0}] = \frac{1}{2}[0.120 + 0.120] = 0.120$

For  $i = 6$   $u_{6,1} = \frac{1}{2}[u_{5,0} + u_{7,0}] = \frac{1}{2}[0.125 + 0.105] = 0.115$

Putting  $j = 1$  in equation (2), we get

$$u_{i,2} = u_{i-1,1} + u_{i+1,1} - u_{i,0}$$

For  $i = 1$   $u_{1,2} = u_{0,1} + u_{2,1} - u_{1,0} = 0 + 0.075 - 0.045 = 0.03$

For  $i = 2$   $u_{2,2} = u_{1,1} + u_{3,1} - u_{2,0} = 0.040 + 0.100 - 0.08 = 0.060$

For  $i = 3$   $u_{3,2} = u_{2,1} + u_{4,1} - u_{3,0} = 0.075 + 0.115 - 0.105 = 0.085$

For  $i = 4$   $u_{4,2} = u_{3,1} + u_{5,1} - u_{4,0} = 0.100 + 0.120 - 0.120 = 0.100$

For  $i = 5$   $u_{5,2} = u_{4,1} + u_{6,1} - u_{5,0} = 0.115 + 0.115 - 0.125 = 0.105$

Similarly for  $j = 2$

$$u_{i,3} = u_{i-1,2} + u_{i+1,2} - u_{i,1}$$

For  $i = 3$   $u_{1,3} = 0.020, u_{2,3} = 0.040, u_{3,3} = 0.060, u_{4,3} = 0.075, u_{5,3} = 0.080$

$u_{i,4} = u_{i-1,3} + u_{i+1,3} - u_{i,2}$

For  $i = 4$   $u_{1,4} = 0.010, u_{2,4} = 0.02,$

$u_{3,4} = 0.030, u_{4,4} = 0.040, u_{5,4} = 0.048$

		0	0.1	0.2	0.3	0.4	0.5	0.6
	$i$	0	1	2	3	4	5	6
$j$								
0	0	0	0.045	0.080	0.105	0.120	0.125	0.120
0.1	1	0	0.040	0.075	0.100	0.115	0.120	0.115
0.2	2	0	0.030	0.060	0.085	0.100	0.105	
0.3	3	0	0.020	0.040	0.060	0.075	0.080	
0.4	4	0	0.010	0.020	0.030	0.040	0.048	

The analytical (exact) solution of the given equation is

$$u = \frac{2}{\pi^3} \sum_{n=1}^{\infty} \frac{1}{n^3} (1 - \cos n\pi) \sin n\pi x \cos n\pi t$$

Comparison of two solutions is given below:

$t = 0.3$	$x =$	0.1	0.2	0.3	0.4	0.5
Numercial solution	$u =$	0.02	0.04	0.06	0.075	0.08
Exact solution	$u =$	0.02	0.04	0.06	0.075	0.08

**Ans.**

### EXERCISE 53.2

1. Solve  $\frac{\partial^2 u}{\partial x^2} = 2 \frac{\partial u}{\partial t}$

under conditions  $u(0, t) = u(4, t) = 0$  and  $u(x, 0) = x(4-x)$ , taking  $h = 1$ , find the values upto  $t = 5$ .

**Ans.**  $u_{1,0} = 3, u_{2,0} = 4, u_{3,0} = 3; u_{1,1} = 2, u_{2,1} = 3, u_{3,1} = 2$

$u_{1,2} = 1.5, u_{2,2} = 2, u_{3,2} = 1.5; u_{1,3} = 1, u_{2,3} = 1.5, u_{3,3} = 1$

$u_{1,4} = 0.75, u_{2,4} = 1, u_{3,4} = 0.75; u_{1,5} = 0.5, u_{2,5} = 0.75, u_{3,5} = 0.50$

2. Solve  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}; 0 \leq x \leq 1, t \geq 0$  under the conditions that

$u(0, t) = u(1, t) = 0$  and  $u(x, 0) = 2x$  for  $0 \leq x \leq \frac{1}{2} = (1-x)$  for  $\frac{1}{2} \leq x \leq 1$

**Ans.**  $u_1 = 0.1989, u_2 = 0.3956, u_3 = 0.5834, u_4 = 0.7381, u_5 = 0.7591$

3. Solve  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}; 0 \leq x \leq 1, t \geq 0$  under the conditions that

$$\begin{aligned} u &= 0, \text{ at } x = 0 \\ u &= 0, \text{ at } x = 1 \end{aligned} \quad t \geq 0$$

$u = \sin \pi x$  at  $t = 0, 0 \leq x \leq 1$

find  $u$  for  $x = 0.8$  at  $t = 1$ .

**Ans.** 0.4853

4. Solve  $\frac{\partial^2 u}{\partial x^2} = \frac{\partial u}{\partial t}$  under the conditions that  $u(0, t) = u(5, t) = 0, u(x, 0) = x^2(25 - x^2)$  at taking  $h = 1$  and  $k = \frac{1}{2}$

**Ans.**  $u_{1,0} = 24, u_{2,0} = 84, u_{3,0} = 144, u_{4,0} = 144$

$u_{1,1} = 42, u_{2,1} = 78, u_{3,1} = 78, u_{4,1} = 57$

$u_{1,2} = 39, u_{2,2} = 60, u_{3,2} = 67.5, u_{4,2} = 39$

$u_{1,3} = 30, u_{2,3} = 53.25, u_{3,3} = 49.5, u_{4,3} = 33.75$

$u_{1,4} = 26.625, u_{2,4} = 39.75, u_{3,4} = 43.5, u_{4,4} = 24.75$

$u_{1,5} = 19.875, u_{2,5} = 35.06, u_{3,5} = 32.25, u_{4,5} = 21.75$

5. Solve  $16 \frac{\partial^2 u}{\partial x^2} = \frac{\partial^2 u}{\partial t^2}$  taking  $h = 1$ , upto  $t = 1.25$ , under the conditions

$u(0, t) = u(5, t) = 0, u_t(x, 0) = 0$  and  $u(x, 0) = x^2(5 - x)$ .

**Ans.**  $u_{1,0} = 4, u_{2,0} = 12, u_{3,0} = 18, u_{4,0} = 16$

$u_{1,1} = 4, u_{2,1} = 12, u_{3,1} = 18, u_{4,1} = 16$

$u_{1,2} = 8, u_{2,2} = 10, u_{3,2} = 10, u_{4,2} = 2$

$u_{1,3} = 6, u_{2,3} = 6, u_{3,3} = -6, u_{4,3} = -6$

$u_{1,4} = -2, u_{2,4} = -10, u_{3,4} = -10, u_{4,4} = -8$

## CALCULUS OF VARIATION

---

---

### 54.1 INTRODUCTION

The calculus of variations primarily deals with finding maximum or minimum value of a definite integral involving a certain function.

### 54.2 FUNCTIONALS

A simple example of functional is the shortest length of a curve through two points  $A(x_1, y_1)$  and  $B(x_2, y_2)$ . In other words, the determination of the curve  $y = y(x)$  for which  $y(x_1) = y_1, y(x_2) = y_2$  such that

$$\int_{x_1}^{x_2} \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx \quad \dots(1)$$

is a minimum.

An integral such as (1) is called a *Functional*.

In general, it is required to find the curve  $y = y(x)$  where  $y(x_1) = y_1$  and

$y(x_2) = y_2$  such that for a given function  $f\left(x, y, \frac{dy}{dx}\right)$ ,

$$\int_{x_1}^{x_2} f\left(x, y, \frac{dy}{dx}\right) dx \quad \dots(2)$$

is maximum or minimum.

Integral (2) is known as the functional.

In differential calculus, we find the maximum or minimum value of functions. But the calculus of variations deals with the problems of maxima or minima of functionals.

A functional  $I[y(x)]$  is said to be linear if it satisfies.

(i)  $I[cy(x)] = cI[y(x)]$ , where  $c$  is an arbitrary constant.

(ii)  $I[y_1(x) + y_2(x)] = I[y_1(x)] + I[y_2(x)]$ , where  $y_1(x) \in M$  and  $y_2(x) \in M$ .

### 54.3 DEFINITION

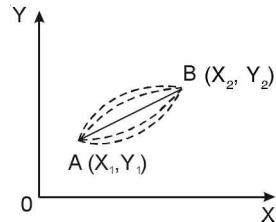

A functional  $I[y(x)]$  is maximum on a curve  $y = y(x)$ , if the values of  $I[y(x)]$  on any curve close to  $y = y_1(x)$  do not exceed  $I[y_1(x)]$ . It means  $\Delta I = I[y(x)] - I[y_1(x)] \leq 0$  and  $\Delta I = 0$  on  $y = y_1(x)$ .

In case of minimum of  $I[y(x)]$ ,  $\Delta I = 0$ .

**Extremal:** A function  $y = y(x)$  which extremizes a functional is called extremal or extremizing function.

### 54.4 EULER'S EQUATION IS

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left( \frac{\partial f}{\partial y} \right) = 0$$

This is the necessary condition for  $I = \int_{x_1}^{x_2} f(x, y, y') dx$  to be maximum or minimum.

**Proof:** Let  $y = y(x)$  be the curve AB which makes the given function I an extremum. Consider a family of neighbouring curves

$$Y = y(x) + \alpha \eta(x) \quad \dots (1)$$

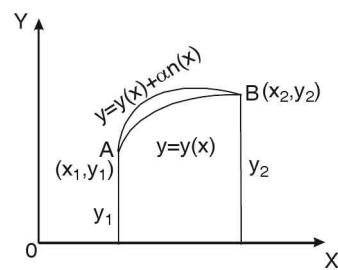

where  $\alpha$  is a parameter,  $-r \text{ or } r$  and  $\eta(x)$  is an arbitrary differentiable function.

At the end points A and B,

$$\eta(x_1) = \eta(x_2) = 0$$

when  $\alpha = 0$ , neighbouring curves become  $y = y(x)$ , which is extremal.

The family of neighbouring curves is called the family of *comparison functions*.

If in the functional  $\int_{x_1}^{x_2} f(x, y, y') dx$  We replace  $y$  by  $Y$ , we get

$$\int_{x_1}^{x_2} f(x, Y, Y') dx = \int_{x_1}^{x_2} f[x, y(x) + \alpha \eta(x), y'(x) + \alpha \eta'(x)] dx.$$

which is a function of  $\alpha$ , say  $I(\alpha)$ .

$$\therefore I(\alpha) = \int_{x_1}^{x_2} f(x, Y, Y') dx$$

For  $\alpha = 0$ , the neighbouring curves become the extremal, an extremum for  $\alpha = 0$ .

The necessary condition for this is  $I'(\alpha) = 0 \quad \dots (2)$

Differentiating  $I$  under the integral sign by Leibnitz's rule, we have

$$I'(\alpha) = \int_{x_1}^{x_2} \left( \frac{\partial f}{\partial x} \frac{\partial x}{\partial \alpha} + \frac{\partial f}{\partial Y} \frac{\partial Y}{\partial \alpha} + \frac{\partial f}{\partial Y'} \frac{\partial Y'}{\partial \alpha} \right) dx$$

$$I'(\alpha) = \int_{x_1}^{x_2} \left( \frac{\partial f}{\partial Y} \frac{\partial Y}{\partial \alpha} + \frac{\partial f}{\partial Y'} \frac{\partial Y'}{\partial \alpha} \right) dx \quad \left( \frac{\partial x}{\partial \alpha} = 0 \text{ as } \alpha \text{ is independent of } x \right) \quad \dots (3)$$

On differentiating (1), w. r. t. 'x', we get,  $Y' = y'(x) + \alpha \eta'(x)$

Again differentiating w.r.t. ' $\alpha$ ', we get  $\frac{\partial Y'}{\partial \alpha} = \eta'(x)$

Differentiating (1), w. r. t., we get  $\alpha \frac{\partial Y}{\partial \alpha} = \eta(x)$

Now (3) becomes  $I'(\alpha) = \int_{x_1}^{x_2} \left[ \frac{\partial f}{\partial Y} \eta(x) + \frac{\partial f}{\partial Y'} \eta'(x) \right] dx$

Integrating the second term on the right by parts, we get

$$= \int_{x_1}^{x_2} \frac{\partial f}{\partial Y} \eta(x) dx + \left[ \left\{ \frac{\partial f}{\partial Y'} \eta(x) \right\}_{x_1}^{x_2} - \int_{x_1}^{x_2} \frac{d}{dx} \left( \frac{\partial f}{\partial Y'} \right) \eta(x) dx \right]$$

$$\begin{aligned}
 &= \int_{x_1}^{x_2} \frac{\partial f}{\partial Y'} \eta(x) dx + \left[ \frac{\partial f}{\partial Y'} \eta(x_2) - \frac{\partial f}{\partial Y'} \eta(x_1) \right] - \int_{x_1}^{x_2} \frac{d}{dx} \left[ \frac{\partial f}{\partial Y'} \right] \eta(x) dx \\
 &= \int_{x_1}^{x_2} \frac{\partial f}{\partial Y'} \eta(x) dx + 0 - \int_{x_1}^{x_2} \frac{d}{dx} \left( \frac{\partial f}{\partial Y'} \right) \eta(x) dx = \int_{x_1}^{x_2} \left[ \frac{\partial f}{\partial Y'} - \frac{d}{dx} \left( \frac{\partial f}{\partial Y'} \right) \right] \eta(x) dx [\eta(x_1) = \eta(x_2) = 0]
 \end{aligned}$$

for extremum value,  $I'(\alpha) = 0$

$$0 = \int_{x_1}^{x_2} \left[ \frac{\partial f}{\partial Y'} - \frac{d}{dx} \left( \frac{\partial f}{\partial Y'} \right) \right] \eta(x) dx$$

$\eta(x)$  is an arbitrary continuous function.

$$\therefore \frac{\partial f}{\partial Y'} - \frac{d}{dx} \left( \frac{\partial f}{\partial Y'} \right) = 0 \text{ which is a required Euler's equation.}$$

Note: Other Forms of Euler's equation

$$1. \frac{d}{dx} f(x, y, y') = \frac{\partial f}{\partial x} \frac{dx}{dx} + \frac{\partial f}{\partial y} \frac{dy}{dx} + \frac{\partial f}{\partial y'} \frac{dy'}{dx}$$

$$\text{or} \quad \frac{df}{dx} = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \quad \dots(4)$$

$$\text{But} \quad \frac{d}{dx} \left( y' \frac{\partial f}{\partial y'} \right) = y' \frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) + \frac{\partial f}{\partial y'} y'' \quad \dots(5)$$

On subtracting (5) from (4), we have

$$\begin{aligned}
 \frac{df}{dx} - \frac{d}{dx} \left( y' \frac{\partial f}{\partial y'} \right) &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' - y' \frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) \\
 \frac{d}{dx} \left[ f - y' \frac{\partial f}{\partial y'} \right] - \frac{\partial f}{\partial x} &= y' \left[ \frac{\partial f}{\partial y} - \frac{d}{dx} \frac{\partial f}{\partial y'} \right] = (y')(0) = 0 \quad [\text{Euler's equation}]
 \end{aligned}$$

$$\text{Hence} \quad \frac{d}{dx} \left[ f - y' \frac{\partial f}{\partial y'} \right] - \frac{\partial f}{\partial x} = 0 \quad \dots(6)$$

Which is another form of Euler's equation.

2. We know that  $\frac{\partial f}{\partial y'}$  is also a function  $x, y, y'$  say  $\phi(x, y, y')$ .

$$\begin{aligned}
 \frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) &= \frac{\partial \phi}{\partial x} \frac{dx}{dx} + \frac{\partial \phi}{\partial y} \frac{dy}{dx} + \frac{\partial \phi}{\partial y'} \frac{dy'}{dx} = \frac{\partial \phi}{\partial x} + \frac{\partial \phi}{\partial y} y' + \frac{\partial \phi}{\partial y'} y'' \\
 \frac{\partial}{\partial x} \left( \frac{\partial f}{\partial y'} \right) + \frac{\partial}{\partial y} \left( \frac{\partial f}{\partial y'} \right) y' + \frac{\partial}{\partial y'} \left( \frac{\partial f}{\partial y'} \right) y'' &= \frac{\partial^2 f}{\partial x \partial y'} + y' \frac{\partial^2 f}{\partial y \partial y'} + y'' \frac{\partial^2 f}{\partial y'^2}
 \end{aligned}$$

Putting the value of  $\frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right)$  in Euler's equation, we get

$$\frac{\partial f}{\partial y} - \frac{\partial^2 f}{\partial x \partial y'} - y' \frac{\partial^2 f}{\partial y \partial y'} - y'' \frac{\partial^2 f}{\partial y'^2} = 0 \quad \dots(7)$$

This is the third form of Euler's equation.

### 54.5 EXTREMAL

Any function which satisfies Euler's equation is known as Extremal. Extremal is obtained by solving the Euler's equation.

**Case 1.** If  $f$  is independent of  $x$ , i.e.,  $\frac{\partial f}{\partial x} = 0$ .

On substituting the value of  $\frac{\partial f}{\partial x}$  in (6), we have  $\frac{d}{dx} \left[ f - y' \frac{\partial f}{\partial y'} \right] = 0$

Integrating, we get  $f - y' \frac{\partial f}{\partial y'} = \text{constant}$

**Case 2.** When  $f$  is independent of  $y$ , i.e.,  $\frac{\partial f}{\partial y} = 0$ .

Putting the value of  $\frac{\partial f}{\partial y}$  in Euler's equation, we get

$\frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) = 0$ , Integrating we get  $\frac{\partial f}{\partial y'} = \text{constant}$

**Case 3.** If  $f$  is an independent of  $y'$ , i.e.,  $\frac{\partial f}{\partial y'} = 0$ . On substituting the value of  $\frac{\partial f}{\partial y'}$  in the Euler's equation, we get  $\frac{\partial f}{\partial y} = 0$

This is the desired solution.

**Case 4.** If  $f$  is independent of  $x$  and  $y$ ,

we have  $\frac{\partial f}{\partial x} = 0$  and  $\frac{\partial f}{\partial y} = 0$  or  $\frac{\partial^2 f}{\partial x \partial y'} = 0$  and  $\frac{\partial^2 f}{\partial y \partial y'} = 0$

Putting these values in Euler's equation (7), we have  $y'' \frac{\partial^2 f}{\partial y'^2} = 0$

If  $\frac{\partial^2 f}{\partial y'^2} \neq 0$  then  $y'' = 0$  whose solution is  $y = ax + b$ .

**Example 1.** Test for an extremum the functional

$$I[y(x)] = \int_0^1 (xy + y^2 - 2y^2 y') dx, \quad y(0) = 1, y(1) = 2$$

**Solution.** Euler's equation

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) = 0 \quad \dots(1)$$

Here  $f = xy + y^2 - 2y^2 y'$

$$\frac{\partial f}{\partial y} = x + 2y - 4yy' \text{ and } \frac{\partial f}{\partial y'} = -2y^2$$

$$\frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) = \frac{d}{dx} (-2y^2) = -4yy'$$

Putting these values in (1), we get  $x + 2y - 4yy' - (-4yy') = 0$

or

$$x + 2y = 0 \quad \text{or} \quad y = -\frac{x}{2} \quad \text{At } x = 0, y = 0; \quad \text{At } x = 1, y = -\frac{1}{2}.$$

This extremal does not satisfy the boundary conditions  $y(0) = 1, y(1) = 2$ .  
Hence there is no extremal.

**Ans.**

**Example 2.** Prove that the shortest distance between two points is along a straight line.

**Solution.** Let  $A(x_1, y_1)$  and  $B(x_2, y_2)$  be the two given points and  $s$  the length of the arc joining these points.

$$\text{Then } s = \int_{x_1}^{x_2} ds = \int_{x_1}^{x_2} \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx = \int_{x_1}^{x_2} \sqrt{(1+y'^2)} dx \quad \dots (1)$$

$$y(x_1) = y_1, \quad y(x_2) = y_2$$

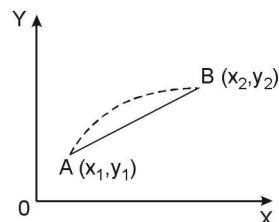

If  $s$  satisfies the Euler's equation, then it will be minimum

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) = 0 \quad (\text{Euler's equation})$$

$$\text{Here in (1), } f = \sqrt{(1+y'^2)}$$

$$f \text{ is independent of } y, \text{ i.e., } \frac{\partial f}{\partial y} = 0$$

$$\frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) = \frac{d}{dx} \left( \frac{\partial}{\partial y'} \sqrt{(1+y'^2)} \right) = \frac{d}{dx} \left[ \frac{1}{2} (1+y'^2)^{-\frac{1}{2}} 2y' \right] = \frac{d}{dx} \frac{y'}{\sqrt{(1+y'^2)}}$$

Putting these values in Euler's Equation, we have

$$0 - \frac{d}{dx} \frac{y'}{\sqrt{(1+y')}} = 0 \quad \text{or} \quad \frac{d}{dx} \frac{y'}{\sqrt{(1+y')}} = 0$$

$$\text{On integrating } \frac{y'}{\sqrt{(1+y')}} \text{ constant (c), i.e., } (y')^2 = c^2 (1+y'^2)$$

$$\text{or } y'^2 (1-c^2) = c^2 \text{ or } y'^2 = \frac{c^2}{1-c^2} = m^2 \text{ or } y' = m \text{ or } \frac{dy}{dx} = m$$

$$\text{Integrating } y = mx + c$$

which is a straight line.

... (2)

**Ans.**

$$\text{Now } y(x_1) = y_1 \quad \text{and} \quad y(x_2) = y_2$$

$$mx_1 + c = y_1 \quad \text{and} \quad mx_2 + c = y_2$$

... (3)

on subtracting, we get

$$\text{or } y_2 - y_1 = m(x_2 - x_1) \quad \text{or} \quad m = \frac{y_2 - y_1}{x_2 - x_1}$$

Subtracting (3) from (2), we get

$$y - y_1 = m(x - x_1)$$

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1} (x - x_1)$$

**Proved.**

**Example 3.** Find the curve connecting the points  $(x_1, y_1)$  and  $(x_2, y_2)$  which when rotated about the x-axis gives a minimum surface.

Find the extremal of the functional.

$$\int_{x_1}^{x_2} 2\pi y ds \text{ or } 2\pi \int_{x_1}^{x_2} y \sqrt{(1+y'^2)} dx$$

$$\text{Subject to } y(x_1) = y_1, y(x_2) = y_2$$

**Solution.**  $2\pi$  is constant so we have to find the extremal of

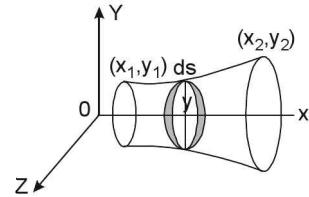

$$\int_{x_1}^{x_2} y \sqrt{(1+y'^2)} dx$$

Here  $f = y \sqrt{(1+y'^2)}$  which is independent of  $x$ .

One form of Euler's equation is

$$\frac{d}{dx} \left[ f - y' \frac{\partial f}{\partial y'} \right] - \frac{\partial f}{\partial x} = 0 \quad \frac{d}{dx} \left[ f - y' \frac{\partial f}{\partial y'} \right] = 0 \quad \left( \frac{\partial f}{\partial x} = 0 \right)$$

On integrating, we get,  $f - y' \frac{\partial f}{\partial y'} = \text{constant } (c)$  ... (1)

Putting the value of  $f$  and  $\frac{\partial f}{\partial y'}$  (1), we have

$$y = \sqrt{(1+y'^2)} - y' \frac{2y'}{2\sqrt{(1+y'^2)}} y = c$$

$$\text{or } y\sqrt{(1+y'^2)} - \frac{yy'^2}{\sqrt{(1+y'^2)}} = c \quad \text{or } y(1+y'^2) - yy'^2 = c\sqrt{(1+y'^2)}$$

$$y = c\sqrt{(1+y'^2)} \quad \text{or } y^2 = c^2(1+y'^2)$$

$$\text{or } y'^2 = \frac{y^2 - c^2}{c^2} \quad \text{or } y' = \frac{\sqrt{y^2 - c^2}}{c} \quad \text{or } \frac{dy}{dx} = \frac{\sqrt{y^2 - c^2}}{c}$$

$$\frac{dy}{\sqrt{y^2 - c^2}} = \frac{dx}{c} \Rightarrow \int \frac{dy}{\sqrt{y^2 - c^2}} = \int \frac{dx}{c} \Rightarrow \cosh^{-1} \frac{y}{c} = \frac{x}{c} + b$$

$y = c \cosh \left( \frac{x}{c} + b \right)$  which is the equation of catenary. This is the required extremal. **Ans.**

**Example 4.** Find the curve connecting two points (not on a vertical line), such that a particle sliding down this curve under gravity (in absence of resistance) from one point to another reaches in the shortest time. (Brachistochrone problem).

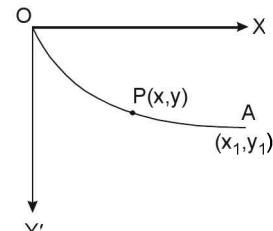

**Solution.** Let the particle slide on the curve OA from O with zero velocity. Let OP =  $s$  and time taken from 0 to P =  $t$ . By the law of conservation of energy, we have

K.E. at P – K.E. at O = potential energy at P.

$$\frac{1}{2}mv^2 - 0 = mgh$$

$$\text{or } \frac{1}{2}m \left( \frac{ds}{dt} \right)^2 = mgh \quad \text{or } \frac{ds}{dt} = \sqrt{(2gy)}$$

Time taken by the particle to move from O to A

$$T = \int_0^T dt = \int_0^{x_1} \frac{ds}{\sqrt{(2gy)}} = \frac{1}{\sqrt{(2g)}} \int_0^{x_1} \frac{ds}{\sqrt{y}} = \frac{1}{\sqrt{(2g)}} \int_0^{x_1} \frac{\sqrt{(1+y'^2)}}{\sqrt{y}} dx$$

Here,  $f = \frac{\sqrt{(1+y'^2)}}{\sqrt{y}}$  which is independent of  $x$ , i.e.,  $\frac{\partial f}{\partial x} = 0$ .

$$\text{and } \frac{\partial f}{\partial y'} = \frac{1}{2\sqrt{y}} \frac{2y'}{\sqrt{(1+y'^2)}} = \frac{y'}{\sqrt{y}\sqrt{(1+y'^2)}}$$

Solution of Euler's equation is

$$f - y' \frac{\partial f}{\partial y'} = \text{constant } c$$

On substituting the values of  $f$  and  $\frac{\partial f}{\partial y'}$ , We get

$$\begin{aligned} & \frac{\sqrt{(1+y'^2)}}{\sqrt{y}} - y' \frac{y'}{\sqrt{y}\sqrt{(1+y'^2)}} = c \\ \Rightarrow & \sqrt{1+y'^2} - \frac{y^2}{\sqrt{(1+y'^2)}} = c\sqrt{y} \quad \text{or} \quad 1+y'^2 - y'^2 = c\sqrt{(1+y'^2)}\sqrt{y} \\ \Rightarrow & 1 = c\sqrt{y(1+y'^2)} \quad \text{or} \quad 1 + \left(\frac{dy}{dx}\right)^2 = \frac{1}{yc^2} \quad \text{or} \quad \frac{dy}{dx} = \frac{\sqrt{1-yc^2}}{yc^2} \\ \Rightarrow & \frac{dy}{dx} = \frac{\sqrt{1/c^2 - y}}{y} = \frac{\sqrt{a-y}}{y} \quad \left(\frac{1}{c^2} = a\right) \\ & dx = \sqrt{\frac{y}{a-y}} dy \\ & \int_0^x x \, dx = \int_0^y \sqrt{\left(\frac{y}{a-y}\right)} dy \quad \begin{array}{l} \text{Put } y = a \sin^2 \theta \\ dy = 2a \sin \theta \cos \theta d\theta \end{array} \\ x = & \int_0^\theta \sqrt{\left(\frac{a \sin^2 \theta}{a - a \sin^2 \theta}\right)} 2a \sin \theta \cos \theta d\theta = \int_0^\theta \left(\frac{\sin \theta}{\cos \theta}\right) 2a \sin \theta \cos \theta d\theta = \int_0^\theta 2a \sin^2 \theta d\theta \\ & = a \int_0^\theta (1 - \cos 2\theta) d\theta = a \left(\theta - \frac{\sin 2\theta}{2}\right)_0^\theta \\ \Rightarrow & x = \frac{a}{2}(2\theta - \sin 2\theta) \quad \text{and} \quad y = a \sin^2 \theta = \frac{a}{2}(1 - \cos 2\theta) \\ \text{On putting } & \frac{a}{2} = A \quad \text{and} \quad 2\theta = \Theta \quad \begin{bmatrix} x = A(\Theta - \sin \Theta) \\ y = A(1 - \cos \Theta) \end{bmatrix} \text{ which is a cycloid.} \end{aligned}$$

### EXERCISE 54.1

1. Find the extremal of the functional

$$I[y(x)] = \int_{x_0}^{x_1} \frac{1+y'^2}{y'^2} dy \quad \text{Ans. } y = \sinh(c_1 x + c_2)$$

$$2. \text{ Solve the Euler's equations for } \int_{x_0}^{x_1} (x+y') y' dx. \quad \text{Ans. } y = -\frac{x^2}{4} + c_1 x + c_2$$

$$3. \text{ Solve the Euler's equation for } \int_{x_0}^{x_1} (1+x^2 y') y' dx \quad \text{Ans. } y = cx^1 + c_2$$

Find the extremals of the functional and extremism value of the following:

$$4. I[y(x)] = \int_{x_0}^{x_1} \frac{1+y'^2}{y'^2} dx \quad \text{Ans. } y = \sinh(c_1 x + c_2)$$

5.  $I[y(x)] = \int_{\frac{1}{2}}^{\frac{1}{2}} x^2 y^2 dx$  subject to  $y\left(\frac{1}{2}\right) = 1, y(2) = 4.$  **Ans.**  $y = -\frac{c}{x} + d$ , value = 1
6.  $I[y(x)] = \int_0^2 (x - y)^2 dx$  subject to  $y(0) = 0, y(2) = 4.$  **Ans.**  $y = \frac{x^2}{2} + cx + d$ , value = 2
7.  $\int_0^{\frac{\pi}{2}} (y'^2 - y^2) dx$  subject to  $y(0), y\left(\frac{\pi}{2}\right) = 1$  **Ans.**  $y = \sin x$ , value = 0
8.  $\int_0^1 (y'^2 + 12xy) dx$  subject to  $y(0) = 0, y(1) = 1$  **Ans.**  $y = x^3$ , value =  $\frac{21}{5}$
9.  $\int_1^2 \frac{\sqrt{1+y'^2}}{x} dx$  subject to  $y(1) = 0, y(2) = 1.$  **Ans.**  $y = x^3$

#### 54.6 ISOPERIMETRIC PROBLEMS

The determination of the shape of a closed curve of the given perimeter enclosing maximum area is the example of isoperimetric problem. In certain problems it is necessary to make a given integral.

$$I = \int_{x_1}^{x_2} f(x, y, y') dx \quad \dots(1)$$

maximum or minimum while keeping another integral

$$I = \int_{x_1}^{x_2} g(x, y, y') dx = K \text{ (Constant)} \quad \dots(2)$$

Problems of this type are solved by Lagrange's multipliers method. We multiply (2) by  $\lambda$  and add to (1) to extremize (1)

$$I^* = \int_{x_1}^{x_2} f(x, y, y') dx + \lambda \int_{x_1}^{x_2} g(x, y, y') dx = \int_{x_1}^{x_2} F dx \text{ (say)}$$

$$\text{Then by Euler's equation } \frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) l = 0$$

**Note.** Isoperimetric problem. To find out possible curves having the same perimeter, the one which encloses the maximum area.

**Example 5.** Find the shape of the curve of the given perimeter enclosing maximum area.

**Solution.** Let  $P$  be the perimeter of the closed curve,

$$\text{Then } P = \int_{x_1}^{x_2} \sqrt{1+y'^2} dx \quad \dots(1)$$

The area enclosed by the curve,  $x$ -axis and two perpendicular lines is

$$A = \int_{x_1}^{x_2} y dx \quad \dots(2)$$

We have to find the maximum value of (2) under the condition (1).  
By Lagrange's multiplier method.

$$F = y + \lambda \sqrt{1+y'^2}$$

For maximum or minimum value of  $A$ ,  $F$  must satisfy Euler's equation

$$\frac{\partial F}{\partial y} - \frac{d}{dx} \left( \frac{\partial F}{\partial y'} \right) = 0$$

$$1 - \lambda \frac{d}{dx} \left[ \frac{1}{2} (1+y'^2)^{-\frac{1}{2}} (2y') \right] = 0 \quad \text{or} \quad 1 - \lambda \frac{d}{dx} \left( \frac{y'}{\sqrt{1+y'^2}} \right) = 0$$

Integrating w.r.t. 'x', we get  $x - \frac{\lambda y'}{(1+y'^2)} = a$

or  $\frac{\lambda y'}{\sqrt{(1+y'^2)}} = x - a \quad \text{or} \quad \lambda^2 y'^2 = (1+y'^2)(x-a)^2$   
 $[\lambda^2 - (x-a)^2] y'^2 = (x-a)^2$

or  $y' = \frac{x-a}{\sqrt{[\lambda^2 - (x-a)^2]}} \quad \text{or} \quad \frac{dy}{dx} = \frac{x-a}{\sqrt{[\lambda^2 - (x-a)^2]}}$

Integrating w.r.t. (x), we obtain

$$y = -\sqrt{[\lambda^2 - (x-a)^2]} + b$$

or  $y - b = -\sqrt{[\lambda^2 - (x-a)^2]} \quad (y-b)^2 = \lambda^2 - (x-a)^2 \quad \text{or} \quad (x-a)^2 + (y-b)^2 = l^2$

This is the equation of a circle whose centre is  $(a, b)$  and radius  $\lambda$ .

Ans.

**Example 6.** Find the extremal of the functional  $A = \int_{t_1}^{t_2} \frac{1}{2} (x \dot{y} - y \dot{x}) dt$  subject to the integral constraint  $\int_{t_1}^{t_2} \frac{1}{2} \sqrt{(\dot{x}^2 - \dot{y}^2)} dt = l$ .

**Solution.** Here  $f = \frac{1}{2} (x \dot{y} - y \dot{x})$ ,  $g = \sqrt{\dot{x}^2 - \dot{y}^2}$

$$F = f + \lambda g \quad F = \frac{1}{2} (xy - yx) + \lambda \sqrt{\dot{x}^2 + \dot{y}^2}$$

For  $A$  to have extremal  $F$  must satisfy the Euler's equation

$$\frac{\partial F}{\partial x} - \frac{d}{dx} \left[ \frac{\partial F}{\partial \dot{x}} \right] = 0 \quad \dots(1)$$

$$\frac{\partial F}{\partial y} - \frac{d}{dx} \left[ \frac{\partial F}{\partial \dot{y}} \right] = 0 \quad \dots(1)$$

$$\frac{\partial F}{\partial \dot{x}} - \frac{d}{dx} \left[ \frac{\partial F}{\partial y} \right] = 0 \quad \dots(2)$$

From (1)

$$\begin{aligned} \frac{1}{2} \dot{y} - \frac{d}{dt} \left( -\frac{y}{2} + \frac{\lambda 2 \dot{x}}{2 \sqrt{\dot{x}^2 + \dot{y}^2}} \right) &= 0 \\ \frac{d}{dt} \left( y - \frac{\lambda \dot{x}}{2 \sqrt{\dot{x}^2 + \dot{y}^2}} \right) &= 0 \end{aligned} \quad \dots(3)$$

From (2)

$$-\frac{1}{2} \dot{x} - \frac{d}{dt} \left[ \frac{x}{2} + \frac{\lambda \dot{y}}{\sqrt{\dot{x}^2 + \dot{y}^2}} \right] = 0 \quad \dots(4)$$

$$\frac{d}{dt} \left[ x - \frac{\lambda \dot{y}}{\sqrt{\dot{x}^2 + \dot{y}^2}} \right] = 0$$

Integrating (3) and (4), we have

$$y - \frac{\lambda \dot{x}}{\sqrt{\dot{x}^2 + \dot{y}^2}} = c_1 \quad \text{or} \quad y - c_1 = \frac{\lambda \dot{x}}{\sqrt{\dot{x}^2 + \dot{y}^2}} \quad \dots(5)$$

$$x - \frac{\lambda \dot{y}}{\sqrt{\dot{x}^2 + \dot{y}^2}} = c_2 \quad \text{or} \quad x - c_2 = \frac{\lambda \dot{y}}{\sqrt{\dot{x}^2 + \dot{y}^2}} \quad \dots(6)$$

Squaring (5), (6) and adding, we get

$$(x - c_2)^2 + (y - c_1)^2 = \lambda^2 \left( \frac{\dot{x}^2 + \dot{y}^2}{\dot{x}^2 + \dot{y}^2} \right)$$

$$(x - c_2)^2 + (y - c_1)^2 = \lambda^2$$

This is the equation of circle.

**Ans.**

**Example 7.** Find the solid of maximum volume formed by the revolution of a given surface area.

**Solution.** Let the curve PA pass through origin and it is rotated about the x - axis.

$$S = \int_a^a 2\pi y ds$$

$$S = \int_0^a 2\pi y \sqrt{1+y'^2} dx \quad \dots(1)$$

$$V = \int_0^a \pi y^2 dx \quad \dots(2)$$

Here we have to extremize V with the given S.

$$\text{Here } f = \pi y^2, g = 2\pi y \sqrt{1+y'^2}$$

$$F = f + \lambda g$$

$$F = \pi y^2 + \lambda 2\pi y \sqrt{1+y'^2}$$

For maximum V, F must satisfy Euler's equation. But F does not contain x.

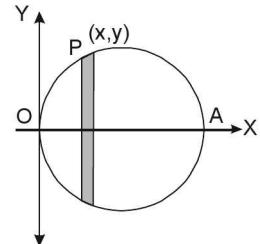

$$\therefore F - y' \frac{\partial F}{\partial y'} = C$$

$$\text{or } \pi y^2 + \lambda 2\pi y \sqrt{1+y'^2} - y' \frac{1}{2} \frac{2\pi y \lambda 2y'}{\sqrt{1+y'^2}} = C$$

$$\text{or } \pi y^2 + 2\pi y \lambda \sqrt{1+y'^2} - \frac{2\pi \lambda y y'^2}{\sqrt{1+y'^2}} = C$$

$$\text{or } \pi y^2 + \frac{2\pi y \lambda}{\sqrt{1+y'^2}} = C$$

As the curve passes through origin (0, 0), so C = 0.

$$\pi y^2 + \frac{2\pi y \lambda}{\sqrt{(1+y'^2)}} = 0$$

or  $y + \frac{2\lambda}{\sqrt{(1+y'^2)}} = 0 \quad \text{or} \quad y\sqrt{(1+y'^2)} = -2\lambda$

or  $1+y'^2 = \frac{4\lambda^2}{y^2} \quad \text{or} \quad y'^2 = \frac{4\lambda^2}{y^2} - 1 = \frac{4\lambda^2 - y^2}{y^2}$

or  $\frac{dy}{dx} = \frac{\sqrt{(4\lambda^2 - y^2)}}{y}$

$$\int \frac{y dy}{\sqrt{(4\lambda^2 - y^2)}} = \int dx + C$$

$$-\sqrt{4\lambda^2 - y^2} = x + C \quad \dots(1)$$

or  $\sqrt{4\lambda^2 - y^2} = -x - C$

The curve passes through (0, 0). On putting  $x = 0, y = 0$  in (1) we get

$$-C = 2\lambda$$

(1) becomes  $\sqrt{4\lambda^2 - y^2} = -x + 2\lambda$

Squaring  $4\lambda^2 - y^2 = (x - 2\lambda)^2$

or  $(x - 2\lambda)^2 + y^2 = 4\lambda^2$

This is the equation of a circle.

Hence, on revolving the circle about  $x$ - axis, the solid formed is a sphere.

**Ans.**

### EXERCISE 54.2

1. Show that an isosceles triangle has the smallest perimeter for a given area and a given base.
2. Find the external in the isoperimetric problem of the extremum of

$$\int_0^1 (y'^2 + z'^2 - 4xz' - 4z) dx$$

subject to  $\int_0^1 (y'^2 + xy' - z'^2) dx = 2, y(0) = 0, z(0) = 0, y(1) = 1, z(1) = 1$ .

**Ans.**  $y = \frac{-5x^2}{2} + \frac{7x}{2}, z = x$

3. Find the surface with the smallest area which encloses a given volume.

**Ans.** Sphere

4. Find the external of the functional  $\int_{t_1}^{t_2} \sqrt{x^2 + y^2 + z^2} dt$  subject to  $x^2 + y^2 + z^2 = a^2$ .

**Ans.** Arc of a great circle of a sphere.

5. Find the extremals of the isoperimetric problem  $\int_{x_0}^{x_1} y'^2 dx$  subject to  $\int_{x_0}^{x_1} y dx = c$ . **Ans.**  $y = x^2 + ax + b$

### 54.7 FUNCTIONALS OF SECOND ORDER DERIVATIVES

Let us consider the extremum of a functional.

$$\int_{x_1}^{x_2} [f(x, y, y', y'')] dx \quad \dots(1)$$

The necessary condition for the above mentioned functional to be extremum is

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) + \frac{d^2}{dx^2} \left( \frac{\partial f}{\partial y''} \right) = 0$$

**Proof.** Let the boundary conditions be

$$y(x_1) = y_1, y(x_2) = y_2, y'(x_1) = y'_1, y'(x_2) = y'_2$$

Let  $\alpha$  be a parameter and  $\eta(x)$  is a differentiable function.

At the end points  $\eta(x_1) = \eta(x_2) = 0$  and  $\eta'(x_1) = \eta'(x_2) = 0$

Putting  $y + \alpha \eta(x)$  for  $y$  in (1), we have

$$\int_{x_1}^{x_2} f[x, y + \alpha \eta(x), y' + \alpha \eta'(x), y'' + \alpha \eta''(x)] dx$$

Writing  $\int_{x_1}^{x_2} f[x, y + \alpha \eta(x), y' + \alpha \eta'(x), y'' + \alpha \eta''(x)] dx = \int_{x_1}^{x_2} F dx = 1$

For extremum value of (1)

$$\frac{dI}{d\alpha} = 0$$

$$\frac{dI}{d\alpha} = \int_{x_1}^{x_2} \frac{\partial F}{\partial \alpha} dx$$

Differentiating under the sign of integral, we get

$$= \int_{x_1}^{x_2} \left( \frac{\partial F}{\partial y} \frac{\partial y}{\partial \alpha} + \frac{\partial F}{\partial y'} \frac{\partial y'}{\partial \alpha} + \frac{\partial F}{\partial y''} \frac{\partial y''}{\partial \alpha} \right) dx = \int_{x_1}^{x_2} \left( \frac{\partial F}{\partial y} \frac{\partial(\alpha n)}{\partial \alpha} + \frac{\partial F}{\partial y'} \frac{\partial(\alpha n')}{\partial \alpha} + \frac{\partial F}{\partial y''} \frac{\partial(\alpha n'')}{\partial \alpha} \right) dx$$

But  $\frac{dI}{d\alpha} = 0$  when  $\alpha = 0$

$$0 = \int_{x_1}^{x_2} \left[ \frac{\partial f}{\partial y} \eta + \frac{\partial f}{\partial y'} \eta' + \frac{\partial f}{\partial y''} \eta'' \right] dx \quad \text{or} \quad \int_{x_1}^{x_2} \frac{\partial f}{\partial y} \eta dx + \int_{x_1}^{x_2} \frac{\partial f}{\partial y'} \eta' dx + \int_{x_1}^{x_2} \frac{\partial f}{\partial y''} \eta'' dx = 0$$

Integrating by parts, w.r.t. 'x', we have

$$\int_{x_1}^{x_2} \frac{\partial f}{\partial y} \eta dx + \left[ \frac{\partial f}{\partial y} \eta - \int_{x_1}^{x_2} \frac{\partial}{\partial x} \left( \frac{\partial f}{\partial y'} \right) \cdot \eta dx \right]_{x_1}^{x_2} + \left[ \frac{\partial f}{\partial y''} \eta' - \frac{d}{dx} \left( \frac{\partial f}{\partial y''} \right) \cdot \eta + \frac{d^2}{dx^2} \left( \frac{\partial f}{\partial y''} \right) \int_{x_1}^{x_2} \eta dx \right]_{x_1}^{x_2} = 0$$

But  $n(x_1) = n(x_2) = 0$  and  $\eta'(x_1) = \eta'(x_2) = 0$

$$\text{so } \int_{x_1}^{x_2} \left[ \frac{\partial f}{\partial y} - \frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) + \frac{d^2}{dx^2} \left( \frac{\partial f}{\partial y''} \right) \right] \eta(x) dx = 0 \Rightarrow \frac{\partial f}{\partial y} - \frac{d}{dx} \left( \frac{\partial f}{\partial y'} \right) + \frac{d^2}{dx^2} \left( \frac{\partial f}{\partial y''} \right) = 0 \quad \text{Proved.}$$

### EXERCISE 54.3

1. Find the extremal of  $\int_{x_0}^{x_1} (16y^2 - y''^2 + x^2) dx$ . **Ans.**  $y = c_1 e^{2x} + c_2 e^{-2x} + c_3 \cos 2x + c_4 \sin 2x$

2. Find the extremal of  $\int_{-c}^c (ay + \frac{1}{2}by''^2) dx$  subject to  $y(-c) = 0, y'(-c) = 0$ ,

$$y(c) = 0, y'(c) = 0. \quad \text{Ans. } y = -\frac{a}{24b}(x^2 - c^2)^2$$

3. Find the extremal of  $\int_0^x y''^2 dx$  subject to  $\int_0^x y^2 dx = 1, y(0) = y(p) = 0, y''(p) = 0$ .

$$\text{Ans. } y = a_1 \sin x + a_2 \sin 2x + \dots$$

4. Find the extremal of  $\int_{x_0}^{x_1} (2xy + y''^2) dx$ . **Ans.**  $y = \frac{x^7}{7!} + c_1 x^5 + c_2 x^4 + c_3 x^3 + c_4 x^2 + c_5 x + c_6$

## TENSOR ANALYSIS

---

### 55.1 INTRODUCTION

*Scalars* are specified by magnitude only, *vectors* have magnitude as well as direction. *Tensors* are associated with magnitude and two or more directions. For example, the stress of an elastic solid at a point depends upon two directions. One of the directions is given by the normal to the area, while the other is that of the force on it.

Tensors are similar to vectors. A vector can be specified by its components (Magnitude and direction). A tensor can be specified only by its components which depend upon the system of reference. The components of the same tensor will be different for two different sets of axes with different orientations.

Tensors analysis is suitable for mathematical formulation of natural laws in forms which are invariant with respect to different frames of reference. That is why Einstein used tensors for the formulation of his Theory of Relativity.

### 55.2 CO-ORDINATE TRANSFORMATION

If we have two systems of rectangular co-ordinate axes  $OX$ ,  $OY$ ,  $OZ$ ;  $OX'$ , or,  $OZ'$ ; having same origin such that the direction cosines of the lines

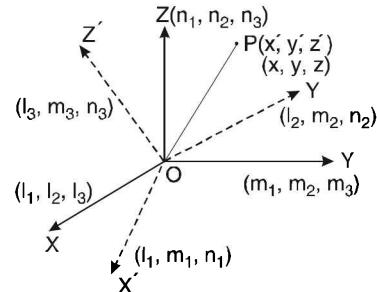

$OX'$ ,  $OY'$ ,  $OZ'$  relative to the system  $OXYZ$  are

$$l_1, m_1, n_1; l_2, m_2, n_2; l_3, m_3, n_3$$

Two equivalent systems of transformation equations express  $x'$ ,  $y'$ ,  $z'$  in terms of  $x$ ,  $y$ ,  $z$  and vice versa.

$$\left. \begin{aligned} x' &= l_1x + m_1y + n_1z \\ y' &= l_2x + m_2y + n_2z \\ z' &= l_3x + m_3y + n_3z \end{aligned} \right\} \quad \dots (1)$$

$$\left. \begin{aligned} x &= l_1x' + l_2y' + l_3z' \\ y &= m_1x' + m_2y' + m_3z' \\ z &= n_1x' + n_2y' + n_3z' \end{aligned} \right\} \quad \dots (2)$$

where  $(x', y', z')$  and  $(x, y, z)$  are co-ordinates of point  $P$  relative to two systems of co-ordinate axes. System of transformation eq. shown above in (1) and (2) can be written as

	$x$	$y$	$z$
$x'$	$l_1$	$m_1$	$n_1$
$y'$	$l_2$	$m_2$	$n_2$
$z'$	$l_3$	$m_3$	$n_3$

### 55.3 SUMMATION CONVENTION

The sum of the following  $a_1x_1 + a_2x_2 + a_3x_3 + \dots + a_nx_n$  ... (1)

can be written in brief as  $\sum_{i=1}^{i=n} a_i x_i$  ... (2)

More simplified and compact notation for (2) used by Einstein is  $a_i x^i$ . ... (3)

In (3) we have omitted  $\Sigma$ -sign.

$$a_i x^i = a_1 x^1 + a_2 x^2 + a_3 x^3 + \dots + a_n x^n$$

We write  $x_1, x_2, x_3, \dots x_n$  as  $x^1, x^2, x^3, \dots x^n$  in tensor analysis. These superscripts do not stand for powers of  $x$  but indicate different symbols. The power of  $x^i$  is written as

$$(x^i)^2, (x^i)^3, \dots$$

**Example 1.** Write out  $a_{rs}x^s = b_r$  ( $r, s = 1, 2, 3, \dots, n$ ) in full:

**Solution.**  $a_{rs}x^s = b_r$

$$a_{1s}x^s + a_{2s}x^s + a_{3s}x^s + \dots + a_{ns}x^s = b_1 + b_2 + b_3 + \dots + b_n \quad (r \text{ occurs 1 to } n)$$

$$(a_{11}x^1 + a_{12}x^2 + a_{13}x^3 + \dots + a_{1n}x^n) + (a_{21}x^1 + a_{22}x^2 + a_{23}x^3 + \dots + a_{2n}x^n)$$

$$+ (a_{31}x^1 + a_{32}x^2 + a_{33}x^3 + \dots + a_{3n}x^n) + \dots = b_1 + b_2 + b_3 + \dots + b_n$$

**Example 2.** If  $f = f(x^1, x^2, x^3, \dots x^n)$  then show that  $df = \frac{\partial f}{\partial x^i} dx^i$

$$\text{Solution. } df = \frac{\partial f}{\partial x^1} dx^1 + \frac{\partial f}{\partial x^2} dx^2 + \dots + \frac{\partial f}{\partial x^n} dx^n = \frac{\partial f}{\partial x^i} dx^i$$

Proved.

### 55.4 SUMMATION OF CO-ORDINATES

The equations of co-ordinates can be written in very compact form in terms of summation convention. We write  $(x_1, x_2, x_3)$  and  $(\bar{x}_1, \bar{x}_2, \bar{x}_3)$  instead of  $(x, y, z)$  and  $(x', y', z')$  and denote the co-ordinate axes as  $OX_1, OX_2, OX_3$  and  $O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$ . Also we denote  $x_i, \bar{x}_j$  as the co-ordinates of a point  $P$  relative to the two systems of axes; where  $i = 1, 2, 3, j = 1, 2, 3$ .

Let  $l_{ij}$  denote the cosines of the angles between  $OX_i, O\bar{X}_j$ . In general  $l_{ij} \neq l_{ji}$

The eq. of co-ordinate transformation can be written as

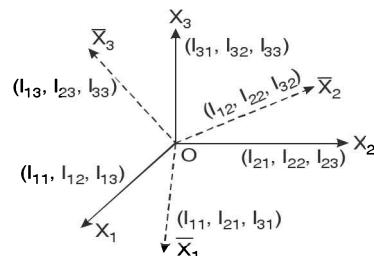

$$\begin{aligned} \bar{x}_1 &= l_{11}x_1 + l_{21}x_2 + l_{31}x_3 \\ \bar{x}_2 &= l_{12}x_1 + l_{22}x_2 + l_{32}x_3 \\ \bar{x}_3 &= l_{13}x_1 + l_{23}x_2 + l_{33}x_3 \end{aligned} \quad \dots (1a)$$

$$\begin{aligned} x_1 &= l_{11}\bar{x}_1 + l_{12}\bar{x}_2 + l_{13}\bar{x}_3 \\ x_2 &= l_{21}\bar{x}_1 + l_{22}\bar{x}_2 + l_{23}\bar{x}_3 \\ x_3 &= l_{31}\bar{x}_1 + l_{32}\bar{x}_2 + l_{33}\bar{x}_3 \end{aligned} \quad \dots (1b)$$

These equations of co-ordinate transformation can be represented by means of a table form such that

	$x_1$	$x_2$	$x_3$
$\bar{x}_1$	$l_{11}$	$l_{21}$	$l_{31}$
$\bar{x}_2$	$l_{12}$	$l_{22}$	$l_{32}$
$\bar{x}_3$	$l_{13}$	$l_{23}$	$l_{33}$

Adopting summation on convention i.e.,

$$a_{11} + a_{22} + a_{33} = a_{ij}$$

$a_{usip} b_{iq} = a_{ip} b_{1q} + a_{2p} b_{2q} + a_{3p} b_{3q}$  we re-write above equations as

$$\begin{aligned}\bar{x}_1 &= l_{11}x_i & x_1 &= l_{1j}\bar{x}_j \\ \bar{x}_2 &= l_{12}x_i & x_2 &= l_{2j}\bar{x}_j \\ \bar{x}_3 &= l_{13}x_i & x_3 &= l_{3j}\bar{x}_j\end{aligned}$$

We can re-write these equations in single equation in the form.

$$\bar{x}_j = l_{ij}x_i, \quad x_i = l_{ij}\bar{x}_j$$

which are complete equivalents of the equations of co-ordinate transformation from either system to another.

### 55.5 RELATION BETWEEN THE DIRECTION COSINES OF THREE MUTUALLY PERPENDICULAR STRAIGHT LINES

The direction cosines of any three mutually perpendicular straight lines  $O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  relative to the system  $OX_1, OX_2, OX_3$  are  $l_{11}, l_{21}, l_{31}, l_{12}, l_{22}, l_{32}, l_{13}, l_{23}, l_{33}$ .

The relation between these direction cosines are

$$l_{11}l_{11} + l_{21}l_{21} + l_{31}l_{31} = l_{j1}l_{j1} = 1 \quad l_{12}l_{12} + l_{22}l_{22} + l_{32}l_{32} = l_{j2}l_{j2} = 1$$

$$l_{13}l_{13} + l_{23}l_{23} + l_{33}l_{33} = l_{j3}l_{j3} = 1.$$

Similarly,

$$l_{11}l_{12} + l_{21}l_{22} + l_{31}l_{32} = l_{j1}l_{j2} = 0 \quad l_{12}l_{13} + l_{22}l_{23} + l_{32}l_{33} = l_{j2}l_{j3} = 0$$

$$l_{13}l_{11} + l_{23}l_{21} + l_{33}l_{31} = l_{j3}l_{j1} = 0$$

Finally, we can write these equations by means of a single equation as

$$l_{ij}l_{kj} = \begin{cases} 1, & \text{when } i = k \\ 0, & \text{when } i \neq k \end{cases} \quad \text{or} \quad \delta_{ik} = \begin{cases} 1, & \text{when } i = k \\ 0, & \text{when } i \neq k \end{cases}$$

where  $\delta_{ik}$  is the kronecker delta.

$$\text{or} \quad \delta_{ik} = l_{ij}l_{kj}$$

Now, we know that  $\bar{x}_j = l_{ij}x_i$

Multiplying both sides by  $l_{jk}$  then

$$\text{or} \quad l_{jk}\bar{x}_j = l_{ij}l_{jk}x_i \quad \Rightarrow \quad l_{jk}\bar{x}_j = \delta_{ik}x_i$$

putting  $i = k$  i.e.,  $\delta_{ik} = 1$  when  $i = k$

$$\delta_{kk}x_k = l_{jk}\bar{x}_j \Rightarrow x_k = l_{jk}\bar{x}_j$$

### 55.6 TRANSFORMATION OF VELOCITY COMPONENTS ON CHANGE FROM ONE SYSTEM OF RECTANGULAR AXES TO ANOTHER

We know that with the help of parallelogram law of velocities, that any given velocity can be represented by means of its three components along three mutually perpendicular lines and the three components characterise velocity completely. The components change as we pass from one system of mutually perpendicular lines to another.

Let  $OX_1, OX_2, OX_3$  and  $O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  are two systems of rectangular axes and suppose that  $l_i, \bar{l}_j$  are the direction cosines of the line of action of the velocity and  $v$ , denote the

magnitude of the velocity. Then

$$v_i = l v, \bar{v}_j = v \bar{l}_j \quad \dots (1)$$

where  $v_i$  and  $\bar{v}_j$ , denotes the components of velocity relative to the two systems of axes.

By the equation of co-ordinate transformation, we have

$$\bar{l}_j = l_{ij} l_i, l_i = l_{ij} \bar{l}_j \quad \dots (2)$$

From (1) and (2).

$$\frac{\bar{v}_j}{v} = l_{ij} \frac{v_i}{v}, \frac{v_i}{v} = l_{ij} \frac{\bar{v}_j}{v}. \quad \text{i.e., } \bar{v}_j = l_{ij} v_i$$

Thus we see equation of transformation of velocity components are same as for the transformation of co-ordinate of points.

### 55.7 RANK OF A TENSOR

The rank of a tensor is the number (without counting an index which appears once as a subscript) of indices in the symbol representing a tensor. For example

Tensor	Symbol	Rank
Scalar	$A$	zero
Contravariant Tensor	$B^i$	1
Covariant Tensor	$C_k$	1
Covariant Tensor	$D_y$	2
Mixed Tensor	$E_{jkl}^{il}$	3

In an  $n$ -dimensional space, the number of components of a tensor of rank  $r$  is  $n^r$ .

### 55.8 FIRST ORDER TENSORS

**Definition.** Any entity representable by a set of three numbers (called components) relatively to a system of rectangular axes is called first order tensors, if its components  $a_i, a_j$  relatively to any two systems of rectangular axes  $OX_1, OX_2, OX_3$ ,  $O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  are connected by the relation,  $\bar{a}_j = l_{ij} a_i$   $\dots (3)$

$$\Rightarrow a_i = l_{ij} \bar{a}_j$$

$l_{ij}$  being cosines of angle between  $OX_i$  and  $O\bar{X}_j$ . A tensor of first order is also called a *vector*.

**Note.** Consider any two tensors of first order and let  $a_i, b_j, \bar{a}_p, \bar{b}_q$ ; be the components of the same relatively to two different systems of axes, we have

$$\bar{a}_p = l_{ip} a_i, \bar{b}_q = l_{jq} b_j$$

where  $l_{ip}$  and  $l_{jq}$  have their usual meanings. This gives

$$\bar{a}_p \bar{b}_q = l_{ip} a_i l_{jq} b_j = l_{ip} l_{jq} a_i b_j \quad \dots (1)$$

The R.H.S. of (1) denotes the sum of 9 terms obtained by giving all possible pair of values to the dummy suffixes  $i, j$  so that each components of  $\bar{a}_p \bar{b}_q$  is expressed as a linear combination of nine components of the set  $a_i, b_j$ ; the coefficient being dependent only upon the positions of the two systems of axes relative to each other and not on the components of the sets  $\bar{a}_p \bar{b}_q, a_i b_j$

### 55.9 SECOND ORDER TENSORS

**Definition.** Any entity representable by a two suffixes set relatively to a system of rectangular axes is called a second order tensor, if the sets  $a_{ij}, \bar{a}_{pq}$  representing the entity

relative to any two systems of rectangular axes  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  are connected by relation.

$$\bar{a}_{pq} = l_{ip} l_{jq} a_{ij}$$

### 55.10 TENSORS OF ANY ORDER

**Definition.** Any entity representable by a set with  $m$ , suffixes relatively to a system of rectangular co-ordinate axes is called a tensor of order  $m$ , if the set  $a_{ijkl}, \dots, \bar{a}_{pqrs}, \dots$  representing the entity relatively to any two systems of rectangular axes  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  are connected by the relation

$$\bar{a}_{pqrs} = l_{ip} l_{jq} l_{kr} l_{ls} a_{ijkl} \dots$$

We say that  $a_{ijkl}, \dots$  are the components of tensor relatively to the rectangular system of axes  $OX_1, OX_2, OX_3$ .

### 55.11 TENSOR OF ZERO ORDER

**Definition.** Any entity representable by a single number such that the same number represents the entity irrespective of any underlying system of axes is called a tensor of order zero. A tensor of order zero is also called a *scalar*.

### 55.12 ALGEBRAIC OPERATIONS ON TENSORS

**Theorem.** If  $a_{ijkl}, \dots, b_{ijkl}, \dots$  are two tensors of the same order then

$$c_{ijkl} = a_{ijkl} + b_{ijkl} \dots$$

is a tensor of the same order.

**Proof.** Let  $a_{ijkl}, \dots, b_{ijkl}, \dots$  and  $\bar{a}_{pqrs}, \dots, \bar{b}_{pqrs}, \dots$  be the components of the given tensors relatively to two systems  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$ .

We write

$$c_{ijkl} = a_{ijkl} + b_{ijkl} \dots$$

$$\bar{c}_{pqrs} = \bar{a}_{pqrs} + \bar{b}_{pqrs} \dots$$

Let  $l_{ij}$  denote the cosine of the angle between  $OX_i$  and  $OX_j$ .

$$\bar{c}_{pqrs} = l_{ip} l_{jq} l_{kr} l_{ls} c_{ijkl} \dots \quad \dots (1)$$

As  $a_{ijkl}, \dots$  and  $b_{ijkl}, \dots$  are tensors, we have

$$\bar{a}_{pqrs} = l_{ip} l_{jq} l_{kr} l_{ls} a_{ijkl} \dots \quad \dots (2)$$

$$\bar{b}_{pqrs} = l_{ip} l_{jq} l_{kr} l_{ls} b_{ijkl} \dots \quad \dots (3)$$

Adding (2) and (3), we obtain (1).

Hence the theorem

Similarly, we can show for difference

$$\begin{aligned} \bar{a}_{pqrs} - \bar{b}_{pqrs} &= l_{ip} l_{jq} l_{kr} l_{ls} [a_{ijkl} - b_{ijkl}] \\ \bar{d}_{pqrs} &= l_{ip} l_{jq} l_{kr} l_{ls} d_{ijkl} \dots \end{aligned}$$

### 55.13 PRODUCT OF TWO TENSORS

**Theorem.** If  $a_{ijkl}, \dots, b_{pqrs}, \dots$  be two tensors of order  $\alpha$  and  $\beta$  respectively, then

$c_{ijkl \dots pqrs} = a_{ijkl} b_{pqrs} \dots$  is a tensor of order  $\alpha + \beta$ .

**Proof.** Let  $a_{ijkl} \dots, b_{pqrs} \dots$  and  $\bar{a}_{ijkl} \dots, \bar{b}_{pqrs} \dots$  be the components of given tensor relatively to two systems  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$ , we write

$$\begin{aligned} c_{ijkl \dots pqrs} &= a_{ijkl} \dots b_{pqrs} \\ \bar{c}_{ijkl \dots p_1 q_1 r_1 s_1} &= \bar{a}_{ijkl} \dots \bar{b}_{pqrs} \dots \end{aligned}$$

Let  $l_{ij}$  be the direction cosines of the angle between  $OX_i$  and  $O\bar{X}_j$ , then

$$\bar{c}_{ijkl \dots p_1 q_1} = l_{i_1} l_{j_1} \dots l_{p_1} l_{q_1} \dots c_{ijkl \dots pqr} \dots \quad \dots (1)$$

As  $a_{ijkl} \dots$  and  $b_{pqrs} \dots$  are tensors we have

$$\bar{a}_{ijkl} \dots = l_{i_1} l_{j_1} l_{k_1} \dots a_{ijkl} \dots \quad \dots (2)$$

$$\bar{b}_{pqrs} \dots = l_{p_1} l_{q_1} l_{r_1} \dots b_{pqrs} \dots \quad \dots (3)$$

Multiplying (2) and (3) we get (1). The new tensor obtained is called product of the tensors.

### 55.14 QUOTIENT LAW OF TENSORS

**Theorem.** If there be an entity representable by a multisuffix set  $a_{ij}$  relatively to any given system of rectangular axes and if  $a_{ij} b_i$  is a vector, where  $b_i$  is any arbitrary vector whatsoever then  $a_{ij}$  is a tensor of order two.

**Proof.**  $a_{ij} b_i = c_j$  so that  $c_j$  is a vector. Let  $a_{ij} b_p c_j$  and  $\bar{a}_{pq}, \bar{b}_p, \bar{c}_q$  be the components of the given entity and two vectors relatively to two systems of axes  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$ , then we have

$$a_{ij} b_i = c_j \quad \dots (1)$$

$$\bar{a}_{pq} \bar{b}_p = \bar{c}_q \quad \dots (2)$$

Also,  $b_p, c_j$  being vectors, we have

$$\bar{c}_q = l_{jq} c_j \quad \dots (3)$$

$$b_p = l_{ip} \bar{b}_p \quad \dots (4)$$

From these, we have

$$\bar{a}_{pq} \bar{b}_p = \bar{c}_q = l_{jq} c_j - l_{jq} a_{ij} b_i = l_{jq} a_{ij} l_{ip} \bar{b}_p = l_{ip} l_{jq} a_{ij} \bar{b}_p$$

$$\text{i.e., } (\bar{a}_{pq} - l_{ip} l_{jq} a_{ij}) \bar{b}_p = 0$$

As the vector  $\bar{b}_p$  is arbitrary, we consider three vectors whose components relatively to  $O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  are  $1, 0, 0 ; 0, 1, 0 ; 0, 0, 1$ .

For these vectors, we have from (5)

$$\bar{a}_{1q} - l_{1l} l_{jq} a_{ij} = 0, \quad \bar{a}_{2q} - l_{2l} l_{jq} a_{ij} = 0, \quad \bar{a}_{3q} - l_{3l} l_{jq} a_{ij} = 0$$

These are equivalent to

$$\bar{a}_{pq} - l_{ip} l_{jq} a_{ij} = 0$$

$$\text{i.e., } \bar{a}_{pq} = l_{ip} l_{jq} a_{ij}, \quad [\text{This shows that } a_{ij} \text{ is of second order}]$$

so that the components of the given entity obey the tensorial transformation laws. Hence the result.

### 55.15 CONTRACTION THEOREM

**Theorem.** If  $a_{ijkl} \dots$  is a tensor of order  $m$ , then the set obtained on identifying any two suffixes is a tensor of order  $(m-2)$ .

**Proof.** Let  $a_{ijkl} \dots, \bar{a}_{pqrs} \dots$  be the components of the given tensor relatively to two coordinate systems of axes  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$ , so that we have,

$$\bar{a}_{pqrs} \dots = l_{ip} l_{jq} l_{kr} \dots a_{jkl} \dots \dots (1)$$

Let us identify  $q$  and  $s$  then,

$$\begin{aligned}\bar{a}_{pqrs} \dots &= l_{ip} l_{js} l_{kr} l_{ls} \dots a_{jkl} \dots \\ \bar{a}_{pr} \dots &= l_{ip} l_{kr} \delta_{jl} \dots a_{jkl} \dots \\ &= l_{ip} l_{kr} \dots a_{ikl} \dots = l_{ip} l_{kr} \dots a_{ik} \dots\end{aligned}\left[ \begin{array}{l} \because \delta_{jl} = 0, \ j \neq l \\ \delta_{jl} = 1, \ j = l \end{array} \right]$$

This shows that the order of the tensor reduces by two.

Hence the theorem.

### 55.16 SYMMETRIC AND ANTISYMMETRIC TENSORS

$$\text{If } A_{rs}^k = A_{sr}^k \text{ or } (A_k^{r,s} = A_k^{s,r})$$

then  $A_{rs}^k$  (or  $A_{sr}^k$ ) are said to be symmetric tensors.

$$\text{If } B_{rs}^k = -B_{sr}^k \text{ or } (B_k^{rs} = -B_k^{sr})$$

then  $B_{rs}^k$  (or  $B_{sr}^k$ ) are known as antisymmetric tensors.

The symmetric (or antisymmetric) property is conserved under a transform of co-ordinates.

### 55.17 SYMMETRIC AND SKEW SYMMETRIC TENSORS

Invariance of the symmetric and skew-symmetric character of the sets of components of tensors

**Theorem.** Show that if  $a_{ijkl} \dots$  is symmetric (skew-symmetric) in any two suffixes, then so is also  $\bar{a}_{pqrs} \dots$  in the same suffixes.

**Proof.** Let  $a_{ijkl} \dots$ ,  $\bar{a}_{pqrs} \dots$  be the components of a tensor respectively to two systems of axes  $OX_1$ ,  $OX_2$ ,  $OX_3$ ,  $O\bar{X}_1$ ,  $O\bar{X}_2$ ,  $O\bar{X}_3$ . Then we have

$$\bar{a}_{pqrs} \dots = l_{ip} l_{jq} l_{kr} l_{ls} \dots a_{jkl} \dots \dots (1)$$

Now, suppose that  $a_{ijkl} \dots$  is symmetric in the second and fourth suffixes. Interchanging  $q$  and  $s$  on the two sides of (1) we obtain

$$\bar{a}_{psrq} \dots = l_{ip} l_{js} l_{kr} l_{iq} \dots a_{jkl} \dots \dots (2)$$

As  $j$  and  $l$  are dummy, we can interchange them. Then interchanging  $j$  and  $l$  on the R.H.S. of (2) we get

$$\bar{a}_{psrq} \dots = l_{ip} l_{ls} l_{kr} l_{jq} \dots a_{jkl} \dots \dots (3)$$

$$\bar{a}_{psrq} \dots = l_{ip} l_{jq} l_{kr} l_{ls} \dots a_{jkl} \dots$$

The set  $a_{ijkl} \dots$  is symmetric in the second and fourth suffixes.

Now from (1) and (3) we have

$$\bar{a}_{pqrs} \dots = \bar{a}_{psrq} \dots$$

Hence the result.

**Definition.** A tensor is said to be symmetric (skew-symmetric) in any two suffixes if its components relatively to every co-ordinate system are symmetric (skew-symmetric) in the two suffixes, in question.

A tensor is said to be symmetric (skew-symmetric) if it is so in every pair of suffixes, e.g.,

If  $u_i v_j$  be any two vectors then the two second order tensors  $u_i v_j + u_j v_i$ ,  $u_i v_j - u_j v_i$  are respectively symmetric and skew-symmetric.

### 55.18 THEOREM

Every second order tensor can be expressed as the sum of a symmetric and a skew-symmetric tensor.

**Proof.** Let  $a_{ij}$  be any tensor of order 2. Now,

$$\bar{a}_{pq} = l_{ip} l_{jq} a_{ij} = l_{jp} l_{iq} a_{ji} \quad \dots(1)$$

where we have interchanged the two dummy suffixes  $i$  and  $j$ . Then (1) shows that  $a_{ij}$  is also a tensor of order two.

$$\text{Now, } a_{ij} = \frac{1}{2} [a_{ij} + a_{ji}] + \frac{1}{2} [a_{ij} - a_{ji}]$$

= symmetric + skew-symmetric

Thus  $a_{ij}$  is the sum of symmetric and skew symmetric tensors.

### 55.19 A FUNDAMENTAL PROPERTY OF TENSORS

**Theorem.** If the components of a tensor relatively to any one system of co-ordinate axes are all zero, then the components relatively to every system of co-ordinate axes are also zero.

**Proof.** Consider a tensor whose components relatively to the systems of axes  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  are  $a_{ijkl}, \bar{a}_{pqrs}, \dots$  and let  $a_{ijkl} = 0$  for every system of values of  $i, j, k, l, \dots$  we have

$$\bar{a}_{pqrs} = l_{ip} l_{jq} l_{kr} l_{ls} a_{ijkl} = 0$$

for every system of values of  $p, q, r, s, \dots$

### 55.20 ZERO TENSOR

**Def.** A tensor whose components relatively to one co-ordinate system and, also relatively to every co-ordinate system are all zero is known as zero tensor.

A zero tensor of every order is denoted by 0.

### EXERCISE 55.1

1. Write the following using summation convention:

(a)  $(x^1)^1 + (x^1)^2 + (x^1)^3 + \dots + (x^1)^n$

**Ans.**  $(x^1)^i$

(b)  $(x^1)^2 + (x^2)^2 + (x^3)^2 + \dots + (x^n)^2$

**Ans.**  $(x^i)^2$

(c)  $\frac{df}{dt} = \frac{\partial f}{\partial x^1} \frac{dx^1}{dt} + \frac{\partial f}{\partial x^2} \frac{dx^2}{dt} + \dots + \frac{\partial f}{\partial x^n} \frac{dx^n}{dt}$

**Ans.**  $\frac{df}{dt} = \frac{\partial f}{\partial x^i} \frac{dx^i}{dt}$

2. Write out all the tensor in  $S = a_{ij} x^i x^j$  taking  $n = 3$ .

**Ans.**  $S = (a_{11} x^1 x^1 + a_{12} x^1 x^2 + a_{13} x^1 x^3) + (a_{21} x^2 x^1 + a_{22} x^2 x^2 + a_{23} x^2 x^3) + (a_{31} x^3 x^1 + a_{32} x^3 x^2 + a_{33} x^3 x^3)$

3. Write the tensor contained in  $x^{pq}, x_{qr}$  if  $n = 2$

**Ans.**  $(x^{11} + x^{21}) x_{11} + (x^{11} + x^{21}) x_{12} + (x^{12} + x^{22}) x_{21} + (x^{12} + x^{22}) x_{22}$

4. How many equations in a four dimensional space are represented by  $R_{\beta\gamma}^\alpha = 0$  **Ans.** 8
5. Show that every tensor can be expressed as the sum of two tensors, one of which is symmetric and the other skew-symmetric in a pair of covariant or contravariant indices.
6. Show that the symmetric (or antisymmetric) property of a tensor is conserved under a transformation of co-ordinates.

7. If  $A^i$  and  $B_j$  are components of a contravariant and covariant tensor of rank one, then show that

$C_j^i = A^i B_j$  are the components of a mixed tensor of rank 2.

8. Write down the laws of transformation for the tensors  $A_k^{ij}$  and  $B_{klm}^{ij}$

$$\text{Ans. } \bar{A}_k^{ij} = \frac{\partial \bar{x}^i}{\partial x^p} \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial x^r}{\partial x^k} A_r^{pq}, \quad \bar{B}_{klm}^{ij} = \frac{\partial \bar{x}^i}{\partial x^p} \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial x^r}{\partial x^k} \frac{\partial x^s}{\partial x^l} \frac{\partial x^t}{\partial x^m} B_{rst}^{kl}$$

9. Evaluate (a)  $\delta_j^i \delta_k^j$  (b)  $\delta_j^i \delta_k^j \delta_l^k$

$$\text{Ans. (a)} \delta_k^i \text{ (b)} \delta_j^i$$

10. Show that the velocity of a fluid at any point is a contravariant tensor of rank one.

## 55.21 TWO SPECIAL TENSORS

### 1. Alternate tensor

Consider an abstract entity of order 3 and dimension 3 such that its components relatively to every system of co-ordinate axes are the same and given by  $\epsilon_{ijk}$  where

$$\epsilon_{ijk} = \begin{cases} 0 & \text{if any two of } ijk \text{ are equal} \\ 1 & \text{if } ijk \text{ is a cyclic permutation 1, 2, 3} \\ -1 & \text{if } ijk \text{ is an anti cyclic permutation 1, 2, 3} \end{cases}$$

Thus for unequal values of the suffixes, we have

$$\epsilon_{123} = \epsilon_{312} = \epsilon_{231} = 1, \quad \epsilon_{132} = \epsilon_{213} = \epsilon_{321} = -1$$

Let  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  be two systems of rectangular axes. We want to show that  $\epsilon_{ijk}$  is a tensor of order three. Consider, now expression

$$l_{ip} l_{jq} l_{kr} \epsilon_{ijk} \dots \quad (1)$$

For any given system of values  $p, q, r$ , the expression (1) consists of a sum of  $3^3 = 27$  terms of which 6 only are non-zero, for the other 21 terms corresponds to a case when atleast two of  $i, j, k$  are equal. The expression (1) can be written as in the form of determinant

$$\begin{vmatrix} l_{ip} & l_{2p} & l_{3p} \\ l_{1q} & l_{2q} & l_{3q} \\ l_{1r} & l_{2r} & l_{3r} \end{vmatrix}$$

From properties of determinants,

$$\text{Above determinant} = \begin{cases} 0 & \text{if any two of } p, q, r \text{ have equal value.} \\ 1 & \text{if } p, q, r \text{ is a cyclic permutation of 1, 2, 3} \\ -1 & \text{if } p, q, r \text{ is a non cyclic permutation of 1, 2, 3} \end{cases}$$

Thus we see that the components of the given entity in any two systems of rectangular axes satisfy the tensorial transformation equations so that the entity is a tensor. This tensor is known as *Alternate tensor*. Thus, we see alternate tensor is same as skew-symmetric tensor.  $\epsilon_{ijk}$ , always denote the alternate tensor.

## 55.22 KRONECKER TENSOR

The symbol  $\delta_i^k$  kronecker delta is defined as

$$\delta_i^k = 0 \text{ when } k \neq i$$

$$\delta_i^k = 1 \text{ when } k = i$$

It mean  $\delta_1^1 = \delta_2^2 = \dots = \delta_n^n = 1$  and  $\delta_1^2 = \delta_2^3 = \dots = 0$

$$\begin{aligned} \text{In general } A_{ij} \delta_k^i &= A_{i1} \delta_k^1 + A_{i2} \delta_k^2 + \dots + A_{ik} \delta_k^k + \dots + A_{in} \delta_k^n \\ &= 0 + 0 + \dots + A_{ik}(1) + \dots + 0 = A_{ik} \end{aligned}$$

**Example 3.** If  $A^{ij}$  are the cofactors of  $a^{ij}$  in a determinant  $\Delta$  of order three, then show that

$$a_{ij}A^{kj} = \Delta\delta_i^k$$

**Solution.** We know that

$$a_{11}A^{11} + a_{12}A^{12} + a_{13}A^{13} = \Delta \quad \dots (1)$$

$$a_{11}A^{21} + a_{12}A^{22} + a_{13}A^{23} = 0 \quad \dots (2)$$

$$a_{11}A^{31} + a_{12}A^{32} + a_{13}A^{33} = 0 \quad \dots (3)$$

These three equations can be written in brief as

$$a_{ij}A^{1j} = \Delta \quad \dots (4) \quad a_{ij}A^{2j} = 0 \quad \dots (5) \quad a_{ij}A^{3j} = 0 \quad \dots (6)$$

Using kronecker delta, equations (4), (5), (6) can be combined into a single equation:

$$a_{ij}A^{kj} = \Delta\delta_i^k \quad \dots (7)$$

Similarly six more equations are given by

$$a_{ij}A^{kj} = \Delta\delta_j^k \quad \dots (8) \quad \text{and} \quad a_{ij}A^{kj} = \Delta\delta_3^k \quad \dots (9)$$

Equations (7), (8), (9) can be written as a single equation.

$$a_{ij}A^{kj} = \Delta\delta_i^k \quad \dots (10)$$

All the nine equations of the determinant are included in one equation (10).

### 55.23 ISOTROPIC TENSOR

A tensor which has the same set of components relatively to every system of co-ordinate axes is called an *Isotropic tensor*.

### 55.24 RELATION BETWEEN ALTERNATE AND KRONECKER TENSOR

Prove that  $\epsilon_{ijm}\epsilon_{klm} = \delta_{ik}\delta_{jl} - \delta_{il}\delta_{jk}$ . Here each side is a tensor of order 4 so that tensor equality is equivalent to set of 81 scalar equality. We have to prove that

$$\epsilon_{ij1}\epsilon_{kl1} + \epsilon_{ij2}\epsilon_{kl2} + \epsilon_{ij3}\epsilon_{kl3} = \delta_{ik}\delta_{jl} - \delta_{il}\delta_{jk}$$

**Proof: Case I.** When  $i = j$  or  $k = l$ . There will be 45 such equations and for all these equations L.H.S. = 0 = R.H.S.

**Case II.** If the pair  $(i, j)$  such that  $i \neq j$  is different from the pair  $(l, k)$ ,  $l \neq k$  we see that there will be 24 such scalar equations for which L.H.S. = 0 = R.H.S.

**Ex.**  $(i, j) = (1, 2), (j, k) = (1, 3), (3, 1), (2, 3), (3, 2)$

$(i, j) = (2, 1), (j, k) = (1, 3), (3, 1), (2, 3), (3, 2)$ .

**Case III.** Thus we are left to consider the possibility when  $i, j$  and  $k, l$  take the pairs of values,

$(1, 2); (1, 3); (2, 3); (2, 1); (3, 1); (3, 2)$ .

Consider the first case we have

$i = 1, j = 2, k = 1, l = 2; i = 1, j = 2, k = 2, l = 1; i = 2, j = 1, k = 1, l = 2; i = 2, j = 1, k = 2, l = 1$ .

Each pair of  $(i, j)$  i.e  $(1, 2)$  gives two scalar equations. Thus 6 pairs of  $(i, j)$  give 12 such scalar equations. In these cases we have

$$\text{L.H.S.} = 1 = \text{R.H.S.}, \text{L.H.S.} = -1 = \text{R.H.S.}$$

$$\text{L.H.S.} = -1 = \text{R.H.S.}, \text{L.H.S.} = 1 = \text{R.H.S.}$$

This result is also true for other five cases. Hence we have the result.

**Example 4.** Prove that  $\epsilon_{ilm}\epsilon_{jlm} = 2\delta_{ij}$

**Proof.** We know  $\epsilon_{ilm}\epsilon_{jkm} = \delta_{ij}\delta_{lk} - \delta_{ik}\delta_{lj}$

Taking  $k = l$  we get

$$\epsilon_{ilm} \epsilon_{jlm} = \delta_{ij} \delta_{ll} - \delta_{il} \delta_{lj}$$

Now  $\delta_{ll} = \delta_{11} + \delta_{22} + \delta_{33} = 1+1+1 = 3$

$$\delta_{il} \delta_{lj} = \delta_{ij} \quad \therefore \delta_{ij} a_{im} = a_{jm}$$

$$\therefore \epsilon_{ilm} \epsilon_{jlm} = 3\delta_{ij} - \delta_{ij} = 2\delta_{ij}$$

**Proved.**

**Example 5.** Prove that  $\epsilon_{ijk} \epsilon_{ijk} = 6$

**Proof.**  $\epsilon_{ilm} \epsilon_{jkm} = \delta_{ij} \delta_{lk} - \delta_{ik} \delta_{lj}$

Taking  $k = l$ , we get

$$\epsilon_{ilm} \epsilon_{jlm} = 2\delta_{ij}$$

Taking  $i = j$  (Contraction)

$$\epsilon_{ilm} \epsilon_{ilm} = 2\delta_{ii} = 2 \times 3 = 6$$

**Proved.**

## 55.25 MATRICES AND TENSORS OF FIRST AND SECOND ORDER

Consider any vector. Its components  $a_i$  relatively to any system of axes may be written in the form of a row or a column matrix as

$$[a_1 a_2 a_3] \text{ or } \begin{bmatrix} a_1 \\ a_2 \\ a_3 \end{bmatrix}$$

We shall be writing  $a_i = [a_1 a_2 a_3]$  or  $a_i = \begin{bmatrix} a_1 \\ a_2 \\ a_3 \end{bmatrix}$

Now consider second order tensor. Its components  $a_{ij}$  relatively to any system of rectangular axes can be written as the form of matrix such that  $a_{ij}$  occurs at the intersection of the  $i^{\text{th}}$  row and  $j^{\text{th}}$  column. Thus we shall write

$$\left[ a_{ij} \right] = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

A matrix obtained by interchanging rows and columns of a given matrix is called the transpose of the same. Transpose of  $[a_{ij}]$  will be denoted by  $[a_{ij}]'$ .

Sum of two matrices of the same type is the matrix whose elements are the sums of the corresponding elements of two matrices.

## 55.26 SCALAR AND VECTOR PRODUCTS OF TWO VECTORS

**Def. 1.** *Scalar product.* The scalar  $u_i v_i$  is called the scalar product of the two vectors  $u_i$ ,  $v_i$ . Thus the scalar product  $= u_1 v_1 + u_2 v_2 + u_3 v_3$ .

**Def. 2.** *Vector product* The vector  $E_{ijk} u_j v_j$  is called vector product of two vectors  $u_i$ ,  $v_j$  taken in this order. Components of these vectors are  $u_2 v_3 = u_3 v_2$ ,  $u_3 v_1 = u_1 v_3$ ,  $u_1 v_2 = u_2 v_1$ .

## 55.27 THE THREE SCALAR INVARIANTS OF A SECOND ORDER TENSOR

I.  $a_{ii}$  or  $a_{11} + a_{22} + a_{33}$

II.  $\frac{1}{2}(a_{ii}a_{jj} - a_{ij}a_{ji})$  or  $a_{11}a_{22} + a_{22}a_{33} + a_{33}a_{11} - a_{12}a_{21} - a_{23}a_{32} - a_{31}a_{13}$

$$\text{III. } |a_{ij}| \quad \text{or} \quad \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

**Proof.** I. Identifying  $i, j$  we see that  $a_{ii}$  is scalar. Thus

$$a_{ii} = a_{11} + a_{22} + a_{33} \quad \dots(1)$$

is invariant.

II. Consider now the tensor of 4<sup>th</sup> order,  $a_{ij}a_{pq}$ . Identifying  $i$  with  $q$  and  $j$  with  $p$  we see that  $a_{ij}a_{ji}$  is scalar.

$$\text{Thus } a_{ij}a_{ji} = (a_{11})^2 + (a_{22})^2 + (a_{33})^2 + 2a_{12}a_{21} + 2a_{23}a_{32} + 2a_{31}a_{13} \quad \dots(2)$$

is invariant. Subtracting (2) from square of (1) and dividing by 2. We establish invariance of II.

(III) If  $a_{ij}$ ,  $\bar{a}_{pq}$  denote the components of tensor relatively to any two co-ordinate systems of axes, then is the usual notation, we have

$$\begin{aligned} \bar{a}_{pq} &= l_{ip}l_{jq}a_{ij} \\ |\bar{a}_{pq}| &= |l_{ip}||l_{jq}||a_{ij}| \\ \text{since } |l_{ip}| &= |l_{jq}| \\ \therefore |\bar{a}_{pq}| &= |l_{ip}|^2 |a_{ij}| \quad \text{but } |l_{ip}|^2 = 1 \\ \therefore |\bar{a}_{pq}| &= |a_{ij}| \end{aligned}$$

Hence it is an invariance.

### 55.28 SINGULAR AND NON-SINGULAR TENSORS OF SECOND ORDER

A tensor of second order is said to be singular or non-singular according as its determinant is zero or non zero.

### 55.29 RECIPROCAL OF A NON-SINGULAR TENSOR

Suppose  $a_{ij}$  be a second order tensor such that  $|a_{ij}| \neq 0$

**Lemma 1.** We form another matrix

$$A_{ij} = \frac{\text{Cofactor of } a_{ij} \text{ in the determinant } a_{ij}}{|a_{ij}|}$$

Now, by theory of determinants, we know

$$A_{ki}a_{ij} = \delta_{kj} \quad \dots(1)$$

We shall now show that  $A_{ij}$  is a second order tensor, we can not do so, by using Quotient law, from equation (1) since  $a_{ij}$  is not an arbitrary tensor. Let  $c_j$  be an arbitrary vector, then

$$c_j a_{ij} = d_i \quad \dots(2)$$

So that  $d_i$  is also a vector. We shall prove that this is an arbitrary vector. Now (2) is equivalent to a set of 3 linear equations in the components of  $c_j$  and as the determinant of  $a_{ij} \neq 0$ , we may assign any arbitrary values to  $d_i$  and the resulting equations can be uniquely solved for the components of  $c_j$ . Thus  $d_i$  is an arbitrary vector. We now have

$$\begin{aligned} d_i A_{ki} &= a_{ij} c_j A_{ki} = A_{ki} a_{ij} c_j = \delta_{kj} c_j = c_k \\ c_k &= d_i a_{ki} \end{aligned} \quad \dots(3)$$

Therefore by quotient law  $A_{ki}$  is a second order tensor.

**Lemma 2.**  $e_{ij} = \frac{\text{Cofactor of } A_{ij} \text{ in the determinant } A_{ij}}{|A_{ij}|}$

We know from the theory of determinants.

$$|A_{ij}| |a_{ij}| = 1 \quad \text{But} \quad |a_{ij}| \neq 0$$

Hence determinant  $|A_{ij}| \neq 0$

We shall now show that  $e_{ij} = a_{ij}$

$$e_{ki} A_{ij} = \delta_{kj}$$

Take inner product with  $a_{ji}$

$$e_{ki} A_{ij} a_{ji} = \delta_{kj} a_{ji}$$

$$e_{ki} \delta_{il} = a_{kl}$$

$$e_{ki} = a_{kl}$$

**Def.** Two second order non-singular tensors  $a_{ij}$  and  $A_{ij}$  are said to be conjugate (or reciprocal) tensors if they satisfy the equation

$$A_{ki} a_{ij} = \delta_{kj}$$

### 55.30 EIGEN VALUES AND EIGEN VECTORS OF A TENSOR OF SECOND ORDER

**Def.** A scalar,  $\lambda$ , is called an eigen value of second order tensor  $a_{ij}$  if there exists a non-zero vector  $x$ , such that  $a_{ij}x_j = \lambda x_i$ . This equation is equivalent to

$$a_{ij}x_j = \lambda \delta_{ij}x_i$$

$$\text{or} \quad (a_{ij} - \lambda \delta_{ij})x_j = 0 \quad \dots (1)$$

$$\text{since } x_j \neq 0, \text{ Hence } |a_{ij} - \lambda \delta_{ij}| = 0 \quad \dots (2)$$

This is a necessary condition for  $\lambda$ , to be eigen value. Eq. (2) is cubic eq. in  $\lambda$  and therefore in general will give us three eigen values may not all be distinct corresponding to the tensor  $a_{ij}$ .

Consider now any system of co-ordinate axes  $OX_1, OX_2, OX_3$ , and let  $a_{ij}$  be the component of the given tensor in this system. Consider now a vector  $x_j$ , whose components relatively to  $OX_1, OX_2, OX_3$  are given on solving (1). As the components of  $x_i$  are not zero relatively to one system  $OX_1, OX_2, OX_3$ , this vector can be zero vector i.e. its components relatively to any system of axes can not all be zero.

The tensor eq. (1) being true for one system  $OX_1, OX_2, OX_3$  will be true for every system of axes.

Thus we see that every second order tensor possesses three eigen values, not necessarily all distinct. These eigen values are the roots of the cubic  $|a_{ij} - \lambda \delta_{ij}| = 0$  in  $\lambda$ . Also to each eigen value corresponds an eigen vector. The vector  $x_i$  corresponding to eigen value  $\lambda$  is called an eigen vector.

### 55.31 THEOREM

Orthogonality of eigen vectors corresponding to distinct eigen values of a symmetric second order tensor.

**Proof.** Let  $a_{ij}$  be a symmetric second order tensor, and let  $x_i$  and  $y_i$  be the eigen vectors corresponding to the distinct eigen values  $\lambda_1$  and  $\lambda_2$  ( $\lambda_1 \neq \lambda_2$ ) we have

$$a_{ij}x_j = \lambda_1 x_i \quad \dots(1)$$

$$a_{ij}y_j = \lambda_2 y_i \quad \dots(2)$$

Now,

$$\begin{aligned} \lambda_1 x_i y_i &= a_{ij} x_j y_i \\ &= a_{ji} x_j y_i \\ &= a_{ij} y_j x_i \end{aligned} \quad [\because a_{ij} = a_{ji}]$$

$$\lambda_1 x_i y_i = a_{ij} y_j x_i$$

$$\therefore \lambda_1 x_i y_i = \lambda_2 y_i x_i \quad \text{or} \quad (\lambda_1 - \lambda_2)(x_i y_i) = 0$$

$$\text{since } \lambda_1 - \lambda_2 \neq 0 \quad \therefore x_i y_i = 0$$

Thus  $x$  and  $y$  are orthogonal i.e. the eigen vectors are orthogonal.

### 55.32 REALITY OF THE EIGEN VALUES

**Theorem.** The eigen values of symmetric second order tensor are real

**Proof.** Let  $\lambda$  be any eigen value so that we have a relation

$$a_{ij}x_i = \lambda x_i \quad \dots(1)$$

Here the components of  $x_j$  cannot be assumed to be all real. Taking complex conjugate (denoted by bar) in (1), we get

$$\bar{a}_{ij}\bar{x}_j = \bar{\lambda}\bar{x}_i$$

$$a_{ij}\bar{x}_j = \bar{\lambda}\bar{x}_i$$

$$\begin{cases} \because a_{ij} \text{ is symmetric} \quad \therefore a_{ij} = a_{ji} \\ \bar{a}_{ij} = a_{ij} \text{ (all elements are real)} \end{cases}$$

Take inner product by  $x_i$

$$a_{ij}\bar{x}_j x_i = \bar{\lambda}\bar{x}_i x_i$$

$$\bar{\lambda} \{ \bar{x}_i x_i \} = a_{ji}(\bar{x}_j x_i) \quad \text{by symmetry}$$

$$= a_{ij}\bar{x}_i x_j \quad [\text{interchanging dummy indices}]$$

$$= a_{ij}x_i \bar{x}_j \quad [\bar{x}_i x_i = \text{real}]$$

$$= \bar{a}_{ij}x_i \bar{x}_j = \text{real} \quad [\because (a - ib)(a + ib) = a^2 + b^2 \text{ which is real}]$$

This shows that the right hand side is real. Hence  $\bar{\lambda}$  is real. Thus  $\lambda$  is real i.e. eigen value are real.

Proved.

### 55.33 ASSOCIATION OF A SKEW SYMMETRIC TENSORS OF ORDER TWO AND VECTORS

We associate the skew symmetric tensor of order two.

$$a_{ij} = \epsilon_{ijk} a_k \quad \dots(1)$$

The tensor  $a_{ij}$  is skew symmetric for

$$a_{ji} = \epsilon_{jik} a_k = -\epsilon_{ijk} a_k = -a_{ij}$$

The relation (1) is equivalent to statements

$$a_{23} = a_1, a_{32} = -a_1; a_{31} = a_2, a_{13} = -a_2; a_{12} = a_3, a_{21} = -a_3; a_{11} = 0, a_{22} = 0; a_{33} = 0.$$

On the inner multiplication with  $\epsilon_{ijm}$  we obtain from (1)

$$\epsilon_{ijm} a_{ij} = \epsilon_{ijm} \epsilon_{ijk} a_k \quad \epsilon_{ijk} \epsilon_{pqk} = \delta_{ip} \delta_{jq} - \delta_{iq} \delta_{jp}$$

$$= 2\delta_{mk} a_k \quad \epsilon_{ijk} \epsilon_{pjk} = \delta_{ip} \delta_{jj} - \delta_{jp} \delta_{ij}$$

$$= 2a_m \quad \text{when } k = m \quad = 3\delta_{ip} - \delta_{ip} = 2\delta_{ip}$$

$$\text{Hence } a_m = \frac{1}{2} \epsilon_{ijm} a_{ij}$$

This shows that association is one-one.

### 55.34 TENSOR FIELDS

A tensor field or a tensor point function is said to be defined when there is given a law which associates to each point of given region of space a tensor of the same order. Thus a tensor field  $a_{ij} \dots$  of any order is defined if the components  $a_{ij} \dots$  are functions of  $x_1, x_2, x_3$ .

### 55.35 GRADIENT OF TENSOR FIELDS:GRADIENT OF A SCALAR FUNCTION.

Let  $u$  be a scalar point function so that there is a value of  $u$  associated with each point of a given region of space. Thus if  $OX_1, OX_2, OX_3$  and  $O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  be any two systems, then  $u$  is a function of  $x_i$  and  $\bar{x}_p$  which are co-ordinates of any point  $P$  relatively to the two systems of axes. For any point  $P$ ,  $x_i, \bar{x}_p$  are different but the values of  $u$  are same. Consider now two sets of first order

$$\frac{\partial u}{\partial x_i}, \frac{\partial u}{\partial \bar{x}_p} \quad \text{we have } \frac{\partial u}{\partial x_i} = \frac{\partial u}{\partial \bar{x}_p} \frac{\partial \bar{x}_p}{\partial x_i}$$

We know that  $\bar{x}_p = l_{ip}x_i$

$$\therefore \frac{\partial \bar{x}_p}{\partial x_i} = l_{ip} \quad \therefore \frac{\partial u}{\partial x_i} = l_{ip} \frac{\partial u}{\partial \bar{x}_p}$$

Thus we see that  $\frac{\partial u}{\partial x_i}$  is a tensor of order one i.e. a vector. This is usually denoted by  $u, i$ ,

$$\text{grad } u = u, i$$

If components  $\frac{\partial u}{\partial x_i}$  and  $\frac{\partial u}{\partial \bar{x}_p}$  relatively to two systems of axes  $OX_1, OX_2, OX_3$  and  $O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$ , obey the tensorial transformation law. This vector is called the *gradient of scalar u*.

### 55.36 GRADIENT OF VECTOR

Consider now any tensor field  $u_i$  of order one. If  $u_p, \bar{u}_p$  be the components relatively to two systems of axes  $OX_1, OX_2, OX_3, O\bar{X}_1, O\bar{X}_2, O\bar{X}_3$  we have  $\bar{u}_p = l_{ip}u_i$

$$\therefore \frac{\partial \bar{u}_p}{\partial \bar{x}_j} = l_{ip} \frac{\partial u_i}{\partial \bar{x}_j} = l_{ip} \frac{\partial u_i}{\partial x_k} \cdot \frac{\partial x_k}{\partial \bar{x}_j} = l_{ip} l_{kj} \frac{\partial u_i}{\partial x_k} \quad \begin{cases} x_k = l_{kj} \bar{x}_j \\ \frac{\partial x_k}{\partial \bar{x}_j} = l_{kj} \end{cases}$$

We see  $\frac{\partial u_i}{\partial x_k}$  is a tensor of second order. It is denoted by symbol  $u_{ij}$  and is called the *gradient of  $u_{ij}$*

### 55.37 DIVERGENCE OF VECTOR POINT FUNCTION

The scalar of the gradient of a vector point function is called the divergence of the point function.

Thus if  $u_i$  is a vector point function so that

$u_{i,j} = \frac{\partial u_i}{\partial x_j}$  is its gradient, then  $u_{i,i} = \frac{\partial u_i}{\partial x_i} = \frac{\partial u_1}{\partial x_1} + \frac{\partial u_2}{\partial x_2} + \frac{\partial u_3}{\partial x_3}$  is called  $\text{div } u_i$

$$\text{div } u_i = u_{i,i}$$

### 55.38 CURL OF A VECTOR POINT FUNCTION

The vector of the gradient of a vector point function is called the curl of the point function.

Thus if  $u_i$  is a vector point function so that  $u_{i,j} = \frac{\partial u_i}{\partial x_j}$  is its gradient, then the vector of a tensor i.e. the vector  $\epsilon_{ijk} u_{i,j}$  is called the curl of  $u_i$  denoted by the symbol curl id,  $u_i = \epsilon_{ijk} u_{i,j}$ .

**Example 6.** Prove the following results

- $$(i) \quad \text{grad } (\phi\psi) = \phi \text{ grad } \psi + \psi \text{ grad } \phi \quad (ii) \quad \text{grad } (\vec{f} \cdot \vec{g}) = \vec{f} \times \text{curl } \vec{g} + \vec{g} \times \text{curl } \vec{f} + \vec{f} \cdot \nabla \vec{g} + \vec{g} \cdot \nabla \vec{f}$$
- $$(iii) \quad \text{div } (\phi \vec{f}) = \phi \text{ div } \vec{f} + \vec{f} \cdot \text{grad } \phi \quad (iv) \quad \text{div } (\vec{f} \times \vec{g}) = \vec{g} \cdot \text{curl } \vec{f} - \vec{f} \cdot \text{curl } \vec{g}$$
- $$(v) \quad \text{curl } (\phi \vec{f}) = \text{grad } \phi \times \vec{f} + \phi \text{ curl } \vec{f} \quad (vi) \quad \text{curl } (\vec{f} \times \vec{g}) = \vec{f} \text{ div } \vec{g} - \vec{g} \text{ div } \vec{f} + \vec{g} \cdot \nabla \vec{f} - \vec{f} \cdot \nabla \vec{g}$$

**Proof.** (i)  $\text{grad } (\phi\psi) = (\phi\psi)_i = \phi\psi_i + \psi\phi_i = \phi \text{ grad } \psi + \psi \text{ grad } \phi$ .

$$(ii) \quad \text{grad } (\vec{f} \cdot \vec{g}) = (f_i g_i)_{,j} = f_{ij} g_{,j} + g_{ij} f_{,j} \quad \dots (1)$$

$$\begin{aligned} \text{Now } \vec{f} \times \text{curl } \vec{g} &= \epsilon_{pkn} f_p \epsilon_{jik} g_{i,j} = - \epsilon_{pmk} \epsilon_{jik} f_p g_{i,j} \\ &= - [\delta_{pj} \delta_{mi} - \delta_{pi} \delta_{mj}] f_p g_{i,j} = - \delta_{pj} \delta_{mi} f_p g_{i,j} + \delta_{pi} \delta_{mj} f_p g_{i,j} \end{aligned}$$

Identifying  $p, j$  and  $m, i$  in first part and  $p, i$  and  $m, j$  in second part, we get.

$$\begin{aligned} \vec{f} \times \text{curl } \vec{g} &= - \delta_{pp} \delta_{mm} f_p g_{m,p} + \delta_{pp} \delta_{mm} f_p g_{p,m} = - f_p g_{m,p} + f_p g_{p,m} \\ &= - \vec{f} \cdot \nabla \vec{g} + f_p g_{p,m} \quad \dots (2) \end{aligned}$$

$$\text{similarly, } \vec{g} \times \text{curl } \vec{f} = - g \cdot \nabla \vec{f} + g_p f_{p,m} \quad \dots (3)$$

Substituting the value of  $f_p g_{p,m} g_p f_{p,m}$  from (2) and (3) into (1), we get

$$\text{grad } (\vec{f} \cdot \vec{g}) = \vec{g} \times \text{curl } \vec{f} + \vec{g} \cdot \nabla \vec{f} + \vec{f} \times \text{curl } \vec{g} + \vec{f} \cdot \nabla \vec{g}$$

$$\text{or } \text{grad } (\vec{f} \cdot \vec{g}) = \vec{g} \times \text{curl } \vec{f} + \vec{f} \times \text{curl } \vec{g} + \vec{g} \cdot \nabla \vec{f} + \vec{f} \cdot \nabla \vec{g}$$

$$(iii) \quad \text{div } (\phi \vec{f}) = (\phi f_i)_{,i} = \phi f_{i,i} + \phi_{,i} f_i = \phi \text{div } \vec{f} + f_i \phi_{,i} = \phi \text{div } \vec{f} + \vec{f} \cdot \text{grad } \phi$$

$$\begin{aligned} (iv) \quad \text{div } (\vec{f} \times \vec{g}) &= (\epsilon_{ijk} f_i g_j)_{,k} = \epsilon_{ijk} \{ f_i g_{j,k} + g_j f_{i,k} \} = \epsilon_{ijk} f_i g_{j,k} + \epsilon_{ijk} g_j f_{i,k} \\ &= - \epsilon_{kji} f_i g_{j,k} + \{ \epsilon_{kij} g_j f_{i,k} \} = - f_i \epsilon_{kji} g_{j,k} + g_j \epsilon_{kij} f_{i,k} \\ &= - \vec{f} \cdot (\text{curl } \vec{g}) + \vec{g} \cdot (\text{curl } \vec{f}) = \vec{g} \cdot (\text{curl } \vec{f}) - \vec{f} \cdot (\text{curl } \vec{g}) \end{aligned}$$

$$\begin{aligned} (v) \quad \text{curl } (\phi \vec{f}) &= \epsilon_{ijk} (\phi f_i)_{,j} = \epsilon_{ijk} \phi f_{i,j} + \epsilon_{ijk} \phi_{,j} f_i \\ &= \phi \epsilon_{ijk} f_{i,j} + \epsilon_{ijk} f_i \phi_{,j} = \phi (\text{curl } \vec{f}) + (\text{grad } \phi) \times \vec{f} \end{aligned}$$

$$\begin{aligned} (vi) \quad \text{curl } (\vec{f} \times \vec{g}) &= \epsilon_{mkn} (\epsilon_{ijk} f_i g_j)_{,m} = - \epsilon_{mnk} \epsilon_{ijk} [f_i g_{j,m} + g_j f_{i,m}] \\ &= - [\delta_{mu} \delta_{nj} - \delta_{mj} \delta_{nj}] [f_i g_{j,m} + g_j f_{i,m}] = - [\delta_{mi} \delta_{nj} f_i g_{j,m} - \delta_{mj} \delta_{ni} f_i g_{j,m} + \delta_{mu} \delta_{nj} g_j f_{i,m} - \delta_{mj} \delta_{ni} g_j f_{i,m}] \\ &= - \delta_{mn} \delta_{nn} f_m g_{n,m} + \delta_{mn} \delta_{nn} f_n g_{m,m} - \delta_{nn} \delta_{nn} g_n f_{m,m} + \delta_{nn} \delta_{nn} g_m f_{n,m} \\ &= - f_m g_{n,m} + f_n g_{m,m} - g_n f_{m,m} + g_m f_{n,m} = - \vec{f} \cdot \nabla \vec{g} + (\text{div } \vec{g}) \vec{f} - (\text{div } \vec{f}) \vec{g} + \nabla \vec{f} \cdot \vec{g} \\ &= \vec{f} \text{div } \vec{g} - \vec{g} \text{div } \vec{f} + \vec{g} \cdot \nabla \vec{f} - \vec{f} \cdot \nabla \vec{g} \end{aligned}$$

### 55.39 SECOND ORDER DIFFERENTIAL OPERATORS

- $$(i) \quad \text{div } (\text{grad } \phi) = \nabla^2 \phi \quad (ii) \quad \text{curl } (\text{grad } \phi) = 0$$
- $$(iii) \quad \text{div } (\text{curl } \vec{f}) = 0 \quad (iv) \quad \text{grad } (\text{div } \vec{f}) = \text{curl } (\text{curl } \vec{f}) + \nabla^2 \vec{f}$$

**Proof.** (I)  $\operatorname{div}(\operatorname{grad} \phi) = (\phi_{,i})_{,i} = \phi_{,ii} = \nabla^2 \phi$

$$(ii) \quad \begin{aligned} \operatorname{curl}(\operatorname{grad} \phi) &= \epsilon_{ijk} (\phi_{,i})_{,i} \\ &= \epsilon_{ijk} \phi_{,ij} = I, \text{ say} \\ \phi_{,ij} &= \phi_{,ji} \\ &\left[ \frac{\partial^2 \phi}{\partial x \partial y} = \frac{\partial^2 \phi}{\partial y \partial x} \right] \end{aligned} \quad \dots (1)$$

Now,

$$I = \epsilon_{ijk} \phi_{,ji} = \epsilon_{ijk} \phi_{,ij} \quad \dots (2)$$

From (1) and (2)

$$2I = (\epsilon_{ijk} + \epsilon_{ijk}) \phi_{,ij}$$

$$2I = (-\epsilon_{ijk} + \epsilon_{ijk}) \phi_{,ij} = 0$$

Hence,  $I = 0$  or  $\operatorname{curl}(\operatorname{grad} \phi) = 0$

$$(iii) \quad \operatorname{div}(\operatorname{curl} \vec{f}) = (\epsilon_{ijk} f_{i,j})_{,k} = \epsilon_{ijk} f_{i,jk} = I \quad (\text{say}) \quad \dots (1)$$

Because

$$f_{i,jk} = f_{i,kj}$$

Then

$$I = \epsilon_{ijk} f_{i,kj} = \epsilon_{kij} f_{i,jk} \quad \dots (2)$$

$$\text{From (1) and (2)} \quad 2I = (\epsilon_{ijk} + \epsilon_{kij}) f_{i,jk} = (\epsilon_{ijk} - \epsilon_{ijk}) f_{i,jk} = 0$$

Hence,

$$I = 0 \text{ or } \operatorname{div}(\operatorname{curl} \vec{f}) = 0$$

$$(iv) \quad \operatorname{grad}(\operatorname{div} \vec{f}) = (f_{i,j})_j = f_{i,ij} \quad \dots (1)$$

$$\operatorname{curl}(\operatorname{curl} \vec{f}) = \epsilon_{mkn} (\epsilon_{ijk} f_{i,j})_m = \epsilon_{nmk} \epsilon_{ijk} f_{i,jm} = (\delta_{nj} \delta_{mi} - \delta_{ni} \delta_{mj}) f_{i,jm}$$

$$= (\delta_{mn} \delta_{mm} f_{m,mm} - \delta_{nn} \delta_{mm} f_{n,mm}) = f_{m,mm} - f_{n,mm}$$

$$= f_{m,mm} - f_{n,mm} = \operatorname{grad}(\operatorname{div} \vec{f}) = \nabla^2 \vec{f} \quad [\text{From (1)}]$$

$$\text{Thus, } \operatorname{grad}(\operatorname{div} \vec{f}) = \operatorname{curl}(\operatorname{curl} \vec{f}) + \nabla^2 \vec{f}$$

#### 55.40 TENSORIAL FORM OF GAUSS'S AND STOKE'S THEOREM

**Gauss's divergence theorem.**

If  $\vec{F}$  is a continuously differentiable vector point function and  $S$  is a closed surface enclosing a region  $V$ , then

$$\oint_S \vec{F} \cdot \hat{n} ds = \int_V \operatorname{div} \vec{F} dV \quad \dots (1)$$

$$\text{where } \hat{n} \text{ is a unit vector } \oint_S \vec{F}_i n_i ds = \int_V F_{i,i} dV = \int \frac{\partial F_i}{\partial x_i} dV$$

#### 55.41 STOKE'S THEOREM

If  $\vec{F}$  is any continuously differentiable vector point function and  $S$  is a surface bounded by a curve  $c$ , then

$$\oint_c \vec{F} \cdot dr = \int_S \operatorname{curl} \vec{F} \cdot \hat{n} ds \quad \dots (2)$$

$$\text{where } \hat{n} \text{ is a unit vector } \oint_c \vec{F}_i dr_i = \int_S (\epsilon_{ijk} F_{i,j}) n_k ds$$

**Example 7.** By means of divergence theorem of Gauss's, show that

$$\oint_S \epsilon_{qpi} n_p \epsilon_{ijk} a_j x_k ds = 2a_q V$$

where  $V$  is the volume enclosed by the surface  $S$ , having the outward drawn normal  $n$ . The position vector to any point in  $V$  is  $x_i$  and  $a_p$  is an arbitrary constant vector.

**Proof.** L.H.S. =  $\oint_S \epsilon_{ipq} \epsilon_{ijk} n_p a_j x_k ds$

$$\begin{aligned} &= \oint_S (\delta_{qj} \delta_{pk} - \delta_{qk} \delta_{pj}) n_p a_j x_k ds = \oint_S n_k a_q x_k ds - \oint_S n_j a_j x_q ds \\ &= a_q \oint_S n_k x_k ds - a_j \oint_S n_j x_q ds = a_q \oint_V \frac{\partial x_k}{\partial x_k} dv - a_j \oint_V \frac{\partial x_q}{\partial x_j} dv = a_q \delta_{kk} v - a_j \delta_{jj} v \\ &= 3a_q v - a_q v = 2a_q v \end{aligned}$$

**Proved.**

**Example 8.** If  $\vec{q} = \vec{w} \times \vec{r}$ , show that  $\nabla \times \vec{q} = \vec{w}$  using the index notation. The vector  $\vec{w}$  is a constant.

**Solution.**  $q_k = \epsilon_{ijk} w_i x_j$

(given)

$$\begin{aligned} [\nabla \times \vec{q}]_m &= \epsilon_{ilm} q_{k,l} = \epsilon_{ilm} \epsilon_{ijk} (w_i x_j)_{,l} \\ [\nabla \times \vec{q}]_m &= \epsilon_{mlk} \epsilon_{ijk} (w_i x_{j,l} + x_j w_{l,i}) = \epsilon_{mlk} \epsilon_{ijk} w_i x_{j,l} \end{aligned}$$

Since  $\vec{w}$  is a constant vector

$$\begin{aligned} \therefore w_{i,l} &= 0 = (\delta_{ml} \delta_{ij} - \delta_{mj} \delta_{il}) w_i x_{j,l} = w_m x_{l,l} - w_l x_{m,l} = w_m \delta_{ll} - w_l \delta_{ml} = 3w_m - w_m \\ [\nabla \times \vec{q}]_m &= w = 2w_m \end{aligned}$$

Hence

$$\nabla \times \vec{q} = 2\vec{w}.$$

**Proved.**

#### 55.42 RELATION BETWEEN ALTERNATE AND KRONECKER TENSOR

$$\epsilon_{ijk} \epsilon_{lmn} = \begin{vmatrix} l_{1i} & l_{2i} & l_{3i} \\ l_{1j} & l_{2j} & l_{3j} \\ l_{1k} & l_{2k} & l_{3k} \end{vmatrix} \times \begin{vmatrix} l_{1l} & l_{2l} & l_{3l} \\ l_{1m} & l_{2m} & l_{3m} \\ l_{1n} & l_{2n} & l_{3n} \end{vmatrix} = \begin{vmatrix} \delta_{il} & \delta_{im} & \delta_{in} \\ \delta_{jl} & \delta_{jm} & \delta_{jn} \\ \delta_{kl} & \delta_{km} & \delta_{kn} \end{vmatrix}$$

Identifying  $k$  and  $l$ , we get

$$\epsilon_{ijk} \epsilon_{kmn} = \begin{vmatrix} \delta_{ik} & \delta_{im} & \delta_{in} \\ \delta_{jk} & \delta_{jm} & \delta_{jn} \\ \delta_{kk} & \delta_{km} & \delta_{kn} \end{vmatrix} = \begin{vmatrix} \delta_{ik} & \delta_{im} & \delta_{in} \\ \delta_{jk} & \delta_{jm} & \delta_{jn} \\ 3 & \delta_{km} & \delta_{kn} \end{vmatrix}$$

$$\therefore \delta_{kk} = \delta_{11} + \delta_{22} + \delta_{33} = 1 + 1 + 1 = 3.$$

Expanding the determinant, we have

$$\begin{aligned} \epsilon_{ijk} \epsilon_{kmn} &= \delta_{ik} (\delta_{jm} \delta_{kn} - \delta_{jn} \delta_{km}) + \delta_{im} (3 \delta_{jn} - \delta_{jk} \delta_{kn}) + \delta_{in} (\delta_{jk} \delta_{km} - 3 \delta_{jm}) \\ &= \delta_{jm} \delta_{in} - \delta_{jn} \delta_{im} + 3 \delta_{im} \delta_{jn} - \delta_{im} \delta_{jn} + \delta_{in} \delta_{jm} - 3 \delta_{in} \delta_{jm} \\ &= \delta_{in} \delta_{jn} - \delta_{in} \delta_{jm} \end{aligned}$$

#### 55.43 THE THREE SCALAR INVARIANTS OF A SECOND ORDER TENSOR

Let  $a_{ij}$  be a second order tensor

(i)  $a_{ii}$

**Proof.**  $\bar{a}_{pq} = l_{ip} l_{jq} a_{ij}$

Identifying  $p$  and  $q$ , we have  $\bar{a}_{pp} = l_{ip} l_{jp} a_{ij}$

$$\bar{a}_{pp} = \delta_{ij} a_{ij} = a_{ii}$$

Hence  $a_{ii}$  is an invariant.

(ii)  $\frac{1}{2} (a_{ii} a_{jj} - a_{ij} a_{ji})$

We know that  $a_{ii}$  and  $a_{jj}$  are invariants. Now we have to show that  $a_{ij} a_{ji}$  is also an invariant. Then  $(a_{ii} a_{jj} - a_{ij} a_{ji})$  will also be invariant.

Let

$$\bar{a}_{pq} = l_{ip} l_{jq} a_{ij} \quad \text{and} \quad \bar{a}_{rs} = l_{mr} l_{ns} a_{mn}$$

Now consider the tensor of 4<sup>th</sup> order

$$\bar{a}_{pq} \bar{a}_{rs} = l_{ip} l_{jq} l_{mr} l_{ns} a_{ij} a_{nm}$$

First identifying  $r$  and  $q$  and then identifying  $p$  and  $s$  we have

$$\bar{a}_{pq} \bar{a}_{sp} = l_{is} l_{jr} l_{mr} l_{ns} a_{ij} a_{nn} = \delta_{in} \delta_{jm} a_{ij} a_{nn} = a_{ij} a_{ji}$$

Hence  $a_{ij} a_{ji}$  is an invariant. Therefore  $\frac{1}{2} (a_{ii} a_{jj} - a_{ij} a_{ji})$  is invariant

$$(iii) |a_{ij}| \quad \text{Proof. } \bar{a}_{pq} = l_{ip} l_{jq} a_{ij} \Rightarrow |\bar{a}_{pq}| = |l_{ip}| |l_{jq}| |a_{ij}|$$

$$\text{We know by the property of determinants } |l_{ip}| |l_{jq}| = 1 \Rightarrow |\bar{a}_{pq}| = |a_{ij}|$$

Hence  $|a_{ij}|$  is an invariant.

#### 55.44 TENSOR ANALYSIS

**Example 9.** What is a mixed tensor of second rank? Prove that  $\delta_q^p$  is a mixed tensor of the second rank

**Solution.** The  $N^2$  quantities  $A_s^q$  are called components of a mixed tensor of the second rank if

$$\bar{A}_r^p = \frac{\partial \bar{x}^p}{\partial x^q} \frac{\partial x^s}{\partial \bar{x}^r} A_s^q$$

$$\text{Now, if } \delta_s^q \text{ defined by } \delta_s^q = \begin{cases} 0 & \text{if } p \neq q \\ 1 & \text{if } p = q \end{cases}$$

is a mixed tensor of second rank, it must transform according to the rule  $\bar{\delta}_k^i = \frac{\partial \bar{x}^i}{\partial x^p} \frac{\partial x^q}{\partial \bar{x}^k} \delta_q^p$

$$\text{The right side equals } \frac{\partial \bar{x}^j}{\partial x^p} \frac{\partial x^p}{\partial \bar{x}^k} = \delta_k^j$$

since  $\bar{\delta}_k^j = \delta_k^j = 1$  if  $j = k$ , and 0 if  $j \neq k$ , it follows that  $\delta_r^p$  is a mixed tensor of rank two.

**Example 10.** Evaluate (i)  $\delta_q^p A_s^{qr}$  (ii)  $\delta_q^p \delta_r^p$

$$\text{Solution. (i) } \delta_q^p A_s^{qr} = \delta_q^p A_s^{pr} = A_s^{pr}$$

$$(ii) \delta_q^p \delta_r^p = \delta_p^p \delta_r^p = \delta_r^p \quad \because \delta_q^p = 1$$

**Example 11.** Show that every tensor can be expressed as the sum of two tensors one of which is symmetric and the other skew-symmetric in a pair of covariant or contravariant indices.

**Solution.** Consider the tensor  $B^{pq}$ , we have

$$B^{pq} = \frac{1}{2} (B^{pq} + B^{qp}) + \frac{1}{2} (B^{pq} - B^{qp})$$

$$\text{But } R^{pq} = \frac{1}{2} (B^{pq} + B^{qp}) = R^{qp} \quad \text{is symmetric and}$$

$$S^{pq} = \frac{1}{2} (B^{pq} - B^{qp}) = R^{qp} \quad \text{is skew-symm.}$$

Thus  $B^{pq} = \text{symm tensor} + \text{skew-symm tensor}$ .

By similar reasoning the result is seen to be true for any tensor.

**Example 12.** What is contraction as applied to tensors? Prove that the contraction of the tensor  $A_q^p$  is a scalar or invariant.

**Solution. Contraction.** If one contravariant and one covariant index of a tensor are set equal, the result indicates that a summation over the equal indices is to be taken according to the summation convention. This resulting sum is a tensor of rank two less than that of the original

tensor. The process is called contraction. For example, in the tensor of rank 3,  $B_q^{mp}$ , set  $p = q$  we get  $B_q^{mp} = C^m$ , a tensor of rank 1.

To prove that contraction of  $A_q^p$  is a scalar or invariant.

we have

$$\bar{A}_k^j = \frac{\partial \bar{x}^j}{\partial x^p} \frac{\partial x^q}{\partial \bar{x}^k} A_q^p$$

$$\text{putting } j = k, \quad \bar{A}_j^j = \frac{\partial \bar{x}^j}{\partial x^p} \frac{\partial x^q}{\partial \bar{x}^j} A_q^p = \delta_p^q A_p^p = A_p^p$$

Then  $\bar{A}_j^j = A_p^p$  and it follows that  $A_p^p$  must be an invariant. Since  $A_q^p$  is a tensor of rank two and contraction with respect to a single index lowers the rank by two. Therefore, an invariant is a tensor of rank zero. **Proved.**

**Example 13.** A covariant tensor has components  $xy, 2y - z^2, xz$  in rectangular co-ordinates. Find its covariant components in spherical co-ordinates.

**Solution.** Let  $A_j$  denote the covariant component in rectangular co-ordinates

$$x^1 = x, x^2 = y, x^3 = z.$$

Then

$$A_1 = xy = x^1 x^2$$

$$A_2 = 2y - z^2 = 2x^2 - (x^3)^2$$

$$A_3 = xz = x^1 x^3$$

Let  $\bar{A}_k$  denote the covariant component in spherical co-ordinates  $\bar{x}^1 = r, \bar{x}^2 = \theta, \bar{x}^3 = \phi$

$$\text{Then } \bar{A}_k = \frac{\partial \bar{x}^j}{\partial \bar{x}^k} A_j \quad \dots (1)$$

In spherical co-ordinates

$$x = r \sin \theta \cos \phi$$

$$\text{or } x^1 = \bar{x}^1 \sin \bar{x}^2 \cos \bar{x}^3 \quad \dots (2)$$

$$y = r \sin \theta \sin \phi$$

$$\text{or } x^2 = \bar{x}^1 \sin \bar{x}^2 \sin \bar{x}^3 \quad \dots (3)$$

$$z = r \cos \theta$$

$$\text{or } x^3 = \bar{x}^1 \cos \bar{x}^2 \quad \dots (4)$$

Therefore equation (1) yields the covariant component.

$$\bar{A}_1 = \frac{\partial x^1}{\partial \bar{x}^1} A_1 + \frac{\partial x^2}{\partial \bar{x}^1} A_2 + \frac{\partial x^3}{\partial \bar{x}^1} A_3$$

$$= (\sin \bar{x}^2 \cos \bar{x}^3) (x^1 x^2) + (\sin \bar{x}^2 \sin \bar{x}^3) \times [(2x^2 - (x^3)^2)] + (\cos \bar{x}^2) (x^1 x^3)$$

$$= (\sin \theta \cos \phi) (r^2 \sin^2 \theta \sin \phi \cos \phi) + (\sin \theta \sin \phi) (2r \sin \theta \sin \phi - r^2 \cos^2 \theta)$$

$$+ (\cos \theta) (r^2 \sin \theta \cos \theta \cos \phi)$$

$$\bar{A}_2 = \frac{\partial x^1}{\partial \bar{x}^2} A_1 + \frac{\partial x^2}{\partial \bar{x}^2} A_2 + \frac{\partial x^3}{\partial \bar{x}^2} A_3$$

$$= (\bar{x}^1 \cos \bar{x}^2 \cos \bar{x}^3) (x^1 x^2) + (\bar{x}^1 \cos \bar{x}^2 \sin \bar{x}^3) [(2x^2 - (x^3)^2)] + \bar{x}^1 (-\sin \bar{x}^2) (x^1 x^3)$$

$$\text{or } \bar{A}_2 = (r \cos \theta \cos \phi) (r^2 \sin^2 \theta \sin \phi \cos \phi) + (r \cos \theta \sin \phi) (2r \sin \theta \sin \phi - r^2 \cos^2 \theta)$$

$$+ (-r \sin \theta) (r^2 \sin \theta \cos \theta \cos \phi) \quad \bar{A}_3 = \frac{\partial x^1}{\partial \bar{x}^3} A_1 + \frac{\partial x^2}{\partial \bar{x}^3} A_2 + \frac{\partial x^3}{\partial \bar{x}^3} A_3$$

$$= (-r \sin \theta \sin \phi) (r^2 \sin^2 \theta \sin \phi \cos \phi) + (r \sin \theta \cos \phi) (2r \sin \theta \sin \phi - r^2 \cos^2 \theta).$$

**Ans.**

**Example 14.** Define symmetric and skew-symmetric tensors. Prove that a symmetric tensor of rank two has at most  $\frac{N(N+1)}{2}$  different components in  $N$ -dimensional space  $V_N$

**Solution.** Symmetric Tensor. A tensor is called symmetric with respect to two contravariant or two covariant indices if its components remain unaltered upon interchange of the indices.

Thus if  $A_{qs}^{mnr} = A_{qs}^{pmr}$ , the tensor is symmetric in  $m$  and  $p$ . If a tensor is symmetric with respect to any two contravariant and any two covariant indices, it is called symmetric.

**Skew-symmetric.** A tensor is called skew-symmetric with respect to two contravariant or two covariant indices if its component change sign upon interchange of the indices. Thus, if  $A_{qs}^{mnr} = -A_{qs}^{pmr}$  the tensor is skew symmetric in  $m$  and  $p$ . If a tensor is skew-symmetric with respect to any two contravariant and any two covariant indices it is called skew-symmetric.

Let  $A_{pq}$  be a tensor of rank 2. The number of its all components in  $V_N$  is  $N^2$ .

The components of  $A_{pq}$  are

$$\begin{array}{ccccccc} A_{11} & A_{12} & A_{13} & \dots & \dots & \dots & A_{1N} \\ A_{21} & A_{22} & A_{23} & \dots & \dots & \dots & A_{2N} \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ A_{N1} & A_{N2} & A_{N3} & \dots & \dots & \dots & A_{NN} \end{array}$$

There are  $N$  independent components of the form

$$A_{11}, A_{22}, A_{33}, \dots, A_{NN}$$

Hence number of components of the form  $A_{12}, A_{23}, A_{34}, \dots$  in which there are distinct subscripts will be  $N^2 - N$ . But these component are symmetric. i.e.,  $A_{12} = A_{21}$  etc.

Hence number of different component of this form are  $\frac{1}{2}(N^2 - N)$   
 $\therefore$  Total number of different components are

$$= \frac{1}{2}(N^2 - N) + N = \frac{N^2}{2} + \frac{N}{2} = \frac{N(N+1)}{2}$$

**Example 15.** Define a metric or fundamental tensor. Determine the components of the fundamental tensor in cylindrical co-ordinates.

**Solution. Metric or Fundamental Tensor.**

In rectangular coordinates  $(x, y, z)$  the differential of arc length  $ds$  is obtained from  $ds^2 = dx^2 + dy^2 + dz^2$ . By transforming to general curvilinear co-ordinates this becomes

$$ds^2 = \sum_{p=1}^3 \sum_{q=1}^3 g_{pq} du_p du_q$$

Such spaces are called three-dimensional Euclidean spaces. We define the line element  $ds$  in this space to be given by the quadratic form, called the metric form or metric,

$$\begin{aligned} ds^2 &= \sum_{p=1}^N \sum_{q=1}^N g_{pq} dx^p dx^q & \dots(1) \\ \Rightarrow ds^2 &= g_{pq} dx^p dx^q \end{aligned}$$

The quantities  $g_{pq}$  are the components of a covariant tensor of rank 2 called the *metric tensor* or *fundamental tensor*.

We know that  $ds^2 = dx^2 + dy^2 + dz^2$

In cylindrical co-ordinates,

$$\begin{aligned}x &= r \cos \theta, y = r \sin \theta, z = z \\ \therefore dx &= -r \sin \theta d\theta + \cos \theta dr \\ dy &= r \cos \theta d\theta + \sin \theta dr \\ dz &= dz \\ ds^2 &= dx^2 + dy^2 + dz^2 \\ &= (-r \sin \theta d\theta + \cos \theta dr)^2 + (r \cos \theta d\theta + \sin \theta dr)^2 + (dz)^2 \\ \text{or } ds^2 &= (dr)^2 + r^2(d\theta)^2 + (dz)^2\end{aligned}$$

Also metric is given by

$$ds^2 = g_{pq} dx^p dx^q \quad \dots (2)$$

$$\text{If } x^1 = r, x^2 = \theta, x^3 = z$$

then comparing (1) & (2), we have

$$g_{11} = 1, g_{22} = r^2, g_{33} = 1, g_{12} = g_{21} = 0, g_{13} = g_{31} = 0, g_{23} = g_{32} = 0.$$

$$\text{Metric tensor is given by } \begin{pmatrix} g_{11} & g_{12} & g_{13} \\ g_{21} & g_{22} & g_{23} \\ g_{31} & g_{32} & g_{33} \end{pmatrix}$$

$$\text{Metric tensor in cylindrical co-ordinates} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & r^2 & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad \text{Ans.}$$

**Example 16.** Define what is meant by invariant? Show that the contraction of the outer product of the tensors  $A^p$  and  $B_q$  is an invariant.

**Solution. Scalar or Invariant.** Suppose  $\phi$  is a function of the co-ordinates  $x^k$ , and let  $\phi$  denote the functional value under a transformation to a new set of co-ordinates  $\bar{x}^k$ . Then  $\phi$  is called a scalar or invariant with respect to the co-ordinate transformation if  $\phi = \bar{\phi}$ .

Since  $A^p$  and  $B_q$  are tensors.

$$\bar{A}^j = \frac{\partial \bar{x}^j}{\partial x^p} A^p, \bar{B}_k = \frac{\partial x^q}{\partial \bar{x}^k} B_q$$

$$\text{Then } \bar{A}^j \bar{B}_k = \frac{\partial \bar{x}^j}{\partial x^p} \frac{\partial x^q}{\partial \bar{x}^k} A^p B_q$$

By contraction (putting  $j = k$ )

$$\bar{A}^j \bar{B}_j = \frac{\partial \bar{x}^j}{\partial x^p} \frac{\partial x^q}{\partial \bar{x}^j} A^p B_q = \delta_p^q A^p B_q = A^p B_p \quad \text{Proved.}$$

and so  $A^p B_p$  is an invariant.

**Example 17.** What do you understand by associated tensors?

**Solution. Associated Tensors.** Given a tensor we can derive other tensors by raising or lowering indices. For example, given the tensor  $A_{pq}$  we obtain by raising the index  $p$ , the tensor  $A_q^p$ , the dot indicating the original position of the moved index. By raising the index  $q$  also we obtain  $A^{pq}$ . We shall often write  $A^{pq}$ . These derived tensors can be obtained by forming inner products of the given tensor with the metric tensor  $g_{pq}$  or its conjugate  $g^{pq}$ . Thus, for example

$$A_q^p = g^{rq} A_{rq}, A^{pq} = g^{rp} g^{sq} A_{rs}$$

All tensors obtained from a given tensor by forming inner products with the metric tensor and its conjugate are called *associated tensors* of the given tensor. For example;  $A^m$  and  $A_m$  are associated tensors, the first are contravariant and the second covariant components. The relation between them is given by

$$A_p = g^{pq} A^q \Rightarrow A^P = g^{pq} A_q$$

For rectangular co-ordinates  $g_{pq} = 1$  if  $p = q$ , and 0 if  $p \neq q$ , so that  $A_p = A^P$ , which explains why no distinction was made between contravariant and covariant components of a vector for rectangular co-ordinates.

### 55.45 CONJUGATE OR RECIPROCAL TENSORS

Let  $g = |g_{pq}|$  denote the determinant with elements  $g_{pq}$  and suppose  $g \neq 0$ . Define  $g^{pq}$  by

$$g^{pq} = \frac{\text{cofactor of } g_{pq}}{g}$$

Then  $g^{pq}$  is a symmetric contravariant tensor of rank two called the conjugate or Reciprocal tensor of  $g_{pq}$ .

Also

$$g^{pq} g_{rq} = \delta_r^p$$

### 55.46 CHRISTOFFEL SYMBOLS

The symbols  $[pq, r] = \frac{1}{2} \left( \frac{\partial g_{pr}}{\partial x^q} + \frac{\partial g_{qr}}{\partial x^p} - \frac{\partial g_{pq}}{\partial x^r} \right); \begin{Bmatrix} s \\ pq \end{Bmatrix} = g^{sr} [pq, r]$

are called the Christoffel symbols of the first and second kind respectively.

**Example 18.** Prove that  $[pq, r] = g_{rs} \begin{Bmatrix} s \\ pq \end{Bmatrix}$

**Solution.**  $g_{ks} \begin{Bmatrix} s \\ pq \end{Bmatrix} = g_{ks} g^{sr} [pq, r] = \delta_k^r [pq, r] = [pq, k]$

$\Rightarrow [pq, k] = g_{ks} \begin{Bmatrix} s \\ pq \end{Bmatrix}$

i.e.  $[pq, r] = g_{rs} \begin{Bmatrix} s \\ pq \end{Bmatrix}$

**Proved.**

**Example 19.** Prove that (i)  $[pq, r] = [qp, r]$  (ii)  $\begin{Bmatrix} s \\ pq \end{Bmatrix} = \begin{Bmatrix} s \\ qp \end{Bmatrix}$ .

**Solution.** (i)  $[pq, r] = \frac{1}{2} \left( \frac{\partial g_{pr}}{\partial x^q} + \frac{\partial g_{qr}}{\partial x^p} - \frac{\partial g_{pq}}{\partial x^r} \right)$

$$= \frac{1}{2} \left( \frac{\partial g_{qr}}{\partial x^p} + \frac{\partial g_{pr}}{\partial x^q} - \frac{\partial g_{pq}}{\partial x^r} \right)$$

$$[pq, r] = [qp, r]$$

(ii)  $\begin{Bmatrix} s \\ pq \end{Bmatrix} = g^{sr} [pq, r] = g^{sr} [qp, r] = \begin{Bmatrix} s \\ qp \end{Bmatrix}$

**Proved.**

**Example 20.** Prove that  $\frac{\partial g_{pq}}{\partial x^m} = [pm, q] + [qm, p]$

**Solution.**  $[pm, q] + [qm, p]$

$$= \frac{1}{2} \left( \frac{\partial g_{pq}}{\partial x^m} + \frac{\partial g_{mq}}{\partial x^p} - \frac{\partial g_{pm}}{\partial x^q} \right) + \frac{1}{2} \left( \frac{\partial g_{qp}}{\partial x^m} + \frac{\partial g_{mp}}{\partial x^q} - \frac{\partial g_{qm}}{\partial x^p} \right) = \frac{1}{2} \frac{\partial g_{pq}}{\partial x^m} + \frac{1}{2} \frac{\partial g_{qp}}{\partial x^m} = \frac{\partial g_{pq}}{\partial x^m}$$

**Example 21.** Prove that  $\frac{\partial g^{pq}}{\partial x^m} = -g^{pn} \begin{Bmatrix} q \\ mn \end{Bmatrix} - g^{qn} \begin{Bmatrix} p \\ mn \end{Bmatrix}$

**Solution.**  $\frac{\partial}{\partial x^m} (g^{jk} g_{ij}) = \frac{\partial}{\partial x^m} (\delta_i^k) = 0$

Then  $g^{jk} \frac{\partial g_{ij}}{\partial x^m} + \frac{\partial g^{jk}}{\partial x^m} g_{ij} = 0 \Rightarrow g^{ij} \frac{\partial g^{jk}}{\partial x^m} = -g^{jk} \frac{\partial g_{ij}}{\partial x^m}$

Multiplying by  $g^{ir}$

i.e.  $\delta_j^r \frac{\partial g^{jk}}{\partial x^m} = -g^{ir} g^{jk} [im, j] + [jm, i]$

$\Rightarrow \frac{\partial g^{rk}}{\partial x^m} = -g^{ir} \begin{Bmatrix} k \\ im \end{Bmatrix} - g^{jk} \begin{Bmatrix} r \\ jm \end{Bmatrix}$

Replace  $r, k, i, j$  by  $p, q, n, n$ , we get  $\frac{\partial g^{pq}}{\partial x^m} = -g^{pn} \begin{Bmatrix} q \\ mn \end{Bmatrix} - g^{qn} \begin{Bmatrix} p \\ mn \end{Bmatrix}$

**Proved.**

**Example 22.** Derive transformation laws for the christoffel symbols of the first and the second kind.

**Solution.** Since  $\bar{g}_{jk} = \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial x^q}{\partial \bar{x}^k} g_{pq}$

$$\therefore \frac{\partial \bar{g}_{jk}}{\partial x^m} = \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial x^q}{\partial \bar{x}^k} \frac{\partial g_{pq}}{\partial x^r} \frac{\partial x^r}{\partial x^m} + \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial^2 x^q}{\partial x^m \partial \bar{x}^k} g_{pq} + \frac{\partial^2 x^p}{\partial x^m \partial \bar{x}^j} \frac{\partial x^q}{\partial \bar{x}^k} g_{pq} \quad \dots (1)$$

By cyclic permutation of indices  $n, k, m$  and  $p, q, r$

$$\frac{\partial \bar{g}_{kn}}{\partial x^j} = \frac{\partial x^q}{\partial \bar{x}^k} \frac{\partial x^r}{\partial \bar{x}^m} \frac{\partial g_{qr}}{\partial x^p} \frac{\partial x^p}{\partial \bar{x}^j} + \frac{\partial x^q}{\partial \bar{x}^k} \frac{\partial^2 x^r}{\partial x^j \partial \bar{x}^m} g_{qr} + \frac{\partial^2 x^q}{\partial x^j \partial \bar{x}^k} \frac{\partial x^r}{\partial \bar{x}^m} g_{pq} \quad \dots (2)$$

$$\frac{\partial \bar{g}_{mj}}{\partial x^k} = \frac{\partial x^r}{\partial \bar{x}^m} \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial g_{rp}}{\partial x^q} \frac{\partial x^q}{\partial \bar{x}^k} + \frac{\partial x^r}{\partial \bar{x}^m} \frac{\partial^2 x^p}{\partial x^k \partial \bar{x}^j} g_{rp} + \frac{\partial^2 x^r}{\partial x^k \partial \bar{x}^m} \frac{\partial x^p}{\partial \bar{x}^j} g_{rp} \quad \dots (3)$$

Subtracting (1) from the sum of (2) and (3) and multiplying by  $\frac{1}{2}$ , we obtain on using the definition of the Christoffel symbols of the first kind,

$$[\bar{j}, \bar{k}, \bar{m}] = \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial x^q}{\partial \bar{x}^k} \frac{\partial x^r}{\partial \bar{x}^m} [pq, r] + \frac{\partial^2 x^p}{\partial \bar{x}^j \partial \bar{x}^k} \frac{\partial x^q}{\partial \bar{x}^m} g_{pq} \quad \dots (4)$$

#### 55.47 TRANSFORMATION LAW FOR SECOND KIND

Multiplying (4) by  $\bar{g}^{mm}$

$$\bar{g}^{mm} = \frac{\partial \bar{x}^n}{\partial x^s} \frac{\partial \bar{x}^m}{\partial x^t} g^{st} \quad \text{we get}$$

$$\bar{g}^{nm} [\bar{j}, \bar{k}, \bar{m}] = \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial x^q}{\partial \bar{x}^k} \frac{\partial x^r}{\partial \bar{x}^m} \frac{\partial \bar{x}^n}{\partial x^s} \frac{\partial \bar{x}^m}{\partial x^t} g^{st} [pq, r] + \frac{\partial^2 x^p}{\partial \bar{x}^j \partial \bar{x}^k} \frac{\partial x^q}{\partial \bar{x}^m} \frac{\partial \bar{x}^n}{\partial x^s} \frac{\partial \bar{x}^m}{\partial x^t} g^{st} g_{pq}$$

Then  $\begin{Bmatrix} n \\ jk \end{Bmatrix} = \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial x^q}{\partial \bar{x}^k} \frac{\partial \bar{x}^n}{\partial x^s} \delta'_i g^{st} [pq, r] + \frac{\partial^2 x^p}{\partial \bar{x}^j \partial \bar{x}^k} \frac{\partial \bar{x}^n}{\partial x^s} \delta'_i g^{st} g_{pq}$

$$\overline{\left\{ \begin{matrix} n \\ jk \end{matrix} \right\}} = \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial x^q}{\partial \bar{x}^k} \frac{\partial \bar{x}^n}{\partial x^s} \left\{ \begin{matrix} s \\ pq \end{matrix} \right\} + \frac{\partial^2 x^p}{\partial \bar{x}^j \partial \bar{x}^k} \frac{\partial \bar{x}^n}{\partial x^p} \quad \dots (5)$$

(4) and (5) are required transformation laws.

**Example 23.** If  $(ds)^2 = r^2 (d\theta)^2 + r^2 \sin^2 \theta (d\phi)^2$ , find the value of

- (a) [22, 1]      (b) [12, 2]      (c) [1, 22]      (d) [2, 12].

**Solution.**  $(ds)^2 = r^2 (d\theta)^2 + r^2 \sin^2 \theta (d\phi)^2$

$$g_{11} = r^2, \quad g_{22} = r^2 \sin^2 \theta, \quad g_{12} = 0 = g_{21}$$

$$g = \begin{vmatrix} g_{11} & g_{12} \\ g_{21} & g_{22} \end{vmatrix} = \begin{vmatrix} r^2 & 0 \\ 0 & r^2 \sin^2 \theta \end{vmatrix} = r^4 \sin^2 \theta$$

$$g^{11} = \frac{\text{cofactor of } g_{11}}{g} = \frac{r^2 \sin^2 \theta}{r^4 \sin^2 \theta} = \frac{1}{r^2}$$

$$g^{22} = \frac{\text{cofactor of } g_{22}}{g} = \frac{r^2}{r^4 \sin^2 \theta} = \frac{1}{r^2 \sin^2 \theta}$$

The christoffel symbols of first kind are

$$[ij, k] = \frac{1}{2} \left[ \frac{\partial g_{jk}}{\partial x^i} + \frac{\partial g_{ik}}{\partial x^j} - \frac{\partial g_{ij}}{\partial x^k} \right]$$

$$(a) [22, 1] = \frac{1}{2} \left[ \frac{\partial g_{21}}{\partial x^2} + \frac{\partial g_{21}}{\partial x^2} - \frac{\partial g_{22}}{\partial x^1} \right] = \frac{1}{2} \left[ \frac{\partial(0)}{\partial \phi} + \frac{\partial(0)}{\partial \phi} - \frac{\partial(r^2 \sin^2 \theta)}{\partial \theta} \right] \\ = r^2 \sin \theta \cos \theta$$

$$(b) [12, 2] = \frac{1}{2} \left[ \frac{\partial g_{22}}{\partial x^1} + \frac{\partial g_{12}}{\partial x^2} - \frac{\partial g_{12}}{\partial x^2} \right] = \frac{1}{2} \left[ \frac{\partial(r^2 \sin^2 \theta)}{\partial \theta} + \frac{\partial(0)}{\partial \phi} - \frac{\partial(0)}{\partial \phi} \right] \\ = r^2 \sin \theta \cos \theta$$

(c) The christoffel symbols of second kind are

$$\left\{ \begin{matrix} k \\ ij \end{matrix} \right\} = g^{kl} [ij, l]$$

$$\left\{ \begin{matrix} 1 \\ 22 \end{matrix} \right\} = g^{ll} [22, l] = g^{11} [22, 1] g^{12} [22, 2]$$

$$= \frac{1}{r^2} [-r^2 \sin \theta \cos \theta] + 0 \quad (g^{12} = 0) = -\sin \theta \cos \theta$$

$$(d) \left\{ \begin{matrix} 2 \\ 12 \end{matrix} \right\} = g^{2l} [22, l] = g^{21} [12, 1] + g^{22} [12, 2] \\ = 0 + \frac{1}{r^2 \sin^2 \theta} [r^2 \sin \theta \cos \theta] = \frac{\cos \theta}{\sin \theta} = \cot \theta = r^4 \sin \theta \cos \theta \quad \text{Ans.}$$

**Example 24.** If  $(ds)^2 = (dr)^2 + r^2 (d\theta)^2 + r^2 \sin^2 \theta (d\phi)^2$ , find the value of

- (a) [22, 1],      (b) [33, 1],      (c) [13, 3],      (d) [23, 3],

$$(e) \left\{ \begin{matrix} 1 \\ 22 \end{matrix} \right\}, \quad (f) \left\{ \begin{matrix} 1 \\ 33 \end{matrix} \right\}, \quad (g) \left\{ \begin{matrix} 3 \\ 13 \end{matrix} \right\}, \quad (h) \left\{ \begin{matrix} 3 \\ 23 \end{matrix} \right\}$$

**Solution.**  $(ds)^2 = (dr)^2 + r^2 (d\theta)^2 + r^2 \sin^2 \theta (d\phi)^2$

$$\begin{aligned}x_1 &= r, \quad x_2 = \theta, \quad x_3 = \phi \\g_{11} &= 1, \quad g_{22} = r^2, \quad g_{33} = r^2 \sin \theta \\g_{12} &= 0 = g_{13} = \dots\end{aligned}$$

$$g = \begin{vmatrix} g_{11} & g_{12} & g_{13} \\ g_{21} & g_{22} & g_{23} \\ g_{31} & g_{32} & g_{33} \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 \\ 0 & r^2 & 0 \\ 0 & 0 & r^2 \sin^2 \theta \end{vmatrix} = r^4 \sin^2 \theta$$

$$g^{11} = \frac{\text{cofactor of } g_{11}}{g} = \frac{\begin{vmatrix} r^2 & 0 \\ 0 & r^2 \sin^2 \theta \end{vmatrix}}{r^4 \sin^2 \theta} = \frac{r^4 \sin^2 \theta}{r^4 \sin^2 \theta} = 1$$

$$g^{22} = \frac{\text{cofactor of } g_{22}}{g} = \frac{\begin{vmatrix} 1 & 0 \\ 0 & r^2 \sin^2 \theta \end{vmatrix}}{r^4 \sin^2 \theta} = \frac{r^2 \sin^2 \theta}{r^4 \sin^2 \theta} = \frac{1}{r^2}$$

$$g^{33} = \frac{\text{cofactor of } g_{33}}{g} = \frac{\begin{vmatrix} 1 & 0 \\ 0 & r^2 \end{vmatrix}}{r^4 \sin^2 \theta} = \frac{r^2}{r^4 \sin^2 \theta} = \frac{1}{r^2 \sin^2 \theta}$$

The christoffel symbols of the first kind are

$$[ij, k] = \frac{1}{2} \left[ \frac{\partial g_{jk}}{\partial x^i} + \frac{\partial g_{ik}}{\partial x^j} - \frac{\partial g_{ij}}{\partial x^k} \right]$$

$$(a) [22, 1] = \frac{1}{2} \left[ \frac{\partial g_{21}}{\partial x^2} + \frac{\partial g_{21}}{\partial x^1} - \frac{\partial g_{22}}{\partial x^1} \right] = \frac{1}{2} \left[ \frac{\partial(0)}{\partial \theta} + \frac{\partial(0)}{\partial \theta} - \frac{\partial(r^2)}{\partial r} \right] = \frac{1}{2} (-2r) = -r$$

$$(b) [33, 1] = \frac{1}{2} \left[ \frac{\partial g_{31}}{\partial x^3} + \frac{\partial g_{31}}{\partial x^1} - \frac{\partial g_{33}}{\partial x^1} \right] = \frac{1}{2} \left[ \frac{\partial(0)}{\partial \phi} + \frac{\partial(0)}{\partial \phi} - \frac{\partial(r^2 \sin^2 \theta)}{\partial r} \right] = \frac{1}{2} (-2r \sin^2 \theta) = -r \sin^2 \theta$$

$$(c) [13, 3] = \frac{1}{2} \left[ \frac{\partial g_{33}}{\partial x^1} + \frac{\partial g_{13}}{\partial x^3} - \frac{\partial g_{13}}{\partial x^1} \right] = \frac{1}{2} \frac{\partial g_{33}}{\partial x^1} = \frac{1}{2} \left[ \frac{\partial(r^2 \sin^2 \theta)}{\partial r} \right] = r \sin^2 \theta$$

$$(d) [23, 3] = \frac{1}{2} \left[ \frac{\partial g_{33}}{\partial x^2} + \frac{\partial g_{23}}{\partial x^3} - \frac{\partial g_{23}}{\partial x^2} \right] = \frac{1}{2} \frac{\partial g_{33}}{\partial x^2} = \frac{1}{2} \frac{\partial}{\partial x^2} (r^2 \sin^2 \theta) = r^2 \sin \theta \cos \theta$$

The christoffel symbols of the second kind are

$$\left\{ \begin{array}{c} k \\ ij \end{array} \right\} = g^{kl} [ij, l]$$

$$(e) \left\{ \begin{array}{c} 1 \\ 22 \end{array} \right\} = g^{1l} [22, l] = g^{11} [22, 1] + g^{12} [22, 2] + g^{13} [22, 3] = (1)(-r) + 0 + 0 = -r$$

$$(f) \left\{ \begin{array}{c} 1 \\ 33 \end{array} \right\} = g^{1l} [33, l] = g^{11} [33, 1] + g^{12} [33, 2] + g^{13} [33, 3] = (1)(-r \sin^2 \theta) + 0 + 0 = -r \sin^2 \theta$$

$$(g) \left\{ \begin{array}{c} 3 \\ 13 \end{array} \right\} = g^{3l} [13, l] = g^{31} [13, 1] + g^{32} [13, 2] + g^{33} [13, 3]$$

$$= 0 (r \sin^2 \theta) + 0 [0] + \frac{1}{r^2 \sin^2 \theta} [r \sin^2 \theta] = \frac{1}{r}$$

$$(h) \begin{Bmatrix} 3 \\ 23 \end{Bmatrix} = g^{31}[23,1] + g^{32}[23,2] + g^{33}[23,3] \\ = 0[0] + 0[0] + \frac{1}{r^2 \sin^2 \theta} (r \sin \theta \cos \theta) = \cot \theta \quad \text{Ans.}$$

**Example 25.** Prove that  $\begin{Bmatrix} p \\ pq \end{Bmatrix} = \frac{\partial}{\partial x^q} \log \sqrt{g}$

**Solution.**  $g = g_{jk} G(j, k)$  (Sum over  $k$  only)  
where  $G(j, k)$  is the cofactor of  $g_{jk}$  in the determinant  $g = |g_{jk}| \neq 0$  since  $G(j, k)$  does not contain  $g_{jk}$  explicitly,

$$\frac{\partial g}{\partial g_{jr}} = G(j, r)$$

Then, summing over  $j$  and  $r$

$$\frac{\partial g}{\partial x^m} = \frac{\partial g}{\partial g_{jr}} \frac{\partial g_{jr}}{\partial x^m} = G(j, r) \frac{\partial g_{jr}}{\partial x^m} = g g^{jr} \frac{\partial g_{jr}}{\partial x^m} = g g^{jr} ([jm, r] + [rm, j])$$

$$\frac{\partial g}{\partial x^m} = g \left( \begin{Bmatrix} j \\ jm \end{Bmatrix} + \begin{Bmatrix} r \\ rm \end{Bmatrix} \right) = 2g \begin{Bmatrix} j \\ jm \end{Bmatrix}$$

Thus  $\frac{1}{2g} \frac{\partial g}{\partial x^m} = \begin{Bmatrix} j \\ jm \end{Bmatrix}$  or  $\begin{Bmatrix} j \\ jm \end{Bmatrix} = \frac{\partial g}{\partial x^m} \log \sqrt{g}$

Replacing  $j$  by  $p$  and  $m$  by  $q$ ,  $\begin{Bmatrix} p \\ pq \end{Bmatrix} = \frac{\partial}{\partial x^q} \log \sqrt{g}$  **Proved.**

#### 55.48 CONTRAVARIANT, COVARIANT AND MIXED TENSOR

If  $A_i$  be a set of  $n$  functions of the co-ordinates  $x^1, x^2, x^3, \dots, x^n(x^i)$ . They are transformed in another system of co-ordinates  $x^{-1}, x^{-2}, x^{-3}, \dots, x^{-n}$  according to  $\bar{A}_i = \frac{\partial x^j}{\partial \bar{x}^i} A_j$

$A_i$  are called the components of a covariant tensor.

If  $\phi(x^1, x^2, \dots, x^n)$  be a scalar function, then  $\frac{\partial \phi}{\partial x^i} = \frac{\partial \phi}{\partial x^1} \frac{\partial x^1}{\partial x^i} + \frac{\partial \phi}{\partial x^2} \frac{\partial x^2}{\partial x^i} + \dots + \frac{\partial \phi}{\partial x^n} \frac{\partial x^n}{\partial x^i}$

then  $\frac{\partial \phi}{\partial x^1}, \frac{\partial \phi}{\partial x^2}, \dots, \frac{\partial \phi}{\partial x^n}$  are the components of a covariant vector.

Since  $x$  is a function of  $x^i$  (i.e.,  $x^1, x^2, \dots, x^n$ )

$$\text{so } d\bar{x}^i = \frac{\partial \bar{x}^i}{\partial x^1} dx^1 + \frac{\partial \bar{x}^i}{\partial x^2} dx^2 + \dots + \frac{\partial \bar{x}^i}{\partial x^n} dx^n \quad \dots (2) \quad = \frac{\partial \bar{x}^i}{\partial x^1} dx^1$$

On comparing (1) and (2) we can say that  $dx^1, dx^2, \dots, dx^n$  is an example of a contravariant tensor.

If  $q$  and  $s$  vary from 1 to  $n$ , then  $A^{qs}$  will be  $n^2$  functions.

If  $N^2$  quantities  $A^{qs}$  in a co-ordinate system  $(x^1, x^2, \dots, x^N)$  are related to  $N^2$  other quantities  $\bar{A}^{pr}$  in another system  $(\bar{x}^1, \bar{x}^2, \dots, \bar{x}^N)$  by the transformation equations

$$\bar{A}^{pr} = \sum_{s=1}^N \sum_{q=1}^N \frac{\partial \bar{x}^p}{\partial x^q} \frac{\partial \bar{x}^r}{\partial x^s} A^{qs} \quad \Rightarrow \quad \bar{A}^{pr} = \frac{\partial \bar{x}^p}{\partial x^q} \frac{\partial \bar{x}^r}{\partial x^s} A^{qs}$$

they are called *contravariant* components of a tensor of the second rank.

If the transformation law is  $\bar{A}^{pr} = \frac{\partial x^q}{\partial \bar{x}^p} \frac{\partial x^s}{\partial \bar{x}^r} A_{qs}$ ,  
then quantities  $A_{qs}$  are called components of *covariant* tensor of second rank.

The  $N^2$  quantities  $A_s^q$  are called components of a *mixed* tensor of second rank if

$$\bar{A}_r^p = \frac{\partial \bar{x}^p}{\partial x^q} \frac{\partial x^s}{\partial \bar{x}^r} A_s^q$$

### EXERCISE 55.2

1. If  $A^i$  are the components of an absolute contravariant tensor of rank one, show that  $\frac{\partial A_i}{\partial x_j}$  are the components of a mixed tensor.
2. If  $A^i$  and  $A_{ij}$  are reciprocal symmetric tensors and  $x_i$  are the components of a covariant tensor of rank one, show that  $A_{ij} x^i x^j = A^{ij} x_i x_j$  where  $x^i = A^{ia} x_a$ .
3. If the components of a tensor are zero in one co-ordinate system, then prove that the components are zero in all co-ordinate systems.
4. Show that the expression  $A(i, j, k)$  is a tensor if its inner product with an arbitrary tensor  $B_k^{jl}$  is a tensor.
5.  $A^y$  is a contravariant tensor and  $B_i$  a covariant tensor. Show that  $A^y B_k$  is a tensor of rank three, but  $A^y B_j$  is a tensor of rank one.
6. If  $g_{ij}$  denotes the components of a covariant tensor of rank two, show that the product  $g_{ij} dx^i dx^j$  is an invariant scalar.
7. Find  $g$  and  $g^{ij}$  corresponding to the metric

$$ds^2 = 5(dx^1)^2 + 3(dx^2)^2 + 4(dx^3)^2 - 6dx^1 dx^2 + 4dx^2 dx^3.$$

$$\text{Ans. } g = 4, g^{11} = 2, g^{22} = 5, g^{33} = 1.5, g^{12} = 3, g^{23} = -2.5, g^{13} = -1.5$$

8. Find the values of  $g$  and  $g^{ij}$ , if

$$ds^2 = \frac{dr^2}{1 - \frac{r^2}{R^2}} + r^2(d\theta^2 + \sin^2 \theta d\phi^2), \text{ where R is constant}$$

$$\text{Ans. } g = \frac{r^4 \sin^2 \theta}{1 - \frac{r^2}{R^2}}, g^{11} = 1 - \frac{r^2}{R^2}, g^{22} = \frac{1}{r^2}, g^{33} = \frac{1}{r^2 \sin^2 \theta}, g^{ij} = 0 (i \neq j)$$

9. Prove that the angle  $\theta_{12}, \theta_{23}, \theta_{31}$  between the co-ordinate curves in a three dimensional co-ordinate system are given by

$$\cos \theta_{12} = \frac{g_{12}}{\sqrt{g_{11}g_{22}}}, \cos \theta_{23} = \frac{g_{23}}{\sqrt{g_{22}g_{33}}}, \cos \theta_{31} = \frac{g_{31}}{\sqrt{g_{33}g_{11}}}$$

10. Prove that for an orthogonal co-ordinate system

$$(a) g_{12} = g_{23} = g_{31} = 0 \quad (b) \quad g^{11} = \frac{1}{g_{11}}, g^{22} = \frac{1}{g_{22}}, g^{33} = \frac{1}{g_{33}}$$

11. Surface of a sphere is a two dimensional Riemannian space. Find its fundamental metric tensor. If  $a$  be the fixed radius of the sphere.

$$\text{Ans. } g_{11} = a^2, g_{22} = a^2 \sin^2 \theta, g = a^4 \sin^2 \theta$$

$$g^{11} = \frac{1}{a^2}, g^{22} = \frac{1}{a^2 \sin^2 \theta}, g^{12} = 0 = g^{21}.$$

CHAPTER  
**56**

## LINEAR PROGRAMMING

---

---

### 56.1. INTRODUCTION

It will be of interest to know that linear programming had its origin during the second world war (1939-45). To fight the war man and material (resources) have to be maintained. There has to be efficient and safe land, sea and airtransport etc.

The government in England studied the problems during war particularly problems of armed forces, civil defence and navel strategy etc. The study for the solutions of the above problems resulted the linear programming.

*Linear programming* is the most popular mathematical technique which involve the limited resources in an optimal manner.

The term *programming* means planning to maximize profit or minimize cost or minimize loss or minimum use of resources or minimizing the time etc. Such problems are called *optimization Problem*. The term linear means that all equations or inequations involved are linear.

**Example 1.** A manufacturer produces two types of toys i.e., A and B. Each toy of type A requires 4 hours of moulding and two hours of polishing whereas each toy of type B requires 3 hours of moulding 5 hours of polishing. Moulder works for 80 hours in a week and polisher works for 180 hours in a week. Profit on a toy of type A is Rs. 3 and on a toy of type B is Rs. 4. In what way the manufacturer allocates his production capacity for the two types of toys so that he may make the maximum profit per week.

**Solution.**

**Table.** The above information can be written in tabular form as follows:

<i>operation</i> <i>Toy</i>	<i>Moulding</i> (in hours)	<i>Polishing</i> (in hours)	<i>Profit</i> (in Rs.)
A	4	2	3
B	3	5	4
Time available (in hours)	80	180	

Let  $x$  be the number of toys of type A and  $y$  be the number of toys of type B produced per week.

Profit on one toy of type A = Rs. 3

Profit on  $x$  toys of type A = Rs.  $3x$

Profit on one toy of type B = Rs. 4

Profit one  $y$  toys of type B = Rs.  $4y$

Let  $Z$  be the weekly profit.

Then the weekly profit in Rs. is

$$Z = 3x + 4y$$

Here,  $Z$  is known as *objective function* which has to maximize/minimize.

One toy of type  $A$  on moulding requires = 4 hours.

$x$  toys of type  $A$  on moulding requires =  $4x$  hours

One toy of type  $B$  on moulding requires = 3 hours

$y$  toys of type  $B$  on moulding requires =  $3y$  hours

On moulding total time required =  $4x + 3y$  hours

But moulder works for only 80 hours in a week.

So,  $4x + 3y$  hours cannot exceed 80 hours.

$$\Rightarrow 4x + 3y \leq 80$$

This is known as *first constraint*:

One toy of type  $A$  on polishing requires = 2 hours

$x$  toys of type  $A$  on polishing requires =  $2x$  hours

One toy of type  $B$  on polishing requires = 5 hours

$y$  toys of type  $B$  on polishing requires =  $5y$  hours

On polishing total time required =  $2x + 5y$  hours

But polisher works for only 180 hours in a week.

So,  $2x + 5y$  hours cannot exceed 180 hours.

$$\Rightarrow 2x + 5y \leq 180$$

This is known as *second constraint*.

Since, the number of toys produced is non-negative.

$$\Rightarrow x \geq 0 \text{ and } y \geq 0$$

This is known as *third constraint*.

Under these three constraints (conditions) we have to plan the system to get the maximum profit.

Now, we summarize the above informations in mathematical form as follows :

$$\text{To maximize } Z = 3x + 4y \quad \dots (1)$$

Subject to the constraints :

$$4x + 3y \leq 80 \quad \dots (2)$$

$$2x + 5y \leq 180 \quad \dots (3)$$

$$\left. \begin{array}{l} x \geq 0 \\ y \geq 0 \end{array} \right\} \quad \dots (4)$$

The above mathematical expression is known as *mathematical formulation*.

From the above inequations we find out the values of  $x$  and  $y$ .

The values of  $x$  and  $y$  are substituted in the objective function  $Z = 3x + 4y$ .

The maximum/minimum value of the objective function is known as *optimal value*.

## 56.2. SOME DEFINITIONS

### 1. Linear Programming Problem

Here, we have to optimize the linear function  $Z$  subject to certain conditions. Such problems are called linear programming problems. As example 1 on page 613.

### 2. Objective functions

Objective function is a linear function of several variables, subject to the conditions that  $Z = 3x + 4y$  in the previous example.

### 3. Optimal Value

Optimal value is a maximum or minimum value of a objective function to be calculated in a linear programming problem.

**4. Non-negative Constants**

Production of any item is always non-negative, so we write  $x \geq 0, y \geq 0$ .

**5. Linear Relations**

All the mathematical relations used in L.P.P. are linear relations.

**6. Programming**

Programming is the method of determining a particular programme.

**7. Decision Variables**

Decision variables are  $x$  and  $y$  which denote the required number of items/products.

**8. Constraints**

Constraints are linear inequalities or equations involved in linear programming problem. In the previous example (2), (3), (4) are constraints.

**9. Optimization Problem**

Optimization problem is a problem in which a objective function is to be maximize or minimize subject to the certain conditions. In the previous example we have to maxmize the profit, so it is optimization problem.

**56.3. MATHEMATICAL FORMULATION OF LINEAR PROGRAMMING PROBLEMS**

In the previous section we have defined certain technical terms of L.P.P. Conversion of the verbal description of L.P.P. into algebraic equations/inequations is known us Mathematical Formultion.

**Working Rule to formulate the L.P.P.**

**Step 1.** Identify the decision variables to be determined and expressed them as  $x, y$  etc.

**Step 2.** Identify all the limitations or constraints in the given problem and then express them as linear inequalities or equations in terms of  $x, y$  etc.

**Step 3.** Identify the objective function ( $Z$ ) which is to optimize (maximize or minimize) and express  $Z$  in terms of  $x, y$ .

**Procedure:**

The solution of the given L.P.P. should be divided under the following heads:

1. Preparation of *table of information*.      2. Write down the *decision variables*.
3. Form the *objective function*.      4. Write down the *constraints*.
5. Write down Mathematical Formulation.

**TYPE 1. TO MAXIMIZE OBJECTIVE FUNCTION**

**Example 2.** A company produces two types of ornaments  $A$  and  $B$  that require gold and silver. Each unit of type  $A$  requires 1 gram of silver and 2 grams of gold. Type  $B$  requires (each unit) 2 grams of silver and 1 gram of gold. The company has only 100 grams of silver and 80 grams of gold. Each unit of type  $A$  brings a profit of Rs. 500 and each unit of type  $B$  brings a profit of Rs. 400. Formulate the problem as a linear programming problem to maximize the profit.

**Solution.** The above information is given in the following table:

**1. Table:**

Metal Ornaments	Silver (in grams)	Gold (in grams)	Profit (in Rs.)
$A$	1	2	500
$B$	2	1	400
	100	80	

**2. Decision variables.** Decision variables are ornaments  $A$  and  $B$ .

Let the number of ornaments  $A$  be  $x$  and the number of ornaments  $B$  be  $y$ .

**3. Objective function.** To maximize profit.

Let  $Z$  be the objective function.

Profit of each unit of type  $A$  = Rs. 500

Profit of  $x$  units of type  $A$  = Rs.  $500x$

Profit of each unit of type  $B$  = Rs. 400

Profit of  $y$  units of type  $B$  = Rs.  $400y$

Total profit =  $500x + 400y$

$$\Rightarrow Z = 500x + 400y$$

**4. Constraint.** (i) Company has only 100 grams of silver.

One unit of ornament  $A$  requires 1 gram of silver.

$x$  units of ornament  $A$  require  $x$  grams of silver.

One unit of ornament  $B$  requires 2 grams of silver.

$y$  units of ornament  $B$  require  $2y$  grams of silver.

Total available quantity of silver for ornament  $A$  and  $B$  = 100 grams

$$\Rightarrow x + 2y \leq 100$$

**Constraint.** (ii) Company has only 80 grams of gold.

One unit of ornament  $A$  requires 2 grams of gold.

$x$  units of ornament  $A$  require  $2x$  grams of gold.

One unit of ornament  $B$  requires 1 gram of gold.

$y$  units of ornament  $B$  require  $y$  grams of gold.

Total available quantity of gold = 80 grams

$$\Rightarrow 2x + y \leq 80$$

**Constraint.** (iii) Production of ornament  $A$  and ornament  $B$  cannot be negative.

$$\Rightarrow x \geq 0 \text{ and } y \geq 0.$$

**5. Mathematical Formulation.** Hence, the linear programming problem for the given problem is as follows:

$$\text{Maximize} \quad Z = 500x + 400y \quad \dots(1)$$

Subject to the constraints:

$$x + 2y \leq 100 \quad \dots(2)$$

$$2x + y \leq 80 \quad \dots(3)$$

$$x \geq 0 \quad \dots(4)$$

$$y \geq 0 \quad \dots(5) \text{ Ans.}$$

**Example 3.** Two tailors  $A$  and  $B$  earn Rs. 150 and Rs. 200 per day respectively.  $A$  can stitch 6 shirts and 4 pants per day while  $B$  can stitch 10 shirts and 4 pants per day. Form a linear programming problem to minimize the labour cost to produce at least 60 shirts and 32 pants.

[CBSE 2005]

**Solution.** The given data can be put in the tabular form as:

**1. Table:**

Earning per day	Rs. 150 per day	Rs. 200 per day	Minimum requirement
Tailors	A	B	
Stitch			
Shirts	6	10	60
Pants	4	4	32

**2. Decision Variable.** Let the tailors  $A$  and  $B$  work for  $x$  and  $y$  days respectively.

**3. Objective function.** The total labour cost for working  $x$  days of tailor  $A$  and  $y$  days of tailor  $B$  is Rs.  $(150x + 200y)$ .

Let  $Z$  denote the minimum labour cost, then

$$Z = 150x + 200y$$

- 4. Constraint (i).** The minimum requirement of shirt is 60.

$$\begin{array}{ll} \text{Tailor } A \text{ stitches in one day} = 6 \text{ shirts} & \text{Tailor } A \text{ stitches in } x \text{ days} = 6x \text{ shirts} \\ \text{Tailor } B \text{ stitches in one day} = 10 \text{ shirts} & \text{Tailor } B \text{ stitches in } y \text{ days} = 10y \text{ shirts} \\ \therefore & 6x + 10y \geq 60 \end{array}$$

- Constraint (ii).** The minimum requirement of pants is 32.

$$\begin{array}{ll} \text{Tailor } A \text{ stitches in one day} = 4 \text{ pants} & \text{Tailor } A \text{ stitches in } x \text{ days} = 4x \text{ pants} \\ \text{Tailor } B \text{ stitches in one day} = 4 \text{ pants} & \text{Tailor } B \text{ stitches in } y \text{ days} = 4y \text{ pants} \\ \Rightarrow 4x + 4y \geq 32. & \end{array}$$

- Constraint (iii).** The number of days worked by  $A$  or  $B$  is non negative.

$$\therefore x \geq 0 \quad \text{and} \quad y \geq 0.$$

### 5. Mathematical formulation.

The mathematical formulation of given L.P.P. is as follows:

$$\text{Minimize } Z = 150x + 200y \quad \dots (1)$$

subject to the constraints:

$$6x + 10y \geq 60 \quad \dots (2)$$

$$4x + 4y \geq 32 \quad \dots (3)$$

$$\text{and} \quad x, y \geq 0. \quad \dots (4)$$

**Ans.**

**Example 4.** A manufacturer of leather belts makes three types of belts  $A$ ,  $B$  and  $C$  which are processed on three machines  $M_1$ ,  $M_2$  and  $M_3$ . Belt  $A$  requires 2 hours on machine  $M_1$  and 3 hours on machine  $M_3$ . Belt  $B$  requires 3 hours on machine  $M_1$ , 2 hours on machine  $M_2$  and 2 hours on machine  $M_3$  and belt  $C$  requires 5 hours on machine  $M_2$  and 4 hours on machine  $M_3$ . There are 8 hours of time per day available on machine  $M_1$ , 10 hours of time per day available on machine  $M_2$  and 15 hours of time per day available on machine  $M_3$ . The profit gained from belt  $A$  is Rs. 3.00 per unit, from belt  $B$  is Rs. 5.00 per unit and from belt  $C$  is Rs. 4.00 per unit. Formulate the L.P.P. to maximize the profit.

**Solution.** The above information is given in the following Table:

#### 1. Table:

Machines Belts	$M_1$ (in hours)	$M_2$ (in hours)	$M_3$ (in hours)	Profit (in Rs.)
$A$	2	0	3	3
$B$	3	2	2	5
$C$	0	5	4	4
Available time (in hours)	8	10	15	

- 2. Decision Variables.** The decision variables are the number of belt  $A$ , belt  $B$  and belt  $C$ .

Let the number of belt  $A$  be  $x_1$ , the number of belt  $B$  be  $x_2$ , and the number of belt  $C$  be  $x_3$ .

- 3. Objective Function.** To maximise the profit.

Profit on 1 belt  $A$  = Rs. 3

Profit on  $x_1$  belts = Rs.  $3x_1$

Profit on 1 belt  $B$  = Rs. 5

Profit on  $x_2$  belts  $B$  = Rs.  $5x_2$

Profit on 1 belt  $C$  = Rs. 4

Profit on  $x_3$  belts  $C$  = Rs.  $4x_3$

Total profit =  $3x_1 + 5x_2 + 4x_3$

$\Rightarrow Z = 3x_1 + 5x_2 + 4x_3$

**4. Constraint (i)** The time available on machine  $M_1 = 8$  hours per day.

Time required for 1 belt  $A$  on machine  $M_1 = 2$  hours per day

Time required for  $x_1$  belts  $A$  on machine  $M_1 = 2x_1$  hours per day

Time required for 1 belt  $B$  on machine  $M_1 = 3$  hours per day

Time required for  $x_2$  belts  $B$  on machine  $M_1 = 3x_2$  hours per day

$$2x_1 + 3x_2 \leq 8$$

**Constraint (ii)** The time available on machine  $M_2 = 10$  hours per day.

Time required for 1 belt  $B$  on machine  $M_2 = 2$  hours per day

Time required for  $x_2$  belts  $B$  on machine  $M_2 = 2x_2$  hours per day

Time required for 1 belt  $C$  on machine  $M_2 = 5$  hours per day

Time required for  $x_3$  belts  $C$  on machine  $M_2 = 5x_3$  hours per day

$$2x_2 + 5x_3 \leq 10$$

**Constraint (iii)** The time available on machine  $M_3 = 15$  hours per day.

Time required for 1 belt  $A$  on machine  $M_3 = 3$  hours per day

Time required for  $x_1$  belts  $A$  on machine  $M_3 = 3x_1$  hours per day

Time required for 1 belt  $B$  on machine  $M_3 = 2$  hours per day

Time required for  $x_2$  belts  $B$  on machine  $M_3 = 2x_2$  hours per day

Time required for 1 belt  $C$  on machine  $M_3 = 4$  hours per day

Time required for  $x_3$  belts  $C$  on machine  $M_3 = 4x_3$  hours per day

$$3x_1 + 2x_2 + 4x_3 \leq 15$$

**Constraint (iv).** The number of belt  $A$ , belt  $B$  and belt  $C$  are non-negative.

$$x_1 \geq 0, \quad x_2 \geq 0 \quad \text{and} \quad x_3 \geq 0.$$

## 5. Mathematical Formulation.

The linear programming problem of the given problem is as follows

$$\text{To maximise} \quad Z = 3x_1 + 5x_2 + 4x_3 \quad \dots(1)$$

$$\text{Subject to the constraints} \quad 2x_1 + 3x_2 \leq 8 \quad \dots(2)$$

$$2x_2 + 5x_3 \leq 10 \quad \dots(3)$$

$$3x_1 + 2x_2 + 4x_3 \leq 15 \quad \dots(4)$$

$$x_1 \geq 0 \quad \dots(5)$$

$$x_2 \geq 0 \quad \dots(6)$$

$$x_3 \geq 0 \quad \dots(7)$$

**Ans.**

## TYPE II. DIET PROBLEMS

**Example 5.** A dietitian mixes together two kinds of food, say,  $X$  and  $Y$  in such a way that the mixture contains at least 6 units of vitamin  $A$ , 7 units of vitamin  $B$ , 12 units of vitamin  $C$  and 9 units of vitamin  $D$ . The vitamin contents of 1 kg of food  $X$  and 1 kg of food  $Y$  are given below:

Cost	Vitamin $A$	Vitamin $B$	Vitamin $C$	Vitamin $D$
Food $X$	1	1	1	2
Food $Y$	2	1	3	1

One kg of food  $X$  costs Rs. 5, whereas one kg of food  $Y$  costs Rs. 8. Formulate the linear programming problem.

**Solution.**

- 1. Decision Variables.** Decision Variables are units of food  $X$  and food  $Y$ . Let food  $X$  in the mixture be  $x$  kg. and food  $Y$  in the mixture be  $y$  kg.

- 2. Objective Function.** To minimise the cost

$$\begin{aligned}1 \text{ kg of food } X &\text{ costs Rs. } 5 \\x \text{ kg of food } X &\text{ costs Rs. } 5x \\1 \text{ kg of food } Y &\text{ costs Rs. } 8 \\y \text{ kg of food } Y &\text{ costs Rs. } 8y \\ \text{Total cost of food } X \text{ and } Y &= 5x + 8y \\ \Rightarrow Z &= 5x + 8y\end{aligned}$$

- 3. Constraint (i)** The mixture contains atleast 6 units of vitamin  $A$ .

$$\begin{aligned}1 \text{ kg of food } X &\text{ contains 1 unit of vitamin } A. \\x \text{ kg of food } X &\text{ contains } x \text{ units of vitamin } A. \\1 \text{ kg of food } Y &\text{ contains 1 unit of vitamin } A. \\y \text{ kg of food } Y &\text{ contains } 2y \text{ units of vitamin } A.\end{aligned}$$

$$\Rightarrow x + 2y \geq 6$$

- Constraint (ii)** The mixture contains atleast 7 units of vitamin  $B$ .

$$\begin{aligned}1 \text{ kg of food } X &\text{ contains 1 unit of vitamin } B. \\x \text{ kg of food } X &\text{ contains } x \text{ units of vitamin } B. \\1 \text{ kg of food } Y &\text{ contains 1 unit of vitamin } B. \\y \text{ kg of food } Y &\text{ contains } y \text{ units of vitamin } B.\end{aligned}$$

$$\Rightarrow x + y \geq 7$$

- Constraint (iii)** The mixture contains at least 12 units of vitamin  $C$ .

$$\begin{aligned}1 \text{ kg of food } X &\text{ contains 1 unit of vitamin } C. \\x \text{ kg of food } X &\text{ contains } x \text{ units of vitamin } C. \\1 \text{ kg of food } Y &\text{ contains 3 units of vitamin } C. \\y \text{ kg of food } Y &\text{ contains } 3y \text{ units of vitamin } C.\end{aligned}$$

$$\Rightarrow x + 3y \geq 12$$

- Constraint (iv)** The mixture contains atleast 9 units of vitamin  $D$ .

$$\begin{aligned}1 \text{ kg of food } X &\text{ contains 2 units of vitamin } D. \\x \text{ kg of food } X &\text{ contains } 2x \text{ units of vitamin } D. \\1 \text{ kg of food } Y &\text{ contains 1 unit of vitamin } D. \\y \text{ kg of food } Y &\text{ contains } y \text{ units of vitamin } D.\end{aligned}$$

$$\Rightarrow 2x + y \geq 9$$

- Constraint (v).** The number of kg of food  $x$  and  $y$  is non-negative.

$$x \geq 0$$

$$y \geq 0$$

- 4. Mathematical Formulation.** The linear programming problem of the given problem is as follows

$$\text{To minimise } Z = 5x + 8y \quad \dots(1)$$

$$\text{Subject to the constraints } x + 2y \geq 6 \quad \dots(2)$$

$$x + y \geq 7 \quad \dots(3)$$

$$x + 3y \geq 12 \quad \dots(4)$$

$$2x + y \geq 9 \quad \dots(5)$$

$$x \geq 0 \quad \dots(6)$$

$$y \geq 0 \quad \dots(7)$$

**Ans.**

**Example 6.** A firm is engaged in breeding goats. The goats are fed on various products grown on the farm. They need certain nutrients, named as X, Y and Z. The goats are fed on two products A and B. One unit of product A contains 36 units of X, 3 units of Y and 20 units of Z, while one unit of product B contains 6 units of X, 12 units of Y and 10 units of Z. The minimum requirement of X, Y and Z is 108 units, 36 units and 100 units, respectively. Product A costs Rs. 20 per unit and product B costs Rs. 40 per unit. Formulate the L.P.P. to minimize the cost.

**Solution.** The above information is given in the following table:

**1. Table:**

<i>Nutrients</i> <i>Food</i>	X	Y	Z	Cost (in Rs.)
A	36	3	20	20
B	6	12	10	40
Minimum required units	108	36	100	

**2. Decision variables.** The decision variables are units of nutrients X, Y and Z. Let the units of food A be  $x$  the units of food B be  $y$ .

**3. Objective function.** To minimize the cost.

$$\begin{array}{ll} \text{cost of 1 unit of food } A = \text{Rs. } 20 & \text{cost of } x \text{ units of food } A = \text{Rs. } 20x \\ \text{cost of 1 unit of food } B = \text{Rs. } 40 & \text{cost of } y \text{ units of food } B = \text{Rs. } 40y \\ \text{Total cost} = 20x + 40y & \Rightarrow Z = 20x + 40y \end{array}$$

**4. Constraint (i).** Minimum requirement of X nutrient = 108 units

One unit of food A contains 36 units of X.

$x$  units of food A contains  $36x$  units of X.

One unit of food B contains 6 units of X.

$y$  units of food B contains  $6y$  units of X.

$$\Rightarrow 36x + 6y \geq 108$$

**Constraint (ii).** The minimum requirement of Y nutrients = 36 units.

One unit of food A contains 3 units of nutrients Y.

$x$  units of food A contains  $3x$  units of nutrients Y.

One unit of food B contains 12 units of nutrients Y.

$y$  units of food B contains  $12y$  units of nutrients Y.

$$\Rightarrow 3x + 12y \geq 36$$

**Constraint (iii).** The minimum requirement of nutrients Z = 100 units.

One unit of food A contains 20 units of nutrients Z.

$x$  units of food A contains  $20x$  units of nutrients Z.

One unit of food B contains 10 units of nutrients Z.

$y$  units of food B contains  $10y$  units of nutrients Z.

$$\Rightarrow 20x + 10y \geq 100$$

**Constraint (iv).** Units of food A and B are non-negative.

$$\therefore x \geq 0 \text{ and } y \geq 0.$$

**4. Mathematical Formulation.**

To minimize,  $Z = 20x + 40y$

Subject to the constraints:  $36x + 6y \geq 108$

$$3x + 12y \geq 36$$

$$20x + 10y \geq 100$$

$$x \geq 0, y \geq 0.$$

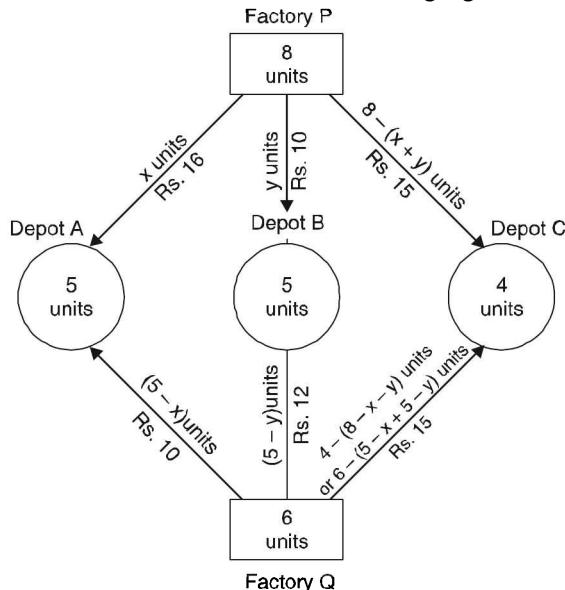

### TYPE III. TRANSPORTATION PROBLEM

**Example 7.** There is a factory located at each of the two places P and Q. From these locations, a certain commodity is delivered to each of the three depots situated at A, B, and C. The weekly requirements of the depots are respectively 5, 5 and 4 units of the commodity while the production capacity of the factories at P and Q are 8 and 6 units respectively just sufficient for the requirement of depots. The cost of transportation per unit is given below:

From \ To	Cost (in Rs.)		
	A	B	C
P	16	10	15
Q	10	12	10

How many units should be transported from each factory to each depot in order that the transportation cost is minimum. Formulate the above as a linear programming problem.

**Solution.** The given information is shown in the following figure

1. **Decision Variables.** Decision variables are units of commodity to be transported from the factories to the depots.

Let the factory at P transport  $x$  units of commodity to depot at A and  $y$  units to depot at B so the remaining units at P,  $8 - (x + y)$  will be transported to depot at C.

2. **Constraint (i).** From Factory at P,  $(8 - x - y)$  units will be transported to the depot at C.

$$8 - x - y \geq 0 \Rightarrow x + y \leq 8 \quad \dots (1)$$

3. **Constraint (ii).**  $x$  and  $y$  units are non-negative units.

$$x \geq 0 \quad \dots (2)$$

$$y \geq 0 \quad \dots (3)$$

#### Constraints (iii).

The remaining requirements  $(5 - x)$  units are to be transported from the factory at Q to the depot at A.  $5 - x \geq 0 \Rightarrow x \leq 5 \quad \dots (4)$

#### Constraints (iv).

The remaining requirements  $(5 - y)$  units are to be transported from factory Q to the depot at B.

$$5 - y \geq 0 \Rightarrow y \leq 5 \quad \dots (5)$$

**Constraints (v).**

The remaining requirements  $4 - (5 - x + 5 - y)$  units of commodity will be transported from the factory at  $Q$  to the depot at  $C$ .

$$4 - (5 - x + 5 - y) \geq 0 \\ \Rightarrow x + y - 4 \geq 0 \quad \Rightarrow \quad x + y \geq 4 \quad \dots (6)$$

- 3. Objective function.** The transportation cost from the factory at  $P$  to the depots at  $A$ ,  $B$  and  $C$  are respectively Rs.  $16x$ ,  $10y$  and  $15(8 - x - y)$

Total cost of transportation from factory at  $P = 16x + 10y + 15(8 - x - y)$ .

Similarly, the transportation cost from the factory at  $Q$  to the depots at  $A$ ,  $B$  and  $C$  are Rs.  $10(5 - x)$ ,  $12(5 - y)$ ,  $10(x + y - 4)$  respectively.

Total transportation cost from factory  $Q = 10(5 - x) + 12(5 - y) + 10(x + y - 4)$

Grand total cost of transportation from both the factories at  $P$  and  $Q$  to all the depots

$$Z = 16x + 10y + 15(8 - x - y) + 10(5 - x) + 12(5 - y) + 10(x + y - 4) \\ \Rightarrow Z = x - 7y + 190$$

**4. Mathematical Formulation.**

$$\begin{array}{ll} \text{To minimize} & Z = x - 7y + 190 \\ \text{Subject to constraints} & x + y \leq 8 \\ & x + y \geq 4 \\ & x \leq 5 \\ & y \leq 5 \\ & x \geq 0 \\ & y \geq 0 \end{array}$$

**Ans.****EXERCISE 56.1**

1. A furniture dealer deals in only two items viz., tables and chairs. He has Rs. 11,000 to invest and a space to store at most 40 pieces. A table costs him Rs. 500 and a chair Rs. 200. He can sell a table at a profit of Rs. 50 and a chair at a profit of Rs. 15. Assume that he can sell all the items that he buys. Formulate this problem as an L.P.P, so that he can maximize the profit.
2. A manufacturer produces nuts and bolts for industrial machinery. It takes 1 hour of work on machine  $A$  and 3 hours on machine  $B$  to produce a package of nuts; while it takes 3 hours on machine  $A$  and 1 hour on machine  $B$  to produce a package of bolts. He earns a profit of Rs. 2.50 per package on nuts and Re. 1 per package on bolts. Form a linear programming problem to maximize his profit, if he operates each machine for at the most 12 hours a day.
3. A person consumes two types of food,  $A$  and  $B$ , everyday to obtain 8 units of protein, 12 units of carbohydrates and 9 units of fat which is his daily minimum requirements. 1 kg of food  $A$  contains 2, 6, 1 units of protein, carbohydrates and fat, respectively. 1 kg of food  $B$  contains 1, 1 and 3 units of protein, carbohydrates and fat, respectively. Food  $A$  costs Rs. 8 per kg while food  $B$  costs Rs. 5 per kg. Form an L.P.P to find how many kg of each food should he buy daily to minimize his cost of food and still meet minimal nutritional requirements.

**Ans.** Maximize,  $Z = 50x + 15y$

Subject to the constraints :

$$\begin{aligned} x + y &\leq 40 \\ 500x + 200y &\leq 11000 \\ x &\geq 0 \\ y &\geq 0 \end{aligned}$$

**Ans.** Maximize,  $Z = 2.5x + y$

Subject to the constraints :

$$\begin{aligned} x + 3y &\leq 12 \\ 3x + y &\leq 12 \\ x &\geq 0 \\ y &\geq 0 \end{aligned}$$

**Ans.** Minimize  $Z = 5x + 8y$

Subject to the constraints :

$$\begin{aligned} 2x + y &\geq 8 \\ 6x + y &\geq 12 \\ x + 3y &\geq 9 \\ x &\geq 0 \\ y &\geq 0 \end{aligned}$$

4. A dietician wishes to mix two types of foods  $F_1$  and  $F_2$  in such a way that the vitamin contents of the mixture contains atleast 6 units of vitamin A and 8 units of vitamin B. Food  $F_1$  contains 2 units/kg of vitamin A and 3 units/kg of vitamin B while food  $F_2$  contains 3 units/kg of vitamin A and 4 units/kg of vitamin B. Food  $F_1$  costs Rs. 50/kg and food  $F_2$  costs Rs. 75/kg. Formulate the problem as a L.P.P. to minimize the cost of mixture.

5. (Investment Problem) A retired person wants to invest an amount of upto Rs. 20,000. His broker recommends investing in two types of bonds A and B, bond A yielding 10% return on the amount invested and bond B yielding 15% return on the amount invested. After some consideration, he decides to invest at least Rs. 5000 in bond A and no more than Rs. 8000 in bond B. He also wants to invest at least as much in bond A as in bond B. What should his broker suggest if he wants to maximize his return on investments. Formulate LPP.

#### 56.4 GRAPHICAL METHOD OF SOLVING LINEAR PROGRAMMING PROBLEMS

If a problem contains only two variables then we can solve the given problem by graphical method. There are two graphical method to solve a linear programming problem.

1. Corner point method
2. Iso-profit or iso-cost method

#### 56.5 CORNER POINT METHOD

This method is based on the fundamental extreme point theorem.

In previous class we have learnt how to formulate a system of linear inequalities involving two variables  $x$  and  $y$  mathematically.

##### Working Rule

**Step 1.** Formulate the given L.P.P. in mathematical form.

**Step 2.** The inequations are converted into equations.

In the equation on putting  $y = 0$  we get  $x$ -coordinate on  $x$ -axis. Similarly, putting  $x = 0$  we get  $y$ -coordinate on  $y$ -axis. Join these two points to get the graph of the equation.

**Step 3.** The inequation of a line divides the plane into two half planes, to choose the plane of the inequation we put  $x = 0$  and  $y = 0$  in the inequation. If origin satisfies the inequation then the region containing the origin is the region represented by the given inequation. Otherwise the half plane not containing the origin is the region represented by the given inequation.

**Step 4.** The region satisfying all the inequations is the feasible region.

**Step 5.** The vertices (corner points) of the required region are known as extreme points of the set of all feasible solutions of the L.P.P.

**Step 6.** By putting the values of  $x$  and  $y$  of each corner point in the objective function we get the values of the objective function at each of the vertices of the feasible region. Out of all the values of the objective function, we get a point at which the objective function is optimum (maximum or minimum).

Consider the following example:-

**Example 8.** Solve the following L.P.P. graphically :

$$\text{Maximize, } Z = 3x + 2y$$

Subject to the constraints  $x + 2y \leq 10$

$$\text{Ans. Minimize } z = 50x + 75y$$

Subject to the constraints :

$$2x + 3y \geq 6$$

$$3x + 4y \geq 8$$

$$x \geq 0, y \geq 0$$

$$\text{Ans. Minimize } Z = \frac{10}{100}x + \frac{15}{100}y$$

$$x \geq 5000$$

$$y \leq 80,000$$

$$x \geq 0, y \geq 0$$

**Solution.** On changing the given inequations into equations, we have

$$x + 2y = 10 \quad \text{and} \quad 3x + y = 15; \quad x = 0 \quad \text{and} \quad y = 0$$

**Region Represented by  $x + 2y \leq 10$ .**

The line  $x + 2y = 10$  meets the  $x$ -axis at the point  $A(10, 0)$  and meets  $y$ -axis at the point  $B(0, 5)$ . Join  $AB$  to obtain the graph of  $x + 2y = 10$ .

Here, origin  $(x = 0, y = 0)$  satisfies the inequation  $x + 2y \leq 10$ . So, the half plane containing the origin represents the solution set of the inequation  $x + 2y \leq 10$ .

**Region Represented by  $3x + y \leq 15$ .**

The line  $3x + y = 15$  meets the  $x$ -axis at the point  $C(5, 0)$  and meets the  $y$ -axis at the point  $D(0, 15)$ . Join  $CD$  to obtain the graph of the line  $3x + y = 15$ . Here, origin  $(x = 0, y = 0)$  satisfies the inequation  $3x + y \leq 15$ . So, the half plane containing the origin represents the solution set of the inequation  $3x + y \leq 15$ .

**Region represented by  $x \geq 0$  and  $y \geq 0$ .**

All the points in the first quadrant satisfies  $x \geq 0$  and  $y \geq 0$ . So, the first quadrant is the region represented by  $x \geq 0$  and  $y \geq 0$ .

The shaded region  $O C E B O$  represents the region satisfying all the inequations.

Each point of this region represents a feasible choice.

Every point of this region is called the feasible solution of the problem.

**Feasible region.** The shaded portion determined by all the constraints including non-negative constants of a linear programming problem is called the feasible region. In this example  $O BEC$  (shaded) is the feasible region for the problem.

**Feasible Solution.** Points within and on the boundary of the feasible region represent feasible solutions of the constraints.

Here,  $(5, 0)$ ,  $(4, 3)$  and  $(0, 5)$  are the feasible solutions. Any point outside the feasible region is called an infeasible solution. For example,  $(0, 15)$  and  $(10, 0)$  are infeasible solutions.

**Optimal Solution.** Any point in the feasible region that gives the optimal value (maximum or minimum) is called an optimal solution.

In the feasible region there are infinitely many points which satisfy all the constraints. It is not possible to check all the points for the maximum value of the objective function.

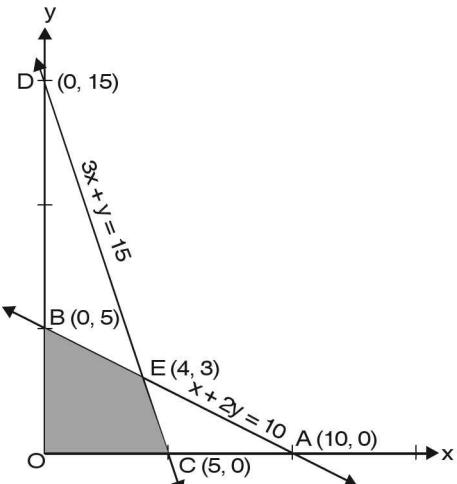

$$Z = 3x + 2y$$

For finding out the optimal solution we have to use the following theorems

**Theorem 1.** The optimal value of objective function must occur at a corner point (vertex) of the feasible region.

**Theorem 2.** If the feasible region is bounded then the objective function  $Z$  has both maximum and minimum values on corner points of the bounded region.

In the above example we have following table showing the value of the objective function at the corner points of the feasible region.

Vertex of the feasible region	Corresponding value of $Z = 3x + 2y$ (in Rs.)
$O (0, 0)$	0
$C (5, 0)$	15
$E (4, 3)$	18 <b>Maximum</b>
$B (0, 5)$	10

We observe that the maximum value of the objective function is 18.

This method of solving linear programming problem is called *corner point method*.

**Procedure:** The solution of the given L.P.P. should be divided under the following heads:

1. Conversion of inequalities into equations.
2. Draw the graph of the lines and find regions represented by the inequations.
3. Apply Corner point method.

**Example 9.** Solve the following linear programming problem graphically :

$$\text{Minimize} \quad Z = -3x + 4y$$

$$\text{Subject to} \quad x + 2y \leq 8$$

$$3x + 2y \leq 12$$

$$x \geq 0, \quad y \geq 0.$$

**Solution.** We have,

$$\text{Minimize} \quad Z = -3x + 4y \quad \dots(1)$$

Subject to the constraints:

$$x + 2y \leq 8 \quad \dots(2)$$

$$3x + 2y \leq 12 \quad \dots(3)$$

$$x \geq 0, y \geq 0 \quad \dots(4)$$

### 1. Conversion

Changing the inequations into equations, we have

$$x + 2y = 8$$

$$3x + 2y = 12$$

$$x = 0, y = 0$$

### 2. Drawing of Graphs of the lines:

**Region represented by  $x + 2y \leq 8$**

$$x + 2y = 8$$

$x$	8	0
$y$	0	4
	A	B

On joining A and B, we get the graph of the equation  $x + 2y = 8$ .

Put  $x = 0, y = 0$  in  $x + 2y \leq 8$ , then  $0 + 0 \leq 8$ , which is true. So the half plane containing origin represents the solution set of the inequation  $x + 2y \leq 8$ .

**Region represented by  $3x + 2y \leq 12$ .**

$$3x + 2y = 12$$

$x$	4	0
$y$	0	6
	C	D

On joining the points  $C$  and  $D$ , we get the graph of the equation  $3x + 2y = 12$ .

Put  $x = 0, y = 0$  in the inequation  $3x + 2y \leq 12$ ,  
then  $0 + 0 \leq 12$  which is true.

So, the half plane containing origin represents the solution set of the inequation  $3x + 2y \leq 12$ .

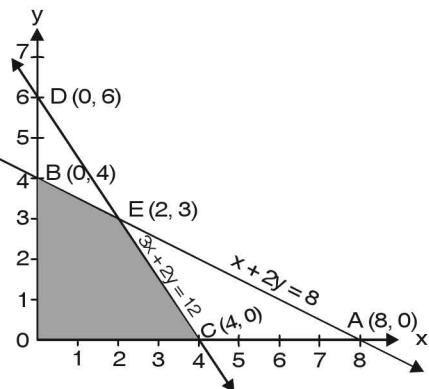

**Region represented by  $x \geq 0$  and  $y \geq 0$ .**

First quadrant is the region of  $x \geq 0, y \geq 0$ .

The shaded region in figure is the feasible region  $O C E B$  determined by the system of constraints (2) to (4), which is bounded. The coordinates of corner points are  $C(4, 0)$ ,  $E(2, 3)$  and  $B(0, 4)$ .

### 3. Corner Point Method

Now we evaluate  $Z = -3x + 4y$  at these corner points.

Corner Point of the feasible region OCEBO	Corresponding value of $Z = -3x + 4y$
$C(4, 0)$	$-3(4) + 4(0) = -12$ Minimum
$E(2, 3)$	$-3(2) + 4(3) = 6$
$B(0, 4)$	$-3(0) + 4(4) = 16$

Hence, the minimum value of  $Z$  is  $-12$  attained at the point  $C(4, 0)$ .

**Ans.**

**Example 10.** Solve the following linear programming problem graphically:

$$\text{Maximise} \quad Z = 5x + 3y$$

$$\text{subject to} \quad 3x + 5y \leq 15$$

$$5x + 2y \leq 10$$

$$x \geq 0, y \geq 0.$$

**Solution.** We have, Maximise  $Z = 5x + 3y$   
subject to the constraints

$$3x + 5y \leq 15 \quad \dots(1)$$

$$5x + 2y \leq 10 \quad \dots(2)$$

$$x \geq 0, y \geq 0. \quad \dots(3)$$

### 1. Conversion

On converting the above inequations, we have the following equations:

$$3x + 5y = 15$$

$$5x + 2y = 10$$

$$x = 0, y = 0$$

### 2. Drawing of the graph of the lines.

Region represented by the inequation  $3x + 5y \leq 15$ .

$$3x + 5y = 15$$

$x$	5	0
$y$	0	3
	$A$	$B$

The line  $3x + 5y = 15$  meets the  $x$ -axis at  $A(5, 0)$  and meets  $y$ -axis at  $B(0, 3)$ . On joining  $A, B$  we get the graph of the line  $3x + 5y = 15$ . Since  $(0, 0)$  satisfies the inequation

$3x + 5y \leq 15$ . So, the half plane containing origin represents the region of the solution set of the inequation  $3x + 5y \leq 15$ .

**The region represented by  $5x + 2y \leq 10$ .**

$5x + 2y = 10$		
$x$	2	0
$y$	0	5
	$C$	$D$

The line  $5x + 2y = 10$  meets the  $x$ -axis at  $C(2, 0)$  and meets  $y$ -axis at  $D(0, 5)$ . On joining  $C, D$  we get the graph of the line  $5x + 2y = 10$ . Since  $(0, 0)$  satisfies the inequation  $5x + 2y \leq 10$ . So the half plane containing origin represents the region of the solution set of the inequation  $5x + 2y \leq 10$ .

**The region represented by  $x \geq 0$  and  $y \geq 0$ .**

$x \geq 0$  and  $y \geq 0$  represent the first quadrant. The shaded region OCEBO bounded by the inequations (1) to (3) is the feasible region.

**3. Corner Point Method.** The coordinates of the vertices  $O, C, E$ , and  $B$  of the feasible region OCEBO are  $O(0, 0), C(2, 0), E(20/19, 45/19)$  and  $B(0, 3)$  respectively.

Note that the coordinates of  $E$  are obtained by solving the equations  $3x + 5y = 15$  and  $5x + 2y = 10$ . The value of the objective function at these points are given in the following table:

Corner point $(x, y)$ of the feasible region OCEBO	Value of the objective function $Z = 5x + 3y$
$O(0, 0)$	$5(0) + 3(0) = 0$
$C(2, 0)$	$5(2) + 3(0) = 10$
$E(20/19, 45/19)$	$5\left(\frac{20}{19}\right) + 3\left(\frac{45}{19}\right) = \frac{100}{19} + \frac{135}{19} = \frac{235}{19}$ maximum
$B(0, 3)$	$5(0) + 3(3) = 9$

Clearly,  $Z$  is maximum when  $x = \frac{20}{19}, y = \frac{45}{19}$ . Thus,  $x = \frac{20}{19}, y = \frac{45}{19}$  is the optimal solution

of the given L.P.P.

Hence the maximum value of  $Z$  is  $\frac{235}{19}$  at  $x = \frac{20}{19}, y = \frac{45}{19}$ . Ans.

**Example 11.** Solve graphically the following linear programming problem to minimise the cost  $Z = 3x + 2y$  subject to the following constraints:

$$5x + y \geq 10; \quad x + y \geq 6; \quad x + 4y \geq 12; \quad x \geq 0, y \geq 0.$$

**Solution.** We have,

$$\text{Minimise} \quad Z = 3x + 2y \quad \dots (1)$$

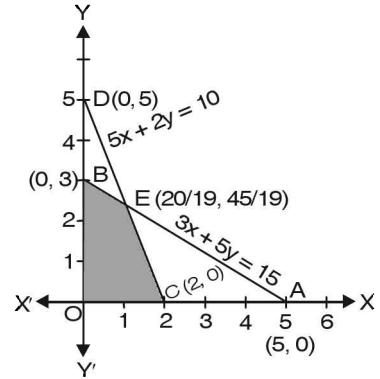

Subject to the constraints

$$5x + y \geq 10 \quad \dots (2)$$

$$x + y \geq 6 \quad \dots (3)$$

$$x + 4y \geq 12 \quad \dots (4)$$

$$x \geq 0, y \geq 0 \quad \dots (5)$$

**1. Conversion.**

On converting the above inequations, we have the following equations

$$\begin{aligned}5x + y &= 10 \\x + y &= 6 \\x + 4y &= 12 \\x = 0, y = 0\end{aligned}$$

**2. Drawing of graphs.**

**The region represented by  $5x + y \geq 10$ .**

$$5x + y = 10$$

$x$	2	0
$y$	0	10
Point	A	B

On joining the points A and B, we get the graph of the line  $5x + y = 10$ . Put  $x = 0, y = 0$  in  $5x + y \geq 10$ , then  $0 + 0 \geq 10$  which is false. So half plane not containing origin represents the region of the solution set of the inequation  $5x + y \geq 10$ .

**The region represented by  $x + y \geq 6$**

$$x + y = 6$$

$x$	6	0
$y$	0	6
Point	C	D

On joining the points C and D, we get the graph of the line  $x + y = 6$ .

Put  $x = 0, y = 0$  in  $x + y \geq 6$ , then  $0 + 0 \geq 6$  which is false. So the half plane not containing origin represents the region of the solution set of  $x + y \geq 6$ .

**The region represented by  $x + 4y \geq 12$**

$$x + 4y = 12$$

$x$	12	0
$y$	0	3
Point	E	F

On joining the points E and F we get the graph of the line  $x + 4y = 12$ .

Put  $x = 0, y = 0$  in  $x + 4y \geq 12$ , then  $0 + 0 \geq 12$  which is false.

So, the half plane not containing origin represents the region of the solution set of the inequation  $x + 4y \geq 12$ .

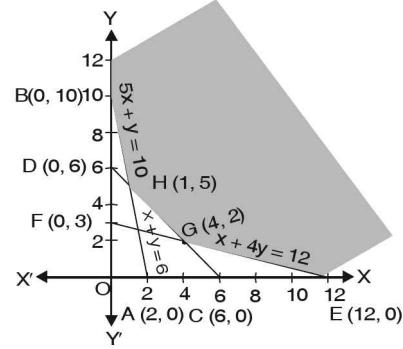

**The region represented by  $x \geq 0$  and  $y \geq 0$ .**

The first quadrant is represented by  $x \geq 0$  and  $y \geq 0$ .

The shaded region is represented by the inequations (2) to (5).

**3. Corner Point Method.** The coordinates of the vertices of the feasible region are  $E(12, 0)$ ,  $G(4, 2)$ ,  $H(1, 5)$  and  $B(0, 10)$  respectively.

Note that the coordinates of G and H are obtained by solving the equations  $x + y = 6$ ,  $x + 4y = 12$  and  $x + y = 6$ ,  $5x + y = 10$  respectively.

The value of the objective function at these points are given in the following table :

Corner Point $(x, y)$ of the feasible region $EGHB$	Value of the objective function $Z = 3x + 2y$
$E, (12, 0)$	$3 \times 12 + 2 \times 0 = 36$
$G, (4, 2)$	$3 \times 4 + 2 \times 2 = 12 + 4 = 16$
$H, (1, 5)$	$3 \times 1 + 2 \times 5 = 3 + 10 = 13$
$B, (0, 10)$	$3 \times 0 + 2 \times 10 = 0 + 20 = 20$

Clearly,  $H$  is minimum when  $x = 1, y = 5$ .

So,  $x = 1, y = 5$  is the optimal solution of the given L.P.P.

Hence,  $Z$  is minimum when  $x = 1$  and  $y = 5$  and the minimum value of  $Z$  is Rs. 13.

### 56.6. ISO-PROFIT OR ISO-COST METHOD (MAXIMUM Z)

Let  $Z = 3x + 2y$  be the objective function.

On putting any value of  $Z$  (say 12) in

$Z = 3x + 2y$ , we have

$$12 = 3x + 2y \quad \dots (1)$$

and draw the corresponding line of the objective function. This line is called Iso-profit or Iso-cost line, since every point on this line will give the same value of  $Z$  (12) (same profit or same cost). Draw one more line parallel to (1), within the feasible region and passing through the farthest point from the origin.

The value of the  $Z$  on the second line is the maximum value of the  $Z$ . It passes through one corner of the shaded region.

Through the point  $E (2, 8)$ , the line of objective function is passing. The point  $E$  is on the shaded region and is vertex of the shaded region and the line  $Z = 3x + 2y$  is farthest from the origin. Here the maximum value of  $Z = 3(2) + 2(8) = 6 + 16 = 22$ . So, the maximum value of the objective function is 22.

### 56.7 ISO-PROFIT OR ISO-COST METHOD (MINIMUM Z)

Let  $Z = x + 2y$

Let us take three different values of  $Z$ ;  $Z_1, Z_2$  and  $Z_3$  we get,

$$Z_1 = x + 2y \quad \dots (1)$$

$$Z_2 = x + 2y \quad \dots (2)$$

$$Z_3 = x + 2y \quad \dots (3)$$

The above three lines are parallel to

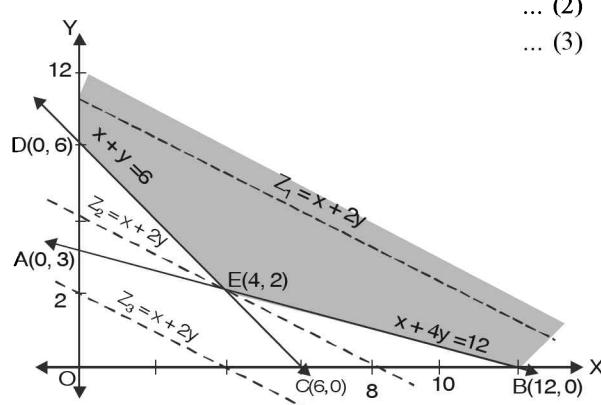

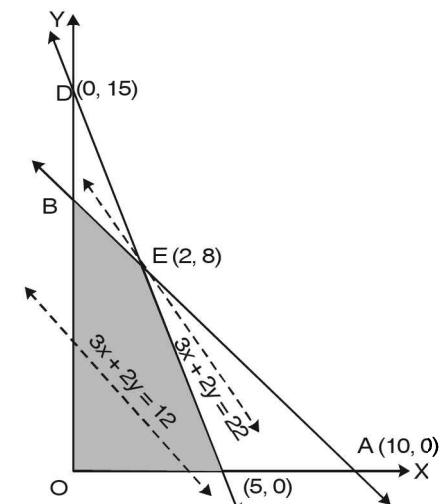

each other having the same slope  $\left(-\frac{1}{2}\right)$ .

Out of these three lines, line (2) is the only line which passes through the point  $E (4, 2)$  nearest to the origin and passing through the feasible region.

Thus,  $Z_2$  is the minimum value of  $Z$ .  $x = 4$  and  $y = 2$  gives the optimal solution.

$$Z_2 = 4 + 2(2) = 4 + 4 = 8$$

So, the minimum value of  $Z$  is 8.

**Example 12.** Solve graphically the following linear programming problem:

$$\text{maximize} \quad Z = 5x + 3y$$

subject to the constraints :

$$x + y \leq 300$$

$$2x + y \leq 360$$

$$x \geq 0$$

$$y \geq 0$$

**Solution.** We have,

$$\text{Maximum} \quad Z = 5x + 3y \quad \dots (1)$$

Subject to the constraints

$$x + y \leq 300 \quad \dots (2)$$

$$2x + y \leq 360 \quad \dots (3)$$

$$x \geq 0 \quad \text{and} \quad y \geq 0 \quad \dots (4)$$

### 1. Conversion

On changing the inequations into equations we get the following equations.

$$x + y = 300 \quad \text{and} \quad 2x + y = 360$$

### 2. Drawing of graphs

**The region represented by  $x + y \leq 300$**

$$x + y = 300$$

$x$	300	0
$y$	0	300
Point	A	B

On joining the points A (300, 0) and B (0, 300) we get the graph of the line AB,  
 $x + y = 300$ .

Put  $x = 0, y = 0$  in  $x + y \leq 300$ , then  $0 + 0 \leq 300$ , which is true. The half plane containing the origin is the region of the solution set of the inequation  $x + y \leq 300$ .

**The region represented by  $2x + y \leq 360$ .**

$$2x + y = 360$$

$x$	180	0
$y$	0	360
Point	C	D

On joining the points C (180, 0) and D (0, 360) we get the graph of the line 2x + y = 360.

Put  $x = 0, y = 0$  in  $2x + y \leq 360$ , then  $0 + 0 \leq 360$ , which is true.

The half plane containing the origin is the region of the solution set of the inequation

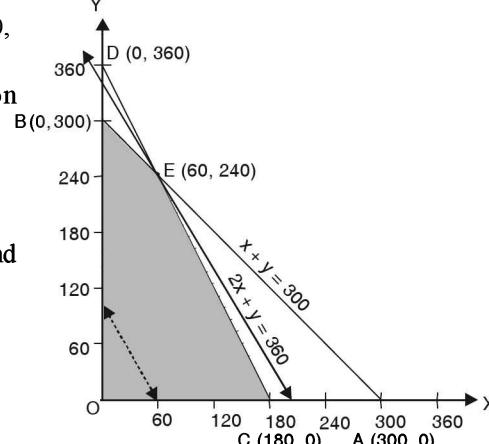

$$2x + y \leq 360.$$

**The region represented by  $x \geq 0$  and  $y \geq 0$ .**

The first quadrant is represented by  $x \geq 0$ , and  $y \geq 0$ .

The shaded region OCEB is the feasible solution bounded by the inequations (2) to (4).

On solving the equations (2) and (3), we get the point of intersection E (60, 240).

The coordinates of the corner points of the feasible region are  $C(180, 0)$ ,  $E(60, 240)$  and  $B(0, 300)$ .

### 3. Iso-profit or Iso-cost Method.

Now, we take a constant value (say 300) i.e.,  
(20 times the l.c.m. of 5 and 3).

On putting  $Z = 300$  in objective function (1), we get  $300 = 5x + 3y \dots (5)$   
We draw the graph of the line  $5x + 3y = 300$ .

Draw one more line parallel to (5) which is the farthest from the origin and has atleast one point of the feasible region.

The parallel line to (5) passes through the farthest point  $E(60, 240)$  from the origin. Here,  $x = 60$  and  $y = 240$  will give the maximum value of  $Z$ .

The maximum value of  $Z$  is given by  $Z = 5(60) + 3(240) = 300 + 720 = 1020$ .

Hence, the maximum value of  $Z$  is 1020. Ans.

**Example 13.** Solve graphically the following L.P.P.

$$\begin{array}{ll} \text{Minimize} & Z = 5x + 4y \\ \text{subject to the constraints :} & \end{array}$$

$$80x + 100y \geq 88$$

$$40x + 30y \geq 36$$

$$x \geq 0, y \geq 0$$

**Solution.** We have,

$$\begin{array}{ll} \text{Minimize} & Z = 5x + 4y \\ \text{Subject to the constraints} & \end{array} \dots (1)$$

$$80x + 100y \geq 88 \dots (2)$$

$$40x + 30y \geq 36 \dots (3)$$

$$x \geq 0, y \geq 0 \dots (4)$$

### 1. Conversion

On converting the inequations into equations, we get

$$80x + 100y = 88$$

$$40x + 30y = 36$$

### 2. Drawing of graphs

**Region represented by  $80x + 100y \geq 88$ .**

$$80x + 100y = 88$$

$x$	1.1	0.0
$y$	0	0.83
<i>Point</i>	<i>A</i>	<i>B</i>

On joining the points  $A(1.1, 0)$  and  $B(0.0, 0.83)$  we get the graph of the line  $80x + 100y = 88$ .

Put  $x = 0, y = 0$  in the inequation  $80x + 100y \geq 88$  then  $0 + 0 \geq 88$ , which is false.

So, the half plane not containing the origin is the region of solution set of the inequation  $80x + 100y \geq 88$

**Region represented by  $40x + 30y \geq 36$ .**

$$40x + 30y = 36$$

$x$	0.91	0
$y$	0	1.14
<i>Point</i>	<i>C</i>	<i>D</i>

On joining the points  $C(0.91, 0)$  and  $D(0, 1.14)$ , we get the graph of the line  $40x + 30y = 36$ . Put  $x = 0, y = 0$  in the inequation  $40x + 30y \geq 36$ , then  $0 + 0 \geq 36$ , which is false.

So, the half plane not containing the origin is the region of solution set of the inequation  $40x + 30y \geq 36$ .

**The region represented by  $x \geq 0$  and  $y \geq 0$**

The first quadrant is represented by

$$x \geq 0 \text{ and } y \geq 0.$$

The shaded region  $AED$  represents the feasible solution bounded by the inequations (2) to (4). On solving (2) and (3), we get the point of intersection of the lines (2) and (3),  $E(0.6, 0.4)$ .

### 3. Iso-profit or Iso-cost Method

Now, we take a constant = 20

On putting  $Z = 20$  in (1), we get

$$5x + 4y = 20 \quad \dots (5)$$

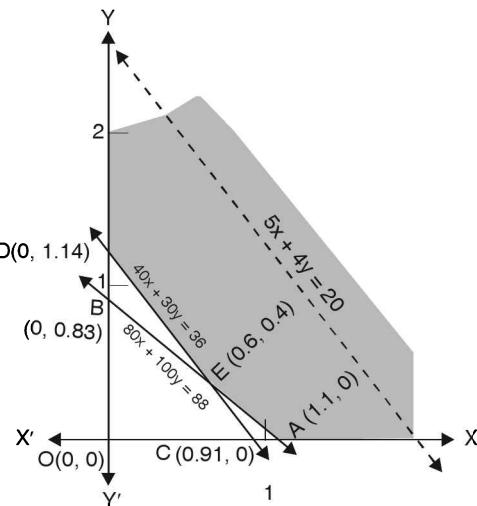

Now, we draw the graph of the line  $5x + 4y = 20$ .

Draw one more line parallel to (5), which is the nearest from the origin and has at least one point of the feasible region.

The parallel line to (5) passes through the nearest point  $E(0.6, 0.4)$  from the origin. Here,  $x = 0.6$  and  $y = 0.4$  will give the minimum value of  $Z$ . The minimum value of  $Z$  is given by

$$Z = 5(0.6) + 4(0.4) = 3.0 + 1.6 = 4.6 \quad \text{Ans.}$$

Hence, the minimum value of  $Z$  is 4.6.

## EXERCISE 56.2

Solve graphically each of the following linear programming problems :

1. Maximize  $Z = 10x + 6y$  subject to the constraints

$$3x + y \leq 12$$

$$2x + 5y \leq 34$$

$$x \geq 0, y \geq 0$$

**Ans.** Maximum : 56;  $x = 2, y = 6$

2. Maximize  $Z = 60x + 15y$  subject to the constraints

$$x + y \leq 50$$

$$3x + y \leq 90$$

$$x \geq 0, y \geq 0$$

**Ans.** Maximum : 1650,  $x = 20, y = 30$

3. Minimize  $Z = 18x + 10y$  subject to the constraints

$$4x + y \geq 20$$

$$2x + 3y \geq 30$$

$$x \geq 0, y \geq 0$$

**Ans.** Minimum : 134;  $x = 3, y = 8$

4. Maximize  $Z = 4x + 9y$  subject to the constraints

$$x + 5y \leq 200$$

$$2x + 3y \leq 134$$

$$x \geq 0, y \geq 0$$

**Ans.** Maximum : 382;  $x = 10, y = 38$

5. Maximize  $Z = 5x + 7y$  subject to the constraints

$$x + y \leq 4$$

$$3x + 8y \leq 24$$

$$10x + 7y \leq 35$$

$$x, y \geq 0$$

**Ans.** Maximum  $Z = \frac{124}{5}, x = \frac{8}{5}, y = \frac{12}{5}$

6. Minimize  $Z = 3x + 2y$  subject to the constraints :

$$x + y \geq 8$$

$$3x + 5y \leq 15$$

$$x \geq 0, y \geq 0$$

**Ans.** No feasible region.

7. Minimize  $Z = 3x + 5y$   
subject to the constraints

$$x + 3y \geq 3$$

$$x + y \geq 2$$

$$x, y \geq 0$$

**Ans.** Minimum  $Z = 7$ ,  $x = \frac{3}{2}$ ,  $y = \frac{1}{2}$

8. Minimize  $Z = 20x + 10y$   
subject to the constraints

$$x + 2y \leq 40$$

$$3x + y \geq 30$$

**Ans.** Minimum  $Z = 200$ ,  $x = 10$ ,  $y = 0$

9. Minimize  $Z = 30x + 20y$   
subject to the constraints

$$x + y \leq 8$$

$$x + 4y \geq 12$$

$$x, y \geq 0$$

**Ans.** Minimum  $Z = 60$ ,  $x = 0$ ,  $y = 3$

10. Minimize  $Z = x - 5y + 20$   
subject to the constraints

$$x - y \geq 0$$

$$-x + 2y \geq 2$$

$$x \geq 3$$

$$y \leq 4$$

$$x, y \geq 0$$

**Ans.** Minimum  $Z = 4$ ,  $x = 4$ ,  $y = 4$

Find  $x$  and  $y$  for which  $3x + 2y$  is minimum subject to these inequalities. Use a graphical method.

11. Find the minimum value of  $3x + 5y$  subject to the constraints:

$$-2x + y \leq 4, \quad x + y \geq 3,$$

$$x - 2y \leq 2, \quad x \geq 0, y \geq 0$$

**Ans.** Minimum  $Z = -300$ ,  $x = 6$ ,  $y = 0$

12. Find the maximum value of  $2x + y$  subject to the constraints :

$$x + 3y \geq 6, \quad x - 3y \leq 3, \quad 3x + 4y \leq 24$$

$$-3x + 2y \leq 6, \quad 5x + y \geq 5, \quad x, y \geq 0$$

**Ans.** Maximum  $Z = \frac{43}{3}$ ,  $x = \frac{84}{13}$ ,  $y = \frac{15}{3}$ .

## 56.8 SOLUTION OF LINEAR PROGRAMMING PROBLEMS

Here we will solve the linear programming problems.

### Working Rule

- Step 1. Define the problem mathematically.
- Step 2. Graph the constraint inequalities by converting them into equations. Find out their respective intercept on both the axes and connect them by straight lines.
- Step 3. Find out the vertices of the feasible region.
- Step 4. Find out the value of the objective function on the vertices.
- Step 5. Find out the optimum value of the objective function.

**Procedure .** The solution of the given LPP should be divided under the following heads:

1. Prepare a table of the data given in the problem.
2. Write down the decision variables.
3. Form the objective function.
4. Write down the constraints.
5. Mathematical formulation.
6. Region represented by inequations.
7. Apply Corner point method/Iso-cost or iso-profit method.

### Type I. To maximize the objective Function ( $Z$ )

**Example 14.** If a young man rides his motor cycle at 25 km/hour he had to spend Rs. 2 per km on petrol. If he rides at a faster speed of 40 km/hour, the petrol cost increases at Rs. 5 per km. He has Rs. 100 to spend on petrol and wishes to find what is the maximum distance he can travel within one hour, express this as an L.P.P. and solve it graphically.

### Solution:

The above information are given in the following table :

#### 1. Table

S.N.	Speeds (km per hour)	Consumption of petrol per km.	Total amount Spent on petrol
1.	25	Rs. 2	
2.	40	Rs. 5	Rs. 100

**2. Decision Variables:** Let the number of km riding motorcycle at the speed of 25km/h =  $x$  km

Let the number of km riding motor cycle at the speed of 40 km/hour =  $y$  km

**3. Objective function**

To maximize the distance of the journey.

$$Z = x + y$$

**4. Constraint (i).** The young man has Rs. 100 to spend on petrol.

When the speed is 25 km/hour cost of petrol for 1 km = Rs. 2

When the speed is 25 km/hour cost of petrol for  $x$  km = Rs.  $2x$

When the speed is 40 km/hour cost of petrol for 1 km = Rs. 5

When the speed is 40 km/hour cost of petrol for  $y$  km = Rs.  $5y$ .

$$\therefore 2x + 5y \leq 100$$

**Constraint (ii)** Time =  $\frac{\text{distance}}{\text{speed}}$

Time taken in the first journey =  $\frac{x}{25}$

Time taken in the second journey =  $\frac{y}{40}$

Total time given = 1 hour

$$\therefore \frac{x}{25} + \frac{y}{40} \leq 1$$

**Constraint (iii)** The distances in the journey are non-negative.

$$\therefore x \geq 0 \text{ and } y \geq 0$$

**5. Mathematical Formulation**

To maximize,  $Z = x + y$  ... (1)

Subject to the constraints :

$$2x + 5y \leq 100 \quad \dots (2)$$

$$\frac{x}{25} + \frac{y}{40} \leq 1 \Rightarrow 8x + 5y \leq 200 \quad \dots (3)$$

$$x \geq 0, y \geq 0. \quad \dots (4)$$

**6. Region represented by the constraints**

$$2x + 5y = 100$$

$x$	50	0
$y$	0	20
Point	A	B

$$8x + 5y = 200$$

$x$	25	0
$y$	0	40
Point	C	D

We have drawn the graphs of the following lines :

$$2x + 5y = 100$$

$$8x + 5y = 200$$

$$x = 0$$

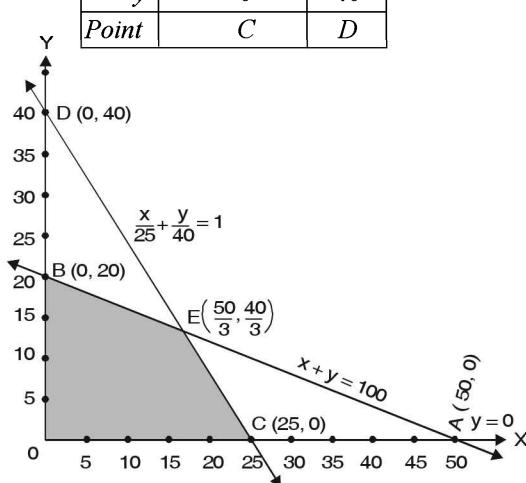

$$y = 0$$

Feasible region is represented by the shaded portion  $OCEBO$ .

**7. Corner Point Method**

The coordinates of the vertices of feasible region  $OCEBO$  are  $O(0, 0)$ ,

$C(25, 0)$ ,  $E\left(\frac{50}{3}, \frac{40}{3}\right)$  and  $B(0, 20)$ .

The values of the objective function at these points are as follows :

Corner Point $(x, y)$ of the feasible region OCEBO	Value of the objective function $Z = x + y$
$C (25, 0)$	$25 + 0 = 25$
$E\left(\frac{50}{3}, \frac{40}{3}\right)$	$\frac{50}{3} + \frac{40}{3} = \frac{90}{3} = 30$ <b>Maximum</b>
$B (0, 20)$	$0 + 20 = 20$

Hence,  $Z = 30$  is maximum when  $x = \frac{50}{3}$  and  $y = \frac{40}{3}$ . **Ans.**

**Example 15.** A factory owner purchased two types of machines, A and B for his factory. The requirements and the limitations for the machines are as follows:

Machine	Area occupied	Labour force	Daily output (in units)
A	1000 m <sup>2</sup>	12 men	60
B	1200 m <sup>2</sup>	8 men	40

He has maximum area of 9000 m<sup>2</sup> available, and 72 skilled labourers who can operate both the machines. How many machines of each type should he buy to maximise the daily output ?

**Solution.**

**1. Decision variables.** Let  $x$  machines of type A and  $y$  machines of type B are bought to maximize the daily output.

**2. Objective function.** It is given that one machine of type A gives output 60 units so  $x$  machines of type A give output  $60x$  units.

Similarly,  $y$  machines of type B give output  $40y$  units.

$$\text{Total output} = 60x + 40y$$

$$\Rightarrow Z = 60x + 40y$$

**3. Constraint (i)**

$\because$  one machine of type A occupies 1000 m<sup>2</sup> area

$\therefore x$  machines of type A occupy  $1000x$  m<sup>2</sup> area

and  $\because$  one machine of type B occupies 1200 m<sup>2</sup> area

$\therefore y$  machines of type B occupy  $1200y$  m<sup>2</sup> area

Available area is 9000 m<sup>2</sup>

$$\therefore 1000x + 1200y \leq 9000.$$

**Constraint (ii)**

$\because$  one machine of type A can be operated by 12 men

$\therefore x$  machines of type A can be operated by  $12x$  men

and  $\because$  one machine of type B can be operated by 8 men

$\therefore y$  machines of type B can be operated by  $8y$  men

Total available labourers = 72.

$$\therefore 12x + 8y \leq 72.$$

**Constraint (iii).** Number of machines cannot be negative.

$$\therefore x \geq 0 \text{ and } y \geq 0$$

#### 4. Mathematical Formulation

Thus the given L.P.P. is

$$\text{Maximize } Z = 60x + 40y$$

$$\text{Subject to } 1000x + 1200y \leq 9000$$

$$12x + 8y \leq 72$$

$$x \geq 0 \text{ and } y \geq 0$$

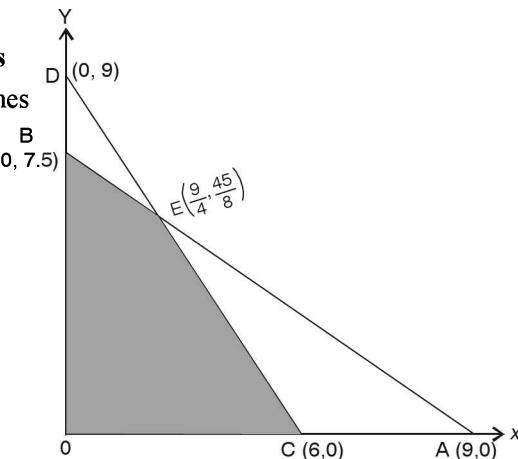

#### 5. Region Represented by the inequations

To solve this L.P.P. we draw the lines

$$1000x + 1200y = 9000. \quad \dots (1)$$

$$12x + 8y = 72 \quad \dots (2)$$

$x$	9	0
$y$	0	7.5
Points	$A$	$B$
$x$	6	0
$y$	0	9
Points	$C$	$D$

The feasible region of the L.P.P. is shaded in the adjoining figure.

#### 6. Corner Point Method

On solving (1) and (2), we get the coordinates of  $E\left(\frac{9}{4}, \frac{45}{8}\right)$ .

The coordinates of corner points are  $C(6, 0)$ ,  $D(0, 7.5)$  and  $E\left(\frac{9}{4}, \frac{45}{8}\right)$ .

Now we evaluate  $Z = 60x + 40y$  at the corner points.

Corner point of the feasible region	Corresponding value of $Z = 60x + 40y$
$C(6, 0)$	$Z = 60(6) + 0 = 360$
$D(0, 7.5)$	$Z = 60(0) + 40(7.5) = 300$
$E\left(\frac{9}{4}, \frac{45}{8}\right)$	$Z = 60\left(\frac{9}{4}\right) + 40\left(\frac{45}{8}\right) = 360$

Hence,  $Z = 360$  is maximum when  $x = 6, y = 0$  or  $x = \frac{9}{4}, y = \frac{45}{8}$ .

**Ans.**

**Example 16.** A dealer wishes to purchase a number of fans and sewing machines. He has only Rs. 5,760 to invest and has space for at most 20 items. A fan and sewing machine cost Rs. 360 and Rs. 240 respectively. He can sell a fan at a profit of Rs. 22 and sewing machine at a profit of Rs. 18. Assuming that he can sell whatever he buys, how should he invest his money in order to maximise his profit ? Translate the problem into LPP and solve it graphically.

**Solution.** The above information are given in the following table :

**1. Table**

Items	Cost (in Rs.)	Profit (in Rs.)	Space for total number of Items
Fan	360	22	
Sewing machine	240	18	
Total	5,760		20

**2. Decision Variables.** Let  $x$  and  $y$  be respectively the number of fans and sewing machines purchased.

**3. Objective function.** To maximize the profit

$$Z = 22x + 18y$$

**4. Constraint (i).** The available space is for at most 20 items.

$$\therefore x + y \leq 20$$

**Constraint (ii).** At most investments is Rs. 5,760.

$$\therefore 360x + 240y \leq 5,760 \Rightarrow 3x + 2y \leq 48$$

**Constraint (iii).** The number of fans and sewing machines are non-negative.

$$\therefore x \geq 0 \text{ and } y \geq 0.$$

**5. Mathematical formulation.**

$$\text{Maximize } Z = 22x + 18y \quad \dots (1)$$

Subject to the constraints

$$x + y \leq 20 \quad \dots (2)$$

$$3x + 2y \leq 48 \quad \dots (3)$$

$$x \geq 0, y \geq 0 \quad \dots (4)$$

**6. Region represented by  $x + y \leq 20$  and  $3x + 2y \leq 48$**

$$x + y = 20$$

$$3x + 2y \leq 48$$

$x$	20	0
$y$	0	20
Point	A	B

$x$	16	0
$y$	0	24
Point	C	D

**7. Corner Point Method**

The feasible region,  $OCEBO$ , is shaded. Here  $C(16, 0)$ ,  $E(8, 12)$  and  $B(0, 20)$  are the corner points.

Now the value of  $Z = 22x + 18y$ .

Corner point  $(x, y)$       Value of the objective  
of the feasible region      function  $Z = 22x + 18y$

$OCEBO$

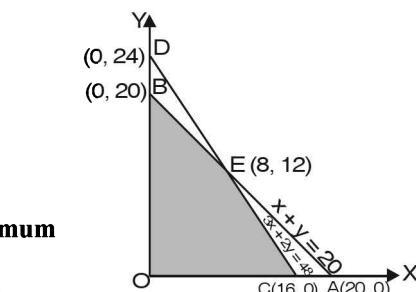

$$C(16, 0) \quad 22(16) + 18(0) = 352$$

$$E(8, 12) \quad 22(8) + 18(12) = 392 \text{ Maximum}$$

$$B(0, 20) \quad 22(0) + 18(20) = 360$$

Thus the profit will be maximum, when 8 fans and 12 sewing machines are purchased and sold.

Also the maximum profit = Rs. 392.

Ans.

**Example 17.** Anil wants to invest at most Rs. 12,000 in Bonds A and B. According to the rules, he has to invest at least Rs. 2,000 in Bond A and at least Rs. 4,000 in Bond B. If the rate of interest on Bond A is 8% per annum and on Bond B is 10% per annum, how should he invest his money for maximum interest? Solve the problem graphically.

**Solution.** The above information are given in the following table:

**1. Table**

Bonds	Interest	Investment in Rs.
A	8%	At least 2,000
B	10%	At least 4,000
Total		12,000

**2. Decision Variables.** Let Anil invest Rs.  $x$  (more than Rs. 2,000) on bond A.

Let Anil invest Rs.  $y$  (more than Rs. 4,000) on bond B.

**3. Objective function.** To maximise the total interest

$$Z = \frac{8x}{100} + \frac{10y}{100}$$

$$\Rightarrow Z = \frac{1}{50}(4x + 5y)$$

**4. Constraint (i).** Total investment = 12,000

$$x + y \leq 12,000$$

**Constraint (ii).** Investment on Bond A = Minimum Rs. 2,000

$$x \geq 2,000$$

**Constraint (iii).** Investment on Bond B = Minimum Rs. 4,000.

$$y \geq 4,000$$

**5. Mathematical formulation**

$$\text{To maximise } Z = \frac{1}{50}(4x + 5y) \quad \dots (1)$$

Subject to the constraints

$$x + y \leq 12,000 \quad \dots (2)$$

$$x \geq 2,000 \quad \dots (3)$$

$$y \geq 4,000 \quad \dots (4)$$

**6. Region represented by**

$$x + y = 12,000$$

$x = 2,000$  is represented by the line  $CD$ .

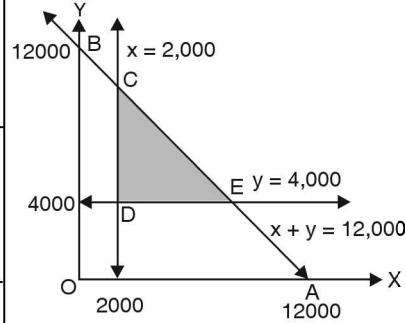

$y = 4,000$  is represented by the line  $DE$ .

$x$	12,000	0
$y$	0	12,000
Points	$A$	$B$

**7. Corner Point Method**

The shaded bounded region  $CDEC$  is the feasible region of the given L.P.P., where the vertices are  $C(2,000; 10,000)$ ,  $D(2,000; 4,000)$  and  $E(8,000; 4,000)$ .

Corner points of the feasible region CDE	Value of the objective function $Z = \frac{1}{50}(4x + 5y)$
C (2,000; 10,000)	$\frac{1}{50}(4 \times 2,000 + 5 \times 10,000) = 1,160$
D (2,000; 4,000)	$\frac{1}{50}(4 \times 2,000 + 5 \times 4,000) = 560$
E (8,000; 4,000)	$\frac{1}{50}(4 \times 8,000 + 5 \times 4,000) = 1,040$

∴ For earning maximum interest (Rs. 1,160), Anil should invest Rs. 2,000 in Bonds A and Rs. 10,000 in Bonds B.

**Ans.**

### Type II. To minimize the objective function (Z)

**Example 18.** There are two types of fertilisers  $F_1$  and  $F_2$ .  $F_1$  consists of 10% nitrogen and 6% phosphoric acid and  $F_2$  consists of 5% nitrogen and 10% phosphoric acid. After testing the soil conditions, a farmer finds that she needs atleast 14 kg. of nitrogen and 14 kg of phosphoric acid for her crop. If  $F_1$  costs Rs. 6/kg and  $F_2$  costs Rs. 5/kg, determine how much of each type of fertilizer should be used so that nutrient requirements are met at a minimum cost. What is the minimum cost?

**Solution.** The above information are given in the table given below :

#### 1. Table.

Fertilisers	Nitrogen	Phosphoric acid	Cost per kg (in Rs.)
$F_1$	10 %	6 %	6
$F_2$	5 %	10 %	5
Mixture	14 kg	14 kg	

#### 2. Decision Variables.

Let the fertiliser  $F_1$  in the mixture be  $x$  kg.

Let the fertiliser  $F_2$  in the mixture be  $y$  kg.

#### 3. Objective function.

To minimise the cost of the mixture of fertilisers  $F_1$  and  $F_2$ .

$$Z = 6x + 5y$$

#### 4. Constraint (i). Minimum requirement of Nitrogen = 14 kg

$$\frac{10}{100}x + \frac{5}{100}y \geq 14 \quad \Rightarrow \quad 2x + y \geq 280$$

#### Constraint (ii). Minimum requirement of phosphoric acid = 14 kg

$$\frac{6}{100}x + \frac{10}{100}y \geq 14 \quad \Rightarrow \quad 3x + 5y \geq 700$$

#### Constraint (iii). Number of kg of fertiliser $F_1$ and $F_2$ be non-negative.

$$x \geq 0 \text{ and } y \geq 0.$$

#### 5. Mathematical Formulation.

To minimise  $Z = 6x + 5y$

Subject to the constraints

$$2x + y \geq 280$$

$$3x + 5y \geq 700$$

$$x \geq 0, \quad y \geq 0.$$

**6. Region represented by  $2x + y \geq 280$ , and  $3x + y \geq 700$**

$$2x + y = 280$$

$$3x + y = 700$$

$x$	140	0
$y$	0	280
Points	$A$	$B$

$x$	$\frac{700}{3}$	0
$y$	0	140
Points	$C$	$D$

### 7. Corner Point Method.

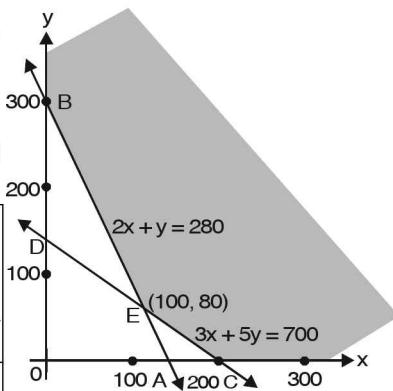

The feasible solution is the shaded portion.

The vertices of the feasible solution are  $B(0, 280)$ ,

$$E(100, 80) \text{ and } C\left(\frac{700}{3}, 0\right)$$

Let us calculate the value of  $Z$  at these corner points  $B, E$  and  $C$ .

Corner point $(x, y)$ of the feasible region	Value of the objective function $Z = 6x + 5y$
$B(0, 280)$	$6 \times 0 + 5 \times 280 = 1400$
$E(100, 80)$	$6 \times 100 + 5 \times 80 = 1000$
$C\left(\frac{700}{3}, 0\right)$	$6 \times \frac{700}{3} + 5 \times 0 = 1400$

The minimum cost of the mixture of fertilisers  $F_1$  and  $F_2$  is Rs. 1000 if 100 kg of the fertiliser  $F_1$  and 80 kg of fertiliser  $F_2$  are mixed. Ans.

**Example 19.** A diet is to contain at least 80 units of vitamin A and 100 units of minerals. Two foods  $F_1$  and  $F_2$  are available. Food  $F_1$  costs Rs. 4 per unit and food  $F_2$  costs Rs. 6 per unit. A unit of food  $F_1$  contains at least 3 units of vitamin A and 4 units of minerals. A unit of food  $F_2$  contains at least 6 units of vitamin A and 3 units of minerals. Formulate this as a linear programming problem. Find the minimum cost for diet that consists of mixture of these two foods and also meets the minimal nutritional requirements.

**Solution.** The above information are given in the table below:

#### 1. Table.

Food	Vitamin A	Mineral (In units)	Cost per unit (in Rs.)
$F_1$	At least 3 units	4	4
$F_2$	At least 6 units	3	6
Diet	At least 80 units	100	

**2. Decision Variables.** Let  $x$  units of food  $F_1$  and  $y$  units of food  $F_2$  be mixed in the diet.

**3. Objective function.** To minimise the cost of the diet.  $Z = 4x + 6y$

**4. Constraint (i).** Diet should contain at least 80 units of vitamin A.  $3x + 6y \geq 80$

**Constraint (ii).** Diet should contain at least 100 units of minerals  $4x + 3y \geq 100$

**Constraint (iii).** Number of units of food  $F_1$  and  $F_2$  are non-negative  $x \geq 0$  and  $y \geq 0$ .

**5. Region represented by  $3x + 6y \geq 80$  and  $4x + 3y \geq 100$ .**

$$3x + 6y = 80$$

$x$	$\frac{80}{3}$	0
$y$	0	$\frac{40}{3}$
Points	$A$	$B$

$$4x + 3y = 100$$

$x$	25	0
$y$	0	$\frac{100}{3}$
Points	$C$	$D$

### 7. Corner Point Method

The feasible region is the shaded portion.

The corner points are  $A\left(\frac{80}{3}, 0\right)$

$E\left(24, \frac{4}{3}\right)$  and  $D(0, 30)$ .

Corner points of the feasible region	Value of the objective function $Z = 4x + 6y$
$A\left(\frac{80}{3}, 0\right)$	$4 \times \frac{80}{3} + 6 \times 0 = \frac{320}{3}$
$E\left(24, \frac{4}{3}\right)$	$4 \times \frac{24}{3} + 6 \times \frac{4}{3} = 40$
$D(0, 30)$	$4 \times 0 + 6 \times 30 = 180$

$Z$  is minimum for  $x = 24$  and  $y = \frac{4}{3}$ .

The least cost of the mixture is Rs. 40 per unit.

Ans.

**Example 20.** A dietitian wishes to mix together two kinds of food  $X$  and  $Y$  in such a way that the mixture contains atleast 10 units of vitamin A, 12 units of vitamin B and 8 units of vitamin C. The vitamin contents of one kg. food is given below:

Food	Vitamin A	Vitamin B	Vitamin C	Cost per kg.
$X$	1	2	3	16
$Y$	2	2	1	20
Mixture	10	12	8	

One kg. of food  $X$  costs Rs. 16 and one kg. of food  $Y$  costs Rs. 20. Find the least cost of the mixture which will produce the required diet?

**Solution.**

#### 1. Decision variables.

Let  $x$  kg. of food  $X$  and  $y$  kg of food  $Y$  are mixed together to make the mixture.

#### 2. Objective function.

It is given that one kg. of food  $X$  costs Rs. 16 and one kg. of food  $Y$  cost Rs. 20. So,  $x$  kg. of food  $X$  and  $y$  kg of food  $Y$  will cost Rs.  $(16x + 20y)$ .

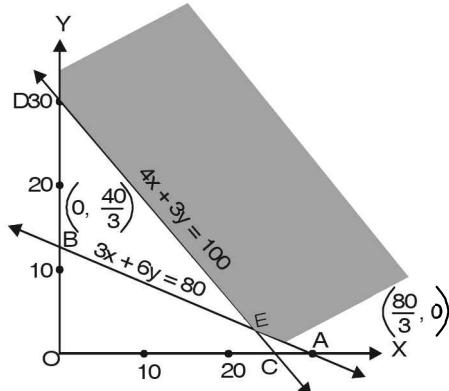

$$\Rightarrow Z = 16x + 20y$$

#### 3. Constraint (i) Since one kg. of food $X$ contains one unit of vitamin A

$\therefore x$  kg. of food  $X$  contains  $x$  units of vitamin A

Since one kg. of food  $Y$  contains 2 units of vitamin A

$\therefore y$  kg. of food  $Y$  contains  $2y$  units of vitamin A

Therefore, the mixture contains  $x + 2y$  units of vitamin A. But the mixture should contain at least 10 units of vitamin A.

$$\therefore x + 2y \geq 10$$

**Constraint (ii).**

Similarly, the mixture of  $x$  kg. of food X and  $Y$  kg. of food Y contains  $(2x + 2y)$  units of vitamin B.

But the mixture should contain at least 12 units of vitamin B.

$$\therefore 2x + 2y \geq 12$$

**Constraint (iii).**

$x$  kg. of food X and  $y$  kg. of food Y contains  $3x + y$  units of vitamin C.

But the mixture should contain at least 8 units of vitamin C.

$$\therefore 3x + y \geq 8.$$

**Constraint (iv).**

Since the quantity of food X and food Y can not be negative:

$$x \geq 0 \quad \text{and} \quad y \geq 0.$$

**4. Mathematical Formulation.**

Thus the given L.P.P. is

$$\text{Minimize} \quad Z = 16x + 20y \quad \dots(1)$$

$$\text{Subject to} \quad x + 2y \geq 10 \quad \dots(2)$$

$$2x + 2y \geq 12 \quad \dots(3)$$

$$3x + y \geq 8 \quad \dots(4)$$

$$\text{and} \quad x \geq 0, \quad y \geq 0 \quad \dots(5)$$

**5. Region Represented by the inequations.**

To solve this L.P.P. we draw the lines

$$x + 2y = 10$$

$$2x + 2y = 12$$

$$\text{and} \quad 3x + y = 8$$

$x$	10	0
$y$	0	5
Points	A	B

$x$	6	0
$y$	0	6
Points	C	D

$x$	$\frac{8}{3}$	0
$y$	0	8
Points	E	F

The feasible region of the L.P.P. is shaded in the adjoining figure.

**6. Corner Point Method**

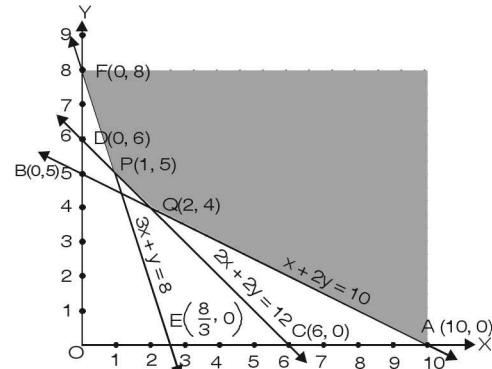

The coordinates of the corner points are  $A(10, 0)$ ,  $Q(2, 4)$ ,  $P(1, 5)$  and  $F(0, 8)$ .

Now, we evaluate  $Z = 16x + 20y$  at the corner points.

Corner points of the feasible region	Corresponding values of $Z = 16x + 20y$
$A(10, 0)$	$Z = 16(10) + 20(0) = 160$
$Q(2, 4)$	$Z = 16(2) + 20(4) = 112$
$P(1, 5)$	$Z = 16(1) + 20(5) = 116$
$F(0, 8)$	$Z = 16(0) + 20(8) = 160$

The minimum value of  $Z = 112$  at the point  $x = 2, y = 4$ .

Hence, the least cost of the mixture is Rs. 112.

**Ans.**

### TYPE III. TRANSPORTATION PROBLEMS

**Example 21.** An oil company has two depots A and B with capacities of 7000 l and 4000 l respectively. The company is to supply oil to three petrol pumps, D, E and F, whose requirements are 4500 l, 3000 l and 3500 l respectively. The distances (in km) between the depots and the petrol pumps is given in the following table:

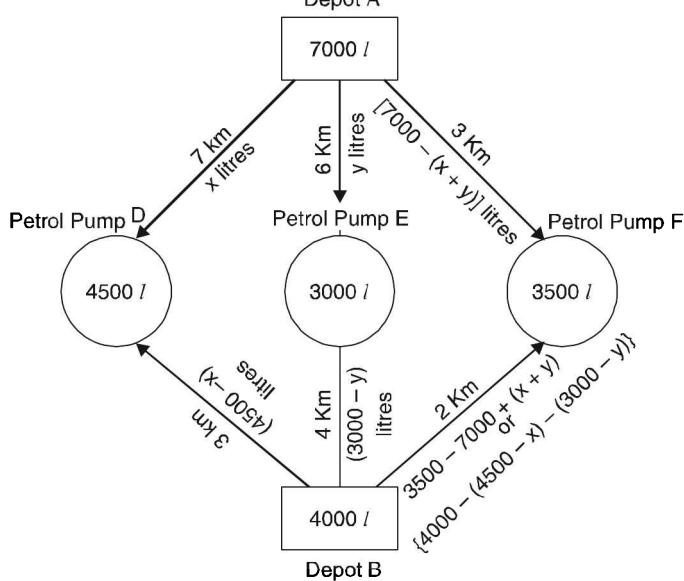

Distance in (km.)

From/To	A	B
D	7	3
E	6	4
F	3	2

Assuming that the transportation cost of 10 litres of oil is Re. 1 per km, how should the delivery be scheduled in order that the transportation cost is minimum? What is the minimum cost?

**Solution.** The given information can be exhibited diagrammatically as follows:

1. **Table.**

2. **Decision Variables.**

Decision variables are the litres of oil to be supplied from depots to the petrol pumps.

Let Depot A supplies  $x$  litres of oil to petrol pump D and  $y$  litres of oil to petrol pump E and  $[7000 - (x + y)]$  litres of oil to petrol pump F.

**Constraint (i).**  $7000 - (x + y) \geq 0 \Rightarrow x + y \leq 7000$

$$x \geq 0, y \geq 0$$

**Constraint (ii)** The remaining requirement  $(4500 - x)$  litres of oil is supplied from the depot B to the petrol pump D,  $(3000 - y)$  litres of oil to petrol pump E and  $4000 - [(4500 - x) + (3000 - y)]$  litres of oil to petrol pump F.

$$4500 - x \geq 0 \Rightarrow x \leq 4500$$

$$3000 - y \geq 0 \Rightarrow y \leq 3000$$

$$4000 - 4500 + x - 3000 + y \geq 0 \Rightarrow x + y \geq 3500$$

### 3. Objective function.

The transportation cost from depot  $A$  to the petrol pump  $D, E$  and  $F$  is Rs.  $\frac{x}{10}$ , Rs.  $\frac{6y}{10}$

and Rs.  $\frac{3}{10}(7000 - x - y)$ .

Similarly, the transportation cost from depot  $B$  to petrol pump  $D, E$  and  $F$  is  
Rs.  $\frac{3}{10}(4500 - x)$ , Rs.  $\frac{4}{10}(3000 - y)$  and Rs.  $\frac{2}{10}[x + y - 3500]$ .

So, the total cost of transportation =  $Z$

$$\begin{aligned} \Rightarrow Z &= \text{Rs.} \left( \frac{7x}{10} + \frac{6y}{10} + \frac{3}{10}(7000 - x - y) + \frac{3}{10}(4500 - x) + \frac{4}{10}(3000 - y) + \frac{2}{10}(x + y - 3500) \right) \\ \Rightarrow Z &= \left( \frac{7}{10} - \frac{3}{10} - \frac{3}{10} + \frac{2}{10} \right)x + \left( \frac{6}{10} - \frac{3}{10} - \frac{4}{10} + \frac{2}{10} \right)y + 2100 + 1350 + 1200 - 700 \\ &= \text{Rs.} \left( \frac{3}{10}x + \frac{1}{10}y + 3950 \right) \end{aligned}$$

### 4. Mathematical formulation.

$$\text{Minimize } Z = \frac{3}{10}x + \frac{1}{10}y + 3950 \quad \dots(1)$$

Subject to constraints

$$x + y \leq 7000 \quad \dots(2)$$

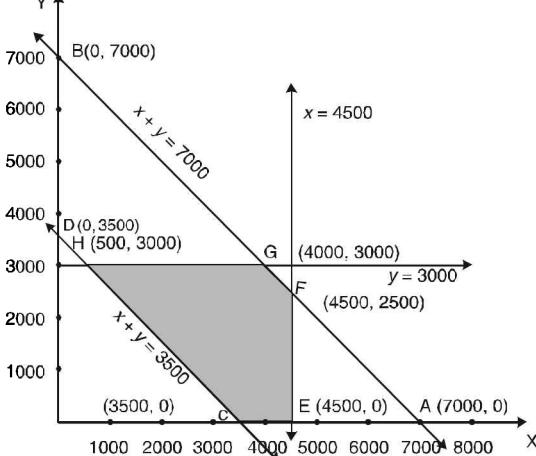

$$x + y \geq 3500 \quad \dots(3)$$

$$x \leq 4500 \quad \dots(4)$$

$$y \leq 3000 \quad \dots(5)$$

$$x \geq 0 \quad \dots(6)$$

$$y \geq 0 \quad \dots(7)$$

### 5. Region represented by the inequations.

$$x + y = 7000$$

$x$	7000	0
$y$	0	7000
Point	$A$	$B$

$$x + y = 3500$$

$x$	3500	0
$y$	0	3500
Point	$C$	$D$

The shaded region  $C E F G H C$  represented by the inequations (2) to (7).

### 6. Corner Point method.

The coordinates of the vertices  $C, E, F, G, H$  and  $C$  of the feasible region  $CEFGHC$  are  $C(3500, 0), E(4500, 0), F(4500, 2500), G(4000, 3000)$  and  $H(500, 3000)$  respectively.

The coordinates of  $F$  are obtained by solving  $x + y = 7000$  and  $x = 4500$ , coordinates of  $G$  are obtained by solving  $x + y = 7000$  and  $y = 3000$ , the coordinates of  $H$  are obtained by solving  $x + y = 3500$  and  $y = 3000$ . The value of the objective function at these points are given in the following table.

Corner points $(x, y)$ of the feasible region C E F G H C	Value of the objective function $Z = \frac{3}{10}x + \frac{1}{10}y + 3950$
C (3500, 0)	$\frac{3}{10}(3500) + \frac{1}{10}(0) + 3950 = 5000$
E (4500, 0)	$\frac{3}{10}(4500) + \frac{1}{10}(0) + 3950 = 5300$
F (4500, 2500)	$\frac{3}{10}(4500) + \frac{1}{10}(2500) + 3950 = 5550$
G (4000, 3000)	$\frac{3}{10}(4000) + \frac{1}{10}(3000) + 3950 = 5450$
H (500, 3000)	$\frac{3}{10}(500) + \frac{1}{10}(3000) + 3950 = 4400$

Hence,  $Z$  is minimum when  $x = 500$  and  $y = 3000$ ; and the minimum value of  $Z$  is 4400. Ans.

**Example 22.** Two godowns A and B have grain capacity of 100 quintals and 50 quintals respectively. They supply to 3 ration shops, D, E and F, whose requirements are 60, 50 and 40 quintals respectively. The cost of transportation per quintal from the godowns to the shops are given in the following table:

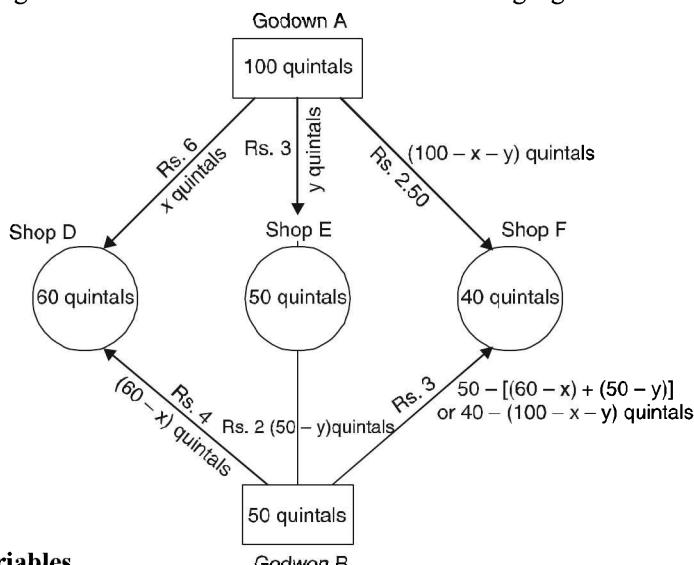

Transportation cost per quintal (in Rs.)

From/To	A	B
D	6	4
E	3	2
F	2.50	3

How should the supplies be transported in order that the transportation cost is minimum. What is the minimum cost ?

**Solution.** The given informations are shown in the following figure:

### 1. Figure

### 2. Decision variables.

Let the godown A transports  $x$  quintals grains to shop D and  $y$  quintals of grain to shop E, so the remaining quintals of grain at A,  $100 - (x + y)$  quintals will be transported to the shop F etc.

**3. Constraint (i).**

$$\begin{aligned} 100 - (x - y) &\geq 0 & \Rightarrow & \quad x + y \leq 100 \\ x &\geq 0 & & \\ y &\geq 0 . & & \end{aligned}$$

**Constraint (ii).** The remaining requirements  $(60 - x)$ ,  $(50 - y)$ , and  $\{40 - (100 - x - y)\}$  quintals are to be transported from the godown  $B$  to the shops  $D$ ,  $E$  and  $F$  respectively.

$$\begin{aligned} 60 - x &\geq 0 & \Rightarrow & \quad x \leq 60 \\ 50 - y &\geq 0 & \Rightarrow & \quad y \leq 50 \\ 40 - (100 - x - y) &\geq 0 & \Rightarrow & \quad x + y - 60 \geq 0 \\ \text{or} & \quad x + y \geq 60 & & \end{aligned}$$

**4. Objective function.**

Cost of transportation from Godown  $A$  to shops  $D$ ,  $E$  and  $F$  are Rs.  $6x$ , Rs.  $3y$  and Rs.  $2.5(100 - x - y)$ . Similarly the cost of transportation from Godown  $B$  to shops  $D$ ,  $E$  and  $F$  are Rs.  $4(60 - x)$ , Rs.  $2(50 - y)$  and Rs.  $3[40 - (100 - x - y)]$  respectively.

So total cost of transportation =  $Z$

$$\begin{aligned} Z &= \text{Rs. } [6x + 3y + 2.5(100 - x - y) + 4(60 - x) + 2(50 - y) + 3(-60 + x + y)] \\ &= [(6 - 2.5 - 4 + 3)x + (3 - 2.5 - 2 + 3)y + 250 + 240 + 100 - 180] \\ &= 2.5x + 1.5y + 410 \end{aligned}$$

**5. Mathematical Formulation**

To minimize  $Z = 2.5x + 1.5y + 410$   
 $x + y \leq 100$  ... (1)

and

$$x \geq 0 \quad \dots (2)$$

$$y \geq 0 \quad \dots (3)$$

$$x + y \geq 60 \quad \dots (4)$$

and  $x \leq 60$  ... (5)

and  $y \leq 50$  ... (6)

**6. (i) Region represented by  $x + y \leq 100$** 

$$x + y = 100$$

$x$	100	0
$y$	0	100
Points	$A$	$B$

On joining  $A$  and  $B$  we get the graph of the line  $x + y = 100$ . Since,  $(0, 0)$  satisfies the inequation  $0 + 0 \leq 100$ . So, the half plane containing origin represents the region of the inequation  $x + y \leq 100$ .

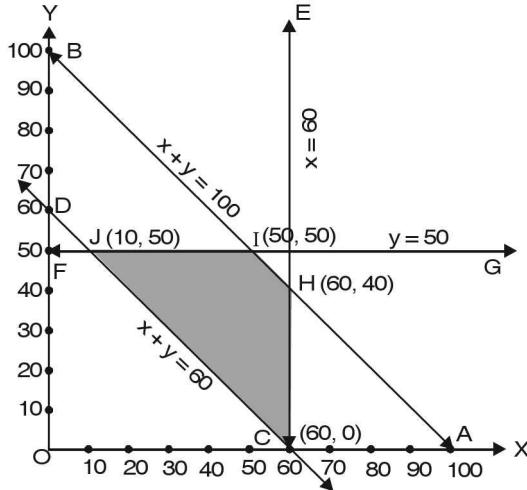

**(ii) Region represented by  $x + y \geq 60$ .**

$$x + y = 60$$

$x$	60	0
$y$	0	60
Points	$C$	$D$

On joining the points  $C(60, 0)$  and  $D(0, 60)$ , we get the graph of the line represented by  $x + y = 60$ . Since,  $(0, 0)$  does not satisfy  $x + y \geq 60$ . So, the half plane not containing origin represents the region of  $x + y \geq 60$ .

- (iii) Region represented by  $x \geq 0$  and  $y \geq 0$  is the first quadrant.  
(iv) Region represented by  $x \leq 60$  is the half plane containing the origin.  
(v) Region represented by  $y \leq 50$  is the half plane containing origin.

### 7. Corner point Method

The feasible region is the shaded portion  $CHIJC$ . Its vertices are  $C(60, 0)$ ,  $H(60, 40)$ ,  $I(50, 50)$  and  $J(10, 50)$ .

The coordinates of  $H$  are calculated by solving the equations  $x + y = 100$  and  $x = 60$ .

The coordinates of  $I$  are calculated by solving the equations  $x + y = 100$  and  $y = 50$ .

The coordinates of  $J$  are calculated by solving the equations  $x + y = 60$  and  $y = 50$ .

The values of the objective function at the corner points are given in the following table.

Corner point $(x, y)$ of the feasible region	Value of the objective function at the corner points in Rs. $Z = 2.5x + 1.5y + 410$
$C(60, 0)$	$2.5(60) + 1.5(0) + 410 = 560$
$H(60, 40)$	$2.5(60) + 1.5(40) + 410 = 620$
$I(50, 50)$	$2.5(50) + 1.5(50) + 410 = 610$
$J(10, 50)$	$2.5(10) + 1.5(50) + 410 = 510$

Hence,  $Z$  is minimum when  $x = 10$  and  $y = 50$ , the minimum cost of transportation in Rs. 510.

### EXERCISE 56.3

- A manufacturer produces two items X and Y. X needs two hours on machine A and two hours on machine B. Y needs 3 hours on machine A and 1 hour on machine B. If machine A can run for a maximum of 12 hours per day and machine B for 8 hours per day and profits from X and Y are Rs. 4 and Rs. 5 per items respectively. Formulate the problem as a linear programming problem and solve it graphically.

**Ans.** Maximum profit = Rs. 22; Number of items X = 3; Number of items Y = 2

- An aeroplane can carry a maximum of 200 passengers. A profit of Rs. 400 is made on each first class ticket and a profit of Rs. 300 is made on each economy class ticket. The airline reserves at least 20 seats for first class. However, at least 4 times as many passengers prefer to travel by economy class to the first class. Determine how many each type of tickets must be sold in order to maximize the profit for the airline. What is the maximum profit ?

**Ans.** Maximum profit = Rs. 64000, First class tickets = 40. Economy class tickets = 160.

3. A manufacturer is trying to decide on the product quantities of two products-tables and chairs. There are 98 units of material and 80 labour-hours available. Each table requires 7 units of material and 10 labour-hours, while each chair requires 14 units of material and 8 labour-hours per chair. The profit on a table and a chair is Rs. 25 and Rs. 20, respectively. How many tables and chairs should be produced to have maximum profit?

(Hint: Use Iso-profit method).

**Ans.** Maximum profit = Rs. 200, Tables = 8, chairs = 0 or Tables = 4, chairs = 5.

4. A man owns a field of area 1000 sq. metre. He wants to plant trees in it. He has a sum of Rs. 1400 to purchase young trees. He has the choice of two types of trees. Type A requires 10 sq. metre of ground per tree and costs Rs. 20 per tree and type B requires 20 sq. metre of ground per tree and costs Rs. 25 per tree. When fully grown, type A produces an average of 20 kg. of fruits which can be sold at a profit of Rs. 2 per kg. and type B produces an average of 40 kg of fruits which can be sold at a profit of Rs. 1.50 per kg. How many trees of each type should be planted to achieve maximum profit when the trees are fully grown? What is the maximum profit ?

**Ans.** Maximum profit = Rs. 32,00, Type A = 20. Type B = 40.

5. A farm is engaged in breeding goats. The goats are fed on various products grown on the farm. They need certain nutrients, named as X, Y and Z. The goats are fed on two products A and B. One unit of product A contains 36 units of X, 3 units of Y and 20 units of Z, while one unit of product B contains 6 units of X, 12 units of Y and 10 units of Z. The minimum requirement of X, Y and Z is 108 units, 36 units and 100 units respectively. Product A costs Rs. 20 per unit and product B costs Rs. 40 per unit. How many units of each product must be taken to minimize the cost?

**Ans.** Minimum cost = Rs. 160, Product A = 4 units, Product B = 2 units.

6. A company producing soft drinks has a contract which requires that a minimum of 80 units of chemical A and 60 units of chemical B are to go in each bottle of the drink. The chemicals are available in a prepared mix from two different suppliers. Supplier X has a mix of 4 units of A and 2 units of B that costs Rs. 10 and the supplier Y has a mix of 1 unit of A and 1 unit of B that costs Rs. 4. How many mixes from X and Y should the company purchase to honour contract requirement and yet minimize the cost?

**Ans.** Minimum cost = Rs. 260. Mix of type A = 10 units, Mix of type B = 40 units.

7. To maintain one's health, a person must fulfil minimum daily requirements for the following three nutrients-calcium, protein and calories. His diet consists of only food items I and II whose prices and nutrient contents are shown below:

Price	Food I Rs. 0.60 per unit	Food II Re. 1 per unit	Minimum requirements
Calcium	10	4	20
Protein	5	5	20
Calories	2	6	12

Find the combination of food items so that the cost may be minimum.

**Ans.** Minimum cost = Rs. 2.80, Food I = 3 units, Food II = 1 unit.

8. A diet for a sick person must contain at least 4000 units of vitamin, 50 units of minerals and 1400 units of calories. Two foods A and B are available at a cost of Rs. 4 and Rs. 3 per unit respectively. If one unit of A contains 200 units of vitamin, 1 unit of mineral and 40 units of calories; one unit of food B contains 100 units of vitamin, 2 units of minerals and 40 units of calories, find what combination of foods should be used to have the least cost?

**Ans.** Minimum cost = Rs. 110, Food A = 5 units, Food B = 30 units.

9. Two godowns A and B have grain storage capacity of 100 quintals and 50 quintals respectively. They supply to three ration shope D, E and F whose requirements are 60, 50 and 40 quintals respectively. The cost of transportation per quital from the godown to the shope are given in the following table:

		<i>From</i>	<i>Godown A</i>	<i>Godown B</i>
<i>To</i>				
D			6.00	4.00
E			3.00	2.00
F			2.50	3.00

How should the supplies we transported in order that the transportation cost is minimum.

**Ans.** From A : 10 quintals, 50 quintals and 40 quintals to D, E and F respectively  
From B : 50 quintals, 0 quintal and 0 quintal to D, E and F respectively.

10. There is a factory located at each of the two places *P* and *Q*. From these locations, a certain commodity is delivered to each of these depots situated at *A*, *B* and *C*. The weekly requirements of the depots are respectively 5, 5 and 4 units of the commodity while the production capacity of the factories at *P* and *Q* are respectively 8 and 6 units. The cost of transportation per unit is given below:

		<i>To</i>	<i>Cost (in Rs.)</i>		
<i>From</i>			<i>A</i>	<i>B</i>	<i>C</i>
<i>P</i>			16	10	15
<i>Q</i>			10	12	10

How many units should be transported from each factory to each depot in order that the transportation cost is minimum. Formulate the above L.P.P mathematically and then solve it.

**Ans.** Minimum cost = Rs. 155,  
From *P* : 0, 5, 3 units to depots at *A*, *B*, *C* respectively  
From *Q* : 5, 0 and 1 units to depots at *A*, *B* and *C* respectively.

11. A brick manufacturer has two depots, *A* and *B* with stock of 30,000 and 20,000 bricks respectively. He receives orders from three builders *P*, *Q* and *R* for 15,000; 20,000 and 15,000 bricks respectively the cost in Rs. transporting 1000 bricks to the builders from the depots are given below:

		<i>From</i>	<i>P</i>	<i>Q</i>	<i>R</i>
<i>To</i>					
<i>A</i>			40	20	30
<i>B</i>			20	60	40

How should the manufacturer fulfill the orders so as to keep the cost of transportation minimum.

**Ans.** Minimum cost = Rs. 1200  
From *A* : 0, 20 and 10 thousand bricks to builders *P*, *Q* and *R*.  
From *B* : 15, 0 and 5 thousand bricks to builders *P*, *Q* and *R*.

12. A publisher sells a hard cover edition of a textbook for Rs. 72.00 and a paper back edition of the same text for Rs. 40.00. Costs to the publisher are Rs. 56.00 and Rs. 28.00 per book respectively in addition to weekly costs of Rs. 9600.00. Both types require 5 minutes of printing time, although hard cover requires 10 minutes binding time and the paper back requires only 2 minutes both the printing and binding operations have 4,800 minutes available each week. How many of each type of Book should be produced in order to maximize profit?

**Ans.** Max. profit = Rs. 2880, 360 hard cover edition, 600 paper back edition

## 56.9 THEORY OF SIMPLEX METHOD

The basis of the complex method consists of two fundamental conditions :-

- (i) The feasibility condition

It ensures that the starting solution is basic feasible, only basic feasible solution will be obtained during computation.

## (ii) Optimality condition

It guarantees only better solution (as compared to the current solution)

**SOME IMPORTANT DEFINITIONS**

Consider the following problem

$$\text{Maximize } Z = c_1x_1 + c_2x_2 + \dots + c_nx_n,$$

$$\begin{aligned} \text{Subject to } & a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n \leq b_1, \\ & a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n \leq b_2, \end{aligned}$$

Objective function

Constraints

$$a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n \leq b_m,$$

$$\text{where } x_1, x_2, \dots, x_n \geq 0.$$

Introducing slack variable  $s, s_1, s_2, s_3, \dots, s_m$  in  $m$  constraint equations. It can be put in the following standard form:

$$\text{Maximize } z = c_1x_1 + c_2x_2 + \dots + c_nx_n + s_1 + s_2 + \dots + s_m. \quad \dots(1)$$

$$\begin{aligned} \text{Subject to } & a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n + s_1 = b_1 \\ & a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n + s_2 = b_2 \end{aligned} \quad \dots(2)$$

$$a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n + s_m = b_m$$

$$\text{where } x_1, x_2, \dots, x_n, s_1, s_2, \dots, s_m \geq 0 \quad \dots(3)$$

1. **Solution :** To find out the values of  $x_1, x_2, \dots, x_n, s_1, \dots, s_m$ .
2. **Feasible solution :** The values of  $x_1, x_2, \dots, x_n, s_1, \dots, s_m$  is known as feasible solution if these values satisfy the equations (2) and (3)
3. **Basic solution :** By making any  $n$  variables out of  $n + m$  equal to zero, the values of the remaining  $m$  variable is called the basic solution, if the determinant of the coefficients of these slack variables is non negative.
4. **Basic variables :** The variables of the basic solution are called basic variables (Some of them may be zero). The other  $n$  variables are called non-basic variables.
5. **Basic feasible solution :** The basic solution of non-negative variable is called basic feasible solution.
6. **Non-degenerate basic feasible solution :** If all  $m$  basic feasible variables non-negative, then the set of these variables known as non degenerate basic feasible solution.
7. **Degenerate basic feasible solution :** If one or more basic feasible variable is zero, then the solution known as degenerate basic feasible solution.
8. **Optimal basic feasible solution :** It contains basic feasible solution that optimize the objective function.
9. **Sets of points :** Linear equation in two variables represents a line and a linear equation in three variables represents a plane. Both of them are considered as set of points.

**Example 23.** Solve by using simplex method :

$$\text{Maximize } z = 3x_1 + 4x_2$$

$$\text{Subject to } x_1 + x_2 \leq 450$$

$$2x_1 + x_2 \leq 600$$

$$x_1, x_2 \geq 0$$

**Solution.**

- Step 1.** Express the the above objective function and inequations in the equation of standard form by adding slack variables.

$$\text{Maximize} \quad z = 3x_1 + 4x_2 + 0s_1 + 0s_2$$

$$\text{Subject to} \quad x_1 + x_2 + s_1 = 450$$

$$2x_1 + x_2 + s_2 = 600$$

$$\text{where } x_1, x_2, s_1, s_2 \geq 0$$

- Step 2.** Find initial basic feasible solution.

Putting  $x_1 = x_2 = 0$ , in the constraints, we get

$$s_1 = 450 \text{ and } s_2 = 600 \text{ and } z = 0$$

This is the initial basic feasible solution.

The above information can be expressed in the tabular form as follows.

Coefficient	$C_j$	3	4	0	0	
$C_B$	Basis	body matrix	identity matrix			value
0	$s_1$	$x_1$ 1	$s_2$ 1	$s_1$ 1	$s_2$ 0	b 450
0	$s_2$	2	1	0	1	600

Row,  $C_j$  represents the coefficients of the variables in the objective function.

Column,  $C_B$  represents the coefficients of the current basic variables. The basic variables are the slack variables  $s_1$  and  $s_2$ .

**Body matrix :** The body matrix under non-basic variables  $x_1$  and  $x_2$  represents their coefficients in the constraints.

**Identity matrix :** The identity matrix represents the coefficients of slack variables in the constraints.

**Column b** indicates the values of the basic variables,  $s_1$  and  $s_2$  in the initial basic feasible solution.

- Step 3. Perform optimality test.** Here, since  $C_j - Z_j$  is positive under  $x_1$  and  $x_2$  columns so initial basic problem is not optimal and can be improved.

	$C_j$	3	4	0	0		
$C_B$	Basis	$x_1$	$x_2$	$s_1$	$s_2$	b	0
0	$s_1$	1	(1)	1	0	450	450
0	$s_2$	2	1	0	1	600	600
	$Z_j = \sum(C_B a_{ij})$	0	0	0	0		
	$C_j - Z_j$	3	4	0	0		
		↑					
				K (Key column)			

→ (Key row)

Row  $Z_j : Z_j = \sum C_B a_{ij}$

where  $a_{ij}$  are the matrix element in the  $i$ -th row and  $j$ th column. For example,  
 $Z_1 = 0 \times 1 + 0 \times 2 = 0$

If the elements in the  $C_j - Z_j$  row are negative or zero, then the current solution is optimal.

Since here, two elements 3 and 4 under  $x_1$  and  $x_2$  variable columns are positive, so the solution is not optimal and we proceed to the next step.

**Step 4. Iterate towards an optimal solution :****Selection of entering variable :**

For this we look for maximum positive values in  $C_j - Z_j$  row. If more than one variable appears with the same maximum value then any one can be chosen arbitrarily. This variable is called entering variable. This column is known as key column. Thus here we find  $x_2$  as entering variable.

**Selection of the leaving variable**

Elements of column  $b$  are divided by the corresponding elements of the key column and row containing the minimum non-negative ratio is marked. This row is called the key row.

The element lying at the intersection of key column and key row is called key (or pivot) element and is enclosed in ( ). Here key element is 1.

**Preparing new simplex table :**

We replace  $s_1$  by  $x_2$  from the basis. Corresponding  $C_B$  coefficient is changed from 0 to 4. If Key element is not unity made it unity and other intersectional elements are made zeros by suitable row operations. Thus, we get the following table:

	$C_j$	3	4	0	0	
$C_B$	Basis	$x_1$	$x_2$	$s_1$	$s_2$	$b$
4	$x_2$	1	1	1	0	450
0	$s_2$	1	0	-1	1	150
	$Z_j = (\sum C_B a_{ij})$	4	4	4	0	1800
	$C_j - Z_j$	-1	0	-4	0	

- Step 5.** Since here all elements of  $C_j - Z_j$  row are either zero or negative so the second feasible solution is optimal.

Hence the optimal solution is

$$\begin{aligned}x_1 &= 0 \\x_2 &= 450 \\Z_{\max} &= \text{Rs } 1800\end{aligned}$$

**Ans.**

**Example 24. Use simplex method to solve the following problem.**

$$\begin{array}{ll}\text{Maximize} & Z = 2x_1 + 5x_2 \\ \text{Subject to} & x_1 + 4x_2 \leq 24 \\ & 3x_1 + x_2 \leq 21 \\ & x_1 + x_2 \leq 9 \\ & x_1, x_2 \geq 0\end{array}$$

**Solution.**

- Step 1.** First we express the objective function and inequalities in equations of standard form by adding slack variables  $s_1$ ,  $s_2$ , and  $s_3$ .

$$\begin{array}{ll}\text{Maximize} & Z = 2x_1 + 5x_2 + 0s_1 + 0s_2 + 0s_3 \\ \text{Subject to} & x_1 + 4x_2 + s_1 = 24 \\ & 3x_1 + x_2 + s_2 = 21 \\ & x_1 + x_2 + s_3 = 9 \\ & x_1, x_2, s_1, s_2, s_3 \geq 0\end{array}$$

- Step 2.** Find initial basic feasible solution.

Putting  $x_1 = x_2 = 0$ , in the constraints, we get

$$s_1 = 24, s_2 = 21 \text{ and } s_3 = 9 \text{ and } z = 0$$

This is initial basic feasible solution.

The above information can be expressed in matrix form as follow:

$C_j$	2	5	0	0	0		
$C_B$ Basis	$x_1$	$x_2$	$s_1$	$s_2$	$s_3$	$b$	$\theta$
0 $s_1$	1	(4)	1	0	0	24	$6 \rightarrow$ (Key row)
0 $s_2$	3	1	0	1	0	21	21
0 $s_3$	1	1	0	0	1	9	9
$Z_j$	0	0	0	0	0	0	
$C_j - Z_j$	2	5	0	0	0	0	first feasible solution
		K↑	key column				

**Step 3.** Perform optimality test :

Here, since  $C_j - Z_j$  is positive under  $x_1$  and  $x_2$  - columns so initial basic feasible solution is not optimal and can be improved.

**Step 4.** Iterate towards an optimal solution.

First we make pivot element unity for this we divide the key row by 4.

$C_j$	2	5	0	0	0	
$C_B$ Basis	$x_1$	$x_2$	$s_1$	$s_2$	$s_3$	$b$
5 $x_2$	$\frac{1}{4}$	1	$\frac{1}{4}$	0	0	6
0 $s_2$	3	1	0	1	0	21
0 $s_3$	1	1	0	0	1	9

$$R_1 \rightarrow \frac{1}{4}R_1$$

Now we make the other elements of key column 0 by suitable following row operations.

$C_j$	2	5	0	0	0	
$C_B$ Basis	$x_1$	$x_2$	$s_1$	$s_2$	$s_3$	$b$
5 $x_2$	$\frac{1}{4}$	1	$\frac{1}{4}$	0	0	6
0 $s_2$	$\frac{11}{4}$	0	$-\frac{1}{4}$	1	0	15
0 $s_3$	$\frac{3}{4}$	0	$-\frac{1}{4}$	0	1	3

$$R_2 \rightarrow R_2 - R_1$$

$$R_3 \rightarrow R_3 - R_1$$

$C_j$	2	5	0	0	0	
$C_B$ Basis	$x_1$	$x_2$	$s_1$	$s_2$	$s_3$	$b$
5 $x_2$	$\frac{1}{4}$	1	$\frac{1}{4}$	0	0	6
0 $s_2$	$\frac{11}{4}$	0	$-\frac{1}{4}$	1	0	$\frac{60}{4}$
0 $s_3$	$\left(\frac{3}{4}\right)$	0	$-\frac{1}{4}$	0	1	3

$$4 \rightarrow$$

$Z_j$	$\frac{5}{4}$	5	$\frac{5}{4}$	0	0	30
$C_j - Z_j$	$\frac{3}{4} \uparrow$	0	$-\frac{5}{4}$	0	0	Second feasible solution

By the above table we observe that  $\frac{3}{4}$  is the maximum positive value of  $C_j - Z_j$  row so its column is the key column. Thus, here  $x_2$  is entering variable.

Also 4 is the minimum ratio under  $\theta$ , so row containing 4 is key row. Thus  $s_3$  is leaving variable. At the intersection of key row and key column is  $\frac{3}{4}$ , so  $\frac{3}{4}$  is pivot element.

$C_B$	Basis	$x_1$	$x_2$	$s_1$	$s_2$	$s_3$	$b$
5	$x_2$	$\frac{1}{4}$	1	$\frac{1}{4}$	0	0	6
0	$s_2$	$\frac{11}{4}$	0	$-\frac{1}{4}$	1	0	15
0	$x_1$	1	0	$-\frac{1}{3}$	0	$\frac{4}{3}$	4

$$R_3 \rightarrow \frac{4}{3} R_3$$

$C_B$	Basis	$x_1$	$x_2$	$s_1$	$s_2$	$s_3$	$b$
5	$x_2$	0	1	$\frac{1}{3}$	0	$-\frac{1}{3}$	5
0	$s_2$	0	0	$\frac{2}{3}$	1	$-\frac{11}{3}$	4
2	$x_1$	1	0	$-\frac{1}{3}$	0	$\frac{4}{3}$	4

$$R_1 \rightarrow R_1 - \frac{1}{4} R_3$$

$$R_2 \rightarrow R_2 - \frac{11}{4} R_3$$

	$C_j$	2	5	0	0	0		
$C_B$	Basis	$x_1$	$x_2$	$s_1$	$s_2$	$s_3$	$b$	
5	$x_2$	0	1	$\frac{1}{3}$	0	$-\frac{1}{3}$	5	
0	$s_2$	0	0	$\frac{2}{3}$	1	$-\frac{11}{3}$	4	
2	$x_1$	1	0	$-\frac{1}{3}$	0	$\frac{4}{3}$	4	
	$Z_j$ $C_j - Z_j$	2 0	5 0	1 -1	0 0	1 -1	33	Third feasible solution

Since here all elements of  $C_j - Z_j$  row are either zero or negative so the third feasible solution is optimal.

Hence, the optimal solution is

$$x_1 = 4$$

$$x_3 = 5$$

$$s_2 = 4$$

$$Z_{\max} = 33$$

**Ans.**

**Example 25.** Solve by simplex method the following L.P. problem.

$$\begin{array}{ll} \text{Minimize} & Z = x_1 - 3x_2 + 3x_3 \\ \text{Subject to} & 3x_1 - x_2 + 2x_3 \leq 7 \\ & 2x_1 + 4x_2 \geq -12 \\ & -4x_1 + 3x_2 + 8x_3 \leq 10 \\ & x_1, x_2, x_3 \geq 0 \end{array}$$

**Solution.**

**Step 1.** Right hand side of second constraint is made positive by multiplying  $-1$ .

Adding the slack variables  $s_1$ ,  $s_2$  and  $s_3$  the above inequations can be written in standard form as follows :

$$\begin{array}{ll} \text{Minimize} & Z = x_1 - 3x_2 + 3x_3 + 0s_1 + 0s_2 + 0s_3 \\ \text{Subject to} & 3x_1 - x_2 + 2x_3 + s_1 = 7 \\ & -2x_1 - 4x_2 + s_2 = 12 \\ & -4x_1 + 3x_2 + 8x_3 + s_3 = 10 \\ & x_1, x_2, x_3, s_1, s_2, s_3 \geq 0 \end{array}$$

**Step 2.** To find initial basic feasible solution putting  $x_1 = x_2 = x_3 = 0$  in the constraints, we get  $s_1 = 7$ ,  $s_2 = 12$ , and  $s_3 = 10$ ;  $Z = 0$

The above information can be written in tabular form as follows:

$C_j$		1	-3	3	0	0	0	$\frac{b}{\text{coefficient of } x_2}$
$C_B$	Basis	$x_1$	$x_2$	$x_3$	$s_1$	$s_2$	$s_3$	$b$
0	$s_1$	3	-1	2	1	0	0	7
0	$s_2$	-2	-4	0	0	1	0	12
0	$s_3$	-4	(3)	8	0	0	1	10
	$Z_j$	0	0	0	0	0	0	
	$C_j - Z_j$	1	-3	3	0	0	0	

K↑ key column

Key Row

**Step 3. Perform optimality test:**

Here as we have to minimize  $Z$ , so if any  $C_j - Z_j$  coefficient is negative the solution is not optimal

The column having most negative  $C_j - Z_j$  value will be the key column.

Since, here element  $-3$  under  $x_2$  variable column is most negative, so the solution is not optimal and we proceed to the next step.

**Step 4.** Iterate towards an optimal solution. Variable  $s_3$  is replaced by  $x_2$  by performing the row operations in the usual ways. Solution will become optimal when all  $C_j - Z_j$  coefficients become zero or positive.

	$C_j$	1	-3	3	0	0	0		$\frac{b}{\text{coefficient of } x_2}$
$C_B$	Basis	$x_1$	$x_2$	$x_3$	$s_1$	$s_2$	$s_3$	$b$	$\theta$
5	$s_1$	$\left(\frac{5}{3}\right)$	0	$\frac{14}{3}$	1	0	$\frac{1}{3}$	$\frac{31}{3}$	$\frac{31}{5} \rightarrow \text{Key Row}$
0	$s_2$	$\frac{-22}{3}$	0	$\frac{32}{3}$	0	1	$\frac{4}{3}$	$\frac{76}{3}$	$\frac{-38}{11}$
0	$x_2$	$\frac{-4}{3}$	1	$\frac{8}{3}$	0	0	$\frac{1}{3}$	$\frac{10}{3}$	$-\frac{5}{2}$
	$Z_j$	4	-3	-8	0	0	-1	-10	
	$C_j - Z_j$	-3	0	11	0	0	1		
		K↑							

Here further we have find a negative element -3 in  $C_j - Z_j$  row, so we again proceed as above, with entering variable  $x_1$  and leaving variable  $s_1$ .

	$C_j$	1	-3	3	0	0	0		
$C_B$	Basis	$x_1$	$x_2$	$x_3$	$s_1$	$s_2$	$s_3$	$b$	
1	$x_1$	1	0	$\frac{14}{5}$	$\frac{3}{5}$	0	$\frac{1}{5}$	$\frac{31}{3}$	
0	$s_2$	0	0	$\frac{156}{5}$	$\frac{22}{5}$	1	$\frac{14}{5}$	$\frac{354}{5}$	
-3	$x_2$	0	1	$\frac{32}{5}$	$\frac{4}{5}$	0	$\frac{3}{5}$	$\frac{58}{5}$	
	$Z_j$	1	-3	$-\frac{82}{5}$	$-\frac{9}{5}$	0	$-\frac{8}{5}$	$-\frac{143}{5}$	
	$C_j - Z_j$	0	0	$\frac{97}{5}$	$\frac{9}{5}$	0	$\frac{8}{5}$	optimal solution	

Since all elements of  $C_j - Z_j$  row is positive or zero.

Hence, optimal solution is

$$x_1 = \frac{31}{5}, x_2 = \frac{58}{5}, x_3 = 0, Z_{\min} = -\frac{143}{5} \quad \text{Ans.}$$

#### EXERCISE 56.4

Solve the following problems by the Simplex method.

1. Maximize  $Z = 3x_1 + 2x_2$

Subject to  $x_1 + x_2 \leq 4$

$x_1 - x_2 \leq 2$

$x_1, x_2 \geq 0$

Ans.  $x_1 = 3, x_2 = 1$

$Z_{\max} = 11$

2. Maximize  $Z = 4x_1 + 10x_2$   
 Subject to  $2x_1 + x_2 \leq 50$  **Ans.**  $x_1 = 0, x_2 = 20$   
 $2x_1 + 5x_2 \leq 100$   $Z_{\max} = 200$   
 $2x_1 + 3x_2 \leq 90$   
 $x_1, x_2 \geq 0$
3. Maximize  $Z = 2x_1 + x_2$   
 Subject to  $x_1 + 2x_2 \leq 10$  **Ans.**  $x_1 = 4, x_2 = 2$   
 $x_1 + x_2 \leq 6$   $Z_{\max} = 10$   
 $x_1 - x_2 \leq 2$   
 $x_1 - 2x_2 \leq 1$   
 $x_1, x_2 \geq 0$
4. Minimize  $Z = x_1 - 3x_2 + 2x_3$  **Ans.**  $x_1 = 4, x_2 = 5, x_3 = 0$   
 Subject to  $3x_1 - x_2 + 2x_3 \geq 7$   $Z_{\min} = -11$   
 $-2x_1 + 4x_2 \leq 12$   
 $-4x_1 + 3x_2 + 8x_3 \leq 10$   
 $x_1, x_2, x_3 \geq 0$
5. Minimize  $Z = 4x_1 + x_2$  **Ans.**  $x_1 = \frac{3}{5}, x_2 = \frac{6}{5}$   
 Subject to  $3x_1 + x_2 = 3$   $Z_{\min} = \frac{18}{5}$   
 $4x_1 + 3x_2 \geq 6$   
 $x_1 + 2x_2 \leq 3$   
 $x_1, x_2 \geq 0$

# CHAPTER

# 57

## STATISTICAL TECHNIQUE

### (MOMENT, MOMENT GENERATING FUNCTION, SKEWNESS, KURTOSIS)

#### 57.1 STATISTICS

Statistics is a branch of science dealing with the collection of data, organising, summarising, presenting and analysing data and drawing valid conclusions and thereafter making reasonable decisions on the basis of such analysis.

#### 57.2 FREQUENCY DISTRIBUTION.

Frequency distribution is the arranged data, summarised by distributing it into classes or categories with their frequencies.

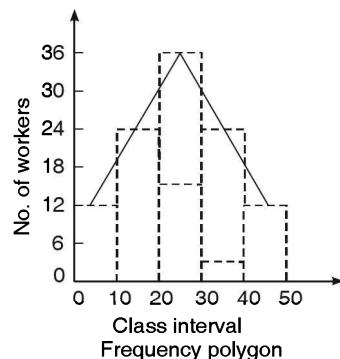

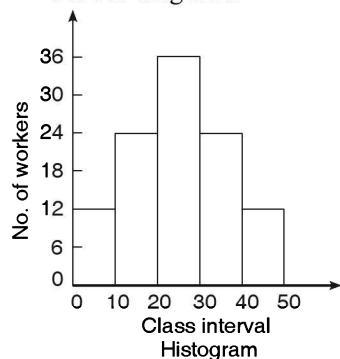

**Wages of 100 workers**

Wages in Rs.	0-10	10-20	20-30	30-40	40-50
Number of workers	12	23	35	20	10

#### 57.3 GRAPHICAL REPRESENTATION

It is often useful to represent frequency distribution by means of a diagram. The different types of diagrams are

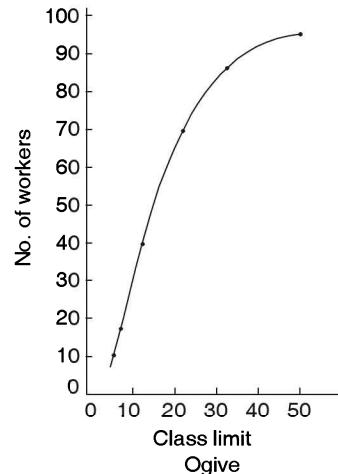

1. Histogram
2. Frequency polygon
3. Frequency curve
4. Cumulative frequency curve or Ogive
5. Bar chart
6. Circles or Pie diagrams.

**1. Histogram.** Histogram consists of a set of rectangles having their heights proportional to the class-frequencies, for equal class-intervals. For unequal class-interval, the areas of rectangles are proportional to the frequencies.

**2. Frequency Polygon.** Frequency Polygon is a line graph of class-frequency plotted against class-mark. It can be obtained by connecting mid-points on the tops of the rectangles in the histogram.

**3. Cumulative Frequency curve or the Ogive.** If the various points are plotted according to the upper limit of the class as  $x$  co-ordinate and the cumulative frequency as  $y$  co-ordinate and these points are joined by a free hand smooth curve, the curve obtained is known as cumulative frequency curve or the Ogive.

#### 57.4 EXCLUSIVE AND INCLUSIVE CLASS INTERVALS

**Exclusive Class intervals:** If the upper limit of a class is not included in its class interval, then this type of class interval is called exclusive, e.g.,

Income (Rs.)	No. of workers
40 – 50	20
50 – 60	30
60 – 70	40
70 – 80	22
80 – 90	18
90 – 100	10

In this method the upper limit of one class is the lower limit of next class. In the above example, in the class 40 – 50 there are twenty persons whose income is from Rs. 40 to 49.99. A person whose income is Rs. 50 is included in the class Rs. 50 – Rs. 60. Not in Rs. 40 – Rs. 50. These type of class-intervals are also known as overlapping class intervals.

**Inclusive Class intervals:** If the upper limit of a class is included in its class interval, then it is called *inclusive class interval*.

Income (Rs.)	Frequency
40 – 49	8
50 – 59	12
60 – 69	15
70 – 79	20
80 – 89	8
90 – 99	7

**Adjustment:** For the sake of continuity and to get correct class-limits, some adjustment is to be done. Find the difference between the upper limit of the first class and lower limit of the next class and divide it by 2. Then subtract this adjustment from the lower-limit & add it to upper limit to get correct class-limit. Here, in the above example,

$$\text{Adjustment} = \frac{50 - 49}{2} = 0.5$$

Subtract 0.5 from all the lower limit and add 0.5 to all the upper limits.

The adjusted class will be

Income (Rs.)	Frequency
39.5 – 49.5	8
49.5 – 59.5	12
59.5 – 69.5	15
69.5 – 79.5	20
79.5 – 89.5	8
89.5 – 99.5	7

## 57.5 AVERAGE OR MEASURES OF CENTRAL TENDENCY

An average is a value which is representative of a set of data. Average value may also be termed as measures of central tendency. There are five types of averages in common.

(i) Arithmetic average or mean (ii) Median (iii) Mode

(iv) Geometric Mean (v) Harmonic Mean

## 57.6 ARITHMETIC MEAN

(a) If  $x_1, x_2, x_3, \dots, x_n$  are  $n$  numbers, then their arithmetic mean (A.M.) is defined by

$$A.M. = \frac{x_1 + x_2 + x_3 + \dots + x_n}{n} = \frac{\sum x}{n}$$

If the number  $x_1$  occurs  $f_1$  times  $x_2$  occurs  $f_2$  times and so on, then

$$A.M. = \frac{f_1 x_1 + f_2 x_2 + f_3 x_3 + \dots + f_n x_n}{f_1 + f_2 + \dots + f_n} = \frac{\sum f x}{\sum f}$$

This is known as direct method.

**Example 1.** Find the mean of 20, 22, 25, 28, 30.

**Solution.**  $A.M. = \frac{20+22+25+28+30}{5} = \frac{125}{5} = 25$

**Ans.**

**Example 2.** Find the mean of the following

Numbers	8	10	15	20
Frequency	5	8	8	4

**Solution. (a) Direct method**  $\Sigma f x = 8 \times 5 + 10 \times 8 + 15 \times 8 + 20 \times 4$   
 $= 40 + 80 + 120 + 80 = 320$   
 $\Sigma f = 5 + 8 + 8 + 4 = 25$

$$A.M. = \frac{\sum f x}{\sum f} = \frac{320}{25} = 12.8$$

**Ans.**

**(b) Short cut method**

Let  $a$  be the assumed mean,  $d$  the deviation of the variate  $x$  from  $a$ . Then

$$\frac{\sum f d}{\sum f} = \frac{\sum f(x-a)}{\sum f} = \frac{\sum f x - \sum f a}{\sum f} = A.M. - \frac{a \sum f}{\sum f} = A.M. - a$$

$\therefore A.M. = a + \frac{\sum f d}{\sum f}$

**Example 3.** Find the arithmetic mean for the following distribution:

Class	0-10	10-20	20-30	30-40	40-50
Frequency	7	8	20	10	5

**Solution.** Let assumed mean ( $a$ ) = 25.

Class	Class-mark $x$	Frequency $f$	$x - 25 = d$	$f.d$
0 – 10	5	7	-20	-140
10 – 20	15	8	-10	-80
20 – 30	25	20	0	0
30 – 40	35	10	+10	+100
40 – 50	45	5	+20	+100
Total		$\Sigma f = 50$		$\Sigma f d = -20$

$$A.M. = a + \frac{\sum f d}{\sum f} = 25 + \frac{-20}{50} = 24.6$$

**Ans.**

### (c) Step deviation method

Let  $a$  be the assumed mean,  $i$  the class length then

$$D = \frac{x - a}{i}, \quad A.M. = a + \frac{\sum f D}{\sum f} i$$

**Example 4.** Find the arithmetic mean of the data given in example 3 by step deviation method.

**Solution.** Let assumed mean ( $a$ ) = 25,  $i$  = 10 (given)

Class	class-mark $x$	Frequency $f$	$D = \frac{x - a}{i}$	$f \cdot D$
0 – 10	5	7	-2	-14
10 – 20	15	8	-1	-8
20 – 30	25	20	0	0
30 – 40	35	10	+1	+10
40 – 50	45	5	+2	+10
Total		$\Sigma f = 50$		$\Sigma f D = -2$

$$A.M. = a + \frac{\sum f D}{\sum f} \cdot i = 25 + \frac{-2}{50} \times 10 = 24.6$$

**Ans.**

## 57.7 MEDIAN

Median is defined as the measure of the central item when they are arranged in ascending or descending order of magnitude.

- (a) When the total number of the items is odd and equal to say  $n$ , then the value of  $\frac{1}{2}(n+1)$ th item gives the median.
- (b) When the total number of the frequencies is even, say  $n$ , then there are two middle items, and so the mean of the values of  $\frac{1}{2}n$ th and  $\left(\frac{1}{2}n+1\right)$ th items is the median.

**Example 5.** Find the median of 6, 8, 9, 10, 11, 12, 13.

**Solution.** Total number of items =  $n = 7$

Since,  $n$  is an odd number. Hence,

$$\text{The middle item} = \frac{1}{2}(7+1)^{\text{th}} = 4^{\text{th}}$$

$$\text{Median} = \text{Value of the } 4^{\text{th}} \text{ item} = 10$$

**Ans.**

(c) For grouped data,

$$\boxed{\text{Median} = l + \frac{\frac{1}{2}N - C}{f} \cdot i}$$

where  $l$  is the lower limit of the median class,  $f$  is the frequency of the class,  $i$  is the class-length,  $C$  is the cumulative frequency of the class preceding the median-class and  $N$  is the cumulative frequency of the data.

**Example 6.** Find the value of Median from the following data:

No. of days for which absent (less than)	5	10	15	20	25	30	35	40	45
No. of students	29	224	465	582	634	644	650	653	655

**Solution.** The given cumulative frequency distribution will first be converted into ordinary frequency as under

Class-Interval	Cumulative frequency	Ordinary frequency
0 – 5	29	$29 = 29$
5 – 10	$224 = C$	$224 - 29 = 195$
$\boxed{10 - 15}$	465	$465 - 224 = \boxed{241} f$
15 – 20	582	$582 - 465 = 117$
20 – 25	634	$634 - 582 = 52$
25 – 30	644	$644 - 634 = 10$
30 – 35	650	$650 - 644 = 6$
35 – 40	653	$653 - 650 = 3$
40 – 45	$\boxed{655} = N$	$655 - 653 = 2$

$$\text{Here, } \frac{N}{2} = \frac{655}{2} = 327.5$$

Hence, Median class = class having c.f. just more than  $\frac{N}{2}$  i.e.  $327.5 = 10 - 15$

$$\text{Now, } \text{Median} = l + \frac{\frac{N}{2} - C}{f} i$$

where  $l$  stands for lower limit of median class,

$N$  stands for the total frequency,

$C$  stands for the cumulative frequency of the class just preceding the median class,

$i$  stands for width of class interval

$f$  stands for frequency of the median class.

$$\text{Median} = 10 + \frac{\frac{655}{2} - 224}{241} \times 5 = 10 + \frac{103.5 \times 5}{241} = 10 + 2.15 = 12.15 \quad \text{Ans.}$$

## 57.8 QUARTILES

Quartiles are the values of the variate which divide the total frequency into four equal parts. When the lower half before the median is divided into two equal parts, the value of the dividing

variate is called **lower Quartile** and is denoted by  $Q_1$ . The value of the variate dividing the upper half into two equal parts is called the **upper Quartile** and is denoted by  $Q_3$ ,  $Q_2$  is the medium.

The formulae for computation of  $Q_1$  and  $Q_3$  are,

$$Q_1 = l + \frac{i}{f} \left( \frac{N}{4} - C \right) \Rightarrow Q_3 = l + \frac{i}{f} \left( \frac{3N}{4} - C \right).$$

### 57.9 DECILES

Deciles are those values of the variate which divide the total frequency into 10 equal parts.

$$D_1 = l + \frac{i}{f} \left( \frac{N}{10} - C \right) \Rightarrow D_2 = l + \frac{i}{f} \left( \frac{2N}{10} - C \right)$$

$$D_3 = l + \frac{i}{f} \left( \frac{3N}{10} - C \right) \text{ and so on}$$

$D_5$ , the fifth decile is the median.

### 57.10 PERCENTILES

Percentiles are those values of the variate which divide the total frequency into 100 equal parts.

$$P_1 = l + \frac{i}{f} \left( \frac{N}{100} - C \right) \Rightarrow P_2 = l + \frac{i}{f} \left( \frac{2N}{100} - C \right) \text{ and so on.}$$

$P_{50}$ , the 50<sup>th</sup> percentile is the median.

**Note.** In case of series where frequency is not given,

$$P_{10} = \text{value of } \frac{10}{100} (n+1)^{\text{th}} \text{ observation}, P_{50} = \text{value of } \frac{50}{100} (n+1)^{\text{th}} \text{ observations etc.}$$

### 57.11 MODE

Mode is defined to be the size of the variable which occurs most frequently.

In case of continuous frequency distribution.

$$\text{Mode} = l + \left( \frac{f - f_{-1}}{2f - f_{-1} - f_{+1}} \right) i$$

where  $l$  is lower limit,  $i$  is the class length,  $f$  is the frequency of the modal class,  $f_{-1}$  and  $f_{+1}$  are the frequencies of the classes preceding and succeeding the modal class respectively.

The following points must be taken care of while calculating mode :

1. The values (or classes of values) of the variable must be in ascending order of magnitude.
2. If the classes are in inclusive form, then the actual limits of the modal class are to be taken for finding  $l$  and  $i$ .
3. The classes must be of equal width.

**Example 7.** Find the mode of the following items : 0, 1, 6, 7, 2, 3, 7, 6, 6, 2, 6, 0, 5, 6, 0.

**Solution.** 6 occurs 5 times and no other item occurs 5 or more than 5 times, hence the mode is 6.

**Ans.**

**Empirical formula**

$$\text{Mean} - \text{Mode} = 3 [\text{Mean} - \text{Median}]$$

**Example 8.** Find the mode from the following data:

Age	0 – 6	6 – 12	12 – 18	18 – 24	24 – 30	30 – 36	36 – 42
Frequency	6	11	25	35	18	12	6

**Solution.**

Age	Frequency	Cumulative frequency
0 – 6	6	6
6 – 12	11	17
12 – 18	$25 = f_{-1}$	42
<b>18 – 24</b>	<b><math>35 = f</math></b>	<b>77</b>
24 – 30	$18 = f_1$	95
30 – 36	12	107
36 – 42	6	113

Here, max. frequency of any item is 35.

Hence modal class is 18.24

$$\text{Mode} = l + \frac{f - f_{-1}}{2f - f_{-1} - f_1} \times i = 18 + \frac{35 - 25}{70 - 25 - 18} \times 6 \\ = 18 + \frac{60}{27} = 18 + 2.22 = 20.22$$

**Ans.**

### 57.12 GEOMETRIC MEAN

If  $x_1, x_2, x_3, \dots, x_n$  be  $n$  values of variates  $x$ , then the geometric mean

$$G = (x_1 \times x_2 \times x_3 \times x_4 \times \dots \times x_n)^{1/n}$$

**Example 9.** Find the geometric mean of 4, 8, 16.

**Solution.**  $G.M. = (4 \times 8 \times 16)^{1/3} = 8$

**Ans.**

### 57.13 HARMONIC MEAN

Harmonic mean of a series of values is defined as the reciprocal of the arithmetic mean of their reciprocals. Thus if  $H$  be the harmonic mean, then

$$\frac{1}{H} = \frac{1}{n} \left[ \frac{1}{x_1} + \frac{1}{x_2} + \dots + \frac{1}{x_n} \right]$$

**Example 10.** Calculate the harmonic mean of 4, 8, 16.

**Solution.** Let,  $\frac{1}{H} = \frac{1}{3} \left[ \frac{1}{4} + \frac{1}{8} + \frac{1}{16} \right] = \frac{7}{48}$ ,  $H = \frac{48}{7} = 6.857$

**Ans.**

### 57.14 AVERAGE DEVIATION OR MEAN DEVIATION

It is the mean of the absolute values of the deviations of a given set of numbers from their arithmetic mean.

If  $x_1, x_2, x_3, \dots, x_n$  be a set of numbers with frequencies  $f_1, f_2, \dots, f_n$  respectively. Let  $\bar{x}$  be the arithmetic mean of the numbers  $x_1, x_2, \dots, x_n$ , then

$$\text{Mean deviation} = \frac{\sum f_i |x_i - \bar{x}|}{\sum f_i}$$

**Example 11.** Find the mean deviation of the following frequency distribution.

Class	0 – 6	6 – 12	12 – 18	18 – 24	24 – 30
Frequency	8	10	12	9	5

**Solution.**  $a = 15$

Class	Mid-value $x$	Frequency $f$	$d = x - a$	$fd$	$ x - 14 $	$f x - 14 $
0 – 6	3	8	-12	-96	11	88
6 – 12	9	10	-6	-60	5	50
12 – 18	15	12	0	0	1	12
18 – 24	21	9	+6	54	7	63
24 – 30	27	5	+12	60	13	65
		$\sum f = 44$		$\sum fd = -42$		$\sum f x - 14  = 278$

$$\text{Mean} = \bar{x} = a + \frac{\sum f d}{\sum f} = 15 - \frac{42}{44} = 14 \text{ (approx.)}$$

$$\text{Mean or Average deviation} = \frac{\sum f |x - \bar{x}|}{\sum f} = \frac{278}{44} = 6.32 \quad \text{Ans.}$$

### 57.15 STANDARD DEVIATION

Standard deviation is defined as the square root of the mean of the square of the deviation from the arithmetic mean.

$$S.D. = \sigma = \sqrt{\frac{\sum f(x - \bar{x})^2}{\sum f}}$$

**Note. 1.** The square of the standard deviation i.e.;  $\sigma^2$  is called variance.

**2.**  $\sigma^2$  is called the second moment about the mean and is denoted by  $\mu_2$ .

### 57.16 SHORTEST METHOD FOR CALCULATING STANDARD DEVIATION

$$\begin{aligned} \text{We know that } \sigma^2 &= \frac{1}{N} \sum f(x - \bar{x})^2 = \frac{1}{N} \sum f(x - a - \bar{x} - a)^2 \\ &= \frac{1}{N} \sum f(d - \bar{x} - a)^2 \quad \text{where } x - a = d = \frac{1}{N} \sum fd^2 - 2(\bar{x} - a) \frac{1}{N} \sum fd + (\bar{x} - a)^2 \frac{1}{N} \sum f \\ &= \frac{1}{N} \sum fd^2 - 2(\bar{x} - a) \frac{1}{N} \sum fd + (\bar{x} - a)^2 \quad [\because \sum f = N] \quad \left[ \bar{x} = a + \frac{\sum fd}{N} \text{ or } \bar{x} - a = \frac{\sum fd}{N} \right] \\ \sigma^2 &= \frac{1}{N} \sum f d^2 - 2 \left( \frac{\sum f d}{N} \right) \left( \frac{\sum f d}{N} \right) + \left( \frac{\sum f d}{N} \right)^2 = \frac{1}{N} \sum f d^2 - 2 \left( \frac{\sum f d}{N} \right)^2 + \left( \frac{\sum f d}{N} \right)^2 \\ \sigma^2 &= \frac{1}{N} \sum fd^2 - \left( \frac{\sum fd}{N} \right)^2, \quad S.D. = \sigma = \sqrt{\frac{\sum fd^2}{N} - \left( \frac{\sum fd}{N} \right)^2} \end{aligned}$$

$$\text{Note. Coefficient of variation} = \frac{\sigma}{x} \times 100$$

**Example 12.** Calculate the mean and standard deviation for the following table, given the age distribution of 542 members.

Age in years	20 – 30	30 – 40	40 – 50	50 – 60	60 – 70	70 – 80	80 – 90
No. of members	3	61	132	153	140	51	2

**Solution.** Assumed mean = 55

$$\text{Here, we take } d = \frac{x - a}{i} = \frac{x - 55}{10}$$

Age grouped	Mid value (x)	Frequency (f)	$d = \frac{x-55}{10}$	$fd$	$fd^2$
20 - 30	25	3	-3	-9	27
30 - 40	35	61	-2	-122	244
40 - 50	45	132	-1	-132	132
50 - 60	55	153	0	0	0
60 - 70	65	140	1	140	140
70 - 80	75	51	2	102	204
80 - 90	85	2	3	6	18
		$\sum f = 542$		$\sum fd = -15$	$\sum fd^2 = 765$

$$\text{Mean} = \bar{x} = a + \frac{\sum fd}{\sum f} \cdot i = 55 + \frac{(-15) \cdot 10}{542} = 55 - 0.28 = 54.72$$

$$\text{Variance} = \sigma^2 = i^2 \left[ \frac{1}{N} \sum fd^2 - \left( \frac{\sum fd}{N} \right)^2 \right] = 100 \left[ \frac{765}{542} - (0.028)^2 \right] = 100 \times 1.4107 = 141.07$$

$$\text{S.D.} = \sigma = 11.9 \text{ years}$$

Ans.

### 57.17 SYMMETRY

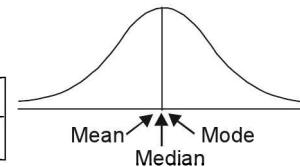

A distribution is said to be symmetrical when its mean, median and mode are identical. i.e.;

$$\text{Mean} = \text{Median} = \text{Mode}.$$

In other words, a distribution is said to be symmetric when the frequencies are symmetrically distributed about the mean (or when the values of the variable are equidistant from the mean and have the same frequency).

Consider the following frequency distribution:

x	10	20	30	40	50	60	70
f	2	6	10	14	10	6	2

$$\text{Mean} = \bar{x} = \frac{10 \times 2 + 20 \times 6 + 30 \times 10 + 40 \times 14 + 50 \times 10 + 60 \times 6 + 70 \times 2}{2+6+10+14+10+6+2} = \frac{2000}{50} = 40$$

In this distribution, we observe that the values 20 and 60 are equidistant from the mean, viz. 40 with the same frequency 6.

A symmetrical distribution when plotted on a graph will give a perfectly bell-shaped curve, which is known as normal curve.

### 57.18 SKEWNESS

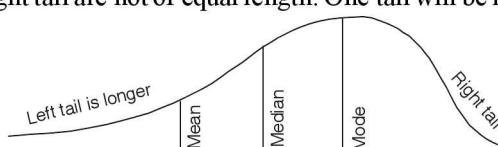

Skewness denotes the opposite of symmetry. It is lack of symmetry,

#### Skew symmetrical Distribution

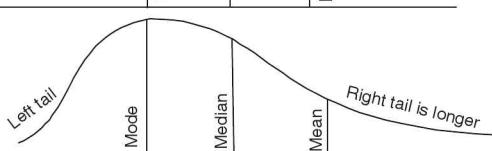

(U.P. III Semester, 2006)

A distribution which is not symmetrical is said to be skew symmetrical distribution. In skew symmetrical distribution the left tail and the right tail are not of equal length. One tail will be longer than the other.

(a) **Negatively skew distribution.** In negatively skew distribution the left tail is longer than the right tail.

(b) **Positively skew distribution.** In positively skew distribution the right tail of the curve will be longer than the left.

In skew distribution mean, median and mode are not equal.

### 57.19 TEST OF SKEWNESS

1. There is no skewness in the distribution if  $AM = Mode = Median$
2. There is no skewness in the distribution if,  $Third\ quartile - Median = Median - First\ quartile$ .
3. There is no skewness if  
The sum of the frequencies which are less than Mode = Sum of the frequencies which are greater than Mode
4. There is no skewness if quartiles are equidistant from the median.
5. The distribution is negatively skewed if A.M. is less than Mode.
6. The curve is not symmetrical about the median if  $AM \neq Median \neq Mode$ .

### 57.20 USES OF SKEWNESS

1. It gives the nature of the curve.
2. It gives nature and concentration of observations about the mean.

### 57.21 TYPES OF DISTRIBUTION

1. Fairly symmetrical
2. Positively skewed
3. Negatively skewed.

### 57.22 MEASURE OF SKEWNESS

Measure of skewness is known as the measure of symmetry.

There are two types of measure of skewness.

1. Absolute measure: Absolute measure = Mean – Mode
2. Relative measure : These are four types of relative measure of skewness.
  - (i) Karl Pearson's Coefficient of Skewness
  - (ii) Bowley's Coefficient of Skewness.
  - (iii) Kelly's Coefficient of Skewness and
  - (iv) Measure of skewness based on the moments.  
(Mode = 3 Median – 2 Mode)

### 57.23 KARL PEARSON'S COEFFICIENT OF SKEWNESS:

$$\begin{aligned} \text{Karl Pearson's Coefficient of Skewness} &= \frac{\text{Mean} - \text{Mode}}{\text{Standard deviation}} \\ &= \frac{\text{Mean} - (3 \text{Median} - 2 \text{Mean})}{\text{Standard deviation}} = \frac{3(\text{Mean} - \text{Median})}{\text{Standard deviation}} \end{aligned}$$

It generally lies between – 1 and 1.

If its value is zero then there is no skewness.

### 57.24 TYPES OF SKEWNESS IN TERMS OF MEAN AND MODE

1. There is no skewness in the distribution

$$S_k = 0$$

$$\Rightarrow \frac{\text{Mean} - \text{Mode}}{\text{S.D.}} = 0 \quad \Rightarrow \quad \text{Mean} - \text{Mode} = 0 \quad \Rightarrow \quad \text{Mean} = \text{Mode}.$$

2. The distribution is positively skewed if  $S_k > 0$ .

$$\frac{\text{Mean} - \text{Mode}}{\text{S.D.}} > 0 \quad \Rightarrow \quad \text{Mean} - \text{Mode} > 0 \quad \Rightarrow \quad \text{Mean} > \text{Mode}.$$

3. The distribution is negatively skewed if  $S_k < 0$

$$\Rightarrow \frac{\text{Mean} - \text{Mode}}{\text{S.D.}} < 0 \Rightarrow \text{Mean} - \text{Mode} < 0 \Rightarrow \text{Mean} < \text{Mode}$$

**Example 13.** Compute the coefficient of Skewness from the following data:

$x$	6	7	8	9	10	11	12
$f$	3	6	9	13	8	5	4

(U.P. III Semester, 2009-2010)

**Solution.** Let  $a = 9$

$x$	$f$	$d = x - 9$	$fd$	$fd^2$	$c.f.$
6	3	-3	-9	27	3
7	6	-2	-12	24	9
8	9	-1	-9	9	18
9	13	0	0	0	31
10	8	1	8	8	39
11	5	2	10	20	44
12	4	3	12	36	48
	$\Sigma f = 48$		$\Sigma fd = 0$	$\Sigma fd^2 = 124$	

$$\text{Mean} = a + \frac{\sum fd}{\sum f} = 9 + \frac{0}{48} = 9$$

Mode = Item of maximum frequency (13) = 9

$$\text{S.D.} = \sqrt{\frac{\sum fd^2}{\sum f} - \left( \frac{\sum fd}{\sum f} \right)^2} = \sqrt{\frac{124}{48} - \left( \frac{0}{48} \right)^2} = \sqrt{\frac{124}{48}} = 1.61$$

$$\text{Karl Pearson's Coefficient of Skewness} = \frac{\text{Mean} - \text{Mode}}{\text{S.D.}} = \frac{9 - 9}{1.61} = \frac{0}{1.61} = 0 \quad \text{Ans.}$$

**Example 14.** Calculate Karl Pearson's Coefficient of Skewness from the given data :

Life time in months	30-40	40-50	50-60	60-70	70-80	80-90	90-100	100-110	110-120
No. of mobile	4	6	8	26	28	12	8	5	3

**Solution.** Let  $a = 75$

Life time in months	No. of mobile ( $f$ )	Mid-value ( $x$ )	$d = x - 75$	$fd$	$fd^2$	Cumulative frequency
30 – 40	4	35	-40	-160	6400	4
40 – 50	6	45	-30	-180	5400	10
50 – 60	8	55	-20	-160	3200	18
60 – 70	26	65	-10	-260	2600	44
70 – 80	28	75	0	0	0	72
80 – 90	12	85	10	120	1200	84
90 – 100	8	95	20	160	3200	92
100 – 110	5	105	30	150	4500	97
110 – 120	3	115	40	120	4800	100
	$\Sigma f = 100$			$\Sigma fd = -210$	$\Sigma fd^2 = 31300$	

$$\text{Mean} = a + \frac{\sum fd}{\sum f} = 75 + \frac{-210}{100} = 72.9$$

$$\text{Median} = l + \frac{\frac{N}{2} - c.f.}{f} i = 70 + \frac{\frac{100}{2} - 44}{28} (10) = 70 + 2.143 = 72.143$$

$$\text{S.D.} = \sqrt{\frac{\sum fd^2}{\sum f} - \left(\frac{\sum fd}{\sum f}\right)^2} = \sqrt{\frac{31300}{100} - \left(\frac{-210}{100}\right)^2} = \sqrt{313 - 4.41}$$

$$= \sqrt{308.59} = 17.57$$

$$\text{Karl Pearson's Coefficient of Skewness} = \frac{3(\text{Mean} - \text{Median})}{\text{S.D.}} = \frac{3(72.9 - 72.143)}{17.57}$$

$$= \frac{3(0.757)}{17.57} = \frac{2.271}{17.57} = 0.1293$$

**Ans.**

$$\begin{aligned}l &= 70 \\N &= 100 \\cf &= 40 \\\sum f &= 100 \\i &= 10\end{aligned}$$

### EXERCISE 57.1

**Calculate Karl Pearson's Coefficient of Skewness from the data given below:**

1. S.D. = 6.5, AM = 29.6, mode = 27.52 **Ans.**  $S_k = 0.32$
2. Mean = 100, Variance = 35, Median = 99.61. **Ans.**  $S_k = 0.2$
3. AM = 45, Median = 48, S.D. = 22.5 **Ans.**  $S_k = -0.4$
4. The sum of the 20 observation is 300 and sum of the squares of the observation is 5000, Median = 15. **Ans.**  $S_k = 0$
5. Find the Karl Pearson's Coefficient of Skewness for the following

Years under	10	20	30	40	50	60
No. of persons	15	32	51	78	97	109

**Ans.** - 0.32

6. Calculate Karl Pearson's Coefficient of Skewness from the following data :
- |                        |     |     |     |     |     |     |      |      |
|------------------------|-----|-----|-----|-----|-----|-----|------|------|
| Cost per item (in Rs.) | 4.5 | 5.5 | 6.5 | 7.5 | 8.5 | 9.5 | 10.5 | 11.5 |
| No. of items           | 35  | 40  | 48  | 100 | 125 | 87  | 43   | 22   |

**Ans.** - 0.2445

7. From the following data calculate Karl Pearson's Coefficient of Skewness.
- |                |     |     |     |    |    |    |    |    |    |
|----------------|-----|-----|-----|----|----|----|----|----|----|
| Scores         | 0   | 10  | 20  | 30 | 40 | 50 | 60 | 70 | 80 |
| No. of players | 150 | 140 | 100 | 80 | 80 | 70 | 30 | 14 | 0  |

**Ans.** - 0.462

8. The weekly wages in Rs. of the workers in a shoe factory are given below :
- |                       |           |           |           |           |            |           |
|-----------------------|-----------|-----------|-----------|-----------|------------|-----------|
| Weekly wages (in Rs.) | 500 - 600 | 600 - 700 | 700 - 800 | 800 - 900 | 900 - 1000 | 1000-1100 |
| No. of workers        | 8         | 12        | 4         | 2         | 1          | 1         |

Calculate Karl Pearson's Coefficient of Skewness. **Ans.** 0.34

9. Which of the following two series is symmetrical :  
Series (a) : Mean = 32, Median = 34, S.D. = 20  
Series (b) : Mean = 32, Median = 36, S.D. = 25 **Ans.** series (a) is more symmetrical than series (b)
10. Karl Pearson's Coefficient of Skewness of a distribution = 0.32, Standard deviation = 6.5 A.M. = 29.6.

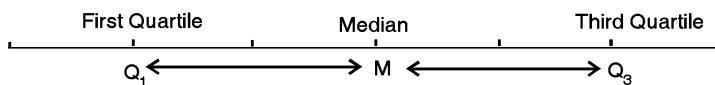

From the above data find the mode and the median for the distribution.

**Ans.** Mode = 27.52, Median = 28.91

### 57.25 BOWLEY'S COEFFICIENT OF SKEWNESS

Bowley's Coefficient of Skewness is based on the quartiles and Median. A distribution is symmetrical if the distance between the first quartile and median is equal to the distance between the median and third quartile i.e.

$$\text{Median} - Q_1 = Q_3 - \text{Median}$$

It is not so i.e.

$\text{Median} - Q_1 \neq Q_3 - \text{Median}$   
then the distribution is skewed.

### 57.26 MEASURE OF BOWLEY'S COEFFICIENT OF SKEWNESS

There are two ways to measure Bowley's Coefficient of Skewness.

1. Bowley's absolute measure of Skewness  $= Q_3 + Q_1 - 2 \text{Median}$
2. Bowley's Relative Measure of Skewness

$$\text{Bowley's Coefficient of Skewness} = \frac{Q_3 + Q_1 - 2 \text{Median}}{Q_3 - Q_1}$$

This formula is also known as Quartile Coefficient of Skewness.

### 57.27 CHARACTERISTICS OF BOWLEY'S COEFFICIENT OF SKEWNESS

1. If the distribution is open or unequal class interval then Pearson's Coefficient of Skewness cannot be calculated and Bowley's Coefficient of Skewness can be calculated.
2. Bowley's Coefficient of Skewness lies between  $-1$  and  $+1$ .
3. Bowley's measure is calculated only from the continuous distribution with exclusive classes.

### 57.28 LIMITATIONS OF BOWLEY'S COEFFICIENT OF SKEWNESS

1. It is based on the central 50% of the data and ignores the remaining 50% of the data on the extremes.
2. Bowley's formulae and Pearson's formulae cannot be compared. However if the distribution is symmetrical thus both coefficients are zero.

**Example 15.** From the following data find Bowley's Coefficient of Skewness:

$$\text{Difference of quartiles} = 80 \quad \text{Mode} = 60$$

$$\text{Sum of the quartiles} = 120 \quad \text{and Mean} = 45$$

**Solution.** Here, we have

$$Q_3 + Q_1 = 120$$

$$Q_3 - Q_1 = 80$$

$$\text{Mode} = 60$$

$$\text{Mean} = 45$$

We know that

$$\text{Mode} = 3 \text{Median} - 2 \text{Mean}$$

$$\Rightarrow 60 = 3 \text{Median} - 2(45) \Rightarrow \text{Median} = 50$$

$$\text{Bowley's Coefficient of Skewness} = \frac{Q_3 + Q_1 - 2M}{Q_3 - Q_1} = \frac{120 - 2(50)}{80} = \frac{1}{4} = 0.25 \quad \text{Ans.}$$

**Example 16.** The sum of the upper quartile and lower quartile is 100 and the median is 55.

The Bowley's Coefficient of Skewness is  $-0.6$ . Find the upper and lower quartiles.

**Solution.** We know that

$$\text{Bowley's Coefficient of Skewness} = \frac{Q_3 + Q_1 - 2M}{Q_3 - Q_1} \quad \dots (1)$$

Here,  $Q_1 + Q_3 = 100$ ,  $M = 55$ ,  $S_k = -0.6$ ,

Putting the values of  $Q_1 + Q_3$ ,  $M$  and Coefficient of Skewness in (1), we get

$$\begin{aligned} -0.6 &= \frac{100 - 2(55)}{Q_3 - Q_1} \Rightarrow -0.6 = \frac{100 - 110}{Q_3 - Q_1} \\ \Rightarrow -0.6 &= \frac{-10}{Q_3 - Q_1} \Rightarrow Q_3 - Q_1 = \frac{50}{3} \\ \text{But } Q_3 + Q_1 &= 100 \quad \dots (2) \quad \text{And } Q_3 - Q_1 = \frac{50}{3} \end{aligned}$$

$$\text{On adding, we get } 2Q_3 = \frac{500}{3} \Rightarrow Q_3 = \frac{250}{3}$$

Putting the value of  $Q_3$  in (2), we get

$$\frac{250}{3} + Q_1 = 100 \Rightarrow Q_1 = 100 - \frac{250}{3} = \frac{50}{3}$$

$$\text{Hence, } Q_1 = \frac{50}{3} \text{ and } Q_3 = \frac{250}{3}$$

**Ans.**

**Example 17.** Calculate Bowley's Coefficient of Skewness from the data given below.

No. of houses	0	1	2	3	4	5	6
No. of Airconditioners	15	20	14	25	13	8	4

**Solution.**

No. of Houses (x)	No. of Air conditioners (f)	Cumulative frequency
0	15	15
1	20	35
2	14	49
3	25	74
4	13	87
5	8	95
6	4	99

$$Q_1 = \text{size of } \frac{N+1}{4} = 25^{\text{th}} \text{ item, Hence } Q_1 = 1$$

$$Q_3 = \text{size of } \frac{3(N+1)}{4} = 75^{\text{th}} \text{ item. Hence } Q_3 = 4$$

$$\text{Median} = \text{size of } \frac{N+1}{2} = 50^{\text{th}} \text{ item. Hence Mean} = 3$$

$$\text{Bowley's Coefficient of Skewness} = \frac{Q_3 + Q_1 - 2M}{Q_3 - Q_1} = \frac{4 + 1 - 2(3)}{4 - 1} = -\frac{1}{3} = -0.33 \quad \text{Ans.}$$

**Example 18.** The following table shows the distances between the worker's residence and their office situated at Connaught Place, New Delhi.

Distances	0 – 10	10 – 20	20 – 30	30 – 40	40 – 50	50 – 60	60 – 70
No. of workers	2	5	10	15	10	4	1

Calculate the Bowley's Coefficient of Skewness.

**Solution.**

<i>Distance (x)</i>	<i>No. of workers (f)</i>	<i>c.f</i>
0 – 10	2	2
10 – 20	5	7
20 – 30	10	17
30 – 40	15	32
40 – 50	10	42
50 – 60	4	46
60 – 70	1	47

$$N = 47, \quad \frac{N+1}{4} = 12, \quad \frac{N+1}{2} = 24, \quad \frac{3(N+1)}{4} = 36$$

The class 30 – 40 is the median class

$$l = 30, \quad i = 10, \quad f = 15, \quad c.f = 17, \quad N = 47$$

$$\text{Median} = l + \frac{\frac{N+1}{4} - c.f.}{f} (i) = 30 + \frac{\frac{47+1}{4} - 17}{15} (10) = 30 + \frac{14}{3} = \frac{104}{3}$$

$$Q_1 = l + \frac{\frac{N+1}{4} - c.f.}{f} i = 20 + \frac{\frac{47+1}{4} - 7}{10} (10) = 20 + 5 = 25$$

$$Q_3 = l + \frac{3\left(\frac{N+1}{4}\right) - c.f.}{f} i = 40 + \frac{36 - 32}{10} (10) = 40 + 4 = 44$$

$$\text{Bowley's Coefficient of Skewness} = \frac{Q_3 + Q_1 - 2M}{Q_3 - Q_1} = \frac{44 + 25 - 2\left(\frac{104}{3}\right)}{44 - 25}$$

$$= \frac{69 - \frac{208}{3}}{19} = \frac{-\frac{1}{3}}{19} = -\frac{1}{57} = -0.0175 \quad \text{Ans.}$$

**EXERCISE 57.2**

1. The data for a distribution is given below :

$$Q_1 = 8.6, \quad \text{Median} = 12.3, \quad Q_3 = 14.04$$

Calculate Bowley's Coefficient of Skewness.

**Ans.** – 0.36

2. Calculate (a) Karl Pearson's Coefficient of Skewness

(b) Bowley's Coefficient of Skewness from the following data :

	City A	City B
A. M.	150	140
Median	142	155
S.D.	30	55
$Q_3$	195	260
$Q_1$	62	80

**Ans.**

	City A	City B
Karl Pearson's Coeff.	0.8	- 0.82
Bowley's Coeff.	- 0.203	0.167

3. Compute the quartile Coefficient of Skewness for the following distribution :

$x$	3 – 7	8 – 12	13 – 17	18 – 22	23 – 27	28 – 32	33 – 37	38 – 42
$f$	2	108	580	175	80	32	18	5

**Ans.** 0.119

4. Calculate Bowley's Coefficient of Skewness for the following data :

$x$	5	10	15	20	25	30	35	40	45
$f$	9	10	12	15	11	7	6	5	2

**Ans.** 0.33

5. A blood donation camp was held at Janakpuri. The distribution of the blood donor is given below :

Age in years	20 – 25	25 – 30	30 – 35	35 – 40	40 – 45	45 – 50	50 – 55	55 – 60
No. of donars	50	70	80	180	150	120	70	50

Calculate the Bowley's Coefficient of Skewness.

**Ans.** 0.232

6. Calculate Bowley's Coefficient of Skewness for the following distribution.

Classes	1 – 5	6 – 10	11 – 15	16 – 20	21 – 25	26 – 30	31 – 35
Frequency	3	4	68	30	10	6	2

Hint: First change to exclusive distribution for taking real class limit as first class 0.5 – 5.5

**Ans.** 0.262

7. The participant of different ages took part in "Marathan" race at INDIA GATE on 2nd October 2008 as follows :

Age (in years)	10 – 20	20 – 30	30 – 40	40 – 50	50 – 60	60 – 70	70 – 80
No. of participants	358	2417	976	129	62	18	10

Calculate Bowley's Coefficient of Skewness.

**Ans.** 0.131

### 57.29 KELLY'S COEFFICIENT OF SKEWNESS

Bowley's measure neglects the extreme data to measure skewness. The entire data should be taken into account in measuring skewness.

Kelly modified Bowley's measure of skewness by taking any two deciles equidistant from the median or any two percentiles equidistant from the median.

$$\text{Kelly's Coefficient of Skewness} = \frac{P_{10} + P_{90} - 2P_{50}}{P_{90} - P_{10}}$$

$$\text{Kelly's Coefficient of Skewness} = \frac{D_1 + D_9 - 2\text{Median}}{D_9 - D_1}$$

$P$  denotes percentile and  $D$  denotes decile.

We know that, Median =  $P_{50} = D_5$

Note : This method is only theoretical generally Karl Pearson's method is widely used.

**Example 19.** Calculate percentile Coefficient of Skewness from the following :

$$P_{90} = 110, \quad P_{10} = 30, \quad P_{50} = 80$$

**Solution.** Here, we have

$$P_{90} = 110, \quad P_{10} = 30, \quad P_{50} = 80$$

$$\text{Kelly's Coefficient of Skewness} = \frac{P_{90} + P_{10} - 2 \text{Median}}{P_{90} - P_{10}}$$

$$= \frac{110 + 30 - 2(80)}{110 - 30} = \frac{140 - 160}{80} = \frac{-20}{80} = \frac{-1}{4} = -0.25$$

**Ans.**

**Example 20.** Calculate Kelly's Coefficient of Skewness for the following data :

$$D_1 = 60, \quad D_9 = 290, \quad \text{Median} = 165$$

**Solution.** Here, we have

$$D_1 = 60, \quad D_9 = 290, \quad \text{Median} = 165$$

$$\text{Kelly's Coefficient of Skewness} = \frac{D_1 + D_9 - 2\text{Median}}{D_9 - D_1} \quad \dots (1)$$

Putting the values of  $D_1$ ,  $D_9$  and the median in (1), we get

$$\text{Kelly's Coefficient of Skewness} = \frac{60 + 290 - 2(165)}{290 - 60}$$

$$= \frac{350 - 330}{230} = \frac{20}{230} = \frac{2}{23} = 0.087 \quad \text{Ans.}$$

**Example 21.** The weights in kg of 9 boys in a class are : 40, 42, 45, 48, 50, 52, 55, 56, 57.

Calculate Kelly's Coefficient of Skewness based on percentiles.

**Solution.** Here, we have 40, 42, 45, 48, 50, 52, 55, 56, 57

$$n = 9$$

$$P_{10} = \text{Value of } \frac{10}{100} (n+1)^{\text{th}} \text{ observation} = \text{Value of } \frac{10}{100} (9+1)^{\text{th}} \text{ observation} \\ = \text{Value of first observation} = 40$$

$$P_{50} = \text{Value of } \frac{50}{100} (n+1)^{\text{th}} \text{ observation} = \text{Value of } \frac{50}{100} (9+1)^{\text{th}} \text{ observation} \\ = \text{Value of 5th observation} = 50$$

$$P_{90} = \text{Value of } \frac{90}{100} (n+1)^{\text{th}} \text{ observation} = \text{Value of } \frac{90}{100} (9+1)^{\text{th}} \text{ observation} \\ = \text{Value of 9th observation} = 57$$

$$\text{Now, Kelly's Coefficient of Skewness} = \frac{P_{10} + P_{90} - 2 \text{ Median}}{P_{90} - P_{10}} = \frac{40 + 57 - 2(50)}{57 - 40} \\ = \frac{97 - 100}{17} = -\frac{3}{17} = -0.176 \quad \text{Ans.}$$

**Example 22.** Calculate the Kelly's Coefficient of Skewness on the basis of percentiles for the following data.

Marks obtained	20–30	30–40	40–50	50–60	60–70	70–80	80–90	90–100
No. of students	3	8	9	14	16	18	8	4

**Solution.**

Marks	No. of students	c.f
20 – 30	3	3
30 – 40	8	11
40 – 50	9	20
50 – 60	14	34
60 – 70	16	50
70 – 80	18	68
80 – 90	8	76
90 – 100	4	80

$$P_{10} = \text{Marks of } 10 \left( \frac{N}{100} \right) \text{th student} = \text{Marks of } 10 \left( \frac{80}{100} \right) \text{th student}$$

= Marks of 8th student.  
 $P_{10}$  lies in the class 30 – 40

$$P_{10} = l + \frac{10 \left( \frac{N}{100} \right) - c.f.}{f} (i) = 30 + \frac{10 \left( \frac{80}{100} \right) - 3}{8} (10) = 30 + \frac{8 - 3}{8} (10)$$

$$= 30 + \frac{50}{8} = 36.25$$

Median = Marks of  $\frac{80}{2}$  th student = Marks obtained by 40th student

Median Class = 60 – 70.

$$\text{Median} = l + \frac{\frac{N}{2} - c.f.}{f} (i) = 60 + \frac{\frac{80}{2} - 34}{16} (10) = 60 + \frac{6}{16} (10) = 63.75$$

$P_{90}$  = Marks of  $90 \left( \frac{N}{100} \right)$  th student = Marks of  $90 \left( \frac{80}{100} \right)$  th student = Marks of 72nd student

$P_{90}$  class = 80 – 90

$$P_{90} = l + \frac{\frac{90}{100} (N) - c.f.}{f} (i) = 80 + \frac{\frac{90}{100} (80) - 68}{8} (10) = 80 + \frac{72 - 68}{8} (10) = 80 + 5 = 85$$

$$\text{Kelly's Coefficient of Skewness} = \frac{P_{10} + P_{90} - 2 \text{ Median}}{P_{90} - P_{10}}$$

$$= \frac{36.25 + 85 - 2 (63.75)}{85 - 36.25} = \frac{-6.25}{48.75} = -0.128$$

Ans.

### EXERCISE 57.3

Find Kelly's Coefficient of Skewness from the following table :

1.  $P_{10} = 25$ ,  $P_{90} = 200$ , Median = 100 Ans. 0.143  
 2.  $D_1 = 15.5$ ,  $D_9 = 120.5$ , Median = 70 Ans. - 0.038

$x$	2.5	3.5	12.5	17.5
c.f.	7	18	25	30

On the basis of deciles.

Ans. 0.866

Rate (in Rs.)	Below 10	10 – 20	20 – 40	40 – 60	60 – 80	above 80
No. of workers	8	10	22	35	20	5

on the basis of deciles.

Ans. - 0.07

Wages (in Rs.)	800-900	900-1000	1000-1100	1100-1200	1200-1300	1300-1400	1400-1500
No. of workers	10	33	47	110	160	80	60

on the basis of percentiles.

Ans. - 0.07

### 57.30 MOMENTS

The  $r$ th moment of a variable  $x$  about the mean  $\bar{x}$  is usually denoted by  $\mu_r$  is given by

$$\mu_r = \frac{1}{N} \sum f_i (x_i - \bar{x})^r, \quad \sum f_i = N$$

The  $r$ th moment of a variable  $x$  about any point  $a$  is defined by  $\mu'_r = \frac{1}{N} \sum f_i (x_i - a)^r$

### 57.31 MOMENT ABOUT MEAN

Let  $\bar{x}$  be the arithmetic mean, then

$$\mu_r = \frac{1}{N} \sum_{i=1}^n f_i (x_i - \bar{x})^r, \quad r = 0, 1, 2, \dots$$

where,  $N = \sum_{i=1}^n f_i$

If  $r = 0$ ,  $\mu_0 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - \bar{x})^0 = 1$

If  $r = 1$ ,  $\mu_1 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - \bar{x})^1 = 0$

If  $r = 2$ ,  $\mu_2 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - \bar{x})^2$  [ $\mu_2$  = variance]

If  $r = 3$ ,  $\mu_3 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - \bar{x})^3$

If  $r = 4$ ,  $\mu_4 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - \bar{x})^4$

### 57.32 MOMENTS ABOUT ANY NUMBER (RAW MOMENTS)

Let  $a$  be an arbitrary number then

$$\mu'_r = \frac{1}{N} \sum_{i=1}^n f_i (x_i - a)^r, \quad r = 0, 1, 2, \dots$$

where  $N = \sum_{i=1}^n f_i$

If  $r = 0$ ,  $\mu'_0 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - a)^0 = 1$

If  $r = 1$ ,  $\mu'_1 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - a)^1$   
 $= \frac{1}{N} \sum_{i=1}^n f_i x_i - \frac{a}{N} \sum_{i=1}^n f_i$   
 $= \bar{x} - a$

$$\left[ \because \sum_{i=1}^n f_i = N \right]$$

If  $r = 2$ ,  $\mu'_2 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - a)^2$

If  $r = 3$ ,  $\mu'_3 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - a)^3$

If  $r = 4$ ,  $\mu'_4 = \frac{1}{N} \sum_{i=1}^n f_i (x_i - a)^4$

.....

.....

### 57.33 MOMENT ABOUT THE ORIGIN

$$v_r = \frac{1}{N} \sum_{i=1}^n f_i x_i^r$$

$$\text{If } r = 0, \quad v_0 = \frac{1}{N} \sum_{i=1}^n f_i x_i^0 = 1$$

$$\text{If } r = 1, \quad v_1 = \frac{1}{N} \sum_{i=1}^n f_i x_i = \bar{x}$$

$$\text{If } r = 2, \quad v_2 = \frac{1}{N} \sum_{i=1}^n f_i x_i^2$$

$$\text{If } r = 3, \quad v_3 = \frac{1}{N} \sum_{i=1}^n f_i x_i^3$$

$$\text{If } r = 4, \quad v_4 = \frac{1}{N} \sum_{i=1}^n f_i x_i^4$$

.....

.....

### 57.34 RELATION BETWEEN $\mu_r$ AND $\mu'_r$ :

We have,

$$\begin{aligned} \mu_r &= \frac{1}{N} \sum_{i=1}^n f_i (x_i - \bar{x})^r \\ &= \frac{1}{N} \sum_{i=1}^n f_i [(x_i - a) - (x - a)]^r \\ &\quad - \frac{1}{N} \sum_{i=1}^n f_i [(x_i - a) - \mu'_1]^r \quad [\mu'_1 = x - a] \end{aligned}$$

On expanding by Binomial theorem,

$$\begin{aligned} &= \frac{1}{N} \sum_{i=1}^n f_i [(x_i - a)^r - {}^r C_1 (x_i - a)^{r-1} \mu'_1 + {}^r C_2 (x_i - a)^{r-2} \mu'_1^2 \\ &\quad - \dots + (-1)^r \mu'_1^r] \end{aligned}$$

$$\mu_r = \mu'_r - {}^r C_1 \mu'_{r-1} \mu'_1 + {}^r C_2 \mu'_{r-2} \mu'_1^2 - \dots + (-1)^r \mu'_1^r$$

Putting  $r = 2, 3, 4, \dots$  we get

$$\mu_2 = \mu'_2 - 2\mu'_1^2 + \mu'_1^2 = \mu_2^1 - \mu'_1^2 \quad [\because \mu_0^1 = 1]$$

$$\mu_3 = \mu'_3 - 3\mu'_2 \mu'_1 + 3\mu'_1^3 - \mu'_1^3$$

$$= \mu'_3 - 3\mu'_2 \mu'_1 + 2\mu'_2^3$$

$$\mu_4 = \mu'_4 - 4\mu'_3 \mu'_1 + 6\mu'_2 \mu'_1^2 - 3\mu'_1^4$$

Thus, we have the following relations:

$$\mu_1 = 0$$

$$\mu_2 = \mu'_2 - \mu'^2_1$$

$$\mu_3 = \mu'_3 - 3\mu'_2\mu'_1 + 2\mu'^3_1$$

$$\mu_4 = \mu'_4 - 4\mu'_3\mu'_1 + 6\mu'_2\mu'^2_1 - 3\mu'^4_1$$

**Note.** 1. The sum of the coefficients of the various terms on the R.H.S. is zero.

2. The dimension of each term on R.H.S. is the same as that of terms on the L.H.S.

3. The number of terms on R.H.S. = order of the moment on L.H.S.

**Conversely**

$$\begin{aligned} \mu'_r &= \frac{1}{N} \sum f_i (x_i - a)^r \\ &\quad - \frac{1}{N} \sum f_i (\bar{x} - \bar{x} + \bar{x} - a)^r \\ &\quad - \frac{1}{N} \left[ \sum f_i (x_i - \bar{x})^r + {}^r C_1 \sum f_i (x_i - \bar{x})^{r-1} (\bar{x} - a) + {}^r C_2 \sum f_i (x_i - \bar{x})^{r-2} (\bar{x} - a)^2 \right. \\ &\quad \quad \quad \ldots + {}^r C_{r-1} \sum f_i (x_i - \bar{x}) (\bar{x} - a)^{r-1} + \left. \sum f_i (\bar{x} - a)^r \right] \\ &= \frac{1}{N} \sum f_i (x_i - \bar{x})^r + {}^r C_1 \frac{1}{N} \sum f_i (x_i - \bar{x})^{r-1} (\bar{x} - a) \\ &\quad + {}^r C_2 \frac{1}{N} \sum f_i (x_i - \bar{x})^{r-2} (\bar{x} - a)^2 + \dots + {}^r C_{r-1} \frac{1}{N} \sum f_i (x_i - \bar{x}) (\bar{x} - a)^{r-1} \\ &\quad \quad \quad + \frac{1}{N} \sum f_i (\bar{x} - a)^r \end{aligned}$$

$$\Rightarrow \mu'_r = \mu_r + r \mu_{r-1} \mu'_1 + \frac{r(r-1)}{2} \mu_{r-2} \mu'^2_1 + \dots + r \mu_1 \mu'^{r-1}_1 + \mu'^r_1$$

$$\text{If } r = 1 \quad \mu'_1 = x - a - \mu_1 - a$$

$$\begin{aligned} \text{If } r = 2, \quad \mu'_2 &= \mu_2 + 2\mu_1 \mu'_1 + \mu'^2_1 = \\ &= \mu_2 + 0 + \mu'^2_1 \end{aligned}$$

$[\mu_1 = 0]$

$$\Rightarrow \mu'_2 = \mu_2 + \mu'^2_1$$

$$\begin{aligned} \text{If } r = 3, \quad \mu'_3 &= \mu_3 + 3\mu_2 \mu'_1 + 3\mu_1 \mu'^2_1 + \mu'^3_1 \\ &= \mu_3 + 3\mu_2 \mu'_1 + 0 + \mu'^3_1 \end{aligned}$$

$[\mu_1 = 0]$

$$\Rightarrow \mu'_3 = \mu_3 + 3\mu_2 \mu'_1 + \mu'^3_1$$

$$\begin{aligned} \text{If } r = 4, \quad \mu'_4 &= \mu_4 + 4\mu_3 \mu'_1 + 6\mu_2 \mu'^2_1 + 4\mu_1 \mu'^3_1 + \mu'^4_1 \\ &= \mu_4 + 4\mu_3 \mu'_1 + 6\mu_2 \mu'^2_1 + 0 + \mu'^4_1 \end{aligned}$$

$$\therefore \mu'_4 = \mu_4 + 4\mu_3 \mu'_1 + 6\mu_2 \mu'^2_1 + \mu'^4_1$$

$$\boxed{\mu'_1 = \mu_1 - a}$$

$$\boxed{\mu'_2 = \mu_2 + \mu'^2_1}$$

$$\boxed{\mu'_3 = \mu_3 + 3\mu_2 \mu'_1 + \mu'^3_1}$$

$$\boxed{\mu'_4 = \mu_4 + 4\mu_3 \mu'_1 + 6\mu_2 \mu'^2_1 + \mu'^4_1}$$

### 57.35 RELATION BETWEEN $v_r$ AND $\mu_r$

$$v_r = \frac{1}{N} \sum_{i=1}^n f_i x_i^r ; \quad r = 0, 1, 2, \dots$$

$$= \frac{1}{N} \sum_{i=1}^n f_i (x_i - a + a)^r$$

On expanding by binomial theorem, we have

$$\begin{aligned} & -\frac{1}{N} \sum_{i=1}^n f_i [(x_i - a)^r + {}^r C_1 (x_i - a)^{r-1} a + \dots + a^r] \\ & = \mu'_r + {}^r C_1 \mu'_{r-1} a + \dots + a^r \end{aligned}$$

On putting  $a = \bar{x}$ , we get  $v_r = \mu_r + {}^r C_1 \mu'_{r-1} \bar{x} + {}^r C_2 \mu'_{r-2} \bar{x}^2 + \dots + \bar{x}^r$  ... (1)

On taking  $r = 1, 2, 3, 4$  in (1), we get

$$\begin{aligned} v_1 &= \mu_1 + \mu_0 \bar{x} = \bar{x} \quad [\mu_1 = 0, \mu_0 = 1] \\ v_2 &= \mu_2 + {}^2 C_1 \mu_1 \bar{x} + {}^2 C_2 \mu_0 \bar{x}^2 = \mu_2 + \bar{x}^2 \\ v_3 &= \mu_3 + {}^3 C_1 \mu_2 \bar{x} + {}^3 C_2 \mu_1 \bar{x}^2 + {}^3 C_3 \mu_0 \bar{x}^3 = \mu_3 + 3\mu_2 \bar{x} + \bar{x}^3 \\ v_4 &= \mu_4 + {}^4 C_1 \mu_3 \bar{x} + {}^4 C_2 \mu_2 \bar{x}^2 + {}^4 C_3 \mu_1 \bar{x}^3 + {}^4 C_4 \mu_0 \bar{x}^4 \\ &= \mu_4 + 4\mu_3 \bar{x} + 6\mu_2 \bar{x}^2 + \bar{x}^4 \end{aligned}$$

$$v_1 = \bar{x}$$

$$v_2 = \mu_2 + \bar{x}^2$$

$$v_3 = \mu_3 + 3\mu_2 \bar{x} + \bar{x}^3$$

$$v_4 = \mu_4 + 4\mu_3 \bar{x} + 6\mu_2 \bar{x}^2 + \bar{x}^4$$

### 57.36 MEASURE OF SKEWNESS BASED ON MOMENT

1. Measure of skewness is given by  $\beta_1$  where

$$\beta_1 = \frac{\mu_3^2}{\mu_2^3}$$

Karl Pearson's coefficient of skewness =  $\pm \frac{\mu_3}{\mu_2^{3/2}}$

The sign of Karl Pearson's coefficient of skewness is determined from the sign of  $\mu_3$ .

2. Measure of Kurtosis is given by  $\beta_2$ , where

$$\beta_2 = \frac{\mu_4}{\mu_2^2}$$

3. Gamma Coefficients

$$\gamma_1 = \pm \sqrt{\beta_1}$$

$$\gamma_2 = \beta_2 - 3$$

**Example 23.** Find the relation between moment about the mean and moment about any arbitrary point. The first four moments of a distribution about the value 4 of the variate are  $-1.5, 17, -30$  and  $108$ . Calculate the first four moments about the mean and find  $\beta_1$  and  $\beta_2$ . (Uttarakhand, III Semester, 2008)

**Solution.** We have,

$$a = 4, \mu'_1 = -1.5, \mu'_2 = 17, \mu'_3 = -30 \text{ and } \mu'_4 = 108$$

Moment about the mean

$$\mu_1 = 0$$

$$\mu_2 = \mu'_2 - (\mu'_1)^2 = 17 - (-1.5)^2 = 17 - 2.25 = 14.75$$

$$\begin{aligned}\mu_3 &= \mu'_3 - 3\mu'_2 \mu'_1 + 2(\mu'_1)^3 \\ &= -30 - 3(17)(-1.5) + 2(-1.5)^3 = -30 + 76.5 - 6.75 \\ &= 39.75\end{aligned}$$

$$\begin{aligned}\mu_4 &= \mu'_4 - 4\mu'_3 \mu'_1 + 6\mu'_2 \mu'_1^2 - 3\mu'_1^4 \\ &= 108 - 4(-30)(-1.5) + 6(17)(-1.5)^2 - 3(-1.5)^4 \\ &= 108 - 180 + 229.5 - 15.19 = 142.31\end{aligned}$$

$$\beta_1 = \frac{(\mu_3)^2}{(\mu_2)^3} = \frac{(39.75)^2}{(14.75)^3} = \frac{1580.06}{3209.05} = 0.4924$$

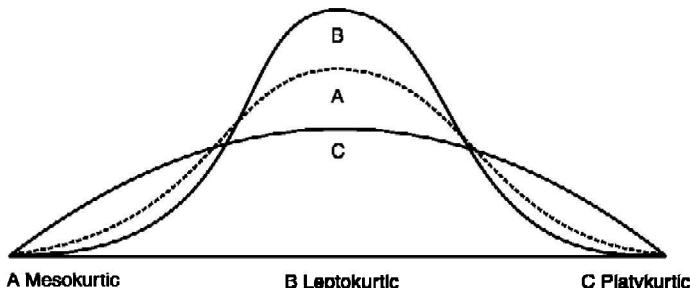

$$\beta_2 = \frac{\mu_4}{(\mu_2)^2} = \frac{142.31}{(14.75)^2} = \frac{142.31}{217.56} = 0.6541$$

**Ans.****57.37 KURTOSIS**

(U.P. III, Semester Dec. 2006)

It measures the degree of peakedness of a distribution and is given by Measure of kurtosis

$$\beta_2 = \frac{\mu_4}{\mu_2^2}, \quad \mu_2 = \frac{\sum (x - \bar{x})^2}{N}, \quad \mu_4 = \frac{\sum (x - \bar{x})^4}{N}$$

If  $\beta_2 = 3$ , the curve is normal or mesokurtic.If  $\beta_2 > 3$ , the curve is peaked or leptokurtic.If  $\beta_2 < 3$ , the curve is flat topped or platykurtic.

$$\gamma_2 = \beta_2 - 3$$

**57.38 GROUPING ERROR AND ITS SHEPPARD'S CORRECTIONS (FOR MOMENTS)**

If the distribution is not symmetrical and the number of class intervals is greater than  $\frac{1}{20}$ th of the range, then the computation of moments will have an error known as grouping error.

$$\mu_2 (\text{corrected}) = \mu_2 - \frac{h^2}{12}$$

$$\mu_4 (\text{corrected}) = \mu_4 - \frac{1}{2} h^2 \mu_2 + \frac{7}{240} h^4$$

where  $h$  is the width of the class-interval while  $\mu_1$  and  $\mu_3$  require no correction.These formulae are known as **Sheppard's corrections**.

**Example 24.** Find the corrected values of the following moments using Sheppard's correction. The width of classes in the distribution is 10 :

$$\mu_2 = 210, \quad \mu_3 = 460, \quad \mu_4 = 96700, \quad h = 12$$

**Solution.** We have,

$$\mu_2 = 210, \quad \mu_3 = 460, \quad \mu_4 = 96700, \quad h = 12$$

$$\text{corrected } \mu_2 = \mu_2 - \frac{h^2}{12} = 210 - \frac{(12)^2}{12} = 210 - 12 = 198$$

$$\text{corrected } \mu_3 = 460$$

$$\text{corrected } \mu_4 = \mu_4 - \frac{1}{2} h^2 \mu_2 + \frac{7}{240} h^4$$

$$= 96700 - \frac{(12)^2}{2} (210) + \frac{7}{240} (12)^4$$

$$= 96700 - 15120 + 604.8 = 82184.8$$

**Ans.**

**Example 25.** Calculate the variance and third central moment from the following data :

$x_i$	0	1	2	3	4	5	6	7	8
$f_i$	1	9	26	59	72	52	29	7	1

(U.P. III Semester Dec. 2005)

**Solution.** Let mean = 4

$x_i$	$f_i$	$x_i - 4$	$f_i (x_i - 4)$	$f_i (x_i - 4)^2$	$f_i (x_i - 4)^3$
0	1	-4	-4	16	-64
1	9	-3	-27	81	-243
2	26	-2	-52	104	-208
3	59	1	59	59	59
4	72	0	0	0	0
5	52	1	52	52	52
6	29	2	58	116	232
7	7	3	21	63	189
8	1	4	4	16	64
	$\sum f_i = 256$		$\sum f_i (x_i - 4) = -7$	$\sum f_i (x_i - 4)^2 = 507$	$\sum f_i (x_i - 4)^3 = -37$

$$\mu'_1 = \frac{\sum f_i (x_i - 4)}{\sum f_i} = \frac{-7}{256}$$

$$\mu'_2 = \frac{\sum f_i (x_i - 4)^2}{\sum f_i} = \frac{507}{256}$$

$$\mu'_3 = \frac{\sum f_i (x_i - 4)^3}{\sum f_i} = \frac{-37}{256}$$

$$\mu_2 = \mu'^2 - \mu'^2 = \frac{507}{256} - \left( \frac{-7}{256} \right)^2 = 1.98047 - 0.00075 = 1.97972$$

$$\mu_2 = \mu'_2 \quad \mu'^2_1 = \frac{507}{256} \quad \left(\frac{7}{256}\right)^2 = 1.98047 \quad 0.00075 = 1.97972$$

$$\begin{aligned}\mu_3 &= \mu'_3 - 3\mu'_2 \cdot \mu'_1 + 2(\mu'_1)^3 \\ &= \frac{-37}{256} - 3\left(\frac{507}{256}\right)\left(-\frac{7}{256}\right) + 2\left(-\frac{7}{256}\right)^3 \\ &= -0.14453 + 0.16246 - 0.00004 \\ &= 0.01789\end{aligned}$$

**Ans.**

**Example 26.** Calculate  $\mu_1, \mu_2, \mu_3, \mu_4$  for the following frequency distribution :

Marks	0-10	10-20	20-30	30-40	40-50	50-60
No. of students	1	6	10	15	11	7

**Solution.**

Marks	No. of students $f$	Mid value $x$	$fx$	$x - \bar{x}$	$f(x - \bar{x})$	$f(x - \bar{x})^2$	$f(x - \bar{x})^3$	$f(x - \bar{x})^4$
0-10	1	5	5	-30	-30	900	-27000	810000
10-20	6	15	90	-20	-120	2400	-48000	960000
20-30	10	25	250	-10	-100	1000	-10000	100000
30-40	15	35	525	0	0	0	0	0
40-50	11	45	495	10	110	1100	11000	110000
50-60	7	55	385	20	140	2800	56000	1120000
$\Sigma f = 50$			$\Sigma fx = 1750$		$\Sigma f(x - \bar{x}) = 0$	$\Sigma f(x - \bar{x})^2 = 8200$	$\Sigma f(x - \bar{x})^3 = -18000$	$\Sigma f(x - \bar{x})^4 = 3100000$

$$\bar{x} = \frac{\Sigma fx}{\Sigma f} = \frac{1750}{50} = 35$$

$$\mu_1 = \frac{\Sigma f(x - \bar{x})}{\Sigma f} = \frac{0}{50} = 0$$

$$\mu_2 = \frac{\Sigma f(x - \bar{x})^2}{\Sigma f} = \frac{8200}{50} = 164$$

$$\mu_3 = \frac{\Sigma f(x - \bar{x})^3}{\Sigma f} = \frac{-18000}{50} = -360$$

$$\mu_4 = \frac{\Sigma f(x - \bar{x})^4}{\Sigma f} = \frac{3100000}{50} = 62000$$

**Ans.**

**Example 27.** Find out the kurtosis of the data given below :

Class-interval	0-10	10-20	20-30	30-40
Frequency	1	3	4	2

**Solution.** Let assumed mean be 25

Class	Frequency $f_i$	Mid value $x_i$	$x_i - 25$	$f_i(x_i - 25)$	$f_i(x_i - 25)^2$	$f_i(x_i - 25)^3$	$f_i(x_i - 25)^4$
0-10	1	5	-20	-20	400	-8000	160000
10-20	3	15	-10	-30	300	-3000	30000
20-30	4	25	0	0	0	0	0
30-40	2	35	10	20	200	2000	20000
	$\Sigma f = 10$			$\Sigma f_i(x_i - 25) = -30$	$\Sigma f_i(x_i - 25)^2 = 900$	$\Sigma f_i(x_i - 25)^3 = -9000$	$\Sigma f_i(x_i - 25)^4 = 210000$

$$\mu'_1 = \frac{\sum f_i (x_i - 25)}{\sum f_i} = \frac{-30}{10} = -3$$

$$\mu'_2 = \frac{\sum f_i (x_i - 25)^2}{\sum f_i} = \frac{900}{10} = 90$$

$$\mu'_3 = \frac{\sum f_i (x_i - 25)^3}{\sum f_i} = \frac{-9000}{10} = -900$$

$$\mu'_4 = \frac{\sum f_i (x_i - 25)^4}{\sum f_i} = \frac{210000}{10} = 21000$$

$$\mu_2 = \mu'_2 - \mu'_1^2 = 90 - (-3)^2 = 90 - 9 = 81 \quad [\text{Article 57.34 on page 1560}]$$

$$\mu_4 = \mu'_4 - 4\mu'_3\mu'_1 + 6\mu'_2\mu'_1^2 - 3\mu'_1^4$$

$$= 21000 - 4(-900)(-3) + 6(90)(-3)^2 - 3(-3)^4$$

$$= 21000 - 10800 + 4860 - 243 = 14,817$$

$$\beta_2 = \frac{\mu_4}{\mu_2^2} = \frac{14,817}{(81)^2} = \frac{14,817}{6561} = 2.258$$

$$\gamma_2 = \beta_2 - 3 = 2.258 - 3 = -0.742$$

**Ans.**

**Example 28.** Calculate the first four moments of the following data. Also make sheppard's correction.

Values	10-20	30-30	30-30	40-50	50-60	60-70	70-80
Frequency	1	20	69	108	78	22	2

**Solution. Calculation of Moments**

Values	$f$	$x$	$d = x - 45$	$\frac{x-45}{10}$	$f_i \left( \frac{x-45}{10} \right)$	$f_i \left( \frac{x-45}{10} \right)^2$	$f_i \left( \frac{x-45}{10} \right)^3$	$f_i \left( \frac{x-45}{10} \right)^4$
10–20	1	15	-30	-3	-3	9	-27	81
20–30	20	25	-20	-2	-40	80	-160	320
30–40	69	35	-10	-1	-69	69	-69	69
40–50	108	45	0	0	0	0	0	0
50–60	78	55	10	1	78	78	78	78
60–70	22	65	20	2	44	88	176	352
70–80	2	75	30	3	6	18	54	162
$N = 300$					$\sum f_i \left( \frac{x-45}{10} \right) = 16$	$\sum f_i \left( \frac{x-45}{10} \right)^2 = 342$	$\sum f_i \left( \frac{x-45}{10} \right)^3 = 52$	$\sum f_i \left( \frac{x-45}{10} \right)^4 = 1062$

Now

$$\mu'_1 = \frac{1}{N} \sum f_i \left( \frac{x-45}{10} \right) \cdot 10 = \left( \frac{16}{300} \right) 10 = 0.53$$

$$\mu'_2 = \frac{1}{N} \sum f_i \left( \frac{x-45}{10} \right)^2 \cdot 10^2 = \left( \frac{342}{300} \right) (10)^2 = 114$$

$$\mu'_3 = \frac{1}{N} \sum f_i \left( \frac{x-45}{10} \right)^3 \cdot 10^3 = \left( \frac{52}{300} \right) (10)^3 = 173.33$$

$$\mu'_4 = \frac{1}{N} \sum f_i \left( \frac{x-45}{10} \right)^4 \cdot 10^4 = \left( \frac{1062}{300} \right) (10)^4 = 35400.$$

Moments about mean

$$\mu_1 = 0 \text{ (always)}$$

$$\mu_2 = \mu'_2 - \mu'_1^2 = 114 - (0.53)^2 = 113.72$$

$$\mu_3 = \mu'_3 - 3\mu'_2 \mu'_1 + 2\mu'_1^3 = 173.33 - 3(114)(0.53) + 2(0.53)^3 = -7.63$$

$$\mu_4 = \mu'_4 - 4\mu'_3 \mu'_1 + 6\mu'_2 \mu'_1^2 - 3\mu'_1^4 \quad [\text{Article 57.34 on page 1560}]$$

$$= 35400 - 4(173.33)(0.53) + 6(114)(0.53)^2 - 3(0.53)^4 = 35224.44.$$

Sheppard's Correction,  $h = 10$ 

$$\mu_1 \text{ (Corrected)} = \mu_1 = 0$$

$$\mu_2 \text{ (Corrected)} = \mu_2 - \frac{h^2}{12} = 113.72 - \frac{(10)^2}{12} = 105.39$$

$$\mu_3 \text{ (Corrected)} = \mu_3 = -7.63$$

$$\mu_4 \text{ (Corrected)} = \mu_4 - \frac{1}{2} h^2 \mu_2 + \frac{7}{240} h^4$$

$$= 35224.44 - \frac{1}{2} (10)^2 (113.72) + \frac{7}{240} (10)^4 = 29830.11$$

Ans.

**Example 29.** The first four moments of a distribution about the value 4 of the variable are  $-1.5, 17, -30$  and  $108$ . Find the moments about mean,  $\beta_1$  and  $\beta_2$ .

Find also the moments about (i) the origin, and (ii) the point  $x = 2$ .

(U.P. III, Semester Dec. 2006)

**Solution.** In the usual notation, we are given assumed mean  $a = 4$  and

$$\mu'_1 = -1.5, \mu'_2 = 17, \mu'_3 = -30 \text{ and } \mu'_4 = 108.$$

(a) Moments about mean:

$$\begin{aligned}\mu_2 &= \mu'_2 - \mu'_1^2 = 17 - (-1.5)^2 = 17 - 2.25 = 14.75 \\ \mu_3 &= \mu'_3 - 3\mu'_2 \mu'_1 + 2\mu'_1^3 \quad [\text{Article 57.34 on page 1560}] \\ &= -30 - 3 \times (17) \times (-1.5) + 2(-1.5)^3 \\ &= -30 + 76.5 - 6.75 = 39.75 \\ \mu_4 &= \mu'_4 - 4\mu'_3 \mu'_1 + 6\mu'_2 \mu'_1^2 - 3\mu'_1^4 \\ &= 108 - 4(-30)(-1.5) + 6(17)(-1.5)^2 - 3(-1.5)^4 \\ &= 108 - 180 + 229.5 - 15.1875 = 142.3125\end{aligned}$$

Hence  $\beta_1 = \frac{\mu_3^2}{\mu_2^3} = \frac{(39.75)^2}{(14.75)^3} = 0.4924$

$$\beta_2 = \frac{\mu_4}{\mu_2^2} = \frac{142.3125}{(14.75)^2} = 0.6541$$

Also  $\bar{x} = a + \mu'_1 = 4 + (-1.5) = 2.5$

(b) *Moments about origin.*

We have moments about  $x$

$$\bar{x} = 2.5, \mu_2 = 14.75, \mu_3 = 39.75 \text{ and } \mu_4 = 142.31 \text{ (approx.)}$$

We know that  $\bar{x} = a + \mu'_1$ , where  $\mu'_1$  is the first moment about the point  $x = a$ .

Taking  $a = 0$ , we get the first moment about origin as  $\mu'_1 = \bar{x} = \text{mean} = 2.5$ .

[Using Article 57.35 of page 1561]

$$\begin{aligned}v_1 &= \bar{x} = 2.5 \\ v_2 &= \mu_2 + (\bar{x})^2 = 14.75 + (2.5)^2 = 14.75 + 6.25 = 21 \\ v_3 &= \mu_3 + 3\mu_2 \bar{x} + (\bar{x})^3 - 39.75 + 3(14.75)(2.5) + (2.5)^3 \\ &\quad - 39.75 + 110.625 + 15.625 - 166 \\ v_4 &= \mu_4 + 4\mu_3 \bar{x} + 6\mu_2 (\bar{x})^2 + (\bar{x})^4 \\ &\quad - 142.3125 + 4(39.75)(2.5) + 6(14.75)(2.5)^2 + (2.5)^4 \\ &= 142.3125 + 397.5 + 553.125 + 39.0625 \\ &= 1132.\end{aligned}$$

*Moments about the point  $x = 2$ .*

We have  $\bar{x} = a + \mu'_1$ . Taking  $a = 2$ , the first moment about the point  $x = 2$  is

$$\mu'_1 = \bar{x} - 2 = 2.5 - 2 = 0.5 \quad [\text{Converse of Art. 57.34 on page 1560}]$$

Hence,  $\mu'_2 = \mu_2 + \mu'_1^2 - 14.75 + 0.25 - 15$

$$\begin{aligned}\mu'_3 &= \mu_3 + 3\mu_2 \mu'_1 + \mu'_1^3 = 39.75 + 3(14.75)(0.5) + (0.5)^3 \\ &\quad - 39.75 + 22.125 + 0.125 - 62\end{aligned}$$

$$\begin{aligned}\mu'_4 &= \mu_4 + 4\mu_3\mu'_1 + 6\mu_2\mu'^2_1 + \mu'^4_1 \\ &= 142.3125 + 4(39.75)(0.5) + 6(14.75)(0.5)^2 + (0.5)^4 \\ &= 142.3125 + 79.5 + 22.125 + 0.0625 = 244\end{aligned}$$

Ans.

**Example 30.** The first three moments about the origin are given by

$$\mu'_1 = \frac{n+1}{2}, \quad \mu'_2 = \frac{(n+1)(2n+1)}{6} \text{ and } \mu'_3 = \frac{n(n+1)^2}{4}$$

Examine the skewness of the data.

**Solution.**

$$\begin{aligned}\mu'_1 &= \frac{n+1}{2}, \quad \mu'_2 = \frac{(n+1)(2n+1)}{6}, \quad \mu'_3 = \frac{n(n+1)^2}{4} \\ \mu_2 &= \mu'_2 - \mu'^2_1 \\ &\quad - \frac{(n+1)(2n+1)}{6} - \frac{(n+1)^2}{4} \\ &= \frac{2(2n^2 + 3n + 1) - 3(n^2 + 2n + 1)}{12} = \frac{n^2 - 1}{12} \\ \mu_3 &= \mu'_3 - 3\mu'_2\mu'_1 + 2\mu'^3_1 \\ &\quad - \frac{n(n+1)^2}{4} - \frac{3(n+1)(2n+1)}{6} \times \frac{(n+1)}{2} + 2\left(\frac{n+1}{2}\right)^3 \\ &= \frac{n^3 + 2n^2 + n}{4} - \frac{2n^3 + 5n^2 + 4n + 1}{4} + \frac{n^3 + 3n^2 + 3n + 1}{4} \\ &= 0\end{aligned}$$

$$\text{Coefficient of skewness} = \gamma_1 = \frac{\mu_3}{\sqrt{\mu_2^3}} = \frac{0}{\sqrt{\mu_2^3}} = 0$$

The data is symmetrical.

Ans.

**Example 31.** The first three moments of a distribution, about the value '2' of the variable are 1, 16 and -40. Show that the mean is 3, variance is 15 and  $\mu_3 = -86$ .**Solution.** We have

$$a = 2, \quad \mu'_1 = 1, \quad \mu'_2 = 16 \text{ and } \mu'_3 = -40$$

$$\text{We know that } \mu'_1 - x - a \Rightarrow x - \mu'_1 + a = 1 + 2 - 3$$

$$\text{Variance} = \mu_2 = \mu'_2 - \mu'^2_1 = 16 - (1)^2 = 15$$

$$\mu_3 = \mu'_3 - 3\mu'_2\mu'_1 + 2\mu'^3_1 = -40 - 3(16)(1) + 2(1)^3 = -40 - 48 + 2 = -86.$$

**Example 32.** The first four moments of a distribution, about the value '35' are -1.8, 240, -1020 and 144000. Find the values of  $\mu_1, \mu_2, \mu_3, \mu_4$ .**Solution.** We have,

$$\mu'_1 = -1.8, \quad \mu'_2 = 240, \quad \mu'_3 = -1020, \quad \mu'_4 = 144000$$

$$\mu_1 = 0$$

$$\mu_2 = \mu'_2 - \mu'^2_1 = 240 - (-1.8)^2 = 236.76 \quad (\text{Article 57.34 on page 1560})$$

$$\mu_3 = \mu'_3 - 3\mu'_2\mu'_1 + 2\mu'^3_1 = -1020 - 3(240)(-1.8) + 2(-1.8)^3 = 264.36$$

$$\mu_4 = \mu'_4 - 4\mu'_3\mu'_1 + 6\mu'_2\mu'^2_1 - 3\mu'^4_1$$

$$= 144000 - 4(-1020)(-1.8) + 6(240)(-1.8)^2 - 3(-1.8)^4 = 141290.11.$$

Ans.

**Example 33.** For a distribution, the mean is 10, variance is 16,  $\gamma_1$  is 1, and  $\beta_2$  is 4. Find the first four moments about the origin.

**Solution.** We have,

$$x = 10, \mu_2 = 16, \gamma_1 = 1, \beta_2 = 4$$

$$\text{Now, } \gamma_1 = 1 \rightarrow \sqrt{\beta_1} = 1 \rightarrow \beta_1 = 1$$

$$\Rightarrow \beta_1 = 1 \Rightarrow \frac{\mu_3^2}{\mu_2^3} = 1 \Rightarrow \mu_3^2 = \mu_2^3 = (16)^3 = (64)^2$$

$$\Rightarrow \mu_3^2 = (64)^2 \Rightarrow \mu_3 = 64$$

$$\text{and } \mu_2^3 = (16)^3 \rightarrow \mu_2 = 16$$

$$\beta_2 = 4$$

$$\Rightarrow \frac{\mu_4}{\mu_2^2} - 4 \Rightarrow \mu_4 - 4(16)^2 = 1024$$

#### Moments about the origin

$$\nu_1 = \bar{x} = 10 \quad (\text{See Art. 57.33 on page 1560})$$

$$\nu_2 = \mu_2 + x^2 = 16 + 100 = 116$$

$$\nu_3 = \mu_3 + 3\mu_2 \bar{x} + \bar{x}^3 = 64 + 3(16)(10) + (10)^3 = 64 + 480 + 1000 = 1544$$

$$\nu_4 = \mu_4 + 4\mu_3 \bar{x} + 6\mu_2 \bar{x}^2 + \bar{x}^4 = 1024 + 4(64)(10) + 6(16)(100) + (10)^4$$

$$= 1024 + 2560 + 9600 + 10000 = 23184$$

**Ans.**

#### EXERCISE 57.4

1. Find the mean and s.d. of the following series:

Expenditure	No. of students
Below Rs. 5	6
" 10	16
" 15	28
" 20	38
" 25	46

**Ans.** Mean = Rs. 1293, S.D. = Rs. 6.41

2. Calculate the arithmetic mean and the standard deviation of the following values of the world's annual gold output (in millions of pounds) for 10 different years:

Year	94	95	96	93	87	79	73	69	68	67
Gold output	78	82	83	89	95	103	108	117	130	97

**Ans.** Mean = 80.50, standard deviation = 9.27

3. For a frequency distribution of marks in History of 200 candidates (grouped in intervals 0–5, 5–10, ...) the mean and standard deviation (s.d.) were found to be 40 and 15. Later it was discovered that the score 43 was misread as 53 in obtaining the frequency distribution. Find the corrected mean and s.d. corresponding to the corrected frequency distribution.

**Ans.** Mean = 39.95. Standard deviation = 14.975 approx.

4. A student while calculating the mean and the standard deviation on 25 observations, obtained the following values:

mean = 56 cms. : standard deviation = 2 cms.

It was later discovered at the time of checking that he had wrongly copied down an observation as 64. What is the mean and s.d. if correct value is omitted?

**Ans.** Mean = 55.67 cms., S.D. = 1.18 cms. approx

5. Calculate first four moments about mean, for the following individual series:

5	5	5	5	5	5
---	---	---	---	---	---

**Ans.**  $\mu_1 = \mu_2 = \mu_3 = \mu_4 = 0$

6. Calculate the first four moments about the mean for the following data. Also calculate  $\beta_1$  and  $\beta_2$ .

x	1	2	3	4	5	6	7	8	9
f	1	6	13	25	30	22	9	5	2

**Ans.**  $\mu'_1 = -0.09$ ,  $\mu_2 = 2.4873$ ,  $\mu_3 = 0.6789$ ,  $\mu_4 = 18.3358$  approx.,  
 $\beta_1 = 0.0299$  approx.,  $\beta_2 = 2.9627$

7. Find the first four moments about mean for the following frequency distribution:

Marks	0–10	10–20	20–30	30–40	40–50
No. of Students	5	10	40	20	25

**Ans.**  $\mu_1 = 0$ ,  $\mu_2 = 125$ ,  $\mu_3 = -300$ ,  $\mu_4 = 37625$

8. The following table gives the monthly wages of workers in a factory. Compute the standard deviation, and skewness

Monthly wages (in Rs.)	No. of workers	Monthly wages (in Rs.)	No. of workers
125–175	2	375–425	4
175–225	22	425–475	6
225–275	19	475–525	1
275–325	14	525–575	1
325–375	3		

**Ans.** S.D. = Rs. 88.52, Skewness = 0.7

9. The first four moments of a distribution about  $x = 4$  are 1, 4, 10, 45. Show that the mean is 5 and the variance is 3 and  $\mu_3$  and  $\mu_4$  are 0 and 26 respectively.

10. Calculate  $\mu_1$ ,  $\mu_2$ ,  $\mu_3$ ,  $\mu_4$  for the series : 4, 7, 10, 13, 16, 19, 22.

**Ans.**  $\mu_1 = 0$ ,  $\mu_2 = 36$ ,  $\mu_3 = 0$ ,  $\mu_4 = 2268$

11. If the first four moments of a distribution about the value 5 are equal to  $-4$ ,  $22$ ,  $-117$  and  $560$ . Determine the corresponding moments:  
 (i) about the mean, and (ii) about zero **Ans.** (i)  $0, 6, 83, 992$  (ii)  $1, 7, 102, 1361$

12. In a certain distribution, the first four moments about the point  $x = 4$  are  $-1.5$ ,  $17$ ,  $-30$  and  $308$ . Calculate  $\beta_1$  and  $\beta_2$ . **Ans.**  $\beta_1 = 0.4923$ ,  $\beta_2 = 1.573$

13. Compute first four moments of the data  $3, 5, 7, 9$  about the mean. Also, compute the first four moments about the point  $4$ . **Ans.**  $\mu_1 = 0, \mu_2 = 5, \mu_3 = 0, \mu_4 = 41$   
 $\mu'_1 = 2, \mu'_2 = 9, \mu'_3 = 38, \mu'_4 = 177$

14. The first four moments of distribution about the value  $5$  of the variable are  $2, 20, 40$  and  $50$ . Calculate mean,  $\mu_2, \mu_3, \mu_4, \beta_1$  and  $\beta_2$ . **Ans.** Mean =  $7$ ,  $\mu_2 = 16, \mu_3 = -64, \mu_4 = 162, \beta_1 = 1$  and  $\beta_2 = 0.63$

15. Show that, if the variable takes the values  $0, 1, 2, \dots, n$  with frequencies proportional to the binomial coefficients,  $1, {}^nC_1, {}^nC_2, \dots, {}^nC_n$  respectively then the mean of the distribution is  $\frac{1}{2}n$ , the mean square deviation about origin is  $\frac{1}{4}n(n+1)$  and the variance is  $\frac{1}{4}n$ .

16. Show that, if the variable takes the values  $0, 1, 2, \dots, n$  with frequencies given by the terms of the binomial series  $q^n, {}^nC_1 q^{n-1}p, {}^nC_2 q^{n-2} p^2, \dots, p^n$  where  $p + q = 1$ , then the mean square deviation is  $n^2 p^2 + npq$  and the variance is  $npq$ .

### 57.39 MOMENT GENERATING FUNCTION

The moment generating function of the variate  $x$  about  $x = a$  is defined as the expected value of  $e^{t(x-a)}$  and is denoted by  $M_a(t)$ .

$$\begin{aligned}
 M_a(t) &= \Sigma p_i e^{t(x_i - a)} \\
 &= \Sigma p_i \left[ 1 + t(x_i - a) + \frac{t^2}{2} (x_i - a)^2 + \dots + \frac{t^r}{r!} (x_i - a)^r + \dots \right] \\
 &= \Sigma p_i + t \Sigma p_i (x_i - a) + \frac{t^2}{2} \Sigma p_i (x_i - a)^2 + \dots + \frac{t^r}{r!} \Sigma p_i (x_i - a)^r + \dots \\
 &= 1 + t \Sigma f_i (x_i - a) + \frac{t^2}{2} \Sigma f_i (x_i - a)^2 + \dots + \frac{t^r}{r!} \Sigma f_i (x_i - a)^r + \dots \quad [p \approx f] \\
 &\quad - \mu_0 + t \mu'_1 + \frac{t^2}{2!} \mu''_2 + \dots + \frac{t^r}{r!} \mu'^r + \dots \quad [\Sigma p_i - 1 = \mu_0]
 \end{aligned}$$

where  $\mu'_r$  is the moment of order  $r$  about  $a$ .

$$\text{Hence } \mu'_r = \text{coefficient of } \frac{t^r}{r!} \text{ or } \mu'_r = \left[ \frac{d^r}{dt^r} M_a(t) \right]_{t=0}$$

$$\begin{aligned} \text{Again } M_a(t) &= \sum p_i e^{t(x_i - a)} \\ &= e^{-at} \sum p_i e^{tx_i} \\ &= e^{-at} M_0(t) \end{aligned}$$

Thus the moment generating function about the point  $a = e^{-at}$  moment generating function about the origin.

**Example 34.** Find the moment generating function of the discrete binomial distribution given by

$$f(x) = {}^nC_x \ p^x \ q^{n-x}$$

Also, find the first and second moment about the mean and standard deviation.

**Solution.** Here, we have

$$f(x) = {}^nC_x p^x q^{n-x}$$

Moment generating function about the origin

$$\begin{aligned} M_0(t) &= \sum e^{tx} \cdot {}^nC_x p^x q^{n-x} \\ &= \sum {}^nC_x (pe^t)^x \cdot q^{n-x} \\ &= q^n + {}^nC_1 q^{n-1} pe^t + {}^nC_2 q^{n-2} (pe^t)^2 + \dots \quad [\text{By Binomial Theorem}] \\ &\quad - [q + pe^t]^n \\ v_1 &= \left[ \frac{d}{dt} M_0(t) \right]_{t=0} = [n(q + pe^t)^{n-1} \cdot (pe^t)]_{t=0} \\ &= n(q + p)^{n-1} p \quad [q + p = 1] \\ &= np \\ v_2 &= \left[ \frac{d^2}{dt^2} M_0(t) \right] = \frac{d}{dt} [n(q + pe^t)^{n-1} (pe^t)]_{t=0} \\ &= [n(n-1)(q + pe^t)^{n-2} (pe^t)^2 + n(q + pe^t)^{n-1} (pe^t)]_{t=0} \\ &= [n(n-1)(q + p)^{n-2} p^2 + n(q + p)^{n-1} \cdot p] \\ &= n(n-1)p^2 + np \quad [q + p = 1] \\ &= n p [(n-1)p + 1] = np [np + (1-p)] = np [np + q] \\ &= n^2 p^2 + npq \end{aligned}$$

$$\mu_1 = x = v_1 = np$$

$$\mu_2 = \mu'_2 - \bar{x}^2 = v_2 - v_1^2 = (n^2 p^2 + npq) - (np)^2$$

$$\Rightarrow \mu_2 = npq$$

Standard deviation =  $\sqrt{npq}$

$$\text{Mean} = np$$

Ans.

**Example 35.** Find the moment generating function of the discrete Poisson distribution given by

$$f(x) = \frac{e^{-m} m^x}{x!}$$

Also, find the first and second moments about mean and variance.

**Solution.** Here, we have

$$f(x) = \frac{e^{-m} m^x}{x!}$$

Moment generating function about the origin

$$\begin{aligned} M_0(t) &= \sum e^{tx} \frac{e^{-m} m^x}{x!} \\ &= e^{-m} \sum \frac{(me^t)^x}{x!} \\ &= e^{-m} \left[ 1 + me^t + \frac{(me^t)^2}{2!} + \frac{(me^t)^3}{3!} + \dots \right] \\ &= e^{-m} \cdot e^{me^t} = e^{m(e^t-1)} \end{aligned}$$

$$\begin{aligned} v_1 &= \left[ \frac{d}{dt} M_0(t) \right]_{t=0} = \left[ \frac{d}{dt} e^{m(e^t-1)} \right]_{t=0} = \left[ e^{m(e^t-1)} m e^t \right]_{t=0} = e^{m(1-1)} \cdot m = m \\ v_2 &= \left[ \frac{d^2}{dt^2} M_0(t) \right]_{t=0} = \frac{d}{dt} \left[ e^{m(e^t-1)} m e^t \right]_{t=0} = \left[ e^{m(e^t-1)} (m e^t)^2 + e^{m(e^t-1)} \cdot m e^t \right]_{t=0} \\ &= \left[ e^{m(1-1)} m^2 + e^{m(1-1)} \cdot m \right] = m^2 + m \end{aligned}$$

$$\mu_2 = v_2 - \bar{x}^2 = v_2 - v_1^2 = (m^2 + m) - m^2 = m$$

Hence, mean =  $m$

Variance =  $m$

**Ans.**

**Example 36.** Find the moment generating function of the random variable whose moments are

$$\mu_r' = (r+1)! 2^r$$

$$\begin{aligned} \text{Solution. } M_x(t) &= E(e^{tx}) = \sum_{x=0}^{\infty} e^{tx} P(X=x) = \sum_{r=0}^{\infty} \frac{t^r}{r!} \mu_r' = \sum_{r=0}^{\infty} \frac{t^r}{r!} (r+1)! \cdot 2^r = \sum_{r=0}^{\infty} (r+1)(2t)^r \\ &= 1 + 2 \cdot 2t + 3 \cdot (2t)^2 + \dots = (1 - 2t)^{-2} \end{aligned}$$

**Ans.**

## 57.40 MOMENT GENERATING FUNCTION OF A FUNCTION OF CONTINUOUS VARIATE

The moment generating function of the continuous probability distribution about  $x = a$  is given by

$$M_0(t) = \int_{-\infty}^{\infty} e^{t(x-a)} f(x) dx$$

## 57.41 PROPERTY OF MOMENT GENERATING FUNCTION

The moment generating function of the sum of two independent chance variables is the product of their respective moment generating functions.

Symbolically,  $M_{x+y}(t) = M_x(t) \times M_y(t)$  provided that  $x$  and  $y$  are independent random variables.

**Proof.** Let  $x$  and  $y$  be two independent random variables so that  $x + y$  is also a random variable.

The m.g.f. of the sum  $x + y$  w.r.t. origin is

$$M_{x+y}(t) = \sum p_i \{e^{t(x+y)}\} = \sum p_i \{e^{tx} \cdot e^{ty}\} = \sum p_i (e^{tx}) \cdot \sum p_i (e^{ty})$$

Since  $x$  and  $y$  are independent variables and so are  $e^{tx}$  and  $e^{ty}$ ,

$$\text{Hence, } M_{x+y}(t) = M_x(t) \cdot M_y(t) \quad \text{Proved.}$$

**Example 37.** Find the moment generating function of the exponential distribution.

$$f(x) = \frac{1}{c} e^{-x/c}, \quad 0 \leq x \leq \infty, \quad c > 0 \quad (\text{U.P. III Semester, Dec. 2005})$$

Hence, find its mean and standard deviation.

**Solution.** The moment generating function about the origin is

$$\begin{aligned} M_0(t) &= \int_0^{\infty} e^{tx} \cdot f(x) dx = \int_0^{\infty} e^{tx} \cdot \frac{1}{c} e^{-\frac{x}{c}} dx = \frac{1}{c} \int_0^{\infty} e^{\left(t - \frac{1}{c}\right)x} dx \\ &= \frac{1}{c} \frac{1}{t - \frac{1}{c}} \left[ e^{\left(t - \frac{1}{c}\right)x} \right]_0^{\infty} \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{c} \cdot \frac{1}{t - \frac{1}{c}} [0 - 1] = \frac{1}{ct - 1} (-1) = \frac{1}{1 - ct} = (1 - ct)^{-t} \\
&= 1 + ct + c^2 t^2 + c^3 t^3 + \dots \quad [\text{Binomial Theorem}] \\
\text{Moment about origin} &= \left[ \frac{d}{dt} M_0(t) \right]_{t=0} = \frac{d}{dt} [1 + ct + c^2 t^2 + c^3 t^3 + \dots]_{t=0} \\
&= [c + 2c^2 t + 3c^3 t^2 + \dots]_{t=0} = c \\
\mu_1 &= \bar{x} = c \\
\mu'_2 &= \left[ \frac{d^2}{dt^2} M_0(t) \right] = \frac{d^2}{dt^2} [1 + ct + c^2 t^2 + c^3 t^3 + \dots]_{t=0} \\
&= \frac{d}{dt} [c + 2c^2 t + 3c^3 t^2 + \dots]_{t=0} = [2c^2 + 6c^3 t + \dots]_{t=0} \\
\mu'_2 &= 2c^2 \\
\mu_2 &= \mu'_2 - \mu_1^2 = 2c^2 - c^2 = c^2 \\
\text{Standard deviation} &= \sqrt{\mu_2} = \sqrt{c^2} = c \quad \text{Ans.}
\end{aligned}$$

**Example 38.** Obtain the moment generating function of the random variable  $x$  having probability distribution

$$f(x) = \begin{cases} x & \text{for } 0 < x < 1 \\ 2-x & \text{for } 1 \leq x < 2 \\ 0 & \text{elsewhere} \end{cases} \text{ Also determine } \mu'_1, \mu'_2 \text{ and } \mu_2.$$

$$\begin{aligned}
\text{Solution.} \quad M_x(t) &= \int e^{tx} f(x) dx \\
&= \int_0^1 x \cdot e^{tx} dx + \int_1^2 (2-x) e^{tx} dx + \int_2^\infty 0 \cdot e^{tx} dx = \left( \frac{xe^{tx}}{t} - \frac{e^{tx}}{t^2} \right)_0^1 + \left( \frac{2e^{tx}}{t} - \frac{xe^{tx}}{t} + \frac{e^{tx}}{t^2} \right)_1^\infty \\
&= \frac{e^t}{t} - \frac{e^0}{t^2} + \frac{1}{t^2} + \left[ \left( \frac{2e^{2t}}{t} - \frac{2e^{2t}}{t} + \frac{e^{2t}}{t^2} \right) - \left( \frac{2e^t}{t} - \frac{e^t}{t} + \frac{e^t}{t^2} \right) \right] = \frac{e^{2t} - 2e^t + 1}{t^2} \\
&= \left( \frac{e^t - 1}{t} \right)^2 = \frac{1}{t^2} (e^{2t} - 2e^t + 1) = \frac{1}{t^2} \left[ 1 + \frac{2t}{1} + \frac{4t^2}{2} + \frac{8t^3}{6} + \frac{16t^4}{24} + \dots - 2 \left( 1 + t + \frac{t^2}{2} + \frac{t^3}{6} + \frac{t^4}{24} + \dots \right) + 1 \right] \\
&= \frac{1}{t^2} + \frac{2}{t} + 2 + \frac{4t}{3} + \frac{2t^2}{3} + \dots - \frac{2}{t^2} - \frac{2}{t} - 1 - \frac{t}{3} - \frac{t^2}{12} + \dots + 1 \\
\mu'_1 &= \text{coefficient of } \frac{t}{1} = \frac{4}{3} - \frac{1}{3} = \frac{3}{3} = 1
\end{aligned}$$

$$\mu'_2 = \text{coefficient of } \frac{t^2}{2!} = \frac{4}{3} - \frac{1}{6} = \frac{8-1}{6} = \frac{7}{6} \quad \mu_2 = \mu'_2 - (\mu'_1)^2 = \frac{7}{8} - (1)^2 = \frac{1}{6}$$

$$\text{Hence } \mu'_1 = 1, \mu'_2 = \frac{7}{6}, \mu_2 = \frac{1}{6} \quad \text{Ans.}$$

**Example 39.** Find the moment generating function of the continuous normal distribution given by

$$f(x) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}; -\infty < x < \infty$$

**Solution.** Here, we have

$$f(x) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

Moment generating function about the origin

$$M_0(t) = \int_{-\infty}^{\infty} e^{tx} \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}} dx \quad \dots (1)$$

Putting  $\frac{x-\mu}{\sigma} = z$  so that  $dx = \sigma dz$  in (1), we get

$$\begin{aligned} M_0(t) &= \frac{1}{\sigma \sqrt{2\pi}} \int_{-\infty}^{\infty} e^{t(\sigma z + \mu)} e^{-\frac{z^2}{2}} (\sigma dz) = \frac{e^{\mu t}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{t\sigma z - \frac{z^2}{2}} dz \\ &= \frac{e^{\mu t + \frac{1}{2}t^2\sigma^2}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \left( e^{t\sigma z - \frac{1}{2}t^2\sigma^2 - \frac{z^2}{2}} \right) dz = \frac{1}{\sqrt{2\pi}} e^{\mu t + \frac{1}{2}t^2\sigma^2} \int_{-\infty}^{\infty} e^{-\frac{1}{2}(z^2 - 2t\sigma z + t^2\sigma^2)} dz \\ &= \frac{1}{\sqrt{2\pi}} e^{\mu t + \frac{1}{2}t^2\sigma^2} \int_{-\infty}^{\infty} e^{-\frac{1}{2}(z-t\sigma)^2} dz = e^{\mu t + \frac{1}{2}t^2\sigma^2} \quad (1) \quad \left[ \int_0^{\infty} e^{-z^2} dz = \frac{\sqrt{\pi}}{2} \right] \\ &= e^{\mu t + \frac{1}{2}t^2\sigma^2} \end{aligned}$$

**Ans.**

**Example 40.** The random variable  $X$  assuming only non-negative values has a gamma probability distribution if its probability distribution is given by

$$f(x) = \begin{cases} \frac{\alpha^\beta}{\Gamma\beta} x^{\beta-1} e^{-\alpha x}; & x > 0, \alpha > 0, \beta > 1 \\ 0, & \text{elsewhere} \end{cases}$$

Find the moment generating function of Gamma probability distribution.

$$\begin{aligned} \text{Solution. } M_x(t) &= \int_0^{\infty} e^{tx} f(x) dx = \int_0^{\infty} e^{tx} \cdot \frac{\alpha^\beta}{\Gamma\beta} \cdot x^{\beta-1} e^{-\alpha x} dx = \frac{\alpha^\beta}{\Gamma\beta} \int_0^{\infty} x^{\beta-1} e^{-x(\alpha-t)} dx \\ &= \frac{\alpha^\beta}{(\alpha-t)^\beta \Gamma\beta} \int_0^{\infty} y^{\beta-1} e^{-y} dy \quad | \text{ where } y = x(\alpha-t) \text{ so that } dy = (\alpha-t) dx \\ &= \frac{1}{\left(1 - \frac{t}{\alpha}\right)^\beta} \cdot \frac{1}{\Gamma\beta} \quad \Gamma\beta = \left(1 - \frac{t}{\alpha}\right)^{-\beta}; |t| < \alpha. \end{aligned}$$

**Ans.**

$$\text{Note: } M_x(t) = \begin{cases} \sum_x e^{tx} p(x), & \text{if } x \text{ is discrete} \\ \int_{-\infty}^{\infty} f_x(x) dx, & \text{if } x \text{ is continuous} \end{cases}$$

### EXERCISE 57.5

Find the moment generating function of the following functions:

1.  $f(x) = me^{-mx}; x, m > 0$

**Ans.**  $\sum_{r=0}^{\infty} \left(\frac{t}{m}\right)^r, \mu'_r = \frac{r!}{m^r}$

2.  $f(x) = e^{-x} (1 + e^{-x})^{-2}, -\infty < x < \infty$

**Ans.**  $\beta(1-t, 1+t), 1-t > 0$

$\pi t \operatorname{cosec} \pi t, t < 1$

3. If  $x$  is a discrete random variable with probability function  $f(x) = \frac{1}{k^x}, x = 1, 2, \dots, (k = \text{constant})$

Find its moment generating function.

$$\text{Ans. } \frac{e^t}{k - e^t}$$

4. Find the moment generating function for the distribution where,

$$f(x) = \begin{cases} \frac{2}{3}, & \text{at } x=1 \\ \frac{1}{3}, & \text{at } x=2 \\ 0, & \text{otherwise} \end{cases}$$

Ans.  $\frac{2}{3} \cdot e^t + \frac{1}{3} e^{2t}$

5. Find the moment generating function of the random variable  $x$  having the probability density function:

$$f(x) = \begin{cases} \frac{1}{k}, & \text{for } -1 < x < 2 \\ 0, & \text{otherwise} \end{cases}$$

Ans.  $\frac{1}{k} t (e^{2t} - e^{-t}), \quad t \neq 0$   
 $\frac{3}{k}, \quad \text{for } t = 0$

6. A random variable  $x$  has density function given by

$$f(x) = \begin{cases} 2e^{-2x}, & x \geq 0 \\ 0, & x < 0 \end{cases}$$

Obtain the moment generating function.

$$\text{Ans. } \frac{2}{2-t}, \quad \text{if } t < 2$$

7. Find the moment generating function, if it exists, given the probability distribution frequency :

$$f(x) = \begin{cases} xe^{-x}, & x > 0 \\ 0, & \text{otherwise} \end{cases}$$

Ans.  $\frac{1}{1-t}$

8. Find the moment generating function for the given distribution

$$f(x) = \begin{cases} \frac{1}{b-a}, & \text{for } a < x < b \\ 0, & \text{otherwise} \end{cases}$$

Ans.  $\frac{e^{bt} - e^{at}}{t(b-a)}$

9. A random variable  $x$  has the probability distribution function

$$f(x) = \begin{cases} \frac{1}{2x}, & \text{for } x = 1, 2, 3, \dots \\ 0, & \text{otherwise} \end{cases}$$

Ans.  $\frac{e^t}{2-e^t}$

10. The first four moments of a distribution about the value '0' are -0.20, 1.76, -2.36 and 10.88. Find the moments about the mean and measure the kurtosis.  
 (U.P., III Semester, Dec. 2009)

**Hint:** In the usual notation, we are given assumed mean  $a = 0$  and

$$\mu'_1 = -0.20, \quad \mu'_2 = 1.76, \quad \mu'_3 = -2.36, \quad \mu'_4 = 10.88$$

**Moment about mean**

$$\mu_1 = \mu'_1 = -0.20$$

$$\mu_2 = \mu'_2 - \mu'_1{}^2 = 1.76 - (-0.20)^2 = 1.76 - 0.04$$

$$\Rightarrow \mu_2 = 1.72$$

$$\mu_3 = \mu'_3 - 3\mu'_2 \mu'_1 + 22\mu'_1{}^3$$

$$= -2.36 - 3(1.76)(-0.20) + 2(-0.20)^3 = -2.36 + 1.056 - 0.016 = -1.32$$

$$\mu_4 = \mu'_4 - 4\mu'_3 \mu'_1 + 6\mu'_2 \mu'_1{}^2 - 3\mu'_1{}^4$$

$$= 10.88 - 4(-2.36)(-0.20) + 6(1.76)(-0.20)^2 - 3(-0.20)^4$$

$$= 10.88 - 1.888 + 0.4224 - 0.0048$$

$$= 9.4096$$

$$\text{Kurtosis} = \beta_2 = \frac{\mu_4}{\mu_2^2} = \frac{9.4096}{(1.72)^2} = \frac{9.4096}{2.9584} = 3.180638188$$

Here,  $\beta_2 > 3$ , so the curve is peaked or Leptokurtic.

Ans.

## METHOD OF LEAST SQUARES

---

### 58.1 PRINCIPLE OF LEAST SQUARE

The method of least squares is probably the most systematic procedure to fit a unique curve through the given points.

Let  $y = f(x)$  be the equation of curve to be fitted to the given data (observed or experimental) points  $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ . At  $x = x_i$ , the observed (or experimental) value of the ordinate is  $y_i$  and the corresponding value on the fitting curve is  $N_i M_i$ , i.e.,  $[f(x_i)]$ . The difference of the observed and the expected (theoretical) value is

$$= P_i M_i - N_i M_i = P_i N_i = e_i.$$

This difference is called the error.

$$e_1 = y_1 - f(x_1)$$

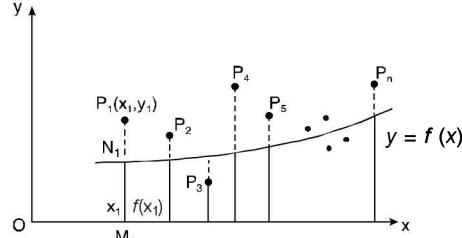

Similarly,

$$e_2 = y_2 - f(x_2)$$

$$e_3 = y_3 - f(x_3)$$

.....

$$e_n = y_n - f(x_n)$$

Some of the errors  $e_1, e_2, e_3, \dots, e_n$  will be positive and others negative.

In finding the total errors, errors are added. In addition, some negative and some positive errors may cancel and in some cases sum of all the errors may be zero, which leads to false result. To avoid such situation, we may make all the errors positive by squaring.

$$\text{Sum} = S = e_1^2 + e_2^2 + e_3^2 + \dots + e_n^2$$

The curve of the best fit is that for which the sum of the squares of errors (S) is minimum. This is called the principle of least squares.

### 58.2 METHOD OF LEAST SQUARES

Let

$$y = a + bx \quad \dots (1)$$

be the straight line to be fitted to the given data points  $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ .

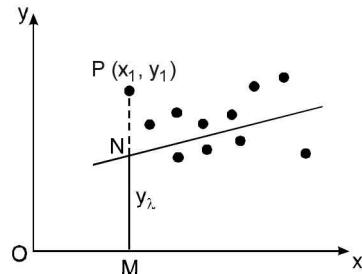

Let  $y_{t_1}$  be the theoretical ordinate for  $x_1$ .

$$PM = y_1 \qquad \qquad NM = y_{t_1}$$

$$PN = PM - NM$$

$$\text{Then} \quad \begin{aligned} e_1 &= y_1 - y_{t_1} & (PN = e_1) \\ e_1 &= y_1 - (a + bx_1) & (y_{t_1} = a + bx_1) \end{aligned}$$

On squaring, we get  $e_1^2 = (y_1 - a - bx_1)^2$

$$S = e_1^2 + e_2^2 + e_3^2 + \dots + e_n^2 = \sum e_i^2$$

$$S = \sum_{i=1}^n (y_i - a - bx_i)^2$$

For S to be minimum

$$\frac{\partial S}{\partial a} = \sum_{i=1}^n 2(y_i - a - bx_i)(-1) = 0 \text{ or } \sum (y_i - a - bx_i) = 0 \quad \dots (2)$$

[To generalise  $y_i$ ,  $y_i$  is written as  $y$ ]

$$\frac{\partial S}{\partial b} = \sum_{i=1}^n 2(y_i - a - bx_i)(-x_i) \text{ or } \sum (xy_i - ax_i - bx_i^2) = 0 \quad \dots (3)$$

On simplification equations (2) and (3) become

$$\sum y = na + b \sum x \quad \dots (4)$$

$$\sum xy = a \sum x + b \sum x^2 \quad \dots (5)$$

The equations (4) and (5) are known as Normal equations.

On solving equations (4) and (5), we get the values of  $a$  and  $b$ .

On putting the values of  $a$  and  $b$  in (1), we get the equation of required line.

**To Remember :** The normal equations (4) and (5) are for

$$y = a + bx$$

(i) Equation (4) is obtained by putting  $\Sigma$  before all the terms on both sides of (1).

i.e.,  $\sum y = \Sigma a + \Sigma bx \Rightarrow \sum y = na + b \sum x$

(ii) Equation (5) is obtained on multiplying equation (1) by  $x$  and putting  $\Sigma$  before each obtained term on both the sides.

i.e.,  $\sum xy = \Sigma ax + \Sigma bx^2$   
 $\sum xy = a \sum x + b \sum x^2$

**Example 1.** Find the best values of  $a$  and  $b$  so that  $y = a + bx$  fits the data given in the table.

$x$	0	1	2	3	4
$y$	1.0	2.9	4.8	6.7	8.6

**Solution.**  $y = a + bx$

... (1)

$x$	$y$	$xy$	$x^2$
0	1.0	0	0
1	2.9	2.9	1
2	4.8	9.6	4
3	6.7	20.1	9
4	8.6	34.4	16
$\Sigma x = 10$	$\Sigma y = 24.0$	$\Sigma xy = 67.0$	$\Sigma x^2 = 30$

Normal equations are  $\sum y = na + b \sum x$

... (2)

$$\sum xy = a \sum x + b \sum x^2$$

... (3)

On putting the values of  $\Sigma x$ ,  $\Sigma y$ ,  $\Sigma xy$ ,  $\Sigma x^2$  in (2) and (3), we have

$$24 = 5a + 10b \quad \dots (4)$$

$$67 = 10a + 30b \quad \dots (5)$$

On solving (4) and (5), we get

$$a = 1, \quad b = 1.9$$

On substituting the values of  $a$  and  $b$  in (1), we get

$$y = 1 + 1.9x$$

**Ans.**

**Example 2.** By the method of least squares, find the straight line that best fits the following data :

$x$	1	2	3	4	5
$y$	14	27	40	55	68

**Solution.** Let the equation of the straight line best fit be  $y = a + bx$  ... (1)

$x$	$y$	$xy$	$x^2$
1	14	14	1
2	27	54	4
3	40	120	9
4	55	220	16
5	68	340	25
$\Sigma x = 15$	$\Sigma y = 204$	$\Sigma xy = 748$	$\Sigma x^2 = 55$

Here,  $n = 5$

$$\text{Normal equations are } \Sigma y = na + b \Sigma x \quad \dots (2)$$

$$\Sigma xy = a \Sigma x + b \Sigma x^2 \quad \dots (3)$$

On putting the values of  $\Sigma x$ ,  $\Sigma y$ ,  $\Sigma xy$  and  $\Sigma x^2$  in (2) and (3), we have

$$204 = 5a + 15b \quad \dots (4)$$

$$748 = 15a + 55b \quad \dots (5)$$

On solving equations (4) and (5), we get

$$a = 0, \quad b = 13.6$$

On substituting the values of  $a$  and  $b$  in (1), we get

$$y = 13.6x \quad \text{Ans..}$$

**Example 3.** Use least-squares method to fit a curve of the form  $y = ae^{bx}$  to the data :

$x$	1	2	3	4	5	6
$y$	7.209	5.265	3.846	2.809	2.052	1.499

**Solution.**  $y = ae^{bx}$  ... (1)

On taking log of both sides, we get

$$\log_e y = \log_e a + bx \quad \dots (2)$$

On putting  $\log_e y = Y$ ,  $\log_e a = c$  in (2), we get

$$Y = c + bx \quad \dots (3)$$

$x$	$y$	$Y = \log_e y$	$xY$	$x^2$
1	7.209	1.97533	1.97533	1
2	5.265	1.66108	3.32216	4
3	3.846	1.34703	4.04109	9
4	2.809	1.03283	4.13132	16
5	2.052	0.71881	3.59405	25
6	1.499	0.40480	2.4288	36
$\Sigma x = 21$		$\Sigma Y = 7.13988$	$\Sigma xY = 19.49275$	$\Sigma x^2 = 91$

$$\text{Normal equations are } \Sigma Y = nc + b \Sigma x \quad \dots (4)$$

$$\Sigma xY = c \Sigma x + b \Sigma x^2 \quad \dots (5)$$

On putting the values of  $n$ ,  $\Sigma x$ ,  $\Sigma Y$ ,  $\Sigma xY$  and  $\Sigma x^2$  in equations (4) and (5), we get

$$7.13988 = 6c + 21b \quad \dots (6)$$

$$19.49275 = 21c + 91b \quad \dots (7)$$

On solving (6) and (7), we obtain  $b = -0.3141$ ,  $c = 2.28933$

$$c = \log_e a = 2.28933 \Rightarrow a = 9.86832$$

On substituting the values of  $a$  and  $b$  in (1), we get

$$y = 9.86832 e^{-0.3141x} \quad \text{Ans.}$$

### 58.3 CHANGE OF ORIGIN AND SCALE

In some problems the magnitude of the variables in the given data is so large that the calculation becomes very tedious. The size of the data can be reduced by assuming some origin for  $x$ ,  $y$  series.

The problem is further simplified by taking suitable scale for the values of  $x$  and  $y$ . If these values are equally spaced.

Let  $z$  be the width of the interval and  $(x_0, y_0)$  be taken as origin. Then putting

$$u = \frac{x - x_0}{h} \text{ and } v = y - y_0$$

**Example 4.** Show that the line of fit to the following data is given by  $y = 0.7x + 11.285$ :

$x$	0	5	10	15	20	25
$y$	12	15	17	22	24	30

**Solution.** Let  $x_0 = 12.5$ ,  $h = 2.5$ ,  $y_0 = 20$

$$u = \frac{x - 12.5}{2.5} \text{ and } v = y - 20$$

$\Rightarrow$  The transformed equation is  $v = a + bu$

$$\begin{aligned} x_0 &= \frac{\sum x}{N} \\ y_0 &= \frac{\sum y}{N} \end{aligned}$$

$x$	$y$	$u = \frac{x - 12.5}{2.5}$	$v = y - 20$	$uv$	$u^2$
0	12	-5	-8	40	25
5	15	-3	-5	15	9
10	17	-1	-3	3	1
15	22	1	2	2	1
20	24	3	4	12	9
25	30	5	10	50	25
		$\sum u = 0$	$\sum v = 0$	$\sum uv = 122$	$\sum u^2 = 70$

$$\text{Normal equations are } \Sigma v = na + b \Sigma u \quad \dots (2)$$

$$\Sigma uv = a \Sigma u + b \Sigma u^2 \quad \dots (3)$$

On putting the values of  $\Sigma u$ ,  $\Sigma v$ ,  $\Sigma uv$ ,  $\Sigma u^2$  in (2) and (3), we get

$$0 = 6a + 0 \Rightarrow a = 0$$

$$122 = a \times 0 + b \times 70 \Rightarrow b = \frac{122}{70} = 1.743$$

Putting the values of  $a$  and  $b$  in (1), we get

$$v = 1.743 u \quad \dots (4)$$

Putting  $u = \frac{x-12.5}{2.5}$  and  $v = y - 20$  in (4), we get

$$\begin{aligned} y - 20 &= 1.743 \left( \frac{x-12.5}{2.5} \right) \\ \Rightarrow 2.5y - 50 &= 1.743x - 1.743 \times 12.5 \\ \Rightarrow 2.5y &= 1.743x - 21.7875 + 50 \\ \Rightarrow 2.5y &= 1.743x + 28.2125 \\ \Rightarrow y &= 0.7x + 11.285 \end{aligned}$$

**Ans.**

**Example 5.** Fit a straight line to the following data :

$x$	71	68	73	69	67	65	66	67
$y$	69	72	70	70	68	67	68	64

**Solution.**

$$y = a + bx \quad \dots (1)$$

$$u = x - 69 \text{ and } v = y - 68$$

Transformed Equation is  $v = a + bu$

$$\dots (2)$$

$x$	$y$	$u = x - 69$	$v = y - 68$	$uv$	$u^2$
71	69	2	1	2	4
68	72	-1	4	-4	1
73	70	4	2	8	16
69	70	0	2	0	0
67	68	-2	0	0	4
65	67	-4	-1	4	16
66	68	-3	0	0	9
67	64	-2	-4	8	4
		$\Sigma u = -6$	$\Sigma v = 4$	$\Sigma uv = 18$	$\Sigma u^2 = 54$

$$\text{Normal equations are } \Sigma v = na + b \Sigma u \quad \dots (3)$$

$$\Sigma uv = a \Sigma u + b \Sigma u^2 \quad \dots (4)$$

On putting the values of  $\Sigma u$ ,  $\Sigma v$ ,  $\Sigma uv$ ,  $\Sigma u^2$  in (3) and (4), we get

$$4 = 8a + b(-6) \quad \dots (5)$$

$$18 = -6a + 54b \quad \dots (6)$$

On solving (5) and (6), we get

$$a = \frac{9}{11}, \quad b = \frac{14}{33}$$

On putting the values of  $a$  and  $b$  in (2), we get

$$v = \frac{9}{11} + \frac{14}{33} u \quad \dots (7)$$

On putting  $u = x - 69$  and  $v = y - 68$  in (7), we get

$$\begin{aligned} y - 68 &= \frac{9}{11} + \frac{14}{33}(x-69) \\ y - 68 &= 0.8182 + 0.4242x - 29.2727 \\ y &= 68.8182 - 29.2727 + 0.4242x \\ y &= 39.5455 + 0.4242x \end{aligned}$$

**Ans.**

**EXERCISE 58.1**

1. Find the linear least square polynomials based on data

$x$	-2	-1	0	1
$y$	6	3	2	2

is given. Find the least square straight line approximation to the data. **Ans.**  $10y = 26 - 13x$

2. The following table shows the number of salesmen working for a certain concern :

Year	1998	1999	2000	2001	2002	2003
Number	28	38	46	40	56	60

Use the method of least squares to fit a straight line trend. **Ans.**  $y = 5.9428x - 11843.9047$

3. If  $F$  is pull required to lift a load  $W$  by means of a pulley, fit a linear law  $F = a - bw$  connecting  $F$  and  $W$  against the following data:

$W$	50	70	100	120
$F$	12	15	21	25

**Ans.**  $F = 2.2785 - 0.1879W$

4. Determine the constants  $a$  and  $b$  by the least-squares method such that  $y = ae^{bx}$  fits the following data :

$x$	1.0	1.2	1.4	1.6
$y$	40.170	73.196	133.372	243.02

**Ans.**  $a = 2, b = 3$

5. Fit a least-square geometric curve  $y = ax^b$  to the following data :

$x$	1	2	3	4	5
$y$	0.5	2	4.5	8	12.5

**Ans.**  $a = 0.5012, b = 1.9977$

6. The pressure and volume of a gas are related by the equation  $PV^r = k$ ,  $r$  and  $k$  being constants. Fit this equation to the following set of observations :

P (kg/cm <sup>2</sup> )	0.5	1.0	1.5	2.0	2.5	3.0
V (litres)	1.62	1.00	0.75	0.62	0.52	0.46

**Ans.**  $PV^{1.276} = 1.039$

7. The pressure of the gas corresponding to various volumes  $V$  is measured, given by the following data :

$V$ (cm <sup>3</sup> )	50	60	70	90	100
$P$ (kg cm <sup>-2</sup> )	64.7	51.3	40.5	25.9	78

Fit the data to the equation  $PV^r = C$

**Ans.**  $PV^{0.28997} = 167.78765$

**58.4 TO FIT UP THE PARABOLA**

Let

$$y = a + bx + cx^2 \quad \dots (1)$$

be the equation of a parabola.

The following normal equations are obtained as in Art. 58.2

$$\Sigma y = na + b \Sigma x + c \Sigma x^2 \quad \dots (2)$$

$$\Sigma xy = a \Sigma x + b \Sigma x^2 + c \Sigma x^3 \quad \dots (3)$$

$$\Sigma x^2y = a \Sigma x^2 + b \Sigma x^3 + c \Sigma x^4 \quad \dots (4)$$

On solving these three normal equations, we get the values of  $a, b$  and  $c$ .

On putting the values of  $a$ ,  $b$  and  $c$  in (1), we get the required equation of parabola.

**To remember** the normal equations (2), (3) and (4) for  $y = a + bx + cx^2$ .

- (i) Equation (2) is obtained by putting  $\Sigma$  before each term on both sides of (1).
- (ii) Equation (3) is obtained on multiplying (1) by  $x$  and putting  $\Sigma$  before each term on both sides of obtained equation.
- (iii) Equation (4) is obtained on multiplying (1) by  $x^2$  and putting  $\Sigma$  before each term on both sides of obtained equation.

**Example 6.** Find least squares polynomial approximation of degree two to the data:

$x$	0	1	2	3	4
$y$	-4	-1	4	11	20

Also compute the least error.

**Solution.** Let the equation of the polynomial be

$$y = a + bx + cx^2 \quad \dots (1)$$

$x$	$y$	$xy$	$x^2$	$x^2y$	$x^3$	$x^4$
0	-4	0	0	0	0	0
1	-1	-1	1	-1	1	1
2	4	8	4	16	8	16
3	11	33	9	99	27	81
4	20	80	16	320	64	256
$\Sigma x = 10$	$\Sigma y = 30$	$\Sigma xy = 120$	$\Sigma x^2 = 30$	$\Sigma x^2y = 434$	$\Sigma x^3 = 100$	$\Sigma x^4 = 354$

$$\text{Normal equations are } \Sigma y = na + b \Sigma x + c \Sigma x^2 \quad \dots (2)$$

$$\Sigma xy = a \Sigma x + b \Sigma x^2 + c \Sigma x^3 \quad \dots (3)$$

$$\Sigma x^2y = a \Sigma x^2 + b \Sigma x^3 + c \Sigma x^4 \quad \dots (4)$$

On putting the values of  $\Sigma x$ ,  $\Sigma y$ ,  $\Sigma xy$ ,  $\Sigma x^2$ ,  $\Sigma x^2y$ ,  $\Sigma x^3$ ,  $\Sigma x^4$  in equations (2), (3), (4), we obtain

$$30 = 5a + 10b + 30c \quad \dots (5)$$

$$120 = 10a + 30b + 100c \quad \dots (6)$$

$$434 = 30a + 100b + 354c \quad \dots (7)$$

On solving these equations, we get  $a = -4$ ,  $b = 2$ ,  $c = 1$ .

The required polynomial is

$$y = -4 + 2x + x^2, \quad \text{Error} = 0 \quad \text{Ans.}$$

**Example 7.** Employ the method of least squares to fit a parabola  $y = a + bx + cx^2$  in the following data :

$$(x, y) : (-1, 2), (0, 0), (0, 1), (1, 2)$$

**Solution.** Let the equation of the parabola be

$$y = a + bx + cx^2 \quad \dots (1)$$

Here,  $n = 4$

$x$	$y$	$x^2$	$x^3$	$x^4$	$xy$	$x^2y$
-1	2	1	-1	1	-2	2
0	0	0	0	0	0	0
0	1	0	0	0	0	0
1	2	1	1	1	2	2
$\Sigma x = 0$	$\Sigma y = 5$	$\Sigma x^2 = 2$	$\Sigma x^3 = 0$	$\Sigma x^4 = 2$	$\Sigma xy = 0$	$\Sigma x^2y = 4$

$$\text{Normal equations are } \Sigma y = na + b \Sigma x + c \Sigma x^2 \quad \dots (2)$$

$$\Sigma xy = a \Sigma x + b \Sigma x^2 + c \Sigma x^3 \quad \dots (3)$$

$$\Sigma x^2y = a \Sigma x^2 + b \Sigma x^3 + c \Sigma x^4 \quad \dots (4)$$

On putting the values of  $\Sigma y$ ,  $\Sigma xy$ ,  $\Sigma x^2y$  etc. in (2), (3) and (4), we get

$$5 = 4a + 0b + 2c \Rightarrow 5 = 4a + 2c \quad \dots (5)$$

$$0 = 0a + 2b + 0c \Rightarrow 0 = 2b \quad \dots (6)$$

$$4 = 2a + 0b + 2c \Rightarrow 4 = 2a + 2c \quad \dots (7)$$

On solving (5), (6) and (7), we get

$$a = 0.5, \quad b = 0, \quad c = 1.5$$

On putting these values in (1), we get

$$y = 0.5 + 1.5x^2 \quad \text{Ans.}$$

**Example 8.** Fit a parabola  $y = ax^2 + bx + c$  to the following data taking  $x$  as independent variable.

$x$	1	2	3	5	7	11	13	17	19	23
$y$	2	3	5	7	11	13	17	19	23	29

(U.P. III Semester, 2009-2010)

**Solution.** Here, we have

$$y = ax^2 + bx + c \quad \dots (1)$$

$x$	$y$	$xy$	$x^2$	$x^2y$	$x^3$	$x^4$
1	2	2	1	2	1	1
2	3	6	4	12	8	16
3	5	15	9	45	27	81
5	7	35	25	175	125	625
7	11	77	49	539	343	2401
11	13	143	121	1573	1331	14641
13	17	221	169	2873	2197	28561
17	19	323	289	5491	4913	83521
19	23	437	361	8303	6859	130321
23	29	667	529	15341	12167	279841
$\Sigma x = 101$	$\Sigma y = 129$	$\Sigma xy = 1926$	$\Sigma x^2 = 1557$	$\Sigma x^2y = 34354$	$\Sigma x^3 = 27971$	$\Sigma x^4 = 540009$

$$\text{Normal equations are } \Sigma y = na + b \Sigma x + c \Sigma x^2 \quad \dots (2)$$

$$\Sigma xy = a \Sigma x + b \Sigma x^2 + c \Sigma x^3 \quad \dots (3)$$

$$\Sigma x^2y = a \Sigma x^2 + b \Sigma x^3 + c \Sigma x^4 \quad \dots (4)$$

On putting the values of  $\Sigma x$ ,  $\Sigma y$ ,  $\Sigma xy$ ,  $\Sigma x^2$ ,  $\Sigma x^2y$ ,  $\Sigma x^3$ ,  $\Sigma x^4$ , in equations (2), (3), (4), we get

$$129 = 10a + 101b + 1557c \quad \dots (5)$$

$$1926 = 101a + 1557b + 27971c \quad \dots (6)$$

$$34354 = 1557a + 27971b + 540009c \quad \dots (7)$$

On solving (5), (6), (7), we get

$$a = 1.41259297$$

$$b = 1.089013957$$

$$c = 0.003136583595$$

Hence, the equation of the required parabola is

$$y = 1.41259297x^2 + 1.089013957x + 0.003136583595 \quad \text{Ans.}$$

**Example 9.** Fit a second degree parabola to the following :

x	1	2	3	4	5
y	1090	1220	1390	1625	1915

(R.G.P.V., Bhopal, III Semester, Dec. 2003)

**Solution.** Let the equation of the parabola be

$$y = a + bx + cx^2 \quad \dots (1)$$

x	y	xy	$x^2$	$x^2y$	$x^3$	$x^4$
1	1090	1090	1	1090	1	1
2	1220	2440	4	4880	8	16
3	1390	4170	9	12510	27	81
4	1625	6500	16	26000	64	256
5	1915	9575	25	47875	125	625
$\Sigma x = 15$	$\Sigma y = 7240$	$\Sigma xy = 23775$	$\Sigma x^2 = 55$	$\Sigma x^2y = 92355$	$\Sigma x^3 = 225$	$\Sigma x^4 = 979$

Normal equations are  $\Sigma y = na + b \Sigma x + c \Sigma x^2 \quad \dots (2)$

$$\Sigma xy = a \Sigma x + b \Sigma x^2 + c \Sigma x^3 \quad \dots (3)$$

$$\Sigma x^2y = a \Sigma x^2 + b \Sigma x^3 + c \Sigma x^4 \quad \dots (4)$$

On putting the values of  $n$ ,  $\Sigma x$ ,  $\Sigma x^2$ ,  $\Sigma x^3$ ,  $\Sigma x^4$ ,  $\Sigma y$ ,  $\Sigma xy$ ,  $\Sigma x^2y$ , in (3), (4) and (5), we get

$$7240 = 5a + 15b + 55c \quad \dots (5)$$

$$23775 = 15a + 55b + 225c \quad \dots (6)$$

$$92355 = 55a + 225b + 979c \quad \dots (7)$$

Steps for solution of (5), (6) and (7) are the following :-

$$3(5), \quad 21720 = 15a + 45b + 165c \quad \dots (8)$$

$$(6) - (8), \quad 2055 = 10b + 60c \quad \dots (9)$$

$$11(5), \quad 79640 = 55a + 165b + 605c \quad \dots (10)$$

$$(7) - (10), \quad 12715 = 60b + 374c \quad \dots (11)$$

$$6(9), \quad 12330 = 60b + 360c \quad \dots (12)$$

$$(11) - (12), \quad 385 = 14c \quad \Rightarrow \quad c = \frac{55}{2}$$

$$\text{From (9),} \quad 2055 = 10b + 60 \left( \frac{55}{2} \right) \quad \Rightarrow \quad b = \frac{81}{2}$$

$$\text{From (5), } 7240 = 5a + 15 \left( \frac{81}{2} \right) + 55 \left( \frac{55}{2} \right) \Rightarrow a = 1024$$

On putting the values of  $a, b, c$  in (1), we get

$$y = 1024 + \frac{81}{2}x + \frac{55}{2}x^2$$

The equation of the required parabola is

$$2y = 2048 + 81x + 55x^2$$

**Ans.**

**Example 10.** Fit a second degree parabola to the following data :

$x$	10	15	20	25	30	35	40
$y$	11	13	16	20	27	34	41

(R.G.P.V., Bhopal, III Semester, June 2005)

**Solution.** Let the equation of the parabola be

$$y = a + bx + cx^2 \quad \dots (1)$$

$x$	$y$	$xy$	$x^2$	$x^2y$	$x^3$	$x^4$
10	11	110	100	1100	1000	10000
15	13	195	225	2925	3375	50625
20	16	320	400	6400	8000	160000
25	20	500	625	12500	15625	390625
30	27	810	900	24300	27000	810000
35	34	1190	1225	41650	42875	1500625
40	41	1640	1600	65600	64000	2560000
$\Sigma x = 175$	$\Sigma y = 162$	$\Sigma xy = 4765$	$\Sigma x^2 = 5075$	$\Sigma x^2y = 154475$	$\Sigma x^3 = 161875$	$\Sigma x^4 = 5481875$

Normal equations are  $\Sigma y = na + b \Sigma x + c \Sigma x^2 \quad \dots (2)$

$$\Sigma xy = a \Sigma x + b \Sigma x^2 + c \Sigma x^3 \quad \dots (3)$$

$$\Sigma x^2y = a \Sigma x^2 + b \Sigma x^3 + c \Sigma x^4 \quad \dots (4)$$

On putting the values of  $n, \Sigma x, \Sigma x^2, \Sigma x^3, \Sigma x^4, \Sigma y, \Sigma xy, \Sigma x^2y$ , in the equation (2), (3) and (4), we get

$$162 = 7a + 175b + 5075c \quad \dots (5)$$

$$4765 = 175a + 5075b + 161875c \quad \dots (6)$$

$$154475 = 5075a + 161875b + 5481875c \quad \dots (7)$$

$$25 \times (5), \quad 4050 = 175a + 4375b + 126875c \quad \dots (8)$$

$$(6) - (8), \quad 715 = 700b + 35000c \quad \dots (9)$$

$$29 \times (6), \quad 138185 = 5075a + 147175b + 4694375c \quad \dots (10)$$

$$(7) - (10), \quad 16290 = 14700b + 787500c \quad \dots (11)$$

$$21 \times (9), \quad 15015 = 14700b + 735000c \quad \dots (12)$$

$$(11) - (12), \quad 1275 = 52500c \Rightarrow c = \frac{17}{700}$$

$$\text{From (9), } 715 = 700b + 35000 \left( \frac{17}{700} \right) \Rightarrow b = -\frac{135}{700}$$

$$\text{From (5), } 162 = 7a + 175 \left( \frac{-135}{700} \right) + 5075 \left( \frac{17}{700} \right)$$

$$7a = 162 + \frac{135}{4} - \frac{493}{4} \Rightarrow a = \frac{145}{14}$$

On putting the values of  $a, b$  and  $c$  in (1), we get

$$y = \frac{145}{14} - \frac{135x}{700} + \frac{17x^2}{700}$$

Hence, the required parabola is

$$700y = 7250 - 135x + 17x^2$$

**Ans.**

### 58.5 CHANGE OF SCALE IN SECOND DEGREE EQUATIONS

If the data is of equal interval in large numbers then we change the scale as

$$u = \frac{x - x_0}{h} \text{ and } v = y - y_0$$

**Example 11.** Fit a second degree parabola to the following data by least squares method :

$x$	1929	1930	1931	1932	1933	1934	1935	1936	1937
$y$	352	356	357	358	360	361	361	360	359

(U.P., II Semester, Summer 2001)

**Solution.** Taking  $x_0 = 1933, y_0 = 357$

Again taking  $u = x - x_0, v = y - y_0$

$$u = x - 1933, v = y - 357$$

The equation  $y = a + bx + cx^2$  is transformed to  $v = A + Bu + Cu^2$

$x$	$u = x - 1933$	$y$	$v = y - 357$	$uv$	$u^2$	$u^2v$	$u^3$	$u^4$
1929	-4	352	-5	20	16	-80	-64	256
1930	-3	356	-1	3	9	-9	-27	81
1931	-2	357	0	0	4	0	-8	16
1932	-1	358	1	-1	1	1	-1	1
1933	0	360	3	0	0	0	0	0
1934	1	361	4	4	1	4	1	1
1935	2	361	4	8	4	16	8	16
1936	3	360	3	9	9	27	27	81
1937	4	359	2	8	16	32	64	256
Total	$\Sigma u = 0$		$\Sigma v = 11$	$\Sigma uv = 51$	$\Sigma u^2 = 60$	$\Sigma u^2v = -9$	$\Sigma u^3 = 0$	$\Sigma u^4 = 708$

Normal equations are

$$\Sigma v = nA + B \Sigma u + C \Sigma u^2 \Rightarrow 11 = 9A + 0B + 60C \Rightarrow 11 = 9A + 60C$$

$$\Sigma uv = A \Sigma u + B \Sigma u^2 + C \Sigma u^3 \Rightarrow 51 = 0A + 60B + 0C \Rightarrow 51 = 60B \Rightarrow B = \frac{17}{20}$$

$$\Sigma u^2v = A \Sigma u^2 + B \Sigma u^3 + C \Sigma u^4 \Rightarrow -9 = 60A + 0B + 708C \Rightarrow -9 = 60A + 708C$$

On solving these equations, we get

$$A = \frac{694}{231}, B = \frac{17}{20}, C = -\frac{247}{924}$$

$$v = \frac{694}{231} + \frac{17}{20}u - \frac{247}{924}u^2$$

Putting  $v = y - 357$  and  $u = x - 1933$ , we get

$$\begin{aligned} y - 357 &= \frac{694}{231} + \frac{17}{20}(x - 1933) - \frac{247}{924}(x - 1933)^2 \\ \Rightarrow y - 357 &= \frac{694}{231} + \frac{17x}{20} - \frac{32861}{20} - \frac{247x^2}{924} - \frac{247}{924}(-3866x) - \frac{247}{924} \times (1933)^2 \\ \Rightarrow y - 357 &= \frac{694}{231} - \frac{32861}{20} - \frac{247}{924}(1933)^2 + \frac{17}{20}x + \frac{247 \times 3866}{924}x - \frac{247}{924}x^2 \\ \Rightarrow y &= 3 - 1643.05 - 998823.36 + 357 + 0.85x + 1033.44x - 0.267x^2 \\ y &= -1000106.41 + 1034.29x - 0.267x^2 \end{aligned}$$

Ans.

**Example 12.** Fit a parabolic curve of regression of  $y$  on  $x$  to the following data :

$x$	1.0	1.5	2.0	2.5	3.0	3.5	4.0
$y$	1.1	1.3	1.6	2.0	2.7	3.4	4.1

**Solution.** Here,  $n = 7$  (odd)

$$u = \frac{x-2.5}{0.5} = 2x - 5$$

Let the equation be  $y = a + bx + cx^2$

The transformed equation is

$$y = a + bu + cu^2 \quad \dots (1)$$

$x$	$y$	$u$	$u^2$	$uy$	$u^2y$	$u^3$	$u^4$
1.0	1.1	-3	9	-3.3	9.9	-27	81
1.5	1.3	-2	4	-2.6	5.2	-8	16
2.0	1.6	-1	1	-1.6	1.6	-1	1
2.5	2.0	0	0	0	0	0	0
3.0	2.7	1	1	2.7	2.7	1	1
3.5	3.4	2	4	6.8	13.6	8	16
4.0	4.1	3	9	12.3	36.9	27	81
Total	$\Sigma y = 16.2$	$\Sigma u = 0$	$\Sigma u^2 = 28$	$\Sigma uy = 14.3$	$\Sigma u^2y = 69.9$	$\Sigma u^3 = 0$	$\Sigma u^4 = 196$

Normal equations are

$$\Sigma y = n a + b \Sigma u + c \Sigma u^2 \quad \dots (2)$$

$$\Sigma uy = a \Sigma u + b \Sigma u^2 + c \Sigma u^3 \quad \dots (3)$$

$$\Sigma u^2y = a \Sigma u^2 + b \Sigma u^3 + c \Sigma u^4 \quad \dots (4)$$

On putting the values of  $\Sigma u$ ,  $\Sigma y$ ,  $\Sigma uy$  etc. in (2), (3) and (4), we get

$$16.2 = 7a + 0 \times b + 28c \quad 16.2 = 7a + 28c$$

$$14.3 = 0 \times a + 28b + 0 \times c \quad \Rightarrow \quad 14.3 = 28b$$

$$69.9 = 28a + 0 \times b + 196c \quad \Rightarrow \quad 69.9 = 28a + 196c$$

On solving the above equations, we get

$$a = 2.07, b = 0.511, c = 0.061$$

On putting the values of  $a, b, c$  in (1), we get

$$y = 2.07 + 0.511 u + 0.061 u^2 \quad \dots (5)$$

On putting the value of  $u = 2x - 5$  in (5), we get

$$\begin{aligned} y &= 2.07 + 0.511(2x - 5) + 0.061(2x - 5)^2 \\ y &= 2.07 + 1.022x - 2.555 + 0.061(4x^2 - 20x + 25) \\ \Rightarrow y &= 2.07 + 1.022x - 2.555 + 0.244x^2 - 1.22x + 1.525 \\ \Rightarrow y &= 1.04 - 0.198x + 0.244x^2 \end{aligned}$$

**Ans.**

**Example 13.** Fit a second degree parabola to the following data :

$x$	1	2	3	4	5	6	7	8	9	10
$y$	124	129	140	159	228	289	315	302	263	210

(U.P., III Semester, Dec. 2009)

**Solution.** Taking  $x_0 = 6$  and  $y_0 = 228$

$x$	$u = x - 6$	$y$	$v = y - 228$	$uv$	$u^2$	$u^2 v$	$u^3$	$u^4$
1	-5	124	-104	520	25	-2600	-125	625
2	-4	129	-99	396	16	-1584	-64	256
3	-3	140	-88	264	9	-792	-27	81
4	-2	159	-69	138	4	-276	-8	16
5	-1	228	0	0	1	0	-1	1
6	0	289	61	0	0	0	0	0
7	1	315	87	87	1	87	1	1
8	2	302	74	148	4	296	8	16
9	3	263	35	105	9	315	27	81
10	4	210	-18	-72	16	-288	64	256
Total	-5		-121	1586	85	-4842	-125	1333

Let the equation of parabola be  $a + bu + cu^2 = v$

Normal equations are

$$\Sigma v = na + b\Sigma u + c\Sigma u^2 \Rightarrow -121 = 10a - 5b + 85c \quad \dots (1)$$

$$\Sigma uv = a\Sigma u + b\Sigma u^2 + c\Sigma u^3 \Rightarrow 1586 = -5a + 85b - 125c \quad \dots (2)$$

$$\Sigma u^2 v = a\Sigma u^2 + b\Sigma u^3 + c\Sigma u^4 \Rightarrow -4842 = 85a - 125b + 1333c \quad \dots (3)$$

$$(1) + 2(2) \Rightarrow 3051 = 165b - 165c \quad \dots (4)$$

$$(3) + 17(2) \Rightarrow 22120 = 1320b - 792c \quad \dots (5)$$

$$8(4) - (5) \Rightarrow 2288 = -528c$$

$$\Rightarrow c = -\frac{13}{3}$$

Putting the value of  $c$  in (4), we get

$$3051 = 165b - 165 \left(-\frac{13}{3}\right)$$

$$\Rightarrow 3051 = 165b + 715$$

$$\Rightarrow 165b = 2336 \Rightarrow b = \frac{2336}{165}$$

Putting the values of  $b$  and  $c$  in (1), we get

$$\begin{aligned} -121 &= 10a - 5 \left( \frac{2336}{165} \right) + 85 \left( -\frac{13}{3} \right) \\ \Rightarrow -121 &= 10a - \frac{2336}{33} - \frac{1105}{3} \\ \Rightarrow 10a &= \frac{10498}{33} \quad \Rightarrow a = \frac{5249}{165} \end{aligned}$$

Putting the values of  $a$ ,  $b$  and  $c$  in  $a + bu + cu^2 = v$ , we get

$$\frac{5249}{165} + \frac{2336}{165}u - \frac{13}{3}u^2 = v$$

Putting the values of  $u = x - 6$  and  $v = y - 228$ , we get

$$\begin{aligned} \frac{5249}{165} + \frac{2336}{165}(x-6) - \frac{13}{3}(x-6)^2 &= y - 228 \\ \Rightarrow \frac{5249}{165} + \frac{2336}{165}x - \frac{4672}{55} - \frac{13}{3}x^2 + 52x - 156 &= y - 228 \\ \Rightarrow -\frac{13}{3}x^2 + \frac{10916}{165}x + \frac{283}{15} &= y \\ \Rightarrow y &= -4.3333x^2 + 66.1576x + 18.8667 \text{ Ans.} \end{aligned}$$

### EXERCISE 58.2

1. Find the values of  $a$ ,  $b$ ,  $c$  so that  $y = a + bx + cx^2$  is the best fit to the data :

$x$	0	1	2	3	4
$y$	1	0	3	10	21

Ans.  $a = 1$ ,  $b = -3$ ,  $c = 2$

2. Fit a second degree parabola to the following data by Least squares method :

$x$	0	1	2	3	4
$y$	1	1.8	1.3	2.5	6.3

Ans.  $y = 1.42 - 1.07x + 0.55x^2$

3. Fit a second degree parabola to the following data taking  $y$  as dependent variable :

$x$	1	2	3	4	5	6	7	8	9
$y$	2	6	7	8	10	11	11	10	9

Ans.  $y = -1 + 3.55x - 0.27x^2$

4. Use the least-square method to obtain a parabola that approximates the data :

$x$	1.0	1.2	1.4	1.6	1.8	2
$y$	2.345	2.419	2.592	2.863	3.233	3.702

Ans.  $y = 3.124 - 2.477x + 1.458x^2$

## CORRELATION AND REGRESSION

---

---

### 59.1 INTRODUCTION

A relationship may be obtained in two series. For example; two series relating to the heights and weights of a group of persons are given. It may be observed that weights increase with increase in heights - so that tall people are heavier than short sized people. We also know that the area A of circle of radius  $r$  is given by  $A = \pi r^2$ . It means larger radius will always have a larger area than a circle with smaller radius.

The intensity of light on the table decreases as the distance between source of light and table increases.

In this chapter we shall study the relationship of two series. Such a relationship is called statistical relationship.

### 59.2 TYPE OF DISTRIBUTION

There are two types of distributions.

- (1) **Univariate Distribution.** A distribution in which there is only one variable, such as heights of students of a class.
- (2) **Bivariate Distribution.** The distribution involving two variables such as heights and weights of the students of a class.

### 59.3 COVARIANCE

Let the corresponding values of two variables  $X$  and  $Y$ , given by ordered pairs

$(x_1, y_1), (x_2, y_2), (x_3, y_3), \dots, (x_n, y_n)$

Then the covariance between  $X$  and  $Y$  is denoted by  $\text{cov}(X, Y)$ .

It is defined as

$$\begin{aligned}\text{cov}(X, Y) &= \frac{(x_1 - \bar{x})(y_1 - \bar{y}) + (x_2 - \bar{x})(y_2 - \bar{y}) + \dots + (x_n - \bar{x})(y_n - \bar{y})}{n} \\ &= \frac{1}{n} \sum_{n=1}^n (x_n - \bar{x})(y_n - \bar{y})\end{aligned}$$

$$\text{cov}(X, Y) = E(XY) - E(X)E(Y)$$

$E(XY), E(X), E(Y)$  are the corresponding means

#### Working Rule

**Step I.** Calculate the sums  $\sum_1^n x_i$  and  $\sum_1^n y_i$

**Step II.** Calculate the sum  $\sum_1^n x_i y_i$  of the products of  $x_i$  and  $y_i$ .

**Step III.** Divide the values obtained in steps I, II by  $n$  to get  $\frac{\sum x_i}{n}, \frac{\sum y_i}{n}, \frac{\sum x_i y_i}{n}$

**Step IV.** Obtain the difference  $\sum_{i=1}^n \frac{x_i y_i}{n} - \left( \frac{\sum x_i}{n} \right) \cdot \left( \frac{\sum y_i}{n} \right)$  to get  $\text{cov}(X, Y)$ .

**Example 1.** Calculate the covariance of the following pairs of observations of two variates.

$$(1, 4), (2, 2), (3, 4), (4, 8), (5, 9), (6, 12)$$

$$\Sigma x_i = 1 + 2 + 3 + 4 + 5 + 6 = 21$$

$$\Sigma y_i = 4 + 2 + 4 + 8 + 9 + 12 = 39$$

$$\begin{aligned} \Sigma x_i y_i &= (1 \times 4) + (2 \times 2) + (3 \times 4) + (4 \times 8) + (5 \times 9) + (6 \times 12) \\ &= 4 + 4 + 12 + 32 + 45 + 72 = 169 \end{aligned}$$

$$\text{Cov}(X, Y) = \frac{\Sigma x_i y_i}{n} - \frac{\Sigma x_i}{n} \cdot \frac{\Sigma y_i}{n} = \left[ \frac{169}{6} - \frac{21}{6} \times \frac{39}{6} \right] = \frac{169}{6} - \frac{91}{4} = \frac{65}{12} \quad \text{Ans.}$$

**Example 2.** Find the covariance of the following pairs of observations of two variates :

$$(10, 35) \quad (15, 20) \quad (20, 30) \quad (25, 30) \quad (30, 35)$$

$$(35, 38) \quad (40, 42) \quad (45, 30) \quad (50, 40) \quad (55, 70)$$

$$\text{Solution. } \sum_{i=1}^n x_i = 10 + 15 + 20 + 25 + 30 + 35 + 40 + 45 + 50 + 55 = 325$$

$$\sum_{i=1}^n y_i = 35 + 20 + 30 + 30 + 35 + 38 + 42 + 30 + 40 + 70 = 370$$

$$\begin{aligned} \sum_{i=1}^n x_i y_i &= (10 \times 35) + (15 \times 20) + (20 \times 30) + (25 \times 30) + (30 \times 35) + (35 \times 38) \\ &\quad + (40 \times 42) + (45 \times 30) + (50 \times 40) + (55 \times 70) \\ &= 350 + 300 + 600 + 750 + 1050 + 1330 + 1680 + 1350 + 2000 + 3850 \\ &= 13260 \end{aligned}$$

$$\begin{aligned} \text{Cov.}(X, Y) &= \left[ \frac{\Sigma x_i y_i}{n} - \frac{\Sigma x_i}{n} \cdot \frac{\Sigma y_i}{n} \right] = \left( \frac{13260}{10} - \frac{325}{10} \cdot \frac{370}{10} \right) = 1326 - 1202.5 \\ &= 123.5 \end{aligned} \quad \text{Ans.}$$

## 59.4 CORRELATION

Whenever two variables  $x$  and  $y$  are so related that an increase in the one is accompanied by an increase or decrease in the other, then the variables are said to be correlated.

For example, the yield of crop varies with the amount of rainfall.

## 59.5 TYPES OF CORRELATIONS

### (1) Positive correlation

If an increase in the value of one variable  $X$  results in a corresponding increase in value of other variable  $Y$  on an average.

OR

If a decrease in the value of one variable  $X$  results in a corresponding decrease in value of other variable  $Y$  on an average.

The correlation is said to be positive.

**(2) Negative correlation**

If the increase in the values of one variable  $X$  results in a corresponding decrease in the values of other variable  $Y$ .

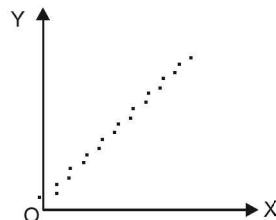

OR

If the decrease in the values of one variable  $X$  results in the increase to a corresponding values of  $Y$ .

The correlation between  $X$  and  $Y$  is said to be negative.

**(3) Linear correlation**

When all the plotted points lie approximately on a straight line, then the correlation is said to be linear correlation.

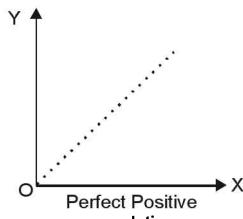

**(4) Perfect correlation**

If the deviation of one variable  $X$  is proportional to the deviation in other variable  $Y$ , then the correlation is said to be perfect.

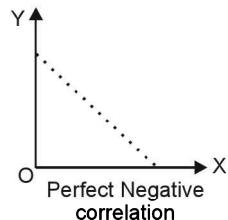

In this case the plotted points on a graph lie exactly on a straight line.

**4 (a) Positive perfect correlation**

If increase in one variable  $X$  is proportional to the increase in the other variable  $Y$ . The graph will be exactly straight line.

**4 (b) Negative perfect correlation**

If increase in one variable is proportional to the decrease in the other variable. The graph will be exactly a straight line.

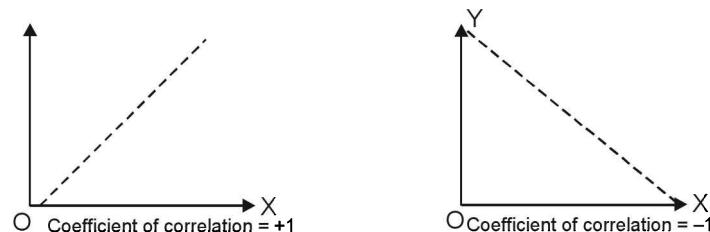

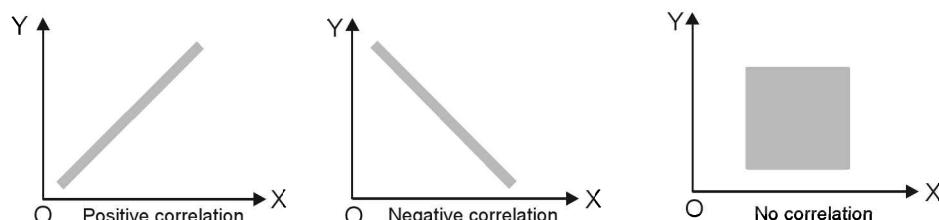

**Perfect Correlation:** If two variables vary in such a way that their ratio is always constant, then the correlation is said to be perfect.

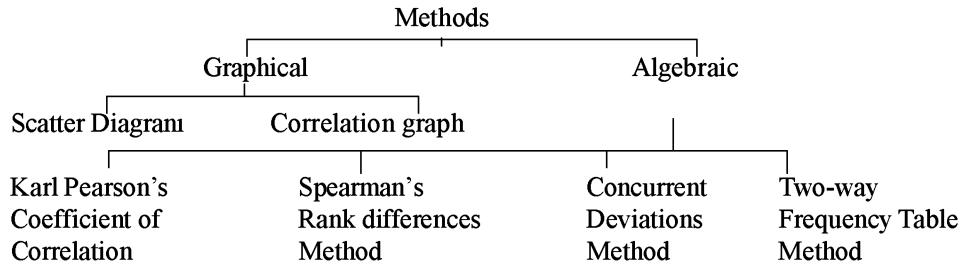

**59.6 SCATTER OR DOT-DIAGRAM**

When we plot the corresponding values of two variables, taking one on x-axis and the other along y-axis, it shows a collection of dots.

This collection of dots is called a dot diagram or a scatter diagram.

## **Methods of Determining Simple Correlation**

## **59.7 KARL PEARSON'S COEFFICIENT OF CORRELATION**

$r$  between two variables  $x$  and  $y$  is defined by the relation

$$r = \frac{\sum XY}{\sqrt{(\sum X^2)(\sum Y^2)}} = \frac{P}{\sigma_x \sigma_y} = \frac{Covariance(x,y)}{\sqrt{variance\ x}\sqrt{variance\ y}},$$

where  $X = x - \bar{x}$ ,  $Y = y - \bar{y}$

i.e.  $X$ ,  $Y$  are the deviations measured from their respective means,

$$P = \left( \frac{\sum XY}{n} \right) = \text{co variance}$$

and  $\sigma_x, \sigma_y$  being the standard deviations of these series.

**Example 3.** Calculate the coefficient of correlation between  $x$  and  $y$  series from the following data:

$$\Sigma(x - \bar{x})^2 = 136, \quad \Sigma(y - \bar{y})^2 = 138$$

$$\Sigma(x - \bar{x})(y - \bar{y}) = 122$$

**Solution.** Here, we have

$$\Sigma X^2 = \Sigma(x - \bar{x})^2 = 136$$

$$\Sigma Y^2 = \Sigma (y - \bar{y})^2 = 138$$

$$\Sigma XY = \Sigma (x - \bar{x})(y - \bar{y}) = 122$$

$$r = \frac{\sum XY}{\sqrt{\sum X^2} \cdot \sqrt{\sum Y^2}} \quad \dots (1)$$

Putting the values of  $\Sigma XY$ ,  $\Sigma X^2$  &  $\Sigma Y^2$  in (1), we get

$$r = \frac{122}{\sqrt{136} \sqrt{138}} = \frac{122}{11.66 \times 11.75} = \frac{122}{137.005} = 0.89 \quad \text{Ans.}$$

**Example 4.** Ten students got the following percentage of marks in Economics and Statistics.

<i>Roll No.</i>	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6</i>	<i>7</i>	<i>8</i>	<i>9</i>	<i>10</i>
<i>Marks in Economics</i>	78	36	98	25	75	82	90	62	65	39
<i>Marks in Statistics</i>	84	51	91	60	68	62	86	58	53	47

*Calculate the coefficient of correlation.*

**Solution.** Let the marks of two subjects be denoted by  $x$  and  $y$  respectively.

Then the mean for  $x$  marks =  $\frac{650}{10} = 65$  and the mean of  $y$  marks =  $\frac{660}{10} = 66$

If  $X$  and  $Y$  are deviations of  $x$ 's and  $y$ 's from their respective means, then the data may be arranged in the following form :

$x$	$y$	$X = x - 65$	$Y = y - 66$	$X^2$	$Y^2$	$XY$
7 8	8 4	13	18	169	324	234
3 6	5 1	-29	-15	841	225	435
9 8	9 1	33	25	1089	625	825
2 5	6 0	-40	-6	1600	36	240
7 5	6 8	10	2	100	4	20
8 2	6 2	17	-4	289	16	-68
9 0	8 6	25	20	625	400	500
6 2	5 8	-3	-8	9	64	24
6 5	5 3	0	-13	0	169	0
3 9	4 7	-26	-19	676	361	494
650	660	0	0	5398	2224	2704

$$\text{Here } \sum X^2 = 5398, \sum Y^2 = 2224, \quad \sum XY = 2704$$

$$\therefore r = \frac{\sum XY}{\sqrt{(\sum X^2)(\sum Y^2)}} = \frac{2704}{\sqrt{5398 \times 2224}} = \frac{2704}{\sqrt{73.4 \times 47.1}} = \frac{2704}{3457} = 0.78 \quad \text{Ans.}$$

**Example 5.** Calculate the coefficient of correlation between the marks obtained by 8 students in mathematics and statistics.

Students	A	B	C	D	E	F	G	H
Mathematics	25	30	32	35	37	40	42	45
Statistics	08	10	15	17	20	23	24	25

(U.P. III Semester, 2009-2010)

**Solution.** Let the marks of two subjects be denoted by  $x$  and  $y$  respectively.

Let the assumed mean for  $x$  marks be 35 and that of for  $y$  be 17.

$x$	$y$	$X' = x - 35$	$Y' = y - 17$	$X'^2$	$Y'^2$	$X'Y'$
25	08	-10	-9	100	81	90
30	10	-5	-7	25	49	35
32	15	-3	-2	9	4	6
35	17	0	0	0	0	0
37	20	2	3	4	9	6
40	23	5	6	25	36	30
42	24	7	7	49	49	49
45	25	10	8	100	64	80
N = 8		$\Sigma X' = 6$	$\Sigma Y' = 6$	$\Sigma X'^2 = 312$	$\Sigma Y'^2 = 292$	$\Sigma X'Y' = 296$

$$\text{We know that, } r = \frac{\frac{\Sigma X'Y'}{N} - \left( \frac{\Sigma X'}{N} \right) \left( \frac{\Sigma Y'}{N} \right)}{\sqrt{\left[ \frac{\Sigma X'^2}{N} - \left( \frac{\Sigma X'}{N} \right)^2 \right] \left[ \frac{\Sigma Y'^2}{N} - \left( \frac{\Sigma Y'}{N} \right)^2 \right]}} = \frac{\frac{296}{8} - \left( \frac{6}{8} \right) \left( \frac{6}{8} \right)}{\sqrt{\left[ \frac{312}{8} - \left( \frac{6}{8} \right)^2 \right] \left[ \frac{292}{8} - \left( \frac{6}{8} \right)^2 \right]}}$$

$$= \frac{\frac{583}{16}}{\sqrt{\left( \frac{615}{16} \right) \left( \frac{575}{16} \right)}} = \frac{583}{\sqrt{353625}} = \frac{583}{594.66} = 0.98039 \quad \text{Ans.}$$

### 59.8 COEFFICIENT OF CORRELATION OF GROUPED DATA

$$r = \frac{\frac{\sum f X' Y'}{N} - \left(\frac{\sum f X'}{N}\right)\left(\frac{\sum f Y'}{N}\right)}{\sqrt{\left\{\frac{\sum f X'^2}{N} - \left(\frac{\sum f X'}{N}\right)^2\right\}} \sqrt{\left\{\frac{\sum f Y'^2}{N} - \left(\frac{\sum f Y'}{N}\right)^2\right\}}}$$

where  $r$  is the coefficient of correlation.

$X'$  = Deviation from assumed mean of  $x = x - a$

$Y'$  = Deviation from assumed mean of  $y = y - b$

$N$  = Total number of items.

**Example 6.** Find the coefficient of correlation between the age and the sum assured from the following table.

*Sum assured in ₹.*

Age - group	10,000	20,000	30,000	40,000	50,000	No. of persons
20 – 30	4	6	3	7	1	21
30 – 40	2	8	15	7	1	33
40 – 50	3	9	12	6	2	32
50 – 60	8	4	2	–	–	14
	17	27	32	20	4	100

**Solution.** Let the sum assured denoted by  $x$  and the age group by  $y$ .

$$x' = \frac{x - 30,000}{10,000}, \quad y' = \frac{y - 45}{10}$$

$$r = \frac{\frac{\sum f X' Y'}{N} - \left(\frac{\sum f X'}{N}\right)\left(\frac{\sum f Y'}{N}\right)}{\sqrt{\left\{\frac{\sum f X'^2}{N} - \left(\frac{\sum f X'}{N}\right)^2\right\}} \sqrt{\left\{\frac{\sum f Y'^2}{N} - \left(\frac{\sum f Y'}{N}\right)^2\right\}}} \quad \dots (1) \quad [N = \sum f]$$

Putting the values in (1), we get

		$x$	Row-wise													
			10,000		20,000		30,000		40,000		50,000					
$y$	$y'$	$f$	$f X' Y'$	$f$	$f X' Y'$	$f$	$f X' Y'$	$f$	$f X' Y'$	$\Sigma f$	$f. Y'$	$f Y^2$	$f X' Y'$			
	20–30	25	-2	4	16	6	12	3	0	7	-14	1	-4	21	-42	84
30–40	35	-1	2	4	8	8	15	0	7	-7	1	-2	33	-33	33	+3
40–50	45	0	3	0	9	0	12	0	6	0	2	0	32	0	0	0
50–60	55	1	8	-16	4	-4	2	0	-	0	-	0	14	14	14	-20
		$\Sigma f$	17		27		32		20		4		$N = 100$	$\Sigma f Y' = -61$	$\Sigma f Y^2 = -131$	$\Sigma f X' Y' = -7$
		$f X'$	-34		-27		0		20		8		$\Sigma f X' = -33$			
		$f X'^2$	68		27		0		20		16		$\Sigma f X'^2 = 131$			
		$f X' Y$		4		16		0		-21		-6	$\Sigma f X' Y = -7$			

$$r = \frac{\frac{-7}{100} - \left(\frac{-33}{100}\right)\left(\frac{-61}{100}\right)}{\sqrt{\left\{ \frac{131}{100} - \left(\frac{-33}{100}\right)^2 \right\}} \sqrt{\left\{ \frac{131}{100} - \left(\frac{-61}{100}\right)^2 \right\}}}$$

Multiplying numerator and denominator by 10,000, we get

$$\begin{aligned} &= \frac{100(-7) - (-33)(-61)}{\sqrt{100(131) - (-33)^2} \sqrt{100(131) - (-61)^2}} = \frac{-700 - 2013}{\sqrt{13100 - 1089} \sqrt{13100 - 3721}} \\ &= \frac{-2713}{\sqrt{12011} \sqrt{9379}} = \frac{-2713}{109.59 \times 96.85} = \frac{-2713}{10613.7915} = -0.2556 \end{aligned}$$

Hence, the age and sum assured are negatively correlated, i.e., as age goes up the sum assured comes down. Ans.

**Example 7.** Calculate the coefficient of correlation for the following table :

<i>x – age marks</i>	0 – 4	4 – 8	8 – 12	12 – 16	Total
0 – 5	7	—	—	—	7
5 – 10	6	8	—	—	14
10 – 15	—	5	3	—	8
15 – 20	—	7	2	—	9
20 – 25	—	—	—	9	9
Total	13	20	5	9	47

**Solution.**

<i>x</i>	<i>x</i>	2		6		10		14		Row-wise			
	<i>X'</i>	– 2		– 1		0		1					
<i>y</i>	<i>Y'</i>	<i>f</i>	<i>fX'Y'</i>	<i>f</i>	<i>fX''Y'</i>	<i>f</i>	<i>fX''Y'</i>	<i>f</i>	<i>fX'''Y'</i>	$\Sigma f$	<i>fY'</i>	<i>fY''^2</i>	$\Sigma fX''Y'$
0 – 5	2.5	– 2	7	28						7	– 14	28	28
5 – 10	7.5	– 1	6	12	8	8				14	– 14	14	20
10 – 15	12.5	0		5	0	3	0			8	0	0	0
15 – 20	17.5	1		7	– 7	2	0			9	9	9	– 7
20 – 25	22.5	2						9	18	9	18	36	18
	$\Sigma f$		13		20		5		9	47	$\Sigma fY' = -1$	$\Sigma fY''^2 = 87$	$\Sigma fX''Y' = 59$
	<i>fX'</i>		– 26		– 20		0		9		$\Sigma fX' = -37$		
	<i>fX''^2</i>		52		20		0		9		$\Sigma fX''^2 = 81$		
	<i>fX'''Y'</i>			40		1		0		18		$\Sigma fX'''Y' = 59$	

Here,  $\Sigma fX' = -37$ ,  $\Sigma fX''^2 = 81$ ,  $\Sigma fY' = -1$ ,  $\Sigma fY''^2 = 87$ ,  $\Sigma fX''Y' = 59$

$$\begin{aligned}
r &= \frac{\frac{\sum f'X'Y'}{N} - \left(\frac{\sum f'X'}{N}\right)\left(\frac{\sum f'Y'}{N}\right)}{\sqrt{\frac{\sum f'X'^2}{N} - \left(\frac{\sum f'X'}{N}\right)^2} \sqrt{\frac{\sum f'Y'^2}{N} - \left(\frac{\sum f'Y'}{N}\right)^2}} \\
&= \frac{\frac{59}{47} - \left(\frac{-37}{47}\right)\left(\frac{-1}{47}\right)}{\sqrt{\left\{\frac{81}{47} - \left(\frac{-37}{47}\right)^2\right\}} \sqrt{\left\{\frac{87}{47} - \left(\frac{-1}{47}\right)^2\right\}}} = \frac{1.255 - 0.017}{\sqrt{1.723 - 0.620} \sqrt{1.851 - 0.0005}} \\
&= \frac{1.238}{\sqrt{1.103} \sqrt{1.8505}} = \frac{1.238}{1.05 \times 1.36} = \frac{1.238}{1.428} = 0.87 \quad \text{Ans.}
\end{aligned}$$

**Example 8.** A computer operator while calculating the coefficient between two variates  $x$  and  $y$  for 25 pairs of observations obtained the following constants :

$$n = 25, \Sigma x = 125, \Sigma x^2 = 650, \Sigma y = 100, \Sigma y^2 = 460, \Sigma xy = 508$$

It was however later discovered at the time of checking that he had copied down two pairs as (6, 14) and (8, 6) while the correct pairs were (8, 12) and (6, 8). Obtain the correct value of the correlation coefficient.

**Solution.** Here, corrected  $\Sigma x = \text{Incorrect } \Sigma x - (6 + 8) + (8 + 6) = 125 - 14 + 14 = 125$   
 Corrected  $\Sigma y = \text{Incorrect } \Sigma y - (14 + 6) + (12 + 8) = 100 - 20 + 20 = 100$   
 Corrected  $\Sigma x^2 = 650 - (6^2 + 8^2) + (8^2 + 6^2) = 650 - 100 + 100 = 650$   
 Corrected  $\Sigma y^2 = 460 - (14^2 + 6^2) + (12^2 + 8^2) = 460 - 232 + 208 = 436$   
 Corrected  $\Sigma xy = 508 - [(6)(14) + (8)(6)] + (8)(12) + (6)(8)$   
 $= 508 - (84 + 48) + (96 + 48) = 508 - 132 + 144 = 520$

Corrected value of correlation coefficient is

$$r_{xy} = \frac{520 - \frac{125 \times 100}{25}}{\sqrt{650 - \frac{(125)^2}{25}} \sqrt{436 - \frac{(100)^2}{25}}} = \frac{520 - 500}{\sqrt{(650 - 625)(436 - 400)}} = \frac{20}{\sqrt{25 \times 36}} = \frac{2}{3} = 0.67$$

Ans.

## 59. 9 SPEARMAN'S RANK CORRELATION

The coefficient of rank correlation is applied to the problems in which data cannot be measured quantitatively but qualitative assessment is possible such as beauty, honesty etc. In this case the best individual is given the rank no. 1 next rank no. 2 and so on.

## 59. 10 SPEARMAN'S RANK CORRELATION COEFFICIENT

$$r = 1 - \frac{6 \sum d^2}{n(n^2 - 1)}$$

**Solution.** Let  $(x_1, y_1), (x_2, y_2) \dots (x_n, y_n)$  be the ranks of  $n$  individuals corresponding to two characteristics.

Assuming nor two individuals are equal in either classification, each individual takes the values 1, 2, 3, ...  $n$  and hence their arithmetic means are, each

$$= \frac{\sum n}{n} = \frac{1}{n} \frac{n(n+1)}{2} = \frac{n+1}{2}$$

Let  $x_1, x_2, x_3, \dots, x_n$  be the values of variable  $X$  and  $y_1, y_2, y_3, \dots, y_n$  those of  $Y$ .

Then  $d = X - Y = \left( x - \frac{n+1}{2} \right) - \left( y - \frac{n+1}{2} \right) = x - y$   
 where  $X$  and  $Y$  are deviations from the mean.

$$\begin{aligned}\sum X^2 &= \sum \left( x - \frac{n+1}{2} \right)^2 = \sum x^2 - (n+1)\sum x + \sum \left( \frac{n+1}{2} \right)^2 \\ &= \frac{n(n+1)(2n+1)}{6} - \frac{(n+1)n(n+1)}{2} + n \left( \frac{n+1}{2} \right)^2 = \frac{n(n^2-1)}{12}\end{aligned}$$

Clearly,  $\sum X = \sum Y$  and  $\sum X^2 = \sum Y^2 \therefore \sum Y^2 = \frac{n(n^2-1)}{12}$

Hence  $\sum d^2 = \sum (x-y)^2 = \sum x^2 + \sum y^2 - 2\sum xy$

$$\therefore \sum XY = \frac{1}{2} \left[ \frac{n(n^2-1)}{6} - \sum d^2 \right] = \frac{1}{12} n(n^2-1) - \frac{1}{2} \sum d^2$$

Putting these values in  $r = \frac{\sum XY}{\sqrt{\sum X^2} \sqrt{\sum Y^2}} = \frac{\frac{1}{12} n(n^2-1) - \frac{1}{2} \sum d^2}{\frac{n(n^2-1)}{12}} = 1 - \frac{6 \sum d^2}{n(n^2-1)}$  Ans.

### Working Rule

**Step I.** Assign ranks to each item of both series, if they are not given.

**Step II.** Calculate the difference  $D$  of ranks of  $X$  from the rank of  $Y$  and write it in a separate column.

**Step III.** Square the difference  $D$  and write  $D^2$  in a separate column.

**Step IV.** Apply the formula to get the Rank correlation.

$$r = 1 - \frac{6 \sum D^2}{n(n^2-1)}$$

where  $n$  is the total number of pairs of observations.

**Example 9.** Compute Spearman's rank correlation coefficient  $r$  for the following data:

Person	A	B	C	D	E	F	G	H	I	J
Rank in statistics	9	10	6	5	7	2	4	8	1	3
Rank in income	1	2	3	4	5	6	7	8	9	10

**Solution.**

Person	Rank in statistics	Rank in income	$d = R_1 - R_2$	$d^2$
A	9	1	8	64
B	10	2	8	64
C	6	3	3	9
D	5	4	1	1
E	7	5	2	4
F	2	6	-4	16
G	4	7	-3	9
H	8	8	0	0
I	1	9	-8	64
J	3	10	-7	49
				$\sum d^2 = 280$

$$r = 1 - \frac{6 \sum d^2}{n(n^2-1)}, \quad r = 1 - \frac{6 \times 280}{10(100-1)} = 1 - 1.697 = -0.697$$

Ans.

### 59.11 EQUAL RANKS

If there are more than one item with the same rank. The rank to the equal items is assigned by average rank to each of these individuals.

For example; Suppose an item is repeated at the rank 5th (i.e., the 5th and 6th items are having the same values then the common rank is assigned to 5th and 6th item is  $\frac{5+6}{2} = 5.5$ , which is the average of 5 and 6. The next rank assigned will be seven.

If an item is repeated thrice at rank 2, then the common rank assigned to each value will be  $\frac{2+3+4}{3} = 3$  which is the arithmetic mean of 2, 3 and 4. Then next rank to be assigned would be 5.

To find the rank of correlation coefficient of repeated ranks, correlation factor is added to the Spearman's rank correlation formula.

### 59.12 CORRELATION FACTOR

In the formula of rank correlation coefficient, add the factor  $\frac{m(m^2 - 1)}{12}$  to  $\sum d^2$ , where  $m$  is the number of times an item (say  $a_1$ ) is repeated. This factor is added for each repeated value in both the series.

The total number of observations is denoted by  $n$ .

**The modified formula** for the rank correlation coefficient is given below

$$r = 1 - \frac{6 \left[ \sum d^2 + \frac{1}{12} (m_1^3 - m_1) + \frac{1}{12} (m_2^3 - m_2) + \frac{1}{12} (m_3^3 - m_3) + \dots \right]}{n(n^2 - 1)}$$

**Example 10.** Obtain the ranks correlation coefficient for the following data :

x	68	64	75	50	64	80	75	40	55	64
y	62	58	68	45	81	60	68	48	50	70

(Nagpur University, Summer 2002, Winter 2002)

**Solution.**

x	y	Rank in $x = x'$	Rank in $y = y'$	$d = x' - y'$	$d^2$
68	62	4	5	-1	1
64	58	6	7	-1	1
75	68	2.5	3.5	-1	1
50	45	9	10	-1	1
64	81	6	1	5	25
80	60	1	6	-5	25
75	68	2.5	3.5	-1	1
40	48	10	9	1	1
55	50	8	8	0	0
64	70	6	2	4	16
				Total	$\Sigma d^2 = 72$

Repeated Rank of $x$ column	No. of times	Repeated Rank of $y$ column	No. of times
2.5	$2 = m_1$	3.5	$2 = m_2$
6	$3 = m_3$		

Rank correlation coefficient

$$r = 1 - \frac{6 \left[ \sum d^2 + \frac{1}{12} (m_1^3 - m_1) + \frac{1}{12} (m_2^3 - m_2) + \frac{1}{12} (m_3^3 - m_3) \right]}{n(n^2 - 1)}$$

$$r = 1 - \frac{6 \left[ 72 + \frac{1}{12} (2^3 - 2) + \frac{1}{12} (2^3 - 2) + \frac{1}{12} (3^3 - 3) \right]}{10(100 - 1)} = 1 - \frac{6(72 + 0.5 + 0.5 + 2)}{10(99)} = 0.545 \quad \text{Ans.}$$

**Example 11.** Find rank correlation coefficient to the following data :

x	65	63	67	64	68	62	70	66	68	67	69	71
y	68	66	68	65	69	66	68	65	71	67	68	70

(Nagpur University, Summer 2005)

**Solution.** Here we assign rank to the values of  $x$  and  $y$  and we have a table of the following form:

x	y	Rank in $x = x'$	Rank in $y = y'$	$d = x' - y'$	$d^2$
65	68	9	5.5	3.5	12.25
63	66	11	9.5	1.5	2.25
67	68	6.5	5.5	1	1
64	65	10	11.5	-1.5	2.25
68	69	4.5	3	1.5	2.25
62	66	12	9.5	2.5	6.25
70	68	2	5.5	-3.5	12.25
66	65	8	11.5	-3.5	12.25
68	71	4.5	1	3.5	12.25
67	67	6.5	8	-1.5	2.25
69	68	3	5.5	-2.5	6.25
71	70	1	2	-1	1
				Total	$\sum d^2 = 72.5$

Repeated Rank of $x$ column	No. of times	Repeated Rank of $y$ column	No. of times
4.5	$2 = m_1$	11.5	$2 = m_3$
6.5	$2 = m_2$	9.5	$2 = m_4$
		5.5	$4 = m_5$

The rank correlation coefficient  $r$  is given by

$$r = 1 - 6 \left[ \frac{\sum d^2 + \frac{1}{12} m_1 (m_1^2 - 1) + \frac{1}{12} m_2 (m_2^2 - 1) + \frac{1}{12} m_3 (m_3^2 - 1) + \frac{1}{12} m_4 (m_4^2 - 1) + \frac{1}{12} m_5 (m_5^2 - 1)}{n(n^2 - 1)} \right]$$

Here  $n = 12$ , two  $x$  values are repeated twice so it is of the same rank. Two  $y$  values are repeated twice and one  $y$  value is repeated four times.

$$r = 1 - 6 \left[ \frac{72.5 + \frac{1}{12} 2(2^2 - 1) + \frac{1}{12} 4(4^2 - 1)}{12(144 - 1)} \right]$$

$$= 1 - \frac{6(72.5 + 2 + 5)}{12 \times 143} = 1 - 0.27797 = 0.722 \quad \text{Ans.}$$

**Example 12.** Establish the formula  $\sigma_{x-y}^2 = \sigma_x^2 + \sigma_y^2 - 2r\sigma_x\sigma_y$  where  $r$  is the correlation coefficient between  $x$  and  $y$ .

**Solution.** We know that  $\sigma_x^2 = \frac{\sum(x-\bar{x})^2}{n}$

$$\therefore \sigma_{x-y}^2 = \frac{\sum[(x-y) - (\bar{x}-\bar{y})]^2}{n}$$

$\bar{x}-\bar{y}$  = mean of  $(x-y)$  series = mean of  $x$ - mean of  $y = \bar{x}-\bar{y}$

$$\begin{aligned} \sigma_{x-y}^2 &= \frac{\sum[(x-y) - (\bar{x}-\bar{y})]^2}{n} = \frac{\sum[(x-\bar{x}) - (y-\bar{y})]^2}{n} \\ &= \frac{\sum[(x-\bar{x})^2 + (y-\bar{y})^2 - 2(x-\bar{x})(y-\bar{y})]}{n} \\ &= \frac{\sum(x-\bar{x})^2}{n} + \frac{\sum(y-\bar{y})^2}{n} - \frac{2\sum(x-\bar{x})(y-\bar{y})}{n} = \sigma_x^2 + \sigma_y^2 - \frac{2\sum(x-\bar{x})(y-\bar{y})}{n} \quad \dots(1) \end{aligned}$$

We know that  $r = \frac{\sum(x-\bar{x})(y-\bar{y})}{n\sigma_x\sigma_y}$  or  $\frac{\sum(x-\bar{x})(y-\bar{y})}{n} = r\sigma_x\sigma_y$

Putting this value in (1), we get

$$\sigma_{x-y}^2 = \sigma_x^2 + \sigma_y^2 - 2r\sigma_x\sigma_y$$

**Proved.**

**Example 13.** If  $X$  and  $Y$  are uncorrelated random variables, find the coefficient of correlation between  $X+Y$  and  $X-Y$ .

**Solution.**

Let  $u = X+Y$  and  $v = X-Y$

Then  $r = \frac{\sum(u-\bar{u})(v-\bar{v})}{n\sigma_u\sigma_v}$

Now  $u = X+Y, \bar{u} = \bar{X}+\bar{Y}$

Similarly  $\bar{v} = \bar{X}-\bar{Y}$

Now  $\sum(u-\bar{u})(v-\bar{v}) = \sum(X-\bar{X}+Y-\bar{Y})[(X-\bar{X})-(Y-\bar{Y})]$   
 $= \sum(x+y)(x-y) = \sum x^2 - \sum y^2 = n\sigma_x^2 - n\sigma_y^2$

Also  $\sigma_u^2 = \frac{\sum(u-\bar{u})^2}{n} = \frac{1}{n}\sum[(X-\bar{X})+(Y-\bar{Y})]^2 = \frac{1}{n}\sum(x+y)^2 = \frac{1}{n}(\sum x^2 + \sum y^2 + 2\sum xy)$   
 $= \sigma_x^2 + \sigma_y^2$  (As  $X$  and  $Y$  are not correlated, we have  $\sum xy = 0$ )

Similarly  $\sigma_v^2 = \sigma_x^2 + \sigma_y^2$

$$\therefore r = \frac{\sum(u-\bar{u})(v-\bar{v})}{n\sigma_u\sigma_v} = \frac{n(\sigma_x^2 - \sigma_y^2)}{\sqrt{n(\sigma_x^2 + \sigma_y^2)}\sqrt{n(\sigma_x^2 + \sigma_y^2)}} = \frac{\sigma_x^2 - \sigma_y^2}{\sigma_x^2 + \sigma_y^2} \quad \text{Ans.}$$

### EXERCISE 59.1

1. Calculate the coefficient of correlation from the data given below :

$x$	4	6	8	10	12
$y$	2	3	4	6	10

**Ans.** 0.95

3. Find the coefficient of correlation of the following data taking new origin of  $x$  at 70 and for  $y$  at 67:

$x$	67	68	64	68	72	70	69	70
$y$	65	66	67	67	68	69	71	73

(A.M.I.E., Winter 2002) **Ans.** 0.472

3. Calculate Karl Pearson's coefficient of correlation from the following data, using 20 as working mean for price and 70 as working mean for demand.

Price	14	16	17	18	19	20	21	22	23
Demand	84	78	70	75	66	67	62	58	60

**Ans.** 1.044

4. The ranks of the same 16 students in two subjects  $A$  and  $B$  were as follows. Two numbers within brackets denote the ranks of the students in  $A$  and  $B$  respectively :

(1, 1), (2, 10), (3, 3), (4, 4), (5, 5), (6, 7), (7, 2), (8, 6), (9, 8),  
(10, 11), (11, 15), (12, 9), (13, 14), (14, 12), (15, 16), (16, 13).

Calculate the rank correlation for proficiencies of this group in subjects  $A$  and  $B$ . **Ans.** 0.8

5. Show that  $E(x) = 0$ ,  $E(x, y) = 0$  and hence deduce that the correlation between  $x$  and  $y$  is zero.  
6.  $x$  and  $y$  are two random variables with the same standard deviation and correlation coefficient  $r$ . Show

that the coefficient of correlation between  $x$  and  $x + y$  is  $\sqrt{\frac{1+r}{2}}$

7. Calculate the coefficients of correlation between  $x$  (Marks in Mathematics) and  $y$  (marks in Physics) given in this following data :

$y \backslash x$	10 – 40	40 – 70	70 – 100	Total
0 – 30	5	20	—	25
30 – 60	—	28	2	30
60 – 90	—	32	13	45
	5	80	15	100

**Ans.** 0.4517

8. Calculate from the data reproduced pertaining to 66 selected villages in Meerut district, the value of  $r$ , between 'total cultivated area' and 'the area under wheat'.

Area under wheat (in Bighas)	0 – 500	500 – 1000	1000 – 1500	1500 – 2000	2000 – 2500	Total
0 – 200	12	6	—	—	—	18
200 – 400	2	18	4	2	1	27
400 – 600	—	4	7	3	—	14
600 – 800	—	1	—	2	1	4
800 – 1000	—	—	—	1	2	3
Total	14	29	11	8	4	66

**Ans.** 0.749

9. Find the coefficient of correlation for the following data :

$y \backslash x$	16 – 18	18 – 20	20 – 22	22 – 24	Total
10 – 20	2	1	1	—	4
20 – 30	3	2	3	2	10
30 – 40	3	4	5	6	18
40 – 50	2	2	3	4	11
50 – 60	—	1	2	2	5
60 – 70	—	1	2	1	4
	10	11	16	15	52

**Ans.** 0.28

10. Two judges in a beauty contest rank the ten competitors in the following order :

6	4	3	1	2	7	9	8	10	5
4	1	6	7	5	8	10	9	3	2

Do the two judges appear to agree in their standard ?

Ans. 0.224

### 59.13 REGRESSION

If the scatter diagram indicates some relationship between two variables  $x$  and  $y$ , then the dots of the scatter diagram will be concentrated round a curve. This curve is called the *curve of regression*.

Regression analysis is the method used for estimating the unknown values of one variable corresponding to the known value of another variable.

### 59.14 LINE OF REGRESSION

When the curve is a straight line, it is called a line of regression. A line of regression is the straight line which gives the best fit in the least square sense to the given frequency.

Regression will be called *non-linear* if there exists a relationship (parabola etc.) other than a straight line between the variables under consideration.

### 59.15 EQUATIONS TO THE LINES OF REGRESSION

Let  $y = a + bx$  ... (1)

be the equation of the line of regression of  $y$  on  $x$ .

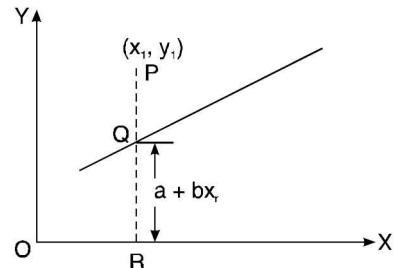

Let  $(x_r, y_r)$  be any point of dot.

From the figure

$$PR = y_r$$

$$QR = a + bx_r$$

$$PQ = PR - QR = y_r - a - bx_r$$

Let  $S$  be the sum of the squares of such distances, then

$$S = \sum (y - a - bx)^2$$

According to the principle of least squares, we have to choose  $a$  and  $b$  so that  $S$  is minimum. The method of least square gives the condition for minimum value of  $S$ .

$$\begin{aligned} \frac{\partial S}{\partial a} &= -2 \sum (y - a - bx), & \frac{\partial S}{\partial b} &= -2 \sum (y - a - bx)x \\ \frac{\partial S}{\partial a} &= 0, & \frac{\partial S}{\partial b} &= 0, \text{ for } S \text{ minimum} \end{aligned}$$

i.e.  $\sum (y - a - bx) = 0 \Rightarrow \sum y - na - b \sum x = 0 \Rightarrow \sum y = na + b \sum x \quad \dots (2)$

and  $\sum (xy - ax - bx^2) = 0 \Rightarrow \sum xy - a \sum x - b \sum x^2 = 0$

$$\Rightarrow \sum xy = a \sum x + b \sum x^2 \quad \dots (3)$$

Dividing (2) by  $n$ , we get

$$\frac{\sum y}{n} = a + b \frac{\sum x}{n} \quad \left( \bar{y} = \frac{\sum y}{n}, \bar{x} = \frac{\sum x}{n} \right)$$

$$\bar{y} = a + b \bar{x}$$

where  $\bar{x}$  and  $\bar{y}$  are the means of  $x$  series and  $y$  series.

This shows that  $(\bar{x}, \bar{y})$  lie on the line of regression (1), shifting the origin to  $(\bar{x}, \bar{y})$ , the equation (3) becomes

$$\begin{aligned} & \sum (x - \bar{x})(y - \bar{y}) = a \sum (x - \bar{x}) + b \sum (x - \bar{x})^2 \\ \text{But} \quad & \sum (x - \bar{x}) = 0 \\ \Rightarrow \quad & \sum (x - \bar{x})(y - \bar{y}) = b \sum (x - \bar{x})^2 \\ \text{or} \quad & b = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2} = \frac{\sum XY}{\sum X^2} \end{aligned} \quad \dots(4)$$

$$\text{We know that } r = \frac{\Sigma XY}{\sqrt{\Sigma X^2} \sqrt{\Sigma Y^2}} = \frac{\Sigma XY}{n \sqrt{\frac{\Sigma X^2}{n}} \sqrt{\frac{\Sigma Y^2}{n}}} = \frac{\Sigma XY}{n \sigma_x \sigma_y}$$

$$\text{or} \quad \sum XY = nr \sigma_x \sigma_y$$

$$\text{Putting the value of } \sum XY \text{ in (4), we get } b = \frac{nr \sigma_x \sigma_y}{\sum X^2} = \frac{r \sigma_x \sigma_y}{\sum X^2} = \frac{r \sigma_x \sigma_y}{\sigma_x^2} = \frac{r \sigma_y}{\sigma_x}$$

$$\text{i.e. slope of the line of regression} = b = r \frac{\sigma_y}{\sigma_x}$$

The line of regression passes through  $(\bar{x}, \bar{y})$ .

$$\text{Hence the equation to the line of regression is } y - \bar{y} = r \frac{\sigma_y}{\sigma_x} (x - \bar{x})$$

$$\text{Similarly the regression line of } x \text{ on } y \text{ is } x - \bar{x} = r \frac{\sigma_x}{\sigma_y} (y - \bar{y}).$$

**Note.**  $b_{yx} = r \frac{\sigma_y}{\sigma_x}$  and  $b_{xy} = r \frac{\sigma_x}{\sigma_y}$  are known as the coefficients of regression.

$$b_{yx} b_{xy} = \left( r \frac{\sigma_y}{\sigma_x} \right) \left( r \frac{\sigma_x}{\sigma_y} \right) = r^2$$

**Example 14.** If  $\theta$  be the acute angle between the two regression lines in the case of two variables  $x$  and  $y$ , show that

$$\tan \theta = \frac{1 - r^2}{r} \frac{\sigma_x \sigma_y}{\sigma_x^2 + \sigma_y^2}$$

where  $r, \sigma_x, \sigma_y$  have their usual meanings. Explain the significance where  $r = 0$  and  $r = \pm 1$ .  
(Nagpur University, Winter 2004, A.M.I.E., Winter 2001)

**Solution.** Lines of regression are

$$y - \bar{y} = r \frac{\sigma_y}{\sigma_x} (x - \bar{x}) \quad \dots(1) \quad \therefore m_1 = r \frac{\sigma_y}{\sigma_x}$$

$$\text{and} \quad x - \bar{x} = r \frac{\sigma_x}{\sigma_y} (y - \bar{y}) \quad \dots(2) \quad \therefore m_2 = \frac{1}{r} \frac{\sigma_y}{\sigma_x}$$

$$\tan \theta = \frac{m_2 - m_1}{1 + m_1 m_2} = \frac{r \frac{\sigma_x}{\sigma_y} - r \frac{\sigma_y}{\sigma_x}}{1 + r \frac{\sigma_y}{\sigma_x} \times r \frac{\sigma_y}{\sigma_x}} = \frac{\left( \frac{1}{r} - r \right) \frac{\sigma_y}{\sigma_x}}{1 + \frac{\sigma_y^2}{\sigma_x^2}}$$

$$\tan \theta = \frac{1-r^2}{r} \cdot \frac{\left(\frac{\sigma_y}{\sigma_x}\right) \sigma_x^2}{\sigma_x^2 + \sigma_y^2} = \frac{1-r^2}{r} \frac{\sigma_x \sigma_y}{\sigma_x^2 + \sigma_y^2} \quad \dots(3) \quad \text{Proved.}$$

(a) If  $r = 0$ , then there is no relationship between the two variables and they are independent.

On putting the value of  $r = 0$  in (3) we get  $\tan \theta = \infty, \theta = \frac{\pi}{2}$ . So the lines (1) and (2) are perpendicular.

(b) If  $r = 1$  or  $-1$

On putting these values of  $r$  in (3) we get,  $\tan \theta = 0$  or  $\theta = 0$   
i.e. lines (1) and (2) coincide.

The correlation between the variables is perfect.

Ans.

**Example 15.** If the coefficient of correlation between two variables  $x$  and  $y$  is 0.5 and the acute angle between their lines of regression is.

$$\tan^{-1} \left( \frac{3}{5} \right), \text{ show that } \sigma_x = \frac{1}{2} \sigma_y.$$

(U.P. III Semester, June 2009)

**Solution.** Here, we have

$$r = 0.5$$

$$\begin{aligned} \theta &= \tan^{-1} \left( \frac{3}{5} \right) \Rightarrow \tan \theta = \frac{3}{5} \\ \tan \theta &= \frac{1-r^2}{r} \cdot \frac{\sigma_x \sigma_y}{\sigma_x^2 + \sigma_y^2} \end{aligned} \quad \dots(1) \quad (\text{From Example 14})$$

Putting the values of  $r$  and  $\tan \theta$  in (1), we get

$$\begin{aligned} \frac{3}{5} &= \frac{1-\frac{1}{4}}{\frac{1}{2}} \frac{\sigma_x \sigma_y}{\sigma_x^2 + \sigma_y^2} \\ \frac{3}{5} &= \frac{3}{2} \frac{\sigma_x \sigma_y}{\sigma_x^2 + \sigma_y^2} \end{aligned}$$

$$2\sigma_x^2 + 2\sigma_y^2 - 5\sigma_x \sigma_y = 0$$

$$\Rightarrow 2\sigma_x^2 - 5\sigma_x \sigma_y + 2\sigma_y^2 = 0$$

$$\Rightarrow 2\sigma_x^2 - 4\sigma_x \sigma_y - \sigma_x \sigma_y + 2\sigma_y^2 = 0$$

$$\Rightarrow 2\sigma_x (\sigma_x - 2\sigma_y) - \sigma_y (\sigma_x - 2\sigma_y) = 0$$

$$\Rightarrow (2\sigma_x - \sigma_y)(\sigma_x - 2\sigma_y) = 0$$

$$\Rightarrow \text{Either } \sigma_x - 2\sigma_y = 0 \Rightarrow \sigma_x = 2\sigma_y \quad (\text{Not desired})$$

$$\text{or } 2\sigma_x - \sigma_y = 0 \Rightarrow \sigma_x = \frac{1}{2} \sigma_y$$

Proved.

**Example 16.** Find the correlation coefficient between  $x$  and  $y$ , when the lines of regression are:

$$2x - 9y + 6 = 0 \text{ and } x - 2y + 1 = 0$$

**Solution.** Let the line of regression of  $x$  on  $y$  be  $2x - 9y + 6 = 0$

Then, the line of regression of  $y$  on  $x$  is  $x - 2y + 1 = 0$

$$\therefore 2x - 9y + 6 = 0 \Rightarrow x = \frac{9}{2}y - 3 \Rightarrow b_{xy} = \frac{9}{2}$$

and  $x - 2y + 1 = 0 \Rightarrow y = \frac{1}{2}x + \frac{1}{2} \Rightarrow b_{yx} = \frac{1}{2}$

$$r = \sqrt{b_{xy} \cdot b_{yx}} = \sqrt{\frac{9}{2} \times \frac{1}{2}} = \frac{3}{2} > 1 \text{ which is not possible.}$$

So our choice of regression line is incorrect.

$\therefore$  The regression line of  $x$  on  $y$  is  $x - 2y + 1 = 0$

And, the regression line of  $y$  on  $x$  is  $2x - 9y + 6 = 0$

$$\therefore x - 2y + 1 = 0 \Rightarrow x = 2y - 1 \Rightarrow b_{xy} = 2$$

$$\text{And } 2x - 9y + 6 = 0 \Rightarrow y = \frac{2}{9}x + \frac{2}{3} \Rightarrow b_{yx} = \frac{2}{9}$$

$$r = \sqrt{b_{xy} \cdot b_{yx}} = \sqrt{2 \times \frac{2}{9}} = \frac{2}{3}$$

Hence, the correlation coefficient between  $x$  and  $y$  is  $\frac{2}{3}$ .

**Ans.**

**Example 17.** Two lines of regression are given by

$$5y - 8x + 17 = 0 \text{ and } 2y - 5x + 14 = 0$$

If  $\sigma_y^2 = 16$ , find (i) the mean values of  $x$  and  $y$  (ii)  $\sigma_x^2$  (iii) the coefficient of correlation between  $x$  and  $y$ .

**Solution.** We have,  $5y - 8x + 17 = 0$  ... (1)

$$2y - 5x + 14 = 0$$

Since  $(\bar{x}, \bar{y})$  is a common point of the two lines of regression, we have

$$5\bar{y} - 8\bar{x} + 17 = 0 \quad \dots (2)$$

$$2\bar{y} - 5\bar{x} + 14 = 0 \quad \dots (3)$$

On solving (2) and (3) for  $\bar{x}$  and  $\bar{y}$ , we have

$$\begin{aligned} \frac{\bar{x}}{17 \times 2 - 14 \times 5} &= \frac{\bar{y}}{-8 \times 14 - (-5 \times 17)} = \frac{1}{5 \times (-5) - (-8) \times 2} \\ \Rightarrow \frac{\bar{x}}{34 - 70} &= \frac{\bar{y}}{-112 + 85} = \frac{1}{-25 + 16} \Rightarrow \frac{\bar{x}}{-36} = \frac{\bar{y}}{-9} = \frac{1}{-9} \Rightarrow \bar{x} = \frac{36}{9} = 4 \text{ and } \bar{y} = \frac{27}{9} = 3 \end{aligned}$$

The equations of line of regression can be written as

$$y = \frac{8}{5}x - \frac{17}{5} \text{ and } x = \frac{2}{5}y + \frac{14}{5}$$

$$r \frac{\sigma_y}{\sigma_x} = \frac{8}{5} \text{ and } r \frac{\sigma_x}{\sigma_y} = \frac{2}{5}$$

On multiplication of two equations, we get

$$\left( r \frac{\sigma_y}{\sigma_x} \right) \left( r \frac{\sigma_x}{\sigma_y} \right) = \frac{8}{5} \times \frac{2}{5} = \frac{16}{25} \Rightarrow r^2 = \frac{16}{25} \Rightarrow r = \pm \frac{4}{5} \dots (4)$$

Now we have to determine the sign of  $r$  i.e. + or -

as  $\sigma_x, \sigma_y$  are always +ve, so  $r$  is also +ve from (4).  $r = \frac{4}{5}$

We are given

$$\sigma_y^2 = 16 \quad \therefore \sigma_y = 4$$

And

$$r \frac{\sigma_y}{\sigma_x} = \frac{8}{5} \quad \dots (5)$$

On putting the values of  $r$  and  $\sigma_y$  in (5), we get

$$\left( \frac{4}{5} \right) \frac{4}{\sigma_x} = \frac{8}{5} \Rightarrow \frac{16}{5\sigma_x} = \frac{8}{5} \Rightarrow \sigma_x = 2$$

$$\Rightarrow \sigma_x^2 = 4$$

$$\text{Hence (i) } \bar{x} = 4, \bar{y} = 3, \text{ (ii) } \sigma_x^2 = 4, \text{ (iii) } r = \frac{4}{5} \quad \text{Ans.}$$

**Example 18.** In a partially destroyed laboratory record of an analysis of correlation data, the following results only are eligible:

$$\sigma_x^2 = 9 \quad \text{Regression equations :}$$

$$8x - 10y + 66 = 0$$

$$40x - 18y = 214$$

What were (a) the mean values of  $x$  and  $y$ , (b) the standard deviation of  $y$ , (c) coefficient of correlation between  $x$  and  $y$ ?

(U.P., III Semester, Dec. 2009, Nagpur University, Summer 2002)

**Solution.** Since both the lines of regression pass through the point  $(\bar{x}, \bar{y})$ , therefore, we have

$$8\bar{x} - 10\bar{y} + 66 = 0 \quad \dots (1)$$

$$40\bar{x} - 18\bar{y} - 214 = 0 \quad \dots (2)$$

On solving (1) and (2), by cross multiplication method, we have

$$\begin{aligned} \frac{\bar{x}}{(-10)(-214) - (66)(-18)} &= \frac{\bar{y}}{(66)(40) - (8)(-214)} = \frac{1}{8(-18) - (-10)(40)} \\ \frac{\bar{x}}{2140 + 1188} &= \frac{\bar{y}}{2640 + 1712} = \frac{1}{-144 + 400} \\ \Rightarrow \frac{\bar{x}}{3328} &= \frac{\bar{y}}{4352} = \frac{1}{256} \Rightarrow \bar{x} = \frac{3328}{256} = 13, \bar{y} = \frac{4352}{256} = 17 \end{aligned}$$

Also given lines of regression can be written as  $y = 0.8x + 6.6$  :  $x = 0.45y + 5.35$

$$\text{We get} \quad r \frac{\sigma_y}{\sigma_x} = 0.8; \quad r \frac{\sigma_x}{\sigma_y} = 0.45$$

$$\begin{aligned} \left( r \frac{\sigma_y}{\sigma_x} \right) \left( r \cdot \frac{\sigma_x}{\sigma_y} \right) &= (0.8) (0.45) \\ \Rightarrow r^2 &= 0.36 \Rightarrow r = 0.6 \end{aligned}$$

$$\text{Ans.} \quad r \frac{\sigma_y}{\sigma_x} = 0.8 \quad \dots (3)$$

On putting the values of  $r$  and  $\sigma_x$  in (3), we get

$$(0.6) \frac{\sigma_y}{3} = 0.8 \Rightarrow \sigma_y = \frac{3(0.8)}{0.6} = 4$$

$$\text{Hence (a) } \bar{x} = 13, \bar{y} = 17, \text{ (b) } \sigma_y = 4 \quad \text{Ans.} \quad (c) r = 0.6$$

**Example 19.** The two regression equations of the variables  $x$  and  $y$  are

$$x = 19.13 - 0.87y \text{ and } y = 11.64 - 0.50x.$$

Find (i) Mean of  $x$ 's; (ii) Mean of  $y$ 's; (iii) The correlation coefficient between  $x$  and  $y$ .

**Solution.**

$$x = 19.13 - 0.87y \quad \dots(1)$$

$$y = 11.64 - 0.50x \quad \dots(2)$$

As (1) and (2) pass through  $(\bar{x}, \bar{y})$ :

$$\bar{x} = 19.13 - 0.87\bar{y} \quad \dots(3)$$

$$\bar{y} = 11.64 - 0.50\bar{x} \quad \dots(4)$$

On solving (3) and (4) we get

$$\bar{x} = 15.937, \bar{y} = 3.67$$

$$\text{From (1)} \quad r \frac{\sigma_x}{\sigma_y} = -0.87 \quad \dots(5)$$

$$\text{From (2)} \quad r \frac{\sigma_y}{\sigma_x} = -0.50 \quad \dots(6)$$

As  $\sigma_x$  and  $\sigma_y$  are always positive, so  $r$  is negative.

Multiplying (5) and (6), we get

$$r \frac{\sigma_x}{\sigma_y} \cdot r \frac{\sigma_y}{\sigma_x} = -0.87 \times (-0.50)$$

$$r^2 = 0.435 \Rightarrow r = \pm 0.66 \quad \text{Ans.}$$

**Example 20.** The regression equations calculated from a given set of observations for two random variables are

$$x = -0.4y + 6.4 \quad \text{and} \quad y = -0.6x + 4.6$$

Calculate  $\bar{x}, \bar{y}$  and  $r$ .

**Solution.** The regression equations are

$$x = -0.4y + 6.4 \quad \dots(1)$$

$$y = -0.6x + 4.6 \quad \dots(2)$$

$$\text{From (1) coefficient of regression of } x \text{ on } y = r \frac{\sigma_x}{\sigma_y} = -0.4 \quad \dots(3)$$

$$\text{From (2) coefficient of regression of } y \text{ on } x = r \frac{\sigma_y}{\sigma_x} = -0.6 \quad \dots(4)$$

From (3) and (4), we have

$$\left( r \frac{\sigma_x}{\sigma_y} \right) \left( r \frac{\sigma_y}{\sigma_x} \right) = (-0.4)(-0.6)$$

$$\Rightarrow r^2 = 0.24 \Rightarrow r = \pm 0.49$$

In (3) and (4),  $\sigma_x$  and  $\sigma_y$  are (always) negative so  $r$  is negative

$$r = -0.49$$

To find  $\bar{x}$  and  $\bar{y}$  we solve the equations (1) and (2) simultaneously. Their point of intersection is  $(\bar{x}, \bar{y})$ .

$$\bar{x} = 6, \quad \bar{y} = 1 \quad \text{Ans.}$$

**Example 21.** Show that the geometric mean of the coefficients of regression is the coefficient of correlation. (AMIE, Summer 2001)

**Solution.** The coefficients of regressions are  $r \frac{\sigma_y}{\sigma_x}$  and  $r \frac{\sigma_x}{\sigma_y}$

i.e.  $G.M = \sqrt{r \frac{\sigma_y}{\sigma_x} \cdot r \frac{\sigma_x}{\sigma_y}} = r$   
 $= \text{coefficient of correlation.}$  **Proved.**

**Example 22.** The regression lines of  $y$  on  $x$  and of  $x$  on  $y$  are respectively  $y = ax + b$  and  $x = cy + d$ . Show that the means are  $\bar{x} = (bc + d)(1 - ac)$  and  $\bar{y} = (ad + b)(1 - ac)$  and correlation coefficient between  $x$  and  $y$  is  $\sqrt{ac}$ . Also, show that the ratio of the standard deviations of  $y$  and  $x$  is  $\sqrt{\frac{a}{c}}$ .

**Solution.** Here, we have

$$\text{The regression line of } y \text{ on } x \text{ is } y = ax + b \quad \dots (1)$$

$$\text{The regression line of } x \text{ on } y \text{ is } x = cy + d \quad \dots (2)$$

As (1) and (2) pass through  $(\bar{x}, \bar{y})$ , so

$$\bar{y} = a\bar{x} + b \quad \dots (3)$$

$$\bar{x} = c\bar{y} + d \quad \dots (4)$$

Solving (3) and (4), we get

$$\bar{x} = \frac{bc + d}{1 - ac} \Rightarrow \bar{y} = \frac{ad + b}{1 - ac}$$

We know that  $r \frac{\sigma_y}{\sigma_x} = a$  = slope of (1) ... (5)

and  $r \frac{\sigma_x}{\sigma_y} = c$  ... (6)

Multiplying (5) and (6), we get

$$r \frac{\sigma_y}{\sigma_x} \cdot r \frac{\sigma_x}{\sigma_y} = a \cdot c \Rightarrow r^2 = ac \Rightarrow r = \sqrt{ac} \quad \text{Proved.}$$

Dividing (5) by (6), we get

$$\frac{r \frac{\sigma_y}{\sigma_x}}{r \frac{\sigma_x}{\sigma_y}} = \frac{a}{c} \Rightarrow \left( \frac{\sigma_y}{\sigma_x} \right)^2 = \frac{a}{c} \Rightarrow \frac{\sigma_y}{\sigma_x} = \sqrt{\frac{a}{c}} \quad \text{Proved.}$$

**Example 23.** Prove that arithmetic mean of the coefficients of regression is greater than the coefficient of correlation. (A.M.I.E.T.E., Summer 2000)

**Solution.** Coefficients of regression are  $r \frac{\sigma_y}{\sigma_x}$  and  $r \frac{\sigma_x}{\sigma_y}$

We have to prove that  $A.M. > r$

$$\begin{aligned} \Rightarrow \quad & \frac{1}{2} \left[ r \frac{\sigma_y}{\sigma_x} + r \frac{\sigma_x}{\sigma_y} \right] > r \Rightarrow \frac{1}{2} \left[ \frac{\sigma_y}{\sigma_x} + \frac{\sigma_x}{\sigma_y} \right] > 1 \\ \Rightarrow \quad & \frac{\sigma_y}{\sigma_x} + \frac{\sigma_x}{\sigma_y} - 2 > 0 \Rightarrow \frac{1}{\sigma_x \sigma_y} [\sigma_x^2 + \sigma_y^2 - 2\sigma_x \sigma_y] > 0 \\ \Rightarrow \quad & \frac{1}{\sigma_x \sigma_y} [\sigma_x - \sigma_y]^2 > 0 \quad \text{which is true.} \quad \text{Proved.} \end{aligned}$$

**Example 24.** In a study between the amount of rainfall and the quantity of air pollution removed the following data were collected.

Daily Rainfall in 0.01 cm	4.3	4.5	5.9	5.6	6.1	5.2	3.8	2.1
Pollution Removed (mg/m <sup>3</sup> )	12.6	12.1	11.6	11.8	11.4	11.8	13.2	14.1

Find the regression line of  $y$  on  $x$ .

(A.M.I.E., Summer 2000)

**Solution.**

S.N	$x$ (metre)	$y$	$xy$	$x^2$
1	4.3	12.6	54.18	18.49
2	4.5	12.1	54.45	20.25
3	5.9	11.6	68.44	34.81
4	5.6	11.8	66.08	31.36
5	6.1	11.4	69.54	37.21
6	5.2	11.8	61.36	27.04
7	3.8	13.2	50.16	14.44
8	2.1	14.1	29.61	4.41
	37.5	98.6	453.82	188.01

Let  $y - a + bx$  be the equation of the line of regression of  $y$  on  $x$ , where  $a$  and  $b$  are given by the following equations.

$$\Sigma y = na + b \Sigma x \Rightarrow 98.6 = 8a + 37.5b \quad \dots(1)$$

$$\Sigma xy = a \Sigma x + b \Sigma x^2 \Rightarrow 453.82 = 37.5a + 188.01b \quad \dots(2)$$

On solving (1) and (2), we get  $a = 15.49$  and  $b = -0.675$ .

The equation of the line of regression is  $y = 15.49 - 0.675x$

**Ans.**

**Example 25.** Find the correlation coefficient and regression lines for the data :

$x$	1	2	3	4	5
$y$	2	5	3	8	7

(Nagpur University, Summer 2000)

**Solution.** We have,

$x$	1	2	3	4	5	$\Sigma x = 15$
$y$	2	5	3	8	7	$\Sigma y = 25$

$$\bar{x} = \frac{1}{n} \sum x = \frac{1}{5} \times 15 = 3 \quad \bar{y} = \frac{1}{n} \sum y = \frac{1}{5} \times 25 = 5$$

$x$	$y$	$X = x - 3$	$Y = y - 5$	$X^2$	$Y^2$	$XY$
1	2	-2	-3	4	9	6
2	5	-1	0	1	0	0
3	3	0	-2	0	4	0
4	8	1	3	1	9	3
5	7	2	2	4	4	4
	Total			10	26	13

$$\text{Correlation coefficient } 'r' = \frac{\Sigma XY}{\sqrt{\Sigma X^2} \sqrt{\Sigma Y^2}} = \frac{13}{\sqrt{10 \times 26}} = 0.8062$$

$$\text{and } r = \frac{\Sigma XY}{n \sigma_x \sigma_y} \Rightarrow \Sigma XY = n r \sigma_x \sigma_y$$

$$\text{Slope of regression line of } y \text{ on } x = \frac{\Sigma XY}{\Sigma X^2} = \frac{13}{10}$$

$$\text{Slope of regression line of } x \text{ on } y = \frac{\Sigma XY}{\Sigma Y^2} = \frac{13}{26} = \frac{1}{2}$$

Equation of regression line of  $y$  on  $x$  is

$$y - \bar{y} = \frac{13}{10}(x - \bar{x}) \Rightarrow y - 5 = \frac{13}{10}(x - 3) \Rightarrow y = 1.3x + 1.1$$

Equation of regression line of  $x$  on  $y$  is

$$x - \bar{x} = \frac{1}{2}(y - \bar{y}) \Rightarrow x - 3 = 0.5(y - 5) \Rightarrow x = 0.5y + 0.5 \text{ Ans.}$$

**Example 26.** Find the coefficient of correlation and regression lines to the following data:

$x$	5	7	8	10	11	13	16
$y$	33	30	28	20	18	16	9

(Nagpur University, Winter 2003)

**Solution.** Here  $n = 7$ ,  $\bar{x} = \frac{\Sigma x}{n} = \frac{70}{7} = 10$

$$\bar{y} = \frac{\Sigma y}{n} = \frac{154}{7} = 22$$

$$\therefore X = x - \bar{x} = x - 10$$

$$Y = y - \bar{y} = y - 22$$

The various calculations are shown in the following table :

$x$	$y$	$X = x - 10$	$Y = y - 22$	$XY$	$X^2$	$Y^2$
5	33	-5	11	-55	25	121
7	30	-3	8	-24	9	64
8	28	-2	6	-12	4	36
10	20	0	-2	0	0	4
11	18	1	-4	-4	1	16
13	16	3	-6	-18	9	36
16	9	6	-13	-78	36	169
$\Sigma x = 70$		$\Sigma y = 154$		$\Sigma XY = -191$	$\Sigma X^2 = 84$	$\Sigma Y^2 = 446$

Coefficient of correlation

$$\text{Now, } r = \frac{\Sigma XY}{\sqrt{\Sigma X^2 \cdot \Sigma Y^2}} = \frac{-191}{\sqrt{84 \times 446}} = -0.9868$$

$$r \frac{\sigma_y}{\sigma_x} = r \sqrt{\frac{\Sigma Y^2}{\Sigma X^2}} = -0.9868 \sqrt{\frac{446}{84}} = -2.2738$$

$$\text{and } r \frac{\sigma_x}{\sigma_y} = r \sqrt{\frac{\Sigma X^2}{\Sigma Y^2}} = -0.9868 \sqrt{\frac{84}{446}} = -0.4283$$

$\therefore$  Equation of line of regression  $y$  on  $x$  is

$$y - \bar{y} = r \frac{\sigma_y}{\sigma_x} (x - \bar{x}), \quad y - 22 = -2.2738(x - 10)$$

$$y - 22 = -2.2738x + 22.738, \quad y = -2.2738x + 44.738$$

and equation of line of regression  $x$  on  $y$  is

$$\begin{aligned}x - \bar{x} &= r \frac{\sigma_x}{\sigma_y} (y - \bar{y}) \\ \Rightarrow x - 10 &= -0.4283 (y - 22) \\ \Rightarrow x - 10 &= -0.4283 y + 9.4226 \\ \Rightarrow x &= -0.4283 y + 19.4226 \\ x + 0.4283 y &= 19.4226\end{aligned}$$

Hence the equation of the line of regression of  $y$  on  $x$  is  $y + 2.2738 x = 44.738$

The equation of the line of regression of  $x$  on  $y$  is  $x + 0.4283 y = 19.4226$  **Ans.**

**Example 27.** Find the coefficient of correlation and obtain the equation of the lines of regression for the data.

$x$	6	2	10	4	8	
$y$	9	11	5	8	7	

(Nagpur University, Winter 2000)

**Solution.** Here, we have

$x$	6	2	10	4	8	$\Sigma x = 30$
$y$	9	11	5	8	7	$\Sigma y = 40$

$$\bar{x} = \frac{\Sigma x}{n} = \frac{30}{5} = 6, \quad \bar{y} = \frac{\Sigma y}{n} = \frac{40}{5} = 8$$

$x$	$y$	$X = x - 6$	$Y = y - 8$	$X^2$	$Y^2$	$XY$
6	9	0	1	0	1	0
2	11	-4	3	16	9	-12
10	5	4	-3	16	9	-12
4	8	-2	0	4	0	0
8	7	2	-1	4	1	-2
				$\Sigma X^2 = 40$	$\Sigma Y^2 = 20$	$\Sigma XY = -26$

$$r = \frac{\Sigma XY}{\sqrt{\Sigma X^2 \cdot \Sigma Y^2}} = \frac{-26}{\sqrt{40 \times 20}} = \frac{-26}{28.2842} = -0.919$$

The regression coefficient of  $y$  on  $x$  is

$$\frac{\Sigma XY}{\Sigma X^2} = -\frac{26}{40} = -0.65 \quad \left( \frac{\Sigma XY}{\Sigma X^2} = r \frac{\sigma_y}{\sigma_x} \right)$$

The equation of line of regression of  $y$  on  $x$  is

$$y - \bar{y} = \frac{\Sigma XY}{\Sigma X^2} (x - \bar{x})$$

$$\Rightarrow y - 8 = -0.65 (x - 6) \quad \Rightarrow y = -0.65 x + 11.9$$

The regression coefficient of  $x$  on  $y$  is

$$\frac{\Sigma XY}{\Sigma Y^2} = -\frac{26}{20} = -1.3$$

The equation of line of regression of  $x$  on  $y$  is

$$x - \bar{x} = \frac{\Sigma XY}{\Sigma Y^2} (y - \bar{y}) \quad \left( \frac{\Sigma XY}{\Sigma Y^2} = r \frac{\sigma_x}{\sigma_y} \right)$$

$$\Rightarrow x - 6 = -1.3(y - 8) \Rightarrow x = -1.3y + 16.4$$

Hence, the equation of the line of regression of  $y$  on  $x$  is

$$y = -0.65x + 11.9$$

The equation of the line of regression of  $x$  on  $y$  is

$$x = -1.3y + 16.4$$

**Ans.**

### 59.16 MULTIPLE REGRESSION

We know that the production of wheat depends not only on the amount of rain fall  $x_1$  but also on the fertilizer  $x_2$ , pesticides  $x_3$ , quality of seeds  $x_4$ , quality of soil  $x_5$  etc. In a multiple regression the dependent variable is a function of more than one independent variable.

Linear regression is a linear relationship between  $y$  and  $x_1, x_2, x_3, \dots$

$$y = a_0 + a_1 x_1 + a_2 x_2 + a_3 x_3 + \dots$$

In multiple non-linear regression equation is not linear; for example

$$y = a_0 + a_1 x^\alpha + a_2 x^\beta + a_3 x^\gamma + \dots$$

### NON LINEAR RELATIONSHIP

**Example 28.** Fit a non linear relationship between the following data :

$x$	1	2	3	4
$y$	1.7	1.8	2.3	3.2

(U.P., III Semester, June 2009)

**Solution.** Here, we have

	$x$	$y$	$x^2$	$xy$	$x^3$	$x^4$	$x^2y$
	1	1.7	1.	1.7	1	1	1.7
	2	1.8	4	3.6	8	16	7.2
	3	2.3	9	6.9	27	81	20.7
	4	3.2	16	12.8	64	256	51.2
Total	10	9.0	30	25.0	100	354	80.8

Let the non linear relationship is  $y = a_0 + a_1 x + a_2 x^2$

Normal equations are

$$\Sigma y = n a_0 + a_1 \Sigma x + a_2 \Sigma x^2$$

$$\Sigma xy = a_0 \Sigma x + a_1 \Sigma x^2 + a_2 \Sigma x^3$$

$$\Sigma x^2y = a_0 \Sigma x^2 + a_1 \Sigma x^3 + a_2 \Sigma x^4$$

Substituting the values of  $\Sigma y$ ,  $n$ ,  $\Sigma x$ ,  $\Sigma x^2$  etc. in these equations, we get

$$9 = 4a_0 + 10a_1 + 30a_2$$

$$25 = 10a_0 + 30a_1 + 100a_2$$

$$80.8 = 30a_0 + 100a_1 + 354a_2$$

Solving these equations, we get  $a_0 = 2$ ,  $a_1 = -0.5$  and  $a_2 = 0.2$

Then the non-linear relationship is  $y = 2 - 0.5x + 0.2x^2$

**Ans.**

### 59.17 ERROR OF PREDICTION

The deviation of the predicted value from the observed value is known as the standard error of prediction. It is given by

$$E_{yx} = \sqrt{\frac{\sum (y - y_r)^2}{n}}$$

where  $y$  is the actual value and  $y_r$  the predicted value.

**Example 29.** Prove that (i)  $E_{yx} = \sigma_y \sqrt{1 - r^2}$  (ii)  $E_{xy} = \sigma_x \sqrt{1 - r^2}$

**Solution.** The equation of the line of regression of  $y$  on  $x$  is

$$\begin{aligned} y - \bar{y} &= r \frac{\sigma_y}{\sigma_x} (x - \bar{x}), \quad y_r = \bar{y} + r \frac{\sigma_y}{\sigma_x} (x - \bar{x}) \\ \text{So, } E_{yx} &= \sqrt{\frac{\sum (y - y_r)^2}{n}} = \left[ \frac{1}{n} \sum \left\{ y - \bar{y} - r \frac{\sigma_y}{\sigma_x} (x - \bar{x}) \right\}^2 \right]^{1/2} \\ &= \left[ \frac{1}{n} \cdot \sum \left\{ (y - \bar{y})^2 + \frac{r^2 \sigma_y^2}{\sigma_x^2} (x - \bar{x})^2 - \frac{2r \sigma_y}{\sigma_x} (x - \bar{x})(y - \bar{y}) \right\} \right]^{1/2} \\ &= \left[ \sum \frac{(y - \bar{y})^2}{n} + r^2 \frac{\sigma_y^2}{\sigma_x^2} \sum \frac{(x - \bar{x})^2}{n} - 2r \frac{\sigma_y}{\sigma_x} \sum \frac{(x - \bar{x})(y - \bar{y})}{n} \right]^{1/2} \\ &= \left[ \sigma_y^2 + r^2 \frac{\sigma_y^2}{\sigma_x^2} \sigma_x^2 - 2r \frac{\sigma_y}{\sigma_x} r \sigma_x \sigma_y \right]^{1/2} = \left[ \sigma_y^2 + r^2 \sigma_y^2 - 2r^2 \sigma_y^2 \right]^{1/2} = \left[ \sigma_y^2 - r^2 \sigma_y^2 \right]^{1/2} \\ &= \sigma_y \sqrt{1 - r^2} \end{aligned}$$

**Proved.**

(ii) Similarly (ii) may be proved.

**Example 30.** Find the standard error of estimate of  $y$  on  $x$  for the data given below:

$x$	1	3	4	6	8	9	11	14
$y$	1	2	4	4	5	7	8	9

**Solution.** The equation of the line of regression of  $y$  on  $x$  is

$$y = \frac{7}{11}x + \frac{6}{11}. \quad \text{So } y_r = \frac{7x}{11} + \frac{6}{11}$$

S.No	$x$	$y$	$y_r$	$(y - y_r)$	$(y - y_r)^2$
1	1	1	$\frac{13}{11}$	$-\frac{2}{11}$	$\frac{4}{121}$
2	3	2	$\frac{27}{11}$	$-\frac{5}{11}$	$\frac{25}{121}$
3	4	4	$\frac{34}{11}$	$\frac{10}{11}$	$\frac{100}{121}$
4	6	4	$\frac{48}{11}$	$-\frac{4}{11}$	$\frac{16}{121}$
5	8	5	$\frac{62}{11}$	$-\frac{7}{11}$	$\frac{49}{121}$
6	9	7	$\frac{69}{11}$	$\frac{8}{11}$	$\frac{64}{121}$
7	11	8	$\frac{83}{11}$	$\frac{5}{11}$	$\frac{25}{121}$
8	14	9	$\frac{104}{11}$	$-\frac{5}{11}$	$\frac{25}{121}$
					$\Sigma (y - y_r)^2 = \frac{308}{121}$

$$E_{yx} = \sqrt{\frac{\sum (y - y_r)^2}{n}} = \sqrt{\frac{308}{121 \times 8}} = \sqrt{\frac{7}{22}} = 0.564$$

**Ans.**

### 59.18 RELATION BETWEEN REGRESSION ANALYSIS AND CORRELATION ANALYSIS

Sr. No.	Correlation Analysis	Regression Analysis
1.	The relationship between two variables is given by the coefficient of correlation.	1. In this case some points are stepped up and some are stepped down for making an average value.
2.	It is a measure of direction and degree of relationship between $x$ and $y$ .	2. $b_{xy}$ and $b_{yx}$ are mathematical measure of average relationship between the two variables.
3.	Here, $r_{xy} = r_{yx}$	3. $b_{xy} \neq b_{yx}$
4.	It does not reflect upon the nature of variable (dependent or independent variable).	4. It indicates which is dependent variable and which is independent variable
5.	It does not imply cause and effect relationship between the variables.	5. It indicates the cause and effect relationship between the variables.
6.	It is a relative measure and have no units.	6. It is an absolute measure.
7.	It indicates the degree of association.	7. It is used to forecast the nature of the dependent variable when the value of independent variable is given.
8.	It is confined to the study of linear relationship.	8. It has not only application of linear relationship but non-linear relationship also.

### EXERCISE 59.2

1. Find the regression line of  $y$  on  $x$  for the data :

$x$	1	4	2	3	5
$y$	3	1	2	5	4

$$\text{Ans. } y = 2.7 + 0.1x$$

2. Compute the regression line of  $x$  on  $y$  for the following data :

$x$	2	4	6	8	10
$y$	12	10	8	6	4

$$\text{Ans. } x = 1 + 3y$$

3. Compute the regression line of  $y$  on  $x$  for the following data :

$x$	1	2	3	4	5	6
$y$	2	2	2	2	2	2

$$\text{Ans. } y = 6 - x$$

4. Find the regression lines of from the given data :

$x$	1	2	3	4	5	6	7	8	9	10
$y$	10	12	16	28	25	36	41	49	40	50

$$\text{Ans. } x = 0.2y - 0.64, \quad y = 4.69x + 4.9$$

5. Find the equations to the lines of regression and the coefficient of correlation for the following data:

$x$	2	4	5	6	8	11
$y$	18	12	10	8	7	5

$$\text{Ans. } y - 10 = -1.34(x - 6), \quad x - 6 = -0.632(y - 10), \quad r = -0.92$$

6. The following marks have been obtained by a class of students in statistics.

Paper I	80	45	55	56	58	60	65	68	70	75	85
Paper II	81	56	50	48	60	62	64	65	70	74	90

Compute the coefficient of correlation for the above data. Find the lines of regression.

$$\text{Ans. } r = 0.918, \quad y - 65.45 = 0.981(x - 65.18), \quad x - 65.18 = 0.859(y - 65.45)$$

7. The following results were obtained from records of age (x) and systolic blood pressure (y) of a group of 10 men :

	x	y
Mean	53	142
Variance	130	165

$$\text{and } \Sigma(x - \bar{x})(y - \bar{y}) = 1220$$

Find the appropriate regression equation and use it to estimate the blood pressure of a man whose age is 45.

$$\text{Ans. } y = 0.94x + 92.26, \text{ Blood pressure} = 134.56$$

8. The following results were obtained from lineups in Applied Mechanics and Engineering Mathematics in an examination :

	Applied Mechanics(x)	Engg. Maths(y)
Mean	47.5	39.5
Standard deviation	16.8	10.8

$$r = 0.95$$

Find both the regression equations. Also estimate the value of y for x = 30.

$$\text{Ans. } y = 0.611x + 10.5, x = 1.478y - 1.143, y = 28.83$$

9. If two regression coefficients are 0.8 and 0.2, what would be the value of coefficient of correlation?

$$\text{Ans. } r = 0.4$$

10. The regression equations are :  $7x - 16y + 9 = 0$ ,  $5y - 4x - 3 = 0$ , find  $\bar{x}$ ,  $\bar{y}$  and  $r$ .

$$(AMIE, Winter 2003) \text{ Ans. } \bar{x} = -\frac{3}{29}, \bar{y} = \frac{15}{29}, r = \frac{3}{4}$$

11. The following regression equations and variances are obtained from a correlation table :

$$20x - 9y - 107 = 0, \quad 4x - 5y + 33 = 0, \quad \text{variance of } x = 9.$$

Find (i) the mean values of x and y, (ii) the standard deviation of y. (A.M.I.E., Winter 2000)

$$\text{Ans. } \bar{x} = 13, \bar{y} = 17, \sigma_y = 4.$$

12. Two random variables have the least square regression lines with equation  $3x + 2y = 26$  and  $6x + y = 31$ . Find mean values and correlation coefficient between x and y.

$$\text{Ans. } \bar{x} = 4, \bar{y} = 7, r = 0.5$$

13. The regression equations of two variables x and y are  $x = 0.7y + 5.2$ ,  $y = 0.3x + 2.8$ . Find the means of the variables and the coefficient of correlation between them.

$$\text{Ans. } r = 0.7395, \bar{x} = -0.1034,$$

$$\bar{y} = 0.5172$$

14. Two lines of regression are given by  $x + 2y = 5$  &  $2x + 3y = 8$ .

Calculate: (i) mean values of x and y

(ii) the coefficient of correlation

(iii) the ratio of the regression coefficients. **Ans.**  $\bar{x} = 4, \bar{y} = 7, r = -0.5$

15. Fill in the blanks :

(a) Arithmetic mean of the coefficients of regression is ..... than the coefficient of correlation.

(A.M.I.E., Summer 2000) **Ans.** greater

(b) If two regression lines coincide then the coefficient of correlation is .....

(A.M.I.E., Winter 2000) **Ans.**  $\pm 1$

# 60

## **CORRELATION AND MULTIPLE REGRESSION ANALYSIS**

---

### **60.1 INTRODUCTION**

So far we have considered correlation between two variables only. But often it is necessary to find correlation between three or more variables.

**For example;** Crops are influenced not only by rainfall but of different fertilizers used.

Correlation between crops rainfall and fertilizer is the multiple correlation.

### **60.2 MULTIPLE CORRELATION**

In multiple correlation we study three or more variables at a time.

In multiple correlation the effect of all the independent variables on a dependent variables is studied.

Let three variables be  $x_1$ ,  $x_2$  and  $x_3$ .

$R_{1.23}$  = Multiple correlation coefficient with  $x_1$  as dependent variable and  $x_2$  and  $x_3$  as independent variables.

$R_{2.13}$  = Multiple correlation coefficient with  $x_2$  as dependent variable and  $x_1$  and  $x_3$  as independent variables.

$R_{3.12}$  = Multiple correlation coefficient with  $x_3$  as dependent variable and  $x_1$  and  $x_2$  as independent variables.

### **60.3 FORMULAE FOR THE CALCULATION OF MULTIPLE CORRELATION COEFFICIENT**

$$R_{1.23} = \sqrt{\frac{r_{12}^2 + r_{13}^2 - 2r_{12}r_{13}r_{23}}{1 - r_{23}^2}}, \quad R_{2.13} = \sqrt{\frac{r_{21}^2 + r_{23}^2 - 2r_{21}r_{23}r_{13}}{1 - r_{13}^2}}, \quad R_{3.12} = \sqrt{\frac{r_{31}^2 + r_{32}^2 - 2r_{31}r_{32}r_{12}}{1 - r_{12}^2}}$$

### **60.4 PROPERTIES OF MULTIPLE CORRELATION**

- (1) Its value lies between 0 and 1.
- (2) If  $R_{1.23} = 0$ , then  $r_{12} = 0$  and  $r_{13} = 0$
- (3)  $R_{1.23} \geq r_{12}$  and  $R_{1.23} \geq r_{13}$
- (4)  $R_{1.23} = R_{1.32}$

**Coefficient of Multiple correlation between four Variables :**

$$R_{1.234} = \sqrt{1 - (1 - r_{14}^2)(1 - r_{12.3}^2)(1 - r_{12.34}^2)}$$

**Example 1.** A simple correlation coefficient between quantity of production of wheat  $x_1$ , fertilizer ( $x_2$ ) and rainfall ( $x_3$ ) are given

$$r_{12} = 0.4, \quad r_{13} = 0.5 \quad \text{and} \quad r_{23} = 0.6$$

Find the coefficient of multiple correlation  $R_{1.23}$ .

**Solution.** Here, we have

$$r_{12} = 0.4, \quad r_{13} = 0.5 \quad \text{and} \quad r_{23} = 0.6$$

We know that

$$\begin{aligned} R_{1.23} &= \sqrt{\frac{r_{12}^2 + r_{13}^2 - 2r_{12}r_{13}r_{23}}{1 - r_{23}^2}} = \sqrt{\frac{(0.4)^2 + (0.5)^2 - 2(0.4)(0.5)(0.6)}{1 - (0.6)^2}} \\ &= \sqrt{\frac{0.16 + 0.25 - 0.24}{1 - 0.36}} = \sqrt{\frac{0.17}{0.64}} = \sqrt{0.2656} = 0.515 \end{aligned} \quad \text{Ans.}$$

**Example 2.** If  $r_{12} = 0.6, \quad r_{23} = 0.35 \quad \text{and} \quad r_{31} = 0.4$   
then find  $R_{3.12}$ .

**Solution.** We have

$$r_{12} = 0.6, \quad r_{23} = 0.35, \quad \text{and} \quad r_{31} = 0.4$$

We know that

$$\begin{aligned} R_{3.12} &= \sqrt{\frac{r_{31}^2 + r_{12}^2 - 2r_{31}r_{12}r_{23}}{1 - r_{12}^2}} = \sqrt{\frac{0.4^2 + (0.35)^2 - 2(0.6)(0.4)(0.35)}{1 - (0.6)^2}} \\ &= \sqrt{\frac{0.16 + 0.1225 - 0.168}{1 - 0.36}} = \sqrt{\frac{0.1145}{0.64}} = \sqrt{0.1789} = 0.423 \end{aligned} \quad \text{Ans.}$$

**Example 3.** If  $r_{12} = 0.25, \quad r_{13} = 0.35 \quad \text{and} \quad r_{23} = 0.45$   
then find  $R_{2.13}$ .

**Solution.** Here, we have

$$r_{12} = 0.25, \quad r_{13} = 0.35, \quad \text{and} \quad r_{23} = 0.45$$

We know that

$$\begin{aligned} R_{2.13} &= \sqrt{\frac{r_{21}^2 + r_{13}^2 - 2r_{21}r_{13}r_{23}}{1 - r_{13}^2}} = \sqrt{\frac{(0.25)^2 + (0.45)^2 - 2(0.25)(0.35)(0.45)}{1 - (0.35)^2}} \\ &= \sqrt{\frac{0.0625 + 0.2025 - 0.07875}{1 - 0.1225}} = \sqrt{\frac{0.18625}{0.8775}} = \sqrt{0.2123} = 0.461 \end{aligned} \quad \text{Ans.}$$

**Example 4.** Given the following data :

$x_1$	3	5	6	8	12	14
$x_2$	16	10	7	4	3	2
$x_3$	90	72	54	42	30	12

Compute the coefficient of linear multiple correlation of  $x_3$  on  $x_1$  and  $x_2$ .

**Solution.** Here  $N = 6; \quad \bar{x}_1 = \frac{\sum x_1}{6} = \frac{48}{6} = 8, \quad \bar{x}_2 = \frac{\sum x_2}{6} = \frac{42}{6} = 7, \quad \bar{x}_3 = \frac{\sum x_3}{6} = \frac{300}{6} = 50$

We have to compute the values of  $r_{13}, r_{23}$  and  $r_{12}$ .

$X_1 = x_1 - \bar{x}_1$			$X_2 = x_2 - \bar{x}_2$			$X_3 = x_3 - \bar{x}_3$					
$x_1$	$X_1$	$X_1^2$	$x_2$	$X_2$	$X_2^2$	$x_3$	$X_3$	$X_3^2$	$X_1 X_2$	$X_1 X_3$	$X_2 X_3$
3	-5	25	16	+9	81	90	+40	1600	-45	-200	+360
5	-3	9	10	+3	9	72	+22	484	-9	-66	+66
6	-2	4	7	0	0	54	+4	16	0	-8	0
8	0	0	4	-3	9	42	-8	64	0	0	+24
12	+4	16	3	-4	16	30	-20	400	-16	-80	+80
14	+6	36	2	-5	25	12	-38	1444	-30	-228	+190
		$\Sigma X_1^2$ = 90			$\Sigma X_2^2$ = 140			$\Sigma X_3^2$ = 4008	$\Sigma X_1 X_2$ = -100	$\Sigma X_1 X_3$ = -582	$\Sigma X_2 X_3$ = 720

$$\text{Now, } r_{12} = \frac{\Sigma X_1 X_2}{\sqrt{\Sigma X_1^2 \times \Sigma X_2^2}} = \frac{-100}{\sqrt{90 \times 140}} = \frac{-100}{\sqrt{12600}} = -0.89$$

$$\text{Also, } r_{13} = \frac{\Sigma X_1 X_3}{\sqrt{\Sigma X_1^2 \times \Sigma X_3^2}} = \frac{-582}{\sqrt{90 \times 4008}} = -0.97$$

$$\text{Again } r_{23} = \frac{\Sigma X_2 X_3}{\sqrt{\Sigma X_2^2 \times \Sigma X_3^2}} = \frac{720}{\sqrt{140 \times 4008}} = 0.96$$

We know that

$$R_{3.12} = \sqrt{\frac{r_{13}^2 + r_{23}^2 - 2r_{12}r_{13}r_{23}}{1 - r_{12}^2}} \quad \dots (1)$$

Substituting the values of  $r_{12}$ ,  $r_{13}$  and  $r_{23}$  in (1), we get

$$\begin{aligned} R_{3.12} &= \sqrt{\frac{(-0.97)^2 + (0.96)^2 - 2(-0.89)(-0.97)(0.96)}{1 - (-0.89)^2}} \\ &= \sqrt{\frac{0.9409 + 0.9216 - 1.66}{1 - 0.7921}} = \sqrt{\frac{0.2025}{0.2079}} = \sqrt{0.9740} = 0.987 \end{aligned} \quad \text{Ans.}$$

### EXERCISE 60.1

- If  $r_{12} = 0.59$ ,  $r_{13} = 0.46$ , and  $r_{23} = 0.77$  then find  $R_{1.23}$ . Ans. 0.416
- If  $r_{12} = 0.5$ ,  $r_{13} = 0.6$ , and  $r_{23} = 0.7$  then find  $R_{2.13}$ . Ans. 0.707
- If  $r_{12} = 0.6$ ,  $r_{13} = 0.7$ , and  $r_{23} = 0.65$  then find  $R_{3.12}$ . Ans. 0.757
- If  $r_{12} = 0.8$ ,  $r_{13} = -0.5$ , and  $r_{23} = 0.40$  then prove that  $R_{1.23} = R_{1.32}$
- If  $r_{12} = 0.45$ ,  $r_{13} = 0.32$ , and  $r_{23} = 0.61$  then find  $R_{1.23}$ . Ans. 0.339

## 60.5 MULTIPLE REGRESSION ANALYSIS

We have considered two types of regression equations one of  $x$  on  $y$  and the other of  $y$  on  $x$ .

Multiple regression analysis represents an extension of two variables to three or more variables.

We take  $x_1$  as dependent variable and  $x_2$  and  $x_3$  as independent variable.

## 60.6 PURPOSE OF MULTIPLE REGRESSION

- From the regression equation to find out the estimate of dependent variable from two or more independent variables.

- (2) To find out the error in the estimate.
- (3) To derive a measure of proportion of variance in the dependent variable from the independent variables.

### 60.7 REGRESSION EQUATION OF THREE VARIABLES

$$X_1 = a + b_{12,3} x_2 + b_{13,2} x_3 \quad \dots (A)$$

Normal equation of multiple regression equation is

$$S = \sum (x_1 - X_1)^2 \quad \dots (B)$$

Putting the value of  $X_1$  from (A) in (B), we get

$$S = \sum (x_1 - a - b_{12,3} x_2 - b_{13,2} x_3)^2$$

Differentiating partially above equation w.r.t.  $a$ ,  $b_{12,3}$  and  $b_{13,2}$ , we get

$$\frac{\partial S}{\partial a} = \sum (x_1 - a - b_{12,3} x_2 - b_{13,2} x_3) = 0 \quad \dots (1)$$

$$\frac{\partial S}{\partial b_{12,3}} = \sum x_2 (x_1 - a - b_{12,3} x_2 - b_{13,2} x_3) = 0 \quad \dots (2)$$

$$\frac{\partial S}{\partial b_{13,2}} = \sum x_3 (x_1 - a - b_{12,3} x_2 - b_{13,2} x_3) = 0 \quad \dots (3)$$

Equation (1) can be rewritten as

$$\sum x_1 - \sum a - b_{12,3} \sum x_2 - b_{13,2} \sum x_3 = 0$$

$$\text{since } \sum x_1 = \sum (X_1 - \bar{X}_1) = 0, \quad \sum x_2 = \sum (X_2 - \bar{X}_2) = 0, \quad \sum x_3 = \sum (X_3 - \bar{X}_3) = 0$$

[Sum of the deviations from the mean = 0]

Therefore from (1),  $a = 0$

Putting the value of  $a = 0$  in (2) and (3), we get

$$\sum x_1 x_2 - b_{12,3} \sum x_2^2 - b_{13,2} \sum x_2 x_3 = 0 \quad \dots (4)$$

$$\sum x_1 x_3 - b_{12,3} \sum x_2 x_3 - b_{13,2} \sum x_3^2 = 0 \quad \dots (5)$$

On solving (4) and (5), we get the values of  $b_{12,3}$  and  $b_{13,2}$ .

On putting the values of  $a$ ,  $b_{12,3}$  and  $b_{13,2}$  in (A), we get the required regression equation.

Similarly

$$x_2 = b_{21,3} x_1 + b_{23,1} x_3$$

$$x_3 = b_{31,2} x_1 + b_{32,1} x_2$$

**Second Method :**

On putting the values of  $\Sigma x_1 x_2$  etc. in (4) and (5), we get

$$r_{12} = \frac{\sum x_1 x_2}{\sigma_1 \sigma_2} \Rightarrow \sum x_1 x_2 = r_{12} \sigma_1 \sigma_2 \text{ etc.}$$

$$r_{12} \sigma_1 \sigma_2 = b_{12,3} r_{23} \sigma_2 \sigma_3 + b_{13,2} \sigma_3^2 \quad \dots (6)$$

$$r_{13} \sigma_1 \sigma_3 = b_{12,3} r_{23} \sigma_2 \sigma_3 + b_{13,2} \sigma_2^2 \quad \dots (7)$$

where  $r_{ij}$  = coefficient of correlation between  $x_i$  and  $x_j$

Solving (6) and (7), we get

$$b_{12,3} = \left| \begin{array}{cc} r_{12} \sigma_1 & r_{23} \sigma_3 \\ r_{13} \sigma_1 & \sigma_3 \end{array} \right| \div \left| \begin{array}{cc} \sigma_2 & r_{23} \sigma_3 \\ r_{23} \sigma_2 & \sigma_3 \end{array} \right| = \frac{-\sigma_1}{\sigma_2} \left| \begin{array}{cc} r_{12} & r_{23} \\ r_{13} & 1 \end{array} \right| = -\frac{\sigma_1}{\sigma_2} \frac{\Delta_{12}}{\Delta_{11}} \quad \dots (8)$$

$$\text{and } b_{13.2} = \frac{-\sigma_1}{\sigma_3} \begin{vmatrix} 1 & r_{12} \\ r_{23} & r_{13} \end{vmatrix} = -\frac{\sigma_1}{\sigma_3} \frac{\Delta_{13}}{\Delta_{11}} \quad \dots (9)$$

Where  $\Delta_{ij}$  is the co-factor of the element in the  $i$ th row and  $j$ th column in the determinant.

$$\Delta = \begin{vmatrix} 1 & r_{12} & r_{13} \\ r_{21} & 1 & r_{23} \\ r_{31} & r_{32} & 1 \end{vmatrix}$$

Hence, on substituting the values of  $b_{12.3}$  and  $b_{13.2}$  the equation to the regression plane of  $x_1$  on  $x_2$  and  $x_3$  is

$$x_1 = \left[ -\frac{\sigma_1}{\sigma_2} \frac{\Delta_{12}}{\Delta_{11}} \right] x_2 + \left[ -\frac{\sigma_1}{\sigma_3} \frac{\Delta_{13}}{\Delta_{11}} \right] x_3 \quad \dots (10)$$

The above equation can also be written as :

$$x_1 = \frac{\sigma_1}{\sigma_2} \left[ \frac{r_{12} - r_{13} r_{23}}{1 - r_{23}^2} \right] x_2 + \frac{\sigma_1}{\sigma_3} \left[ \frac{r_{13} - r_{12} r_{23}}{1 - r_{23}^2} \right] x_3$$

Similarly,

$$x_2 = \frac{\sigma_2}{\sigma_3} \left[ \frac{r_{23} - r_{12} r_{13}}{1 - (r_{13})^2} \right] x_3 + \frac{\sigma_2}{\sigma_1} \left[ \frac{r_{12} - r_{23} r_{13}}{1 - (r_{31})^2} \right] x_1, \quad x_3 = \frac{\sigma_3}{\sigma_2} \left[ \frac{r_{23} - r_{12} r_{13}}{1 - (r_{12})^2} \right] x_2 + \frac{\sigma_3}{\sigma_1} \left[ \frac{r_{13} - r_{23} r_{12}}{1 - (r_{12})^2} \right] x_1$$

#### Standard Error of the estimate for multiple regression and multiple correlation

The standard error of the estimate  $X_1, X_2$  and  $X_3$  is

$$S_{1.23} = \sqrt{\frac{\sum (X_1 - Y_1)^2}{N - 3}}$$

where  $S_{1.23}$  is standard error of the estimate of  $X_1$  on  $X_2$  and  $X_3$ .

$X_1$  is the original value of  $X$  and  $Y_1$  is the estimated value on the basis of the regression equation.

#### Standard error in terms of multiple correlation

$$S_{1.23} = \sigma_1 \sqrt{\frac{1 - r_{12}^2 - r_{13}^2 - r_{23}^2 + 2r_{12}r_{13}r_{23}}{1 - r_{23}^2}}$$

**Example 5.** If  $r_{12} = 0.6$ ,  $r_{13} = 0.8$ ,  $r_{23} = 0.3$

$$\sigma_1 = 8, \quad \sigma_2 = 9, \quad \sigma_3 = 5$$

Determine regression equation of  $x_1$  on  $x_2$  and  $x_3$ .

**Solution.** Let  $x_1, x_2$  and  $x_3$  be the respective deviations from the means of  $X_1, X_2$  and  $X_3$  series.

Regression equation of  $X_1$  on  $X_2$  and  $X_3$  is

$$x_1 = b_{12.3} x_2 + b_{13.2} x_3 \quad \dots (1)$$

$$\text{Now } b_{12.3} = \frac{\sigma_1}{\sigma_2} \times \left[ \frac{r_{12} - r_{13} r_{23}}{1 - r_{23}^2} \right]$$

$$= \frac{8}{9} \left[ \frac{0.6 - 0.8 \times 0.3}{1 - (0.3)^2} \right] = \frac{8}{9} \left[ \frac{0.6 - 0.24}{1 - 0.09} \right] = \frac{8}{9} \left[ \frac{0.36}{0.91} \right] = \frac{2.88}{8.19} = 0.35$$

$$b_{13.2} = \frac{\sigma_1}{\sigma_3} \times \left[ \frac{r_{13} - r_{12} r_{23}}{1 - r_{23}^2} \right] = \frac{8}{5} \left[ \frac{0.8 - 0.6 \times 0.3}{1 - (0.3)^2} \right]$$

$$= \frac{8}{5} \left[ \frac{0.8 - 0.18}{1 - 0.09} \right] = \frac{8}{5} \left[ \frac{0.62}{0.91} \right] = \frac{4.96}{4.55} = 1.09$$

Substituting the values of  $b_{12.3}$  and  $b_{13.2}$  in the equation (1), we get

$$x_1 = 0.35 x_2 + 1.09 x_3$$

**Ans.**

**Example 6.** If  $r_{12} = 0.75$ ,  $r_{13} = 0.65$ ,  $r_{23} = 0.55$ ,  $\sigma_1 = 9$ ,  $\sigma_2 = 7$ ,  $\sigma_3 = 4$

Determine the regression equation of  $X_2$  on  $X_1$  and  $X_3$ .

**Solution.** The regression equation of  $X_2$  on  $X_1$  and  $X_3$  is given by

$$x_2 = b_{21.3} x_1 + b_{23.1} x_3 \quad \dots (1)$$

We know that

$$\begin{aligned} b_{21.3} &= \frac{\sigma_2}{\sigma_1} \left[ \frac{r_{12} - r_{23} r_{13}}{1 - r_{31}^2} \right] = \frac{7}{9} \left[ \frac{0.75 - 0.55 \times 0.65}{1 - (0.65)^2} \right] = \frac{7}{9} \left[ \frac{0.75 - 0.3575}{1 - 0.4225} \right] \\ &= \frac{7}{9} \left[ \frac{0.3925}{0.5775} \right] = \frac{2.7475}{5.1975} = 0.5286 \end{aligned}$$

$$\text{and } \begin{aligned} b_{23.1} &= \frac{\sigma_2}{\sigma_3} \left[ \frac{r_{23} - r_{12} r_{13}}{1 - r_{13}^2} \right] = \frac{7}{4} \left[ \frac{0.55 - 0.75 \times 0.65}{1 - (0.65)^2} \right] = \frac{7}{4} \left[ \frac{0.55 - 0.4875}{1 - 0.4225} \right] \\ &= \frac{7}{4} \left[ \frac{0.0625}{0.5775} \right] = \frac{0.4375}{2.3100} = 0.1894 \end{aligned}$$

Substituting the values of  $b_{12.3}$  and  $b_{23.1}$  in (1), we get

$$x_2 = 0.5286 x_1 + 0.1894 x_3$$

**Ans.**

**Example 7.** If  $\sigma_1 = 3$ ,  $\sigma_2 = 2.5$ ,  $\sigma_3 = 3.5$

$$r_{12} = 0.3, \quad r_{13} = 0.5, \quad r_{23} = 0.4$$

Find the regression equation of  $x_3$  on  $x_1$  and  $x_2$ .

**Solution.** Here, we have

$$\sigma_1 = 3, \quad \sigma_2 = 2.5, \quad \sigma_3 = 3.5$$

$$r_{12} = 0.3, \quad r_{13} = 0.5, \quad r_{23} = 0.4$$

The regression equation of  $x_3$  on  $x_1$  and  $x_2$  is

$$x_3 = b_{31.2} x_1 + b_{32.1} x_2 \quad \dots (1)$$

We know that

$$\begin{aligned} b_{31.2} &= \frac{\sigma_3}{\sigma_1} \left[ \frac{r_{13} - r_{23} r_{12}}{1 - r_{12}^2} \right] = \frac{3.5}{3} \left[ \frac{0.5 - 0.4 \times 0.3}{1 - (0.3)^2} \right] \\ &= \frac{3.5}{3} \left[ \frac{0.5 - 0.12}{1 - 0.09} \right] = \frac{3.5}{3} \left[ \frac{0.38}{0.91} \right] = \frac{1.33}{2.73} = 0.487 \\ b_{32.1} &= \frac{\sigma_3}{\sigma_2} \left[ \frac{r_{23} - r_{12} r_{13}}{1 - r_{13}^2} \right] = \frac{3.5}{2.5} \left[ \frac{0.4 - 0.3 \times 0.5}{1 - (0.3)^2} \right] \\ &= \frac{3.5}{2.5} \left[ \frac{0.4 - 0.15}{1 - 0.09} \right] = \frac{3.5}{2.5} \left[ \frac{0.25}{0.91} \right] = \frac{0.875}{2.275} = 0.385 \end{aligned}$$

Substituting the values of  $b_{31.2}$  and  $b_{32.1}$  in (1), we get

$$x_3 = 0.487 x_1 + 0.385 x_2$$

**Ans.**

**Example 8.** Find the multiple regression equation of  $x_1$  on  $x_2$  and  $x_3$  from the data given below :

$X_1$	3	5	6	8	12	10
$X_2$	10	10	5	7	5	2
$X_3$	20	25	15	16	15	2

**Solution.** The regression equation of  $X_1$  on  $X_2$  and  $X_3$  is given by

$$X_1 = a_{1.23} + b_{12.3} X_2 + b_{13.2} X_3 \quad \dots (A)$$

The three normal equations for getting the values of  $a_{1.23}$ ,  $b_{12.3}$  and  $b_{13.2}$  are

$$\Sigma X_1 = N a_{1.23} + b_{12.3} \Sigma X_2 + b_{13.2} \Sigma X_3$$

$$\Sigma X_1 X_2 = a_{1.23} \Sigma X_2 + b_{12.3} \Sigma X_2^2 + b_{13.2} \Sigma X_2 X_3$$

$$\Sigma X_1 X_3 = a_{1.23} \Sigma X_3 + b_{12.3} \Sigma X_2 X_3 + b_{13.2} \Sigma X_3^2$$

$X_1$	$X_2$	$X_3$	$X_1 X_2$	$X_1 X_3$	$X_2 X_3$	$X_2^2$	$X_3^2$
3	10	20	30	60	200	100	400
5	10	25	50	125	250	100	625
6	5	15	30	90	75	25	225
8	7	16	56	128	112	49	256
12	5	15	60	180	75	25	225
10	2	2	20	20	4	4	4
$\Sigma X_1$ = 44	$\Sigma X_2$ = 39	$\Sigma X_3$ = 93	$\Sigma X_1 X_2$ = 246	$\Sigma X_1 X_3$ = 603	$\Sigma X_2 X_3$ = 716	$\Sigma X_2^2$ = 303	$\Sigma X_3^2$ = 1735

Substituting the values in normal equations, we get

$$6 a_{1.23} + 39 b_{12.3} + 93 b_{13.2} = 44 \quad \dots (1)$$

$$39 a_{1.23} + 303 b_{12.3} + 716 b_{13.2} = 246 \quad \dots (2)$$

$$93 a_{1.23} + 716 b_{12.3} + 1735 b_{13.2} = 603 \quad \dots (3)$$

Multiplying (1) by 13 and (2) by 2, we get

$$78 a_{1.23} + 507 b_{12.3} + 1209 b_{13.2} = 572 \quad \dots (4)$$

$$78 a_{1.23} + 606 b_{12.3} + 1432 b_{13.2} = 492 \quad \dots (5)$$

Subtracting (4) from (5), we get

$$99 b_{12.3} + 223 b_{13.2} = -80 \quad \dots (6)$$

Multiplying (2) by 31 and (3) by 13, we get

$$1209 a_{1.23} + 9393 b_{12.3} + 22196 b_{13.2} = 7626 \quad \dots (7)$$

$$1209 a_{1.23} + 9308 b_{12.3} + 22555 b_{13.2} = 7839 \quad \dots (8)$$

Subtracting (8) from (7), we get

$$85 b_{12.3} - 359 b_{13.2} = -213 \quad \dots (9)$$

Multiplying (6) by 85 and (9) by 99, we get

$$8415 b_{12.3} + 18955 b_{13.2} = -6800 \quad \dots (10)$$

$$8415 b_{12.3} - 35541 b_{13.2} = -21087 \quad \dots (11)$$

Subtracting (11) from (10), we get

$$54496 b_{13.2} = 14287 \Rightarrow b_{13.2} = 0.2621$$

Putting the value of  $b_{13.2}$  in (6), we get

$$99 b_{12.3} + 223 (0.2621) = -80 \Rightarrow 99 b_{12.3} = -80 - 58.4483$$

$$\Rightarrow b_{12.3} = \frac{-138.4483}{99} = -1.3984$$

Putting the values of  $b_{12.3}$  and  $b_{13.2}$  in (1), we get

$$6 a_{1.23} + 39 (-1.3984) + 93 (0.2621) = 44$$

$$\Rightarrow 6 a_{1.23} - 54.5376 + 24.3753 = 44$$

$$\Rightarrow 6 a_{1.23} = 44 + 54.5376 - 24.3753 \Rightarrow a_{1.23} = \frac{74.1647}{6} = 12.3608$$

Substituting the values  $a_{1.23} = 12.3608$ ,  $b_{12.3} = -1.3984$  and  $b_{13.2} = 0.2621$  in equation (A), we get

$$X_1 = 12.3608 - 1.3984 X_2 + 0.2621 X_3$$

which is the required regression equation of  $X_1$  on  $X_2$  and  $X_3$ . Ans.

**Example 9.** If  $r_{12} = 0.60$ ,  $r_{13} = 0.70$ ,  $r_{23} = 0.65$ , and  $\sigma_1 = 1.0$ , find  $S_{1.23}$ .

**Solution.** Here, we have

$$r_{12} = 0.60, r_{13} = 0.70, r_{23} = 0.65, \text{ and } S_1 = 1.0$$

We know that

$$\begin{aligned} S_{1.23} &= \sigma_1 \times \sqrt{\frac{1 - r_{12}^2 - r_{13}^2 - r_{23}^2 + 2r_{12}r_{13}r_{23}}{1 - r_{23}^2}} \\ &= 1.0 \times \sqrt{\frac{1 - (0.60)^2 - (0.70)^2 - (0.65)^2 + 2(0.60)(0.70)(0.65)}{1 - (0.65)^2}} \\ &= 1.0 \times \sqrt{\frac{1 - 0.36 - 0.49 - 0.4225 + 0.546}{1 - 0.4225}} \\ &= \sqrt{\frac{0.2735}{0.5775}} = \sqrt{0.4736} = 0.6882 \end{aligned}$$

Ans.

## EXERCISE 60.2

- If  $r_{12} = 0.8$ ,  $r_{13} = 0.7$ ,  $r_{23} = 0.6$ ,  $\sigma_1 = 10$ ,  $\sigma_2 = 8$ ,  $\sigma_3 = 5$ , then find the regression equation of  $x_1$  on  $x_2$  and  $x_3$ . Ans.  $x_1 = 0.742 x_2 + 0.6875 x_3$
- If  $\sigma_1 = 3$ ,  $\sigma_2 = 4$ ,  $\sigma_3 = 5$ ,  $r_{12} = 0.7$ ,  $r_{23} = 0.4$ ,  $r_{31} = 0.6$ , then determine the regression equation of  $x_1$  on  $x_2$  and  $x_3$ . Ans.  $x_1 = 0.41 x_2 + 0.229 x_3$
- If  $r_{12} = 0.28$ ,  $r_{23} = 0.49$ ,  $r_{31} = 0.51$ ,  $\sigma_1 = 2.7$ ,  $\sigma_2 = 2.4$ ,  $\sigma_3 = 2.7$ , then find the regression equation of  $x_3$  on  $x_1$  and  $x_2$ . Ans.  $x_3 = 0.405 x_1 + 0.424 x_2$
- Find the multiple linear regression equation of  $x_1$  on  $x_2$  and  $x_3$  from the data given below:

$x_1$	2	4	6	8
$x_2$	3	5	7	9
$x_3$	4	6	8	10

Ans.  $x_1 = 2x_2 - x_3$

CHAPTER  
**61**

## PROBABILITY

---

### 61.1 PROBABILITY

Probability is a concept which numerically measure the degree of uncertainty and therefore, of certainty of the occurrence of events.

If an event  $A$  can happen in  $m$  ways, and fail in  $n$  ways, all these ways being equally likely to occur, then the probability of the happening of  $A$  is

$$= \frac{\text{Number of favourable cases}}{\text{Total number of mutually exclusive and equally likely cases}} = \frac{m}{m+n}$$

and that of its failing is defined as  $\frac{n}{m+n}$

If the probability of the happening =  $p$   
and the probability of not happening =  $q$

then 
$$p+q = \frac{m}{m+n} + \frac{n}{m+n} = \frac{m+n}{m+n} = 1 \text{ or } p+q = 1$$

For instance, on tossing a coin, the probability of getting a head is  $\frac{1}{2}$ .

### 61.2 DEFINITIONS

1. **Die :** It is a small cube. Dots are . . . . :: :: marked on its faces. Plural of the die is dice. On throwing a die, the outcome is the number of dots on its upper face.
2. **Cards :** A pack of cards consists of four suits *i.e.* Spades, Hearts, Diamonds and Clubs. Each suit consists of 13 cards, nine cards numbered 2, 3, 4, ..., 10, and Ace, a King, a Queen and a Jack or Knave. Colour of Spades and Clubs is black and that of Hearts and Diamonds is red. Kings, Queens, and Jacks are known as *face* cards.
3. **Exhaustive Events or Sample Space :** The set of all possible outcomes of a single performance of an experiment is exhaustive events or sample space. Each outcome is called a sample point. In case of tossing a coin once,  $S = (H, T)$  is the *sample space*. Two outcomes Head and Tail constitute an exhaustive event because no other outcome is possible.
4. **Random Experiment :** There are experiments, in which results may be altogether different, even though they are performed under identical conditions. They are known as random experiments. Tossing a coin or throwing a die is random experiment.
5. **Trail and Event :** Performing a random experiment is called a trial and outcome is termed as event. Tossing of a coin is a trial and the turning up of head or tail is an event.
6. **Equally likely events:** Two events are said to be '*equally likely*', if one of them cannot be expected in preference to the other. For instance, if we draw a card from well-shuffled pack, we may get any card, then the 52 different cases are equally likely.
7. **Independent event :** Two events may be *independent*, when the actual happening of one does not influence in any way the probability of the happening of the other.

**Example.** The event of getting head on first coin and the event of getting tail on the second

- coin in a simultaneous throw of two coins are independent.
8. **Mutually Exclusive events:** Two events are known as *mutually exclusive*, when the occurrence of one of them excludes the occurrence of the other. For example, on tossing of a coin, either we get head or tail, but not both.
  9. **Compound Event :** When two or more events occur in composition with each other, the simultaneous occurrence is called a compound event. When a die is thrown, getting a 5 or 6 is a compound event.
  10. **Favorable Events :** The events, which ensure the required happening, are said to be favourable events. For example, in throwing a die, to have the even numbers, 2, 4 and 6 are favourable cases.
  11. **Conditional Probability :** The probability of happening an event  $A$ , such that event  $B$  has already happened, is called the conditional probability of happening of  $A$  on the condition that  $B$  has already happened. It is usually denoted by  $P(A/B)$ .
  12. **Odds in favour of an event and odds against an event**

If number of favourable ways =  $m$ , number of not favourable events =  $n$

$$(i) \text{ Odds in favour of the event} = \frac{m}{n}, \text{ Odds against the event} = \frac{n}{m}.$$

13. **Classical Definition of Probability.** If there are  $N$  equally likely, mutually, exclusive and exhaustive of events of an experiment and  $m$  of these are favourable, then the probability of

the happening of the event is defined as  $\frac{m}{N}$ .

14. **Expected value.** If  $p_1, p_2, p_3, \dots, p_n$  of the probabilities of the events  $x_1, x_2, x_3 \dots x_n$  respectively the expected value

$$E(x) = p_1 x_1 + p_2 x_2 + p_3 x_3 + \dots + p_n x_n = \sum_{r=1}^n p_r x_r$$

**Example 1.** Find the probability of throwing

(a) 5, (b) an even number with an ordinary six faced die.

**Solution.** (a) There are 6 possible ways in which the die can fall and there is only one way of throwing 5.

$$\text{Probability} = \frac{\text{Number of favourable ways}}{\text{Total number of equally likely ways}} = \frac{1}{6} \quad \text{Ans.}$$

(b) Total number of ways of throwing a die = 6

Number of ways falling 2, 4, 6 = 3

$$\text{The required probability} = \frac{3}{6} = \frac{1}{2} \quad \text{Ans.}$$

**Example 2.** Find the probability of throwing 9 with two dice.

**Solution.** Total number of possible ways of throwing two dice

$$= 6 \times 6 = 36$$

Number of ways getting 9. i.e., (3 + 6), (4 + 5), (5 + 4), (6 + 3) = 4.

$$\therefore \text{The required probability} = \frac{4}{36} = \frac{1}{9}. \quad \text{Ans.}$$

**Example 3.** From a pack of 52 cards, one is drawn at random. Find the probability of getting a king.

**Solution.** A king can be chosen in 4 ways.

But a card can be drawn in 52 ways.

$$\therefore \text{the required probability} = \frac{4}{52} = \frac{1}{13} \quad \text{Ans.}$$

### EXERCISE 61.1

1. In a class of 12 students, 5 are boys and the rest are girls. Find the probability that a student selected will be a girl. Ans.  $\frac{7}{12}$
2. A bag contains 7 red and 8 black balls. Find the probability of drawing a red ball. Ans.  $\frac{7}{15}$
3. Three of the six vertices of a regular hexagon are chosen at random. Find the probability that the triangle with three vertices is equilateral. Ans.  $\frac{1}{10}$
4. What is the probability that a leap year, selected at random, will contain 53 Sundays. *(A.M.I.E., Dec. 2009, Summer 2001)* Ans.  $\frac{2}{7}$

**Fill in the blanks with appropriate correct answer**

5. Chance of throwing 6 at least once in four throws with single dice is .....

$$(A.M.I.E., Summer 2000) \quad \text{Ans. } \frac{671}{1296}$$

6. A pair of fair dice is thrown and one die shows a four. The probability that the other die shows 5 is ..... *(A.M.I.E., Summer 2000)* Ans.  $\frac{1}{36}$

### 61.3 ADDITION LAW OF PROBABILITY

If A and B are two events associated with an experiment; then

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

**Proof.** Let  $m_1$ ,  $m_2$ , and m be the number of favourable outcomes to the events A, B and  $A \cap B$  respectively. The mutually exclusive outcomes in the sample space of the experiment be n.

$$P(A) = \frac{m_1}{n}, \quad P(B) = \frac{m_2}{n}, \quad P(A \cap B) = \frac{m}{n}$$

The favourable outcomes to the event A only =  $m_1 - m$

The favourable outcomes to the event B only =  $m_2 - m$

The favourable outcomes to the event  $A \cap B$  only = m.

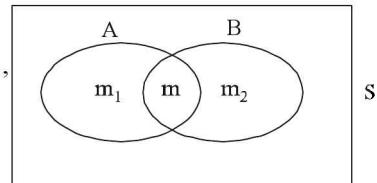

The favourable outcomes to the events A or B or both i.e.,

$$\begin{aligned} A \cup B &= m_1 - m + (m_2 - m) + m \\ &= m_1 + m_2 - m \end{aligned}$$

$$\text{So, } P(A \cup B) = \frac{m_1 + m_2 - m}{n}$$

$$= \frac{m_1}{n} + \frac{m_2}{n} - \frac{m}{n}$$

$$= P(A) + P(B) - P(A \cap B)$$

**Theorem.** If A and B are any two events prove that  $P(A \cup B) = P(A) + P(B) - P(A \cap B)$  and hence prove that if A, B and C are any three events.

$$P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(A \cap C) + P(A \cap B \cap C)$$

*(AMIETE, June 2010)*

#### Note: Mutually Exclusive Events

Consider the case where two events A and B are not mutually exclusive. The probability of the event that either A or B or both occur is given as

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

**Example 4.** An urn contains 10 black and 10 white balls. Find the probability of drawing two balls of the same colour.

**Solution.** Probability of drawing two black balls =  $\frac{^{10}C_2}{^{20}C_2}$

$\therefore$  Probability of drawing two white balls =  $\frac{^{10}C_2}{^{20}C_2}$

$\therefore$  Probability of drawing two balls of the same colour

$$= \frac{^{10}C_2}{^{20}C_2} + \frac{^{10}C_2}{^{20}C_2} = 2 \cdot \frac{^{10}C_2}{^{20}C_2} = 2 \cdot \frac{\frac{10 \times 9}{2 \times 1}}{\frac{20 \times 19}{2 \times 1}} = \frac{9}{19}$$

**Ans.**

**Example 5.** A bag contains four white and two black balls and a second bag contains three of each colour. A bag is selected at random, and a ball is then drawn at random from the bag chosen. What is the probability that the ball drawn is white?

**Solution.** There are two mutually exclusive cases,

(i) when the first bag is chosen, (ii) when the second bag is chosen.

Now the chance of choosing the first bag is  $\frac{1}{2}$  and if this bag is chosen, the probability of drawing a white ball is  $4/6$ . Hence the probability of drawing a white ball from first bag is

$$\frac{1}{2} \times \frac{4}{6} = \frac{1}{3}$$

Similarly the probability of drawing a white ball from second bag is  $\frac{1}{2} \times \frac{3}{6} = \frac{1}{4}$

Since the events are mutually exclusive the required probability =  $\frac{1}{3} + \frac{1}{4} = \frac{7}{12}$  **Ans.**

#### 61.4 MULTIPLICATION LAW OF PROBABILITY

If there are two independent events the respective probabilities of which are known, then the probability that both will happen is the product of the probabilities of their happening respectively.

$$P(AB) = P(A) \times P(B)$$

**Proof.** Suppose  $A$  and  $B$  are two independent events. Let  $A$  happen in  $m_1$  ways and fail in  $n_1$  ways.

$$\therefore P(A) = \frac{m_1}{m_1 + n_1}$$

Also let  $B$  happen in  $m_2$  ways and fail in  $n_2$  ways.

$$\therefore P(B) = \frac{m_2}{m_2 + n_2}$$

Now there are four possibilities

$A$  and  $B$  both may happen, then the number of ways =  $m_1 \cdot m_2$ .

$A$  may happen and  $B$  may fail, then the number of ways =  $m_1 \cdot n_2$

$A$  may fail and  $B$  may happen, then the number of ways =  $n_1 \cdot m_2$

$A$  and  $B$  both may fail, then the number of ways =  $n_1 \cdot n_2$

Thus, the total number of ways =  $m_1 m_2 + m_1 n_2 + n_1 m_2 + n_1 n_2 = (m_1 + n_1)(m_2 + n_2)$

Hence the probabilities of the happening of both  $A$  and  $B$

$$P(AB) = \frac{m_1 m_2}{(m_1 + n_1)(m_2 + n_2)} = \frac{m_1}{m_1 + n_1} \cdot \frac{m_2}{m_2 + n_2} = P(A) \cdot P(B)$$

**Proved.**

**Example 6.** An article manufactured by a company consists of two parts A and B. In the process of manufacture of part A, 9 out of 100 are likely to be defective. Similarly, 5 out of 100 are likely to be defective in the manufacture of part B. Calculate the probability that the assembled article will not be defective (assuming that the events of finding the part A non-defective and that of B are independent).

**Solution.** Probability that part A will be defective =  $\frac{9}{100}$

$$\text{Probability that part A will not be defective} = \left(1 - \frac{9}{100}\right) = \frac{91}{100}$$

$$\text{Probability that part B will be defective} = \frac{5}{100}$$

$$\text{Probability that part B will not be defective} = \left(1 - \frac{5}{100}\right) = \frac{95}{100}$$

Probability that the assembled article will not be defective = (Probability that part A will not be defective)  $\times$  (Probability that part B will not be defective)

$$= \left(\frac{91}{100}\right) \times \left(\frac{95}{100}\right) = 0.8645 \quad \text{Ans.}$$

**Example 7.** The probability that machine A will be performing an usual function in 5 years'

time is  $\frac{1}{4}$ , while the probability that machine B will still be operating usefully at the

end of the same period, is  $\frac{1}{3}$

Find the probability in the following cases that in 5 years time :

(i) Both machines will be performing an usual function.

(ii) Neither will be operating.

(iii) Only machine B will be operating.

(iv) At least one of the machines will be operating.

**Solution.**  $P(A \text{ operating usefully}) = \frac{1}{4}$ , so  $q(A) = 1 - \frac{1}{4} = \frac{3}{4}$

$P(B \text{ operating usefully}) = \frac{1}{3}$ , so  $q(B) = 1 - \frac{1}{3} = \frac{2}{3}$

$$(i) P(\text{Both } A \text{ and } B \text{ will operate usefully}) = P(A) \cdot P(B) = \left(\frac{1}{4}\right) \times \left(\frac{1}{3}\right) = \frac{1}{12}$$

$$(ii) P(\text{Neither will be operating}) = q(A) \cdot q(B) = \left(\frac{3}{4}\right) \left(\frac{2}{3}\right) = \frac{1}{2}$$

$$(iii) P(\text{Only } B \text{ will be operating}) = P(B) \times q(A) = \left(\frac{1}{3}\right) \times \left(\frac{3}{4}\right) = \frac{1}{4}$$

$$(iv) P(\text{At least one of the machines will be operating}) \\ = 1 - P(\text{none of them operates})$$

$$= 1 - \frac{1}{2} = \frac{1}{2} \quad \text{Ans.}$$

**Example 8.** There are two groups of subjects one of which consists of 5 science and 3 engineering subjects and the other consists of 3 science and 5 engineering subjects. An unbiased

die is cast. If number 3 or number 5 turns up, a subject is selected at random from the first group, otherwise the subject is selected at random from the second group. Find the probability that an engineering subject is selected ultimately.

(A.M.I.E.T.E., Summer 2000)

**Solution.** Probability of turning up 3 or 5 =  $\frac{2}{6} = \frac{1}{3}$

Probability of selecting engineering subject from first group =  $\frac{3}{8}$

Now the probability of selecting engineering subject from first group on turning up 3 or 5

$$= \left(\frac{1}{3}\right) \times \left(\frac{3}{8}\right) = \frac{1}{8} \quad \dots (1)$$

Probability of not turning up 3 or 5 =  $1 - \frac{1}{3} = \frac{2}{3}$

Probability of selecting engineering subject from second group =  $\frac{5}{8}$

Now probability of selecting engineering subject from second group on not turning up 3 or 5

$$= \frac{2}{3} \times \frac{5}{8} = \frac{5}{12} \quad \dots (2)$$

Probability of the selection of engineering subject =  $\frac{1}{8} + \frac{5}{12}$  [From (1) and (2)]

$$= \frac{13}{24} \quad \text{Ans.}$$

**Example 9.** An urn contains nine balls, two of which are red, three blue and four black. Three balls are drawn from the urn at random. What is the probability that

(i) the three balls are of different colours?

(ii) the three balls are of the same colour? (A.M.I.E., Summer 2000)

**Solution.**

Urn contains 2 Red balls, 3 Blue balls and 4 Black balls.

(i) Three balls will be of different colours if one ball is red, one blue and one black ball are drawn.

$$\text{Required probability} = \frac{{}^2C_1 \times {}^3C_1 \times {}^4C_1}{{}^9C_3} = \frac{2 \times 3 \times 4}{84} = \frac{2}{7} \quad \text{Ans.}$$

(ii) Three balls will be of the same colour if either 3 blue balls or 3 black balls are drawn.

$P(3 \text{ Blue balls or } 3 \text{ Black balls}) = P(3 \text{ Blue balls}) + P(3 \text{ Black balls})$

$$= \frac{{}^3C_3}{{}^9C_3} + \frac{{}^4C_3}{{}^9C_3} = \frac{1+4}{84} = \frac{5}{84} \quad \text{Ans.}$$

**Example 10.** A bag contains 10 white and 15 black balls. Two balls are drawn in succession. What is the probability that first is white and second is black?

**Solution.** Probability of drawing one white ball =  $\frac{10}{25}$

Probability of drawing one black ball without replacement =  $15/24$

Required probability of drawing first white ball and second black ball

$$= \frac{10}{25} \times \frac{15}{24} = \frac{1}{4} \quad \text{Ans.}$$

**Example 11.** A committee is to be formed by choosing two boys and four girls out of a group of five boys and six girls. What is the probability that a particular boy named A and a particular girl named B are selected in the committee?

**Solution.** Two boys are to be selected out of 5 boys. A particular boy A is to be included in the committee. It means that only 1 boy is to be selected out of 4 boys.

$$\text{Number of ways of selection} = {}^4C_1$$

Similarly a girl B is to be included in the committee.

Then only 3 girls are to be selected out of 5 girls.

$$\text{Number of ways of selection} = {}^5C_3$$

$$\text{Required probability} = \frac{{}^4C_1 \times {}^5C_3}{{}^5C_2 \times {}^6C_4} = \frac{4 \times 10}{10 \times 15} = \frac{4}{15} \quad \text{Ans.}$$

**Example 12.** Three groups of children contain respectively 3 girls and 1 boy; 2 girls and 2 boys; 1 girl and 3 boys. One child is selected at random from each group. Find the chance of selecting 1 girl and 2 boys.

**Solution.** There are three ways of selecting 1 girl and two boys.

**I way :** Girl is selected from first group, boy from second group and second boy from third group.

$$\text{Probability of the selection of (Girl + Boy + Boy)} = \frac{3}{4} \times \frac{2}{4} \times \frac{3}{4} = \frac{18}{64}$$

**II way :** Boy is selected from first group, girl from second group and second boy from third group.

$$\text{Probability of the selection of (Boy + Girl + Boy)} = \frac{1}{4} \times \frac{2}{4} \times \frac{3}{4} = \frac{6}{64}$$

**III way :** Boy is selected from first group, second boy from second group and the girl from the third group.

$$\text{Probability of selection of (Boy + Boy + Girl)} = \frac{1}{4} \times \frac{2}{4} \times \frac{1}{4} = \frac{2}{64}$$

$$\text{Total probability} = \frac{18}{64} + \frac{6}{64} + \frac{2}{64} = \frac{26}{64} = \frac{13}{32} \quad \text{Ans.}$$

**Example 13.** The number of children in a family in a region are either 0, 1 or 2 with probability 0.2, 0.3 and 0.5 respectively. The probability of each child being a boy or girl 0.5. Find the probability that a family has no boy.

**Solution.** Here there are three types of families

(i) Probability of zero child (boys) = 0.2

(ii)	Boy	Girl
0		1
1		0

Probability of zero boy in case II =  $0.3 \times 0.5 = 0.15$

(iii)	Boy	Girl
0		2
1		1
2		0

$$\text{In this case probability of zero boy} = 0.5 \times \frac{1}{3} = 0.167$$

Considering all the three cases, the probability of zero boy

$$= 0.2 + 0.15 + 0.167 = 0.517$$

Ans.

**Example 14.** A husband and wife appear in an interview for two vacancies in the same

post. The probability of husband's selection is  $\frac{1}{7}$  and that of wife's selection is

$\frac{1}{5}$ . What is the probability that

- (i) both of them will be selected.
- (ii) only one of them will be selected, and
- (iii) none of them will be selected?

**Solution.**  $P(\text{husband's selection}) = \frac{1}{7}$ ,  $P(\text{wife's selection}) = \frac{1}{5}$

$$(i) P(\text{both selected}) = \frac{1}{7} \times \frac{1}{5} = \frac{1}{35}$$

$$(ii) P(\text{only one selected}) = P(\text{only husband's selection}) + P(\text{only wife's selection})$$

$$= \frac{1}{7} \times \frac{4}{5} + \frac{1}{5} \times \frac{6}{7} = \frac{10}{35} = \frac{2}{7}$$

$$(iii) P(\text{none of them will be selected}) = \frac{6}{7} \times \frac{4}{5} = \frac{24}{35}$$

**Ans.**

**Example 15.** A problem of statistics is given to three students A, B and C whose chances of solving it are  $\frac{1}{2}$ ,  $\frac{3}{4}$  and  $\frac{1}{4}$  respectively. What is the probability that the problem will be solved?

**Solution.** The probability that A can solve the problem =  $\frac{1}{2}$

The probability that A cannot solve the problem =  $1 - \frac{1}{2}$ .

Similarly the probability that B and C cannot solve the problem are

$$\left(1 - \frac{3}{4}\right) \text{ and } \left(1 - \frac{1}{4}\right)$$

$\therefore$  The probability that A, B, C cannot solve the problem

$$= \left(1 - \frac{1}{2}\right) \times \left(1 - \frac{3}{4}\right) \times \left(1 - \frac{1}{4}\right) = \frac{1}{2} \times \frac{1}{4} \times \frac{3}{4} = \frac{3}{32}$$

Hence, the probability that the problem can be solved =  $1 - \frac{3}{32} = \frac{29}{32}$  **Ans.**

**Example 16.** A student takes his examination in four subjects  $\alpha$ ,  $\beta$ ,  $\gamma$ ,  $\delta$ . He estimates his

chances of passing in  $\alpha$  as  $\frac{4}{5}$ , in  $\beta$  as  $\frac{3}{4}$ , in  $\gamma$  as  $\frac{5}{6}$  and in  $\delta$  as  $\frac{2}{3}$ . To qualify, he must pass in  $\alpha$  and at least two other subjects. What is the probability that he qualifies? (AMIETE, Dec. 2010)

**Solution.**  $P(\alpha) = \frac{4}{5}$ ,  $P(\beta) = \frac{3}{4}$ ,  $P(\gamma) = \frac{5}{6}$ ,  $P(\delta) = \frac{2}{3}$

There are four possibilities of passing at least two subjects.

$$(i) \text{Probability of passing } \beta, \gamma \text{ and failing } \delta = \frac{3}{4} \times \frac{5}{6} \times \left(1 - \frac{2}{3}\right) = \frac{3}{4} \times \frac{5}{6} \times \frac{1}{3} = \frac{5}{24}$$

$$(ii) \text{Probability of passing } \gamma, \delta \text{ and failing } \beta = \frac{5}{6} \times \frac{2}{3} \times \left(1 - \frac{3}{4}\right) = \frac{5}{6} \times \frac{2}{3} \times \frac{1}{4} = \frac{5}{36}$$

$$(iii) \text{Probability of passing } \delta, \beta \text{ and failing } \gamma = \frac{2}{3} \times \frac{3}{4} \times \left(1 - \frac{5}{6}\right) = \frac{2}{3} \times \frac{3}{4} \times \frac{1}{6} = \frac{1}{12}$$

$$(iv) \text{ Probability of passing } \beta, \gamma, \delta = \frac{3}{4} \times \frac{5}{6} \times \frac{2}{3} = \frac{5}{12}$$

$$\text{Probability of passing at least two subjects} = \frac{5}{24} + \frac{5}{36} + \frac{1}{12} + \frac{5}{12} = \frac{61}{72}$$

$$\text{Probability of passing } \alpha \text{ and at least two subjects.} = \frac{4}{5} \times \frac{61}{72} = \frac{61}{90} \quad \text{Ans.}$$

**Example 17.** There are 6 positive and 8 negative numbers. Four numbers are chosen at random, without replacement, and multiplied. What is the probability that the product is a positive number?

**Solution.** To get from the product of four numbers, a positive number, the possible combinations are as follows :

S. No.	Out of 6 Positive Numbers	Out of 8 Negative Numbers	Positive Numbers
1.	4	0	${}^6C_4 \times {}^8C_0 = \frac{6 \times 5}{1 \times 2} \times 1 = 15$
2.	2	2	${}^6C_2 \times {}^8C_2 = \frac{6 \times 5}{1 \times 2} \times \frac{8 \times 7}{1 \times 2} = 420$
3.	0	4	${}^6C_0 \times {}^8C_4 = 1 \times \frac{8 \times 7 \times 6 \times 5}{1 \times 2 \times 3 \times 4} = 70$
Total = 505			

$$\text{Probability} = \frac{{}^6C_4 \times {}^8C_0 + {}^6C_2 \times {}^8C_2 + {}^6C_0 \times {}^8C_4}{{}^{14}C_4} = \frac{15 + 420 + 70}{14 \times 13 \times 12 \times 11} = \frac{505 \times 4 \times 3 \times 2 \times 1}{14 \times 13 \times 12 \times 11} = \frac{505}{1001} \quad \text{Ans.}$$

$$1 \times 2 \times 3 \times 4$$

**Example 18.** A can hit a target 3 times in 5 shots, B 2 times in 5 shots and C three times in 4 shots. All of them fire one shot each simultaneously at the target. What is the probability that

- (i) 2 shots hit      (ii) At least two shots hit?

$$\text{Solution.} \quad \text{Probability of A hitting the target} = \frac{3}{5}$$

$$\text{Probability of B hitting the target} = \frac{2}{5}$$

$$\text{Probability of C hitting the target} = \frac{3}{4}$$

Probability that 2 shots hit the target

$$= P(A)P(B)q(C) + P(A)P(C)q(B) + P(B)P(C)q(A)$$

$$= \frac{3}{5} \times \frac{2}{5} \times \left(1 - \frac{3}{4}\right) + \frac{3}{5} \times \frac{3}{4} \times \left(1 - \frac{2}{5}\right) + \frac{2}{5} \times \frac{3}{4} \times \left(1 - \frac{3}{5}\right) = \frac{6}{25} \times \frac{1}{4} + \frac{9}{20} \times \frac{3}{5} + \frac{6}{20} \times \frac{2}{5}$$

$$= \frac{6+27+12}{100} = \frac{45}{100} = \frac{9}{20} \quad \text{Ans.}$$

(ii) Probability of at least two shots hitting the target

$$= \text{Probability of 2 shots} + \text{probability of 3 shots hitting the target}$$

$$= \frac{9}{20} + P(A)P(B)P(C) = \frac{9}{20} + \frac{3}{5} \times \frac{2}{5} \times \frac{3}{4} = \frac{63}{100} \quad \text{Ans.}$$

**Example 19.** *A and B take turns in throwing two dice, the first to throw 10 being awarded the prize. Show that if A has the first throw, their chances of winning are in the ratio 12:11. (AMIETE, Dec. 2009)*

**Solution.** The combinations of throwing 10 from two dice can be

$$(6+4), (4+6), (5+5).$$

The number of combinations is 3.

Total combinations from two dice =  $6 \times 6 = 36$ .

$$\therefore \text{The probability of throwing 10} = p = \frac{3}{36} = \frac{1}{12}$$

$$\text{The probability of not getting 10} = q = 1 - \left(\frac{1}{12}\right) = \frac{11}{12}$$

If A is to win, he should throw 10 in either the first, the third, the fifth, ... throws.

$$\text{Their respective probabilities are} = p, q^2 p, q^4 p, \dots = \frac{1}{12}, \left(\frac{11}{12}\right)^2 \frac{1}{12}, \left(\frac{11}{12}\right)^4 \frac{1}{12}, \dots$$

$$\begin{aligned} A's \text{ total probability of winning} &= \frac{1}{12} + \left(\frac{11}{12}\right)^2 \cdot \frac{1}{12} + \left(\frac{11}{12}\right)^4 \cdot \frac{1}{12} + \dots \\ &= \frac{\frac{1}{12}}{1 - \left(\frac{11}{12}\right)^2} = \frac{12}{23} \quad \left[ \text{This is infinite G.P. Its sum} = \frac{a}{1-r} \right] \end{aligned}$$

B can win in either 2nd, 4th, 6th ... throws.

So B's total chance of winning =  $qp + q^3 p + q^5 p + \dots$

$$= \left(\frac{11}{12}\right) \left(\frac{1}{12}\right) + \left(\frac{11}{12}\right)^3 \left(\frac{1}{12}\right) + \left(\frac{11}{12}\right)^5 \left(\frac{1}{12}\right) + \dots = \frac{\left(\frac{11}{12}\right) \left(\frac{1}{12}\right)}{1 - \left(\frac{11}{12}\right)^2} = \frac{11}{23}$$

$$\text{Hence } A's \text{ chance to } B's \text{ chance} = \frac{12}{23} : \frac{11}{23} = 12 : 11$$

**Proved.**

**Example 20.** *A and B throw alternatively a pair of dice. A wins if he throws 6 before B throws 7 and B wins if he throws 7 before A throws 6. Find their respective chances of winning, if A begins.*

**Solution.** Number of ways of throwing 6

$$\text{i.e., } (1+5), (2+4), (3+3), (4+2), (5+1) = 5.$$

$$\text{Probability of throwing 6} = \frac{5}{36} = p_1, \quad q_1 = \frac{31}{36}$$

Number of ways of throwing 7

$$\text{i.e., } (1+6), (2+5), (3+4), (4+3), (5+2), (6+1) = 6$$

$$\text{Probability of throwing 6} = \frac{6}{36} = \frac{1}{6} = P_2, \quad q_2 = \frac{5}{6}$$

$$P(A) = p_1 + q_1 q_2 p_1 + q_1^2 q_2^2 p_1 + \dots$$

$$P(B) = q_1 p_2 + q_1^2 q_2 p_2 + q_1^3 q_2^2 p_2 + \dots$$

$$\text{Probability of A's winning} = p_1 + q_1 q_2 p_1 + q_1^2 q_2^2 p_1 + \dots$$

$$= \frac{p_1}{1-q_1q_2} = \frac{\frac{5}{36}}{1-\frac{31}{36} \times \frac{5}{6}} = \frac{5}{36} \times \frac{36 \times 6}{61} = \frac{30}{61}$$

Probability of B's winning =  $q_1 p_2 + q_1^2 q_2 p_2 + q_1^3 q_2^2 p_2 + \dots$

$$= \frac{q_1 p_2}{1-q_1q_2} = \frac{\frac{31}{36} \times \frac{1}{6}}{1-\left(\frac{31}{36}\right)\left(\frac{5}{6}\right)} = \frac{31}{36 \times 6} \times \frac{36 \times 6}{61} = \frac{31}{61}$$

**Ans.**

### EXERCISE 61.2

1. The probability that Nirmal will solve a problem is  $\frac{2}{3}$  and the probability that Satyajit will solve it is  $\frac{3}{4}$ . What is the probability that (a) the problem will be solved (b) neither can solve it.

**Ans.** (a)  $\frac{11}{12}$ , (b)  $\frac{1}{12}$

2. An urn contains 13 balls numbering 1 to 13. Find the probability that a ball selected at random is a ball with number that is a multiple of 3 or 4.

**Ans.**  $\frac{6}{13}$

3. Four persons are chosen at random from a group containing 3 men, 2 women, and 4 children. Show that the probability that exactly two of them will be children is  $\frac{10}{21}$ .

4. A five digit number is formed by using the digits 0, 1, 2, 3, 4 and 5 without repetition. Find the probability that the number is divisible by 6.

**Ans.**  $\frac{4}{25}$

5. The chances that doctor A will diagnose a disease X correctly is 60%. The chances that a patient will die by his treatment after correct diagnosis is 40% and the chances of death by wrong diagnosis is 70%. A patient of doctor A, who had disease X, died, what is the chance that his disease was diagnosed correctly.

**Ans.**  $\frac{6}{13}$

6. An anti-aircraft gun can take a maximum of four shots on enemy's plane moving from it. The probabilities of hitting the plane at first, second, third and fourth shots are 0.4, 0.3, 0.2 and 0.1 respectively. Find the probability that the gun hits the plane.

**Ans.** 0.6976.

7. An electronic component consists of three parts. Each part has probability 0.99 of performing satisfactorily. The component fails if two or more parts do not perform satisfactorily. Assuming that the parts perform independently, determine the probability that the component does not perform satisfactorily.

**Ans.** 0.000298

8. The face cards are removed from a full pack. Out of the remaining 40 cards, 4 are drawn at random. What is the probability that they belong to different suits?

**Ans.**  $\frac{1000}{9139}$

9. Of the cigarette smoking population, 70% are men and 30% women, 10% of these men and 20% of these women smoke 'WILLS.' What is the probability that a person seen smoking a 'WILLS' will be a man.

**Ans.**  $\frac{7}{13}$

10. A machine contains a component C that is vital to its operation. The reliability of component C is 80%. To improve the reliability of a machine, a similar component is used in parallel to form a system S. The machine will work provided that one of these components functions correctly. Calculate the reliability of the system S.

**Ans.** 96%

11. The odds that a book will be favourably reviewed by three independent critics are 5 to 2, 4 to 3, 3 to 4 respectively. What is the probability that of the three reviews, a majority will be favourable?

$$\text{Ans. } \frac{209}{343}$$

12. A man takes a step forward with probability 0.4 and backward with probability 0.6. Find the probability that at the end of 11 steps, he is just one step away from the starting point.

$$\text{Ans. } 0.5263$$

13. A candidate is selected for interview for three posts. For the first post there are three candidates, for the second there are 4, and for the third are 2. What is the chance of getting at least one post?

$$(A.M.I.E., Summer 2001) \text{ Ans. } \frac{3}{4}$$

14. The chance of hitting a target by a bomb is 50% when 4 bombs are dropped, what is the probability of destroying the target, if one bomb is just sufficient to destroy it. *(A.M.I.E., Winter 2003)*

$$\text{Ans. } \frac{15}{16}$$

15. Tick  $\checkmark$  the correct answer :

- (i)  $A, B, C$  in order toss a coin, the first to throw a head wins. Assuming if  $A$  begins and the game continues indefinitely their respective chances of winning are:

$$(a) \frac{4}{7}, \frac{2}{7}, \frac{1}{7} \quad (b) \frac{1}{7}, \frac{4}{7}, \frac{2}{7} \quad (c) \frac{2}{7}, \frac{4}{7}, \frac{1}{7} \quad (d) \text{None of these}$$

$$(A.M.I.E., winter 2000) \text{ Ans. (a)}$$

- (ii) An unbiased die with faces marked 1, 2, 3, 4, 5, 6 is rolled 4 times, out of four face values obtained, the probability that the minimum face value is not less than 2 and the maximum face value is not greater than 5 is then

$$(a) \frac{16}{81} \quad (b) \frac{2}{9} \quad (c) \frac{80}{81} \quad (d) \frac{8}{9}$$

$$(A.M.I.E.T.E., Summer 2000) \text{ Ans. (a)}$$

- (iii) India plays two matches each with England and Australia. In any match the probability of its getting points 0, 1 and 2 are 0.45, 0.05 and 0.5 respectively. Assuming the outcomes are independent, the probability that India gets at least seven points is

$$(a) 0.8750 \quad (b) 0.0875 \quad (c) 0.0625 \quad (d) 0.0250$$

$$(A.M.I.E.T.E., Summer 2001) \text{ Ans. (b)}$$

**Fill up the blanks:**

- (iv) Probability of any event can not be greater than \_\_\_\_\_ and less than \_\_\_\_\_.

$$(A.M.I.E.T.E., Winter 2001) \text{ Ans. } 0, 1$$

## 61.5 CONDITIONAL PROBABILITY

Let  $A$  and  $B$  be two events of a sample space  $S$  and let  $P(B) \neq 0$ . Then conditional probability of the event  $A$ , given  $B$ , denoted by  $P(A/B)$ , is defined by

$$P(A/B) = \frac{P(A \cap B)}{P(B)} \quad \dots (1)$$

**Theorem.** If the events  $A$  and  $B$  defined on a sample space  $S$  of a random experiment are independent, then

$$P(A/B) = P(A) \text{ and } P(B/A) = P(B)$$

**Proof.**  $A$  and  $B$  are given to be independent events,

$$P(A \text{ and } B) = P(A) \cdot P(B)$$

$$\Rightarrow P(A/B) = \frac{P(A \cap B)}{P(B)} = \frac{P(A) \cdot P(B)}{P(B)} = P(A)$$

$$\Rightarrow P(B/A) = \frac{P(B \cap A)}{P(A)} = \frac{P(B) \cdot P(A)}{P(A)} = P(B)$$

### 61.6 BAYE'S THEOREM

If  $B_1, B_2, B_3, \dots, B_n$  are mutually exclusive events with  $P(B_i) \neq 0$ , ( $i = 1, 2, \dots, n$ ) of a random experiment then for any arbitrary event  $A$  of the sample space of the above experiment with  $P(A) > 0$ , we have

$$P(B_i/A) = \frac{P(B_i)P(A/B_i)}{\sum_{i=1}^n P(B_i)P(A/B_i)} \quad (\text{for } n=3)$$

$$P(B_2/A) = \frac{P(B_2)P(A/B_2)}{P(B_1)P(A/B_1) + P(B_2)P(A/B_2) + P(B_3)P(A/B_3)}$$

**Proof.** Let  $S$  be the sample space of the random experiment.

The events  $B_1, B_2, \dots, B_n$  being exhaustive

$$S = B_1 \cup B_2 \cup \dots \cup B_n$$

$$[\because A \subset S]$$

$$\begin{aligned} \therefore A = A \cap S &= A \cap (B_1 \cup B_2 \cup \dots \cup B_n) \\ &= (A \cap B_1) \cup (A \cap B_2) \cup \dots \cup (A \cap B_n) \quad [\text{Distributive Law}] \end{aligned}$$

$$\begin{aligned} \Rightarrow P(A) &= P(A \cap B_1) + P(A \cap B_2) + \dots + P(A \cap B_n) \\ &= P(B_1)P(A/B_1) + P(B_2)P(A/B_2) + \dots + P(B_n)P(A/B_n) \\ &= \sum_{i=1}^n P(B_i)P(A/B_i) \end{aligned} \quad \dots (1)$$

$$\text{Now, } P(A \cap B_i) = P(A)P(B_i/A)$$

$$\Rightarrow P(B_i/A) = \frac{P(A \cap B_i)}{P(A)} = \frac{P(B_i)P(A/B_i)}{\sum_{i=1}^n P(B_i)P(A/B_i)} \quad [\text{Using (1)}]$$

**Note.**  $P(B)$  is the probability of occurrence  $B$ . If we are told that the event  $A$  has already occurred.

On knowing about the event  $A$ ,  $P(B)$  is changed to  $P(B/A)$ . With the help of Baye's theorem we can calculate  $P(B/A)$ .

**Example 21.** An urn I contains 3 white and 4 red balls and an urn II contains 5 white and 6 red balls. One ball is drawn at random from one of the urns and is found to be white. Find the probability that it was drawn from urn I.

**Solution.** Let  $U_1$ : the ball is drawn from urn I

$U_2$ : the ball is drawn from urn II

$W$ : the ball is white.

We have to find  $P(U_1/W)$

By Baye's Theorem

$$P(U_1/W) = \frac{P(U_1)P(W/U_1)}{P(U_1)P(W/U_1) + P(U_2)P(W/U_2)} \quad \dots (1)$$

Since two urns are equally likely to be selected,  $P(U_1) = P(U_2) = \frac{1}{2}$

$$P(W/U_1) = P(\text{a white ball is drawn from urn I}) = \frac{3}{7}$$

$$P(W/U_2) = P(\text{a white ball is drawn from urn II}) = \frac{5}{11}$$

$$\therefore \text{From (1), } P(U_1/W) = \frac{\frac{1}{2} \times \frac{3}{7}}{\frac{1}{2} \times \frac{3}{7} + \frac{1}{2} \times \frac{5}{11}} = \frac{33}{68} \quad \text{Ans.}$$

**Example 22.** Three urns contains 6 red, 4 black; 4 red, 6 black; 5 red, 5 black balls respectively. One of the urns is selected at random and a ball is drawn from it. If the ball drawn is red find the probability that it is drawn from the first urn.

**Solution.** Let  $U_1$ : the ball is drawn from  $U_1$ ,

$U_2$ : the ball is drawn from  $U_2$ ,

$U_3$ : the ball is drawn from  $U_3$ ,

$R$  : the ball is red.

We have to find  $P(U_1/R)$ .

By Baye's Theorem,

$$P(U_1/R) = \frac{P(U_1)P(R/U_1)}{P(U_1)P(R/U_1) + P(U_2)P(R/U_2) + P(U_3)P(R/U_3)} \quad \dots (1)$$

Since the three urns are equally likely to be selected  $P(U_1) = P(U_2) = P(U_3) = \frac{1}{3}$

$$\text{Also } P(R/U_1) = P(\text{a red ball is drawn from urn I}) = \frac{6}{10}$$

$$P(R/U_2) = P(\text{a red ball is drawn from urn II}) = \frac{4}{10}$$

$$P(R/U_3) = P(\text{a red ball is drawn from urn III}) = \frac{5}{10}$$

$$\therefore \text{From (1), we have } P(U_1/R) = \frac{\frac{1}{3} \times \frac{6}{10}}{\frac{1}{3} \times \frac{6}{10} + \frac{1}{3} \times \frac{4}{10} + \frac{1}{3} \times \frac{5}{10}} = \frac{2}{5} \quad \text{Ans.}$$

**Example 23.** In a bolt factory, machines A, B and C manufacture respectively 25%, 35% and 40% of the total. If their output 5, 4 and 2 per cent are defective bolts. A bolt is drawn at random from the product and is found to be defective. What is the probability that it was manufactured by machine B?

**Solution.**  $A$  : bolt is manufactured by machine A.

$B$  : bolt is manufactured by machine B.

$C$  : bolt is manufactured by machine C.

$$P(A) = 0.25, P(B) = 0.35, P(C) = 0.40$$

The probability of drawing a defective bolt manufactured by machine A is  $P(D/A) = 0.05$

Similarly,  $P(D/B) = 0.04$  and  $P(D/C) = 0.02$

By Baye's theorem

$$\begin{aligned} P(B/D) &= \frac{P(B)P(D/B)}{P(A)P(D/A) + P(B)P(D/B) + P(C)P(D/C)} \\ &= \frac{0.35 \times 0.04}{0.25 \times 0.05 + 0.35 \times 0.04 + 0.40 \times 0.02} = 0.41 \end{aligned} \quad \text{Ans.}$$

**Example 24.** An insurance company insured 2000 scooter drivers 4000 car drivers and 6000 truck drivers. The probability of accidents are 0.01, 0.03 and 0.15 respectively. One of the insured persons meets with an accident. What is the probability that he is a scooter driver?

(AMIETE, Dec. 2009)

**Solution.** Let  $E_1, E_2, E_3$  and  $A$  be the events defined as follows :

$E_1$  = person chosen is a scooter driver

$E_2$  = person chosen is a car driver

$E_3$  = person chosen is a truck driver, and

$A$  = person meets with an accident.

We have,

$$n(E_1) = 2000, n(E_2) = 4000, n(E_3) = 6000$$

$$\text{Total number of persons} = 2000 + 4000 + 6000 = 12000.$$

Therefore,

$$P(E_1) = \frac{2000}{12000} = \frac{1}{6} \text{ and } P(E_2) = \frac{4000}{12000} = \frac{1}{3} \text{ and } P(E_3) = \frac{6000}{12000} = \frac{1}{2}$$

It is given that

$$\begin{aligned} P(A/E_1) &= \text{Probability that a person meets with an accident given that he is a scooter driver} \\ &= 0.01. \end{aligned}$$

$$\text{Similarly, } P(A/E_2) = 0.03 \text{ and } P(A/E_3) = 0.15$$

We are required to find  $P(E_1/A)$  i.e., given that the person meets with an accident, what is the probability that he was a scooter driver.

By Bayes' rule, we have

$$\begin{aligned} P(E_1/A) &= \frac{P(E_1)P(A/E_1)}{P(E_1)P(A/E_1) + P(E_2)P(A/E_2) + P(E_3)P(A/E_3)} \\ \Rightarrow P(E_1/A) &= \frac{\frac{1}{6} \times 0.01}{\frac{1}{6} \times 0.01 + \frac{1}{3} \times 0.03 + \frac{1}{2} \times 0.15} = \frac{1}{1+6+45} = \frac{1}{52} \end{aligned} \quad \text{Ans.}$$

### EXERCISE 61.3

1. A bag contains 3 coins of which one is two headed and the other two are normal & fair. A coin is selected at random and tossed 4 times in succession. If all the four times it appears to be head what is the probability that the two headed coin was selected.

(AMIETE, JUNE 2010) Ans.  $\frac{8}{9}$

2. An airline knows that 13% of the people who make reservations on a certain flight will not turn up. Consequently their policy is to sell 12 tickets which can accommodate only 10. What is the probability that everyone who turns up on a given day is accommodated? (AMIETE, JUNE 2010)

# CHAPTER

# 62

## SAMPLING METHODS

---

### 62.1 POPULATION (UNIVERSE)

Before giving the notion of sampling, we will first define *population*. The group of individuals under study is called *population* or *universe*. It may be finite or infinite.

### 62.2 SAMPLING

A part selected from the population is called *a sample*. The process of selection of a sample is called sampling. A *Random sample* is one in which each member of population has an equal chance of being included in it. There are  ${}^N C_n$  different samples of size  $n$  that can be picked up from a population of size  $N$ .

### 62.3 PARAMETERS AND STATISTICS

The statistical constants of the population such as mean ( $\mu$ ), standard deviation ( $\sigma$ ) are called parameters. Parameters are denoted by Greek letters.

The mean ( $\bar{x}$ ), standard deviation ( $|S|$ ) of a sample are known as statistics. Statistics are denoted by Roman letters.

#### Symbols for Population and Samples

Characteristic	Population	Sample
	Parameter	Statistic
Symbols	population size = $N$ population mean = $\mu$ population standard deviation = $\sigma$ population proportion = $p$	sample size = $n$ sample mean = $\bar{x}$ sample standard deviation = $s$ sample proportion = $\tilde{p}$

### 62.4 AIMS OF A SAMPLE

The population parameters are not known generally. Then the sample characteristics are utilised to approximately determine or estimate of the population. Thus, static is an estimate of the parameter. To what extent can we depend on the sample estimates?

The estimate of mean and standard deviation of the population is a primary purpose of all scientific experimentation. The logic of the sampling theory is the logic of *induction*. In induction, we pass from a particular (sample) to general (population). This type of generalization here is known as *statistical inference*. The conclusion in the sampling studies are based not on certainties but on probabilities.

### 62.5 TYPES OF SAMPLING

Following types of sampling are common:

- (1) Purposive sampling (2) Random sampling (3) Stratified sampling (4) Systematic sampling

## 62.6 SAMPLING DISTRIBUTION

From a population a number of samples are drawn of equal size  $n$ . Find out the mean of each sample. The means of samples are not equal. The means with their respective frequencies are grouped. The frequency distribution so formed is known as *sampling distribution of the mean*. Similarly, sampling distribution of standard deviation we can have.

## 62.7 STANDARD ERROR (S.E.)

is the standard deviation of the sampling distribution. For assessing the difference between the expected value and observed value, standard error is used. Reciprocal of standard error is known as *precision*.

## 62.8 SAMPLING DISTRIBUTION OF MEANS FROM INFINITE POPULATION

Let the population be infinitely large and having a population mean of  $\mu$  and a population variance of  $\sigma^2$ . If  $x$  is a random variable denoting the measurement of the characteristic, then

Expected value of  $x$ ,  $E(x) = \mu$

Variance of  $x$ ,  $Var(x) = \sigma^2$

The sample mean  $\bar{x}$  is the sum of  $n$  random variables, viz.,  $x_1, x_2, \dots, x_n$  each being divided by  $n$ . Here,  $x_1, x_2, \dots, x_n$  are independent random variables from the infinitely large population.

$$\therefore E(x_1) = \mu \quad \text{and} \quad Var(x_1) = \sigma^2$$

$$E(x_2) = \mu \quad \text{and} \quad Var(x_2) = \sigma^2 \text{ and so on}$$

$$\text{Finally } E(\bar{x}) = E\left[\frac{x_1 + x_2 + \dots + x_n}{n}\right] = \frac{1}{n}E(x_1) + \frac{1}{n}E(x_2) + \dots + \frac{1}{n}E(x_n) = \frac{1}{n}\mu + \frac{1}{n}\mu + \dots + \frac{1}{n}\mu = \mu$$

$$\text{and } Var(\bar{x}) = Var\left[\frac{x_1 + x_2 + \dots + x_n}{n}\right] = Var\left(\frac{x_1}{n}\right) + Var\left(\frac{x_2}{n}\right) + \dots + Var\left(\frac{x_n}{n}\right)$$

$$= \frac{1}{n^2}Var(x_1) + \frac{1}{n^2}Var(x_2) + \dots + \frac{1}{n^2}Var(x_n) = \frac{1}{n^2}\sigma^2 + \frac{1}{n^2}\sigma^2 + \dots + \frac{1}{n^2}\sigma^2 = \frac{n\sigma^2}{n^2} = \frac{\sigma^2}{n}$$

The expected value of the sample mean is the same as population mean. The variance of the sample mean is the variance of the population divided by the sample size.

The average value of the sample tends to true population mean. If sample size ( $n$ ) is increased then

variance of  $\bar{x}$ ,  $\left(\frac{\sigma^2}{n}\right)$  gets reduced, by taking large value of  $n$ , the variance  $\left(\frac{\sigma^2}{n}\right)$  of  $\bar{x}$  can be

made as small as desired. The standard deviation  $\left(\frac{\sigma}{\sqrt{n}}\right)$  of  $\bar{x}$  is also called **standard error of the mean**. It is denoted by  $\sigma_{\bar{x}}$ .

### Sampling with Replacement

When the sampling is done with replacement, so that the population is back to the same form before the next sample member is picked up. We have

$$E(\bar{x}) = \mu$$

$$Var(\bar{x}) = \frac{\sigma^2}{n} \text{ or } \sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}}$$

### Sampling without replacement from Finite population

When a sample is picked up without replacement from a finite population, the probability distribution of second random variable depends on the outcome of the first pick up.  $n$  sample members do not remain independent. Now we have

$$E(\bar{x}) = \mu$$

and

$$\text{Var}(\bar{x}) = \sigma_{\bar{x}}^2 = \frac{\sigma^2}{n} \cdot \frac{N-n}{N-1} \quad \text{or} \quad \sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}} \cdot \sqrt{\frac{N-n}{N-1}}$$

$$= \frac{\sigma}{\sqrt{n}} \text{ app} \quad (\text{if } \frac{n}{N} \text{ is very small})$$

### Sampling from Normal Population

If  $x \sim N(\mu, \sigma^2)$  then it follows that  $\bar{x} \sim N(\mu, \frac{\sigma^2}{n})$

**Example 1.** The diameter of a component produced on a semi-automatic machine is known to be distributed normally with a mean of 10 mm and a standard deviation of 0.1 mm. If we pick up a random sample of size 5, what is the probability that the same mean will be between 9.95 and 10.05 mm?

**Solution.** Let  $x$  be a random variable representing the diameter of one component picked up at random.

$$\begin{aligned} \text{Here } x \sim N(10, 0.01), \text{ Therefore, } \bar{x} \sim N\left(10, \frac{0.01}{5}\right) & \quad \left[ \bar{x} = N\left(\bar{x}, \frac{\sigma^2}{n}\right) \right] \\ Pr\{9.95 \leq \bar{x} \leq 10.05\} &= 2 \times Pr\{10 \leq \bar{x} \leq 10.05\} \quad \left\{ z = \frac{\bar{x} - \mu}{\frac{\sigma}{\sqrt{n}}} \right\} \\ &= 2 \times Pr\left\{\frac{10 - \mu}{\frac{\sigma}{\sqrt{n}}} \leq \frac{\bar{x} - \mu}{\frac{\sigma}{\sqrt{n}}} \leq \frac{10.05 - \mu}{\frac{\sigma}{\sqrt{n}}}\right\} \\ &= 2 \times Pr\left\{0 \leq z \leq \frac{10.05 - 10}{\frac{0.1}{\sqrt{5}}}\right\} = 2 \times Pr\{0 \leq z \leq 1.12\} = 2 \times 0.3686 = 0.7372 \quad \text{Ans.} \end{aligned}$$

### Similar Question

A sample of size 25 is picked up at random from a population which is normally distributed with a mean 100 and a variance of 36. Calculate (a)  $Pr\{\bar{x} \leq 99\}$ , (b)  $Pr\{98 \leq \bar{x} \leq 100\}$

**Ans.** (a) 0.2023 (b) 0.4522

### 62.9 SAMPLING DISTRIBUTION OF THE VARIANCE

We use a sample statistic called the sample variance to estimate the population variance. The sample variance is usually denoted by  $s^2$

$$s^2 = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n-1}$$

### 62.10 TESTING A HYPOTHESIS

On the basis of sample information, we make certain decisions about the population. In taking such decisions we make certain assumptions. These assumptions are known as *statistical hypothesis*. These hypothesis are tested. Assuming the hypothesis correct we calculate the probability of getting

the observed sample. If this probability is less than a certain assigned value, the hypothesis is to be rejected.

### 62.11 NULL HYPOTHESIS ( $H_0$ )

Null hypothesis is based for analysing the problem. Null hypothesis is the *hypothesis of no difference*. Thus, we shall presume that there is no significant difference between the observed value and expected value. Then, we shall test whether this hypothesis is satisfied by the data or not. If the hypothesis is not approved the difference is considered to be significant. If hypothesis is approved then the difference would be described as due to sampling fluctuation. Null hypothesis is denoted by  $H_0$ .

### 62.12 ERRORS

In sampling theory to draw valid inferences about the population parameter on the basis of the sample results.

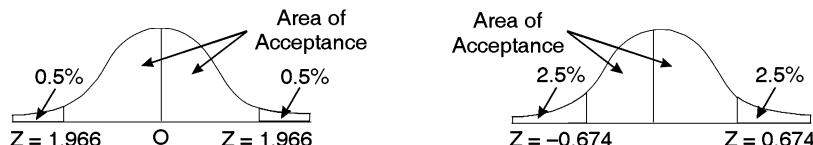

We decide to accept or to reject the lot after examining a sample from it. As such, we are liable to commit the following two types of errors.

**Type I Error.** If  $H_0$  is rejected while it should have been accepted.

**Type II Error.** If  $H_0$  is accepted while it should have been rejected.

### 62.13 LEVEL OF SIGNIFICANCE

There are two critical regions which cover 5% and 1% areas of the normal curve. The shaded portions are the critical regions.

Thus, the probability of the value of the variate falling in the critical region is the level of significance. If the variate falls in the critical area, the hypothesis is to be rejected.

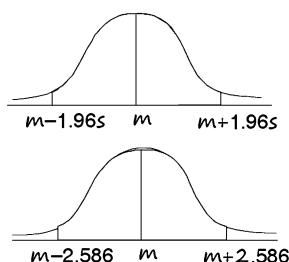

### 62.14 TEST OF SIGNIFICANCE

The tests which enables us to decide whether to accept or to reject the null hypothesis is called the tests of significance. If the difference between the sample values and the population values are so large (lies in critical area), it is to be rejected

### 62.15 CONFIDENCE LIMITS

$\mu - 1.96\sigma, \mu + 1.96\sigma$  are 95% confidence limits as the area between  $\mu - 1.96\sigma$  and  $\mu + 1.96\sigma$  is 95%. If a sample statistics lies in the interval  $\mu - 1.96\sigma, \mu + 1.96\sigma$ , we call 95% confidence interval.

Similarly,  $\mu - 2.58\sigma, \mu + 2.58\sigma$  is 99% confidence limits as the area between  $\mu - 2.58\sigma$  and  $\mu + 2.58\sigma$  is 99%. The numbers 1.96, 2.58 are called confidence coefficients.

### 62.16 TEST OF SIGNIFICANCE OF LARGE SAMPLES ( $N > 30$ )

Normal distribution is the limiting case of Binomial distribution when  $n$  is large enough. For normal distribution 5% of the items lie outside  $\mu \pm 1.96\sigma$  while only 1% of the items lie outside  $\mu \pm 2.586\sigma$ .

$$z = \frac{x - \mu}{\sigma}$$

where  $z$  is the standard normal variate and  $x$  is the observed number of successes.

First we find the value of  $z$ . Test of significance depends upon the value of  $z$ .

(i) (a) If  $|z| < 1.96$ , difference between the observed and expected number of successes is not significant at the 5% level of significance.

(b) If  $|z| > 1.96$ , difference is significant at 5% level of significance.

(ii) (a) If  $|z| < 2.58$ , difference between the observed and expected number of successes is not significant at 1% level of significance.

(b) If  $|z| > 2.58$ , difference is significant at 1% level of significance.

**Example 2.** A cubical die was thrown 9,000 times and 1 or 6 was obtained 3120 times. Can the deviation from expected value lie due to fluctuations of sampling?

**Solution.** Let us consider the hypothesis that the die is an unbiased one and hence the probability

$$\text{of obtaining 1 or } 6 = \frac{2}{6} = \frac{1}{3} \text{ i.e., } p = \frac{1}{3}, q = \frac{2}{3}$$

$$\text{The expected value of the number of successes} = np = 9000 \times \frac{1}{3} = 3000$$

$$\text{Also } \sigma = \text{S.D.} = \sqrt{npq} = \sqrt{9000 \times \frac{1}{3} \times \frac{2}{3}} = \sqrt{2000} = 44.72$$

$$3\sigma = 3 \times 44.72 = 134.16$$

$$\text{Actual number of successes} = 3120$$

$$\begin{aligned} \text{Difference between the actual number of successes and expected number of successes} \\ = 3120 - 3000 = 120 \text{ which is } < 3\sigma \end{aligned}$$

Hence, the hypothesis is correct and the deviation is due to fluctuations of sampling due to random causes. Ans.

## 62.17 SAMPLING DISTRIBUTION OF THE PROPORTION

A simple sample of  $n$  items is drawn from the population. It is same as a series of  $n$  independent trials with the probability  $p$  of success. The probabilities of  $0, 1, 2, \dots, n$  success are the terms in the binomial expansion of  $(q + p)^n$ .

Here mean =  $np$  and standard deviation =  $\sqrt{npq}$ .

Let us consider the proportion of successes, then

$$(a) \text{Mean proportion of successes} = \frac{np}{n} = p$$

$$(b) \text{Standard deviation (standard error) of proportion of successes} = \frac{\sqrt{npq}}{n} = \sqrt{\frac{pq}{n}}$$

$$(c) \text{Precision of the proportion of success} = \frac{1}{\text{S.E.}} = \sqrt{\frac{n}{pq}}.$$

**Example 3.** A group of scientific mens reported 1705 sons and 1527 daughters. Do these figures conform to the hypothesis that the sex ratio is  $\frac{1}{2}$ .

**Solution.** The total number of observations =  $1705 + 1527 = 3232$

The number of sons = 1705

$$\text{Therefore, the observed male ratio} = \frac{1705}{3232} = 0.5275$$

On the given hypothesis the male ratio = 0.5000

Thus, the difference between the observed ratio and theoretical ratio

$$\begin{aligned} &= 0.5275 - 0.5000 \\ &= 0.0275 \end{aligned}$$

$$\text{The standard deviation of the proportion } s = \sqrt{\frac{pq}{n}} = \sqrt{\frac{\frac{1}{2} \times \frac{1}{2}}{3232}} = 0.0088$$

The difference is more than 3 times of standard deviation.

Hence, it can be definitely said that the figures given do not conform to the given hypothesis.

### 62.18 ESTIMATION OF THE PARAMETERS OF THE POPULATION

The mean, standard deviation etc. of the population are known as parameters. They are denoted by  $\mu$  and  $\sigma$ . Their estimates are based on the sample values. The mean and standard deviation of a sample are denoted by  $\bar{x}$  and  $s$  respectively. Thus, a static is an estimate of the parameter. There are two types of estimates.

(i) *Point estimation*: An estimate of a population parameter given by a single number is called a point estimation of the parameter. For example,

$$(\text{S.D.})^2 = \frac{\sum (x - \bar{x})^2}{n-1}$$

(ii) *Interval estimation*: An interval in which population parameter may be expected to lie with a given degree of confidence. The intervals are

(i)  $\bar{x} - \sigma_s$  to  $\bar{x} + \sigma_s$  (68.27% confidence level)

(ii)  $\bar{x} - 2\sigma_s$  to  $\bar{x} + 2\sigma_s$  (95.45% confidence level)

(iii)  $\bar{x} - 3\sigma_s$  to  $\bar{x} + 3\sigma_s$  (99.73% confidence level)

$\bar{x}$  and  $\sigma_s$  are the mean and S.D. of the sample.

Similarly,  $\bar{x} \pm 1.96\sigma_s$  and  $\bar{x} \pm 2.58\sigma_s$  are 95% and 99% confidence of limits for  $\mu$ .

$\bar{x} \pm 1.96 \frac{\sigma}{\sqrt{n}}$  and  $\bar{x} \pm 2.58 \frac{\sigma}{\sqrt{n}}$  are also the intervals as  $\sigma_s = \frac{\sigma}{\sqrt{n}}$ .

### 62.19 COMPARISON OF LARGE SAMPLES

Let two large samples of size  $n_1$ ,  $n_2$  be drawn from two populations of proportions of attributes A's as  $P_1$ ,  $P_2$  respectively.

(i) *Hypothesis*: As regards the attribute A, the two populations are similar. On combining the two samples

$$P = \frac{n_1 P_1 + n_2 P_2}{n_1 + n_2}$$

where  $p$  is the common proportion of attributes.

Let  $e_1$ ,  $e_2$  be the standard errors in the two samples, then

$$e_1^2 = \frac{pq}{n_1} \text{ and } e_2^2 = \frac{pq}{n_2}$$

If  $e$  be the standard error of the combined samples, then

$$e = P_1^2 + P_2^2 = \frac{pq}{n_1} + \frac{pq}{n_2} = pq \left[ \frac{1}{n_1} + \frac{1}{n_2} \right]$$

$$z = \frac{P_1 - P_2}{e}$$

1. If  $z > 3$ , the difference between  $P_1$  and  $P_2$  is significant.
2. If  $z < 2$ , the difference may be due to fluctuations of sampling.
3. If  $2 < z < 3$ , the difference is significant at 5% level of significance.

(ii) *Hypothesis.* In the two populations, the proportions of attribute  $A$  are not the same, then standard error  $e$  of the difference  $p_1 - p_2$  is

$$\begin{aligned} e^2 &= p_1 + p_2 \\ &= \frac{P_1 - q_1}{n_1} + \frac{P_2 - q_2}{n_2}, z = \frac{P_1 - P_2}{e} < 3, \end{aligned}$$

difference is due to fluctuations of samples.

**Example 4.** In a sample of 600 men from a certain city, 450 are found smokers. In another sample of 900 men from another city, 450 are smokers. Do the data indicate that the cities are significantly different with respect to the habit of smoking among men.

**Solution.**  $n_1 = 600$  men, Number of smokers = 450,  $P_1 = \frac{450}{600} = 0.75$

$$n_2 = 900 \text{ men, Number of smokers} = 450, P_2 = \frac{450}{900} = 0.5$$

$$P = \frac{n_1 P_1 + n_2 P_2}{n_1 + n_2} = \frac{600 \times 0.75 + 900 \times 0.5}{600 + 900} = \frac{900}{1500} = 0.60$$

$$q = 1 - P = 1 - 0.6 = 0.4$$

$$e^2 = P_1^2 + P_2^2 = Pq \left( \frac{1}{n_1} + \frac{1}{n_2} \right)$$

$$e^2 = 0.6 \times 0.4 \left( \frac{1}{600} + \frac{1}{900} \right) = 0.000667$$

$$e = 0.02582$$

$$z = \frac{P_1 - P_2}{e} = \frac{0.75 - 0.50}{0.02582} = 9.682$$

$z > 3$  so that the difference is significant.

**Ans.**

**Example 5.** One type of aircraft is found to develop engine trouble in 5 flights out of a total of 100 and another type in 7 flights out of a total of 200 flights. Is there a significant difference in the two types of aircrafts so far as engine defects are concerned.

**Solution.**  $n_1 = 100$  flights, Number of troubled flights = 5,  $P_1 = \frac{5}{100} = \frac{1}{20}$

$$n_2 = 200 \text{ flights, Number of troubled flights} = 7, P_2 = \frac{7}{200}$$

$$e^2 = \frac{P_1 q_1}{n_1} + \frac{P_2 q_2}{n_2} = \frac{0.05 \times 0.95}{100} + \frac{0.035 \times 0.965}{200}$$

$$= 0.000475 + 0.0001689 = 0.0006439$$

$$e = 0.0254$$

$$z = \frac{0.05 - 0.035}{0.0254} = 0.59$$

$z < 1$ , Difference is not significant.

**Ans.**

## 62.20 THE t-DISTRIBUTION (FOR SMALL SAMPLE)

The students distribution is used to test the significance of

- (i) The mean of a small sample.
- (ii) The difference between the means of two small samples or to compare two small samples.
- (iii) The correlation coefficient.

Let  $x_1, x_2, x_3, \dots, x_n$  be the members of random sample drawn from a normal population with mean  $\mu$ . If  $\bar{x}$  be the mean of the sample then

$$t = \frac{\bar{x} - \mu}{\frac{s}{\sqrt{n}}} \text{ where } s^2 = \frac{\sum (x - \bar{x})^2}{n-1}$$

**Example 6.** A machine which produces mica insulating washers for use in electric device to turn out washers having a thickness of 10 mm. A sample of 10 washers has an average thickness 9.52 mm with a standard deviation of 0.6 mm. Find out  $t$ .

**Solution.**  $\bar{x} = 9.52, M = 10, S' = 0.6, n = 10$

$$\begin{aligned} t &= \frac{\bar{x} - M}{\frac{s}{\sqrt{n}}} = \frac{9.52 - 10}{\frac{0.6}{\sqrt{10}}} = -\frac{0.48\sqrt{10}}{0.6} = -\frac{4}{5}\sqrt{10} \\ &= -0.8 \times 3.16 = -2.528 \end{aligned}$$

**Ans.**

## 62.21 WORKING RULE

To calculate significance of sample mean at 5% level.

Calculate  $t = \frac{\bar{x} - \mu}{\frac{s}{\sqrt{n}}}$  and compare it to the value of  $t$  with  $(n-1)$  degrees of freedom at 5% level, obtained from the table. Let this tabulated value of  $t$  be  $t_1$ .

If  $t < t_1$ , then we accept the hypothesis i.e., we say that the sample is drawn from the population.

If  $t > t_1$ , we compare it with the tabulated value of  $t$  at 1% level of significance for  $(n-1)$  degrees of freedom. Denote it by  $t_2$ . If  $t_1 < t < t_2$  then we say that the value of  $t$  is significant.

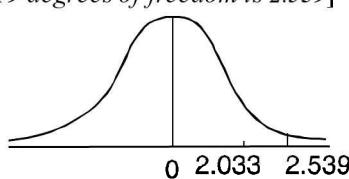

If  $t > t_2$ , we reject the hypothesis and the sample is not drawn from the population.

**Example 7.** A manufacturer intends that his electric bulbs have a life of 1000 hours. He tests a sample of 20 bulbs, drawn at random from a batch and discovers that the mean life of the sample bulbs is 990 hours with a S.D of 22 hours. Does this signify that the batch is not up to the standard?

[Given: The table value of  $t$  at 1% level is significance with 19 degrees of freedom is 2.539]

**Solution.**  $\bar{x} = 990, \sigma = 22, x = 1000$

$$t = \frac{\bar{x} - \mu}{\frac{s}{\sqrt{n}}} = \frac{990 - 1000}{\frac{22}{\sqrt{20}}} = -\frac{10\sqrt{20}}{22} = -\frac{22.36}{11} = -2.033$$

Since the calculated value of  $t$  (2.032) is less than the value of  $t$  (2.539) from the table. Hence, it is not correct to say that this batch is not upto this standard.

**Ans.**

**Example 8.** Ten individuals are chosen at random from a population and their heights are found to be in inches 63, 63, 64, 65, 66, 69, 69, 70, 70, 71. Discuss the suggestion that the Mean height of universe is 65.

For 9 degree of freedom  $t$  at 5% level of significance = 2.262.

**Solution.**

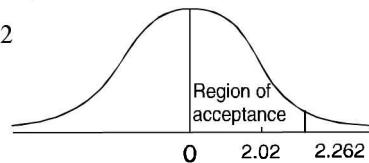

$x$	$x - 67$	$(x - 67)^2$
63	-4	16
63	-4	16
64	-3	9
65	-2	4
66	-1	1
69	+2	4
69	+2	4
70	+3	9
70	+3	9
71	+4	16
$\sum x = 670$		$\sum (x - \bar{x})^2 = 88$

$$\bar{x} = \frac{\sum x}{n} = \frac{670}{10} = 67,$$

$$s = \sqrt{\frac{\sum (x - \bar{x})^2}{n-1}} = \sqrt{\frac{88}{9}} = 3.13$$

$$t = \frac{\bar{x} - \mu}{\frac{s}{\sqrt{n}}} = \frac{67 - 65}{\frac{3.13}{\sqrt{10}}} = \frac{2\sqrt{10}}{3.13} = 2.02$$

$$2.02 < 2.262$$

Calculated value of  $t$  (2.02) is less than the table value of  $t$  (2.262). The hypothesis is accepted the mean height of universe is 65 inches. **Ans.**

**Example 9.** The mean life time of sample of 100 fluorescent light bulbs produced by a company is computed to be 1570 hours with a standard deviation of 120 hours. The company claims that the average life of the bulbs produced by it is 1600 hours. Using the level of significance of 0.05, is the claim acceptable?

**Solution.**

$$\bar{x} = 1570, s = 120, n = 100, \mu = 1600$$

$$t = \frac{\bar{x} - \mu}{\frac{s}{\sqrt{n}}} = \frac{1570 - 1600}{\frac{120}{\sqrt{100}}} = \frac{-30}{12} = -2.5$$

At 0.05 the level of significance,  $t = 1.96$

Calculated value of  $t >$  Table value of  $t$ .

$$-2.5 > -1.96$$

Hence the claim is to be rejected. **Ans.**

**Example 10.** A sample of 6 persons in an office revealed an average daily smoking of 10, 12, 8, 9, 16, 5 cigarettes. The average level of smoking in the whole office has to be estimated at 90% level of confidence.

$$t = 2.015 \text{ for } 5 \text{ degree of freedom}$$

**Solution.**

$x$	$x - 10$	$(x - 10)^2$
10	0	0
12	2	4
8	-2	4
9	-1	1
16	+6	36
5	-5	25
Total	0	$\sum (x - 10)^2 = 70$

$$\text{Mean} = a + \frac{\sum fd}{\sum f} = 10 + \frac{0}{6} = 10$$

$$s = \sqrt{\frac{\sum (x - \bar{x})^2}{n-1}} = \sqrt{\frac{70}{5}} = 3.74$$

At 90% level of confidence,  $t = \pm 2.015$ .

$$t = \frac{\bar{x} - \mu}{\frac{s}{\sqrt{n}}} \Rightarrow \pm 2.015 = \frac{10 - \mu}{\frac{3.74}{\sqrt{6}}}$$

$$\Rightarrow \mu = 2.015 \times \frac{3.74}{\sqrt{6}} + 10 = 6.92, 13.08 \text{ Ans.}$$

**Example 11.** A fertiliser mixing machine is set to give 12 kg of nitrate for quintal bag of fertiliser:

Ten 100 kg bags are examined. The percentages of nitrate per bag are as follows:

11, 14, 13, 12, 13, 12, 13, 14, 11, 12

Is there any reason to believe that the machine is defective? Value of  $t$  for 9 degrees of freedom is 2.262.

**Solution.** The calculation of  $\bar{x}$  and  $s$  is given in the following table:

$x$	$d = x - 12$	$d^2$
11	-1	1
14	2	4
13	1	1
12	0	0
13	1	1
12	0	0
13	1	1
14	2	4
11	-1	1
12	0	0
$\sum x = 125$		$\sum d = 5$
		$\sum d^2 = 13$

$$\mu = 12 \text{ kg}, n = 10, \bar{x} = \frac{\sum x}{n} = \frac{125}{10} = 12.5$$

$$s^2 = \frac{\sum d^2}{n} - \left( \frac{\sum d}{n} \right)^2 = \frac{13}{10} - \left( \frac{5}{10} \right)^2 = \frac{13}{10} - \frac{1}{4} = \frac{21}{20} = \frac{105}{100}$$

$$s = 1.024$$

$$\text{Value of } t \text{ for 9 degrees of freedom} = 2.262$$

$$\text{Also } t = \frac{\bar{x} - \mu}{s} \sqrt{n} = \frac{12.5 - 12}{1.024} \sqrt{10} = 1.54$$

Since the value of  $t$  is less than 2.262, there is no reason to believe that machine is defective. **Ans.**

**Example 12.** A random sample of size 16 values from a normal population showed a mean of 53 and a sum of squares of deviation from the mean equals to 150. Can this sample be regarded as taken from the population having 56 as mean? Obtain 95% and 99% confidence limits of the mean of the population.

$$\gamma = 15, \alpha = 0.05, t = 2.131$$

$$\alpha = 0.01, t = 2.947$$

**Solution.**

$$\mu = 56, n = 16, \bar{x} = 53, \sum (x - \bar{x})^2 = 150$$

$$s^2 = \frac{\sum (x - \bar{x})^2}{n-1} = \frac{150}{15} = 10$$

$$s = \sqrt{10}$$

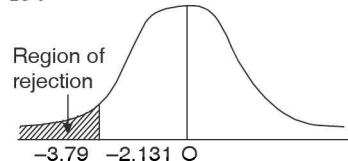

$$t = \frac{\bar{x} - \mu}{\frac{s}{\sqrt{n}}} = \frac{53 - 56}{\frac{\sqrt{10}}{\sqrt{16}}} = \frac{-3 \times 4}{\sqrt{10}} = -3.79$$

$$t = 3.79$$

When  $\alpha = 0.5$  then  $3.79 > 2.131$

When  $\alpha = 0.01$  then  $3.79 > 2.947$

Thus, the sample cannot be regarded as taken from the population. **Ans.**

## 62.22 TESTING FOR DIFFERENCE BETWEEN MEANS OF TWO SMALL SAMPLES

Let the mean and variance of the first population be  $\mu_1$  and  $\sigma_1^2$  and  $\mu_2$ ,  $\sigma_2^2$  be the mean and variance of the second population.

Let  $\bar{x}_1$  be the mean of small sample of size  $n_1$  from first population and  $\bar{x}_2$  the mean of a sample of size  $n_2$  from second population.

We know that

$$E(\bar{x}_1) = \mu_1 \text{ and } \text{Var}(\bar{x}_1) = \frac{\sigma_1^2}{n_1}$$

$$E(\bar{x}_2) = \mu_2 \text{ and } Var(\bar{x}_2) = \frac{\sigma_2^2}{n_2}$$

If the samples are independent, then  $(\bar{x}_1)$  and  $(\bar{x}_2)$  are also independent.

$$E(\bar{x}_1 - \bar{x}_2) = \mu_1 - \mu_2 \text{ and } Var(\bar{x}_1 - \bar{x}_2) = \frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}$$

$$\bar{x}_1 \sim N\left(\mu_1, \frac{\sigma_1^2}{n_1}\right) \text{ and } \bar{x}_2 \sim N\left(\mu_2, \frac{\sigma_2^2}{n_2}\right) \text{ then } (\bar{x}_1 - \bar{x}_2) \sim N\left(\mu_1 - \mu_2, \frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}\right)$$

$$t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}}$$

If the population is the same then

$$t = \frac{\bar{x}_1 - \bar{x}_2}{\sigma \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}} \quad (\mu_1 - \mu_2 = \mu_1 - \mu_1 = 0)$$

**Example 13.** Two independent samples of 8 and 7 items respectively had the following values of the variable (weight in ounces):

Sample 1: 9 11 13 11 15 9 12 14

Sample 2: 10 12 10 14 9 8 10

Is the difference between the means of the sample significant?

[Given for  $V = 13$ ,  $t_{0.05} = 2.16$ ]

**Solution.**

Assumed mean of  $x = 12$ , Assumed mean of  $y = 10$

$x$	$(x-12)$	$(x-12)^2$	$y$	$(y-10)$	$(y-10)^2$
9	-3	9	10	0	0
11	-1	1	12	2	4
13	1	1	10	0	0
11	-1	1	14	4	16
15	3	9	9	-1	1
9	-3	9	8	-2	4
12	0	0	10	0	0
14	2	4	-	-	-
94	-2	34	73	3	25

$$\bar{x} = \frac{\sum x}{n} = \frac{94}{8} = 11.75$$

$$\sigma_x^2 = \frac{\sum (x-12)^2}{n} - \left( \frac{\sum (x-12)}{n} \right)^2 = \frac{34}{8} - \left( \frac{-2}{8} \right)^2 = 4.1875$$

$$\bar{y} = \frac{\sum y}{n} = \frac{73}{7} = 10.43$$

$$\sigma_y^2 = \frac{\sum (y-10)^2}{n} - \left[ \frac{\sum (y-10)}{n} \right]^2 = \frac{25}{7} - \left( \frac{3}{7} \right)^2 = 3.388$$

$$s = \sqrt{\frac{(x-\bar{x})^2 + \sum (y-\bar{y})^2}{n_1 + n_2 - 2}} = \sqrt{\frac{34+25}{8+7-2}} = \sqrt{\frac{59}{13}} = \sqrt{4.54} = 2.13$$

$$t = \frac{\bar{x} - \bar{y}}{s \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}} = \frac{11.75 - 10.43}{2.13 \sqrt{\frac{1}{8} + \frac{1}{7}}} = \frac{1.32}{2.13 \sqrt{0.268}} = \frac{1.32}{2.13 \times 0.518} = \frac{1.32}{1.103} = 1.2$$

Thus, 5% value of  $t$  for 13 degree of freedom is given to be 2.16. Since calculated value of  $t$  is 1.2 is less than 2.16, the difference between the means of samples is not significant. **Ans.**

### EXERCISE 62.1

1. A random sample of six steel beams has mean compressive strength of 58.392 psi (pounds per square inch) with a standard deviation of  $s = 648$  psi. Test the null hypothesis  $H_0: \mu = 58,000$  psi against the alternative hypothesis  $H_1: \mu > 58,000$  psi at 5% level of significance (value for  $t$  at 5 degree of freedom and 5% significance level is 2.0157). Here  $\mu$  denotes the population mean. *(A.M.I.E., Summer 2000)*

2. A certain cubical die was thrown 96 times and shows 2 upwards 184 times. Is the die biased?

**Ans.** die is biased.

3. In a sample of 100 residents of a colony 60 are found to be wheat eaters and 40 rice eaters. Can we assume that both food articles are equally popular?
4. Out of 400 children, 150 are found to be under weight. Assuming the conditions of simple sampling, estimate the percentage of children who are underweight in, and assign limits within which the percentage probably lies.

**Ans.** 37.5% approx. Limits =  $37.5 \pm 3$  (2.4)

5. 500 eggs are taken at random from a large consignment, and 50 are found to be bad. Estimate the percentage of bad eggs in the consignment and assign limits within which the percentage probably lies.

**Ans.** 10%,  $10 \pm 3.9$

6. A machine puts out 16 imperfect articles in a sample of 500. After the machine is repaired, puts out 3 imperfect articles in a batch of 100. Has the machine been improved?

**Ans.** The machine has not been improved.

7. In a city  $A$ , 20% of a random sample of 900 school boys had a certain slight physical defect. In another city  $B$ , 18.5% of a random sample of 1600 school boys had the same defect. Is the difference between the proportions significant?

**Ans.**  $z = 0.37$ , Difference between proportions is significant.

8. In two large populations there are 30% and 25% respectively of fair haired people. Is this difference likely to be hidden in samples of 1200 and 900 respectively from the two populations?

**Ans.**  $z = 2.5$ , not hidden at 5% level of significance.

9. One thousand articles from a factory are examined and found to be three percent defective. Fifteen hundred similar articles from a second factory are found to be only 2 percent defective. Can it reasonably be concluded that the product of the first factory is inferior to the second?

**Ans.** It cannot be reasonable concluded that the product of the first factory is inferior to that of the second.

10. A manufacturing company claims 90% assurance that the capacitors manufactured by them will show a tolerance of better than 5%. The capacitors are packaged and sold in lots of 10. Show that about 26% of his customers ought to complain that capacitors do not reach the specified standard.

### 62.23 CHI SQUARE TEST

The Chi-square distribution is one of the most extensively used distribution function in statistics. It was first discovered by Helmert in 1875 and later on Karl Pearson's in 1900.

## 62.24 CHI-SQUARE VARIATES

The square of a standard normal variate is known as Chi-square variate ( $\chi^2$ ) with one degree function :

$$z = \frac{x - \mu}{\sigma} \text{ is a normal variate.}$$

Hence  $\left(\frac{x - \mu}{\sigma}\right)^2$  is a Chi-square variate.

If  $x$  be a normally distributed variate and  $x_1, x_2, \dots, x_n$  be a random sample of  $n$ -values from this population then  $w = x_1^2 + x_2^2 + \dots + x_n^2$  has  $\chi^2$  distribution with  $n$ -degree of freedom.

## 62.25 CONDITIONS FOR CHI-SQUARE TEST

There are some conditions which are necessary for Chi square test.

1. The sample under study must be large and may be total of cell frequency should not be less than 50.
2. The member of the cells should be independent.
3. The cell frequency of each cell should be greater than 5. If any cell has frequency less than 5 then it should be combined with the next or preceding cell until the total frequency exceeds 5.
4. If there are any constraint on the cell frequencies they should be linear  
*i.e.;*  $\alpha_1 x_1 + \alpha_2 x_2 + \alpha_3 x_3 + \dots + \alpha_i x_i + \dots + \alpha_n x_n = \lambda$

**Note:** Cell frequency should not involve any logarithmic, exponential or trigonometric relation.

## 62.26 CHI-SQUARE ( $\chi^2$ ) IS USED AS:

- (1) Test of independence
- (2) Test of goodness of fit
- (3) To test if the hypothetical value of the population variate is  $\sigma^2$
- (4) To test the homogeneity of independent estimate of the population variance.

We shall mainly use the first two test

## 62.27 CHI-SQUARE TEST OF GOODNESS OF FIT

This test is used to test significance of the discrepancy between theory and experiment. It helps us to find if the deviation of the experiment from the theory is just by chance or it is due to the inadequacy of the theory to fit the observed data.

The theoretical frequencies for various classes are calculated from the assumption of the population. The significant deviation between the observed and theoretical frequencies is tested by means of this test.

$\chi^2$  is calculated by means of the following formula

$$\chi^2 = \sum_{i=1}^k \frac{(O_i - E_i)^2}{E_i} \quad \text{and} \quad \Sigma O_i = \Sigma E_i = N$$

where  $O_i$  is the observed frequency  $E_i$  is the expected (Theoretical) frequency of the cell.

## 62.28 WORKING RULE TO CALCULATE $\chi^2$ :

**Step 1.** Calculate the expected frequencies.

**Step 2.** Calculate the difference between each observed frequency  $O_i$  and the corresponding expected frequency  $E_i$  for each class i.e.; to find  $O_i - E_i$

**Step 3.** Square the difference obtained in step 2 for each value i.e.; Calculate  $(O_i - E_i)^2$ .

**Step 4.** Divide  $(O_i - E_i)^2$  by the expected frequency  $E$  to get  $\frac{(O_i - E_i)^2}{E_i}$

**Step 5.** Add all these quotients obtained in step 4. Then  $\chi^2 = \sum_{i=1}^n \frac{(O_i - E_i)^2}{E_i}$

**It is to be noted**

- (1) The value of  $\chi^2$  is always positive. (2)  $\chi^2$  will be zero if each pair is zero.
- (3) The value of  $\chi^2$  lies between 0 and  $\infty$ .

### 62.29 DEGREE OF FREEDOM

**Case I.** If the data is given in the form of a series of variables in a row or column then the degree of freedom = (No. of items in the series) – 1

**Case 2.** When the number of frequencies are put in cells in a contingency table.

The degree of freedom =  $(R - 1)(C - 1)$

where  $R$  is number of rows and  $C$  is the number of columns.

**Example 14.** A survey of 320 families with 5 children is given below :

No. of boys	5	4	5	2	1	0	Total
No. of girls	0	1	2	3	4	5	
No. of families	14	56	110	88	40	12	320

Is this result consistent with hypothesis i.e.; the male and female birth are equally possible.

**Solution.** Null Hypothesis  $H_0$ :

(1) Male and Female birth are equally probable.

**Alternate Hypothesis  $H_1$ :** Male and female birth are not equally probable.

Calculation of expected frequencies  $(q + p)^n$

$$\text{Probability of female birth} = p = \frac{1}{2}$$

$$\text{Probability of male birth} = q = \frac{1}{2}$$

$$(q + p)^n = q^n + {}^n C_1 p q^{n-1} + {}^n C_2 p^2 q^{n-2} + {}^n C_3 p^3 q^{n-3} + \dots + p^n$$

$$\left(\frac{1}{2} + \frac{1}{2}\right)^5 = \left(\frac{1}{2}\right)^5 + 5\left(\frac{1}{2}\right)^4 \left(\frac{1}{2}\right)^1 + 10\left(\frac{1}{2}\right)^3 \left(\frac{1}{2}\right)^2 + 10\left(\frac{1}{2}\right)^2 \left(\frac{1}{2}\right)^3 + 5\left(\frac{1}{2}\right)^1 \left(\frac{1}{2}\right)^4 + \left(\frac{1}{2}\right)^5$$

$$\text{No. of girls} = 320 \left[ \frac{1}{32} + \frac{5}{32} + \frac{10}{32} + \frac{10}{32} + \frac{5}{32} + \frac{1}{32} \right]$$

$$= 320 \times \frac{1}{32} + 320 \times \frac{5}{32} + 320 \times \frac{10}{32} + 320 \times \frac{10}{32} + 320 \times \frac{5}{32} + 320 \times \frac{1}{32}$$

$$= 10 + 50 + 100 + 100 + 50 + 10$$

These are the expected frequencies of the female births.

$O$	$E$	$O - E$	$(O - E)^2$	$\frac{(O - E)^2}{E}$
14	10	4	16	1.60
56	50	6	36	0.72
110	100	10	100	1.00
88	100	-12	144	1.44
40	50	-10	100	2.00
12	10	2	4	0.40
			Total	7.16

**Level of significance** Let  $\alpha = 0.05$

**Critical value.** The table value of  $\chi^2$  at  $\alpha = 0.05$  for  $(6 - 1)(2 - 1) = 5$  degree of freedom is 11.07

**Decision** Since the calculated value of  $\chi^2$  (7.16) < Table value of  $\chi^2$  at level of significance 0.05 for  $5df = 11.07$

Hence, the null hypothesis is accepted i.e.; the male and female birth is equally probable.

**Example 15.** The table below give the number of air craft accidents that occurred during the various days of the week. Test whether the accidents are uniformly distributed over the week.

Days	Mon.	Tue.	Wed.	Thu.	Fri.	Sat.	Sun.	Total no. accidents
No. of accidents	14	18	12	11	15	14	14	98

**Solution.**  $H_0$  : Null Hypothesis : The accidents are uniformly distributed over the week.

The expected frequencies of the accidents on each day =  $\frac{98}{7} = 14$

$O$	$E$	$O - E$	$(O - E)^2$	$\frac{(O - E)^2}{E}$
14	14	0	0	0
18	14	4	16	1.14
12	14	-2	4	0.29
11	14	-3	9	0.64
15	14	1	1	0.07
14	14	0	0	0
14	14	0	0	0
98			Total	2.14

**Level of significance :**

Let  $\alpha = 0.05$

**Critical value:** The table value of  $\chi^2$  at  $\alpha = 0.05$  is for  $(7 - 1)(2 - 1)$  i.e., 6 degree is  $\chi^2 = 12.592$

Since the calculated value of  $\chi^2$  (7.16) < Table value of  $\chi^2$  at level of significance 0.05 for six degree = 12.592

Hence, the null Hypothesis is accepted i.e.; the air craft accident are uniformly distributed over the week. **Ans.**

### 62.30 CHI-SQUARE TEST AS A TEST OF INDEPENDENCE

$$\text{Expected Frequency} = \frac{\text{Row total} \times \text{Column total}}{\text{Grand total}}$$

**Example 16.** In an investigation into the health and nutrition of two groups of children of different social status the following results are obtained.

Social Status Health \ \diagdown	Poor	Rich	Total
Below Normal	130	20	150
Normal	102	108	210
Above normal	24	96	120
Total	256	224	480

Discuss the relation between the health and their social status.

**Solution.**  $H_0$ . Null Hypothesis : There is no association between health and social status.

$H_1$ . Alternate Hypothesis: there is no association between health and social status.

$$\text{Expected frequency} = \frac{\text{Row total} \times \text{Column total}}{\text{Grand total}}$$

Social Status Health \ \diagdown	Poor	Rich	Total
Below Normal	$\frac{256 \times 150}{480} = 80$	$\frac{224 \times 150}{480} = 70$	150
Normal	$\frac{256 \times 210}{480} = 112$	$\frac{224 \times 210}{480} = 98$	210
Above normal	$\frac{256 \times 120}{480} = 64$	$\frac{224 \times 120}{480} = 56$	120
Total	256	224	480

Total number of observed frequencies = Total number of expected frequencies = 480

Degree of freedom =  $(3 - 1)(2 - 1) = 2$

Level of significance, take  $\alpha = 0.5$

Critical value the table value of  $\chi^2$  at  $\alpha = 0.05$  for degree of freedom 2 is 5.99.

**Decision.** Since the calculated value of  $\chi^2$  (122.44) > table value of  $\chi^2$  at level of significance 0.05 for two  $2d.f = 5.991$ .

Hence, the null hypothesis is rejected i.e., social status and health are associated (Dependent). **Ans.**

### Calculation of Chi-square

Observed value ( $O$ )	Expected Value ( $E$ )	$O - E$	$(O - E)^2$	$\frac{(O - E)^2}{E}$
130	80	50	2500	$\frac{2500}{80} = 31.25$
102	112	-10	100	$\frac{100}{112} = 0.89$
24	64	-40	1600	$\frac{1600}{64} = 25$
20	70	-50	2500	$\frac{2500}{70} = 35.71$
108	98	10	100	$\frac{100}{98} = 1.02$
96	56	40	1600	$\frac{1600}{56} = 28.57$
			Total	122.44

**Example 17.** The I.Q. and economic condition of home of 1000 students of an engineering college, Delhi were noted as given in the table :

<i>I.Q.</i> <i>Economic cond.</i>	High	Low	Total
Rich	100	300	400
Poor	350	250	600
Total	450	550	1,000

Find out whether there is any association between economic condition at home and I.Q. of the students.

Given for 1 d.f.,  $\chi^2$  at the level of significance 0.05 is 3.84.

#### Solution.

**Null Hypothesis  $H_0$ :** There is no association between economic condition at home and I.Q.

**Alternative hypothesis  $H_1$ :** There is an association between economic condition at home and I.Q.

$$\text{Expected frequency } E = \frac{\text{Row total} \times \text{Column total}}{\text{Grand total}}$$

<i>I.Q.</i> <i>Economic cond.</i>	High	Low	Total
Rich	$\frac{400 \times 450}{1000} = 180$	$\frac{400 \times 550}{1000} = 220$	400
Poor	$\frac{600 \times 450}{1000} = 270$	$\frac{600 \times 550}{1000} = 330$	600
Total	450	550	1000

**Calculation of Chi-square**

Observed value ( $O$ )	Expected Value ( $E$ )	$O - E$	$(O - E)^2$	$\frac{(O - E)^2}{E}$
100	180	-80	6400	35.5
350	270	80	6400	23.7
300	220	80	6400	29.1
250	330	-80	6400	19.4
			Total	107.7

Degree of freedom =  $(R - 1)(C - 1) = (2 - 1)(2 - 1) = 1$  given for  $df = 1$ ,  
 $\chi^2$  at the level of significance 0.05 = 3.84

**Decision.** The calculated value of  $\chi^2$  is greater than Table value of  $\chi^2$ . Hence, the hypothesis is rejected and the alternative hypothesis is accepted.

Hence, there is an association between economic condition at home and I.Q. **Ans.**

**Example 18.** To test the effectiveness of inoculation against cholera, the following table was obtained.

	Attached	Not attached	Total
Inoculated	30	160	190
Not inoculated	140	460	600
Total	170	620	790

(The figures represent the number of persons)

Use  $\chi^2$  - test to defend or refute the statement. The inoculation prevents attack from cholera.  
(U.P. III Semester Dec. 2009)

**Solution.**  $H_0$  Null Hypothesis: No inoculation prevents attack from cholera.

$H_1$  Alternate Hypothesis:

The inoculation prevents attack from cholera.

$$\text{Expected frequency } E = \frac{\text{Row total} \times \text{Column Total}}{\text{Grand total}}$$

	Attacked	Not Attacked	Total
Inoculated	$\frac{170 \times 190}{790} = 40.9$	$\frac{620 \times 190}{790} = 149.1$	190
Not inoculated	$\frac{170 \times 600}{790} = 129.1$	$\frac{620 \times 600}{790} = 470.9$	600
Total	170	620	790

Total number of observed frequencies  
= Total number of expected frequencies = 790

**Calculation of Chi-square**

Observed value (O)	Expected value (E)	(O – E)	$(O - E)^2$	$\frac{(O - E)^2}{E}$
30	40.9	- 10.9	118.81	2.904
140	129.1	10.9	118.81	0.920
160	149.1	10.9	118.81	0.797
460	470.9	- 10.9	118.81	0.252
			Total	4.873

Degree of freedom =  $(R - 1)(C - 1) = (2 - 1)(2 - 1) = 1$

The critical value of the table value of  $\chi^2$  at  $\alpha = 0.05$  for 1d.f. is 3.841.

**Decision:** Since the calculated value of  $\chi^2$  (4.873) is greater than the table value (3.841).

Thus, the hypothesis is rejected and the alternative hypothesis is accepted.

Hence, the inoculation prevents attack from cholera.

**Ans.**

**EXERCISE 62.2**

1. In an experiment immunization of cattle from a disease, the following results are obtain:

	Affected	Unaffected	Total
Inoculated	12	28	40
No Inoculated	13	7	20
Total	25	35	60

Examine the effect of vaccine in controlling the incidence of the disease. **Ans.** Not independent

2. In the contingency table given below use Chi-square test to test for independence of hair colour and eye colour of persons:

Hair colour		Light	Dark	Total
Eye colour	Blue	26	9	35
	Brown	7	18	25
Total	33	27	60	

**Ans.** Hair colour and eye colour are associated

3. A survey amongst women was conducted to study the family life. The observations are as follows:

**Family life**

	Happy	Not Happy	Total
Educated	70	30	100
Not educated	60	40	100
Total	130	70	200

Test whether there is any association between family life and education.

**Ans.** there is no association between family life and education.

4. A certain drug was administrated to 500 people out of a total of 800 included in a sample to test its efficiency against typhoid, the results are given below :

	Typhoid	No Typhoid	Total
Drug	200	300	500
No Drug	280	20	300
	48	320	800

On the basis of the data, can we say that drug is effective in preventing Typhoid.

**Ans.**  $\chi^2 = 222.22$  drug is effective

5. The following table gives the number of person's whose eye sight is attacked and an injection of macugen is injected by Prof. Atul.

	Eye sight Improved	Eye sight not improved	total
Injected	216	145	361
Not injected	105	234	339
Total	321	379	700

Do you think macugen injection can improve the eye sight. **Ans.** By injection, eye sight has improved

6. From the table given below, whether the colour of the sons eyes is associated with that of father's eye.

Eyes colour in sons

		Not light	light	
Eyes colour in fathers	Not light light	230 151	148 471	378 622
		381	619	1000

There is an association between the colour of eyes of sons and colours of eye's of fathers.

**Ans.** Null hypothesis is rejected

7. The following table gives the classification of 500 plants according to the nature of leaf and flower colour.

	Blue flowers	White flower	Total
Flat leaf	329	121	450
Creppled leaf	78	32	110
Total	407	153	560

Test whether they have any association between them.

**Ans.** No association between them

8. The table below gives the data obtained from a hospital of sugar patients:

	Cured	Not cured	Total
Inoculated	31	469	500
Not inoculated	185	1,315	1500
	216	1784	2000

Test the effectiveness of inoculation in preventing the sugar disease.

**Ans.** Inoculation is effective in preventing the attack of sugar

9. The following table give the no. of good and defective parts produced by each of these shifts in a factory. Test whether the shift has any association with good or defective parts.

	Day shift	Evening shift	Night shift	Total
Good parts	960	940	950	2850
Defective parts	40	50	45	135
	1000	990	995	2985

**Ans.**  $\chi^2 = 0.3485$ , Null Hypothesis is accepted

10. The following table shows the results of drug against B.P.

	Not attacked	Attacked	Total
Drug	267	37	304
No Drug	757	155	912
Total	1024	192	1216

Find out whether there is any significance association between drug and attack.

**Ans.** Drug prevents the attack of B.P.

## BINOMIAL DISTRIBUTION

---

### 63.1 BINOMIAL DISTRIBUTION $P(r) = {}^nC_r \cdot p^r \cdot q^{n-r}$

To find the probability of the happening of an event once, twice, thrice, .....  $r$  times ..... exactly in  $n$  trials.

Let the probability of the happening of an event  $A$  in one trial be  $p$  and its probability of not happening be  $1 - p = q$ .

We assume that there are  $n$  trials and the happening of the event  $A$  is  $r$  times and its not happening is  $n - r$  times.

$$\begin{array}{ll} A \cdot A \dots A & \bar{A} \cdot \bar{A} \dots \bar{A} \\ r \text{ times} & n - r \text{ times} \end{array} \quad \dots(1)$$

$A$  indicates its happening,  $\bar{A}$  its failure and  $P(A) = p$  and  $P(\bar{A}) = q$ .

We see that (1) has the probability

$$\frac{pp \dots p}{r \text{ times}} \cdot \frac{q \cdot q \dots q}{n - r \text{ times}} = p^r \cdot q^{n-r} \quad \dots(2)$$

Clearly (1) is merely one order of arranging  $rA$ 's.

The probability of (1) =  $p^r q^{n-r} \times$  Number of different arrangements of

$rA$ 's and  $(n-r)\bar{A}$ 's.

The number of different arrangements of  $rA$ 's and  $(n-r)\bar{A}$ 's =  ${}^nC_r$

$\therefore$  Probability of the happening of an event  $r$  times  ${}^nC_r \cdot p^r \cdot q^{n-r}$ .

$$\begin{aligned} P(r) &= {}^nC_r \cdot p^r \cdot q^{n-r} \quad (r = 0, 1, 2, \dots, n). \\ &= (r+1)\text{th term of } (q+p)^n \end{aligned}$$

If  $r = 0$ , probability of happening of an event 0 times =  ${}^nC_0 \cdot q^n \cdot p^0 = q^n$

If  $r = 1$ , probability of happening of an event 1 time =  ${}^nC_1 \cdot q^{n-1} \cdot p$

If  $r = 2$ , probability of happening of an event 2 times =  ${}^nC_2 \cdot q^{n-2} \cdot p^2$

If  $r = 3$ , probability of happening of an event 3 times =  ${}^nC_3 \cdot q^{n-3} \cdot p^3$  and so on.

These terms are clearly the successive terms in the expansion of  $(q+p)^n$ .

Hence it is called Binomial Distribution.

**Example 1.** Find the probability of getting 4 heads in 6 tosses of a fair coin.

**Solution.**  $p = \frac{1}{2}, q = \frac{1}{2}, n = 6, r = 4$ .

We know that  $P(r) = {}^nC_r \cdot q^{n-r} \cdot p^r$

$$P(4) = {}^6C_4 \cdot q^{6-4} \cdot p^4 = \frac{6 \times 5}{1 \times 2} \left(\frac{1}{2}\right)^2 \left(\frac{1}{2}\right)^4 = 15 \times \left(\frac{1}{2}\right)^6 = \frac{15}{64} \quad \text{Ans.}$$

**Example 2.** If on an average one ship in every ten is wrecked, find the probability that out of 5 ships expected to arrive, 4 at least will arrive safely.

**Solution.** Out of 10 ships, one ship is wrecked.

i.e., Nine ships out of ten ships are safe.

$$p(\text{safety}) = \frac{9}{10}$$

$$P(\text{At least 4 ships out of 5 are safe}) = P(4 \text{ or } 5) = P(4) + P(5)$$

$$= {}^5C_4 p^4 q^{5-4} + {}^5C_5 p^5 q^0 = 5\left(\frac{9}{10}\right)^4 \left(\frac{1}{10}\right) + \left(\frac{9}{10}\right)^5 = \left(\frac{9}{10}\right)^4 \left(\frac{5}{10} + \frac{9}{10}\right) = \frac{7}{5} \left(\frac{9}{10}\right)^4 \quad \text{Ans.}$$

**Example 3.** The overall percentage of failures in a certain examination is 20. If six candidates appear in the examination, what is the probability that at least five pass the examination?

$$\text{Solution. Probability of failures} = 20\% = \frac{20}{100} = \frac{1}{5}$$

$$\text{Probability of pass } (P) = 1 - \frac{1}{5} = \frac{4}{5}$$

$$\begin{aligned} \text{Probability of at least five pass} &= P(5 \text{ or } 6) \\ &= P(5) + P(6) = {}^6C_5 p^5 q + {}^6C_6 p^6 q^0 = 6\left(\frac{4}{5}\right)^5 \left(\frac{1}{5}\right) + \left(\frac{4}{5}\right)^6 = \left(\frac{4}{5}\right)^5 \left[\frac{6}{5} + \frac{4}{5}\right] = 2\left(\frac{4}{5}\right)^5 = \frac{2048}{3125} \\ &= 0.65536 \end{aligned} \quad \text{Ans.}$$

**Example 4.** Ten percent of screws produced in a certain factory turn out to be defective. Find the probability that in a sample of 10 screws chosen at random, exactly two will be defective.

$$\text{Solution. } p = \frac{1}{10}, \quad q = \frac{9}{10}, \quad n = 10, \quad r = 2$$

$$\begin{aligned} P(r) &= {}^nC_r p^r q^{n-r} \\ P(2) &= {}^{10}C_2 \left(\frac{1}{10}\right)^2 \left(\frac{9}{10}\right)^{10-2} = \frac{10 \times 9}{1 \times 2} \left(\frac{1}{10}\right)^2 \left(\frac{9}{10}\right)^8 = \frac{1}{2} \cdot \left(\frac{9}{10}\right)^9 = 0.1937 \end{aligned} \quad \text{Ans.}$$

**Example 5.** The probability that a man aged 60 will live to be 70 is 0.65. What is the probability that out of 10 men, now 60, at least 7 will live to be 70?

**Solution.** The probability that a man aged 60 will live to be 70 =  $p = 0.65$

$$q = 1 - p = 1 - 0.65 = 0.35$$

$$\text{Number of men} = n = 10$$

Probability that at least 7 men (7 or 8 or 9 or 10) will live to 70

$$\begin{aligned} &= P(7) + P(8) + P(9) + P(10) = {}^{10}C_7 q^3 p^7 + {}^{10}C_8 q^2 p^8 + {}^{10}C_9 q p^9 + p^{10} \\ &= \frac{10 \times 9 \times 8}{1 \times 2 \times 3} (0.35)^3 (0.65)^7 + \frac{10 \times 9}{1 \times 2} (0.35)^2 (0.65)^8 + 10 (0.35) (0.65)^9 + (0.65)^{10} \\ &= (0.65)^7 [120 (0.35)^3 + 45 (0.35)^2 (0.65) + 10 (0.35) (0.65)^2 + (0.65)^3] \\ &= (0.65)^7 \times 125 [120 \times (0.07)^3 + 45 \times (0.07)^2 (0.13) + 10 (0.07) (0.13)^2 + (0.13)^3] \\ &= 0.04902 \times 125 [0.04 + 0.028665 + 0.011830 + 0.002197] \\ &= 6.1275 \times 0.082692 = 0.5067 \end{aligned} \quad \text{Ans.}$$

**Example 6.** If 10 % of bolts produced by a machine are defective. Determine the probability that out of 10 bolts, chosen at random (i) 1 (ii) none (iii) at most 2 bolts will be defective.

**Solution.** Probability of defective bolts =  $p = 10\% = 0.1$

Probability of not defective bolts =  $q = 1 - p = 1 - 0.1 = 0.9$

Total number of bolts =  $n = 10$

$$\begin{aligned}
 (i) \text{ Probability of 1 defective bolt} &= {}^{10}C_1 (0.1)^1 (0.9)^9 = 0.3874 \\
 (ii) \text{ Probability that none is defective} &= \text{Probability of 0 defective bolt} \\
 &= P(0) = {}^{10}C_0 (0.1)^0 (0.9)^{10} = 0.3487 \\
 (iii) \text{ Probability of 2 defective} &= {}^{10}C_2 (0.1)^2 (0.9)^8 = 0.1937 \\
 \text{Probability of at most 2 defective} &= P(0 \text{ or } 1 \text{ or } 2) \\
 &= P(0) + P(1) + P(2) = 0.3487 + 0.3874 + 0.1937 \\
 &= 0.9298 \quad \text{Ans.}
 \end{aligned}$$

**Example 7.** An underground mine has 5 pumps installed for pumping out storm water, the probability of any one of the pumps failing during the storm is  $\frac{1}{8}$ . What is the probability that (i) at least 2 pumps will be working; (ii) all the pumps will be working during a particular storm?

**Solution.** (i) Probability of pump failing  $= \frac{1}{8}$

$$\text{Probability of pump working} = 1 - \frac{1}{8} = \frac{7}{8}, \quad P = \frac{7}{8}, \quad q = \frac{1}{8}, \quad n = 5$$

$$\begin{aligned}
 (i) P(\text{At least 2 pumps working}) &= P(\text{2 or 3 or 4 or 5 pumps working}) \\
 &= P(2) + P(3) + P(4) + P(5) = {}^5C_2 p^2 q^3 + {}^5C_3 p^3 q^2 + {}^5C_4 p^4 q + {}^5C_5 p^5 q^0 \\
 &= 10\left(\frac{7}{8}\right)^2\left(\frac{1}{8}\right)^3 + 10\left(\frac{7}{8}\right)^3\left(\frac{1}{8}\right)^2 + 5\left(\frac{7}{8}\right)^4\left(\frac{1}{8}\right) + \left(\frac{7}{8}\right)^5 \\
 &= \frac{1}{8^5}[10 \times 49 + 10 \times 343 + 5 \times 2401 + 16807] \\
 &= \frac{1}{8^5}[490 + 3430 + 12005 + 16807] = \frac{32732}{8^5} = \frac{8183}{8192}
 \end{aligned}$$

$$(ii) P(\text{All the 5 pumps working}) = P(5) = {}^5C_5 p^5 q^0 = \left(\frac{7}{8}\right)^5 = \frac{16807}{32768} \quad \text{Ans. (i)} \frac{8183}{8192} \quad \text{(ii)} \frac{16807}{32768}$$

**Example 8.** Write two-three areas where binomial distribution is applied. The probability of entering student in chartered accountant will be graduate 0.5. Determine the probability that out of 10 students (i) none (ii) one or (iii) at least one will graduate.

(R.G.P.V., Bhopal, Dec., 2003)

**Solution.** Given, the probability of an entering student in chartered accountant will graduate is  $p = 0.5$

∴ The probability of an entering student in chartered accountant will not graduate is  $q = 0.5$ .

Therefore

- (i) The probability of none will graduate out of 10 students  
 $P(0) = {}^{10}C_0 p^0 q^{10} = {}^{10}C_0 (0.5)^0 (0.5)^{10} = 9.765625 \times 10^{-4}$  **Ans.**
- (ii) The probability of exactly one student will graduate out of 10 students.  
 $P(1) = {}^{10}C_1 (0.5)^1 (0.5)^9 = 10 \times 0.5 \times (0.5)^9 = 9.765625 \times 10^{-3}$  **Ans.**
- (iii) The probability of at least one will graduate out of 10 students  
 $P(\text{At least one}) = 1 - (\text{probability of none will graduate})$   
 $= 1 - 9.765625 \times 10^{-4} = 0.99$  **Ans.**

**Example 9.** The probability that a bomb dropped from a plane will strike the target is  $\frac{1}{5}$ . If six bombs are dropped, find the probability that:

- (i) Exactly two will strike the target.
- (ii) At least two will strike the target. (R.G.P.V., Bhopal, II Semester, Feb. 2006)

**Solution.** Here,  $p = \frac{1}{5}$ ,  $q = 1 - \frac{1}{5} = \frac{4}{5}$ ,  $n = 6$

We know that  $P(r) = {}^nC_r p^r q^{n-r}$

$$P(2) = {}^6C_2 \left(\frac{1}{5}\right)^2 \left(\frac{4}{5}\right)^{6-2} = 15 \left(\frac{256}{15625}\right) = \frac{768}{3125} = 0.24576$$

$$\begin{aligned} P(\text{at least } 2) &= P(2, 3, 4, 5, 6) = P(2) + P(3) + P(4) + P(5) + P(6) \\ &= P(0) + P(1) + P(2) + P(3) + P(4) + P(5) + P(6) - P(0) - P(1) \\ &= 1 - [P(0) + P(1)] \\ &= 1 - \left[ {}^6C_0 \left(\frac{1}{5}\right)^0 \left(\frac{4}{5}\right)^6 + {}^6C_1 \left(\frac{1}{5}\right) \left(\frac{4}{5}\right)^5 \right] = 1 - \left[ \frac{4096}{15625} + 6 \left(\frac{1024}{15625}\right) \right] \\ &= 1 - \frac{10240}{15625} = \frac{5385}{15625} = \frac{1077}{3125} = 0.34464 \end{aligned}$$

Hence (i)  $P = 0.24576$  (ii)  $P = 0.34464$

**Ans.**

### EXERCISE 63.1

1. If 20% of the bolts produced by a machine are defective, determine the probability that out of 4 bolts chosen at random  
(a) 1 (b) 0 (c) At most 2  
**Ans.** (a) 0.4096, (b) 0.4096, (c) 0.9728.
2. Six dice are thrown 729 times. How many times do you expect at least three dice to show a five or a six?  
**Ans.** 233
3. Find the probability of getting a total of 7 at least once in 4 tosses of a pair of fair dice.  
**Ans.**  $\frac{671}{1296}$  (*A.M.I.E., Winter 2002*)
4. If the chance that any one of the 10 telephone lines is busy at any instant is 0.2, what is the chance that 5 of the lines are busy? What is the probability that all the lines are busy?  
**Ans.**  ${}^{10}C_5 (0.2)^5 (0.8)^5$ ,  $(0.2)^{10}$
5. An insurance salesman sells policies to 5 men, all of identical age in good health. According to the actuarial tables the probability that a man of this particular age will be alive 30 years hence is  $\frac{2}{3}$ . Find the probability that in 30 years.  
(a) All 5 men (b) At least 3 men (c) Only 2 men (d) At least 1 man will be alive.  
**Ans.** (a)  $\frac{32}{243}$  (b)  $\frac{192}{243}$  (c)  $\frac{40}{243}$  (d)  $\frac{242}{243}$
6. Consider an urn in which 4 balls have been placed by the following scheme : A fair coin is tossed; if the coin falls head, a white ball is placed in the urn, and if the coin falls tail, a red ball is placed in urn. (i) What is the probability that the urn will contain exactly 3 white balls ? (ii) What is the probability that the urn will contain exactly 3 red balls, given that the first ball placed was red?  
**Ans.** (i)  $\frac{1}{8}$ , (ii)  $\frac{3}{8}$
7. A box contains 10 screws, 3 of which are defective. Two screws are drawn at random without replacement. Find the probability that none of the two screws is defective.  
**Ans.**  $\frac{7}{15}$
8. Out of 800 families with four children each, how many families would be expected to have :  
(i) 2 boys and 2 girls; (ii) at least one boy; (iii) no girl; (iv) at most two girls ?  
Assume equal probabilities for boys and girls.  
**Ans.** (i) 300, (ii) 750, (iii) 50, (iv) 550.
9. In a hurdle race, a player has to cross 10 hurdles. The probability that he will clear each hurdle is  $5/6$ . What is the probability that he will knock down less than 2 hurdles?  
**Ans.**  $\frac{8}{3} \left(\frac{5}{6}\right)^9$

10. An electronic component consists of three parts. Each part has probability 0.99 of performing satisfactorily. The component fails if 2 or more parts do not perform satisfactorily. Assuming that the parts perform independently, determine the probability that the component does not perform satisfactorily.

**Ans.** 0.000298

11. The incidence of occupational disease in an industry is such that the workers have 20% chance of suffering from it. What is the probability that out of 6 workers 4 or more will catch the disease ?

(A.M.I.E., Winter 2005) **Ans.**  $\frac{53}{2125}$

12. Among 10,000 random digits, find the probability  $p$  that the digit 3 appears at most 950 times.

(A.M.I.E., Summer 2003) **Ans.**  $\sum_{n=0}^{950} 1000 C_r \left(\frac{1}{10}\right)^r \left(\frac{9}{10}\right)^{1000-r}$

13. A fair coin is tossed 400 times. Using normal approximation to the binomial, find the probability that a head will occur (a) more than 180 times and (b) less than 195 times.

(A.M.I.E. Winter 2004) **Ans.** (a)  $1 - \left(\frac{1}{2}\right)^{221}$  (b)  $1 - \left(\frac{1}{2}\right)^{115}$

14. In a bombing action there is 50% chance that any bomb will strike the target. Two direct hits are needed to destroy the target completely. How many bombs are required to be dropped to give a 99% chance or better of completely destroying the target. (R.G.P.V., Bhopal, June 2008) **Ans.** 11

### 63.2 MEAN OF BINOMIAL DISTRIBUTION

(GBTU, Dec. 2012, AMIETE, Winter 2002, Summer 2000, A.M.I.E., Winter 2002)

$$(q + p)^n = q^n + {}^n C_1 q^{n-1} p^1 + {}^n C_2 q^{n-2} p^2 + {}^n C_3 q^{n-3} p^3 + \dots + {}^n C_r q^{n-r} p^r + \dots + p^n$$

Successes $r$	Frequency $f$	Product $rf$
0	$q^n$	0
1	$n q^{n-1} p$	$n q^{n-1} p$
2	$\frac{n(n-1)}{2} q^{n-2} p^2$	$n(n-1) q^{n-2} p^2$
3	$\frac{n(n-1)(n-2)}{6} q^{n-3} p^3$	$\frac{n(n-1)(n-2)}{2} q^{n-3} p^3$
....	.....	.....
$n$	$p^n$	$np^n$

$$\begin{aligned} \Sigma f r &= n q^{n-1} p + n(n-1) q^{n-2} p^2 + \frac{n(n-1)(n-2)}{2} q^{n-3} p^3 + \dots + n p^n \\ &= np [q^{n-1} + \frac{(n-1)}{1!} q^{n-2} p + \frac{(n-1)(n-2)}{2} q^{n-3} p^2 + \dots + p^{n-1}] \\ &= n p (q + p)^{n-1} = np \end{aligned} \quad (\text{since } q + p = 1)$$

$$\begin{aligned} \Sigma f &= q^n + n q^{n-1} p + \frac{n(n-1)}{2} q^{n-2} p^2 + \dots + p^n \\ &= (q + p)^n = 1 \quad (\text{since } q + p = 1) \end{aligned}$$

$$\text{Hence, } \text{Mean} = \frac{\Sigma f r}{\Sigma f} = \frac{np}{1} \quad \text{Ans.}$$

### 63.3 STANDARD DEVIATION OF BINOMIAL DISTRIBUTION

(A. M. I. E.T. E., Winter 2002, A.M.I.E., Winter 2002)

Successes $r$	Frequency $f$	Product $r^2 f$
0	$q^n$	0
1	$n q^{n-1} p$	$n q^{n-1} p$
2	$\frac{n(n-1)}{2} q^{n-2} p^2$	$2 n (n-1) q^{n-2} p^2$
3	$\frac{n(n-1)(n-2)}{6} q^{n-3} p^3$	$\frac{3n(n-1)(n-2)}{2} q^{n-3} p^3$
.....	.....	.....
$n$	$p^n$	$n^2 p^n$

We know that  $\sigma^2 = \frac{\sum f r^2}{\sum f} - \left( \frac{\sum f r}{\sum f} \right)^2$  ... (1)

$r$  is the deviation of items (successes) from 0.

$$\sum f = 1, \quad \sum f r = np$$

$$\begin{aligned}
 \sum f r^2 &= 0 + nq^{n-1} p + 2n(n-1)q^{n-2} p^2 + \frac{3n(n-1)(n-2)}{2} q^{n-3} p^3 + \dots + n^2 p^n \\
 &= np[q^{n-1} + \frac{2(n-1)}{1!} q^{n-2} p + \frac{3(n-1)(n-2)}{2!} q^{n-3} p^2 + \dots + np^{n-1}] \\
 &= np[q^{n-1} + \frac{(n-1)q^{n-2} p}{1!} + \frac{(n-1)(n-2)}{2!} q^{n-3} p^2 + \dots + p^{n-1} \\
 &\quad + \frac{(n-1)q^{n-2} p}{1!} + \frac{2(n-1)(n-2)}{2!} q^{n-3} p^2 + \dots + (n-1) p^{n-1}] \\
 &= np \left[ q^{n-1} + (n-1)q^{n-2} p + \frac{(n-1)(n-2)}{2!} q^{n-3} p^2 + \dots + p^{n-1} \right. \\
 &\quad \left. + (n-1) p \left\{ q^{n-2} + (n-2) q^{n-3} p + \frac{(n-2)(n-3)}{2!} q^{n-4} p^2 + \dots + p^{n-2} \right\} \right] \\
 &= np [(q+p)^{n-1} + (n-1)p(q+p)^{n-2}] = np [1 + (n-1)p] \\
 &= np [np + (1-p)] = np[np + q] = n^2 p^2 + npq
 \end{aligned}$$

Putting these values in (1), we have

$$\text{Variance} = \sigma^2 = \frac{n^2 p^2 + npq}{1} - \left( \frac{np}{1} \right)^2 = npq,$$

$$S.D. = \sigma = \sqrt{npq}$$

Hence for the binomial distribution,

$$\text{Mean} = np, \quad \mu_2 = \sigma^2 = n p q$$

**Example 10.** Find the first four moments of the binomial distribution. (AMIETE, Summer 2000)

**Solution.** First moment about the origin

$$\begin{aligned}
 \mu'_1 &= \sum_{r=0}^n {}^n C_r p^r q^{n-r} r = \sum_{r=0}^n r \cdot \frac{n(n-1)(n-2)\dots(n-r+1)}{r!} p^r q^{n-r} \\
 &= n \sum_{r=1}^n \frac{(n-1)(n-2)\dots(n-r+1)}{(n-r)!} p^r q^{n-r} = np \sum_{r=1}^n {}^{n-1} C_{r-1} p^{r-1} q^{n-r}
 \end{aligned}$$

$$= np(q + p)^{n-1} = np$$

Thus, the mean of the Binomial distribution is  $np$ .

**Second moment about the origin**

$$\begin{aligned}\mu_2' &= \sum_{r=0}^n {}^n C_r p^r q^{n-r} r^2 \quad [r^2 = r(r-1) + r] \\ &= \sum_{r=0}^n \{r(r-1)+r\} {}^n C_r p^r q^{n-r} = \sum_{r=0}^n r(r-1) {}^n C_r p^r q^{n-r} + \sum_{r=0}^n r \cdot {}^n C_r p^r q^{n-r} \\ &= \sum_{r=0}^n \frac{r(r-1)n(n-1)(n-2)\dots(n-r+1)}{r!} p^r q^{n-r} \\ &\sum_{r=0}^n \frac{r n(n-1)(n-2)\dots(n-r+1)}{r!} p^r q^{n-r} \\ &= n(n-1)p^2 \sum_{r=2}^n \frac{(n-2)(n-3)\dots(n-r+1)}{(r-2)!} p^{r-2} q^{n-r} \\ &\quad + np \sum_{r=1}^n \frac{(n-1)(n-2)\dots(n-r+1)}{(r-1)!} p^{r-1} q^{n-r} \\ &= n(n-1)p^2 (q+p)^{n-2} + np(q+p)^{n-1} = n(n-1)p^2 + np\end{aligned}$$

**Third moment about the origin**

$$\mu_3' = \sum_{r=0}^n {}^n C_r p^r q^{n-r} r^3$$

[Let  $r^3 = Ar(r-1)(r-2) + Br(r-1) + Cr$

By putting  $r = 1, 2, 3$ , we get  $A = 1, B = 3, C = 1$ ]

$$\begin{aligned}\mu_3' &= \sum_{r=0}^n \{r(r-1)(r-2) + 3r(r-1) + r\} {}^n C_r p^r q^{n-r} \\ &= \sum_{r=0}^n r(r-1)(r-2) {}^n C_r p^r q^{n-r} + 3 \sum_{r=0}^n r(r-1) {}^n C_r p^r q^{n-r} + \sum_{r=0}^n r \cdot {}^n C_r p^r q^{n-r} \\ &= \sum_{r=0}^n \frac{r(r-1)(r-2) \cdot n(n-1)\dots(n-r+1)}{r!} p^r q^{n-r} \\ &\quad + 3 \sum_{r=0}^n \frac{r(r-1) \cdot n(n-1)\dots(n-r+1)}{r!} p^r q^{n-r} + \sum_{r=0}^n r \frac{n(n-1)\dots(n-r+1)}{r!} p^r q^{n-r} \\ &= \sum_{r=3}^n \frac{n(n-1)(n-2)(n-3)\dots(n-r+1)}{(r-3)!} p^r q^{n-r} \\ &\quad + 3 \sum_{r=2}^n \frac{n(n-1)(n-2)(n-3)\dots(n-r+1)}{(r-2)!} p^r q^{n-r} \\ &\quad + \sum_{r=1}^n \frac{n(n-1)(n-2)\dots(n-r+1)}{(r-1)!} p^r q^{n-r} \\ &= n(n-1)(n-2)p^3 \sum_{r=3}^n {}^{n-3} C_{r-3} p^{r-3} q^{n-3} + 3n(n-1)p^2 \sum_{r=2}^n {}^{n-2} C_{r-2} p^{r-2} q^{n-2} \\ &\quad + np \sum_{r=1}^n {}^{(n-1)} C_{r-1} p^{r-1} q^{n-1} \\ &= n(n-1)(n-2)p^3 (q+p)^{n-3} + 3n(n-1)p^2 (q+p)^{n-2} + np(q+p)^{n-1} \\ &= n(n-1)(n-2)p^3 + 3n(n-1)p^2 + np\end{aligned}$$

**Fourth Moment**

$$\mu'_4 = \sum_{r=0}^n {}^n C_r p^r q^{n-r} r^4$$

[Let  $r^4 = Ar(r-1)(r-2)(r-3) + Br(r-1)(r-2) + Cr(r-1) + Dr$

By putting  $r = 1, 2, 3, 4$ , we get  $A = 1, B = 6, C = 7, D = 1$ ]

$$\begin{aligned} \mu'_4 &= \sum_{r=0}^n r(r-1)(r-2)(r-3) \cdot {}^n C_r p^r q^{n-r} + \sum_{r=0}^n 6r(r-1)(r-2) \cdot {}^n C_r p^r q^{n-r} \\ &\quad + \sum_{r=0}^n 7r(r-1) \cdot {}^n C_r p^r q^{n-r} + \sum_{r=0}^n r \cdot {}^n C_r p^r q^{n-r} \\ &= \sum_{r=0}^n \frac{r(r-1)(r-2)(r-3) \cdot n(n-1) \dots (n-r+1)}{r!} p^r q^{n-r} \\ &\quad + 6 \sum_{r=0}^n \frac{r(r-1)(r-2) \cdot n(n-1) \dots (n-r+1)}{r!} p^r q^{n-r} \\ &\quad + 7 \sum_{r=0}^n \frac{r(r-1) \cdot n(n-1) \dots (n-r+1)}{r!} p^r q^{n-r} + \sum_{r=0}^n \frac{r \cdot n(n-1) \dots (n-r+1)}{r!} p^r q^{n-r} \\ &= \sum_{r=4}^n \frac{n(n-1)(n-2)(n-3)(n-4) \dots (n-r+1)}{(r-4)!} p^r q^{n-r} \\ &\quad + 6 \sum_{r=3}^n \frac{n(n-1)(n-2)(n-3) \dots (n-r+1)}{(r-3)!} p^r q^{n-r} \\ &\quad + 7 \sum_{r=2}^n \frac{n(n-1)(n-2) \dots (n-r+1)}{(r-2)!} p^r q^{n-r} + \sum_{r=1}^n \frac{n(n-1) \dots (n-r+1)}{(r-1)!} p^r q^{n-r} \\ &= n(n-1)(n-2)(n-3) \sum_{r=4}^n {}^{n-4} C_{r-4} p^r q^{n-r} + 6n(n-1)(n-2) \sum_{r=3}^n {}^{n-3} C_{r-3} p^r q^{n-r} \\ &\quad + 7n(n-1) \sum_{r=2}^n {}^{n-2} C_{r-2} p^r q^{n-r} + n \sum_{r=1}^n {}^{n-1} C_{r-1} p^r q^{n-r} \\ &= n(n-1)(n-2)(n-3) p^4 (q+p)^{n-4} + 6n(n-1)(n-2) p^3 (q+p)^{n-3} \\ &\quad + 7n(n-1) p^2 (q+p)^{n-2} + np(q+p)^{n-1} \\ &= n(n-1)(n-2)(n-3) p^4 + 6n(n-1)(n-2) p^3 + 7n(n-1) p^2 + np \end{aligned}$$

**63.4 CENTRAL MOMENTS : (Moments about the mean)**

Now, the first four central moments are obtained as follows:

**Second Central Moment**

$$\mu_2 = \mu'_2 - \mu'_1 = [n(n-1)p^2 + np] - n^2 p^2 = np[(n-1)p + 1 - np] = np(1-p) = npq$$

Variance of Binomial distribution is  $npq$

**Third Central Moment**

$$\begin{aligned} \mu_3 &= \mu'_3 - 3\mu'_2 \mu'_1 + 2\mu'^3_1 \\ &= \{n(n-1)(n-2)p^3 + 3n(n-1)p^2 + np\} - 3\{n^2 p^2 + npq\} np + 2n^3 p^3 \\ &= np[-3np^2 + 3np + 2p^2 - 3p + 1 - 3npq] \\ &= np[3np(1-p) + 2p^2 - 3p + 1 - 3npq] \\ &= np[3npq + 2p^2 - 3p + 1 - 3npq] = np[2p^2 - 3p + 1] = np[2p^2 - 2p + q] \\ &= np[-2p(1-p) + q] = np(-2pq + q) = npq(1-2p) = npq(q-p) \end{aligned}$$

## Fourth Central Moment

$$\begin{aligned}
\mu_4 &= \mu'_4 - 4\mu'_3\mu'_1 + 6\mu'_2\mu'^2_1 - 3\mu'^4_1 \\
&= n(n-1)(n-2)(n-3)p^4 + 6n(n-1)(n-2)p^3 + 7n(n-1)p^2 \\
&\quad + np - 4[n(n-1)(n-2)p^3 + 3n(n-1)p^2 + np]np \\
&\quad + 6[n(n-1)p^2 + np]n^2p^2 - 3n^4p^4 \\
&= np[(n-1)(n-2)(n-3)p^3 + 6(n-1)(n-2)p^2 + 7(n-1)p \\
&\quad + 1 - 4\{n(n-1)(n-2)p^3 + 3n(n-1)p^2 + np\} \\
&\quad + 6\{n(n-1)p^2 + np\}np - 3n^3p^3] \\
&= np[(n^3 - 6n^2 + 11n - 6)p^3 + (6n^2 - 18n + 12)p^2 + 7np - 7p + 1 \\
&\quad + \{(-4n^3 + 12n^2 - 8n)p^3 - 4(3n^2 - 3n)p^2 - 4np\} \\
&\quad + \{(6n^3 - 6n^2)p^3 + 6n^2p^2\} - 3n^3p^3] \\
&= np[(n^3 - 6n^2 + 11n - 6 - 4n^3 + 12n^2 - 8n + 6n^3 - 6n^2 - 3n^3)p^3 \\
&\quad + (6n^2 - 18n + 12 - 12n^2 + 12n + 6n^2)p^2 + (7n - 7 - 4n)p + 1] \\
&= np[(3n - 6)p^3 + (-6n + 12)p^2 + (3n - 7)p + 1] \\
&= np[3np^3 - 6p^3 - 6np^2 + 12p^2 + 3np - 7p + 1] \\
&= np[3np^3 - 3np^2 - 6p^3 + 6p^2 - 3np^2 + 3np + 6p^2 - 6p - p + 1] \\
&= np[-3np^2(1-p) + 6p^2(1-p) + 3np(1-p) - 6p(1-p) + (1-p)] \\
&= np[-3np^2q + 6p^2q + 3npq - 6pq + q] = npq[-3np^2 + 6p^2 + 3np - 6p + 1] \\
&= npq[3np(1-p) - 6p(1-p) + 1] = npq[3npq - 6pq + 1] \\
&= npq[1 + 3(n-2)pq]
\end{aligned}$$

Ans.

## 63.5 MOMENT GENERATING FUNCTIONS OF BINOMIAL DISTRIBUTION ABOUT ORIGIN

$$\begin{aligned}
M_0(t) &= E(e^{tx}) = \sum nC_x p^x q^{n-x} \cdot e^{tx} \\
&= \sum nC_x (pe^t)^x q^{n-x} = (q + pe^t)^n
\end{aligned}$$

Differentiating w.r.t. 't' we get  $M_a'(t) = n(q + pe^t)^{n-1}p \cdot e^t$ On putting  $t = 0$ , we get  $\mu'_1 = n(q + p)^{n-1}p$ 

$$\mu'_1 = np$$

Since

$$M_a(t) = e^{-at} M_0(t)$$

Moment generating function of the Binomial distribution about its mean ( $m$ ) =  $np$  is given by

$$\begin{aligned}
M_m(t) &= e^{-npt} M_0(t) \\
M_m(t) &= e^{-npt}(q + pe^t)^n = (qe^{-pt} + pe^{-pt} + t)^n = (qe^{-pt} + pe^{(1-p)t})^n \\
&= \left[ q(1-pt + \frac{p^2t^2}{2!} - \frac{p^3t^2}{2!} + \frac{p^4t^4}{4!} + \dots) + p(1+qt + \frac{q^2t^2}{2!} + \frac{q^3t^3}{3!} + \frac{p^4t^4}{4!} + \dots) \right]^n \\
&= \left[ 1 + pq\frac{t^2}{2!} + pq(q^2 - p^2)\frac{t^3}{3!} + pq(q^3 + p^3)\frac{t^4}{4!} + \dots \right]^n \\
&= 1 + \mu_1 t + \mu_2 \frac{t^2}{2!} + \mu_3 \frac{t^3}{3!} + \mu_4 \frac{t^4}{4!} + \dots \\
&= 1 + npq\frac{t^2}{2!} + npq(q-p)\frac{t^3}{3!} + npq[1 + 3(n-2)pq]\frac{t^4}{4!} + \dots
\end{aligned}$$

Equating the coefficients of like powers of  $t$  on both sides, we get

$$\mu_2 = npq, \quad \mu_3 = npq(q-p), \quad \mu_4 = npq[1 + 3(n-2)pq]$$

Hence the moment coefficient of skewness is

$$\beta_1 = \frac{\mu_3^2}{\mu_2^3} = \frac{[npq(q-p)]^2}{(npq)^3} = \frac{(q-p)^2}{npq} ; \quad \gamma_1 = \sqrt{\beta_1} = \frac{q-p}{\sqrt{npq}}$$

Coefficient of Kurtosis is given by

$$\beta_2 = \frac{\mu_4}{\mu_2^2} = \frac{npq[1+3pq(n-2)]}{(npq)^2} = 3 + \frac{1-6pq}{npq} ; \quad \gamma_2 = \beta_2 - 3 = \frac{1-6pq}{npq}$$

**Example 11.** If the probability of a defective bolt is 0.1, find

(a) the mean (b) the standard deviation for the distribution bolts in a total of 400.

**Solution.**  $n = 400$ ,  $p = 0.1$ , Mean =  $np = 400 \times 0.1 = 40$

$$\begin{aligned} \text{Standard deviation} &= \sqrt{npq} = \sqrt{400 \times 0.1(1-0.1)} \\ &= \sqrt{400 \times 0.1 \times 0.9} = 20 \times 0.3 = 6 \end{aligned} \quad \text{Ans.}$$

**Example 12.** A die is tossed thrice. A success is getting 1 or 6 on a toss. Find the mean and variance of the number of successes. (AMIETE, Dec. 2010)

$$\text{Solution.} \quad n = 3, \quad p = \frac{1}{3}, \quad q = \frac{2}{3}$$

$$\text{Mean} = np = 3 \times \frac{1}{3} = 1$$

$$\text{Variance} = npq = 3 \times \frac{1}{3} \times \frac{2}{3} \times \frac{2}{3} = \frac{2}{9} \quad \text{Ans.}$$

**Example 13.** If mean and variance of a binomial distribution are 4 and 2 respectively, find the probability of (i) exactly 2 successes (ii) less than 2 successes (iii) at least 2 successes. (R.G.P.V., Bhopal, II Semester, June 2005)

$$\text{Solution.} \quad \text{Mean} = 4 \quad \Rightarrow \quad np = 4 \quad \dots (1)$$

$$\text{Variance} = 2 \quad \Rightarrow \quad npq = 2 \quad \dots (2)$$

Dividing (2) by (1), we get

$$\frac{npq}{np} = \frac{2}{4} \quad \Rightarrow \quad q = \frac{1}{2}$$

$$p = 1 - q = 1 - \frac{1}{2} = \frac{1}{2}$$

Putting the value of  $p$  in (1), we get

$$n \left( \frac{1}{2} \right) = 4 \quad \Rightarrow \quad n = 8$$

(i) Probability of  $r$  successes =  ${}^n C_r p^r q^{n-r}$

$$P(2) = {}^8 C_2 \left( \frac{1}{2} \right)^2 \left( \frac{1}{2} \right)^{8-2} = {}^8 C_2 \left( \frac{1}{2} \right)^8 = \frac{8 \times 7}{2} \frac{1}{256} = \frac{7}{64}$$

(ii)  $P(\text{less than 2 successes}) = P(0) + P(1) = {}^8 C_0 p^0 q^8 + {}^8 C_1 p^1 q^7$

$$= \frac{1}{256} + 8 \frac{1}{2} \left( \frac{1}{2} \right)^7 = \frac{9}{256}$$

(iii)  $P(\text{at least 2 successes}) = P(2) + P(3) + \dots + P(8)$

$$= P(0) + P(1) + P(2) + P(3) + \dots + P(8) - P(0) - P(1)$$

$$= 1 - P(0) - P(1) = 1 - [P(0) + P(1)] = 1 - \frac{9}{256} = \frac{247}{256}$$

Ans.

**Example 14.** Fit a Binomial distribution for the following data and compare the theoretical frequencies with actual ones :

$x$	0	1	2	3	4	5
$y$	2	14	20	34	22	8

(R.G.P.V., Bhopal, II Semester, June 2006)

**Solution.**

$x$	$y = f$	$fx$	$P = {}^5C_r p^r q^{5-r}$	Theoretical Frequency
0	2	0	${}^5C_0 (0.568)^0 (0.432)^5 = 0.015$	$100 \times 0.015 = 1.5$
1	14	14	${}^5C_1 (0.568)^1 (0.432)^4 = 0.099$	$100 \times 0.099 = 9.9$
2	20	40	${}^5C_2 (0.568)^2 (0.432)^3 = 0.260$	$100 \times 0.260 = 26.0$
3	34	102	${}^5C_3 (0.568)^3 (0.432)^2 = 0.342$	$100 \times 0.342 = 34.2$
4	22	88	${}^5C_4 (0.568)^4 (0.432)^1 = 0.225$	$100 \times 0.225 = 22.5$
5	8	40	${}^5C_5 (0.568)^5 (0.432)^0 = 0.0591$	$100 \times 0.0591 = 5.91$
	100	284		

$$\sum f = 100, \quad \sum fx = 284$$

$$\text{Mean} = \frac{\sum fx}{\sum f} = \frac{284}{100} = 2.84$$

$$\text{Mean} = np = 2.84$$

$$5p = 2.84 \Rightarrow p = \frac{2.84}{5} = 0.568$$

$$q = 1 - p = 1 - 0.568 = 0.432$$

$$\text{Binomial Distribution} = 100 (0.432 + 0.568)^5$$

**Ans.**

### 63.6 RECURRENCE RELATION FOR THE BINOMIAL DISTRIBUTION

By Binomial distribution,  $P(r) = {}^nC_r p^r q^{n-r}$  ... (1) (A.M.I.E., Summer 2002)

$P(r+1) = {}^nC_{r+1} p^{r+1} q^{n-r-1}$  ... (2)

On dividing (2) by (1), we get

$$\begin{aligned} \frac{P(r+1)}{P(r)} &= \frac{{}^nC_{r+1} p^{r+1} q^{n-r-1}}{{}^nC_r p^r q^{n-r}} \\ &= \frac{n(n-1)(n-2)\dots(n-r)}{(r+1)!} \frac{r!}{n(n-1)(n-2)\dots(n-r+1)} \frac{p}{q} \end{aligned}$$

$$\frac{P(r+1)}{P(r)} = \frac{n-r}{r+1} \frac{p}{q} \text{ or } P(r+1) = \frac{n-r}{r+1} \frac{p}{q} P(r)$$

**Ans.**

### EXERCISE 63.2

1. Fit a binomial distribution to the following frequency data:

$x$	0	1	3	4
$f$	2 8	6 2	10	4

(U.P. III Sem. Dec. 2004)  
**Ans.**  $P(r) = {}^{104}C_r (0.00999)^r (0.99111)^{104-r}$

2. Four coins were tossed 200 times. The number of tosses showing 0, 1, 2, 3 and 4 heads were found to be as under. Fit a binomial distribution to these observed results. Find the expected frequencies.

No. of heads:,	0	1	2	3	4
No. of tosses:	15	35	90	40	20

(A.M.I.E. Winter 2004)

3. Fill in the blanks :

- (a) If three persons selected at random are stopped on a street, then the probability that all of them were

born on Sunday is \_\_\_\_\_.

(A.M.I.E., Winter 2001) Ans.  $\frac{1}{343}$

- (b) The mean, standard deviation and skewness of binomial distribution are \_\_\_\_\_, \_\_\_\_\_ and \_\_\_\_\_.

(A.M.I.E., Summer 2001) Ans.  $n p, \sqrt{n p q}$

4. Tick  $\checkmark$  the correct answer :

- (a) The variance for a Binomial distribution is :

(i)  $n p$       (ii)  $\sqrt{n p}$       (iii)  $n p q$       (iv)  $\sqrt{n p q}$

(R.G.P.V., Bhopal, II Semester, June 2007) Ans. (iii)

- (b) For the Binomial distribution  $(p + q)^n$ , the relation of mean and variance is :

(i) means = variance	(ii) means < variance
(iii) mean > variance	(iv) $(\text{mean})^2 = \text{variance}$

(R.G.P.V., Bhopal, II Semester, June 2006) Ans. (iii)

- (c) In usual notation, for Binomial distribution,  $n p q$ , is

(i)  $< n p$       (ii)  $n p$       (iii)  $> n p$       (iv) None of the above

(A.M.I.E., Winter 2005) Ans. (i)

# CHAPTER

# 64

## POISSON DISTRIBUTION

---

---

### 64.1 POISSON DISTRIBUTION

Poisson distribution is a particular limiting form of the Binomial distribution when  $p$  (or  $q$ ) is very small and  $n$  is large enough.

Poisson distribution is

$$P(r) = \frac{m^r e^{-m}}{r!}$$

where  $m$  is the mean of the distribution.

**Proof.** In Binomial distribution,

$$\begin{aligned} P(r) &= {}^n C_r q^{n-r} p^r = {}^n C_r (1-p)^{n-r} p^r \\ &\quad \left( \text{since mean } m = np, p = \frac{m}{n} \right) \\ &= {}^n C_r \left(1 - \frac{m}{n}\right)^{n-r} \left(\frac{m}{n}\right)^r \quad (m \text{ is constant}) \\ &= \frac{n(n-1)(n-2)\dots(n-r-1)}{r!} \left(\frac{m}{n}\right)^r \left(1 - \frac{m}{n}\right)^{n-r} \\ &= \frac{\frac{n}{n} \left(\frac{n}{n} - \frac{1}{n}\right) \left(\frac{n}{n} - \frac{2}{n}\right) \dots \left(\frac{n}{n} - \frac{r-1}{n}\right) m^r \left(1 - \frac{m}{n}\right)^n}{r! \quad \left(1 - \frac{m}{n}\right)^r} \\ &= \frac{1 \left(1 - \frac{1}{n}\right) \left(1 - \frac{2}{n}\right) \dots \left(1 - \frac{r-1}{n}\right) m^r \left(1 - \frac{m}{n}\right)^n}{r! \quad \left(1 - \frac{m}{n}\right)^r} \end{aligned}$$

Taking limits, when  $n$  tends to infinity

$$\lim_{n \rightarrow \infty} \left(1 - \frac{m}{n}\right)^n = \lim_{n \rightarrow \infty} \left[ \left(1 - \frac{m}{n}\right)^{-\frac{n}{m}} \right]^{-m} = e^{-m} \quad \text{and} \quad \lim_{n \rightarrow \infty} \left(1 - \frac{m}{n}\right)^r = 1$$

$$P(r) = \frac{m^r}{r!} e^{-m}$$

$$P(r) = \frac{e^{-m} \cdot m^r}{r!}$$

## 64.2 MEAN OF POISSON DISTRIBUTION

$$P(r) = \frac{e^{-m} \cdot m^r}{r!}$$

(A.M.I.E.T.E., Summer 2004, 2002)

Successes $r$	Frequency $f$	$f \cdot r$
0	$\frac{e^{-m} m^0}{0!}$	0
1	$\frac{e^{-m} m^1}{1!}$	$e^{-m} \cdot m$
2	$\frac{e^{-m} m^2}{2!}$	$e^{-m} \cdot m^2$
3	$\frac{e^{-m} m^3}{3!}$	$\frac{e^{-m} \cdot m^3}{2!}$
...	...	...
$r$	$\frac{e^{-m} m^r}{r!}$	$\frac{e^{-m} \cdot m^r}{(r-1)!}$
...	...	...

$$\sum f r = 0 + e^{-m} \cdot m + e^{-m} \cdot m^2 + e^{-m} \cdot \frac{m^3}{2!} + \dots + e^{-m} \cdot \frac{m^r}{(r-1)!} + \dots = e^{-m} \cdot m \left[ 1 + \frac{m}{1!} + \frac{m^2}{2!} + \dots + \frac{m^{r-1}}{(r-1)!} + \dots \right]$$

$$= m \cdot e^{-m} \cdot [e^m] = m$$

$$\text{Mean} = \frac{\sum f r}{\sum f} = \frac{m}{1},$$

**Mean =  $m$ .**

**Ans.**

## 64.3 STANDARD DEVIATION OF POISSON DISTRIBUTION

$$P(r) = \frac{e^{-m} m^r}{r!}$$

(A.M.I.E.T.E., Summer 2002)

Successes $r$	Frequency $f$	Product $r f$	Product $r^2 f$
0	$\frac{e^{-m} m^0}{0!}$	0	0
1	$\frac{e^{-m} m^1}{1!}$	$e^{-m} \cdot m$	$e^{-m} \cdot m$
2	$\frac{e^{-m} m^2}{2!}$	$e^{-m} \cdot m^2$	$2e^{-m} \cdot m^2$
3	$\frac{e^{-m} m^3}{3!}$	$\frac{e^{-m} \cdot m^3}{2!}$	$3e^{-m} \cdot \frac{m^3}{2!}$
.....	.....	.....	.....
$r$	$\frac{e^{-m} m^r}{r!}$	$\frac{e^{-m} \cdot m^r}{(r-1)!}$	$\frac{r e^{-m} \cdot m^r}{(r-1)!}$
.....	.....	.....	.....

$$\sum f = 1,$$

$$\sum f r = m$$

$$\sum f r^2 = 0 + e^{-m} \cdot m + 2e^{-m} \cdot m^2 + 3 \cdot e^{-m} \cdot \frac{m^3}{2} + \dots + \frac{r e^{-m} \cdot m^r}{(r-1)!} + \dots$$

$$\begin{aligned}
&= m \cdot e^{-m} \left[ 1 + 2m + \frac{3m^2}{2!} + \frac{4m^3}{3!} + \dots + \frac{r \cdot m^{r-1}}{(r-1)!} + \dots \right] \\
&= m \cdot e^{-m} \left[ 1 + m + \frac{m^2}{2!} + \frac{m^3}{3!} + \dots + \frac{m^{r-1}}{(r-1)!} + \dots + m + 2 \frac{m^2}{2!} + \frac{3m^3}{3!} + \dots + \frac{(r-1)m^{r-1}}{(r-1)!} + \dots \right] \\
&= m \cdot e^{-m} \left[ \left\{ 1 + m + \frac{m^2}{2!} + \frac{m^3}{3!} + \dots + \frac{m^{r-1}}{(r-1)!} + \dots \right\} + m \left\{ 1 + \frac{m}{1!} + \frac{m^2}{2!} + \dots + \frac{m^{r-2}}{(r-2)!} + \dots \right\} \right] \\
&= m \cdot e^{-m} [e^m + m e^m] = m + m^2 \\
\sigma^2 &= \frac{\sum r^2 f_r}{\sum f_r} - \left( \frac{\sum r f_r}{\sum f_r} \right)^2 = \frac{m + m^2}{1} - (m)^2 = m \quad \text{or} \quad \sigma = \sqrt{m}
\end{aligned}$$

$$\text{S. D.} = \sqrt{m}$$

Hence mean and variance of a Poisson distribution are each equal to  $m$ . Similarly we can obtain,

$$\mu_3 = m, \quad \mu_4 = 3m^2 + m$$

$$\beta_1 = \frac{1}{m}, \quad \beta_2 = 3 + \frac{1}{m}$$

$$\gamma_1 = \frac{1}{\sqrt{m}}, \quad \gamma_2 = \frac{1}{m}$$

#### 64.4 MEAN DEVIATION

Show that in a Poisson distribution with unit mean, and the mean deviation about the mean is  $\left(\frac{2}{e}\right)$  times the standard deviation.

**Solution.**  $P(r) = \frac{m^r}{r!} e^{-m}$  But mean = 1 i.e.  $m = 1$  and S.D. =  $\sqrt{m} = 1$

$$\text{Hence, } P(r) = \frac{e^{-m}}{r!} = \frac{e^{-1}}{r!} = \frac{1}{e} \cdot \frac{1}{r!}$$

$r$	$P(r)$	$ r - 1 $	$P(r)  r - 1 $
0	$\frac{1}{e}$	1	$\frac{1}{e}$
1	$\frac{1}{e}$	0	0
2	$\frac{1}{e} \frac{1}{2!}$	1	$\frac{1}{e} \frac{1}{2!}$
3	$\frac{1}{e} \frac{1}{3!}$	2	$\frac{1}{e} \frac{2}{3!}$
4	$\frac{1}{e} \frac{1}{4!}$	3	$\frac{1}{e} \frac{3}{4!}$
.....	.....	.....	.....
$r$	$\frac{1}{e} \frac{1}{r!}$	$r - 1$	$\frac{1}{e} \frac{r-1}{r!}$

$$\begin{aligned}
\sum P(r) |r - 1| &= \frac{1}{e} + 0 + \frac{1}{e} \frac{1}{2!} + \frac{1}{e} \frac{2}{3!} + \frac{1}{e} \frac{3}{4!} + \dots + \frac{1}{e} \frac{r-1}{r!} + \dots = \frac{1}{e} \left[ 1 + 0 + \frac{1}{2!} + \frac{2}{3!} + \frac{3}{4!} + \dots + \frac{r-1}{r!} + \dots \right] \\
&= \frac{1}{e} \left[ 1 + \left( \frac{1}{1!} - \frac{1}{1!} \right) + \left( \frac{2}{2!} - \frac{1}{2!} \right) + \left( \frac{3}{3!} - \frac{1}{3!} \right) + \left( \frac{4}{4!} - \frac{1}{4!} \right) + \dots + \left( \frac{r}{r!} - \frac{1}{r!} \right) + \dots \right]
\end{aligned}$$

$$\begin{aligned}
&= \frac{1}{e} \left[ 1 + \frac{1}{1!} + \frac{2}{2!} + \frac{3}{3!} + \frac{4}{4!} + \dots + \frac{r}{r!} + \dots - \frac{1}{1!} - \frac{1}{2!} - \frac{1}{3!} - \frac{1}{4!} - \dots - \frac{1}{r!} - \dots \right] \\
&= \frac{1}{e} \left[ 1 + \left\{ 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \dots + \frac{1}{(r-1)!} + \dots \right\} - \left\{ 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots + \frac{1}{r!} \dots \right\} + 1 \right] \\
&= \frac{1}{e} [1 + e - e + 1] = \frac{2}{e} = \frac{2}{e} (1) = \frac{2}{e} \text{ S.D.}
\end{aligned}$$

**Proved.****64.5 MOMENT GENERATING FUNCTION OF POISSON DISTRIBUTION**

(A.M.I.E., Summer 2000)

**Solution.**  $P(r) = \frac{e^{-m} m^r}{r!}$

Let  $M_x(t)$  be the moment generating function, then

$$M_x(t) = \sum_{r=0}^{\infty} e^{tr} \frac{e^{-m} \cdot m^r}{r!} = \sum_{r=0}^{\infty} e^{-m} \cdot \frac{(me^t)^r}{r!} = e^{-m} \left[ 1 + me^t + \frac{(me^t)^2}{2!} + \frac{(me^t)^3}{3!} + \dots \right] = e^{-m} \cdot e^{mt} = e^{m(e^t-1)}$$

**64.6 CUMULANTS**The cumulant generating function  $K_x(t)$  is given by

$$\begin{aligned}
K_x(t) &= \log_e M_x(t) = \log_e e^{m(e^t-1)} = m(e^t-1) \log_e e \\
&= m(e^t-1) = m \left[ 1 + t + \frac{t^2}{2!} + \frac{t^3}{3!} + \dots + \frac{t^r}{r!} + \dots - 1 \right] = m \left[ t + \frac{t^2}{2!} + \frac{t^3}{3!} + \dots + \frac{t^r}{r!} + \dots \right]
\end{aligned}$$

Now  $K_r = r$  th cumulant = coefficient of  $\frac{t^r}{r!}$  in  $K(t) = m$ i.e.,  $k_r = m$ , where  $r = 1, 2, 3, \dots$ 

Hence, all the cumulants of the Poisson distribution are equal. In particular, we have

$$\begin{aligned}
\text{Mean} &= K_1 = m, \quad \mu_2 = K_2 = m, \quad \mu_3 = K_3 = m \\
\mu_4 &= K_4 + 3K_2^2 = m + 3m^2 \\
\beta_1 &= \frac{\mu_3^2}{\mu_2^3} = \frac{m^2}{m^3} = \frac{1}{m}, \quad \beta_2 = \frac{\mu_4}{\mu_2^2} = \frac{m+3m^2}{m^2} = \frac{1}{m} + 3
\end{aligned}$$

**64.7 RECURRENCE FORMULA FOR POISSON DISTRIBUTION****Solution.** By Poisson distribution

$$P(r) = \frac{e^{-m} m^r}{r!} \quad \dots (1)$$

$$P(r+1) = \frac{e^{-m} m^{r+1}}{(r+1)!} \quad \dots (2)$$

By dividing (2) by (1), we get

$$\frac{P(r+1)}{P(r)} = \frac{e^{-m} m^{r+1}}{(r+1)!} \frac{r!}{e^{-m} m^r} = \frac{m}{r+1}$$

$$P(r+1) = \frac{m}{r+1} P(r)$$

**Ans.****Example 1.** If the variance of the Poisson distribution is 2, find the probabilities for  $r = 1, 2, 3, 4$  from the recurrence relation of the Poisson distribution. Also find  $P(r \geq 4)$ .**Solution.** Variance =  $m = 2$ ;  
Mean = 2

$$P(r+1) = \frac{m}{r+1} P(r) \quad [\text{Recurrence relation}]$$

Now  $P(r+1) = \frac{2}{r+1} P(r)$   $(m = 2)$

If  $r = 0, P(1) = \frac{2}{0+1} P(0) = \frac{2}{0+1} (0.1353) = 0.2706$   $P(0) = e^{-m} = e^{-2} = 0.1353$

If  $r = 1, P(2) = \frac{2}{1+1} P(1) = \frac{2}{2} (0.2706) = 0.2706$

If  $r = 2, P(3) = \frac{2}{2+1} P(2) = \frac{2}{3} (0.2706) = 0.1804$

If  $r = 3, P(4) = \frac{2}{3+1} P(3) = \frac{1}{2} (0.1804) = 0.0902$   
 $P(r \geq 4) = P(4) + P(5) + P(6) + \dots$   
 $= 1 - [P(0) + P(1) + P(2) + P(3)]$   
 $= 1 - [0.1353 + 0.2706 + 0.2706 + 0.1804]$   
 $= 1 - 0.8569 = 0.1431$  Ans.

**Example 2.** Assume that the probability of an individual coal miner being killed in a mine

accident during a year is  $\frac{1}{2400}$ . Use appropriate statistical distribution to calculate the probability that in a mine employing 200 miners, there will be at least one fatal accident in a year. (A.M.I.E.T.E., Summer 2001)

**Solution.**  $P = \frac{1}{2400}, n = 200$   
 $m = np = \frac{200}{2400} = \frac{1}{12}$   
 $P(\text{At least one}) = P(1 \text{ or } 2 \text{ or } 3 \text{ or } \dots \text{ or } 200) = P(1) + P(2) + P(3) + \dots + P(200)$   
 $= 1 - P(0) = 1 - \frac{e^{-m} \cdot m^0}{0!} = 1 - e^{-\frac{1}{12}} = 1 - 0.92 = 0.08$  Ans.

**Example 3.** Suppose 3% of bolts made by a machine are defective, the defects occurring at random during production. If bolts are packaged 50 per box, find  
(a) exact probability and  
(b) Poisson approximation to it, that a given box will contain 5 defectives.

**Solution.**  $p = \frac{3}{100} = 0.03$   
(a)  $q = 1 - p = 1 - 0.03 = 0.97$   
Hence the probability for 5 defective bolts in a lot of 50  
 $= {}^{50}C_5 (0.03)^5 (0.97)^{45} = 0.013074$  (Binomial Distribution)

(b) To get Poisson approximation  $m = np = 50 \times \frac{3}{100} = \frac{3}{2} = 1.5$

Required Poisson approximation  $= \frac{m^r e^{-m}}{r!} = \frac{(1.5)^5 e^{-1.5}}{5!} = 0.01412$  Ans.

**Example 4.** The number of arrivals of customers during any day follows Poisson distribution with a mean of 5. What is the probability that the total number of customers on two days selected at random is less than 2?

**Solution.**  $m = 5$

$$P(r) = \frac{e^{-m} m^r}{r!}, P(r) = \frac{e^{-5} (5)^r}{r!}$$

If the number of customers on two days  $< 2 = 1$  or 0

First day	Second Day	Total
0	0	0
0	1	1
1	0	1

$$\begin{aligned}
 \text{Required probability} &= P(0)P(0) + P(0)P(1) + P(1)P(0) \\
 &= \frac{e^{-5}(5)^0}{0!} \cdot \frac{e^{-5}(5)^0}{0!} + \frac{e^{-5}(5)^0}{0!} \cdot \frac{e^{-5}(5)^1}{1!} + \frac{e^{-5}(5)^1}{1!} \cdot \frac{e^{-5}(5)^0}{0!} \\
 &= e^{-5} \cdot e^{-5} + e^{-5} \cdot e^{-5} \cdot 5 + e^{-5} \cdot 5 \cdot e^{-5} \\
 &= e^{-10} [1 + 5 + 5] = 11e^{-10} = 11 \times 4.54 \times 10^{-5} \\
 &= 4.994 \times 10^{-4}
 \end{aligned}$$

Ans.

**Example 5.** In a certain factory producing cycle tyres, there is a small chance of 1 in 500 tyres to be defective. The tyres are supplied in lots of 10. Using Poisson distribution, calculate the approximate number of lots containing no defective, one defective and two defective tyres, respectively, in a consignment of 10,000 lots.

**Solution.**  $p = \frac{1}{500}, n = 10$

$$m = np = 10 \cdot \frac{1}{500} = \frac{1}{50} = 0.02, \quad P(r) = \frac{e^{-m} \cdot m^r}{r!}$$

S.No.	Probability of defective	Number of lots containing defective
1	$P(0) = \frac{e^{-0.02}(0.02)^0}{0!} = e^{-0.02} = 0.9802$	$10,000 \times 0.9802 = 9802$ lots
2	$P(1) = \frac{e^{-0.02}(0.02)^1}{1!}$	$10,000 \times 0.019604 = 196$ lots
3.	$= 0.9802 \times 0.02 = 0.019604$ $P(2) = \frac{e^{-0.02}(0.02)^2}{2!}$	$10,000 \times 0.000196 = 2$ lots $= 0.9802 \times 0.0002 = 0.00019604$

Ans.

**Example 6.** A car hire firm has two cars which it hires out day by day. The number of demands for a car on each day is distributed as a Poisson distribution with mean 1.5. Calculate the number of days in a year on which

- (i) neither car is on demand  $(e^{-1.5} = 0.2231)$
- (ii) a car demand is refused.

(MDU, Dec. 2010, A.M.I.E., Summer 2004 Winter 2001, June 2009)

**Solution.**  $m = 1.5$

(i) If the car is not used, then demand ( $r = 0$ )

$$P(r) = \frac{e^{-m} \cdot m^r}{r!}, \quad P(0) = \frac{e^{-1.5}(1.5)^0}{0!} = e^{-1.5} = 0.2231$$

Number of days in a year when the demand is zero  $= 365 \times 0.2231 = 81.4315$  Ans. 81 days

(ii) Some demand is refused if the number of demands is more than two i.e.  $r > 2$ .

$$P(r > 2) = P(3) + P(4) + \dots = 1 - [P(0) + P(1) + P(2)]$$

$$= 1 - \left[ \frac{e^{-1.5}(1.5)^0}{0!} + \frac{e^{-1.5}(1.5)^1}{1!} + \frac{e^{-1.5}(1.5)^2}{2!} \right]$$

$$\begin{aligned}
 &= 1 - [e^{-1.5} + e^{-1.5} \times 1.5 + e^{-1.5} \times 1.125] = 1 - e^{-1.5} [1 + 1.5 + 1.125] = 1 - e^{-1.5} \times 3.625 \\
 &= 1 - 0.2231 \times 3.625 = 1 - 0.8087375 = 0.1912625 \quad \text{Ans.}
 \end{aligned}$$

Number of days in a year when some demand of car is refused

$$= 365 \times 0.1912625 = 69.81 = 70 \text{ days} \quad \text{Ans.}$$

**Example 7.** If the probability that an individual suffers a bad reaction from a certain injection is 0.001, determine the probability that out of 2000 individuals

- (a) exactly 3 (b) more than 2 individuals (c) None (d) More than one individual will suffer a bad reaction. *(A.M.I.E.T.E., Winter, 2002, 2000)*

**Solution.**  $p = 0.001, n = 2000$

$$m = np = 2000 \times 0.001 = 2$$

$$\therefore P(r) = \frac{e^{-m} m^r}{r!} = e^{-2} \frac{2^r}{r!} = \frac{1}{e^2} \times \frac{2^r}{r!}$$

$$(a) P(\text{more than } 3) = \frac{1}{e^2} \cdot \frac{2^3}{3!} = \frac{1}{(2.718)^2} \times \frac{8}{6} = (0.135) \times \frac{4}{3} = 0.18$$

$$\begin{aligned}
 (b) P(\text{more than } 2) &= P(3) + P(4) + P(5) + \dots + P(2000) \\
 &= 1 - [P(0) + P(1) + P(2)] = 1 - \left[ \frac{e^{-2}(2)^0}{0!} + \frac{e^{-2}(2)^1}{1!} + \frac{e^{-2}(2)^2}{2!} \right]
 \end{aligned}$$

$$= 1 - e^{-2}[1+2+2] = 1 - \frac{5}{e^2} = 1 - 5 \times 0.135 = 1 - 0.675 = 0.325 \quad \text{Ans.}$$

$$(c) P(\text{none}) = P(0) = \frac{e^{-2}(2)^0}{0!} = 0.135$$

$$(d) P(\text{more than } 1) = P(2) + P(3) + P(4) + \dots + P(2000) = 1 - [P(0) + P(1)]$$

$$= 1 - \left[ \frac{e^{-2}(2)^0}{0!} + \frac{e^{-2}(2)^1}{1!} \right] = 1 - 3e^{-2} = 1 - 3 \times 0.135 = 1 - 0.405 = 0.595 \quad \text{Ans.}$$

**Example 8.** In a certain factory turning out razor blades, there is a small chance of 0.002 for any blade to be defective. The blades are supplied in packets of 10. Use appropriate and suitable distribution to calculate the approximate number of packets containing no defective, one defective and two defective blades respectively in a consignment of 50000 packets. *(R.G.P.V., Bhopal, II Semester, June 2006)*

**Solution.** Here,  $p = 0.002, n = 10$   
 $m = np \Rightarrow m = 10 \times 0.002 = 0.020$

$$P(r) = \frac{e^{-m} \cdot (m)^r}{r!}$$

$r$	$P(r) = \frac{e^{-0.02} (0.02)^r}{r!}$	Number of packets = 50000 $p$
0	$P(0) = \frac{e^{-0.02} (0.02)^0}{0!} = 0.980$	$50000 \times (0.980) = 4900$
1	$P(1) = \frac{e^{-0.02} (0.02)^1}{1!} = 0.0196$	$50000 \times (0.0196) = 980$
2	$P(2) = \frac{e^{-0.02} (0.02)^2}{2!} = 0.000196$	$50000 \times (0.000196) = 9.8$

Hence, number of packets containing no defective razor blades = 49000.

Number of packets containing one defective razor blade = 980

Number of packets containing two defective razor blade = 9.8

**Example 9.** If there are 3 misprints in a book of 1000 pages find the probability that a given page will contain

(i) no misprint    (ii) more than 2 misprints. (U.P., III Semester, Dec. 2009)

**Solution.** Total number of pages = 1000

No. of misprints = 3

$$P = \frac{3}{1000} = 0.003, \quad n = 1, \quad m = np = 1 \times 0.003 = 0.003$$

Poisson distribution

$$P(r) = \frac{e^{-m} \cdot m^r}{r!}, \quad P(0) = \frac{e^{-0.003} (0.003)^0}{0!} = e^{-0.003} = 0.997$$

$$P(r > 2) = P(3) = \frac{e^{-0.003} (0.003)^3}{3!} = 0.0000000045$$

Hence (i) the probability that a page will contain no error = 0.997

(ii) the probability that a page will contain more than two misprints = 0.0000000045 **Ans.**

**Example 10.** A manufacturer knows that the condensers he makes contain on an average 1% of defectives. He packs them in boxes of 100. What is the probability that a box picked out at random will contain 4 or more faulty condensers?

**Solution.**  $P = 1\% = 0.01, n = 100, m = np = 100 \times 0.01 = 1$

$$P(r) = \frac{e^{-m} \cdot (m)^r}{r!} = \frac{e^{-1} (1)^r}{r!} = \frac{e^{-1}}{r!}$$

$$P(\text{4 or more faulty condensers}) = P(4) + P(5) + \dots + P(100) = 1 - [P(0) + P(1) + P(2) + P(3)] \\ = 1 - \left[ \frac{e^{-1}}{0!} + \frac{e^{-1}}{1!} + \frac{e^{-1}}{2!} + \frac{e^{-1}}{3!} \right] = 1 - e^{-1} \left[ 1 + 1 + \frac{1}{2} + \frac{1}{6} \right] = 1 - \frac{8}{3e} = 1 - 0.981 = 0.019 \quad \text{Ans.}$$

**Example 11.** An insurance company found that only 0.01% of the population is involved in a certain type of accident each year. If its 1000 policy holders were randomly selected from the population, what is the probability that not more than two of its clients are involved in such an accident next year? (given that  $e^{-0.1} = 0.9048$ )

**Solution.**  $P = 0.01\% = \frac{1}{100} \times \frac{1}{100} = \frac{1}{10000}, \quad n = 1000$

$$m = np = (1000) \times \frac{1}{10000} = \frac{1}{10} = 0.1$$

$$P(r) = \frac{e^{-m} m^r}{r!}$$

$$P(\text{not more than 2}) = P(0, 1 \text{ and } 2) = P(0) + P(1) + P(2) \\ = \frac{e^{-0.1} (0.1)^0}{0!} + \frac{e^{-0.1} (0.1)^1}{1!} + \frac{e^{-0.1} (0.1)^2}{2!} = e^{-0.1} \left( 1 + 0.1 + \frac{0.01}{2} \right) \\ = 0.9048 \times 1.105 = 0.9998 \quad \text{Ans.}$$

**Example 12.** Fit a Poisson distribution to the set of observations :

x	0	1	2	3	4
f	122	60	15	2	1

(R.G.P.V., Bhopal, II Semester, Dec. 2007, June 2007)

**Solution.** The mean number =  $\frac{\sum f \cdot x}{\sum f}$ .

x	f	fx
0	122	0
1	60	60
2	15	30
3	2	6
4	1	4
Total	200	100

$$\text{Mean} = \frac{\sum f x}{\sum f} = \frac{100}{200} = \frac{1}{2}$$

x	$P(x) = \frac{e^{-1/2}(1/2)^x}{x!}$	Theoretical frequency	Given frequency
0	$P(0) = \frac{e^{-\frac{1}{2}} \left(\frac{1}{2}\right)^0}{0!} = 0.6065$	$0.6065 \times 200 = 121.3$	121
1	$P(1) = \frac{e^{-\frac{1}{2}} \left(\frac{1}{2}\right)^1}{1!} = \frac{0.6065}{2} = 0.3033$	$0.3033 \times 200 = 60.7$	61
2	$P(2) = \frac{e^{-\frac{1}{2}} \left(\frac{1}{2}\right)^2}{2!} = \frac{0.6065}{8} = 0.0758$	$0.0758 \times 200 = 15.2$	15
3	$P(3) = \frac{e^{-\frac{1}{2}} \left(\frac{1}{2}\right)^3}{3!} = \frac{0.6065}{48} = 0.0126$	$0.0126 \times 200 = 2.5$	2
4	$P(4) = \frac{e^{-\frac{1}{2}} \left(\frac{1}{2}\right)^4}{4!} = \frac{0.6065}{384} = 0.0016$	$0.0016 \times 200 = 0.32$	1

**Ans.**

### EXERCISE 64.1

- Find the probability that at most 5 defective fuses will be found in a box of 200 fuses if experience shows that 2 per cent of such fuses are defective. **Ans.** 0.785
- The number of accidents during a year in a factory has the Poisson distribution with mean 1.5. The accidents during different years are assumed independent. Find the probability that only 2 accidents take place during 2 years time. **Ans.** 0.224
- A manufacturer of cotter pins knows that 5% of his product is defective. If he sells cotter pins in boxes of 100 and guarantee that not more than 10 pins will be defective, what is the approximate probability that a box will fail to meet the guaranteed quality. [ $e^{-5} = 0.006738$ ] **Ans.** 0.0136875
- Suppose the number of telephone calls on an operator received from 9.00 to 9.05 follow a Poisson distribution with mean 3. Find the probability that
  - the operator will receive no calls in that time interval tomorrow,
  - in the next three days the operator will receive a total of 1 call in that time interval.
 [ $e^{-3} = 0.04978$ ] **Ans.** (i)  $e^{-3}$  (ii)  $3 \times (e^{-3})^2 (e^{-3} \cdot 3)$
- On the basis of past record it has been found that there is 70% chance of power cut in a city on any particular day. What is the probability that from the first to the 10th date of the month, there are 5 or more days without power cut. **(A.M.I.E.T.E., Summer 2001)**

$$\text{Ans.} \left[ \frac{3^5}{5!} + \frac{3^6}{6!} + \frac{3^7}{7!} + \frac{3^8}{8!} + \frac{3^9}{9!} + \frac{3^{10}}{10!} \right] e^{-3}$$

6. The distribution of typing mistakes committed by a typist is given below. Assuming a Poisson model, find out the expected frequencies:

Mistakes per pages	0	1	2	3	4	5
No. of pages	142	156	69	27	5	1

Ans. 147, 147, 74, 25, 6, 1 pages.

7. Let  $x$  be the number of cars per minute passing a certain crossing of roads between 5.00 P.M. and 7.00 P.M. on a holiday. Assume  $x$  has a Poisson distribution with mean 4. Find the probability of observing atmost 3 cars during any given minute between 5.00 P.M. and 7 P.M. (given  $e^{-4} = 0.0183$ ) Ans. 0.4331
8. Number of customers arriving at a service counter during a day has a Poisson distribution with mean 100. Find the probability that at least one customer will arrive on each day during a period of five days. Also find the probability that exactly 3 customers will arrive during two days.

$$\text{Ans. } (1 - e^{-100})^5, e^{-200} \times \frac{4(100)^3}{3}$$

9. In a normal summer, a truck driver gets on an average one puncture in 1000 km. Applying Poisson distribution, find the probability that he will have  
 (i) no puncture, (ii) two punctures in a journey of 3000 kms. Ans. (i)  $e^{-3}$  (ii)  $4.5 e^{-3}$
10. Wireless sets are manufactured with 25 soldered joints each. On the average, 1 joint in 500 is defective. How many sets can be expected to be free from defective joints in a consignment of 10000 sets ?

$$\text{Ans. } 9512$$

11. In a certain factory turning out razor blades, there is small chance  $\frac{1}{500}$  for any blade to be defective. The blades are supplied in packets of 10. Using Poisson's distribution, calculate the approximate number of packets containing (i) no defective (ii) one defective and (iii) two defective blades respectively in a
12. If  $m$  and  $\mu_r$  denote by the mean and central  $r$ th moment of a Poisson distribution, then prove that

$$\mu_{r+1} = rm\mu_{r-1} + m \frac{d\mu_r}{dm}. \quad \text{Hint. } \mu_r = \sum_{x=0}^{\infty} (x-m)^r \frac{e^{-m} m^x}{x!}, \text{ find } \frac{d\mu_r}{dm}$$

13. A certain screw-making machine produces an average 2 defective screws out of 100, and pack them in boxes of 500. Find the probability that a box contains 15 defective screws.  
 (A.M.I.E., Winter 2005) Ans. 0.0347

14. The distribution of the number of road accidents per day in a city is Poisson with mean 4. Find the number of days out of 100 days when there will be:  
 (i) no accident (ii) at least 2 accidents (iii) at most 3 accidents (iv) between 2 and 5 accidents  
 Ans. (i) 2 days (ii) 91 days (iii) 43 days (iv) 39 days

15. Fill in the blanks.

- (a) If  $x$  has a Poisson distribution such that  $P(x=k) = P(x=k+1)$  for some positive integer  $k$  then mean of  $x$  is ..... Ans.  $k+1$

16. Choose the correct answer:

- (a) In the Poisson distribution if  $P(x=k) = P(x=k+1)$ , then the mean is :  
 (i)  $k$  (ii)  $2k$  (iii)  $k+1$  (iv)  $k-1$  (R.G.P.V. Bhopal, II Semester, June 2007) Ans. (iii)

- (b) The value of measure of skewness of Poisson distribution is :

- (i)  $m$  (ii)  $\sqrt{m}$  (iii)  $\frac{1}{m}$  (iv)  $\frac{1}{\sqrt{m}}$  (R.G.P.V. Bhopal, II Semester, June 2006) Ans. (iii)

- (g) Poisson distribution with unit mean, mean-deviation about the mean is :

- (i)  $\frac{1}{e}$  (ii)  $\frac{\sigma}{e}$  (iii)  $\frac{2\sigma}{e}$  (iv)  $\frac{2}{e}$  (R.G.P.V. Bhopal, II Semester, Feb 2006) Ans. (iv)

- (h) In the Poisson distribution if  $2P(x=1) = P(x=2)$ , then the variance is :

- (i) 0 (ii) -1 (iii) 4 (iv) 2 (R.G.P.V. Bhopal, II Semester, June 2007) Ans. (iii)

- (i) In the Poisson distribution if  $2p(x=1) = p(x=2)$   
 Then mean is

- (i) 0 (ii) -1 (iii) 4 (iv) 2 (R.G.P.V. Bhopal, II Semester, June 2007) Ans. (iii)

# 65

## NORMAL DISTRIBUTION

---

---

### 65.1 CONTINUOUS DISTRIBUTION

So far we have dealt with discrete distributions where the variate takes only the integral values. But the variates like temperature, heights and weights can take all values in a given interval. Such variables are called continuous variables.

$$\begin{aligned} \text{Let } f(x) \text{ be a continuous function, then Mean} &= \int_{-\infty}^{+\infty} x \cdot f(x) dx \\ \text{Variance} &= \int_{-\infty}^{+\infty} (x - \bar{x})^2 \cdot f(x) dx \quad (\bar{x} = \text{mean}) \end{aligned}$$

**Note.**  $f(x)$  is called probability density function if

$$\begin{aligned} (1) \quad f(x) &\geq 0 \text{ for every value of } x. & (2) \quad \int_{-\infty}^{+\infty} f(x) dx &= 1 \\ (3) \quad \int_a^b f(x) dx &= P, & (a < x < b) \end{aligned}$$

**Example 1.** The probability density function  $f(x)$  of a continuous random variable  $x$  is defined by

$$f(x) = \begin{cases} \frac{A}{x^3}, & 5 \leq x \leq 10 \\ 0, & \text{otherwise} \end{cases} \quad \text{Find the value of } A.$$

**Solution.** Here,  $f(x) = \frac{A}{x^3}$ ,  $5 \leq x \leq 10$

Since  $f(x)$  is probability density function, so

$$\begin{aligned} \int_5^{10} \frac{A}{x^3} dx &= 1 \quad \Rightarrow \quad \left[ -\frac{A}{2x^2} \right]_5^{10} = 1 \\ \frac{A}{2} \left[ -\frac{1}{100} + \frac{1}{25} \right] &= 1 \\ \frac{A}{2} \left( \frac{3}{100} \right) &= 1 \quad \Rightarrow \quad A = \frac{200}{3} \quad \text{Ans.} \end{aligned}$$

**Example 2.** A function  $f(x)$  is defined as follows

$$f(x) = \begin{cases} 0, & x < 2 \\ \frac{1}{18}(2x+3), & 2 \leq x \leq 4 \\ 0, & x > 4 \end{cases}$$

Show that it is a probability density function.

**Solution.**

$$f(x) = \begin{cases} 0, & x < 2 \\ \frac{1}{18}(2x+3), & 2 \leq x \leq 4 \\ 0, & x > 4 \end{cases}$$

*If  $f(x)$  is a probability density function, then*

(i)  $\int_{-\infty}^{\infty} f(x) dx = 1$

Here  $\int_2^4 \frac{1}{18}(2x+3) dx = \frac{1}{18} [x^2 + 3x]_2^4 = \frac{1}{18} (16 + 12 - 4 - 6) = 1$

(ii)  $f(x) > 0$  for  $2 \leq x \leq 4$

Hence, the given function is a probability density function.

**Proved.****Example 3.** The diameter of an electric cable is assumed to be continuous random variate with probability density function:

$f(x) = 6x(1-x), 0 \leq x \leq 1$

(i) verify that above is a p.d.f. (ii) find the mean and variance.

$$\text{Solution. (i)} \quad \int_{-\infty}^{\infty} f(x) dx = \int_0^1 6x(1-x) dx = \int_0^1 (6x - 6x^2) dx \\ = (3x^2 - 2x^3)_0^1 = 3 - 2 = 1$$

Secondly  $f(x) > 0$  for  $0 \leq x \leq 1$ .

Hence the given function is a probability density function.

$$\text{(ii) Mean} = \int_{-\infty}^{\infty} x.f(x) dx = \int_0^1 x.6x(1-x) dx \\ = \int_0^1 (6x^2 - 6x^3) dx = \left( 2x^3 - \frac{3}{2}x^4 \right)_0^1 = 2 - \frac{3}{2} = \frac{1}{2} \quad \text{Ans.}$$

$$\text{Variance} = \int_{-\infty}^{\infty} (x - \bar{x})^2 . f(x) dx = \int_0^1 \left( x - \frac{1}{2} \right)^2 . 6x(1-x) dx \\ = \int_0^1 \left( x^2 - x + \frac{1}{4} \right) (6x - 6x^2) dx = \int_0^1 \left( 12x^3 - 6x^4 - \frac{15}{2}x^2 + \frac{3}{2}x \right) dx \\ = \left( 3x^4 - \frac{6}{5}x^5 - \frac{5}{2}x^3 + \frac{3}{4}x^2 \right)_0^1 = \left( 3 - \frac{6}{5} - \frac{5}{2} + \frac{3}{4} \right) = \frac{1}{20} \quad \text{Ans.}$$

**Example 4.** A continuous random variable has p.d.f.

$f(x) = k e^{-\frac{x}{5}}, x \geq 0,$

 $= 0, \text{ else where}$ then the value of  $k$  is.....

(A.M.I.E., Winter 2002)

**Solution.**  $\int_{-\infty}^{\infty} p.d.f(x) dx = 1$

$\Rightarrow \int_{-\infty}^0 p.d.f(x) dx + \int_0^{\infty} p.d.f(x) dx = 1$

$0 + \int_0^{\infty} k e^{-\frac{x}{5}} dx = 1, \Rightarrow k \left[ \frac{e^{-\frac{x}{5}}}{-\frac{1}{5}} \right]_0^{\infty} = 1 \Rightarrow -5k \left[ \frac{1}{e^{\infty}} - 1 \right] = 1 \Rightarrow 5k = 1 \Rightarrow k = \frac{1}{5}$

**Ans.**

**Example 5.** If the probability density function of a random variable  $x$  is

$$f(x) = \begin{cases} kx^{\alpha-1}(1-x)^{\beta-1}, & \text{for } 0 < x < 1, \alpha > 0, \beta > 0 \\ 0, & \text{otherwise} \end{cases}$$

Find  $k$  and mean of  $x$ .

**Solution.** If  $f(x)$  is a probability density function,

Then  $\int_{-\infty}^{\infty} x \cdot f(x) dx = 1$

Here  $\int_0^1 k x^{\alpha-1}(1-x)^{\beta-1} dx = 1$  [ $f(x)$  is a Beta function.]

$$\Rightarrow k \frac{\sqrt{\alpha} \sqrt{\beta}}{\sqrt{\alpha+\beta}} = 1 \Rightarrow k = \frac{\sqrt{\alpha+\beta}}{\sqrt{\alpha} \sqrt{\beta}}$$

$$\begin{aligned} \text{Mean} &= \int_{-\infty}^{\infty} x \cdot f(x) dx = \int_0^1 x \cdot k x^{\alpha-1}(1-x)^{\beta-1} dx \\ &= k \int_0^1 x^{\alpha+1-1}(1-x)^{\beta-1} dx \end{aligned} \quad \dots (1)$$

[ $f(x)$  is Beta function]

Putting the value of  $k$  and the integral in (1), we get

$$\text{Mean} = \frac{\sqrt{\alpha+\beta}}{\sqrt{\alpha} \sqrt{\beta}} \cdot \frac{\sqrt{\alpha+1} \sqrt{\beta}}{\sqrt{\alpha+\beta+1}} = \frac{\sqrt{\alpha+\beta}}{\sqrt{\alpha} \sqrt{\beta}} \cdot \frac{\alpha \sqrt{\alpha} \sqrt{\beta}}{(\alpha+\beta) \sqrt{\alpha+\beta}} = \frac{\alpha}{\alpha+\beta} \quad \text{Ans.}$$

### EXERCISE 65.1

1. The probability density  $p(x)$  of a continuous random variable is given by

$$p(x) = y_0 e^{-|x|}, -\infty < x < \infty$$

Prove that  $y_0 = 1/2$ . Find mean and variance of the distribution. **Ans. 0.2**

2. If  $f(x) = \begin{cases} \frac{1}{2}(x+1), & -1 < x < 1 \\ 0, & \text{elsewhere} \end{cases}$  **Ans. } \frac{1}{3}, \frac{2}{9}**

Find the mean and variance.

3.  $X$  is a random variable giving time (in minutes) during which a certain electrical equipment is used at maximum load in a specified time period. If the pdf is given by

$$f(x) = \begin{cases} \frac{x}{(1500)^2}, & 0 \leq x \leq 1500 \\ -\frac{(x-3000)}{(1500)^2}, & 1500 \leq x \leq 3000 \\ 0, & \text{elsewhere,} \end{cases}$$

represents the density of a variable  $x$ , find  $E(x)$  and  $Var(x)$

find the expected value of  $X$ . **Ans. 1500, 375000**

4. A function is defined as under :

$$f(x) = \frac{1}{k}, \quad x_1 \leq x \leq x_2 = 0, \quad \text{elsewhere.}$$

Find the cumulative distribution of the variate  $x$  when  $k$  satisfies the requirements for  $f(x)$  to be a density function.

$$\text{Ans. } f(x) = 0, \quad x < x_1; \quad (x - x_1) / (x_2 - x_1), \quad x_1 \leq x \leq x_2; \quad 1; \quad x \geq x_2.$$

5. A continuous distribution of a variable  $x$  in the range  $(-3, 3)$  is defined as

$$\begin{cases} f(x) = \frac{1}{16} (3+x)^2, & -3 \leq x < -1 \\ & \\ & = \frac{1}{16} (6-2x^2), & -1 \leq x < 1 \\ & \\ & = \frac{1}{16} (3-x)^2, & 1 \leq x \leq 3. \end{cases}$$

Verify that the area under the curve is unity. Show that the mean is zero.

### 65.2 MOMENT GENERATING FUNCTION OF THE CONTINUOUS PROBABILITY DISTRIBUTION ABOUT $x = a$ is given by

$$M_a(t) = \int_{-\infty}^{\infty} e^{t(x-a)} f(x) dx \quad \text{where } f(x) \text{ is p.d.f.}$$

**Example 6.** Find the moment generating function of the exponential distribution

$$f(x) = \frac{1}{c} e^{-x/c} \quad 0 \leq x \leq \infty, c > 0$$

Hence find its mean and S.D.

**Solution.** The moment generating function about origin is

$$\begin{aligned} M_0(t) &= \int_0^{\infty} e^{tx} \frac{1}{c} e^{-x/c} dx = \frac{1}{c} \int_0^{\infty} e^{(t-1/c)x} dx = \frac{1}{c} \left[ \frac{e^{(t-1/c)x}}{t-1/c} \right]_0^{\infty} = \frac{1}{c} \left[ -\frac{1}{t-1/c} \right] = \frac{1}{1-ct} = (1-ct)^{-1} \\ &= 1 + ct + c^2 t^2 + c^3 t^3 + c^4 t^4 + \dots \\ \mu'_1 &= \frac{d}{dt} [M_0(t)]_{t=0} = [c + 2c^2 t + 3c^3 t^2 + 4c^4 t^3 + \dots]_{t=0} = c \\ \mu'_2 &= \frac{d^2}{dt^2} [M_0(t)]_{t=0} = [2c^2 + 6c^3 t + 12c^4 t^2 + \dots]_{t=0} = 2c^2 \\ \mu_2 &= \mu'_2 - (\mu'_1)^2 = 2c^2 - c^2 = c^2 \\ \text{S.D.} &= c \end{aligned}$$

Hence, Mean =  $c$ , S.D. =  $c$

Ans.

### 65.3 NORMAL DISTRIBUTION

(A. M. I. E., Summer 2002)

Normal distribution is a continuous distribution. It is derived as the limiting form of the Binomial distribution for large values of  $n$  and  $p$  and  $q$  are not very small.

The normal distribution is given by the equation

$$f(x) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}} \quad \dots(1)$$

where  $\mu$  = mean,  $\sigma$  = standard deviation,  $\pi = 3.14159 \dots$ ,  $e = 2.71828 \dots$

$$P(x_1 < x < x_2) = \int_{x_1}^{x_2} \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}} dx$$

$$\text{On substitution } z = \frac{x-\mu}{\sigma} \text{ in (1), we get } f(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}} \quad \dots(2)$$

Here mean = 0, standard deviation = 1.

(2) is known as standard form of normal distribution.

**Theorem.** To derive normal distribution as a limiting case of Binomial distribution where  $p \neq q$  but  $p \approx q$ . (U.P. III Semester, Dec. 2006; R.G.P.V., Dec. 2001)

**Statement.** The limiting case of binomial distribution  $(p+q)^n$ , as  $n \rightarrow \infty$  and neither  $p$  nor  $q$  are very small, generates the normal distribution.

**Proof.** The frequency for  $r$  and  $(r+1)$  successes in binomial distribution are

$$f(r) = N \cdot {}^n C_r p^r q^{n-r} \text{ and } f(r+1) = N \cdot {}^n C_{r+1} p^{r+1} q^{n-(r+1)}$$

The frequency of  $r$  successes > frequency of  $(r+1)$  successes if

$$\begin{aligned} f(r) > f(r+1) &\Rightarrow \frac{f(r)}{f(r+1)} > 1 \\ \Rightarrow \frac{N \cdot {}^n C_r p^r q^{n-r}}{N \cdot {}^n C_{r+1} p^{r+1} q^{n-r-1}} &> 1 \Rightarrow \frac{\frac{n!}{r!(n-r)!} \cdot p^r \cdot q^{n-r}}{\frac{n!}{(r+1)!(n-r-1)!} p^{r+1} q^{n-r-1}} > 1 \\ \Rightarrow \frac{n! p^r \cdot q^{n-r} (r+1)! (n-r-1)!}{r!(n-r)! \cdot n! p^{r+1} \cdot q^{n-r-1}} &> 1 \Rightarrow \frac{q \cdot (r+1)}{(n-r) p} > 1 \Rightarrow q r + q > n p - p r \\ \Rightarrow \frac{q}{r} &> np - r(p+q) \\ \Rightarrow \frac{r}{np-q} &> 1 \end{aligned} \quad \dots (1)$$

Again, similarly the frequency of  $r$  successes > the frequency of  $(r-1)$  successes if

$$\begin{aligned} f(r) > f(r-1) &\Rightarrow \frac{f(r)}{f(r-1)} > 1 \\ \Rightarrow \frac{N \cdot {}^n C_r p^r q^{n-r}}{N \cdot {}^n C_{r-1} p^{r-1} q^{n-(r-1)}} &> 1 \Rightarrow \frac{\frac{n!}{r!(n-r)!} \cdot p^r \cdot q^{n-r}}{\frac{n!}{(r-1)!(n-r+1)!} p^{r-1} q^{n-r+1}} > 1 \\ \Rightarrow \frac{n! p^r q^{n-r} (r-1)! (n-r+1)!}{r!(n-r)! n! p^{r-1} q^{n-r+1}} &> 1 \Rightarrow \frac{p(n-r+1)}{r q} > 1 \\ \Rightarrow p n - p r + p &> r q \Rightarrow p n + p > p r + qr \\ \Rightarrow p n + p &> r(p+q) \Rightarrow p n + p > r \end{aligned} \quad \dots (2)$$

$$[\because p+q=1]$$

From (1) and (2), we have

$$\begin{aligned} p n + p &> r > n p - q \\ p n + p + q &> r > n p \\ n p + 1 &> r > n p \end{aligned}$$

Since a possible value of  $r$  is  $np$ , therefore, without loss of generality we can assume that  $np$  is an integer as  $n \rightarrow \infty$ . Hence the frequency of  $np$  successes can be assumed to be maximum frequency. Let  $y_0$  be the frequency of  $np$  successes and  $y_x$  be the frequency of  $(np+x)$  successes.

Then

$$y_0 = f(np) = N \cdot {}^n C_{np} p^{np} q^{n-np} \quad [\text{From (1), for } r = np]$$

$$= N \frac{n!}{(np)!(n-np)!} p^{np} q^{n-np} = N \frac{n!}{(np)!(nq)!} p^{np} q^{nq} \dots (3) \quad [\because q=1-p]$$

$$\text{and } y_x = N \cdot \frac{n!}{(np+x)!(nq-x)!} p^{np+x} q^{nq-x} \quad \dots (4)$$

$$\text{Dividing (4) by (3), we get } \frac{y_x}{y_0} = \frac{(np)!(nq)!}{(np+x)!(nq-x)!} p^x q^{-x} \quad \dots (5)$$

In  $n$  be large, then according to James Stirling, we have

$$n! = e^{-n} h^{n+\frac{1}{2}} \sqrt{(2\pi)}$$

$$\begin{aligned}
 \text{From (5)} \quad \frac{y_x}{y_0} &= \frac{e^{-np}(np)^{np+1/2} \sqrt{2\pi} e^{-nq}(nq)^{nq+1/2} \sqrt{2\pi} p^x q^{-x}}{e^{-(np+x)}(np+x)^{np+x+1/2} \sqrt{2\pi} e^{-(nq-x)}(nq-x)^{nq-x+1/2} \sqrt{2\pi}} \\
 &= \frac{(np)^{np+1/2} (nq)^{nq+1/2} (nq/nq)^x}{(np)^{np+x+1/2} \left\{1 + \frac{x}{np}\right\}^{np+x+1/2} (np)^{nq-x+1/2} \left\{1 - \frac{x}{nq}\right\}^{nq-x+1/2}} \\
 &= \frac{1}{\left\{1 + \frac{x}{np}\right\}^{np+x+1/2} \left\{1 - \frac{x}{nq}\right\}^{nq-x+1/2}} \\
 \therefore \quad \log \frac{y_x}{y_0} &= -\left(np + x + \frac{1}{2}\right) \log \left(1 + \frac{x}{np}\right) - \left(nq - x + \frac{1}{2}\right) \log \left(1 - \frac{x}{nq}\right) \\
 &= -\left(np + x + \frac{1}{2}\right) \left(\frac{x}{nq} - \frac{x^2}{2n^2 p^2} + \frac{x^3}{3p^3 q^3} - \dots\right) + \left(nq - x + \frac{1}{2}\right) \left(\frac{x}{nq} + \frac{x^2}{2n^2 q^2} + \frac{x^3}{3n^3 q^3} + \dots\right) \\
 &= x \left(1 - \frac{1}{2np} + 1 + \frac{1}{2np}\right) + x^2 \left(\frac{1}{2np} - \frac{1}{np} + \frac{1}{4n^2 p^2} + \frac{1}{2nq} - \frac{1}{nq} + \frac{1}{4n^2 q^2}\right) \\
 &\quad + x^3 \left(\frac{1}{3n^2 q^2} + \frac{1}{6n^3 q^3} - \frac{1}{2n^2 q^2} - \frac{1}{2n^2 p^2} - \frac{1}{3n^2 q^2} + \frac{1}{6n^3 p^3}\right) - \dots \\
 &= \frac{p-q}{2npq} x + \frac{p^2+q^2}{4n^2 p^2 q^2} x^2 - \frac{x^2}{2npq} + \dots + \text{terms of higher orders.}
 \end{aligned}$$

Neglecting terms containing  $1/n^2$ , we have

$$\therefore \log \frac{y_x}{y_0} = -\frac{q-p}{2npq} x - \frac{x^2}{2npq}$$

Since  $p < 1$ ,  $q < 1$  and so  $q-p$  is very small as compared with  $n$ . Therefore 1<sup>st</sup> term may be neglected.  $(q-p=0)$

$$\begin{aligned}
 \therefore \quad \log \frac{y_x}{y_0} &= -\frac{x^2}{2npq} = -\frac{x^2}{2\sigma^2} \quad [\because \sigma^2 = npq, \text{ the variance of Binomial distribution}] \\
 \Rightarrow \quad y_x &= y_0 e^{-x^2/2\sigma^2}
 \end{aligned}$$

#### 65.4 NORMAL CURVE

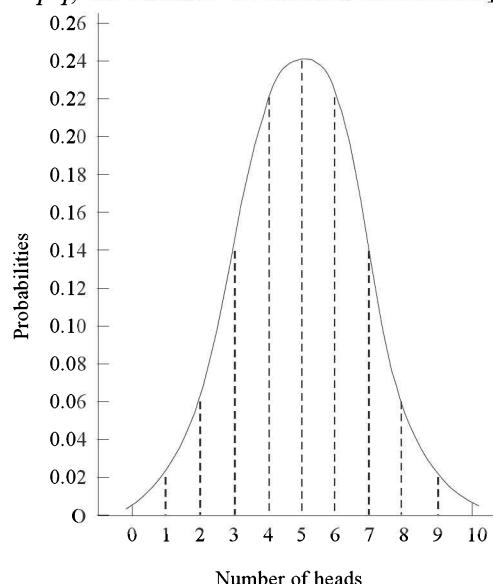

Let us show binomial distribution graphically.

The probabilities of heads in 10 tosses are

$$\begin{aligned}
 {}^{10}C_0 q^{10} p^0, {}^{10}C_1 q^9 p^1, {}^{10}C_2 q^8 p^2, \\
 {}^{10}C_3 q^7 p^3, {}^{10}C_4 q^6 p^4, {}^{10}C_5 q^5 p^5, \\
 {}^{10}C_6 q^4 p^6, {}^{10}C_7 q^3 p^7, {}^{10}C_8 q^2 p^8, \\
 {}^{10}C_9 q^1 p^9, {}^{10}C_{10} q^0 p^{10}.
 \end{aligned}$$

$p = \frac{1}{2}$ ,  $q = \frac{1}{2}$ . It is shown in the figure given.

If the variates (heads here) are treated as if they were continuous, the required probability curve will be a *normal curve* as shown in the above figure by dotted lines.

**Properties of the normal curve.**  $y = y_0 e^{-\frac{x^2}{2\sigma^2}}$

1. The curve is symmetrical about the y-axis. The mean, median and mode coincide at the origin.
2. The curve is drawn, if mean (origin of  $x$ ) and standard deviation are given. The value of  $y_0$  can be calculated from the fact that the area of the curve must be equal to the total number of observations.
3.  $y$  decreases rapidly as  $x$  increases numerically. The curve extends to infinity on either side of the origin.
4. (a)  $P(\mu - \sigma < x < \mu + \sigma) = 68\%$   
 (b)  $P(\mu - 2\sigma < x < \mu + 2\sigma) = 95.5\%$   
 (c)  $P(\mu - 3\sigma < x < \mu + 3\sigma) = 99.7\%$

Hence (a) About  $\frac{2}{3}$  of the values will lie between  $(\mu - \sigma)$  and  $\mu + \sigma$

- (b) About 95% of the values will lie between  $(\mu - 2\sigma)$  and  $(\mu + 2\sigma)$ .
- (c) About 99.7% of the values will lie between  $(\mu - 3\sigma)$  and  $(\mu + 3\sigma)$ .

### 65.5 MEAN FOR NORMAL DISTRIBUTION

$$\begin{aligned} \text{Mean} &= \int_{-\infty}^{+\infty} \frac{1}{\sigma \sqrt{(2\pi)}} e^{-\frac{x^2}{2\sigma^2}} \cdot x dx = \frac{1}{\sigma \sqrt{(2\pi)}} \int_{-\infty}^{+\infty} e^{-\frac{t^2}{2}} (t\sigma)(\sigma dt) \quad \left[ \text{putting } \frac{x}{\sigma} = t \right] \\ &= \frac{\sigma}{\sqrt{(2\pi)}} \int_{-\infty}^{+\infty} t e^{-\frac{t^2}{2}} dt = \frac{\sigma}{\sqrt{2\pi}} \left[ e^{-\frac{t^2}{2}} \right]_{-\infty}^{+\infty} = \frac{\sigma}{\sqrt{(2\pi)}} [0] = 0 \end{aligned}$$

### 65.6 STANDARD DEVIATION FOR NORMAL DISTRIBUTION

$$\begin{aligned} \mu'_2 &= \int x^2 \cdot f(x) dx \quad \text{or} \quad \mu'_2 = \int_{-\infty}^{+\infty} x^2 \cdot \frac{1}{\sigma \sqrt{(2\pi)}} e^{-\frac{x^2}{2\sigma^2}} dx \\ \text{Put} \quad \frac{x^2}{2\sigma^2} &= t \quad \Rightarrow \quad x = \sqrt{2\sigma} t^{1/2}, \quad \Rightarrow \quad dx = \frac{\sqrt{2}\sigma}{2t^{1/2}} dt \\ \mu'_2 &= \int_{-\infty}^{+\infty} (2\sigma^2 t) \frac{1}{\sigma \sqrt{(2\pi)}} e^{-\frac{2\sigma^2 t}{2\sigma^2}} \cdot \frac{\sqrt{2}\sigma}{2t^{1/2}} dt = \int_{-\infty}^{+\infty} (2\sigma^2 t) \frac{1}{\sigma \sqrt{(2\pi)}} e^{-t} \left( \frac{\sqrt{2}\sigma}{2t^{1/2}} \right) dt \\ &= \frac{2\sigma^2}{\sigma \sqrt{(2\pi)}} \frac{\sqrt{2}\sigma}{2} \int_{-\infty}^{+\infty} t^{\frac{3}{2}-1} e^{-t} dt, \quad = \frac{\sigma^2}{\sqrt{\pi}} \cdot 2 \int_0^{+\infty} t^{\frac{3}{2}-1} e^{-t} dt \quad \left[ \int_0^{+\infty} x^{n-1} e^{-x} dx = \lceil n \rceil \right] \\ &= \frac{\sigma^2}{\sqrt{\pi}} \cdot 2 \sqrt{\frac{3}{2}} \quad = 2 \frac{\sigma^2}{\sqrt{\pi}} \cdot \frac{1}{2} \sqrt{\frac{1}{2}} \quad = \frac{\sigma^2}{\sqrt{\pi}} \sqrt{\pi} = \sigma^2 \\ \mu_2 &= \mu'_2 - (\mu'_1)^2 = \sigma^2 - (0)^2 = \sigma^2 \\ S.D. &= \sigma \end{aligned}$$

Ans.

### 65.7 MEDIAN OF THE NORMAL DISTRIBUTION

If  $a$  is the median, then it divides the total area into two equal halves so that

$$\int_{-\infty}^a f(x) dx = \frac{1}{2} = \int_a^{\infty} f(x) dx$$

where  $f(x) = \frac{1}{\sigma \sqrt{(2\pi)}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$

Suppose Median  $a >$  mean,  $\mu$       then

$$\int_{-\infty}^{\mu} f(x) dx + \int_{\mu}^a f(x) dx = \frac{1}{2}$$

$$\left[ \text{But } \int_{-\infty}^{\mu} f(x) dx = \frac{1}{2} \right]$$

$$\frac{1}{2} + \int_{\mu}^a f(x) dx = \frac{1}{2}$$

( $\mu = \text{mean}$ )

$$\int_{\mu}^a f(x) dx = 0$$

Thus  $a = \mu$

Similarly, when  $a <$  mean, we have  $a = \mu$ .

Thus, median = mean =  $\mu$ .

### 65.8 MEAN DEVIATION ABOUT THE MEAN $\mu$

(U.P. III Semester, Dec. 2009)

Mean deviation =  $E |x - \mu|$

$$= \int_{-\infty}^{\infty} |x - \mu| \frac{1}{\sigma \sqrt{(2\pi)}} e^{-\frac{(x-\mu)^2}{2\sigma^2}} dx$$

$$= \Rightarrow d z = \frac{1}{\sqrt{2}} t^{-\frac{1}{2}} d t \quad \text{where } z = \frac{x-\mu}{\sigma} \quad \Rightarrow \quad d z = \frac{d x}{\sigma}$$

$$= \sigma \frac{1}{\sqrt{(2\pi)}} \left[ \int_{-\infty}^0 -z e^{-\frac{z^2}{2}} dz + \int_0^{\infty} z e^{-\frac{z^2}{2}} dz \right]$$

$$= \frac{2\sigma}{\sqrt{(2\pi)}} \int_0^{\infty} z e^{-\frac{z^2}{2}} dz = \sigma \sqrt{\frac{2}{\pi}} \left[ -e^{-\frac{z^2}{2}} \right]_0^{\infty} \quad (\text{as the function is even})$$

$$= \sigma \sqrt{\frac{2}{\pi}} [-0+1] = \sigma \sqrt{\frac{2}{\pi}} = \frac{4}{5}\sigma \text{ approximately.}$$

### 65.9 MODE OF THE NORMAL DISTRIBUTION

We know that mode is the value of the variate  $x$  for which  $f(x)$  is maximum. Thus, by differential calculus  $f(x)$  is maximum if  $f'(x) = 0$  and  $f''(x) < 0$

$$\text{where } f(x) = \frac{1}{\sigma \sqrt{(2\pi)}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

Clearly  $f(x)$  will be maximum when the exponent will be maximum which will be the case

$$\frac{(x-\mu)}{2\sigma^2} = 0 \quad \Rightarrow \quad (x-\mu)^2 = 0 \quad \Rightarrow \quad x = \mu$$

Thus mode is  $\mu$ , and modal ordinate =  $\frac{1}{\sigma \sqrt{(2\pi)}}$

### 65.10 MOMENT OF NORMAL DISTRIBUTION

$$\mu_{2n+1} = \int_{-\infty}^{\infty} (x-\mu)^{2n+1} f(x) dx = \frac{1}{\sigma \sqrt{(2\pi)}} \int_{-\infty}^{\infty} (x-\mu)^{2n+1} e^{-\frac{(x-\mu)^2}{2\sigma^2}} dx$$

$$= \frac{1}{\sqrt{(2\pi)}} \int_{-\infty}^{\infty} (\sigma z)^{2n+1} e^{-\frac{z^2}{2}} dz \quad \left[ z = \frac{x-\mu}{\sigma} \right]$$

$$\begin{aligned}
 &= \frac{\sigma^{2n+1}}{\sqrt{(2\pi)}} \int_{-\infty}^{\infty} z^{2n+1} e^{-\frac{z^2}{2}} dz = 0 \quad (\text{since } z^{2n+1} e^{-\frac{z^2}{2}} \text{ is an odd function}) \\
 \mu_{2n} &= \int_{-\infty}^{\infty} (x - \mu)^{2n} f(x) dx = \frac{1}{\sqrt{(2\pi)}} \int_{-\infty}^{\infty} (\sigma z)^{2n} e^{-\frac{z^2}{2}} dz = \frac{\sigma^{2n}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} z^{2n} e^{-\frac{z^2}{2}} dz \\
 &= \frac{2\sigma^{2n}}{\sqrt{(2\pi)}} \int_0^{\infty} z^{2n} e^{-\frac{z^2}{2}} dz = \frac{2\sigma^{2n}}{\sqrt{(2\pi)}} \int_0^{\infty} (2t)^n e^{-t} \frac{1}{\sqrt{2}} t^{-\frac{1}{2}} dt \\
 &= \frac{2^n \sigma^{2n}}{\sqrt{\pi}} \int_0^{\infty} t^{\left(n + \frac{1}{2} - 1\right)} e^{-t} dt = \frac{2^n \sigma^{2n}}{\sqrt{\pi}} \int_0^{\infty} e^{-t} t^{\left(\frac{n-1}{2}\right)} dt \quad \left[ \frac{z^2}{2} = t \Rightarrow dz = \frac{1}{\sqrt{2}} t^{-\frac{1}{2}} dt \right] \\
 &= \frac{2^n \sigma^{2n}}{\sqrt{\pi}} \sqrt{n + \frac{1}{2}}
 \end{aligned}$$

Changing  $n$  to  $(n-1)$ , we get

$$\mu_{2n-2} = \frac{2^{n-1} \sigma^{2n-2}}{\sqrt{\pi}} \sqrt{n - \frac{1}{2}}$$

On dividing, we get

$$\begin{aligned}
 \frac{\mu_{2n}}{\mu_{2n-2}} &= 2\sigma^2 \frac{\sqrt{n + \frac{1}{2}}}{\sqrt{n - \frac{1}{2}}} = \frac{2\sigma^2 \left(n - \frac{1}{2}\right) \sqrt{n - \frac{1}{2}}}{\sqrt{n - \frac{1}{2}}} = 2\sigma^2 \left(n - \frac{1}{2}\right) \\
 \mu_{2n} &= \sigma^2 (2n - 1) \mu_{2n-2}
 \end{aligned}$$

which gives the recurrence relation for the moments of normal distribution

$$\begin{aligned}
 \mu_{2n} &= [(2n - 1)\sigma^2] [(2n - 3)\sigma^2] \mu_{2n-4} \\
 &= [(2n - 1)\sigma^2] [(2n - 3)\sigma^2] [(2n - 5)\sigma^2] \mu_{2n-6} \\
 &= [(2n - 1)\sigma^2] [(2n - 3)\sigma^2] [(2n - 5)\sigma^2] \dots (3\sigma^2) (1 \cdot \sigma^2) \mu_0 \\
 &= (2n - 1)(2n - 3)(2n - 5) \dots 1 \cdot \sigma^{2n} \quad (\mu_0 = 1) \\
 &= 1, 3, 5, 7, \dots, (2n - 5)(2n - 3)(2n - 1)\sigma^{2n}
 \end{aligned}$$

### 65.11 MOMENT GENERATING FUNCTION OF NORMAL DISTRIBUTION

Normal distribution function is given by

$$f(x) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}, \quad -\infty < x < \infty$$

Moment generating function about the origin =  $M_0(t)$

$$= \int_{-\infty}^{\infty} e^{ix} \sigma \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2} \left(\frac{x-\mu}{\sigma}\right)^2} dx \quad \dots(1)$$

On putting  $\frac{x-\mu}{\sigma} = z$  so that  $dx = \sigma dz$  in (1), we get

$$\begin{aligned}
 M_0(t) &= \frac{1}{\sigma \sqrt{2\pi}} \int_{-\infty}^{\infty} e^{t(\sigma z + \mu)} e^{-\frac{z^2}{2}} \sigma dz = \frac{\sigma e^{\mu t}}{\sigma \sqrt{2\pi}} \int_{-\infty}^{\infty} e^{t\sigma z} e^{-\frac{z^2}{2}} dz = \frac{e^{\mu t}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{1}{2}(z^2 - 2t\sigma z)} dz \\
 &= \frac{e^{\mu t}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{1}{2}[z^2 - 2t\sigma z + t^2\sigma^2] + \frac{1}{2}t^2\sigma^2} dz = \frac{e^{\mu t + \frac{1}{2}t^2\sigma^2}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{1}{2}(z-t\sigma)^2} dz \quad \dots(2)
 \end{aligned}$$

On putting  $\frac{1}{2} (z-t\sigma)^2 = y^2$  in (2) so that  $(z-t\sigma) dz = 2y dy$

$$i.e. \quad \Rightarrow \quad \sqrt{2} y dz = 2y dy$$

$$\Rightarrow dz = \sqrt{2} dy \quad M_0(t) = \frac{e^{\frac{\mu t + \frac{1}{2}t^2\sigma^2}{2}}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-y^2} \sqrt{2} dy = \frac{e^{\frac{\mu t + \frac{1}{2}t^2\sigma^2}{2}}}{\sqrt{\pi}} \int_{-\infty}^{\infty} e^{-y^2} dy$$

$$= e^{\frac{\mu t + \frac{1}{2}t^2\sigma^2}{2}} \frac{1}{\sqrt{\pi}} (\sqrt{\pi}) = e^{\frac{\mu t + \frac{1}{2}t^2\sigma^2}{2}} \quad \left[ \because \int_{-\infty}^{\infty} e^{-y^2} dy = \sqrt{\pi} \right]$$

## 65.12 AREA UNDER THE NORMAL CURVE

By taking  $z = \frac{x - \bar{x}}{\sigma}$ , the standard normal curve is formed.

The total area under this curve is 1. The area under the curve is divided into two equal parts by  $z = 0$ . Left hand side area and right hand side area to  $z = 0$  is 0.5. The area between the ordinate  $z = 0$  and any other ordinate can be noted from the table.

**Example 7.** On a final examination in mathematics, the mean was 72, and the standard deviation was 15. Determine the standard scores of students receiving grades.

## Solution.

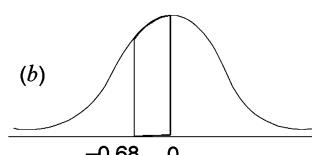

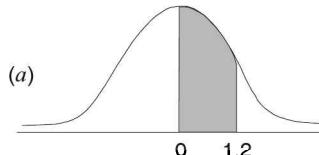

$$(a) z = \frac{x - \bar{x}}{\sigma} = \frac{60 - 72}{15} = -0.8 \quad (b) z = \frac{93 - 72}{15} = +1.4 \quad (c) z = \frac{72 - 72}{15} = 0 \quad \text{Ans.}$$

**Example 8.** Find the area under the normal curve in each of the cases

- (a)  $z = 0$  and  $z = 1.2$ ;      (b)  $z = -0.68$  and  $z = 0$ ;  
 (c)  $z = -0.46$  and  $z = 2.21$ ;      (d)  $z = 0.81$  and  $z = 1.94$ ;  
 (e) To the left of  $z = 0.6$ ;      (f) Right of  $z = -1.28$ .

### Solution.

- $$(a) \text{Area between } z = 0 \text{ and } z = 1.2 = .3849 \quad (b) \text{Area between } z = 0 \text{ and } z = -0.68 = 0.2518$$

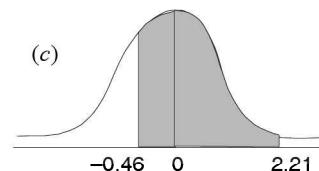

(c) Required area = (Area between  $z = 0$  and  $z = 2.21$ )

+ (Area between  $z = 0$  and  $z = -0.46$ )

$\equiv$  (Area between  $z \equiv 0$  and  $z \equiv 2.21$ )

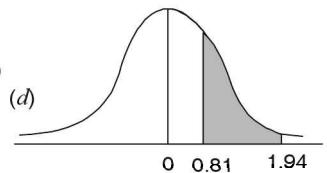

$\pm$  (Area between  $z = 0$  and  $z = 0.46$ )

$$= 0.4865 + 0.1772 = 0.6637$$

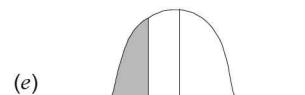

(d) Required area = (Area between  $z = 0$  and

$$\begin{aligned} z &= 1.94) - (\text{Area between } z = 0 \text{ and } z = 0.81) \\ &= 0.4738 - 0.2910 = 0.1828 \end{aligned}$$

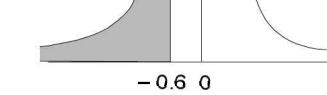

(e) Required area =  $0.5 - (\text{Area between } z = 0 \text{ and } z = 0.6)$

$$= 0.5 - 0.2257 = 0.2743$$

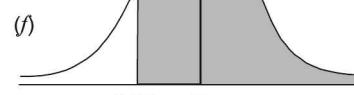

(f) Required area = (Area between  $z = 0$  and  $z = -1.28$ ) + 0.5

$$\begin{aligned} &= 0.3997 + 0.5 \\ &= 0.8997. \end{aligned}$$

**Example 9.** Find the value of  $z$  in each of the cases

(a) Area between 0 and  $z$  is 0.3770

(b) Area to the left of  $z$  is 0.8621

**Solution.**

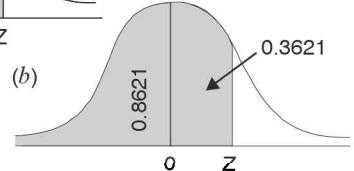

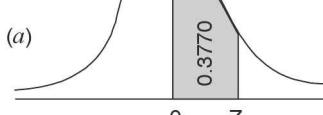

(a)  $z = \pm 1.16$

(b) Since the area is greater than 0.5.

Area between 0 and  $z$ .

$$= 0.8621 - 0.5 = 0.3621$$

from which  $z = 1.09$  **Ans.**

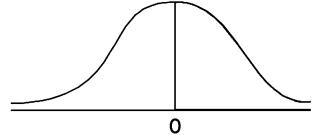

**Example 10.** Students of a class were given an aptitude test. Their marks were found to be normally distributed with mean 60 and standard deviation 5. What percentage of students scored more than 60 marks?

**Solution.**

$$x = 60, \bar{x} = 60, \sigma = 5$$

$$z = \frac{x - \bar{x}}{\sigma} = \frac{60 - 60}{5} = 0$$

if  $x > 60$  then  $z > 0$

Area lying to the right of  $z = 0$  is 0.5.

The percentage of students getting more than 60 marks = 50 %

**Ans.**

**Example 11.** Assume mean height of soldiers to be 68.22 inches with a variance of 10.8 inches square. How many soldiers in a regiment of 1,000 would you expect to be over 6 feet tall, given that the area under the standard normal curve between  $x = 0$  and  $x = 0.35$  is 0.1368 and between  $x = 0$  and  $x = 1.15$  is 0.3746.

(U.P. III Semester Dec. 2001)

**Solution.**

$$\text{Mean} = \bar{x} = 68.22 \text{ inches}$$

$$\text{variance} = \sigma^2 = 10.8 \text{ inches squares}$$

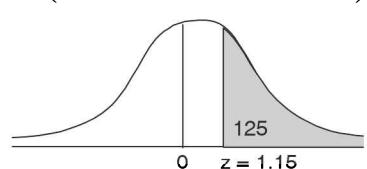

If  $x = 72$  inches then

$$z = \frac{x - \mu}{\sigma} = \frac{72 - 68.22}{\sqrt{10.8}} = 1.15$$

$$P(x > 72) = P(z > 1.15)$$

$$= 0.5 - P(0 \leq z \leq 1.15) = 0.5 - 0.3746 = 0.1254$$

$$\text{Number of soldiers} = 1000 \times 0.1254 = 125.4 \approx 125 \text{ (app.)}$$

**Ans.**

$$z = \frac{x - \mu}{\sigma} \Rightarrow z = \frac{x - 64.5}{3.3} \quad \dots (1)$$

Area between 0 and  $z = 0.99 - 0.5 = 0.49$

From the table,  $z$  for area 0.49 is 2.327.

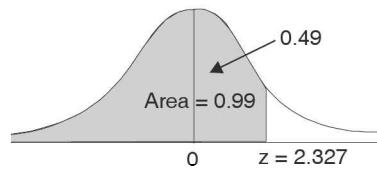

Putting the value of  $z$  in (1), we get

$$\Rightarrow \frac{x - 64.5}{3.3} = 2.327 \Rightarrow x - 64.5 = 3.3 \times 2.327 \\ x - 64.5 = 7.68$$

$$\Rightarrow x = 7.68 + 64.5 = 72.18 \text{ inches}$$

Hence 99% students are of height less than 72.18 inches.

**Ans.**

**Example 12.** A sample of 100 dry battery cells tested to find the length of life produced the following results:

$$\bar{x} = 12 \text{ hours}, \quad \sigma = 3 \text{ hours}$$

Assuming the data to be normally distributed, what percentage of battery cells are expected to have life

(i) more than 15 hours

(ii) less than 6 hours

(iii) between 10 and 14 hours ?

(U.P. III Semester Dec. 2003)

**Solution.** Here, Mean =  $\bar{x} = 12$  hours

and Standard deviation =  $\sigma = 3$  hours

$x$  denotes the length of life of dry battery cells.

$$z = \frac{x - \bar{x}}{\sigma}$$

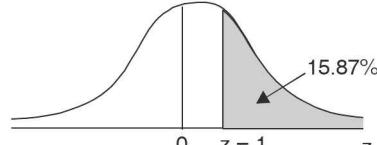

$$(i) \text{ When } x = 15, \text{ then } z = \frac{15 - 12}{3} = 1$$

$$\therefore P(x > 15) = P(z > 1)$$

$$= P(0 < z < \infty) - P(0 < z < 1)$$

$$= 0.5 - 0.3413 = 0.1587 = 15.87\%$$

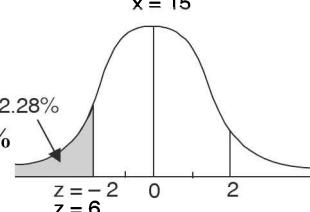

$$(ii) \text{ When } x = 6, \text{ then } z = \frac{6 - 12}{3} = \frac{-6}{3} = -2$$

$$P(x < 6) = P(z < -2)$$

$$= P(z > 2) = 0.5 - P(0 < z < 2)$$

$$= 0.5 - 0.4772 = 0.0228 = 2.28\%$$

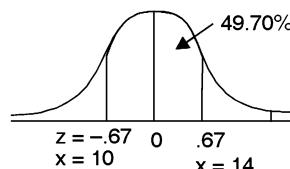

$$(iii) \text{ When } x = 10, \text{ then } z = \frac{10 - 12}{3} = \frac{-2}{3} = -0.67$$

$$\text{When } x = 14, \text{ then } z = \frac{14 - 12}{3} = \frac{2}{3} = 0.67$$

$$P(10 < x < 14) = P(-0.67 < z < 0.67)$$

$$= 2P(0 < z < 0.67) = 2 \times 0.2485 = 0.4970 = 49.70\% \quad \text{Ans.}$$

**Example 13.** The mean yield per plot of a crop is 17 kg and standard deviation is 3 kg. If distribution of yield per plot is normal, find the percentage of plots giving yields:

(i) Between 15.5 kg and 20 kg ; and

(ii) More than 20 kg.

[U.P. (MBA) 2005)]

**Solution.**

Mean =  $\mu = 17$  kg

S.D. =  $\sigma = 3$  kg

Standard Normal variable  $z = \frac{x - \mu}{\sigma}$

$$(i) \text{ When } x_1 = 15.5, z_1 = \frac{x_1 - \mu}{\sigma} = \frac{15.5 - 17}{3} = -0.5$$

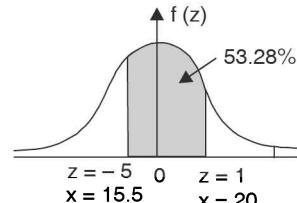

$$\text{When } x_2 = 20, z_2 = \frac{x_2 - \mu}{\sigma} = \frac{20 - 17}{3} = 1$$

$$\therefore P(15.5 < x < 20) = P(-0.5 < z < 1) \\ = P(0 < z < 0.5) + P(0 < z < 1) = 0.1915 + 0.3413 = 0.5328$$

$\therefore$  Required percentage of plots = 53.28%

$$(ii) \text{ When } x = 20, z = \frac{20 - 17}{3} = 1$$

$$P(x > 20) = P(z > 1) \\ = 0.5 - P(0 < z < 1) = 0.5 - 0.3413 \\ = 0.1587$$

Ans.

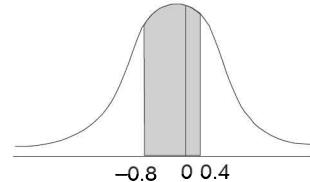

**Example 14.** In a sample of 1000 cases, the mean of a certain test is 14 and standard deviation is 2.5. Assuming the distribution to be normal, find

- (i) how many students score between 12 and 15?
- (ii) how many score above 18? (iii) how many score below 8?
- (iv) how many score 16?

**Solution.**  $n = 1000, \bar{x} = 14, \sigma = 2.5$

$$(i) z_1 = \frac{x - \bar{x}}{\sigma} = \frac{12 - 14}{2.5} = -0.8$$

$$z_2 = \frac{15 - 14}{2.5} = \frac{1}{2.5} = 0.4$$

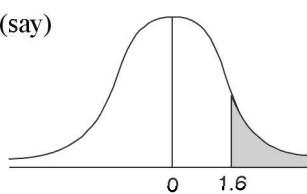

The area lying between  $-0.8$  to  $0.4$  = Area from  $0$  to  $-0.8$  + area from  $0$  to  $0.4$   
 $= 0.2881 + 0.1554 = 0.4435$

The required number of students =  $1000 \times 0.4435 = 443.5 = 444$  (say)

$$(ii) z_1 = \frac{18 - 14}{2.5} = \frac{4}{2.5} = 1.6$$

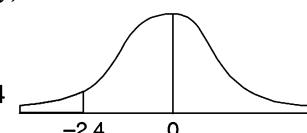

Area right to 1.6 =  $0.5 - \text{Area between } 0 \text{ and } 1.6$   
 $= 0.5 - 0.4452 = 0.0548$

The required number of students  
 $= 1000 \times 0.0548 = 54.8 = 55$  (say)

$$(iii) z = \frac{8 - 14}{2.5} = -\frac{6}{2.5} = -2.4$$

Area left to  $-2.4$  =  $0.5 - \text{area between } 0 \text{ and } -2.4$   
 $= 0.5 - 0.4918 = 0.0082$

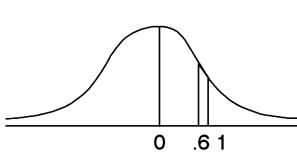

The required number of students =  $1000 \times 0.0082 = 8.2 = 8$  (say)

(iv) Area between 15.5 and 16.5

$$z_1 = \frac{15.5 - 14}{2.5} = 0.6$$

$$z_2 = \frac{16.5 - 14}{2.5} = 1$$

Area between 0.6 and 1 =  $0.3413 - 0.2257 = 0.1156$

The required number of students =  $0.1156 \times 1000 = 115.6 = 116$  say

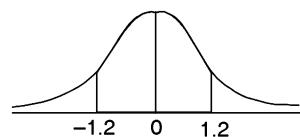

Ans.

**Example 15.** The mean inside diameter of a sample of 200 washers produced by a machine is 0.502 cm and the standard deviation is 0.005 cm. The purpose for which these washers are intended allows a maximum tolerance in the diameter of 0.496 to 0.508 cm, otherwise the washers are considered defective. Determine the percentage of defective washers produced by the machine, assuming the diameters are normally distributed  
(A.M.I.E., Summer 2001)

**Solution.**

$$z_1 = \frac{x - \bar{x}}{\sigma} = \frac{0.496 - 0.502}{0.005} = -1.2$$

$$z_2 = \frac{x - \bar{x}}{\sigma} = \frac{0.508 - 0.502}{0.005} = +1.2$$

Area for non-defective washers = Area between  $z = -1.2$  and  $z = +1.2$

$$= 2 \text{ Area between } z = 0 \text{ and } z = 1.2 \\ = 2 \times (0.3849) = 0.7698 = 76.98\%$$

Percentage of defective washers =  $100 - 76.98\% \\ = 23.02\%$

**Ans.**

**Example 16.** A manufacturer of envelopes knows that the weight of the envelopes is normally distributed with mean 1.9 gm and variance 0.01 gm. Find how many envelopes weighing (i) 2 gm or more, (ii) 2.1 gm or more, can be expected in a given packet of 1000 envelopes.

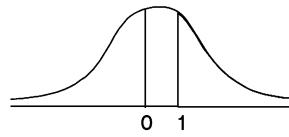

[Given : if  $t$  is the normal variable, then  $\phi(0 \leq t \leq 1) = 0.3413$  and  $\phi(0 \leq t \leq 2) = 0.4772$ ]

**Solution.**  $\mu = 1.9$  gm, Variance = 0.01 gm  $\Rightarrow \sigma = 0.1$

(i)  $x = 2$  gms or more

$$z = \frac{x - \mu}{\sigma} = \frac{2 - 1.9}{0.1} = \frac{0.1}{0.1} = 1$$

$$P(z > 1) = \text{Area right to } z = 1 \\ = 0.5 - 0.3413 = 0.1587$$

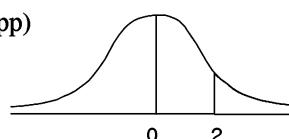

Number of envelopes heavier than 2 gm in a lot of 1000

$$= 1000 \times 0.1587 = 158.7 = 159 \text{ (app)}$$

(ii)  $z = \frac{2.1 - 1.9}{0.1} = \frac{0.2}{0.1} = 2$

$$P(z > 2) = \text{Area right to } z = 2 \\ = 0.5 - 0.4772 = 0.0228$$

Number of envelopes heavier than 2.1 gm in a lot of 1000

$$= 1000 \times 0.0228 = 22.8 = 23 \text{ (app)} \quad \text{Ans. (i) } 159 \text{ (ii) } 23$$

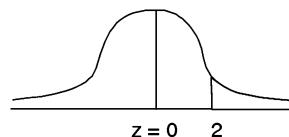

**Example 17.** The life of army shoes is 'normally' distributed with mean 8 months and standard deviation 2 months. If 5000 pairs are issued how many pairs would be expected to need replacement after 12 months?

[Given that  $P(z \geq 2) = 0.0228$  and  $z = \frac{(x - \mu)}{\sigma}$ ]

**Solution.** Mean ( $\mu$ ) = 8

Standard deviation ( $\sigma$ ) = 2

Number of pairs of shoes = 5000

Total months ( $x$ ) = 12

$$\text{When } z = \frac{x - \mu}{\sigma} = \frac{12 - 8}{2} = 2$$

Area when ( $z \geq 2$ ) = 0.0228

Number of pairs whose life is more than 12 months ( $z > 2$ )

$$= 5000 \times 0.0228 = 114$$

Replacement after 12 months =  $5000 - 114 = 4886$  pairs of shoes

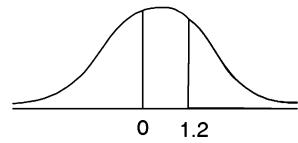

**Example 18.** In a male population of 1000, the mean height is 68.16 inches and standard deviation is 3.2 inches. How many men may be more than 6 feet (72 inches)?  
[ $\phi(1.15) = 0.8749$ ,  $\phi(1.2) = 0.8849$ ,  $\phi(1.25) = 0.8944$ ]  
where the argument is the standard normal variable.

**Solution.** Male population = 1000

Mean height = 68.16 inches

Standard deviation = 3.2 inches

Men more than 72 inches = ?

$$\phi(1.15) = 0.8749, \quad \phi(1.2) = 0.8849$$

$$\phi(1.25) = 0.8944$$

$$z = \frac{x - \bar{x}}{\sigma} = \frac{72 - 68.16}{3.2} = 1.2$$

$$\phi(1.2) = 0.8849$$

$$\phi \text{ for more than } 1.2 = 1 - 0.8849 = 0.1151$$

$$\text{Men more than 72 inches} = 1000 \times 0.1151 = 115.1 = 115 \text{ (say)}$$

**Ans.**

**Example 19.** Pipes for tobacco are being packed in fancy plastic boxes. The length of the pipes is normally distributed with  $\mu = 5"$  and  $\sigma = 0.1"$ . The internal length of the boxes is 5.2". What is the probability that the box would be small for the pipe?

[given that  $\phi(1.8) = 0.9641$ ,  $\phi(2) = 0.9772$ ,  $\phi(2.5) = 0.9938$ ]

**Solution.**

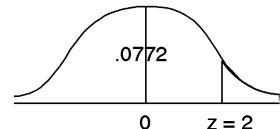

$$\mu = 5", \quad \sigma = 0.1", \quad x = 5.2"$$

$$\phi(1.8) = 0.9641, \quad \phi(2) = 0.9772, \quad \phi(2.5) = 0.9938$$

$$z = \frac{x - \mu}{\sigma} = \frac{5.2 - 5}{0.1} = 2$$

$$\phi(2) = 0.9772$$

$$\phi(z > 2) = 1 - 0.9772 = 0.0228$$

The box will be small if the length of the pipe is more than 5.2" ( $z = 2$ ).

Hence the probability is 0.0228

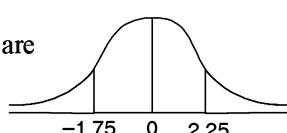

**Ans.**

**Example 20.** Assuming that the diameters of 1,000 brass plugs taken consecutively from a machine form a normal distribution with mean 0.7515 cm and standard deviation 0.0020 cm, how many of the plugs are likely to be rejected if the approved diameter is  $0.752 \pm .004$  cm?

**Solution.** Tolerance limits of the diameter of non-defective plugs are

$$0.752 - 0.004 = 0.748 \text{ cm and}$$

$$0.752 + 0.004 = 0.756 \text{ cm}$$

$$z = \frac{x - \mu}{\sigma}$$

If  $x_1 = 0.748$ ,  $z_1 = \frac{0.748 - 0.7515}{0.002} = -1.75$

If  $x_2 = 0.756$ ,  $z_2 = \frac{0.756 - 0.7515}{0.002} = 2.25$

Area under  $z_1 = -1.75$  to  $z_2 = 2.25$

$$\begin{aligned} &= (\text{Area from } z = 0 \text{ to } z_1 = -1.75) + (\text{Area from } z = 0 \text{ to } z_2 = 2.25) \\ &= 0.4599 + 0.4878 = 0.9477 \end{aligned}$$

Number of plugs likely to be rejected

$$= 1000 (1 - 0.9477) = 1000 \times .0523 = 52.3$$

Approximately 52 plugs are likely to be rejected.

**Ans.**

**Example 21.** A manufacturer knows from experience that the resistance of resistors he produces is normal with mean  $\mu = 100$  ohms and standard deviation  $\sigma = 2$  ohms. What percentage of resistors will have resistance between 98 ohms and 102 ohms?

**Solution.**  $\mu = 100$  ohms,  $\sigma = 2$  ohms

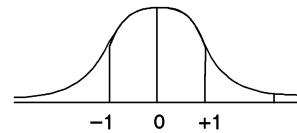

$$x_1 = 98, \quad x_2 = 102$$

$$z = \frac{x - \mu}{\sigma}, \quad z_1 = \frac{98 - 100}{2} = -1$$

$$z_2 = \frac{102 - 100}{2} = +1$$

Area between  $z_1 = -1$  and  $z_2 = +1$

$$\begin{aligned} &= (\text{Area between } z = 0 \text{ and } z = -1) \\ &\quad + (\text{Area between } z = 0 \text{ and } z = +1) \\ &= 2 (\text{Area between } z = 0 \text{ and } z = +1) = 2 \times 0.3413 = 0.6826 \end{aligned}$$

Percentage of resistors having resistance between 98 ohms and 102 ohms = 68.26 **Ans.**

**Example 22.** In a normal distribution, 31% of the items are under 45 and 8% are over 64.

Find the mean and standard deviation of the distribution. (AMIETE, Dec. 2010)

**Solution.** Let  $\mu$  be the mean and  $\sigma$  the S.D.

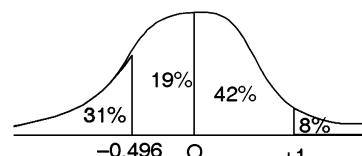

If  $x = 45$ ,

$$z = \frac{45 - \mu}{\sigma}$$

If  $x = 64$ ,

$$z = \frac{64 - \mu}{\sigma}$$

Area between 0 and  $z = \frac{45 - \mu}{\sigma} = 0.50 - .31 = 0.19$

[From the table, for the area 0.19,  $z = 0.496$ ]

$$\frac{45 - \mu}{\sigma} = -0.496 \quad \dots(1)$$

Area between  $z = 0$  and  $z = \frac{64 - \mu}{\sigma} = 0.5 - 0.08 = 0.42$ .

(From the table, for area 0.42,  $z = 1.405$ )

$$\frac{64 - \mu}{\sigma} = 1.405 \quad \dots(2)$$

Solving (1) and (2) we get  $\mu = 50$ ,  $\sigma = 10$ .

**Ans.**

**Example 23.** The income of a group of 10,000 persons was found to be normally distributed with mean Rs. 750 p.m. and standard deviation of Rs. 50. Show that, of this group, about 95% had income exceeding Rs. 668 and only 5% had income exceeding Rs. 832. Also find the lowest income among the richest 100.

(U.P. III Semester Dec. 2004)

**Solution.**

$$\text{Mean} = \mu = 750$$

$$\text{Standard deviation} = \sigma = 50$$

and

$$z = \frac{x - \mu}{\sigma}$$

(i) If  $x_1 = 668$ , then

$$z_1 = \frac{668 - 750}{50} = -1.64$$

$$P(x_1 > 668) = P(z_1 < -1.64)$$

$$= 0.5 + P(-1.64 \leq z \leq 0) = 0.5 + P(0 \leq z \leq 1.64) = 0.5 + 0.4495 = 0.9495$$

∴ Percentage of persons having income exceeding Rs. 668 = 94.95% ≈ 95% (approx.)

(ii) If  $x = 832$ , then

$$z = \frac{832 - 750}{50} = 1.64$$

$$P(x_2 > 832) = P(z_2 > 1.64)$$

$$= 0.5 - 0.4495$$

$$= 0.0505$$

∴ Percentage of persons having income exceeding Rs. 832 = 5.05% = 5% (approx.)

(iii) Let  $x$  be the lowest income among the richest 100 persons.

100 persons = 1% of 10,000

100 persons represents 1% area under the curve on the right hand side.

Thus the area between 0 and  $z$

$$= 0.5 - 0.01 = 0.49$$

From the table  $z$  for area 0.49 is 2.33

$$z = \frac{x - \mu}{\sigma}$$

$$\Rightarrow 2.33 = \frac{x - 750}{50} \Rightarrow x - 750 = 50 \times 2.33$$

$$\Rightarrow x - 750 = 116.5 \Rightarrow x = 866.5$$

Hence, the minimum income among the 100 richest persons is equal to Rs. 866.5.

**Ans.**

**Example 24.** Fit a normal curve to the following data :

Length of line (in cm)	8.60	8.59	8.58	8.57	8.56	8.55	8.54	8.53	8.52
Frequency	2	3	4	9	10	8	4	1	1

**Solution.** Let assumed mean = 8.56 cm

$x_i$	$f_i$	$x_i - 8.56$	$f_i(x_i - 8.56)$	$f_i(x_i - 8.56)^2$
8.60	2	.04	.08	.0032
8.59	3	.03	.09	.0027
8.58	4	.02	.08	.0016
8.57	9	.01	.09	.0009

8.56	10	0	0	0
8.55	8	-.01	-.08	.0008
8.54	4	-.02	-.08	.0016
8.53	1	-.03	-.03	.0009
8.52	1	-.04	-.04	.0016
$\sum f_i = 42$		$\sum f_i (x_i - 8.56) = 0.11$	$\sum f_i (x_i - 8.56)^2 = 0.0133$	

$$\text{Mean} = \mu + \frac{\sum f_i (x_i - \mu)}{\sum f_i} = 8.56 + \frac{0.11}{42} = 8.56 + 0.00262 = 8.56262 \quad \text{Ans.}$$

$$\begin{aligned} \text{Standard deviation} &= \sqrt{\frac{\sum f_i (x_i - \mu)^2}{\sum f_i} - \left( \frac{\sum f_i (x_i - \mu)}{\sum f_i} \right)^2} = \sqrt{\frac{0.0133}{42} - \left( \frac{0.11}{42} \right)^2} \\ &= \sqrt{0.000316666 - 0.000006859} = \sqrt{0.00030980} = 0.0176 \end{aligned}$$

Hence, the equation of the normal curve fitted to the given data is

$$P(x) = \frac{N}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

where,

$$\mu = 8.56262 \quad \sigma = 0.0176 \quad \text{and} \quad N = 42 \quad \text{Ans.}$$

### EXERCISE 65.2

1. In a regiment of 1000, the mean height of the soldiers is 68.12 units and the standard deviation is 3.374 units. Assuming a normal distribution, how many soldiers could be expected to be more than 72 units? It is given that

$$P(z = 1.00) = 0.3413, P(z = 1.15) = 0.3749 \text{ and}$$

$$P(z = 1.25) = 0.3944, \text{ where } z \text{ is the standard normal variable.} \quad \text{Ans. 125}$$

2. The lifetime of radio tubes manufactured in a factory is known to have an average value of 10 years. Find the probability that the lifetime of a tube taken randomly (i) exceeds 15 years, (ii) is less than 5 years, assuming that the exponential probability law is followed.  $\text{Ans. (i) 0.2231, (ii) 0.3935.}$

3. The breaking strength  $X$  of a cotton fabric is normally distributed with  $E(x) = 16$  and  $\sigma(x) = 1$ . The fabric is said to be good if  $X \geq 14$ . What is the probability that a fabric chosen at random is good. Given that  $\phi(2) = 0.9772$   $\text{Ans. 0.9772}$

4. A manufacturer knows from experience that the resistance of resistors he produces is normal with mean  $\mu = 140 \Omega$  and standard deviation  $\sigma = 5\Omega$ . Find the percentage of the resistors that will have resistance between  $138 \Omega$  and  $142 \Omega$ . (given  $\phi(0.4) = 0.6554$ , where  $z$  is the standard normal variate).  $\text{Ans. 31.08\%}$

5. A manufacturing company packs pencils in fancy plastic boxes. The length of the pencils is normally distributed with  $\mu = 6''$  and  $\sigma = 0.2''$ . The internal length of the boxes is  $6.4''$ . What is the probability that the box would be too small for the pencils (Given that a value of the standardized normal distribution function is  $\phi(2) = 0.9772$ ).  $\text{Ans. 0.0228.}$

6. A manufacturer produces airmail envelopes, whose weight is normal with mean  $\mu = 1.95$  gm and standard deviation  $\sigma = 0.05$  gm. The envelopes are sold in lots of 1000. How many envelopes in a lot will be

$$\text{heavier than 2 gm? Use the fact that } \frac{1}{\sqrt{2\pi}} \int_2^1 \exp\left(\frac{-x^2}{2}\right) dx = 0.3413 \quad \text{Ans. 159}$$

7. The mean height of 500 students is 151 cm and the standard deviation is 15 cm. Assuming that the heights are normally distributed, find how many student's height lie between 120 and 155 cm.

$$\text{Ans. 294}$$

8. A large number of measurement is normally distributed with a mean of 65.5" and S.D. of 6.2". Find the percentage of measurements that fall between 54.8 and 68.8". **Ans.** 66.01%

9. Find the mean and variance of the density function  $f(x) = \lambda e^{-\lambda x}$  **Ans.**  $\frac{1}{\lambda}, \frac{1}{\lambda^2}$

10. If  $x$  is normally distributed with mean 1 and variance 4,

(i) Find  $Pr(-3 \leq x \leq 3)$ ; (ii) Obtain  $k$  if  $Pr(x \leq k) = 0.90$  **Ans.** (i) 0.8185, (ii) 3.56

11. A normal variable  $x$  has mean 1 and variance 4. Find the probability that  $x \geq 3$ . (Given:  $z$  is the standard normal variable and  $\phi(0) = 0.5$ ,  $\phi(0.5) = 0.6915$ ,  $\phi(1) = 0.8413$ ,  $\phi(1.5) = 0.9332$ ) **Ans.** 0.1587

12. The random variable  $x$  is normally distributed with  $E(x) = 2$  and variance  $V(x) = 4$ . Find a number  $p$  (approximately), such that  $P(x > p) = 2P(x \leq p)$ . [The values of the standard normal distribution are 0 (-0.43) = 0.3336, and 0 (-0.44) = 0.3300]. **Ans.** 1.13834

If  $X \sim N(10, 4)$  find  $Pr(|X| \geq 5)$ . **Ans.**  $\frac{1}{e}, \frac{1}{5\sqrt{2}\pi} e^{-\frac{(x-75)^2}{2(0.5)}}, 0.062$

13. The continuous random variable  $x$  is normally distributed with  $E(x) = \mu$  and  $V(x) = \mu^2$ . If  $Y = cx + d$ , then find  $V(Y)$ . **Ans.**  $c^2 \mu^2$

14. The pdf of  $X$  is given by  $f(X) = \lambda e^{-\lambda x}$   $x \geq 0$ ,  $\lambda \geq 0$ . Calculate  $Pr[X > E(X)]$ .

If  $X \sim N(75, 25)$ , find  $Pr[X > 80/X > 77]$  **(A.M.I.E., Winter 2001)**

If  $X \sim N(10, 4)$ , find  $Pr[X \geq 5]$  **Ans.**  $\frac{1}{e}, \frac{1}{5\sqrt{2}\pi} e^{-\frac{(x-75)^2}{2(0.5)}}, 0.062$

15. A random variable  $x$  has a standard normal distribution  $\phi$ . Prove :  $Pr(|X| > k) = 2[1 - \phi(k)]$

16. The random variable  $x$  has the probability density function  $f(x) = kx$  if  $0 \leq x \leq 2$

Find  $k$ . Find  $x$  such that

(i)  $Pr(X \leq x) = 0.1$  (ii)  $Pr(X \leq x) = 0.95$  **Ans.**  $k = \frac{1}{2}$  (i)  $x = 0.632$  (ii)  $x = 1.949$

17. For a normal curve, show that  $\mu_{2n+1} = 0$  and  $\mu_{2n} = (2n-1) \sigma^2 \mu_{2n-2}$ .

18. In a mathematics examination, the average grade was 82 and the standard deviation was 5. All the students with grades from 88 to 94 received a grade B. If the grades are normally distributed and 8 students received a B grade, find how many students took the examination. Given

$\frac{x}{\sigma}$	1.20	2.00	2.40	2.45
$A$	0.3849	0.4772	0.4918	0.4929

**(A.M.I.E.T.E., Winter 2001)** **Ans.** 75 students

19. Explain the characteristics and importance of a normal distribution. **(A.M.I.E., Summer 2004)**

20. The life time of a certain component has a mean life of 400 hours and standard deviation of 50 hours. Assuming normal distribution for the life time of 1000 components, determine approximately the number of components whose life time lies between 340 to 465 hours. You may use the following data? Where symbols have their usual meanings. **(A.M.I.E., Winter 2002)** **Ans.** 788

21. For standard normal variate mean  $\mu$  is **(A.M.I.E., Winter 2005)**

(a) 1 (b) 0 (c) 6 (d) none of the above **Ans.** (b)

22. Fill in the blanks :

(f) The mean, median and mode of a normal distribution are..... **(A.M.I.E., Summer 2000)** **Ans.** zero

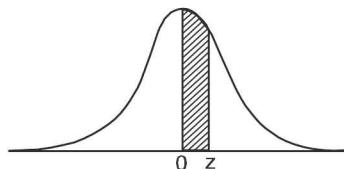

(h) The probability density function of Beta distribution with  $\alpha = 1$ ,  $\beta = 4$  is  $f(x) = \dots$

**(AMIE., Summer 2000)** **Ans.**  $4(1-x)^3$

**TABLE - 1**

**AREA UNDER STANDARD NORMAL CURVE FROM  $z = 0$  TO  $z = \frac{x - \mu}{\sigma}$**

An entry in the table is the proportion under the entire curve which is between  $z = 0$  and a positive value of  $z$ . Area for negative values of  $z$  are obtained by symmetry.

$z$	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09

CHAPTER  
**66**

## FUZZY SET

---

### 66.1 INTRODUCTION

If a doctor asks a patient “How are you” patient replies almost O.K.”

The word “almost” is a vague term and not mathematical i.e. It means neither “yes” nor “No” but between them.

But the word “almost” gives lots of information to the doctor & the doctor decides the further future treatment of the patient.

For this reason a mathematical modelling of vague knowledge is necessary. To convey such an information “Fuzzy set” is introduced. L.A. Zadeh in 1965 introduced this concept on the basis of membership function defined as:

$$\mu: X \rightarrow \{0,1\}$$

Here

$\mu(x) = 1$ , means full membership

$\mu(x) = 0$ , means non-membership and

$0 < \mu(x) < 1$ , means intermediate membership.

Due to Zadeh's work, a theory of vagueness (fuzziness) is now fully developed. The concept of ‘Fuzzy set’ & membership degree were introduced to form a mathematical model of vagueness.

A set is collection of well-defined distinct objects. A set of intelligent students is not a set. Because the criteria to be intelligent is not well-defined. We cannot say whether a particular student belongs to or not. The belongingness is not clear but vague. In fuzzy set theory, we assume that all students are members, all belong to the set upto certain extent.

Let Among Anil, Rajiv and Suresh, Anil got 10 marks, Rajiv got 40 marks and Suresh get 90 marks out of 100. Hence in comparison to Anil Rajiv is intelligent but if compared to Suresh he is not intelligent. All the three can be said to be intelligent to some extent and hence all the three are the members of this set of intelligent students.

**For example:** We write

$A = \{0.5 \text{ Rita}, 0.9 \text{ Kusum}, 0.4 \text{ Suresh}, 0.6 \text{ John}, 0.2 \text{ Latif}\}$  for the set of rich people.

It indicates that Rita has 0.5 degree of membership in A, Kusum has 0.9 degree of membership in A. Suresh has a 0.4 degree of membership in A, John has a 0.6 degree of membership in A and Latif has a 0.2 degree of membership in A. Thus, Kusum is the richest and Latif is the poorest of these people.

## 66.2 FUZZY SET

**Definition.** Let  $X$  be a non-zero set. A fuzzy set  $A$  of this set  $X$  is defined by the following set of pairs.

$$A = \{(x, \mu_A(x)): x \in X\}$$

Where,  $\mu_A: X \rightarrow [0, 1]$

is a function called as the membership function of  $A$  &  $\mu_A(x)$  is the grade of membership or degree of belonginess or degree of membership of  $x \in X$  in  $A$ .

Thus a fuzzy set is a set of pairs consisting of a particular element of the universe and its degree of membership.

$A$  can also be written as

$$A = \{(x_1, \mu_A(x_1)), (x_2, \mu_A(x_2)), \dots, (x_n, \mu_A(x_n))\}$$

Symbolically we write

$$A = \left\{ \frac{x_1}{\mu_A(x_1)}, \frac{x_2}{\mu_A(x_2)}, \dots, \frac{x_n}{\mu_A(x_n)} \right\}$$

## 66.3 EQUALITY OF TWO FUZZY SETS:

**Example 1.** Let  $X = \{2, 3, 4\}$

Consider the three fuzzy sets  $A, B, C$  of  $X$  as given below

$$A = \left\{ \frac{2}{5}, \frac{3}{6}, \frac{4}{1} \right\}$$

$$B = \left\{ \frac{2}{7}, \frac{4}{8}, \frac{3}{9} \right\}$$

$$C = \left\{ \frac{4}{1}, \frac{2}{5}, \frac{3}{6} \right\}$$

Here in set ‘ $A$ ’ and set “ $C$ ” members and their degrees are same.

$\therefore A = C$ , But in set “ $A$ ” & set “ $B$ ” members are the same but their degrees of membership are not the same.

Hence  $A \neq B$ .

## 66.4 COMPLEMENT OF A ‘FUZZY SET’

The component of a fuzzy set  $A$  is the set  $\bar{A}$  with degree of the membership of an element in  $\bar{A}$  is equal to one minus the degree of the membership of this element in  $A$ .

**Example.** The set “ $A$ ” is written as

$A = [0.9 \text{ Rama}, 0.4 \text{ Manju}, 0.8 \text{ Neera}, 0.1 \text{ Jyoti}]$  for the set of beautiful girls.

Thus  $\bar{A} = \{0.1 \text{ Rama}, 0.6 \text{ Manju}, 0.2 \text{ Neera}, 0.9 \text{ Jyoti}\}$  for the set of girls who are not beautiful.

## 66.5 UNION OF TWO FUZZY SETS

The union of two fuzzy sets  $A$  and  $B$  is the fuzzy set  $A \cup B$ , where the degree of member-

ship of an element in  $A \cup B$  is the maximum of the degrees of membership of this element in  $A$  and in  $B$ .

**Example.** We write

$$A = \{0.3 \text{ Radha}, 0.9 \text{ Pawan}, 0.6 \text{ Mahesh}, 0.4 \text{ Kunal}\} \text{ for the set of rich people.}$$

$$B = \{0.4 \text{ Radha}, 0.8 \text{ Pawan}, 0.2 \text{ Mahesh}, 0.7 \text{ Kunal}\} \text{ for the set of famous people.}$$

Here the degree in  $A \cup B$  of each element is the maximum of degrees of membership of this element in  $A$  & in  $B$ .

$$A \cup B = \{0.4 \text{ Radha}, 0.9 \text{ Pawan}, 0.6 \text{ Mahesh}, 0.7 \text{ Kunal}\}$$

## 66.6 INTERSECTION OF TWO FUZZY SETS

The intersection of two fuzzy sets  $A$  and  $B$  is the fuzzy set  $A \cap B$ , where the degree of membership of an element in  $A \cap B$  is the minimum of the degrees of membership of this element in  $A$  and in  $B$ .

**Example:** Let  $A = [0.5 \text{ Pushpa}, 0.1 \text{ Suman}, 0.8 \text{ Rani}, 0.4 \text{ Kailash}]$  for the set of fat people.

$$B = [0.3 \text{ Pushpa}, 0.6 \text{ Suman}, 0.2 \text{ Rani}, 0.7 \text{ Kailash}] \text{ for the set of tall people.}$$

Here the degree of membership in  $A \cap B$  of each element is the minimum of degree of membership of this element in  $A$  and in  $B$ .

$$A \cap B = \{0.3 \text{ Pushpa}, 0.1 \text{ Suman}, 0.2 \text{ Rani}, 0.4 \text{ Kailash}\}$$

## 66.7 TRUTH VALUE (R.G.P.V. Bhopal I/II Sem. Summer 2004)

### (i) Truth value of the negation of a proposition

The truth value of the negation of a proposition in fuzzy logic is 1 minus the truth value of the proposition.

**Example.** If the truth value “Vimla is happy” is 0.9.

Then the truth value of the statement “Vimla is not happy” is  $1 - 0.9 = 0.1$

**Example.** If the truth value of the statement “Devendra is smart” is 0.8.

Then the truth value of the statement that Devendra is not smart” is  $1 - 0.8 = 0.2$

### (ii) Truth value of the conjunction of two prepositions.

The truth value of the conjunction of two prepositions in the fuzzy logic is the minimum of the truth values of the two prepositions.

**Example.** If the truth value of the statement “Khan is brave” is 0.7 And the truth value of the statement “Kamal is brave”. is 0.8.

Then the truth value of the statement “Khan and Kamal are brave is 0.7 (minimum of the two).

And the truth value of “neither Khan nor Kamal is brave” is 0.2 (As truth value of the negation of 1st statement is  $1 - 0.7 = 0.3$  and that of second statement is  $1 - 0.8 = 0.2$  & minimum of 0.3 and 0.2 is 0.2)

### (iii) The truth value of the disjunction of two prepositions.

The truth value of the disjunction of two prepositions in fuzzy logic is the maximum of the truth values of the two prepositions.

**Example.** If the truth value of the statement “Neera is intelligent” is 0.9 and the truth value of the statement “Rekha is intelligent” is 0.6

Then the truth values of the statements

“Neera is intelligent, or “Rekha is intelligent” is 0.9 (Maximum of the two).

The truth values of the statements “Neera is not intelligent” or “Rekha is not intelligent” is 0.4 (Maximum of  $1 - 0.9 = 0.1$  and  $1 - 0.6 = 0.4$ ).

### EXERCISE 66.1

1. Interpret the following:

(i) The set  $A = \{0.7 \text{ Anu}, 0.9 \text{ Rasika}, 0.2 \text{ Sarita}, 0.5 \text{ Kartik}\}$  for the set of honest people.

(ii) The set of  $B = [0.2 \text{ John}, 0.4 \text{ Charu}, 0.9 \text{ Medha}, 0.8 \text{ Gagan}]$  for the set of brave people.

2. What are the constituents of the pair in a fuzzy set.

3. Which of the two fuzzy sets are equal of the following:

$$A = [0.3 \text{ Sonu}, 0.8 \text{ Renu}, 0.9 \text{ Paul}, 0.5 \text{ Kunal}]$$

$$B = [0.6 \text{ Kunal}, 0.9 \text{ Paul}, 0.7 \text{ Renu}, 0.3 \text{ Sonu}]$$

$$C = [0.8 \text{ Renu}, 0.9 \text{ Paul}, 0.3 \text{ Sonu}, 0.5 \text{ Kunal}]$$

4. Write down complement set of  $A$ , if

$$A = [0.3 \text{ Krishna}, 0.8 \text{ Kamal}, 0.7 \text{ Rajnish}, 0.6 \text{ Surendra}]$$

5. Write down  $A \cup B$  in fuzzy sets.

$$\text{If fuzzy set } A = [0.5 x_1, 0.3 x_2, 0.7 x_3, 0.8 x_4]$$

$$\text{Fuzzy set } B = [0.6 x_1, 0.4 x_2, 0.9 x_3, 0.1 x_4]$$

6. Write down  $A \cap B$  in fuzzy sets.

$$\text{If fuzzy set } A = [0.4 P, 0.7 Q, 0.2 R, 0.5 S]$$

$$\text{fuzzy set } B = [0.8 P, 0.6 Q, 0.1 R, 0.4 S]$$

7. Find the truth value of the negation of the following prepositions.

(i) The truth value of “ $A$  is happy” is 0.8.

(ii) The truth value of “ $B$  is rich” is 0.7.

(iii) The truth value of “Kamla is beautiful” is 0.9.

8. Find the truth value of the conjunction of the two prepositions. If the truth value of the statements

“Ranjeet is a good driver” is 0.7.

Latif is a good driver is 0.6.

9. Give the truth value of the disjunction of the two prepositions

If the truth value “Sarla has a good health” is 0.6.

And the truth value “Vijay possesses a good health” is 0.8.

10. Write short notes on “Fuzzy sets”.

### ANSWERS

1. (i) Rasika is the most honest and Sarita is the least honest.

(ii) Medha is the bravest girl and John is the least.

2. Members and its degree of membership.

3.  $A = C$

4.  $\bar{A} = [0.7 \text{ Krishna}, 0.2 \text{ Kamal}, 0.3 \text{ Rajnish}, 0.4 \text{ Surendra}]$

5.  $A \cup B = [0.6 x_1, 0.4 x_2, 0.9 x_3, 0.8 x_4]$

6.  $A \cap B = [0.4 P, 0.6 Q, 0.1 R, 0.4 S]$
7. (i) The truth value of "A is not happy" is  $= 1 - 0.8 = 0.2$ .  
 (ii) The truth value of "B is not rich" is  $1 - 0.7 = 0.3$ .  
 (iii) The truth value of "Kamla is not beautiful" is  $1 - 0.9 = 0.1$
8. The truth value of the conjunction, Ranjeet & Latif are good drivers is 0.6 (minimum of the two).
9. The truth value "Sarla has a good health" or "Vijay possesses a good health" is 0.8 (Maximum of the two).

## 66.8 APPLICATIONS

All engineering disciplines have already been affected to various degrees by new methodological possibilities opened by fuzzy sets, fuzzy measures.

### (i) Electrical Engineering

By developing fuzzy controllers, electrical engineering was first engineering discipline within which the utility of fuzzy sets and fuzzy logic was recognised. Fuzzy image processing, electronic circuits for fuzzy logic or robotics is also developed in electrical engineering.

### (ii) Civil Engineering

In civil engineering, some initial ideas regarding the application of fuzzy sets emerged in 1970. There is the uncertainty in applying theoretical solution to civil engineering projects, designing at large. Designer deals with the uncertainty, in safety which is required in the construction of bridges; buildings, dams etc. Fuzzy set theory has already proven useful, consists of problems of assessing or evaluating existing constructions.

### (iii) Mechanical Engineering

It was realised around mid-1980s that fuzzy set theory is eminently suited for mechanical engineering design.

A wide range of material might be used in mechanical engineering and the membership function is expressed in terms of corrosion, thermal expansion or some other measurable material property. A combination of several properties including the cost of different materials, may also be used.

### (iv) Industrial Engineering

Two well-developed areas of fuzzy set theory that are directly relevant to industrial engineering are fuzzy control and fuzzy decision making.

Numerous their applications of fuzzy set theory in industrial engineering have also been explored to various degrees, Fuzzy set are convenient for estimating the service life of a given piece of equipment for various conditions under which it operates.

In industrial environment, fuzzy sets are also applied in designing built-in tests for industrial systems.

### (v) Computer Engineering

In mid 1980s, when the utility of fuzzy controllers became increasingly visible, the need for computer hardware to implement the various operations involved in fuzzy logic and approximate reasoning has been recognised. All inference rules of a complex fuzzy inferences engine are processed in parallel. This increases efficiency tremendously and extends the scope of applicability of fuzzy controllers, and potentially, other fuzzy expert systems. In digital mode, fuzzy sets are represented as vectors of numbers (0, 1). Analog fuzzy hardware is characterised by high speed and

good compatibility with sensors, it is thus suitable for complex on-line fuzzy controllers.

(vi) **Reliability theory**

The classical theory of reliability is developed in world war II on the following assumptions.

(a) **Assumption of dichotomous states.** At any given time, the engineering products is either in functioning state or in failed state.

(b) **Probability assumption.** The behaviour of the engineering product with respect to the two critical states (functioning and failed) can adequately be characterised in terms of probability theory.

An alternative reliability theory, rooted in fuzzy sets and probability.

(c) **Assumption of fuzzy sets.** At any time the engineering products may be in functioning states to some degree and in failed state to another degree.

(d) **Possibility assumption.** The behaviour of the engineering product with respect to the two critical fuzzy states (fuzzy functioning state and fuzzy failed state) can adequately be characterised in terms of possibility theory, while second theory based on fuzzy sets is more meaningful.

(vii) **Robotics**

The fuzzy set theory that is relevant to robotics include approximate reasoning, fuzzy controllers and other kind of fuzzy systems, fuzzy pattern recognition and image processing, fuzzy data bases.

## EXERCISE 66.2

1. Write short note on the following:

Fuzzy logic affects many disciplines.

(Rajiv Gandhi University, M.P. Summer 2001)

2. Define with example

Fuzzy graph, fuzzy relations.

(Ravi Shanker Uni. I semester 2003)

# INDEX

## **A**

- Algebraic function 672
- Algebraic Multiplicity 489
- Algebraic & Transcendental eqn. 1372
  - Bisection method 1374
  - Bolzano method 1374
  - Graphical method 1373
  - Iteration method 1398
  - Newton-Rahson method 1378
  - Regula-Falsae method 1389
  - Secant method 1395
- Angular velocity 516
- Application of
  - Double Integration, 133
  - Triple Integration 182
- Approximation, 667
- Area
  - cartesian coordinate 159
  - polar coordinate 162
  - of parallelogram 515
- Argand diagram 612
- Argument, 620

## **B**

- Baye's Theorem 1639
- Bernoulli's equation 220
- Bessel's function 871
- Beta function 968
- Bilinear Transformation 721
- Binomial distribution 1662
  - Central moment 1669
  - Mean 1657
  - Recurrence Relation 1672
  - Standard deviation 1667
- Bowley's coeff of skewness 1553

## **C**

- Calculus of variation, 1456
- Cauchy Euler's Homogeneous differential equation, 266
- Cauchy Fundamental test, 1010
- Cauchy Integral Formula 754
- Cauchy Integral Theorem 752
- Calculus of residue 793
- Centre of Gravity 167, 200
- Centre of Pressure 204

- Change of order of Integration 143
- Change of variables 153
- Charpit's Method 1281
- Chebyshev polynomial 949
  - Orthogonal property 950
  - Recurrence Relation 951
- Chi Square Test 1653
- Complex Number 612
  - Argument 620
  - Conjugate complex number 615
  - Modulus 620
  - Complex Variable 629, 669
  - C – R equation 682
